The selling of state assets – from airlines to jute mills – is captivating politicians... Almost everywhere... governments are either selling assets or talking of doing so... Brazil may eventually privatise more than 100 state-owned enterprises; Mexico has around 250 up for sale... At its best, "privatisation" creates competition, efficiency and wealth. At its worst, it substitutes insensitive privately-owned monopolies for insensitive publicly-owned ones and feeds corruption... Consider... the money involved. When receipts from house and land sales are included, Britain's privatisation programme has so far raised more than £19 billion and the government expects it to raise another £14.25 billion over the coming three years. Japan's government stands to get almost \$40 billion from the partial sale of Nippon Telegraph and Telephone... What is happening around the world is the greatest exchange ever of money and property between private citizens and their governments. Not everyone thinks the transaction worthwhile. Misgivings are elegantly summed up by the [now] 91-year-old... who was... Britain's Conservative [PM] from 1957 to 1963. "First of all the Georgian silver goes, and then all that nice furniture that used to be in the saloon. Then the Canaletto go." In other words, governments are selling to provide for current spending – in business a sure way to go bankrupt. What do governments do when they have nothing left to sell? That is not how some of the brightest theorists see it... [A]n economist well paid by Britain's private sector, says that... the... lesson is simple... the public sector will always tend towards inefficiency, since it cannot go bankrupt and therefore has no compulsion to compete or to excel... The proffered solution is equally simple: let the private sector, where only the fit survive, push back the frontiers of the state. Taxpayers will benefit because a shrinking public sector means lower subsidies. So will the customers, because competition will lead to better quality at lower prices. It is this hypothesis which is now being tested... The theoretical arguments for privatisation are not as clear-cut or convincing as the propagandists would wish... How do you satisfy yourself that consumers benefit? ...Also, the management of a private-sector company has a basic responsibility to maximise profits for the shareholders; the managers in a state organisation may have a responsibility to deliver services regardless of price; or to employ labour which is surplus; or to sell a product or service below cost. How then can you sensibly compare the two managements? Academics nonetheless try. - Privatisation everybody's doing it

The Forestry Corporation has announced a record \$168 million profit a week after the [NZ] Government sold the company... Tax was \$43 million... The annual report shows the value of the corporation's forests was revised down by \$300 million to \$1.8 billion. Sales were worth \$501 million. The corporation... paid its chief executive... between \$410,000 and \$419,000. Two other staff earned \$300,000 or more, six were paid \$200,000 or more and 19 were paid \$100,000 or more... The corporation is now owned by... [a consortium made up of] China International Trust... Challenge... [and another local company, BIL].

...Having disposed of the Forestry Corporation for a net \$1.6 billion last week, the cabinet has been considering... another... state asset sale with speculation sweeping through trade union circles that a buyer has been found for Works and Development Services Corporation... the state company formed out of the old Ministry of Works. Works Corp, which has assets valued at \$157 million, employs more than 2600 staff. Potential redundancies have been an issue.

...THE drawer where the Government keeps the family silver opened for the 32nd time last week, just long enough for what was Works Corp to be sold. That brought to an end a chapter in state asset sales stretching to the ill-fated 1988 sale of NZ Steel. But if any future government wants to continue the sell-off, then plenty of opportunity remains. Even after eight years and income from state asset sales of \$13.5 billion, [SOE]s worth \$11 billion remain. The [1987 Labour] Government was keen to eliminate the \$12.8 billion-and-rising foreign debt mountain.

...The Government may be forced to disclose whether it declined a chance to bail out of its legal difficulties over the N[Z] Steel sale to Equiticorp for a fraction of the... cost it now faces. The Alliance is demanding that the Government tell Parliament whether it was offered a chance to settle the legal case for \$20 million, but refused on Crown Law advice. Given mounting speculation that Crown Law advice that the Government would win the case was widely disputed, the Alliance has lodged a series of parliamentary questions to discover what advice it sought and received, and which Cabinet ministers have been involved in the sale and subsequent legal decisions... The Government has heavily restricted its comments on the case... over the legal fall-out from the sale/share swap deal between the Crown and Equiticorp for the state steel company in 1987-88... pending the appeal of last week's High Court judgment of \$189.7 million against the Crown... The legal and likely appeal costs could ultimately mean the Crown has to pay out \$500 million in total to clean up the legal mess. Two Treasury officials instrumental in the deal have stood down from their jobs, after [the High Court] Justice... reserved particularly harsh criticism for their stewardship.

...No one has been held accountable for... the bungled sale of N[Z] Steel to Equiticorp, the Alliance leader... said yesterday. [He] was commenting on the news that Treasury officials named in a High Court judgment... were resuming their normal duties... "Those who are responsible for the N[Z] Steel calamity must bear the consequences of their staggering incompetence," [he] said... The Crown this month announced that it would appeal against the judgment, the final cost of which rose... after Justice... ordered it to pay \$133 million in interest and \$4 million in costs. The Secretary to the Treasury... said yesterday that the Crown Law Office had engaged [a] QC, who... was not involved in the earlier trial... [but] had

advised there were good grounds to appeal against the findings... It was a follow-on from the collapse of Equiticorp, the largest commercial failure ever seen in the country...

The Government's bill from the marathon Equiticorp case yesterday reached \$328.4 million – \$91 for every man, woman, and child in N[Z] – and it is still rising. Interest costs add \$100,000 every day until the full amount is paid... The Attorney-General... said the Government would announce by the end of the month whether it would take the judgment to the Court of Appeal. The case could go as far as the Privy Council. - 1996

...two Auckland lawyers... were the instructing solicitors who successfully sued the Government in the record-breaking Equiticorp case. It is they who won \$189.7 million from the Government on behalf of Equiticorp's statutory managers, and ultimately the long-suffering creditors of the former sharemarket high flyer once headed by [a man who has since been] disgraced... By the time the Government's appeal against the judgment is argued before the Court of Appeal... in February 1998 – it is estimated the High Court's award of \$189.7 million, plus accrued interest, will have grown to \$387m... [The case over 'the sale of NZ Steel by the Labour Government a day before the 1987 stockmarket crash, was the longest-running civil suit in NZ's history. Most of Equiticorp's creditors are overseas banks.' The Government wrote] off \$1.5 billion before selling the operation to... Equiticorp for \$327 million... [In related news, t]he Treasury spent... about \$4 million... on consultants for the Forestry Corporation sale... Advice on the Works Corporation sale... cost Treasury about \$1.4 million... However, Treasury's[total annual] payments to consultants were significantly down at \$13.1 million, from \$24.1 million in the [previous year. The NZ Government and its departments spent in total 'nearly \$113 million on private consultants in the past financial year']

...The Treasury has paid more than \$4.5 million in staff bonuses over the past three financial years. The... information has been supplied to[a] Labour MP... who sent questions to various ministers on bonuses paid to departmental employees other than chief executives. The responses have ranged from a refusal to supply any information – [by]the Minister for Courts... – to actual amounts of bonuses paid. In the case of ACC, one employee received more than \$54,000 in a bonus this year... [The Labour MP] said taxpayers did not expect their hard-earned cash to be used for bonuses for public servants, “especially those in departments like Treasury that have a reputation for narrow ideological thinking and poor forecasting... [This year 38] staff who already earn over \$80,000... share[d] nearly half a million dollars in... [bonuses. A further \$600,000 wa]s... divided among 94 staff earning between \$50,000 and \$80,000... Treasury has a role to help ensure fiscal prudence. They should not be involved in inappropriate or questionable spending of taxpayer funds. [The Treasurer] should intervene and give a written direction to the Secretary for Treasury that the bonuses should cease.” ...[a] finance and expenditure select committee review of the Treasury points to staff retention problems – the turnover in the[past] year... was 25[% – although t]he committee's report said the problem [c]ould be addressed with moderate salary increases to staff whose skills were in highest demand. These would be met from savings within the Treasury. [However, t]he duty minister... said the Government wanted departments to be autonomous, and bonuses produced better performance. [The Labour] party had introduced autonomy for government departments through the State Sector Act in the late 1980s.

...Ten years on, SOE model still has flaws... [The former Labour PM who was the SOE] architect... says the model he created vastly improved the N[Z] economy – but wasn't able to prevent the political intervention it set out to eradicate. Ten years ago last Thursday, amid considerable controversy and fears of privatisation, the first SOEs were created in N[Z]. They numbered 14. Over the years more have been created and 12 have been sold into private ownership... [Its architect] said while it had been a highly effective transitional tool, the inability of the system to prevent increasing political involvement made it clear that privatisation of more bodies was the only answer to creating what should be purely commercial operations. The current Government had nevertheless promised to retain key SOEs, he said... However, [the]... Minister of SOEs... said the first 10 years of SOEs had proved their value to the taxpayer. “The public has gained so much from the sale of SOEs in the past. There is no logical reason for the Government [not]to continue... I know it has been personally painful for many N[Z]ers who found themselves, through no fault of their own, at the cutting edge of change. But I would suggest that as we look back now, there would be few who would argue for a return to the old days.”

...Ten years after the first wave of [SOE]s were established, a study by three Auckland academics has rated the corporatisation experiment extremely successful. But they warn that unless the further step of privatisation is taken the gains are at risk of erosion and the SOEs will remain vulnerable to the “slow infiltration of politics and wider social considerations... Although privatisation does not appear to have been part of the original reform agenda of the... Government... pressure[for further privatisation] has come from boards and management of SOEs, Government... officials and politicians, including shareholding ministers, who see the real productivity and efficiency gains achieved by SOEs being eroded over time.” ...They conclude that corporatisation turned what were bureaucratic and often inefficient and wasteful organisations, with mixed and confusing objectives, into well-focused, commercially orientated and profitable companies. International interest in the N[Z] experience remains high... It brings Japanese MPs here on fact-finding missions and has created a demand for N[Z] consultants as far away as Mongolia. First, a reminder of the problem: In 1985/86, the Electricity Division of the Ministry of Energy, State Coal, the Post Office, Lands and Survey, the Forest Service and the Airways system managed assets valued at more than \$20 billion. But collectively, they brought no net after-tax return to taxpayers. The reform process involved imposing a corporate structure on the organisations, deregulating the industries they dominated and separating off the non-commercial functions they were expected to fulfil... The resulting dilemma about whether commercial or social objectives should be paramount, led to disputes... about profit targets, dividend levels and diversification. Eventually, the primacy of commercial objectives was established... SOEs were... to operate as successful businesses and be as profitable and efficient as comparable businesses not owned by the Crown... The authors of the study have compared the financial performance of the... SOEs between 1988 and 1992 with 82 public listed companies that survived through the same period. From 1990, all... SOEs made a return on equity better than the medium for the listed companies... Such measures crucially depend on the valuation of the assets transferred to the SOEs. Especially for the earliest SOEs... arguments over valuation were protracted and, sometimes, acrimonious... The Government is[currently] adverse to pouring any new money into SOEs to support large-scale investments they might want to make... [By the way, a survey o]f... senior business executives... this week... [found 84%] saw the need for more structural reform leading to more efficient use of resources, while 87[%] regarded the sale of more state-owned assets as highly desirable.

...The sell-off of more state corporations has been mooted by the Minister for S[OE]s, but she] is not saying which companies are possible candidates for privatisation. She and the Minister of Finance... were “looking closely” at [SOE]s and airports which were not listed as strategic assets in the coalition agreement to see whether they should remain in public ownership... [She] said the previous Government had moved on the sale of airport shareholdings and the coalition was working on the sale of Tauranga airport[, which is in the NZ First leader's electorate]. “...We are looking at them all on a case-by-case basis... It will be an option for the coalition to consider whether they wish to advance any such divestment.” She refused to speculate on specific state companies, but said National certainly believed some, over time, would be better off in private hands... N[Z] First has acknowledged that the coalition agreement allows cabinet ministers to look at privatising some state corporations on a case-by-case basis... Having promised in its election policy to stop all asset sales, N[Z] First succeeded during the coalition talks in negotiating the list of major “strategic” assets which would not be... sold – the Electricity Corporation, Contact Energy, Trans Power, New Zealand Post, Television One, National Radio and Concert FM... Other SOEs not protected from sale are Airways Corporation, Coal Corporation, Land Corporation, TV2, Timberlands West Coast, MetService and Terra Link.

...NZ First[']s leader... has indicated support for the sale of selected S[OE]s, but with the hope N[Z] owners can be found... “We believe the ownership of N[Z] assets in N[Z] hands is something to aspire to. You’ve got to look at it issue by issue. You would do it within the philosophical framework of N[Z] ownership where that is the best thing to do... Our objective is to get the best possible management structures in place in the interests of the N[Z] taxpayer...” ...In particular, he favours the sale of Government Property Services... valued at around \$160 million... and says some airports would be better out of the hands of government and into the hands of local people... “In the case of airports, there is probably a very strong argument that they would be better owned by local authorities and or local ratepayers where you’d have much better potential for localised management in the commercial sense, rather than centralised control...” ...Also being looked at for sale is the Vehicle Testing Services (\$12m)... His comments give the green light to National’s plans to revive the State asset sales programme. His views are in stark contrast to NZ First’s absolute opposition before the election to any further [S]tate asset sales...

The... [NZ First leader,] who berated previous Labour and National Governments for selling state assets and described privatisation as just another word for private greed... has dropped his crusade against privatisation by signposting the sale of two state-owned enterprises – Government Property Services and Vehicle Testing New Zealand... The only difference about these sales is that the coalition Government is considering a public float... [He] uttered the “f” word yesterday in his maiden speech as Treasurer. “Float” is a term no N[Z] politician in power had deigned to use in a decade of disposals of public assets... But... the... chances of the public buying shares in either business would appear to be slim, given the size of Vehicle Testing N[Z] and the risks and uncertainty of the property market... Furthermore, the coalition Government has given approval for “non-core” parts of strategic assets to be sold...

...a raft of [SOE]s will be expected to divest non-core businesses as the Government moves to boost its flagging coffers... [Meanwhile, t]he Government has moved swiftly to... sell Government Property Services... In last week’s budget statement, the Government estimated a net worth of \$177 million for Property Services. Assuming 35[%] gearing, as is the common level for similar property companies, this would place a value of about \$270 million on the business... Small bikkies compared with the \$US1000 billion... raised by the cumulative sales of... assets since the global privatisation wave began sweeping the world in the early 1980s. But [the price] is a useful fillip to the[NZ] Government’s coffers nevertheless... Property Services has had a history of troubles. In 1990, the Government injected \$240 million to stop it from going into bankruptcy. It now has a portfolio of 38 properties, 81.5[%] of which are Wellington-based. Its major tenant is the Government.

...Four investment banks will line up at a beauty parade in Wellington next week to compete for a... mandate to float Government Property Services[, which]... has reported a net profit of \$7.55 million for the[past] six months... compared with \$8.38 million for the same period last year.

...Government-owned Standards New Zealand has sold its systems and product certification services division to international certification company Bureau Veritas Quality International for an undisclosed sum. The deal gives BVQI the exclusive right to certify products with the familiar S mark and the Quality Assured Supplier mark... [In related news, the] sale of Valuation New Zealand appears almost certain, as the organisation gears up for competition for the \$30 million local authority ratings valuation business. [A] review of VNZ by[its] chief executive and Valuer-General... has already brought an about-face by the Government over whether the organisation should remain a government department or become a[n] SOE. Meanwhile, the SOE Electricity Corporation (ECNZ) and VNZ... are heading back to court for the next round in a protracted battle over the value of the power company’s assets. The High Court ruled earlier this year that valuations for ECNZ power stations should drop by an average of 22[%]. The decision followed the company’s objection, after its formation in 1987, to the method used by the then Valuation Department to access its properties. Both sides have lodged appeals against the decision.

...A National cabinet minister... yesterday talked of putting... Trans Power assets on the block... In his first speech as Minister of Energy, [he] told power company chief executives that their desire to buy part of Trans Power was being worked on by Government officials... Power companies, many of them foreign owned, want to buy the “spur lines” ...power lines which feed off the main national electricity grid to substations up and down the country. Both sets of power lines are natural monopolies. Industry sources told... that Trans Power’s spur lines are worth about... a quarter of the company’s \$2.8 billion book value... [A] spokesman for the minister said any possible sales did not mean Trans Power would be privatised. “The core group would be maintained.” The spokesman also played down the work being done by officials, saying they were just looking at the “possibility” for sales. “It is really a matter of getting officials to have a look at all the issues involved to see if it makes sense to maintain them by Trans Power or sell them off.” ...[the Minister of Energy], one of the driest ministers in cabinet... made no mention in his speech of a... promise in the coalition agreement to “overhaul energy pricing.” Instead, he gave every indication that he would follow in the footsteps of previous National energy ministers and leave pricing to the industry. “The strong direction of the reforms has been away from Government involvement.” But [he] did have a firm message to the industry to deliver benefits from the electricity reforms to domestic customers or face consumer pressure on the Government for a fairer deal through more interventionist mechanisms... The... N[Z] First leader... could not be reached for comment...

N[Z] First is understood to have agreed to National’s plan to sell eight power stations, despite its strong election policy... The leader of NZ First... last night had a hazy recollection of the[coalition] discussions and said he would have to consult the party’s negotiators who had handled the issue... [H]e recalled some discussion about the completed sale of one power station and how the other stations did not appear to be linked to any national strategy. Beyond that... he could not be “more effusive.” ...Opposition to the sale of state assets has been a philosophical pillar for NZ First... Asked if NZ First still upheld its strong commitment to retain publicly owned assets in public hands, [he] said: “That has always been the view of NZ First, it still is the view and will go on being the view.” ...The Minister for S[OE]s... however, was adamant that NZ First had agreed to the sale of eight small hydro stations – put on the block when National split the Electricity Corporation into two [SOE]s in 1995... [She] said the coalition Government’s junior partner had signed up to the proposal. A spokeswoman for the [minister] said National reached a “clear understanding” from NZ First during the coalition negotiations to proceed with the sales. The coalition agreement explicitly rules out privatisation of the... [c]orporation... The stations on the block[only] generate a total of 325 megawatts – ...[which means they] represent just 6.3[%] of NZ’s generating capacity and 8.6[%] of its hydro capacity... [– but] could... have a combined value of... between \$650 million and \$1.1 billion. The... largest, Matahina in the Bay of Plenty, generates 72MW, but is being strengthened at a cost of \$200 million after it was found to be outside international earthquake safety standards.

...Maori considerations are behind N[Z] First’s abandoning its pre-election rhetoric and agreeing to the privatisation of eight power companies... A statement about the sales, issued yesterday by the leader of NZ First... the Minister of Finance... and the Minister for S[OE]s... stressed that the stations were for sale only to local energy companies or Maori interests... Iwi and power companies have formed consortiums to buy the hydro stations... but there appears to be nothing to stop power companies with foreign ownership from bidding... If any are not sold 18 months after the privatisation process starts, they will be transferred to the state-owned generating company Contact Energy... When the Minister of Energy... suggested last month that Trans Power spur lines could be sold, he was forced into accepting that... [such a move would break] the... coalition agreement... Asked how “no privatisation of Trans Power” meant no sale of spur lines, but “no privatisation of ECNZ” meant eight power stations could be sold, [the Minister for SOEs] said that was because the sale of spur lines was never firmed up by National before the election, whereas the sale of power stations was.

...E[CNZ] has sold the 31MW Mangahao hydro power station in the Horowhenua for \$53.5 million to... [a consortium that includes a corporation which is 20% owned by] Utilicorp NZ... and owns 50[%] of Kiwi Dairy’s 70MW co-generation plant at Hawera... [plus] the Taumarunui-based

King Country Energy... [which already owns the] 7.2MW Kuratau and Piriaka hydro schemes... Mangahao was commissioned in 1924 when it was the largest power station in the North Island and was expected to be able to supply all the electricity requirements of the lower North Island for the next 50 years. A \$17 million upgrade in 1993 increased its peak capacity from 20MW... The Minister for S[OE]s... and the Minister of Finance... welcomed the sale, saying it would encourage competition in generation and help to keep power prices down... Consultation with Maori has delayed other sales, although... ECNZ... tipped yesterday that talks over the 35MW Coleridge, in Canterbury, were nearly complete... [Incidentally,] Lenin once said that communism would result from Soviet power plus the electrification of the country. Bosses of energy companies these days seem to believe that western management skills plus the electrification of the whole world will result in huge profits for their firms. Like Lenin's, this theory may well prove a pretty awful mess.

...Contact Energy said one-time charges contributed to a net loss of \$32.6 million for the eight months to September 30[, 1996]... In 1995, the Government rejected official advice for a three-way split of the... government-owned E[CNZ]... and opted to establish Contact Energy with about 28[%] of the country's generating capacity. The exercise was designed to encourage private sector involvement in generation, kick-start the wholesale electricity market, and put downward pressure on prices. - 1997

A power game where suppliers are setting all the rules... The chief executive of the Electricity Supply Association paints a rosy picture of the coming wholesale market for electricity. As a consumer, I[– the spokesperson for the consumer group Power for Our Future –] beg to differ. First, the name wholesale market is misleading. A wholesaler bundles the demand for retailers, carries a range of different products, and pre-selects products according to quality and price. Electricity is a uniform product; the retailers deal directly with producers. No wholesaling there. At best the new wholesale market, so called, is merely a clearing house for contracts, and a place to trade the over – and under – supply of a single product. At worst it is a place where the dominant participants “game” the market to their own advantage... because the value of hydro storage is not determined by production cost but scarcity; the price is then set not by the lowest cost of supply but the highest. The most destructive aspect of the market, however, is that there is nothing to deal with a problem unique to N[Z]. Proportionately, our hydro storage is the smallest in the world. This is a topographic feature and cannot be remedied. Without inflow, and at full generating capacity, our lakes go from maximum to minimum level in 57 days. In contrast Canada and Brazil have storage levels which can maintain generation for more than a year. For this reason, in combination with its insular position, N[Z] needs back-up stations which may run only once in 40 years – and someone must pay for them. Admittedly the former Electricity Department built more power stations than were needed in the end. That happened to most industrial nations at the time. More than that, the department realised that the cost of idle power stations was preferable to running out of electricity in a water shortage; they played it safe... A market is well capable of finding the balance between security of supply and the cost to get it, provided that the market is set up that way. [NZ's electricity] wholesale market is not... The hydro crisis of 1992 set the pattern: The *benefits* of running the system without sufficient reserves fell to ECNZ. [Prior to the 1992 crisis, to] save money, it decommissioned[the ‘210 MW coal-burning thermal power station’ at] Meremere, sold vital back-up fuel for Marsden A and introduced other changes to the system which saved money but also reduced reserve capacity. The financial *risk* of such action fell on the manufacturing and commercial sectors (ECNZ merely had to forgo some profits from electricity it did not have). At the time ECNZ was still responsible for maintaining an adequate reserve. It did not, and was rapped over the knuckles – with a wet bus ticket. Things now are even worse. Neither the generators nor the power companies have to guarantee reserve capacity... [The chief executive of the ESA] admits as much by saying that at times the price of electricity will rise to a point that manufacturers will stop manufacturing. That is outrageous. Electricity... is a vital but rather small ingredient to most businesses. Manufacturers have to consider factors such as loss of markets from delayed deliveries, on-going fixed costs, and obligations to suppliers. The manufacturer's response[during a future crisis] to a temporary higher electricity price will be nil[– with the exception of the Comalco aluminium smelter (where ‘a cost-cutting review is costing \$4.5 million’)]... because an extremely high proportion of its production cost, about 30[%], is electricity. NZers will have the privilege of buying back electricity, at the high spot market price, which Comalco had secured at throw-away prices. Since security of supply has a cost, in a true market the company would have to pay a premium rather than getting a discount on its electricity. The burden of savings and, worse, cuts in supply will again fall on both the small business and domestic consumers because they do not have the market power to insist on penalty clauses for non-supply[(although Mercury Energy, for example, now pays its customers \$50 ‘if it fails to meet stated performance standards’)]. During the previous hydro crisis the consumers responded willingly. Judging by recent letters to editors, however, there appears to be some hostility from consumers towards their investor-dominated power companies. Co-operation may not be forthcoming in the future, and financial incentives are nowhere in sight – simply because the technology is not there to reward customers for short-term savings... [Therefore] the new electricity market is designed to have the benefits accrue to the electricity industry, with the risk pushed, literally, down the line to the consumers. This is not really surprising because the electricity industry virtually designed the market to its own ends. The Government was an interested but befuddled bystander at best; and the consumers were studiously heard – and then ignored.

...The Government... g[a]ve... approval to the wholesale electricity market without input from those who will pay for it – the consumers. Had it asked, the answer would almost certainly have been “no.” The market is due to take effect on October 1...

N[Z] has spent five years and \$100 million developing a market, due to start in less than three months. According to the Electricity Market Company, Emco, which has been preparing N[Z] market rules, Norway's hydro-dominated system is the most similar to N[Z]'s. Its market structure is also the one most closely resembled by N[Z]'s proposed market, an Emco spokeswoman said last week. She was not aware... [that i]n its four years of operation, the Nordic Exchange has been characterised by concerns about gaming, the practice of generators and energy traders manipulating prices by controlling water storage... [Furthermore, while] Norway has the advantage of much larger water storage capacity – a year's worth of generation – and can buy electricity from other countries if it runs out[, NZ] can store only a few weeks' worth of water and has no cable to A[US] or anywhere else... In Norway and Sweden, lack of rain and snow has led to low hydro reservoir levels but questions are also being asked about the market's performance. Prices for electricity on the Nordic Exchange have risen 20[%] since May, while six-month forward contracts have gone up 150[%]. Trading has been suspended on three separate days since May 31.

...Power New Zealand has increased household electricity prices by 11[%], and says more increases may be in store as it struggles to cope with new transmission charges introduced with the wholesale power market... Before this month, householders in the Auckland north and west paid 8.77c a unit. The new price, showing up on the latest bills, is 9.66c, with the... fixed daily charge of 56c... and GST on top... In a note to customers, Power N[Z] said the change meant an increase of about \$1.50 a week to the average domestic user[, who]... used 650 units a month. A more pressing issue for the company was the charges Trans Power introduced on October 1. Power N[Z] was refusing to pay it while it argued their validity. If accepted, they would mean higher prices for all customers but particularly for householders... Power N[Z] last raised household power prices in January by about 5[%]. Later the same month Mercury Energy said it was increasing residential power prices by an average of \$1.50 a week. In fact the price rises for its smallest domestic customers were up to 29[%]... Mercury charges householders 60c a day regardless of consumption and 9.8c a unit (but then offers a 10[%] discount for prompt payment); Tauranga electricity charges 11.09c a unit but no additional daily charge...

HOUSEHOLDERS in the King Country around... [the PM]'s home town of Te Kuiti paid less on average last year for their electricity than anywhere else in N[Z] – while those in central Hawke's Bay paid the most, according to figures prepared... by the Ministry of Commerce... At \$115

for 30 days supply to a domestic customer, Central Hawke's Bay Power is 54% more expensive than King Country Energy... The figures also show the profits each company makes from its line... networks, which in most cases provide a natural monopoly... Topping the list is Auckland's Mercury with a return of 10.85%. K[CE] was the only company to operate its line network business at a loss – with a return of -0.14% - 1996

N[Z]... has too many electricity companies and some need to merge to force power costs down, according to a report by [an international] accounting firm... Since deregulation... in 1993... [the] number of companies selling electricity has dropped... from... 46... to 38... but that is considered too many for a relatively small country... Figures... show that power companies here, on average, supply 43,000 customers, compared with utilities in A[US], Britain and the U[S], which supply... millions of clients.

...In two years, N[Z]'s domestic power prices have risen more than 12[%] in real terms, says a British survey of power supply companies in 25 countries. The average household in the U[S], Canada or South Africa now receives smaller power bills. Two years ago N[Z] was the cheapest. The survey shows we paid 17.9[%] more in 1996 than in 1994, while inflation was 5.6[%]. In Canada, the domestic price dropped 13.6[%], in the U[S] 11.7[%], and in South Africa 10.1[%]. The Consumer Coalition on Energy... said yesterday that [NZ's] supply companies were pocketing the savings made from more efficient operation of the power system. The coalition pointed out that... ECNZ power stations are now generating electricity 15% more efficiently than 10 years ago... and... the average wholesale price of electricity has fallen by 17% since 1987... [However, the ESA has] hit back, saying [the coalition] was telling only part of the story. South Africa had a huge state monopoly and very cheap labour while Canada had similar monopolies... Power prices for non-domestic consumers, who previously paid up to four times as much as households, had been reduced substantially... said [the association's] executive director...

Domestic consumers are getting a shoddy deal from electricity retailers and may not even be getting the power they pay for, a hard-hitting Ministry of Consumer Affairs report has found. The report says householders have missed out on the advantages commercial consumers have gained since the market was opened to competition in 1993. It... also... says more than 10[%] of domestic electricity meters have been in place unchanged, and in many cases not maintained, since 1956. Only Dunedin Electricity operates an internationally accepted system for testing meters... [- the rest] often simply wait... for customers to report problems... The report ranks the 36 electricity retailers in order of performance. The lower East Coast's Wairoa Power... - [which] has only 10,000 customers... [-] comes out top, and Waitaki Power in Oamaru is [at] the bottom... The Auckland region power companies Mercury Energy and Power N[Z] placed 10th and 16th respectively... The report identifies a range of other concerns including: • Companies requiring customers to pay for power they have not used. • Failing to consult customers on changes to the contract. • Disconnecting power without pursuing all other options. • Requiring customers to pay for problems caused by the power company. • Requiring customers to pay for meter faults. • No clear, free and efficient disputes procedures... The report... suggested the industry consider having an ombudsman... The Minister of Consumer Affairs... said yesterday that she would monitor the response of power companies to the report. The [ESA] president... said power companies regarded the report as a constructive document which would be a valuable resource for the industry.

...The aim of deregulating the electricity market in 1993 was to promote competition to benefit consumers by improving efficiency and service. While this has happened for large commercial users, domestic consumers are worse off because, along with regulations governing how electricity was distributed went regulations that protected the rights and benefits of consumers. The Ministry of Consumers' Affairs report... has found that... domestic... consumers are at the mercy of often outrageously unbalanced contracts foisted upon them by their local monopoly supplier. In the year to September 1996, Trans Power estimated that... the... competitive market accounted for only 4.4[%] of total electricity sales. This is mainly because the cost of supplying small, geographically dispersed users with electricity makes it uneconomic for competition to occur at the level of individual households. Customers therefore have no choice over the electricity supplier...

Electricity consumers are victims of one of the biggest con jobs of all time, the chief executive of the Consumers' Institute... says. At a conference in Wellington reviewing the electricity market, [he]... said deregulation and promises made when it began a decade ago had failed the small consumer... Surprisingly, many others at the conference appeared to back [him]... They had heard a stern message the previous evening by the Minister for S[OE]s... that it was time people paying the household power bill had a choice of supplier. "If you don't deliver that, I would seriously question whether the market direction we have set is sustainable over time,"... But her message was not the first in a similar vein. The Minister of Energy... has twice called for a better deal for households and his predecessor... did the same thing several times during... 1993-1996...

The Minister of Energy... yesterday painted himself as champion of the small electricity user, saying the issue of getting lower household prices was a personal challenge for him. At the opening of the Southdown power station in Auckland, [the minister] reminded power companies that the Government had the power to impose price controls if it thought competition was limited. But... [the minister] was unwilling to put a deadline on when he would take action if competition did not emerge... [Such competition may come from a] power meter made by a Porirua electronics firm... [that will, for example,] enable Wellington and Auckland home owners to buy cheaper electricity from a Dunedin power company. The sophisticated electronic meter... provide[s] the vital technological link to opening up deregulation of the power market for domestic users... The smart meter... not only does away with the need for meter readers, it will offer individual home consumers greater choice in the way they pay for power... [T]he metering system allow[s] power companies to measure rates every half hour. This makes possible a competitive retail market where buyers can take advantage of cheaper rates at different times of the day... The meter[- which]... will enable companies to market on price, give greater flexibility in balancing their power loads, and capture customer in other parts of the country... [-] has the ability to monitor power use of individual appliances and turn them on and off... [Furthermore, f]ire alarms, burglar alarms, medic alerts and even gas meters can be monitored in the home through the meter and power line and connected immediately to the appropriate fire brigade, security company, ambulance or gas company... [The minister suggested the] new meters could be in homes within three years. [However, i]t was not clear who should pay - the consumer, the incumbent supplier or a rival supplier. Southdown, which is owned by Mercury Energy... (47.5[%]), Canadian company TransAlta (47.5[%]) and gas retailer Enerco (S[%]), has a 116MW capacity and began generating in December. The chairman of Mercury... said it met a quarter of the company's needs and provided security of supply. "We don't want Auckland to ever have the lights go out," he said... Southdown is a combined cycle plant which means it produces electricity not only from the twin gas turbines but also with steam generated by the hot exhaust gases. The turbines are rated at 40% thermal efficiency and the steam cycle generation adds a further 10%[, which means]... Southdown compares more than favourably with other thermal power plants in N[Z] which average about 35% efficiency.

...Christchurch-based Southpower and Dunedin-based United Electricity will compete for up to 1000 of each other's residential customers... [during a trial of] a technique called profiling... When a customer switches power supplier the physical flows will not change. The same electrons flow from the same power station to the same dishwasher, say, as they would have if the consumer had not changed supplier. What changes is that a different electricity retailer buys the energy from the generator and sells it on to the consumer. As the wholesale price varies from one half-hour to another, the company needs to know - or have a pretty good guess - how much the consumer uses in any half-hour period. Time-of-use meters would capture that information, but they are still too expensive for domestic use. So "deemed profiling" has been developed as a proxy. The approach is actuarial, like life insurance. The power company knows already what proportion of a typical domestic consumer's consumption occurs in any half-hour period. It uses that profile in making its energy buying decisions. Under the Southpower-United plan, the companies agree to use those profiles to square accounts with one another. The new supplier will be responsible for billing and handling faults complaints. The

original supplier will continue to read the meters, for a fee. Line charges continue to be paid to the incumbent network... In addition to being Christchurch's incumbent electricity company, Southpower is the majority shareholder of Enerco which supplies gas in the Auckland and Wellington markets. United is the energy retailing joint venture of Dunedin Electricity, Invercargill Electricity, Timaru-based Alpine Electricity and the rural Southland supplier, the Power Company.

...Bantam-weight energy company Powerco of Taranaki is muscling in on the Auckland electricity market and has begun supplying one of the city's biggest energy users – Auckland Healthcare... Powerco... owns five hydro-electric plants with total capacity of 170 gigawatt hours a year. The Healthcare contract is for around 20 gigawatt hours, enough power to keep a one-bar heater going continuously for more than 2000 years... Auckland Healthcare officials were unwilling to specify the exact amount they will save from the new deal, but[the] contract and supply manager... said the difference was “sufficiently large for us to take it seriously.” The group's recent power bills have been more than \$2 million a year... [A]round half a dozen suppliers tendered for the Healthcare contract... The exclusive three-year deal to supply Healthcare comes hard on the heels of Powerco winning a contract to sell electricity to another big Auckland user, the Tip Top frozen foods factory in Mt Wellington. In both cases, Powerco won the business from... Mercury Energy. While in dollar terms the contracts are not critical to Mercury... [–] the Healthcare contract represented less than half a per cent of its total annual power sales... [–] they typify how development of a wholesale electricity market is putting pressure on traditional suppliers and reducing costs for commercial electricity users... Powerco will supply electricity to more than 60 Auckland [Healthcare] buildings... Powerco will not generate the electricity it must deliver... Instead, it will supply the power from the wholesale electricity market. That market is a hypothetical reservoir for all power generated in N[Z]. In theory, the energy Powerco is selling in Auckland could be produced by generation plants owned by Mercury... Powerco will pay Mercury for use of its network of transformers, switches and electricity lines... through an interconnection agreement...

Powerco yesterday announced a slightly increased after-tax profit of \$10.5 million for the six months... The company said... the latest half year was affected by a depreciation policy change, a one-off restructuring and interest costs associated with its acquisition of Egmont Electricity.

...Hawke's Bay Power has announced a half-year after-tax profit of \$2.47 million... [T]he result... meant the consumer trust-owned company would not increase electricity tariffs in the foreseeable future.

...Electricity retailer TransAlta N[Z] has beaten its profit forecasts by more than two-thirds, announcing earnings of \$7.2 million in its fiscal first half... Revenue for the six months was \$125.5 million... while the company's tax bill was \$5.7 million... [However,] Contact Energy has produced another disastrous financial result, raising questions about the cost to taxpayers of the Government's decision to split the Electricity Corporation into two competing companies. For the six months to March 31, Contact made a \$19.9 million profit... a 51[%] return on the Government's equity. By comparison, ECNZ is returning 14[%] and has never returned less than 11[%], even after the 1992 drought. Last year, Contact laid off more than a third of its 450 staff to cut costs, but after its first eight months of operation wrote \$200 million off its asset value (a 12.5[%] reduction) and recorded a net loss of \$32.6 million. For the current financial year it had predicted a 9.3[%] return on equity... It now believes it will struggle to achieve that. In its report tabled in Parliament yesterday, Contact's chairman... and chief executive... blamed the weather. They said “large hydro inflows” over the half-year depressed spot prices in the electricity market and reduced demand for gas, which Contact sells.

...Top Energy has cut its fixed charges by 10[%] to offset increases in its electricity prices... [Its] chief executive... said the result of the pricing adjustment would be no increase in power bills for Far North customers this year. This was despite a 10[%] increase – \$1 million a year – in what the Kaikohe-based company had to pay the state generators and Trans Power. [The chief executive] said... its prices are as low as or lower than Auckland's, despite its having to pay more than any other company to get the power.

...Mercury Energy has confessed that its boast of having N[Z]'s lowest power prices was untrue. It made the claim in its January customer newsletter, then withdrew it, blaming a typographical error. “We are, in fact, in the middle of the range.” ...[meanwhile, Power NZ has] issued its interim results... showing... half-year earnings after tax... down 7[%] at \$25.8 million, despite a 26[%] rise in sales to \$225.8 million...

All Mercury Energy residential customers will receive a \$60 credit in their next electricity bill. The credits are their share of the company's \$45.9 million after-tax profit over the past six months... [By the way,] Mercury Energy, Southpower and Powerco are involved in consumer trials of push-button technology providing household access to a range of products and services, including competitive energy supply. Known as Orca, the technology has been installed in 500 homes in Auckland, New Plymouth and Christchurch. Through an easy-to-use keypad it can be used to set household appliances to take advantage of cheaper off-peak electricity prices, to monitor electricity use, to turn lights on and off, to run home security systems and to pay bills and order fast food. Bay of Plenty company TrustPower is also trying out meters that will lead to customers having a choice about their electricity supply arrangements – such as the power company they buy from, prices available for each half-hour period and payment arrangements. The trials, which have been running for six months, involve homes in new subdivisions in Tauranga and also in Auckland – outside TrustPower's traditional catchment area. Evidence from other sectors of the economy shows that marketplace competition within a self-regulating environment is the best way of bringing the benefits of reform to customers... Aggressive competition in N[SW] and Victoria has pushed spot wholesale electricity prices down to less than 1.5Ac... a unit from about 4.5Ac[, but the trend may reverse now that]... Victoria's high voltage electricity transmission network, PowerNet Victoria... [–] which transports electricity to electricity retailers and customers... [–] has been sold to United States Energy Company (GPU) for \$A2.716 billion... [In related news, NZ's] Contact Energy... will join... the listed investment company Infratil Australia and the A[US] superannuation company UniSuper... to... pay \$A391 million... for Southern Hydro... which runs five hydro-electric power stations... The group... will pay less than half in cash, and will borrow the rest... Contact Energy is [also] launching a \$200 million commercial paper programme... Contact Energy has a Standard & Poor's long term credit rating of A and a short term rating of A-1... Because Contact is state-owned, banks consider it to be Government-backed. That means its debts are a taxpayer liability... The price being paid... [for Southern Hydro] is widely regarded as too high. The Victorian Government itself had expected only \$300 million for the assets... The [NZ Government has] been fully advised of the investment, which [represents] only a speck of Contact's total assets... After listening to many of the self-proclaimed public commentators, [NZ's] domestic consumers could be forgiven for believing that the electricity reforms have failed... [here. However, NZ] retail electricity prices are still among the cheapest in the world. The standard domestic retail price was the sixth lowest of 30 international prices surveyed by[the] British Electricity Association in January this year... Statistics N[Z] figures show that fuel (excluding transport fuel) and power charges amounted to less than 2.5[%] of average household consumption spending in 1996 as against almost 2.7[%] for telephone and postage.

...N[Z]'s low electricity prices are certainly not a result of the electricity reforms. Real electricity prices were falling long before the reforms were introduced. The Ministry of Commerce published a graph in 1989 which showed that real domestic electricity prices had fallen from 1960 to 1987 by 40[%] despite costly new power stations being built during the 1970s. There are... reasons for our low electricity prices when compared internationally: old hydro stations produce electricity at ever-falling real cost because their main cost is capital service which is not subject to inflation. Furthermore, thermal stations run on gas, which the Government has sold at a throwaway price, and there are no costly emission controls for thermal stations... It is no surprise that members of the electricity industry are rapt with the reforms: they have become monopoly players in a deregulated economy. However, for the small consumers, both domestic and business, the picture looks grim. The former Minister of Energy... and his advisers have consistently ignored watchdog groups such as Power for Our Future, and have ridden roughshod over many consumers' wish to retain their power company in trust ownership. Many electricity consumers now find themselves at the mercy of commercial

investors who can milk the natural monopoly of the power companies. Also, the investors were allowed to buy into the companies before their real value was established. This has deprived the original owners, the consumers, of a few hundred million dollars. Unfortunately, the power companies' financial success is not a measure of business acumen but merely an indication of how much they are bleeding their captive consumers. They can, with impunity, build new power stations for which the captive consumers carry the risk, acquire overvalued shares in other companies, launch costly advertising battles, employ legions of lawyers and pay their executives exorbitant salaries – all on the backs of the long-suffering consumers... Competition does not apply to the power lines anyway; and even if competition for supply should arrive, it would only resemble that of the oil companies – which, according to the Minister of Energy, persistently enjoy inflated profit margins. From the small consumer's point of view, the electricity reforms are bungled... It has been suggested that the Government play a more heavy-handed role in regulating power companies... Capping the revenue does not work, and capping prices may give rise to lawsuits... [Incidentally, t]he... \$10.9 million... South Island price differential – which subsidises the cost of electricity to South Island customers – is to go from the end of September... The removal of the subsidy could raise the average South Island power bill by 30c a week, or \$16 a year... But the Mayor of Christchurch... said... that... the Government... was trying to divert attention from the fact that South Islanders were paying to transmit electricity to the North Island and[were] thus contributing to the \$83 million dividend the Government expected from Transpower... About 75[% of NZ]'s electricity comes from hydro stations and the biggest stations with the largest storage lakes are in the South Island.

...Wholesale electricity prices are shooting up as South Island hydro lake levels drop and possible power shortages loom. The El Nino weather pattern present during the 1992 power crisis is back... Price information released by... Emco... yesterday showed wholesale prices, normally 4c to 5c a unit, have hit 9c in the North Island and 8.7c in the South. A water shortage would be a stern test for Emco, which began operating the wholesale market last October. In theory, higher prices should curb demand but the reality is that virtually all consumers are insulated from the fluctuations of the market by their local supplier, which sets a flat retail price of around 10c to 12c a unit. Most power companies have pushed up prices as fast and as far as customers can stand. All they can do now is cut heating to hot water cylinders to reduce demand during peaks – lessening their exposure to high “spot” prices... The Government's delay... over the South Island price[differential] was the second acknowledgment this week that the wholesale market was failing customers. On Thursday it said officials had been ordered to review the market to see why supposed competition between generators and distributors was resulting in higher prices for households. But the review will take a year and the officials charged with conducting it are likely to be the same ones who came up with the market plan.

...Wholesale electricity market prices shot up 1400[%] to more than 60c a kilowatt-hour for two half-hours last week when one of Trans Power's Cook Strait cables failed and high-priced emergency thermal generation was fired up at Whirinaki and Stratford.

...The risk of electricity shortages this winter has eased but higher prices are still likely... The biggest generator, [ECNZ]... has been burning more gas at thermal power stations in recent weeks to conserve water in its lakes... If power companies lose money this winter, consumers will face the consequences when tariffs are next adjusted.

...Dry weather is costing the country about \$2.5 million a week in thermal generation. North Island lakes – at 15[%] of generating capacity – are close to the level when electricity was rationed in 1973.

...Mercury Energy has... a costly fight to fire up its \$80 million central North Island geothermal power station... which [has] been idle for six months... [due to] local Maori... opposition to air discharge permits... The... delay to opening the... country's first private power station... ha[s] cost the company between \$6 million and \$7 million... [Meanwhile, ECNZ] has announced plans for a massive lift in the output of its largest thermal power station, Huntly. It looks likely to be able to extract a further 200MW from the 1000MW station at the relatively cheap cost of \$50 million. The announcement comes just a day after... Contact Energy won resource consents for a new power station (up to 400MW) in Auckland at a cost of about \$350 million... [ECNZ] has... plans to upgrade the Waitaki power scheme as well. ECNZ expects to complete its consideration of whether to re-power Huntly... [– by] burning the gas produced by underground coal in one of the four... turbines instead of natural gas... [–] at the end of this month. When the Government split the corporation into two to create a wholesale market for electricity it attempted to reduce its dominance by restricting it to building no more than half of any new capacity. However, that restriction does not apply to upgrades on existing power stations.

...Power stations at New Plymouth and Stratford are to be closed or partly closed late next year as part of a[proposed] deal to clear environmental opposition to a big new... \$350 million[natural] gas power station... in Auckland... Contact[Energy], the financially struggling, state-owned offshoot of [ECNZ], received resource consents from the Auckland Regional Council in March to build a station of up to 400mW on the site of its existing 135mW gas and diesel-fired station at Bairds Rd. Greenpeace lodged an appeal over the air discharge consent. It opposes more thermal power stations on the grounds that they increase carbon dioxide emissions. Instead it favours renewable energy sources such as wind and solar power. Contact argued that the modern station would reduce N[Z]'s total emissions, because it is more efficient than the older thermal stations, such as ECNZ's Huntly (1000mW) and its own New Plymouth (590mW), Stratford (198mW) and Otara stations... Both parties have been in mediation since the appeal was lodged and refuse to talk publicly... It is understood that the agreement... will remain commercially confidential... However, it has been known in the electricity industry that Contact is pressing ahead with its plans and spending millions of dollars in anticipation of the appeal not proceeding. Construction of the station... also carries significant risks for the taxpayer. Contact has yet to confirm a contract to sell the output... Gas supplies will also be an issue. Contact is likely to sell some of its Maui gas supply to itself, but Maui is due to run out around 2005.

...Propelled by higher gas sales, Natural Gas Corporation's net earnings rose 14.6[%] to \$32.1 million in the year... Wholesale gas sales jumped 21[%] to 51.9 petajoules, but more than half of the increase was a one-off of 5pj to [ECNZ]. The start of full deliveries to the Southdown power station also boosted sales... NGC's capital expenditure programme in the current year – at \$60 million nearly twice last year's – includes spending \$19 million on new turbines to increase the capacity to push gas from Huntly to Auckland, partly in anticipation of Contact Energy's upgrading the Otahuhu power station... [By the way, NGC] will complete its proposed \$6.5 million buy-out of the 30[%] of Natural Gas Waikato it does not already own from Hamilton City Council within the next week... [The] group chairman... told the annual meeting in Wellington yesterday... [that AUS]n Gas Light Co, which owns one-third of N[GC], reported an 18.7[%] increase in second-half profit to... \$NZ84.35 million...

N[GC]'s monopoly on the wholesale gas supply business has been broken, heralding increased competition and a possible drop in delivered gas prices. NGC and Wellington-regional power company TransAlta N[Z] yesterday negotiated a new gas supply contract. It essentially separates the sale of gas from the cost of moving it. The agreement settles an 18-month legal dispute and means TransAlta will be able to buy gas from sources other than NGC. NGC is negotiating a similar settlement with Auckland-regional gas company Enerco... NGC owns and operates the high-pressure transmission system which would allow competing suppliers to feed gas to the North Island retail companies. It has wholesale gas supply contracts dating back to 1980 and had refused to remove so-called exclusivity provisions... Early last year NGC sued Enerco and TransAlta for more than \$10 million, saying the utilities had not reimbursed it for gas they had to pay for, even if they did not use it. These “take-or-pay” contracts were condemned by the Commerce Commission and the utilities refused to pay on the grounds they would not be enforceable under the Commerce Act. NGC and TransAlta declined to comment on the settlement in detail yesterday, but it is understood no money changed hands.

...Auckland-based gas retailer Enerco N[Z] yesterday reported a 5[%] rise in after-tax profit to \$13.49 million for the[past] six months... Revenue from gas sales rose 6[%] to \$90.7 million and revenue from appliance sales, servicing and the company's LPG business rose 27[%] to \$22.7 million... Enerco said it had connected 5300 new residential customers in the latest period, increasing total customer numbers to 108,000.

...Enerco Gas has hit commercial customers in Auckland, Wellington, Palmerston North and Hawkes Bay with hefty price rises without telling them why. In a letter to its “valued” customers, Enerco implied that the “price change” was the Government’s fault because of the need to comply with new regulations. But... the Ministry of Commerce said yesterday that it was not intended that the new rules usher in price rises. Customers who use 40,000 units (kilowatt-hours) of gas a year will pay 17.25[%] more, another \$384 a year; those who use 20,000 units will have to find an extra \$484, a 40[%] price rise. Enerco did not publicly announce the price increase, which businesses began to notice in their bills over the past month. Earlier this year it increased household gas bills by between 10 and 15[%], also without a public statement... The chief executive of Enerco... said some customers got increases, others decreases and some stayed the same... Gas companies are required to itemise what portion of each bill is for the gas itself and what portion is for pipelines. Enerco has substantially increased the unavoidable “fixed charge” for pipelines from 40c a day to \$2.

...A fine slapped on gas giant Enerco... should be seen by other companies as a wake-up call not to mislead consumers, the Commerce Commission said yesterday. In the Auckland District Court, Enerco was ordered to pay fines and costs totalling \$14,535 after admitting its “Buy Smart” and “Home Smart” gas promotions were misleading... About 10,000 customers had signed up for the deals. The commission said the company had promoted the schemes as cheap ways of having gas connected and appliances installed, but it failed to disclose extra costs of up to \$2520... [Incidentally, t]he Government has yet to decide on the future of state-owned coal mining company Solid Energy... [The P]M... last week suggested it was an asset that could easily be sold... Solid Energy was now looking at projects worth twice its \$195 million in assets and equity... [M]ore than \$380 million of capital spending would be needed by the company in the next five years to expand the West Coast operations and maintain existing North Island capacity... The... shareholding minister... conceded: “It is hard to avoid concluding that private owners are much better placed than Government for business tasks where hundreds of millions are set at risk on high-tech mining and entrepreneurial global marketing projects.” ...The chief executive of Solid Energy, formerly known as Coal Corporation... says it should be sold as a single enterprise rather than broken up... Earlier, [he]... said the company was reluctant to invest heavily in a proposed West Coast coal terminal, but would do so if that was required to get the project going... [to handle] a multi-million dollar coal find... at Mt Davy... The... twelve million tonnes of high-grade... coal... is more than a kilometre from the surface making it the country’s deepest underground coal mine... It’s destined for export markets like India, China and Japan... [Solid Energy has already] received resource consents for... the 2.2km jetty and handling facility at... Granity, 32km north-east of Westport...

Solid Energy... is considering building a \$130 million steel jetty on the West Coast to export coal. It also faces a \$40 million bill to develop its Mt Davy mine on the West Coast and \$30 million to build a system to move coal from its Stockton mine to the coast... In its latest financial year it made a net profit after tax of \$18.9 million on sales of \$208 million and shareholders’ funds of \$104 million... [(In comparison,) State Coal posted losses in 20 of the 21 years before it was made into an SOE.] ...Solid Energy produces nearly three million tonnes of coal a year and exports about half of that, mostly to Japan, India and China... The southern mines supply mainly export markets while the northern operation primarily mine coal to fire the Huntly power station and to make steel... at Glenbrook... The export business could expand significantly if the jetty went ahead. It would cut the transport costs of rail freighting coal across the South Island for shipment from Lyttelton... However... the... company had not closed the door on talks with TransRail or the Lyttelton Port... [T]he International Energy Agency has identified coal as “the least attractive” energy investment over the next three years because... [coal] produces more carbon dioxide than any other fuel and there is a real prospect of new punitive measures such as a carbon tax... ECNZ[’s] chief executive... says... that the Government’s decision to create competing generator Contact Energy from ECNZ last year... meant more fossil fuel being burned and more carbon dioxide... emissions because coordination between the hydro systems was lost... [T]hat was ironic when the Government had spent the past three years negotiating with industries to voluntarily reduce their emissions.

...this week... [as NZ] Government representatives were in Germany... for talks on the international climate convention and plans to reduce greenhouse gas emissions... Contact [Energy announced that it has] been given a licence to pump 21 million tonnes of carbon dioxide into the atmosphere during the 20-year consent period... [of its] power station at Otara... A spokesman... said about 200 workers would be needed to build the station and 30 to run it.

...The Huntly power station will lose more than a third of its 270 staff as... [ECNZ] moves to save \$9 million a year and compete with new power stations. Staff were told yesterday that... virtually all positions would be up for grabs over the next two months. About 40 engineering staff would be re-employed by separate companies on one-year contracts to tender for service contracts at the station... [In related news, s]ome of the companies helping to build Contact Energy’s \$350 million Otahuhu power station want an assurance they will be paid now the South Korean owner of one of the main subcontractors has been put into receivership... The primary contract... was awarded this year to[a] German-based technology group... which in turn requisitioned work from companies including Halla... The Halla Group was declared bankrupt this week after failing to meet a \$US215 million... debt payment... Halla N[Z], a division of [the] collapsed Korean industrial conglomerate... has a contract to build several parts for the... gas-fired station. Halla has in turn hired local companies to work with it on the project... The level of Halla’s involvement is unclear, but it includes work on critical boilers... The chief executive of Steel & Tube... said his company’s contract with Halla was worth around \$10 million. “At this point we are unconcerned because we have only just started the work... Had it happened in [3] months it might have been more of a problem.”

...[BIL and ECNZ] officials were breathing a sigh of relief yesterday after the Indonesian Government gave the go-ahead for a... geothermal project in West Java. The \$US1.2 billion... project was under threat after the Indonesian Government last week announced it was reviewing a number of infrastructure projects in order to peg back its current account deficit... Because construction of the project has begun, the Indonesian Government decided it should continue... Asia Power, a company three-quarters owned by [BIL], is a majority partner in the first stage of the 330 megawatt Wayang Windu power station... Design Power, a subsidiary of ECNZ, is contracted as engineer on the project... The project is N[Z]’s single biggest investment in Indonesia. It will be the first geothermal project in the world to use 110MW generators – up to now the standard has been generators ranging from 55MW to 75MW... [By the way, y]our final chance to invest in what is potentially one of the most lucrative investments on offer anywhere in the world... closes... [soon. Inquiries have already been] received... from around the world for Vortec wind generators to the value of \$US3.2 billion...

Wind-turbine developer Vortec Energy Ltd has failed in a bid to raise \$10 million through a public share issue... The issue is not due to close until Tuesday but the company said yesterday that it was not expected to be fully subscribed. A Vortec representative said the size of the shortfall would not be known until the issue closed, but it would be substantial... The issue was not underwritten... [However, the] managing director of Vortec... said yesterday that the directors were happy with the level of new shareholding, which was sufficient to meet the company’s immediate needs. The prospectus said proceeds from the share issue would be used in part to build two Vortec 20 wind turbines which would stand 52m tall. A smaller prototype turbine, called the Vortec 7, has been installed at Waikaretu, west of Huntly. [The managing director] said test results on the prototype were very encouraging and the company was on schedule to report power performance and cost-to-energy results at the end of October. Commissioning required before Vortec 7 was connected to the Counties Power grid was well advanced. He said Vortec had received inquiries that could amount to sales of 1400 full-scale turbines, worth \$5 billion... [Incidentally, ECNZ] has signed an agreement to sell Meremere power station to Nga Pua Waitanga, which plans to turn it from coal-fired to rubbish fired. Under the agreement Nga Pua has two years to get resource consents and make a final decision.

...Greenpeace has had to tone down wording in an “information pack” that planned to trash Olivine N[Z]’s proposal to incinerate rubbish on the site of the mothballed Meremere electricity plant... [T]he report was completed... before Greenpeace had even seen the Olivine prospectus... The

Greenpeace information pack... being mailed to institutional investors who have been offered shares in a \$6.5 million public issue by Olivine... still contends there are economic and environmental concerns about the Olivine proposal... A central point debated by Greenpeace is a figure of \$30 a tonne that Olivine quotes as the likely incineration cost at the Meremere plant. Greenpeace said the... price was "ridiculously low" compared with costs for other incineration plants worldwide of \$150 to \$300 a tonne. But Greenpeace now concedes the [Olivine] price does not include waste handling and collection costs and is also based on costs being offset by production of by-products, such as cement using fly-ash from the plant... Olivine... has an option to buy the Meremere plant for \$17.2 million... [A] director of Olivine, told a meeting of people interested in the project that a garbage supplier has signed an "irrevocable" understanding to provide 70,000 tonnes of rubbish a year to the plant... [thus guaranteeing] that it could set up one rubbish-fuelled furnace... [The] proposal to redevelop the Meremere power plant and use the site to burn waste will involve technology that is so far commercially unproven. Olivine is the name given to a type of ore mined by Olivine Corporation of the U[S]. The ore is used to make panels that line a range of incinerators made by the corporation. The existing incinerators primarily burn forestry timber waste, but... Olivine N[Z]... has further developed the incinerators to burn municipal waste from which energy and other material such as glass can be recovered. The new incinerators will even be able to burn sludge with up to 70[%] water content... Meremere is planned as a flagship for similar projects elsewhere in the world... [Speaking of rubbish, NZ]'s second largest waste services company, Waste Care Ltd, has been sold to French conglomerate Suez Lyonnaise des Eaux... [as] part of the purchase by Suez Lyonnaise subsidiary SITA of the non-North American operations of Waste Care's owner, Houston-based waste company... BFI[, which] will receive \$US1 billion in cash and a 20[%] stake in SITA.

...Talks between Auckland-based Mercury Energy and U[S] company Utilicorp could result in a deal that reshapes the northern North Island electricity supply industry. A giant regional power company made up of Waikato, Bay of Plenty and possibly King Country electricity suppliers is on the cards if Mercury can wrest control of the Auckland section of Power N[Z]. Utilicorp, which owns a third of both Power N[Z] and Hamilton's WEL Energy, is believed to be seriously considering a deal that would see it abandon the north and west of metropolitan Auckland and instead try to fuse the Thames Valley and Waikato component of Power N[Z] into a Hamilton-based company. Whakatane's Bay Of Plenty Electricity, already 52[%] owned by Power N[Z], could also join... Utilicorp had originally planned to merge Power N[Z] with WEL and Wellington's Energy Direct and have a controlling shareholding. Those plans went awry when Canada's TransAlta took over Energy Direct, merged it with neighbouring Capital Power, and Mercury launched a takeover bid for Power N[Z]... to unite metropolitan Auckland into one supply company... Since then there has been an impasse, with Mercury holding about 34[%] of Power N[Z] and Utilicorp 31[%]. Currently, 'Mercury has 244,000 customers, 580 staff and sales of \$500m, while Power NZ has 214,000 customers, 580 staff and \$300m in sales'.

...Mercury... and Utilicorp... [- which has just] filed to sell up to \$US250 million... of senior notes, raising funds to repay the multinational gas and electricity provider's debt... [-] have confirmed plans to reduce duplication in the Auckland electricity market. The two companies... are seeking... Commerce Commission... clearance to form a joint venture known as Holdco. The holding company[- which]... was formed primarily to break an impasse between Utilicorp and Mercury, who for two and a half years have been battling to take over Power NZ... [-] will have a controlling stake in Mercury's main rival in the Auckland power market... and will also control... Bay of Plenty Electricity... and WEL Energy... Mercury and Utilicorp have offered \$6 a share for the 36[%] of Power NZ they don't already own.

...The Overseas Investment Commission has approved a take-over of Power N[Z] by Mercury... and Utilicorp.

...Power N[Z] has formed a subsidiary, Power N[Z] Generation, that is considering investing in electricity plants developed by the... company's main rival... Power N[Z]'s corporate development manager... said the new unit would develop generation capabilities even if Power NZ was taken over by a joint venture between Mercury and Utilicorp... [P]otential investments... included [the] 395-megawatt power station at Otahuhu being built by state-owned Contact Energy and the recently completed 114-megawatt Southdown cogeneration plant built by Mercury. Southdown was designed to include a third generation unit and Power NZ could be involved in that... In the longer term, Power NZ wanted to build generation capacity north of the Auckland Harbour Bridge... Power NZ is well placed financially to develop a generation business. Its total liabilities of \$157.5 million are covered four times by shareholders funds of \$644 million.

...The formal offer for a \$900 million takeover of Power N[Z] by a joint venture between Mercury... and Utilicorp... has been delayed slightly by legal technicalities. The paperwork is expected to be completed in the next couple of days and the offer of \$6 for each Power N[Z] share should be lodged with the stock exchange by early next week.

...[the] battle for control of... Power N[Z] is heading back into the courtroom with... WEL Energy Group and the WEL Energy Trust seeking an injunction to have a proposed takeover of the company stopped.

...The... WEL Energy Trust... deputy chairman... said he was devastated that successful court action by... Utilicorp had spelled the end of the trust's efforts to keep ownership of WEL Energy in the Waikato... [He] said negotiations should have stayed in the boardroom but a "predatory" Utilicorp had taken the matter to the courts. Although the trust had been "out-smarted by the Yanks" for now he vowed to continue the battle.

...The billion dollar battle for control of Power N[Z] is over. A single electricity company is set to emerge for Auckland that is more than twice the size of any competitor. Under a deal announced yesterday... Mercury Energy, and its rival for control, the American firm Utilicorp, which had been the cornerstone shareholder in Power N[Z], will aim to acquire 100[%] ownership jointly. They will then delist the company from the stock exchange... Consumers of Mercury... and Power N[Z]... have seen... [millions of dollars] from their power bills spent on the 30-month fight, which has involved top advertising agencies, high-priced lawyers and financial advisers. They will now hope to see the benefits... Savings of up to \$24 million are... expected to be achieved from the annual operating costs of the two big Auckland companies, which will be run by Mercury. A full merger should save \$30 million a year. By ending the unwinnable war, Mercury and Utilicorp have set the scene for a company large enough to rival the state-owned generators, ECNZ and Contact. Redundancies loom for Power N[Z] management and a question mark hangs over the Pacific Energy buying group it half owns. The North Shore, Waitakere, and Rodney councils are expected to be given the go-ahead to sell their combined 10.7[%] stake in Power N[Z]... North Shore is entitled to 47[%] of the council shares, Waitakere 36 and Rodney 17. The money could be spent on debt repayment or capital works, in either event easing the burden on ratepayers... If they cash up, the 16.2 million shares presently locked in a 10-year trust arrangement will convert to \$97.2 million at the \$6 price being offered... But the price may well rise. Shareholders not tempted to sell at \$8 on Monday will not stampede to sell at \$6 or yesterday's market close of \$6.50... Local authorities in the Thames Valley and Waikato parts of Power N[Z] will be able to sell their shares, too, but at a much lower price than the \$10 which Mercury earlier offered but which agreements with Utilicorp prevented them taking. When Waitemata Electricity privatised in conjunction with Thames Power as Power N[Z] in 1994, Waitemata customers were given 400 shares each and people on the electoral roll in the Valley Power area 500 shares. The shares quickly gained value. Utilicorp was able to buy shares at \$3 but Mercury lodged a hostile takeover bid, offering \$3.40. A bitter struggle and a huge war of words broke out. Within a month Power N[Z] was calling for a halt, saying it had spent \$1.5 million on advertising its opposition to Mercury's bid. By March 1995, Power N[Z] said it had spent just under \$4 million on the battle. Only about 8[%] of Power N[Z] shares remain in private hands... While the objective of drawing together the two Auckland supply companies - the former Auckland and Waitemata power boards - had merit, it [had been] pursued at "ridiculous cost,"... according to a former Auckland Electric Power Board chairman... Mercury had spent about \$300 million on shares and \$30 million on other costs... "The savings of co-operation, in management, billing and purchasing, would have been better gained through a negotiated settlement than a hostile takeover. The funds spent on the corporate struggle would have been better spent by Auckland consumers

themselves. The costs of servicing those funds will be borne by both Auckland and Waitemata electricity consumers.” [He] also questioned whether it was in the interests of Auckland power consumers for Mercury and Power N[Z] to buy shares in W[EL] “when they are not wanted.”

...A Waikato community group is stumping up nearly \$40 million to protect its local power company from takeover... The WEL Energy Trust... that holds a major stake in Hamilton electricity supplier WEL Energy, is offering \$21.15 a share for the 10[%] stake in the company owned by Power N[Z]... The directors of Power N[Z] plan to consult with their company’s main shareholders before deciding whether they will accept... The offer compares with the \$13.75 each shares in WEL Energy were changing hands for this week... The trust already holds a 43[%] stake in WEL Energy. The offer is primarily aimed at thwarting a joint venture involving Utilicorp and Mercury taking control of WEL Energy. Utilicorp already holds 33[%] of WEL... The group’s action is yet another twist in the bitter battle between Mercury... Power N[Z], and Utilicorp... to control electricity supply in the upper North Island... Meanwhile... a lawyer acting for... small shareholders, said the... Power N[Z] Shareholders Society has asked the Stock Exchange... to rule on the main shareholders’ eligibility to vote.

...A new board of directors was elected to control... Power N[Z] yesterday, but only after an explosive meeting of shareholders. More than 500 investors – most of them also Power NZ consumers – failed to thwart representatives of Utilicorp... and Mercury Energy... taking all six seats on their company’s board table. Mercury and Utilicorp together own 64[%] of Power NZ and used their block vote to topple the incumbent directors... While the outcome was always obvious, the potency of the venom some shareholders spat at the major owners was unexpected. “Judas,” “prostitutes,”... and “snakes” were just some of the insults. The main gripe of small shareholders was that[when] Mercury and Utilicorp... swallow the remainder of Power NZ... its service to customers... might... [be compromised. O]ne of the outgoing Power NZ directors... noted that Utilicorp had been invited to become a shareholder and signed a so-called cornerstone agreement with Power NZ to protect it from hostile takeover... “Business can’t prosper in an environment where large numbers of people think it is morally acceptable to break their agreements,” he said in a bitter address... Representatives of Mercury and Utilicorp were at the meeting, but declined to address it. Their silence fuelled the hostility.

...The business world can be cruel and [the] former chairman of Power N[Z] is now an expert on the subject. On Thursday night he walked dejectedly into Power N[Z]’s annual meeting with all the appearance of a man with a knife in his back. He started the meeting as chairman and finished as an ordinary shareholder with just 553 shares. It made little difference that 99[%] of the 600 plus shareholders at the meeting supported him. He had been checkmated by high-powered corporate manoeuvrings... Two years ago the situation was completely reversed. At Power N[Z]’s 1995 annual general meeting [he] had absolute control... The reason for the turnaround is simple. One of the major players... switched its support... UtiliCorp would not win any prizes for popularity on the North Shore... [However, the problem] is rooted in the traditional rivalry between the old Auckland Power Board and the Waitemata Power Board. The smaller utility north of the bridge has always feared domination by... [its southern neighbour. Eventually,] Mercury and UtiliCorp... [will have 100%] control of Power N[Z]... This is not good news for retail electricity customers. Inevitably the major shareholders will want to recover the massive costs incurred during the three-year conflict. Mercury and UtiliCorp have paid a high price for their shareholdings and the protracted takeover has been a gravy train for a bevy of lawyers, financial advisers and spin doctors... [Neither company will] be keen on Power NZ distributing some profits to customers... In theory customers can shop around for other utilities but, with a large proportion of Power N[Z]’s customers bordered by Mercury and WEL Energy, the opportunity to find another supplier maybe somewhat limited... There is one glimmer on the horizon. The Auckland Electricity Consumer Trust is considering privatising some of Mercury next year. A bold trust would push for privatisation of the lot... It could even effect a merger by giving a stake in Mercury to Utilicorp, in return for the Americans’ Power NZ stake. That would kick off the ultimate local power battle – for control of the enlarged Mercury...

Aucklanders hoping to get free shares in Mercury Energy are out of luck, according to the trust that owns the power company. The trust secretary... yesterday issued a statement shooting down promises of free shares that he said were made by two candidates in the trust election now under way... [In related news, t]he 330,000 shareholders in Tauranga-based electricity company TrustPower are to get... a one-third increase in their interim dividend payment. The news came yesterday as the company reported an 18[%] increase in pre-tax profit, to \$16.9 million...

More than 40,000 Bay of Plenty and Taupo residents and businesses have pledged loyalty to their power company, TrustPower, in exchange for a reprieve from price rises... of about 4.5[%] for households and 3.5[%] for businesses. Under... a scheme called Friends, customers who promise to stick with the company for the next three years will save 30[%] on the price rise and are guaranteed no further price rises until March 2001.

...Dunedin-based electricity retailer United Electricity has reported a \$2.6 million profit for the year... reversing a \$2 million-plus loss the year before... [T]he result... represented only a 1.3[%] pre-tax return on sales...

Mercury Energy’s after-tax profit of \$82.1 million gave its shareholders a 22[%] return on their equity in 1996/97, the company’s annual report shows... Mercury’s pre-tax profit [was] \$121.7 million... The... Mercury chief executive... is likely to have been the[company’s] top-paid... employee... He received a salary of \$460,000-\$470,000, compared with the next highest-paid executive’s \$270,000-\$280,000... [(and) the chief executive of... [ECNZ], who is on about \$455,000[)]... Mercury is owned by the Auckland Energy Consumer Trust. The trust was paid a \$50.5 million dividend on its investment [for] the latest year... The dividend was passed on to Mercury’s customers, who each received \$120. That represented around six weeks free power for a typical residential customer... The remainder... of [the profit] was retained for future investments. Mercury’s general manager of finance... noted in the annual report that Mercury has increased reserves to fund expansion. “We need to give the company room to acquire, room to grow,” he said. Mercury will spend around \$120 million next year acquiring a one-third stake in a new power plant being built at Stratford. At the end of the... financial year Mercury had total assets of \$895 million... The assets included \$258 million in investments, of which \$220.3 million were shares listed on the stock exchange. Those were mainly [its 34%] stake in Power N[Z]. Mercury... borrowed to buy the Power N[Z] shareholding and paid \$17.8 million interest on those borrowings in the latest year. It received \$24.6 million in dividends from Power NZ so is more than breaking-even on the funding costs.

...Tariff information compiled by the Ministry of Commerce shows that for every category of consumer... Mercury’s... power prices are higher than the weighted national average... The profit it makes on its lines business, at 9.52[%], is above... the national average of 7.3[%], and... the energy content of Auckland power bills... for Mercury’s domestic consumers... is above the norm [at] 1.1c a kilowatt/hour... [F]or a small consumer using 6000kWh a year, the difference is \$60 a year.

...Power companies earn the lion’s share of their profits not from selling electricity, but from the charging for the lines it comes down. In 1996 the average net profit after tax per customer (of all sizes) from line charges was \$100, plus another \$27 from energy.

...[a] report, commissioned by the E[SA, says]... there was no evidence line businesses [a]re extracting monopoly profits.

...Evidence of excessive charging by some power companies has hardened the Government’s determination to expose them to further reform... Ministry of Commerce figures [showed] line charges have risen significantly higher than inflation over the past three years. They have increased 33[%] on average for households and 14[%] on average for the medium commercial user. Seven of the... power companies have been taking profits of more than 11[%] off their line businesses... Southpower [was taking 30.60%].

...Southpower is expected to announce next week the sale of its retail outlets... [thereby bringing to an] end what some retailers regard as unfair competition by the firm from whom they buy their electricity. The sale will also re-ignite demands from free-enterprise council factions for local-body-owned Southpower to be privatised... Under[a] former... manager... Southpower aggressively bought into Enerco, building up a stake of

68.8[%] for about \$180 million. The stake is now worth about \$374 million... [Incidentally, a]nnual savings of more than \$100 per customer could be possible if small power companies merged their energy trading operations... sa[ys] a... report.

...Manawatu power company CentralPower has doubled its... after-tax profit to \$2.1 million... “The increased profit reflected the larger scale of the company following the merger with Electro Power and the subsequent cost savings that had been achieved,” [its chairman] said. Palmerston North City power supplier Electro Power agreed to merge with its... neighbour in December. CentralPower said at the time that it expected the deal would save about \$3 million a year.

...National grid operator Trans Power exceeded its profit and all key operational targets for the year... A net surplus of \$92.8 million was achieved... and... [a] total dividend of \$64.9 million was paid to the Crown[, even though]... last year the company said its full-year profit of \$96 million had been insufficient to properly meet the capital cost of maintaining its long-life assets... [Meanwhile,] savings of up to \$20 million a year were anticipated as a result of a restructuring involving the loss of up to 85 staff.

...Householders are expected to be the main winners from Government moves to adjust the way supply companies pay for having electricity transmitted. A reduction in power cost of 5 to 6[%] is considered possible... The Government plans to bring down costs mainly by... [letting] electricity users choose the level of extra capacity they want. That means a power company could choose to take on more risk in return for lower electricity costs... The Government has[also] indicated it is prepared to take on the nose a drop in the value of national power grid operator Trans Power in order to force electricity prices down. The Ministers of Finance, S[OE]s and Energy have agreed that getting the best rate of return on the Government’s \$1.4 billion investment in Trans Power is no longer a priority. Instead, Trans Power’s main goal will be to make sure it improves the efficiency of its transmission services... As part of its management of the grid, Trans Power must ensure sufficient capacity in the network to cover any breakdowns or unusual demands... The aim is to impose on Trans Power the same sort of pressures it would face if there was a rival network for transmitting electricity... However, power industry players said the changes had been forced on the Government by industry. “Maybe reducing costs is a policy objective but the fact is that some companies have stopped signing transmission contracts with Trans Power,” said... Power N[Z]’s chief executive... Some power companies, like Power NZ, believed Trans Power was charging too much for its monopolistic services... “The risk for the Government was that there was a large litigation battle coming,”... Competition in the electricity industry would force suppliers to pass on cost savings to consumers, but there was no guarantee of savings... The Government... will... also... accept lower returns on generation assets owned through ECNZ and Contact Energy. This duopoly produces 95[%] of our electricity but only competes for 20[%] of the market.

...[Trans Power’s] chairman... has been axed and four other directors dumped in a Government backlash against the error-prone national electricity grid company... Late last year the two state power generators – ECNZ and Contact Energy – refused point-blank to pay increased costs which Trans Power imposed on them for transmitting electricity through its high-voltage direct-current link from Benmore in the South Island across Cook Strait to... Wellington. The generators were joined in the industry standoff by distribution giants Mercury Energy and Power N[Z]. The industry heavies were upset at what they saw as a preferential deal which Trans Power had earlier made with Transalta at their expense... The board cleanout comes on top of major changes to Trans Power’s statement of corporate intent... which are designed to increase the overall competitiveness of the electricity industry... [Meanwhile,] ECNZ... has cut the dividend it will pay the Crown this year. It will pay a final dividend of \$67 million, on top of an interim dividend of \$81 million and a special dividend of \$158 million (following a revaluation of its assets...). This year’s ordinary dividends represent 56[%] of ECNZ’s net profit of \$264 million... [I]ts payout ratio... [has averaged 77%] over the past four years...

Later this year... the... Energy Minister... is expected to force... ECNZ to form a third division to invest in efficient new power plants, and also push ahead with a controversial proposal to make electricity companies separate the monopolistic side of their businesses from contestable operations. Private electricity companies say they will fight the latter proposal because it would have limited pricing impact on what they claim is already a highly competitive industry.

...The prospects of a further breakup of... E[CNZ and its] eventual privatisation... were raised yesterday by the Minister of Energy... unless... power companies... stop fiddling their costs at the expense of helpless consumers. The stern message coincides with new figures showing that since electricity deregulation five years ago, domestic power bills have risen 19.3[%] faster than inflation while wholesale prices have dropped 4.4[%]. Power companies also have]... until the end of next year to stop discouraging potential competitors by inflating charges for the use of power lines... [The Minister of Energy] favours power companies being split into separate line and energy companies... On Sunday, the Minister for the Environment... told the party’s central North Island divisional conference that National must be prepared to debate the role of government and examine whether sacred cows should be culled... [He] said energy companies had not been privatised because... the public had never been convinced of the merits. Selling E[CNZ] and Contact Energy would generate \$5 billion to \$6 billion.

...[the] Energy Minister... has turned up the heat under the power companies, by making the carve-up of... [ECNZ] and separating the line and energy businesses of the local power companies a package deal. “I could not support the further split of ECNZ without simultaneous moves to enhance competition at the retail end of the industry,” he told a conference of energy trusts yesterday. [The minister] contends that so long as the same companies which own the natural monopoly of the lines network are also in the... business of selling electricity it will be both possible and tempting for them to indulge in anti-competitive cross-subsidising... The... Mercury chief executive... said that if separation resulted in more than 30 small monopolies – miniature Trans Powers – it would be a retrograde step... He also questioned the point of splitting ECNZ except as a prelude to privatisation, which [the minister] says is not on the agenda... [The minister has, in turn, been] critical of the Commerce Act’s inability to prevent the aggregation of Mercury and Power N[Z]. ECNZ’s chairman is urging]... the Government to consider a partial float of the electricity generator rather than a split into several operating units.

...The Government would stand to lose up to \$3.2 billion in the value of its electricity generation businesses if... E[CNZ] was split into separate generation units. The prediction was made yesterday by[the] ECNZ chief executive... The least dramatic option for splitting ECNZ, a carve-up between the North and South Islands, would result in a \$1.2 billion loss in value to the Crown’s investment... [Incidentally, c]redit rating agency Standard and Poor’s is looking at... ECNZ with a view to a possible downgrade of its credit status should it be split into separate companies... ECNZ’s long-term rating is A+, while the short-term is A-1.

...An \$879 million price tag for splitting... ECNZ... in three is believed to have proved too rich for the Government, which will now back off and take further advice... The \$879 million was ECNZ’s estimate, based on consultants’ advice, of how much would have to be pumped into the three companies to make them viable in what would be an intensely competitive environment. One of the three proposed state-owned enterprises, based on... the ageing... Huntly power station, was expected to be made so vulnerable by plummeting wholesale prices that it would not be able to carry any debt... The 16-year-old... power station will close at Christmas for the first time in its life, reflecting the pressures on it from the new power market and the threat of new, more efficient generators coming on stream next year.

...[the sale by the Government of a 60% slice of Contact Energy to the public starts next week with a slick advertising campaign. In a first for NZ, the Government has decided to use a pre-registration process to give nearly 100,000 NZers priority treatment in the sale. Once the level of interest is gauged, the Treasury will decide how much of the 60% stake to put aside for public investors. The remainder will be bought by so-called institutional investors, such as insurance companies, banks and fund managers. Marketing surveys show that most people do not know much about what Contact owns, largely because its executives have deliberately kept a low profile as they have built up the company’s assets. Some of the assets that Contact was given when it was split off from the Electricity Corporation in 1995 were regarded as second rate – compared with assets that ECNZ kept. In particular, Contact was

saddled with some old and inefficient gas-fired power stations. On the plus side, Contact was given the Roxburgh hydro-power station and the giant Clyde Dam plant. The Clyde Dam – which was a financial thorn in the Government's side for many years because of unbudgeted costs associated with earthquake protection measures – is now one of the biggest attractions in the Contact asset portfolio that includes eight power stations. The dam was a Think Big project that ultimately cost taxpayers \$1.7 billion. Another of Contact's valuable assets is its rights to nearly half the production from NZ's largest gas field, Maui. It also has rights to all the output from smaller gas fields. Owning the gas rights means Contact can run its power plants at least as cheaply as competing power station owners. It also recently bought the supply business of the country's largest natural gas retailer, Enerco. In addition, Contact has been busily buying up retail electricity operations that have been sold by other energy companies. Contact now has more than 420,000 people buying either gas or electricity from one or other of its subsidiaries, making it the second-largest energy retailer in the land, behind TransAlta. A cornerstone investor will buy the 40% of Contact not being sold through the public share float. The Government has shortlisted six companies, including TransAlta, and will decide on the main shareholder next month. Because many of its assets have been built or acquired recently, it is difficult to put a value on Contact. But most estimates are that Contact will sell for more than \$1.5 billion, and the new owners can expect a pretax return of about 9% of that initial investment.'

... 'the former chief executive of Contact Energy was paid \$6.5 million for two years work, the company's annual report shows. This included a \$2.9 million salary package – more than six times the pay of a chief executive of a comparable NZ business.' In international news, 'California's Governor invoked emergency powers yesterday as hospitals, schools and even high-tech firms like Apple and Hewlett Packard were plunged into temporary darkness by electricity shortages. The lights went out in nearly 2 million California homes and businesses in a second straight day of blackouts as state lawmakers struggled to find a way out of the deepening crisis. The emergency powers will allow the Governor to use \$US400 million of taxpayers' money to buy urgently needed megawatts from out-of-state suppliers. He was forced to take the extra-ordinary measure – a deeply embarrassing one for the overwhelmingly Democratic political leadership of America's most populous and economically dynamic state – because the two biggest private electricity distribution companies, Southern Californian Edison and Pacific Gas and Electric, are teetering on the brink of bankruptcy. The shortages are the result of a botched deregulation of the electricity industry, which has left California woefully undersupplied. Its utility companies are largely at the mercy of out-of-state energy providers, which have taken advantage of the crunch to charge sky-high rates. Since prices charged to consumers have remained largely fixed, that means companies like Edison and PG&E have had to eat up billions of dollars in cash reserves to keep going. This week, Edison defaulted on almost \$US600 million in unpaid bills, and the following day PG&E followed suit, reneging on about \$US33 million of its debts. Several Republican politicians have blamed the crisis on Californian not-in-my-backyard thinking and the state's supposed refusal to countenance new electricity plants. Their voices were echoed by generating companies, which feared California was about to re-regulate its electricity industry and stifle the free market.'

...NZ 'power companies admit that the open-market competition for householders' wallets has been chaos. But the industry is promising the delays and bad service when customers switch supplier are being sorted out. Even the former Energy Minister who steered the restructuring has admitted things did not go according to plan and consumers were the losers. "I accept that in the end the responsibility is mine, but I was acting on the best advice at the time and everybody said, 'Look, we'll be okay'," he declared without offering to resign from Parliament. Figures show that since competition began, 261,590 of the 1.7 million electricity customers have switched retailers – one of the higher rates in the world for what the industry calls "consumer churn." But many customers have been beset with poor service, lengthy delays, disconnections and bills that are either wrong or non-existent.' In an extreme example, 'late last year Mercury sent a customer a bill for \$80,000 – less \$8000 if she paid promptly. That's the equivalent of about 55 years worth of electricity for an average family paying \$120 a month. The customer had already received two bills of almost \$500 each, ridiculously high considering she was living alone in a bedsit. In frustration, she called for a meter reader to visit. The result was the \$80,028 account. Mercury immediately accepted that the bill was a mistake and wiped it, but the customer had lost confidence in the company and decided to switch to First Electric. Then her problems really started. First Electric told her to expect a letter within days confirming the switch from Mercury, and a monthly bill. After five months of hearing nothing from either First Electric or Mercury, and just about to move out of her flat, the customer demanded a final bill from First Electric and received one for \$200. She accepted the amount but told the company that she would take five months to pay it considering they had taken five months to bill her. First Electric was happy with the arrangement, so the customer set up an automatic payment from her account to the company of \$40 a month starting on August 17. Although bank statements prove her payments were going through, First Electric sent her a second letter on August 18 claiming she had not paid her bill. Another letter warned her the firm had called in debt collectors. The company's records did not show the customer had paid, but a company spokesman said "if this is an error we would be keen to sort it out to her satisfaction." A Mercury spokesman said a computer glitch was responsible for the \$80,000 bill and a new billing system now blocked such inconsistencies.' ■ British 'company Yorkshire Electricity has apologised to a customer after sending her a bill for more than £2 billion.'

... 'with the Vector fiasco becoming sillier by the minute, Auckland Energy Consumer Trust members who meet today surely have no choice but to disown the controversial LineCare insurance scheme. As the 100% owner of Vector, Auckland's main power line utility, the trust has to accept responsibility for the scheme – particularly as it was briefed about it before the launch and raised no eyebrows. You will recall how Vector recently wrote to its 238,000 residential customers trying to lock them into a \$20.50 a year insurance scheme covering the wiring connecting their homes with the street. To avoid automatic payments being added to power bills, customers have to write back opting out of the deal. This inertia-selling tactic is illegal when dealing with goods. Somehow it is deemed acceptable for services such as insurance. But five power retailers have judged it so tacky that they have refused to include the LineCare insurance on their bills. Joining the criticism is the Housing Ministry, which has advised all residential tenants to reject the offer because landlords are responsible for damage to power lines. A property manager for 35 years unearthed more confusion when he rang Vector's advice service. He asked what would happen if all but one occupant in a block of flats serviced by one connecting line was insured. He was told that if there was a callout, the uninsured person would have to pay. When I put the same question to a Vector spokesman, his answer was different, but still zany. He said it would be a matter of which resident called for help. The ministry ruling that landlords are responsible only complicated the issue further. Power contracts are between the end-user and the provider. Now, it seems, a third party – the landlord – is liable for sagging wires and blown fuses. Given the traditional landlord's reluctance to part with money, and there being no contract to fall back on, I suspect collecting on these bills will take more money than it's worth. Underlying all this nonsense is the issue of how householders became guardians of the power cables running through their properties anyway. Traditionally cables were the property of the old power boards, but in 1984 the electricity supply regulations were altered to let the boards hand over responsibility to the homeowner.' In related news,] **North Shore residents whose household appliances were wrecked by a power surge are demanding compensation... The surge occurred after a newly installed transformer was energised... However, Power N[Z] has agreed only to repair or replace appliances ruined by the surge last Wednesday, which affected 35 homes... The amount of damage in dollar terms was unknown... [Power NZ's] chief executive... said it was going a bit far to expect the company to pay compensation when it had already agreed to fix damaged appliances. Under the terms and conditions of the standard power supply contract, the company had no obligation to fix damage if the surge was caused by something outside its control – such as lightning strikes or a car hitting a power pole... [But] a father-of-two, said... [other] companies, like Telecom, paid compensation when they failed to deliver services, so why not Power N[Z]?**

... 'Mercury Energy has teamed up with a US telecommunications firm to offer cheap phone deals to its 250,000 power customers in Auckland. Mercury customers who want the cheap phone deal will actually have to sign with the US company, which admits that competition in the long-distance market is threatened following a price-slashing special offered to residential customers by Telecom.' By the way,] **according to the Minister of Consumer Affairs... Telecom's efficiency in answering directory assistance calls and installing new phones has slipped... "While Telecom have improved their performance in fixing faults, I am concerned about other performance... indicators[which] show that the average time to answer a directory**

assistance call has increased by 90[%]. Telecom attribute this to a 28[%] increase in demand this year.” ...[the minister] knew Telecom considered the solution was to reduce demand by charging for directory assistance, but she disagreed. “Service, not demand, is the issue here. My challenge to Telecom is if you provide a service, it should be of a high standard irrespective of demand.” The performance indicator, which is a statutory obligation, [also] shows that the percentage of installation requests which met the requested time decreased from 93.3[%] in the previous period to 90.8... - 1997

[NZ’s] automatic telephone exchange building... will probably come into use in March next year to coincide with the release of the new telephone directory. Free dialling... is expected in 1970. - 1967

Before 1 April 1987, all domestic and international telecommunications services were provided by the New Zealand Post Office, as the NZ Post Office Act gave it a statutory monopoly... [(The Act also gave ‘NZ Post the sole right to carry standard letters up to 200 grams, unless more than 80 cents per item is charged’, but the coalition Government has introduced legislation to deregulate this market sometime in 1998.)] By 1986 the Post Office was the largest organisation in N[Z], employing 39,000 people and with assets of \$5.5 billion... In 1986, the Government... formed... [a] number of new corporate state trading companies... Telecom Corporation of N[Z] Limited, as one of those companies, began operating on 1 April 1987... When Telecom was corporatised, the first priority was to restructure the company in preparation for deregulation and eventual competition... Vigorous cost-cutting programmes were put in place... A substantial staff down-sizing exercise was undertaken [– to ‘23,900 during 1988 and then down to 18,144 during 1989’]... Outdated, inefficient systems were thrown out and replaced with modern computerised alternatives as the whole telecommunications network underwent substantial upgrading... The deregulation of the telecommunications market followed and in 1990 Telecom Corporation was sold to a consortium headed by two of America’s largest telecommunications companies, Ameritech and Bell Atlantic. The other founding members of the consortium were N[Z] companies... An agreement with the N[Z] Government specified that the owners reduce their holding in the company by offering a sale of shares to the N[Z] public and institutions. The first public offering of shares on N[Z] and world markets took place during June and July 1991... Telecom N[Z] Ltd... has one of the world’s most modern telecommunications systems with over 97% digital computer exchanges... supplies over 95% of telecommunications services used by businesses... more than 93% of N[Z] households with telecommunications services... [and] provides a wide range of other telecommunication services...

The NZ Post Office made over ‘\$208 million in profit after tax during the financial year ended 31 March 1985, and the Telecommunications Business section of the Post Office accounted for more than \$201m’ of it. In 1997 the PO made ‘a net profit of \$47.69m, down from the \$75.19m reported for 1996 (although the Government’s dividend harvest in 1997 was \$113.62m, up from \$85.31m). Revenue in 1997 was \$678m and total assets came to \$467.86m.’ This means that in 1986 the Telecommunications Business section accounted for a substantial portion of the PO’s *assets of \$5.5 billion*. After splitting the PO into NZ Post and Telecom, the NZ Government invested a further ‘\$1.843 billion’ in Telecom then sold it in 1990 for ‘\$4.25 billion’! For that price the new owners got a communications system which was almost fully modernised (fibre optic cable was already ‘in place along all the main trunk routes,’ ‘fibre rings surrounded the central business districts of the main cities by 1989’ and the ‘last manual exchange was replaced in 1991’).

Telecom’s goal is to be one of the best performing telecommunications companies in the world. The creation of *Value for Shareholders* is our ultimate measure of progress towards that goal. To add value for shareholders we must grow operating revenues and earnings while managing Telecom’s assets with increased efficiency.

To become an efficient competitor, Telecom had to provide an adequate basic service to N[Z] customers. The first step was to mount an extensive capital expenditure programme... Since 1988, Telecom has invested \$4.2 billion in developing a modern, sophisticated telecommunications service in N[Z]... The international exchange, Gateway 6, completed [the] final stage in upgrading of Telecom’s... circuits [during 1993. ‘Telecom’s annual capital expenditure had risen to \$770m by 1990’, but gradually decreased after its sale – down to ‘\$749m in 1991, \$666m in 1992, \$521m in 1993 and \$416m in 1994.’ That downward trend of reinvestment has, however, been reversed – back up to ‘\$600m during 1994-95’ and ‘approximately \$700m during 1995-96.’] Telecom is N[Z]’s leading telecommunications supplier in a highly competitive marketplace. Over 150 telecommunications companies compete in every facet of the industry. The only exception is in providing residential service (or local access), where Telecom’s inherited monopoly position still remains.

Telecom’s new owners had virtually every NZ home and business as an existing customer (‘the Post Office had 1,254,896 subscribers by 1985 – Telecom had 1,719,000 by 1996’) while, initially, having no competition. It was, therefore, able to concentrate on investing in additional services (i.e., additional sources of profit). Telecom also owned the country’s public telephone booths. One investment was to replace old public phones with newer models that could, for example, accept credit cards or prepaid phonecards. Coin-operated booths were redesigned to accept 10c, 20c, 50c, \$1 and \$2 coins but not to give change. At about the same time the charge for public phones went from a flat rate of 20c per local call to 50c. However, Telecom does have to ‘spend about \$1.5m a year on vandalised public phone booths’!

Net earnings for 1988 were \$63.9 million. Telecom achieved record net earnings for the year ending 31 March 1994 of \$528.1 million, an increase of 15.4% from \$457.7 million for the year ending 31 March 1993, excluding the effect of abnormal redundancy and restructuring costs.

The *effect* reduced that year’s net earnings to ‘\$108 million’. During the 1989-90 financial year the state-owned Telecom had achieved ‘net earnings of \$257m, and \$235m’ the year before that. At the end of the 1990-91 financial year the new owners achieved ‘net earnings of \$332m, followed by \$402m. In 1994-95 net earnings rose to \$620.2m and then a record \$717m in the 1995-96 financial year – for a return on average total assets of 15.7%’. While these profits were being gained the number of employees continued to decrease (from ‘16,263 in 1990 to 9,257 in 1994’). At the same time, ‘Net Earnings per Share went from 11c in 1990 to 22.7c in 1994 (which was paid out to over 30,679 shareholders’). By 1995 this had risen to ‘32.8c (or a 30c dividend per share), followed by 37.9c in 1996 (35c dividend per share)’.

Telecom’s profit results might bring quarterly howls of protest from those upset at its sale to an American-led consortium... [but] the buyers were prepared to pay about a billion dollars more than even the Government’s experienced international advisers were expecting. That extra billion came in handy against the [national] overdraft.

...Telecom is cutting prices of digital computer communication and dedicated voice links... but raising those of... analogue circuits to swing business users away from the older technology. Rapid growth in the volume of data traffic has reduced the marginal cost of providing these services, Telecom officials said yesterday, and technology advances had lowered equipment costs. But intensifying competition from Clear – and, in future, [AUS’s] Telstra... is not a factor Telecom is likely to have ignored... Telstra, not bound by the same regulations or service obligations, could enter the high profit ends of the market developed by Telecom with aggressive pricing at any time... Within the Auckland, Wellington,

Christchurch and Dunedin business districts, the monthly “service delivery point” fees fall from \$500 a month to \$300 for the first 2Mbit/s circuit and access fees per end drop from \$350 to \$250. Together with the elimination of transmission charges for high speed DDS circuits... this means a monthly cost of \$1840, instead of \$5650 a month for a customer with two sites connected by a 25-channels circuit.

...REMEMBER party lines? The good old days when two or more telephone subscribers with different numbers shared the same line? Thanks to a development called distinctive ringing, those days are back, but this time it is good news for home office workers, especially if you’ve got a fax machine or computer modem... Distinctive ringing allows you to have two phone numbers – one for personal calls and one for your fax... modem or for work-related telephone calls – without having to pay the hefty charges for an extra line. When your phones ring they will sound different, depending on which of your two numbers the caller dialled... At the moment there are two distinctive rings available – the normal... ring that we are all used to, and another which Telecom calls the “FaxAbility” ring. Fax machines that are FaxAbility-compatible can recognise this second ring and answer the call, while leaving other calls... If you already have a fax machine or modem that isn’t FaxAbility-compatible all is not lost – you can buy a gadget called a “ring decoder”... *The SmartRing Decoder*... is priced at \$99 (plus gst). *The Stealth Ring Decoder* is... priced at \$159.95 (including gst). • A faxability number costs \$3.95 a month. • The alternative to a ring decoder or fax switch is a second residential telephone line that costs \$175.13 installation, plus \$35.87 a month.

...Consumers winners in phone war... [T]he... battle between Telecom and Clear... has led both telecommunications companies to introduce \$5 week-night toll calls for residential customers. The price war started at the weekend with Telecom announcing \$6 week-night calls until the end of the year, but the offer was undercut by Clear introducing \$5 calls from Monday night. Telecom responded yesterday by matching the \$5 calls, starting last night... Neither company would say whether further price cuts were likely... The chief executive of the Consumers Institute... said the price cuts were welcome rewards from competition, but neither company would be losing from the deal. The specials would generate business during the off-peak evening hours.

...An embarrassed Telecom has agreed to apologise to staff after one of its managers offered a pay rise to anyone who left the union. The company, locked in an industrial battle with employees over individual contracts, was threatened with court action yesterday by the Engineering and Printing Union... after... Telecom[’s] manager... of the design, construction and maintenance division... recorded the offer on “voice mail” then told staff to ring and listen to the message[– which]... said staff would get an immediate 2[%] increase if they left the union and another increase later to match whatever the union negotiated. The increase would be backdated, which union members would not get... Telecom staff are running an industrial campaign of short-term strikes and limited work bans against the company’s push for individual contracts... About 5000 telephones are awaiting repair, 2000 of them in Auckland, with delays of up to four days.

...Telecom faces more snap strikes next week as it continues to struggle with huge backlogs of household telephone faults. Workers already on a national overtime ban walked off the job again on Thursday, during the company’s annual meeting, and their union warned yesterday of more disruption in coming days. The company was busy yesterday drafting in extra contractors to work through the weekend in the absence of most regular staff in Auckland, where the faults backlog is worst. It said last night that there were still 2200 Auckland households waiting for repairs to telephone lines, and acknowledged that the number could rise even higher if the weekend brought much more rain. An Auckland spokesman for the Engineering and Printing Union... said repair workers were telling him that the figure had reached 2400 and there were 444 cable faults awaiting attention... [M]ore and more customers would be disconnected as water was left to seep further into these. The company now acknowledges that Auckland residential customers are having to wait up to six days for repairs, but the union believes some delays are running to nine days. Business faults are being fixed much faster, however, in little more than a day. A Telecom spokesman... confirmed statements attributed to [his chief executive] that Telecom stood ready to negotiate collective contracts where that was the wish of union members. But he reiterated the company’s desire for separate contracts for technic[ians] and telephone services staff.

...Auckland telephone exchange workers have been threatened with disciplinary action if they take “micropauses” as prescribed by occupational health experts to prevent strain injuries... [The] Engineering and Printing Union... is urging workers to... pause for 10 seconds every three minutes while using computer keyboards... regardless, citing... that... [e]mployers had a statutory duty to provide healthy and safe workplaces, under pain of criminal penalties if they failed to do so... The union has for some time been considering whether to sue Telecom on behalf of up to 60 Auckland telephone exchange workers who... have reported strain injuries since 1991... [Meanwhile,] Telecom’s faults crisis has set new records for the length of time customers have been left without service. Some... customers in Auckland have been waiting for more than two weeks... – twice as long as the company claimed. An irate customer... said... “we are living in N[Z]’s biggest city and we are being delivered Third World standards.”

...Telecom is expected to hand out thousands of \$50 phone cards or free one-month line rentals to Auckland customers caught in the faults crisis. Customers who have to wait more than 24 hours to have phones fixed are entitled to either... under Telecom’s service agreement. However, customers who qualify have to call Telecom on 120 and order... [their choice] – they are not automatically handed out. A spokesman for Telecom... was reluctant to divulge the exact number of cards and line rentals already given away... But... [he] said staff had made good progress yesterday, bringing the number of faults down to under 2100. “Considering we were over 3000 on Friday, that’s good going.” ...As well as 78 contractors brought in from outside Auckland, technicians in administrative positions had shed their suits and gone back, temporarily, to repairing faults... [The spokesman] said that in extremely rare cases Telecom provided cellular phones to customers.

...If consumers had to give Telecom an end of year report card many would probably give... a D for service... Unusually wet weather and industrial action were the reasons offered by Telecom’s public relations team... for the excessive... time it took to fix faults... But the Ministry of Consumer Affairs, which keeps an eye on Telecom’s post-privatisation performance, reckons these are pretty poor excuses for slipping from bad to worse... A former supervisor in Telecom’s faults department... who took voluntary redundancy three years ago, said... the main problems... were that Telecom lacked experienced staff to cope with heavy faults workloads, and had failed to invest in replacing cables... - 1996

Telecom customers can expect widespread disruption to services... Staff began a nationwide go-slow yesterday over their employment contract... After nine months the staff had had enough of trying to reach agreement with a company which appeared to be driven by greed. The union was seeking a 5[%] pay rise, given the company’s record profits over the past few years. However, it had offered only 2[%]... A union spokeswoman... said... “Telecom’s desire to rip off its staff so that it can make more profit is just outrageous, and simply does not sit well with normal N[Z] business practice.” Last night a Telecom spokesman... accused the union of seeking publicity and said that fresh negotiations were under way... but Telecom management believes the effects on customers will be minimal... The union did not have enough members to have a major effect on services... Telecom employed 8500 workers, 2000 of whom were at management level. Around 3500 of the operational staff were union members.

...Telecom is calling on its American owners to help in a cost-cutting drive, triggering fears that workers will be hit in the pocket... Unions say... the proposed contract would knock \$4 million from the pay packets of 1600 workers by removing double-time payments and changing work arrangements so that overtime was reduced.

...One Telecom... employee, who would not give his name, said... a backlog of faults had built up in Auckland during the past four to six weeks because of an overtime ban introduced by the telecommunications giant... The... overtime ban included after-hours emergency callouts. Until about a month ago, customers with medical conditions – the sick, elderly and pregnant women – could have faulty phones repaired immediately. The lineman said the delays could have tragic consequences: “We are scared there could be a death caused by this. We don’t feel it’s safe and we are

not happy working in this environment.” Telecom seemed more interested in saving money on overtime than giving customers good service, he said... But Telecom denied customers were facing long periods without service. A spokesman said there was no overtime ban and faults were being repaired in one day on average. At most, customers were waiting three days, he said. But the *N[Z] Herald* has spoken to at least two Telecom residential customers who were left with faulty phones for five days.

...Telecom’s backlog of Auckland telephone faults has surged even higher, with about 2600 householders now facing repair delays of up to a week.

...Telecom plans to shed more than 10[%] of the staff in its design, build and maintenance division before totally throwing their work open to competition. Nationwide, 199 jobs out of 1600 have been tagged for cutting before the division, whose staff maintain the telecommunications network, loses its near monopoly...

[Yesterday, t]wo teams of staff in the... design, build and maintenance business unit walked out in the morning when two colleagues were given suspension notices. Then another two teams went on strike about lunchtime and two more workers were suspended...

Telecom [has sacked] two repairmen for falsifying time sheets... [Other] staff are being told to check their rear-view mirrors after revelations that the company used private investigators to spy on [the two repairmen]... An industrial officer... said the union was appalled at the practice, which was underhand and destroyed trust. Telecom should have said it was concerned about their work and given them a chance to improve. It was a difficult case to argue, however, when the sacked employees had clearly not been where they claimed to have been at the times they wrote on their time sheets... Private eyes followed one repairman around Auckland for two days last month, taking photographs and recording his location every five minutes... A Telecom communications manager... would not reveal the cost of the operation... [In related news,] Telecom customers wanting peace of mind over wiring faults will soon be paying nearly double for it... [Telecom’s] optional wire maintenance fee... [will rise] from 98c to \$1.95 (including GST)... Telecom[’s] spokesperson... said the company was increasing the charge to improve the return it received from providing the service... The latest price rise has the potential to... [give] it an extra \$20 million in revenue each year... Commercial customers will pay the increased cost for each phone line... Before last year’s rise... by 92%... the fee had remained at 51c-a-month since it was introduced in 1988... The... fee... [means] faults with the wiring or sockets, which are owned by the homeowner, would be fixed by Telecom at no extra charge... If customers chose to take the risk and cancel it “the odds are... that most people will be ahead.” ...More than 90[%] of Telecom’s 1.8 million customers nationwide opt to pay the... fee... Most problems with wiring within the house were caused by dampness or rodents or both... Telecom’s general manager... said the minimum callout charge was \$30, and with materials and labour added, the cost of a repair “can easily come to \$100 a call.” However, independent telephone repairers... said the typical charge for replacing a junction box, the most common task they were called to do for residential customers, was about \$65. Another option was for people to save the \$23.40 a year Telecom would charge, and fix any problems themselves. For example, last week The Warehouse was selling master wall sockets for \$11.99, 10m of telephone cable for \$9.99 and packets of 25 clips to secure the cable for \$3.99. Similarly, people may find buying a new telephone cheaper than renting one from Telecom. Telecom charges \$4.01-a-month to rent a standard phone, or \$4.95-a-month for one with pre-set calls memory. Similar phones were available from The Warehouse for \$29.99, which meant a customer would be saving money after six to eight months if they returned their Telecom phone and bought a new one [– unless they pay \$139 for a cordless phone with]... 25 channels, 10 speed dials... [and scramble technology to keep] calls private... With most telephone equipment now being reliable, the possibility of problems... over the next couple of years... was... remote for most customers...

Despite earlier indications from Telecom... [the company] wants residential customers to pay... every time they call directory assistance... [E]very household would get a cut in the \$35 monthly line charge and then pay when calling the 018 service... The company has produced figures to back its push to charge for... directory assistance. They show... [that i]n the past three years residential calls to directory have risen from 22 million to 33 million. Threequarters of those are for local numbers and most of the time (73[%]) the number required is listed in the phone book... “Basically it’s idleness,” [a]... spokeswoman for Telecom... said. “It’s a real socio-economic divide. People in higher income groups... use directory assistance a lot more than low-income people. These days people have about four phones in their house, but they don’t necessarily have four phone books.” The company is having talks with interested groups, such as those representing the blind... Representatives of the blind and partially blind are concerned they will be penalised because they are unable to read telephone directories. People with arthritis and other disabilities or who are unable to read also face financial disadvantage. There will be no distinction made in the charges between those who call for local numbers that are listed in their telephone book and those who call for new listings, incorrect listings, out-of-town or unlisted numbers. Telecom would not say yesterday how much less customers would pay in line rental or how much directory calls would cost. It was still deciding... Certain residential consumer protections were contained in the Kiwi Share agreement, written when the Labour Government sold Telecom... These say Government approval is required for Telecom to increase standard line rentals faster than inflation, introduce compulsory charging for local calls or reduce the telephone service. So far no variations have been sought and... Telecom did not believe the... proposal would require approval... If Telecom has its way, it could extract an extra \$16.5 million a year from residential customers at 50c a call... Business customers have also been calling directory more, up from 6.7 million inquiries in 1994-1995 to 9 million last year, but they already pay 50c a call. Cellphone calls have jumped from 1.3 million to 2.5 million, but again users pay 50c, plus talking time.

...Tracking down that long-lost friend overseas could soon be a costly exercise. Telecom announced yesterday that from December 1 it would no longer run a free directory service. Customers will pay \$1.50 every time they call directory for an international number and 50c for a *N[Z]* number. To offset the new charges, Telecom will cut the residential line rental fee by \$1.25 a month... Calls to the service had more than doubled since 1994 and grew 28[%] last year alone when 44.5 million were fielded... A spokeswoman for Telecom... said... “We just can’t keep on going like that each year. We are having problems coping with the number of calls.” ...over 80[%] of calls were made by just 20[%] of customers, most in the high-income bracket... Provisions have been made for blind people and others unable to read and for physically disabled customers unable to use phone books... [T]hose customers could apply for an exemption from the directory charges but would forfeit the reduced line rental if they did.

...Those long-lasting, long-distance phone calls to friends and family will cost more when Telecom reshuffles its toll prices next month. The new regime will offer cheaper day-time international rates for residential customers and cheaper night-time rates for some subscribers... But... [toll] calls over 30 minutes long[that] currently attract a 45[%] discount... from July 1 will warrant only 30[%] off. The rest of the more-you-talk-the-more-you-save discounts will also be shaved... [A] Telecom spokeswoman... said... [duration-based] discounts were not “that popular... People prefer something straightforward, you know, this costs x per minute. It’s a move to make the process easier to understand.” [Telecom offers a range of ways for customers to be charged for calls (e.g., households can opt to have a low monthly rental but be charged 20c per local call, or pay a higher rental – an extra \$14 – and have free local calls). The free-call area for Auckland ends to the north at the Hibiscus Coast.]

...Calls to and from... Hibiscus Coast... [and] Auckland in the 10 pm to 8 am time slot will rise 450[%] from 2c a minute to 11c. Daytime calls between 8 am and midday will rise 234[%] from 6c a minute to 20c, while calls between noon and 6 pm will rise 300[%] from 5c a minute to 20c... The revamped charges also include a maximum charge of 20c a minute off-peak to anywhere in *N[Z]* and the \$5 maximum charge for weekends and week nights... The new international toll regime will see economy rates fall by 35 to 37[%], while standard rates drop between 14 and 16[%] from the beginning of next year. But peak local call charges to commercial customers will go up 1c a minute to 4.55c, while local off-peak calls will rise 0.55c to 0.99c... [L]ocal business line charges will drop \$2 a month to \$58.42... Clear charges... \$48 a month plus GST... [for] its analogue business line rental... [plus] 3.5c a minute at peak times and 1c a minute off-peak.

...Insufficient competition is costing the economy \$250 million a year in excessive telephone charges... This needs to be addressed rapidly because monopoly profit costs are reflected in unnecessarily high telecommunications service prices that put the competitiveness of businesses at risk. The issue of telecommunications industry deadweight losses has come to light recently in documents obtained under the Official Information Act by the Telecommunications Users Association of N[Z]... A deadweight loss in economics is normally associated with a tax. It is money lost to the consumer through Government actions. In the telecommunications industry the deadweight loss referred to by Government officials is the benefit lost by the telecommunications user through the premium profit gained by the monopolist. In effect it is a Telecom tax... [W]hile interconnection agreements have been signed over the past few years, significant sectors of the telecommunications market – including residential and commercial local networks and the provision of high-speed data services – have remained devoid of open competition. This is hearsay, some will say, and point to the big price reductions that have taken place. Just recently Telecom celebrated its 10th birthday by claiming that a one-minute toll call to Wellington from Auckland that cost \$2.58 in 1987 now costs just 29c. While that statement is true it masks the whole story. On average national toll call prices have fallen by 82[%] since 1987. Three-quarters of that drop happened before 1990 while Telecom was in public ownership. Just one-quarter of that drop has occurred in the seven years since Telecom was privatised. Yet during those years costs have continued to fall sharply as Telecom completed the digitisation of its network and dramatically reduced staff. International toll call prices have been tracked in an independent survey conducted over the past 10 years by [a Sydney-based organisation]. This records that while a toll call from Wellington to New York has fallen in price by 58[%] since 1992 N[Z] is now ranked the most expensive country of 12 OECD countries to make that call, compared to fourth most expensive five years ago... [W]e are getting relatively more expensive compared to other countries for international and national toll calls. Another major part of the price story is the line charge and the cost of local business calls. This is where there is almost no competition and nor is there likely to be because of the enormous cost of duplicating the entire Telecom local network. Since 1987 the residential line charge has nearly doubled from \$18.23 a month to \$35.97 a month. It is worse for business because local phone calls cost nothing in 1987 but now cost 4c a minute... And it isn't just plain old phone services that are pricey. A 1996 Ministry of Commerce survey into the popular integrated service digital network concluded that N[Z] rates for local, low-use ISDN applications were 69[%] higher than the average of the other countries surveyed (A[US], Britain, the U[S], Sweden and Finland). And national and international high-use ISDN applications were 97[%] higher than the average...

U[S] efforts to force other countries to slash the rates they charge for incoming phone calls could prove toothless in the face of the complexities of the international calls market, the general manager of Telecom's network marketing... says. The US regulator, the Federal Communications Commission, has set benchmarks ranging from 15USc to 23c a minute, or as much as a tenth below the current levels some state monopoly companies charge to complete international calls. The FCC argues the move could save US consumers \$US17 billion over five years and bring down prices globally... International call charging is established in so-called accounting rate agreements which set reciprocal prices at which carriers terminate incoming calls. Telecom, for instance, has agreements with five carriers in the US... N[Z] was regarded as being in the "good guy" camp by the U[S]. But many other countries, typically developing economies with state-owned telephone companies, relied on high settlement rates to boost national coffers... [T]hey could afford to negotiate high accounting rates because they usually originated a proportionately low number of calls... and most of the countries concerned had no operations of their own in the US.

...Entrepreneurs answer call of open market... If you get fed up with telephone bills and the standard of service, start your own telecommunications company. That is what a couple of San Diegan businessmen did, and now their company, WorldXChange, is in N[Z], the third in a recent flush of competitors for Telecom and Clear. With aggressive use of high technology to cut overheads, the new companies are offering up to 55[%] off the price of calls to the U[S] and Europe, 40[%] lower charges to A[US] and savings on national calls. It is all a result of the N[Z] Government creating "the most open telecommunications market in the world, and the fastest expanding," says [one of the San Diegans]. Clear, largely an offshoot of the U[S] operator, MCI, with some local shareholding, was the first to compete with Telecom when the market was deregulated... It has been followed by another huge operator, Global One, an offshoot of the American operator, U.S. Sprint, in consortium with Deutsch Telecom and France Telecom. Then there is the A[US]n Government-owned Telstra, and now WorldXChange. All have interconnection agreements for national toll services with the Telecom network, and own or lease international connections. They have all spent millions of dollars setting up computer systems for switching calls, compiling bills and providing customer service. Some of the facilities are mindblowing. Telstra has switching equipment in Auckland and Wellington capable of handling 700,000 calls an hour. Telecom does not feel intimidated by the competition... said [a company] spokesman...

The recently-arrived national and international toll carrier WorldxChange plans to offer local telephone services by Christmas... The company, which officially completes the rollout of its domestic and international long-distance services on Monday, has picked up 2000 customers in the 10 weeks it has been operational, even though its first advertising campaign has yet to begin... The rollout gives customers... international calls priced between 30 and 50[%] less than Telecom's standard rates... WorldxChange is targeting small and medium-sized businesses... doing more than 20,000 minutes a month... The... WorldxChange... group operates in Austria, Canada, France, Germany, Denmark, Guam and Britain and forecasts 1997/98 revenues of more than \$US500 million... [Incidentally, when callers use an operator to make toll calls from a public booth in the US and charge it to their credit card, they are 'asked which long-distance company they wish to use. Common replies are "whichever," "any one will do," "I don't care," "it doesn't matter." An entrepreneur has registered those plus other replies as company names and charges twice as much']

...this weekend Telecom is holding a *Talk-a-thon* – you can 'call anywhere in NZ as many times as you wish, and talk for as long as you like, but pay no more than \$14' in total. In response, a competitor is offering 'weekend rates for anywhere in NZ of 15c per minute or no more than \$3 per call.'

...Telephone callers may soon find their conversations interrupted by advertisements – in exchange for free toll calls. An A[US]n company plans to introduce a service in N[Z] next year which will give subscribers free national calls, interrupted with 10-second ads every few minutes. Whitfield Investments will test the free phone service in N[SW] later this year... The system, which was first introduced in Sweden in February, had attracted 100,000 subscribers in Stockholm in its first seven months... Telecom and Clear... have no immediate plans to introduce a similar service, but both companies say they will study the A[US]n pilot scheme.

...Telecom gave [an Aucklander] the fright of her life yesterday. The Auckland legal secretary mistook the telecommunication giant's promotional mail-out for a letter bomb. Telecom's card – advertising its new Calltrack service – malfunctioned and emitted a whirring electrical noise, which resulted in the evacuation of the Southern Cross building in the inner city. Bomb disposal experts, police and firefighters were called during the morning bomb scare which [also] closed down parts of High, Lorne and Victoria Streets for about 90 minutes and caused a university capping parade to be diverted. The card came in a red envelope bearing the warning "beware" in bold type. When opened the card emitted a roaring noise and featured an origami-type monster. The advertisement – promising to take the "horror" out of totalling up the phone bill – was mailed out to about 3000 Auckland and Northland businesses and was due to be sent to other businesses nationwide, but has now been withdrawn... [A] lawyer who works in the building, described the promotion as extremely irresponsible... [He] and other lawyers were planning on billing Telecom for lost work hours... A Telecom spokesman... said he was "deeply sorry" for the incident... [By the way, a]bout 3000 people have asked to be put on a register so that they are not called by telemarketers. The Direct Marketing Association, which set up the register about six months ago, said the most common complaint about telemarketers was "they always ring at tea time." The association membership services director... said sales-shy people had to register their wish to be left alone as the association needed permission to store that information under the Privacy Act.

...Clear... has slashed its tariffs and launched an aggressive telemarketing campaign to win customers from Telecom... [The man who was] appointed yesterday as its chief executive... declined to give details... but a call to Clear's customer service department revealed minimum savings for a small business switching from Telecom were: 250 free minutes of toll calls or \$100 credit, plus discounts from Clear's standard tariffs[– including 26%] for calls between N[Z] cities or A[US]... Bigger businesses would get larger discounts... Telstra... said it was disappointing to see Clear as the key protagonist in the latest round of price cuts. "People who buy business are doing nobody any favours." Telecom said Clear was countering some of its own recent initiatives. If Clear offered a Telecom customer a new pricing package, Telecom would "ensure we'd provide comparable value for money taking into account quality of service [and] efficiency." ...[Clear's new head] has been acting chief executive... since July and a board member for 18 months representing British Telecom, Clear's 25[%] shareholder.

...The surprise \$US30 billion... bid by fourth-ranked U[S] long distance carrier WorldCom to take over... MCI Communications... casts further doubt on the already uncertain state of Clear's ownership... British Telecom has been expected to cement control of the company when it takes over MCI in a deal which is still to be approved by MCI shareholders... But all that is now in doubt. WorldCom, which has been doubling in size each year, would now like to add MCI to its list of 50 acquisitions. To do so it is offering \$US10 a share more than BT, whose offer was recently revised (sizeably) downward because of MCI's flagging performance in the US... Domestic market losses for this year could reach \$US800 million... Should WorldCom succeed, it will not only thwart BT's long-standing global aspirations, but also change the shareholding outlook for Clear. Clear is offering an official "no comment" when asked about the impact of the development. But there is no doubt that it comes at a time when the telecommunications market is particularly unsettled... [I]t is no secret that TVNZ would like to sell [its shares in Clear]... The negotiations between B[T] and Telstra, expected to result in BT taking a stake in Telstra after the A[US]n Government's partial float[of Telstra] later this year, collapsed. In addition, they were thought to have included an arrangement in which BT's interest in Clear was to be passed on to Telstra in return for Telstra's British operations. Given the nature of the industry, the chief executive of any telco cannot expect an easy time.

...British Telecommunications is in preliminary merger talks with GTE Corporation of the US as it seeks to recoup from its unsuccessful bid for MCI... A merger with GTE would give the British telephone company a stake in the annual \$US200 billion... US telecommunications market... [BT] made a second-quarter loss of £32 million... The company... said the... loss compared with a profit of £461 million a year earlier. The main reason for the loss was the £510 million windfall tax – imposed on BT and other previously state-owned utilities... in recognition of what the [British] Government called their excess profits.

...Clear... [has reported an 11%] slump in bottom-line earnings... from \$23.4 million in 1996 to \$20.8 million... The result took full account of interconnection payments... worth about \$500,000 a month... due to Telecom which Clear, since August last year, has partially withheld... Clear's shareholders... [which include] MCI... and TVNZ, received dividends at the same rate as 1996 – a total of \$12 million in each year. While Clear's shareholders' funds rose modestly from \$133 million to \$141 million... long-term debt... jumped from \$40 million... to nearly \$74 million, while total assets were up from \$226 million to \$271 million.

...N[Z]'s largest company, Telecom, is at a turning point after years of meteoric growth. The company yesterday reported a 19[%] drop in bottomline profit for the [1996-97] year to \$581.4 million, in part due to restructuring costs... In the full year, Telecom's dividend payout of 39c a share is greater than its net earnings per share of 30.8c... The chairman... said it was pleasing that a 6.2[%] revenue rise to \$3.12 billion... had outstripped economic growth... [because] Telecom has been fighting competition from Clear Communications in the national and international calling markets, and BellSouth in the once highly profitable cellphone market... Performance was also hampered by start-up costs associated with Internet provider Xtra and the cable video and information services company First Media... [Telecom's] shareholder Ameritech reported a fourth-quarter profit of \$784 million, up 10%...

Telecom's much-trumpeted Xtra internet service... [– which] is offering dedicated Internet data networks at up to 40[%] less than Telecom subsidiary Netway... [–] is red-faced today after two computer-savvy 14-year-olds found an easy way to read confidential online files. As a result... Telecom Xtra has temporarily shut down customer access to its online billing information, which gives details of clients' internet usage and charges, and is working on improved security. The service development manager... said Xtra was sorry this had occurred and was concerned enough to take immediate action. "We're also in touch with our software supplier..."... One of the boys... said he and his friend... found the security hole by looking at their own Xtra bills online. They noticed that the Web page location (URL) code at the top of the screen contained a string of information, including a user name and some numbers. When they substituted another user's name in the string, that person's billing details were displayed. "I... suppose it's not particularly confidential information, but when you access your account it looks like there is high security – you have to type in your user name and password – but it's not." The boys had e-mailed Xtra about the problem, but did not get a reply until a week later. Xtra claimed the information could not be accessed without a user name and password. The company responded very differently when the N[Z] *Herald* followed up the boys' concerns. [The service development manager] said it appeared Xtra billing staff had misunderstood the e-mail... [T]he Privacy Act requires an agency that holds personal information to take reasonable steps to "prevent unauthorised use or unauthorised disclosure" of the information it holds... [In related news, t]elephone companies could lose \$US8 billion... in revenue worldwide over the next four years as more customers turn to the Internet for voice and fax phone calls, says a new report. Lower prices on the Internet will prompt phone companies worldwide to lower their prices... International long distance companies will feel the biggest impact from the Internet... said the study by Action Information Services... International phone calling by voice and fax will generate more than \$62 billion in revenue this year. Based on the International Trade Union's revenue figures, that will likely grow to about \$77 billion over the next four years...

[British p]arents have been warned that their children could be running up higher bills than they realise using British Telecom... phone... cards [which] allow youngsters to make computerised calls without cash. [A] maths teacher... was shocked to find that the cost can be three times the standard rate. "It's a rip-off," she claimed after telling how her 12-year-old daughter ran up a £121 bill over 11 days' holiday with family friends in Hong Kong. BT admitted chargecard calls were more expensive, particularly from abroad. But they said using a pin number involved expensive processing by computers needed to cut out the operator.

...London callgirls... [a]re asking the Office of Fair Trading to force the country's recently privatised phone giant... to reopen the lines they use to contact customers. BT is blocking the phone lines because the prostitutes' business cards clutter the walls of hundreds of West End... phone booths. "I'm a very bad girl, spank me," reads one... "It's messy and it gives a bad impression of central London," said... a member of the Westminster Borough council. "The advertising is too explicit and that's bad when the boxes can be used by children and tourists... Some kids collect the cards and they even ring up the numbers..." [A] BT spokesman... said: "There's no question these cards are deterring people from using the phones. We're getting regular complaints." He wouldn't say how many... The callgirls say they need the phone booth displays because [respectable] newspapers, magazines and billboards refuse to run their advertisements. It's illegal to solicit sex for money in Britain, but it is legal to post cards that don't specifically offer sexual services for money. Thousands of the naughty notes are posted in phone boxes daily. BT cleanup crews remove more than 150,000 a week. Westminster Council asked the government to outlaw the phone booth trade. So far, parliament has refused to oblige. Politicians and BT officials say the only way to eliminate the problem is to shut down the 400-odd phone numbers... The campaign to denude the booths of the business cards began last October... It sends two warnings to the callgirls' billing addresses. If they ignore the warnings, the phones are shut off... By mid-February, BT had blocked 75 lines... So the callgirls... complained to the Office of Fair Trading... The Office... ordered the lines reconnected. BT restored service to [the] 75 customers in February. BT then... began disconnecting the same phones... [and currently] is

blocking about two phone lines a week... [In local news, an AUS]n publisher of business directories has pulled out of [the country] after its attempts to compete with Telecom failed spectacularly. Colour Pages Ltd set up a N[Z] subsidiary at the end of 1995, but was placed in receivership this week, owing about \$1.3 million to unsecured creditors... The managing director of Colour Pages... yesterday estimated the company's losses at more than \$2 million... More than 1000 businesses in Auckland and Wellington are believed to have signed up for advertisements in two directories which will not now be published... Plans by the company to produce an Auckland business directory on yellow paper were thwarted last year when Telecom threatened to take legal action. Telecom has since lodged a trademark application for the sole right to use the colour yellow. Colour Pages reprinted the directory on blue paper, but delays in getting the directory out upset advertisers and some withheld payment of their bills... In early July, Telecom failed to get an injunction stopping Colour Pages from producing a Wellington directory. However, the High Court ruled the case should go to a substantive hearing to hear copyright issues and Colour Pages was required to lodge \$300,000 with the court to prove it could afford to defend the case... Twenty company staff in Auckland will lose their jobs.

...Telecom has pared back its capital expenditure plans for this financial year... from the \$800 million foreshadowed when the annual results were announced two months ago to no more than \$750 million. "And possibly significantly less than that."

...Telecom yesterday reported a \$188 million net profit for the... quarter... up 6.2[%] from \$177.1 million in the same period last year... Revenue grew 9.6[%] to \$800.6 million... Telecom[also reported that it] is to chop capital spending by \$500 million over the next three years in a cost-control programme... In the current year, capital expenditure will fall by \$100 million to \$700 million... [Incidentally,] Telecom has walked out of the Telecommunications Users Association (Tuanz), criticising the group for shifting its focus to political objectives aimed at getting Government intervention in the telecommunications marketplace... Telecom has been a significant sponsor and financial contributor since Tuanz was formed in 1986.

...Collective action is better, say the founders of the newly-formed N[Z] Telecommunications Industry Organisation... With Telecom refusing to join their organisation, the chief executives of Clear... Telstra, BellSouth, Saturn and Global One will talk a lot to themselves. Telecom is the company they need to bring to the table... Issues ranging from technical standards... to... pornography on the Internet... will benefit from a common voice. Telecom's response once again displays its fortress mentality... So far, dealing with Telecom has been a sorry saga of lengthy and sometimes fruitless negotiations, litigation and grandstanding... But far more effective than talk is the real weapon the five could wield – global power. Their parents are some of the largest telecom companies in the world who could make life just as tough for Telecom abroad as Telecom makes for the five here... [By the way, 'the final report of the Ministerial Inquiry into Telecommunications makes recommendations aimed at clarifying the ground rules for competition in this most dynamic of industries. The inquiry has also recommended a stronger form of regulation for a small but crucial set of services. Opponents of this proposal have argued that regulation is not justified and say that the industry is already competitive. This argument probably seems compelling to many people, but it is quite wrong. The fact that we have alternative suppliers of toll calls, for example, tells us nothing about whether the price of toll calls is unnecessarily high. To understand this point, consider one of the most famous errors ever made by a court. Back in 1956, the US Supreme Court was considering a case involving DuPont. The court effectively ruled that DuPont did not have market power in the supply of cellophane because alternatives to cellophane were widely available. In fact, DuPont had a monopoly on the supply of cellophane and, like any sensible firm in that position, had kept the price high for many years. Because the price of cellophane was so high, entrepreneurs were able to begin selling inferior alternatives, such as waxed paper, pricing these just below the monopoly price of cellophane. The Supreme Court error, now known as the cellophane fallacy, was to infer that DuPont lacked the market power in the supply of cellophane because it had competitors. A similar error is now being made in comments on the telecommunications inquiry report. Telecom clearly does have market power in the supply of access through the copper network. Naturally, it uses this power in setting the prices that its rivals must pay to route calls through the network. This "access" price is an unavoidable cost to Telecom's rivals and must, therefore, be recovered through retail sales. So all retail prices are higher than they would be if Telecom's access prices were regulated.'

... 'Telecom charged the police \$40,000 to sift through telephone records in a murder inquiry. The case is cited by the Police Association as an extreme example of Telecom's charging regime, which began about four years ago. Concern about charging law enforcers for evidence needed to bring criminals to justice has been compounded by a decision by one of Telecom's competitors to follow suit five months ago. That company has reported a dramatic drop in police requests for phone records since then, although a spokesman said the number still exceeded a hundred a month.' Incidentally,] **Inland Revenue has named Telecom as its preferred supplier for telecommunications services under a five-year outsourcing contract. The deal... comes on the heels of one to manage and operate ANZ[Bank]'s communications infrastructure... While the ANZ contract was more in the nature of a consolidation of existing contracts (around 300 in all), the Inland Revenue pact involved a change in supplier...**

Clear and Telecom working together in harmony? Nah, it couldn't happen. But that's what did happen in the delivery of the Department of Social Welfare's new \$8 million-plus telephone system. The project involved the implementation by Telecom Business Systems of a national integrated PBX network linking 150 sites, with Clear... as the carrier. "Initially, there was a bit of jostling and finger pointing by both suppliers... But that soon settled down and they worked together in[a] very professional manner." ...Of the one million calls[made] each month by Social Welfare's 6000 employees... 40[%] were being carried over the tie lines, representing significant savings... A further measure of the cooperation between Clear and Telecom is seen in the centralised billing. In the past, community offices using Telecom's network would have received separate bills for calls. Now all Telecom-based services are billed to Clear, which provides Social Welfare with a single consolidated bill each month.

...Yesterday, Telecom, under industry pressure, expressly stated what everybody thought was its position anyway: that it owns [NZ's] telephone numbering system. There was one important proviso: that it had no control over numbers developed by carriers with access codes such as BellSouth's 021 series. In those cases, the numbers belonged to the carrier. One catch is that the access code is still allocated by Telecom, and presumably, without it, BellSouth would not be in the market. The other is that Telecom's dominant retail position means that its numbers are far more important than any plan developed by a competitor. The question is, how could Telecom be so arrogant as to believe it owns the numbers? The answer lies in the manner in which its assets were bought from the Post Office when the SOE was created... a deal which stipulated that anything not expressly excluded was part of the sale. The then SOE minister... says Telecom could well be right that it owns the numbering plan because it occurred to nobody in 1987, including Telecom staff advising, that there was even an issue... "If Telecom does own it, then the Commerce Act puts a very clear obligation on them to trade – and trade in a fair way," [he] says... A BellSouth spokesman said N[Z] was the only country where the numbering plan was effectively controlled by the dominant player in the market. The numbering plan should be placed in the hands of an independent administrator... Telecom had... said... [that other] carriers were free to develop whatever numbers they liked in their own networks, so long as the numbers were not sourced from Telecom.

...Telecom's commitment to helping customers keep the same numbers if they move to a new telephone company is again being called into question... Along with interconnection, number portability has become a major battleground in the industry... Portability is important because disenchanted customers who think they can get a better deal from another carrier may think twice about moving if they have to get a new phone number. For residential customers, a new number may be of little consequence. But for a business, a change of number could be fatal. Customers may lose touch and go elsewhere, and there could also be crippling costs associated with upgrading stationary, signage and promotional material... In addition to the disincentive to portability implicit in Telecom's natural desire to hang on to its customer base, the implementation of number portability is also technically complicated. Because a call to the customer moving to a new carrier must first land at the old network it, therefore,

requires facilities at the old carrier that recognise the call no longer belongs to it and reroutes it to the new carrier. For that to happen requires technical solutions and agreement on who bears the cost of their implementation.

...Telstra N[Z] is content with the number portability agreement it has struck with Telecom, despite its being significantly more expensive than one just imposed by the Government in A[US, which]... ruled that A[US]'s second largest carrier, Optus, should pay the largest carrier, Telstra, \$A8 for the initial set-up charge and 0.5c per call when a Telstra customer wanted to keep the same number... [The terms of Telstra NZ]'s portability agreement... have not been made public. However, its managing director... said the initial charge per line had been set at slightly less than \$20 with ongoing fees of 0.5c a minute. Telecom had originally demanded \$30 per line to set up portability. At 0.5c per minute, the ongoing charge is said to average out around 2c a call... [In] Britain... OfTel has established a set-up of £4.70 and 0.5p a minute... The A[US]n Government has decided Telstra Corp... must allow competitors to use Telstra phone numbers for local calls for a fee of one cent per call...

Optus Communications... reported annual profit [was] \$123 million for the year... which was more than double the previous year's \$60 million. Sales in the year... rose 28[%] to \$2.48 billion... [In comparison, Telstra Corp's] profit for the year [was] \$1.62 billion, down 29.9[%] on last year... The result included a one-time loss of \$1.73 billion. The profit [was] Telstra's last as a wholly government-owned organisation. One-third of the company will be sold to the public by the end of November.

...Brazil, with 160 million people, foreign reserves of \$US62 million and now the largest emerging market after China, is preparing to privatise its... telecommunications carrier[, which] has revenues of nearly \$30 billion, and the world's big players are gathering for the sell-off next year.

...[the] French Government said it will sell up to 38[%] of France Telecom SA... Europe's second-biggest phone company... for about 76 billion francs (\$NZ20 billion) in one of the world's biggest-ever initial public offerings... [Meanwhile, the AUS]n Government has demanded an explanation of alleged corruption by the Japanese stock broker responsible for the float of... Telstra in Asia... Japan's... second-biggest broker... was one of seven A[US]n and international brokers named in March to handle the \$A10 billion... float... The... [broker's] Melbourne-based A[US]n arm declined to comment yesterday.

...A[US]'s biggest sharemarket offering gets under way today... N[Z]ers wanting a piece of the \$A14 billion... float... will have to line up alongside institutions around the world... Some 30[%] of the public offer has been allocated to non-A[US]n investors. N[Z]ers will have to pay the full 200Ac a share against the 195c a share offered to A[US]n residents... The huge retail demand indicated for Telstra has raised the concern of institutional investors who, despite their billions of dollars under management, are concerned their allocation will be cut short... Indeed, offers to buy shares are flooding in... Demand from individuals... [for] France Telecom's... initial public offering... outstripped the allocation by 2.9 times, with institutional investors oversubscribed by close to 20 times.

...N[Z]ers who had been able to buy a share in... Telstra made a quick killing yesterday. Shares... opened at a 30[%] premium, giving those who had applied for 2000 shares an immediate \$1300 gain... Telecom shares[also] gained 11c yesterday to close at a record high... as the company announced the second sale of capital notes to retail investors to fund its \$1 billion share repurchase plan... from major holders Bell Atlantic and Ameritech... Telecom has [so far bought back] more than 68 million shares... at an average price of 708c, a total cost of just over \$481 million... Telecom[recently] proclaimed a "return to strong growth" with a \$210 million net profit – its best ever – in the September quarter.

...There should have been a few red faces in Wellington this week. The strong share price performance of Telecom... and overwhelming demand for Telstra Corp... shares have reconfirmed that the Crown sold the N[Z] company for the proverbial song seven years ago. In September 1990, Telecom was sold for \$4.25 billion. Midweek the company had a value of \$16.7 billion, including the 1994 capital repayment and the recent share buyback. The original buyers of Telecom, who were mainly offshore interests, are now receiving an annual... tax free dividend yield in excess of 21[%] on the 1990 purchase price of 181c per share... In 1988-89 Telecom's personnel costs represented 21.3[%] of revenue. This ration had fallen to 11.2[%] in 1996-97 because of improved productivity and reduced staff numbers. The reduction in the personnel cost ration has accounted for nearly 40[%] of Telecom's profit increase since 1988-89... Telecom's prospective price earnings ration is approximately 10[%] higher than the average of similar international telephone companies.

...Telecom's share price continues its upward climb to new heights... It touched \$9 before settling... at \$8.95.

...The Americans have made their dough and are leaving N[Z]. That was the message from Ameritech and Bell Atlantic... when they told the stock exchange they were quitting their Telecom shareholdings.

...Shares in Telecom... plunged... to \$7.70 on news that Ameritech would quit its... 24.9[%]... stake in the first half of next year and Bell Atlantic would put in place a capital structure that would enable it to sell out... [of its] holding of the same size... in future if it wished[, resolving]... longstanding doubts about the two investors' long-term commitment... Both American companies... are switching their efforts and capital away from N[Z] to communications markets offering faster growth and more opportunities... For Ameritech and BellAtlantic the[Telecom] investment has been extremely lucrative. Their combined 90[%] shareholding cost \$3.8 billion yet they have received an estimated \$5 billion from dividends, a capital repayment, share buyback and the sale of shares in the 1991 float and in 1992 and 1993... [-] yet they still have a combined holding of 874.4 million shares... Thus the two American telecommunication giants will exit N[Z] with an estimated total realisation... of \$11.5 billion... This is a total gain of \$7.7 billion and gives credibility to the rumours that both companies will dedicate a special Telecom New Zealand room where directors can go for the obligatory glass of Dom Perignon after board meetings. It is difficult to understand what either Ameritech or Bell Atlantic did to earn this huge return.

...[a trio of broking firms have scored] the deal to realign the \$7 billion shareholdings of Telecom's two major... investors... Ameritech is[also] embarking on a \$US2 billion... two-year buyback of its own shares, the largest yet by a U[S] telecoms group. Bell Atlantic is heavy on short-term debt... But it too has shareholder approval for a \$1 billion buyback... Thanks to its \$30 billion merger with Nylex this year, it already offers local service in 13 states from Maine to Virginia over 40 million lines... Ameritech, based in Chicago, is focusing its expansion on North America and Europe. It has already invested \$5 billion in companies in 15 countries on the continent.

...Telecom has bought out one of the two remaining resellers of its cellular service... for an undisclosed sum... Ericsson Cellular... will pay redundancy to the 110 staff affected, of whom between 60 and 80 are expected to be rehired by Telecom[, which bought a third company's]... cellular reselling business in June... and is renegotiating its contract with the... only remaining reseller... Telecom has[also] signed a deal giving it access to Equant, a voice and data communications network operating in 225 countries... Equant owns the network, the world's largest in geographical spread, in partnership with Sita... [Incidentally,] Telecom is suing Clear for disputed amounts arising from their local service interconnection... [Clear's] claim on Wednesday for damages was just a rejigged version of a counterclaim to Telecom's own claim for non-payment of bills... The action is... being watched closely by cellular operator BellSouth, which, along with Clear, has frequently complained of unsatisfactory operation of the light-handed telecommunications regime... Asked if BellSouth would issue proceedings of its own... [a] spokesman... said "we are continuing our investigations..."

...BellSouth N[Z] says it is close to signing a new and less expensive interconnection agreement with Telecom and is already paying the lower charges that have been negotiated. The... BellSouth chief executive... said charges under the new agreement were still too high but he was grateful for anything he could get from Telecom... BellSouth... has invested \$550 million in its cellular network and a further \$110 million [is] earmarked for... 199[8]... The company has yet to report a profit although [the chief executive] said it was likely to break even this financial year... The cellphone operator is claiming 90,000 customers, 15[%] of the cellular market... Th[at total doesn't include th]e country's 120 MPs[, who] each

received a gift-wrapped cellphone at Parliament yesterday, as part of a BellSouth promotion... MPs are mulling over whether to keep [the] free cellphone and call package worth a total of \$36,000... The taxpayer already pays each MP to have a cellphone... The corporate communications manager for BellSouth... said the \$299 package... was not a lobbying exercise, but “an introduction to a revolutionary new product.” ...Members of the parliamentary press gallery received the same package. The *N[Z] Herald* gallery team decided to return the cellphones.

...Labour and Act MPs are returning cellphone packs... to BellSouth, which yesterday conceded the gifts were part of a lobbying exercise.

...BellSouth's digital cellular network is much like Telecom's in most respects, but it's voice quality is superior, according to research conducted by BellSouth... The research aimed to dispel a perception reinforced by Telecom advertising that BellSouth's voice quality was inferior... According to BellSouth, cumulative results from its testing so far show its GSM network as roughly equal to Telecom's – 94[%] to 96... in the number of successful calling attempts. However, Telecom's recent digital AMPS network scored only 78[%] on call quality, compared with BellSouth's 85[%]... In the first quarter of this year, the BellSouth researchers tested most comprehensively in the Auckland region, where arterial routes and suburbs have been checked in a 40km radius.

...Forget the coverage wars, the new battle in mobile phone communications between Telecom and BellSouth is over features. BellSouth's latest weapon, to be launched this week, is Internet Preview – the ability to send and receive e-mail messages from a mobile phone – giving it an advantage over Telecom, which does not yet offer the facility. The option adds to BellSouth's impressive arsenal, including caller ID, the ability to receive faxes, and BellText – its short messaging service. Many of these are unavailable to most of Telecom's mobile users... although Telecom is catching up... [However, BellSouth has also] launched an all-out assault on the consumer end of the cellular market with a pre-paid phone whose charges are based solely on airtime... But... [are NZ] mobile phone users ready for such high-tech innovation?

...Telstra N[Z] is to enter the mobile telecommunications market using the BellSouth network under an agreement unveiled yesterday. Telstra, which does not offer cellular at the moment, will sell its GSM mobile spectrum licence to BellSouth and gain rights to use BellSouth's network for 12 years... BellSouth... said the extra spectrum would increase usable network capacity in metropolitan areas, resulting in fewer cell sites...

Anti-cellsite protesters have spent the week disrupting Telecom's attempts to build a transmitter at Waitakere Village... which stands within 10m of homes... Groups of between four and 20 locals have kept a 24-hour vigil at the... site, resulting in more than 10 police callouts and one arrest... [on charges of] breaching the peace... after [a protester] lay down in front of a concrete mixer. She said residents were determined to stop the building of the 21m tower because of its visual impact and health concerns... Telecom... said the lack of consensus was disappointing... [However, the company] would continue... The foundations for the... transmitter... were almost complete... But a spokesman for the Waitakere Resident's Association... said 200 locals could be at the site to protest within moments of contractors turning up [again].

...The Mayor of Waitakere City... yesterday called Telecom “N[Z]'s worst corporate citizen” after... [two] men were arrested during a spirited morning clash between Waitakere Village residents and contractors... After the protest [the mayor] lashed out at Telecom, saying it was devoid of integrity and soul and cared only about increasing its profits. “Telecom just doesn't give a damn about the people in this community. We have little old ladies crying and lying down in front of the crane but Telecom refuses to stop work...,”... But a spokesman for the company... hit back at the mayor, saying Telecom had responded to residents' concerns last year by investigating and consulting over other options. They were denied consent by the council to build on the most suitable alternative site... “To have the mayor now making such intemperate statements after all our efforts is particularly disappointing.”

...The Waikato District Council has approved a Tamahere cellphone tower, despite the concerns of nearby livestock breeders for the fertility of their top animals... Telecom had commissioned a report from an environmental physician which concluded that the transmitter was too weak to affect animals. The council's hearing committee said the structure met district plan requirements.

...The Environment Court this week overturned a Telecom resource consent for a cellphone tower on Mt Te Aroha largely on the grounds that the mountain was sacred and had already been degraded by a water tower and television transmitter. Residents who appealed against the Matamata-Piako District Council's granting of the consent joined forces with the Te Aroha tangata whenua, Ngati Rahiri Tumu Tumu. They jointly told the court the... tower would have a negative visual impact.

...Residents of a popular Bay of Plenty holiday spot are bristling at Telecom's decision to cater for cellphone-toting holidaymakers ahead of improving their telephone exchange. Telecom has installed a 12m-high cellphone tower at Waihi Beach... It is one of about a dozen temporary transmitters put up throughout the country to widen coverage over the summer... A Telecom spokesman... said the cell tower, which doubles capacity in the area, cost \$5000 to \$10,000 to erect. This compared with up to \$2 million to improve the local exchange... The chairwoman of the Waihi Beach community board said... locals... have been told they have to wait up to two years for a digital exchange allowing such services as call-minder and diversion... Waihi's population swells from 3200 to near 20,000 over the Christmas-New Year period and Telecom would make thousands of dollars from cellphone calls logged over that time, she said. The tower will be dismantled after February...

It seems no place is sacrosanct to Telecom in its quest for cellphone mast sites. An Auckland church congregation has agreed to let the company erect a 10m tower outside its front door, and will top off the edifice with a Christian cross. Unfazed by outcries about masts... Telecom says it has [also] been welcomed with open arms by several Wellington churches willing to embrace modern technology in return for healthy contributions to their collection boxes... The Wellington City Council... [is considering] Telecom's request to put low-powered antennas for cellphones on street lights and traffic signal poles.

...A WELLINGTON couple is facing legal action after refusing to pay their daughter's school fees... which... are \$60 a term... because they say a cellphone transmitter on neighbouring land is endangering her health... The Catholic Education Management Board said the [couple] owed \$370. It wants Wellington's Disputes Tribunal to order payment... [The girl's father] said research showed cellphone sites emitted radiation... “And there are concerns that just one cellphone causes headaches and possibly tumours, so who knows what the cellsite is capable of?” He said while the issue was not about money for him, he believed that was the reason the [board] allowed the cellsite to be installed... on the spire of the neighbouring church two years ago... “They've got an 18-year contract with Telecom and are being paid \$5000 a year.”

...BellSouth has erected a cellphone transmitter on the roof of the Wellington Town Hall. The mayor... whose office is below the site area, had no comment on the development yesterday, saying: “It's a management issue.” The development has annoyed a[n a]partment-dweller... who lives across the road... “What is this doing on a... city-owned building? Public property shouldn't be used for those sorts of purposes.” A Wellington City Council spokesman... said the council had approved a resource consent application from BellSouth for the transmitter site without public notification. The council only had to notify such applications if it considered the items being installed had a significant... visual... impact...

TELEVISION advertisements claim even babies can use cellphones, but when it comes to spotting a BellSouth cell site now, even their parents might find it a challenge. In the depths of South Auckland, amid a busy intersection thousands of motorists pass through each day, lurks a palm tree of a different kind. It's fibreglass. Sporting a cellphone antennae, the tree is the latest in telecommunications fashion... BellSouth would not comment on the cost of the palm, although... BellSouth's communications manager... said it was more than a standard cell site, which cost between \$500,000 and \$750,000... “We've put it up just to see how the country responds,” [he] said... And as for our four-legged friends... even if a dog mistook the cell site for a real tree, it would not cause any damage.

...Schools from all over the country have chipped in to help Shirley Primary School in Christchurch in its fight to stop a cellphone tower being erected next door... [Meanwhile, p]arents have pulled 12 children from a West Auckland school staging a picket over a... planned... cellphone mast.

...Vandals have attacked a West Auckland car repair business at the centre of a cellphone mast feud and threatened to firebomb the property. The owner of Koala Auto Services in Green Bay... said he had received numerous abusive phone calls but declined to elaborate... "This is the Wild West come to Auckland with self-appointed vigilantes literally terrifying members of their own community,"... said... Telecom[']s national media relations manager... The company believed the threats... were directly linked to "misinformation" being fed to residents about health risks. Independent tests showed radio frequencies from the mast would not even register over much of the school grounds, which are opposite the cellphone site... [However,] Green Bay Primary School yesterday closed its classrooms indefinitely... [T]he 470 pupils... cleaned out their belongings on the last day of the school term... Green Bay High School has offered classrooms and the Waitakere City Council has offered buses to take children to its community centres when classes resume...

MORE than 500 protesters converged on a proposed Telecom cell site yesterday demanding an end to[the tower's] construction... 90m from... a primary school. The protest went ahead in heavy rain despite a Telecom announcement it was delaying construction... because of threats and abuse to owners of the[Godley Rd] site. Umbrellas shielded banners with slogans such as... "Education not radiation"... Two security guards stood inside the proposed site... as angry protesters hurled abuse at Telecom and[the] vehicle repair shop[']s owner... who had stayed away. One water-filled balloon was thrown at the building but the crowd was otherwise well controlled. Telecom was to have started work at the location... this weekend... A man was arrested on Friday after the phone line to Koala Auto Services was cut.

...Telecom has bowed to public pressure and is looking at alternative sites in West Auckland for its controversial cellphone mast. The company announced the move last night following a meeting with its key opponent – Green Bay Primary School[, which has also]... backed down and will let all of its pupils back... [when classes resume. The s]chool had planned to open only seven classrooms... Telecom's general manager of mobility services... said the company was considering seven options and would decide within a month. However, it had not ruled out the existing site...

Remuera residents have received a jolt in the wake of Green Bay Primary School's battle with Telecom over cellphone transmitters. Residents living near the Rawhiti Bowling Club were dismayed to learn that the Auckland City Council had granted Telecom a resource consent to replace two existing flagpoles on the club property with... new ones bearing cellphone... antennas. Telecom's application was not publicly notified. Neither the club nor Telecom took any steps to inform residents of the application, despite the public interest highlighted by the Green Bay dispute...

Telecom was challenged... yesterday to pledge "in blood" that cellphone towers are harmless to children [when an] Alliance list MP... crossed swords with the company during a public rally organised by Green Bay Primary School which attracted around 150 people. The school's ongoing feud with Telecom sparked a member's bill by [the MP] seeking to ban the building of cellphone masts near schools... Yesterday, she challenged Telecom to live up to the warm, fuzzy, family-oriented image of its television commercials... The company has stalled its plans in the West Auckland suburb after what it has described as public hysteria whipped up by vigilantes. Though reviewing alternative sites, Telecom has still not ruled out putting the tower up at the controversial site near the school. An occupational health specialist advising Telecom... told the rally that... [cellphone] transmitters were simply efficient, low-powered versions of those conventionally used to broadcast radio... Meanwhile, parents have threatened to withdraw their children from schools near a Hamilton East cell site where cellphone towers are being built. The site in Grey St is less than 10m from a handful of houses and 200m from Marian Primary School and Sacred Heart Girls' College... Parents and students... are[also] organising a boycott of Telecom products and services and a businessman... says he will switch his \$6000 annual landline account to another company... The Telecom general manager... said... alternatives to the site... were investigated, but none was acceptable.

...BellSouth... has rejected a formal request to withdraw its application for a cell site near the... Devonport Primary School... The request was made on the strength of BellSouth's measured support for legislation... that call[s] for a moratorium... on new cellphone towers within 300m of schools... BellSouth had indicated that the... bill would be a useful vehicle for the scientific establishment and public "buy-in" of concrete national guidelines... [But the] school's board of trustees... chairwoman... said there was no "buy-in" from Devonport and 263 submissions to the North Shore City Council all opposed the two proposed cellphone antennas... [Furthermore,] BellSouth's stance now appeared to be "thinly disguised commercial rhetoric." However, the BellSouth corporate communications manager... said the school was being "somewhat mischievous" in the way that it described the company's position.

...A bill aimed at banning cellphone transmitters near schools will again be debated in Parliament next week... The bill, sponsored by[an] Alliance list MP... would put the brakes on about 70 applications from telecommunications firms for Auckland school sites until safety questions were settled. Labour... supported the bill going to a select committee but... [it] looks likely to fail after the coalition Government last night signalled its opposition...

Parliament is expected to toss out a bill tonight that would stop cellphone transmitters being installed within 300m of schools... The bill has the support of only the Alliance and Labour. It would place a moratorium on resource consents for cellphone transmitters near schools until the Ministry for the Environment, with input from the Ministry of Health, prepared a national statement. The principal of Green Bay School... said the bill... [was meant to] "buy... us time while the scientists look into it." The next step would be a petition to... try to get support for a citizens-initiated referendum on the issue.

...there is no scientific evidence to support fears that the ever-increasing use of cellphones may threaten human health, say scientists from 10 countries who met in Vienna recently... But... [the] group did agree to intensify research into radio frequency electromagnetic fields... which emanate from mobile phones. "This is something that we hold as a high priority. We want to find out if these electromagnetic fields do produce cancer," said... an A[US]n who heads the international EMF project of the W[HO]. The... project, launched last year, is a five-year, \$5.35 million programme to study possible health hazards stemming from exposure to... EMF sources. "To date, health research in this area has been largely ad hoc and totally uncoordinated at the international level." ...[a professor from] the school of psychology at the University of St Andrews, Scotland, said: "The level of risk that is perceived by the public is sometimes higher... than is justified by the current scientific knowledge..." A Finnish study partly funded by the telecommunications industry examined the effect of radio frequencies used by mobile phones on the brains of 19 people and on mice. It showed[that] human brains convert mobile phone radio waves into heat, but the levels are far from hazardous. Mobile phones also interfere with pacemakers, hearing aids and electrical devices in hospitals. Last April, an A[US]n study led by [the] chief scientist at the Royal Adelaide Hospital, showed that cancer rates almost doubled in mice after prolonged exposure to radio frequency EMFs of the type used in mobile phones. The A[US]n Government tried to allay public fears, insisting that the risk of mobile phones causing cancer in humans was minimal.

...Why do some people fear cellphone towers yet use cellphones? ..."The general public smokes billions of cigarettes a year while banning an artificial sweetener because of a one-in-a-million chance it might cause cancer. The same public eats meals full of fat, flocks to cities prone to earthquakes, and goes hang gliding while it frets about pesticides in food, avoids the ocean because of sharks and breaks into a cold sweat on airline flights." This quote... captures the flavour of the fascinating area of how individuals decide on health risk. Recent events at Green Bay Primary School have highlighted the discrepancy between environmental risk as determined by industry and as seen by the public... If the hazard is seen as being natural it is typically seen as being more acceptable than hazards that are artificial. Risks under individual control are more acceptable than those over which the individual has no control... Similarly, risks that are evenly distributed across a city are more acceptable than ones that affect only a proportion of the community. Risks that are familiar rather than new... are also perceived as less risky... Considering the way individuals assign risk, it is easy to see why cellphone towers cause so much public anxiety. The risk is not spread evenly but is seen as affecting those closest to the tower; in this recent case it is the children at Green Bay Primary... Perhaps most importantly, the risk is seen as involuntary in that children

have little choice about whether to attend their local school and so expose themselves to possible radiation. It is not surprising, then, that scientists and communities may come to different conclusions about the risks posed by environmental threats.

...“We are here because we want to protect... children throughout N[Z today] and the children of future generations. There is big money at stake. We are talking about billions of dollars, and like the tobacco industry Telecom, and others, will stop at nothing to defend their profits.” Such is the tone of the cell site debate as it was delivered in Aotea Square, Auckland, on a recent Sunday... Similar opposition has arisen in every country that has cellphones. The telecommunications companies insist there is no health risk from the transmitters and they have the scientific evidence to prove it. Opponents say the transmitters do pose a health risk, and they have the scientific evidence to prove it. In fact, neither side can prove anything. The best the opponents can do is quote from studies that “strongly suggest a statistically significant increase in risk of cancer and miscarriage” at the level of radiation found around cell sites. They have to rely on evidence from radio and television transmitters because cell sites are too new and cancer takes too long to develop to provide any results. The best the telecommunications industry can do is argue that these epidemiological studies have not been replicated often enough to be considered conclusive. These studies may show one community with a marked increase in cancer also happens to be near a radio transmitter, but that does not prove the radio transmitter caused the cancer.

...A LEADING brain researcher says new American research points to a strong link between... microwaves at frequencies similar to those from cellphone towers and cellphones... and major damage to brain tissue... The research, from the Biomagnetics Laboratory at the University of Washington, adds ammunition to protesters at schools... The... studies had been replicated both at Washington and, within the past two months, at California’s Loma Linda Electronics Laboratory... Telecom’s external relations manager... was not aware the Washington research had been reproduced, but said N[Z] standards were tighter than those in the US and were based on W[HO] recommendations. He said Telecom had looked at a Titirangi golf course as an alternative to the Koala Motors site near Green Bay Primary – but the golf club rejected it because it meant cutting down trees for the tower to work properly... [In related news, a] Telecom scheme designed to raise money for schools through spending on toll calls has been so successful that donations to schools are being capped. Thousands of people have over the years signed up for the School Connection Programme, under which a percentage of their toll spending goes to a school of their choice. Telecom says more than \$33 million has been given to schools and pre-schools so far... but from February... [next] year... the amount available to be donated will be fixed at \$750,000 a month. A Telecom spokeswoman... said that did not represent a cut in funding. The company was simply identifying how much money would go into the scheme so it could finance another programme that would target disadvantaged schools. - 1997

The scheme, which had *disadvantaged* many schools, was eventually ‘replaced’ with a points system redeemable for Telecom products.’

YOU’VE TALKED US INTO GIVING \$20 MILLION TO NZ SCHOOLS Thanks to the efforts of over 470,000 residential customers who’ve joined Telecom School Connection, Telecom has given \$20 million to schools... throughout N[Z] over the last three years. You can support this incredible fundraising effort by joining... Telecom will then donate 5% of the value of your residential toll bill to the school of your choice (and it doesn’t cost you a thing). [Of the ‘2818 schools sponsored, 78% have received payments totalling between \$1 and \$9999; 18% received \$10,000 to \$19,999; 3% received \$20,000 to \$29,999; 0.7% received \$30,000 to \$49,999; 7 schools received \$50,000 to \$99,999; 2 schools received over \$100,000 (one getting just over \$100,000 and the other – Auckland Grammar – getting over \$150,000) – both were in the North Island, as were all the schools that received more than \$50,000. Only two of the 801 schools in the South Island received more than \$30,000 – both in Queenstown (a small tourist township) – and 15 of the 27 North Island schools that received more than \$30,000 were in Auckland (where 93% of schools received less than \$20,000’.)]

...It’ll be a great day when our schools get all the money they need and the Air Force has to hold a cake stall...

Money man takes over education job... THE MINISTRY of Education’s new chief executive... has more of a background in economics and financial strategy than in education... [- i]n the eight months before his new appointment, he was the chief executive of the Ministry of Commerce... [-] but that doesn’t mean he will be a financial hatchet man... [He] says it will be his role and the... Ministry’s responsibility to ensure both that the Government is well advised on what resources are needed and that the money is well spent... to ensure that educating students is effective and that people are emerging from the system with the skills to make their way in, and contribute to, society... His financial background will be of considerable benefit as the world moves to an economy where a nation’s competitive advantage and economic success is based on the ideas and skills of people rather than on primary resources... He was not going to predict what he would do in the ministry, or what changes would be made. He first wants to take time to get to know his new job on a practical level.

...The country’s new education boss... will not be short of feedback from the teaching chalkface... [He] has a sister and brother-in-law who are Christchurch secondary school-teachers, and a sister-in-law who is a primary school teacher, also in Christchurch... [His] father, now retired, was principal of Papanui High School for 15 years and his two daughters are in Wellington schools... The affable 46-year-old has spent 24 years in the public service... He began in the Treasury, had a stint in Foreign Affairs and joined the P[M]’s Department in 1995... With such a background, [his]... arrival at a ministry described by the State Services Commissioner... as having “lost its way” has raised questions about his intentions.

...A *plot to privatise our state school system*... Once there was no state education in N[Z]. Education was available only through church schools or in other private institutions. Education for the majority was a hit-and-miss affair – not free, not freely available and not compulsory. Since the middle of last century education for every child has come to be seen as not only a fundamental right but essential for full participation in a democratic society. “We must educate our masters” was the cry in England’s political circles as universal (male) suffrage was established. But in N[Z] after 12 years of dramatic economic and social upheaval, this fundamental right is on the road to becoming just a wishful memory. Schools now face the onslaught of the privatisation drive of the past 12 years. “Tomorrow’s schools,” initiated by the Labour Government in 1987, set the scene. A businessman... was put in charge and a business model was developed using the concept of the “self-governing school.” From that basis the privatisation agenda has been pushed hard. But it has been more difficult with schools compared to other sectors. Ironically, one of the main reasons for this difficulty has been the general perception that the state school system is fundamentally doing a good job and demand for private schooling has been slow. In fact private schools have had a troubled recent history. State bailouts have been frequent and hugely expensive. The National Government has extended direct state support for private schools while state schools have been strapped for cash. The operations grant which is used to pay the day-to-day running expenses has been frozen for several years (in real terms a decrease in Government funding as inflation has eaten it away). Schools in poor areas have been least able to make up the deficit from local sources and have suffered the most. The powers that be hope that both these trends will increase the demand for private schooling. The state can then begin to withdraw from the provision of schooling... Dividing state schools is an important precursor to privatisation. Schools have been encouraged to compete for students (needless to say the only competition has been for the academically able students). Winner and loser schools are being identified with many winner schools having turned manipulation of their external exam pass rates into an art form to attract brighter students and improve their pass rates further. The larger winner schools were further assisted last year by the ministerial reference group report on school staffing – since implemented by the Government – which resulted in a further shift of resources from smaller schools (most always the poorer schools) to the larger winner schools. The P[M] and... a... new agency... the Education Review Office are very fond of saying that poorer schools get a higher per-student amount from the Government but by the time the money reaches the classroom the figures are reversed dramatically... Equality of opportunity in education is going from the reasonable bet it was in the past to a certain loss. The suppression of teacher salaries for so long has also had an impact on winner

and loser schools. The drift of qualified, experienced teachers from poorer schools to wealthier schools is gathering momentum. Salaries are being topped up by wealthier schools either to poach from other schools or retain teachers in subjects where teachers are in short supply. This will be the destiny of much of the Government's so-called performance pay units recently negotiated in the Post Primary Teachers Association collective contract... [which ended] the protracted dispute... [that closed secondary] schools around the country... as part of industrial action by teachers... Rather than rewarding performance it will reward teachers in shortest supply as schools strive to recruit or retain them. Poorer schools will be stripped of their most experienced, trained and qualified teachers... Adding to their difficulties the poorest secondary schools are about to receive the first big wave of students who have grown up in the unemployment of the 1980s and 1990s... [The ERO] tells us its job is to be a public watchdog, providing accountability and improving education standards. But... [rather] than providing help and assistance to schools in our poorest communities it repeatedly blames the school management and teachers for student failure. Improvements can and must be made but the review office gives no recognition to the fact that most of these students come from homes where no one has ever had a full-time job in the student's lifetime. Rather than calling for more support and more resources, the office encourages middle N[Z] to abandon poorer schools and the concept of equality of opportunity and to side with the more wealthy. This separation and movement by middle-class parents and their children is essential for privatisation of schools to succeed... Eventually... the "winner" state schools can be sold off to private enterprise... N[Z] education is on a fast track to the "two-thirds-one third" model... Two thirds of schools will be worthy institutions, providing a good education and can be privatised as a good investment. The other one third will be ghetto schools, minimally funded by the state (welfare "basket cases") and left to exist merely as a dumping ground for the poor. The cultural change forced on N[Z] over the past 10 years still has enough momentum to wound our national education system mortally. The horror story told here is well under way and will be fully played out in the coming years unless a strong Kiwi fightback takes place. Is this N[Z] schooling the way we want it? [● 'In 1939, NZ's first Labour Government enunciated the goal of education: That every person, whatever his academic ability, rich or poor, has a right as a citizen to a free education of the kind for which he is best fitted, and to the fullest extent of his powers.'

... 'If you wanted the one defining attribute of the Middle Classes it is a reverence for education. I think the Middle Class preoccupation is a desire to maintain class position like a sort of person losing puff treading water in the deep end of a swimming pool. Education, or lack of it, has definitely played a huge role in keeping people down, but it's terribly hard for anybody in the Middle Class to admit that their children are thick. You can pour money into your children and they can still come out as thick as bricks, can't they, and people always blame the school. You never hear Middle Class parents saying: "Actually, my child is braindead." However, if you can afford to send your kid to a school with smaller classes and with better facilities then he's obviously going to have a better chance. If you go for a job interview and there's two of you and you say you're from a top private school you've automatically got an advantage. Yet, to be quite honest with you, most people I've met who went to a private school didn't seem particularly educated to me, or they did a very bad job. Unfortunately, if you bring the education of public schools up to the level of the top private schools, then the private schools become superfluous.']

... Trustees at Hillary and Tangaroa colleges in Otara have been overwhelmed by the burden of running their own schools, says the deputy chairman of both boards... He says the boards had no idea how to respond to scathing attacks on both schools from the E[RO]... "When we first had the ERO problems, we didn't know what to do. There we were, told we might be closed down, and we didn't have a clue." They took advice from the School Trustees Association and the Ministry of Education to help the boards to tackle their deep-seated problems, many of which stem from poverty... The lack of money is reflected at board level... other boards pay themselves \$70 a meeting but at Tangaroa and Hillary the going rate is about \$35... The South Auckland lawyer – who stood as United candidate for Manukau East in the last election – says... that Tomorrow's Schools has enabled the Government to get very cheap volunteer labour to run the most difficult schools in the country. Some board members had done more than 500 hours of extra work, mostly without pay, after the critical ERO reports... [(trustees around the country generally)] spend anywhere between eight and 40 hours a month on the job, apart from the time in meetings[]... He acknowledges the boards have been at fault too. Hillary was split for some time between Maori, Cook Island and Niuean groups all demanding a seat on the board. "Time that should be spent on board issues has been wasted on conflicts between board members... and the job wasn't getting done." ...Both boards had problems in getting information from their former principals... "The board doesn't really know what's going on. At Hillary... we discovered in the middle of a meeting that there were a number of teachers with serious teaching disabilities." He suggests other staff members, such as the deputy principal, could be included on the board to get a wider range of information... [However, he] says the school's biggest problem is not self-management but the National Government's abolition of zoning in 1991, which meant pupils began leaving Otara for better-off schools elsewhere.

... CONFLICT and job dissatisfaction is causing school principals to quit their jobs... A total of 466 principals' jobs have been advertised in the Education Gazette this year and, according to... [the] Principals' Federation president... more than a third of those who leave their jobs leave principalship altogether... [One f]ormer principal... quit his job at Remuera Primary in east Auckland this time last year. There was nothing wrong with the school – he had just had enough of the frustration of being in the profession. "The workload compared to the remuneration was outrageous... I was[also] tired of the whole teaching profession trying to undermine things. It's enormously protective of ineffective practices." He described the attitude of many people in education as "hey, I'm not paid very much, why should I do very much?" ...[he] is now working in real estate, [and has] no plans to return to education full-time. "Not unless the salary was doubled and the whole ethos changed," he said.

... The Government will need to inject tens of millions of dollars into primary school teachers' pay packets... [– which] have risen just 22.5%... between March 1986 and March 1995... while there has been total inflation of 60.8%... over the same period... – ...to keep them in the classrooms. Otherwise, many will "jump ship" into secondary teaching ranks, or take their skills elsewhere. That was the blunt message given yesterday by the incoming president of the N[Z] Education Institute...

Pay rises of 3.1... to 5.7[%] were announced yesterday for special education workers and Maori language assistants in primary and secondary schools. But a new national collective contract covering the 250 workers will leave special education assistants on a top salary no higher than \$21,362... The Education Institute acknowledged that the pay scale for... assistants to teachers of severely disabled students would range from about \$23,200 to \$33,461 after a \$1000 rise. Salaries for assistants working in classrooms with children with lesser disabilities would, however, start at only about \$18,500 under the contract.

... A new... contract gives... area school teachers... with management roles a pay increase of 10 to 20[%], while graduate teachers will receive 10 to 15[%]. Most area school teachers without degrees will receive 5 to 10[%] more. Meanwhile... Auckland kindergarten teachers are being offered an average pay increase of about 9[%] if they agree to... close for only one afternoon a week, instead of two. But the teachers' union... says teachers should not have to work extra hours for a pay rise they already deserve... The Auckland Kindergarten Association... general manager... said the association could afford the pay rise only by increasing opening hours from 320 to 360 sessions a year to get more Government funding. This meant teachers would spend 25 instead of 22.5 hours a week teaching children. Mid-graded teachers would be better-paid than primary school teachers at up to \$28,000... Teachers at the top of the scale and head teachers were not being offered comparable rates to their primary school colleagues. The association was offering head teachers \$34,700 to \$41,600... The association was also offering free health insurance.

... Labour's education spokesman... says a funding package for kindergartens set to be announced this week is a "gross miscalculation" by the Government of how unpopular its previous proposals were. The... [spokesman] has learned that only 43[%] of childcare facilities opted for the higher funding levels the Government offered last year. The Ministry of Education had expected that 75[%] would accept the offer. None of the 591 kindergartens opted for it (22[%] were expected to)[, and only 1%] of playcentres (none was expected to)... [H]ome-based services... [provided the

greatest level of support at 61%] (none was expected to)... [In related news, t]he kindergartens of about 8000 Auckland pre-schoolers will be closed tomorrow as teachers strike over pay. The 280 teachers from 102 kindergartens... are angry that the Government's offer of pay parity with primary school teachers is conditional on their working more hours... Last week, kindergarten teachers from the rest of N[Z] walked off the job. The Auckland teachers were forced last year on to a separate collective contract from their counterparts...

Nearly 100 years ago Mrs Leo Myres established the Auckland Kindergarten Association to provide education for children of the working women of Karangahape Rd. Today as the largest association in N[Z] with 102 kindergartens from Wellsford to South Auckland, the association faces a crossroads. Should it close because of lack of Government support, or should it completely alter its aim of providing free early childhood education? The same issues are being faced by all public kindergarten associations. There are over 585 kindergartens looking after over 46,000 children of all socio-economic groups and more than 30 different ethnic groups... A few years ago with the advent of bulk funding the Auckland association faced receivership. Hard financial decisions were made and today it is in a much healthier state. However, it still cannot afford to build the 50-odd kindergartens needed for all the children over the age of three in Auckland. Funding is the critical issue. The Government pays kindergartens \$2.90 an hour... [per child (but, 'to further complicate the equation, kindergartens only get their \$2.90 if the child attends regularly')]. Kindergartens are run for only three hours a session, two sessions a day. A private kindergarten run for profit gets \$2.50. They not only charge fees but parents can receive a subsidy from Income Support to send their child to them. They can be open from 8 am or earlier until 6 pm. Free kindergartens are penalised in a more subtle way, too. They are funded only for 24 hours a week, 42 weeks of the year. However, teachers are paid for 40 hour weeks, 52 weeks of the year... [By the way,] Kindergarten teachers called off a strike planned for today after settlement on a pay dispute was reached... Teachers will get cash payments ranging from \$1500 to \$1750 and in January a pay rise of 5.5[%]. - 1996

Free kindergartens say they are in crisis, with thousands of children on waiting lists and dozens of new kindergartens needed to solve the shortage. Auckland is hardest hit. More than 10,000 preschoolers in the city are on waiting lists for kindergartens, 6000 of whom are over three – the age at which kindergartens try to admit children... In Orewa, for example, 260 children are queuing to get into a kindergarten with a capacity of 90... [On average, f]or every two pre-schoolers enrolled in Auckland, one cannot get a place. Some are not being accepted until they are four-and-a-half[, when]... it was "too late." With too few free kindergartens parents were forced to pay up to \$700 a term to private preschool education or send children straight to school... The Auckland Kindergarten Association estimates it would need 72 new kindergartens to blitz waiting lists... To build a new kindergarten, a community could spend "eight years holding cake stalls" if local or central Government did not pitch in... An Associate Minister of Education... said yesterday that the... Government would not provide more money for kindergartens, [which]... made up just 30[%] of the sector... The... Government had never said it would fully fund early childhood education. Waiting lists were not necessarily an indication that children were missing out on preschool education because they might be enrolled elsewhere, he said.

...The Minister of State Services... announced yesterday that individual kindergarten associations would negotiate pay with their staff [as she] introduced a bill to remove kindergartens from the State Sector Act... That brought howls of protest from teacher unions and some of the 594 kindergartens who labelled it "shocking and underhand." ...The Free Kindergarten Association said the move would commercialise kindergartens and was the first step towards privatisation. That would mean parents could be charged several hundred dollars a term to send their children to "free" kindergartens. They also claimed that children at small kindergartens and those in rural areas who could not afford to pay their teachers as much would be worse off... The Auckland Kindergarten Association opted to negotiate directly with staff at its 102 kindergartens two-and-a-half years ago... While the Auckland association did not regret its move... [its] president... said the Government was throwing kindergartens into a "negotiating minefield"... [at a time when 'kindergarten teachers are asking to be paid the same rate as schoolteachers.' O]rganisations with less experienced board members would struggle. "I just question the wisdom of throwing to volunteer parents the job of negotiating with such a powerful union as the NZEI,"... [However, the minister] said... the new law would bring kindergartens into line with other early childhood organisations who handled their own pay negotiations... [S]he expected larger associations to support smaller associations in negotiations, so some would not be left "floundering." ...In Parliament, some of the 40 kindergarten teachers in the public gallery were asked to leave after chanting "Free kindergartens, stop privatisation." ...teachers were already disillusioned about underfunding. "What they are saying is they want to bring kindergartens down to the level of the more poorly resourced child-care centres,"... said... one of the [chanters]... The Labour leader... said the Government was washing its hands of kindergartens... Funding, support and monitoring for kindergartens... would not change.

...Infants and preschoolers with special needs are the target of a Government funding boost but the extra money... [-] \$19.5 million... over three years... [-] will not help older children who have dipped out under new special education criteria... The money is intended to fund direct work with children to support them at early childhood centres and provide specialist support for families and educators. Details of the special education package were announced in November [but] parents say they are still unsure of exactly where their children stand. The... Ministry of Education... has confirmed that it received 13,500 applications for teacher support under the revised system and about 8500 children had been turned down... The ministry's senior policy analyst... said the ministry was reviewing the cases of more than 1000 children who had appealed... [Meanwhile, k]indergarten leaders are worried they will have trouble attracting teachers now that the Government is removing them from the provision of the State Sector Act. They predict dire long-term implications for the quality of early childhood education and are angry at the haste with which the act is being amended. Until now kindergarten teachers, who have to be registered via a three-year tertiary course, have been covered by the act. This meant the State Services Commission negotiated their contracts with the teachers' union – the New Zealand Education Institute. Now the... 37... financially stretched associations in the national movement... will have to deal with NZEI themselves... At present... Free Kindergarten Association... teachers... start on just over \$22,000 and can rise to a maximum of just under \$33,000.

...Parents will be hit with compulsory fees at some kindergartens as money woes hang over many centres. The Central North Island Free Kindergarten Association plans to charge \$2 per session next year at its 48... kindergartens, saying it needs the fees to survive... During the past two months, kindergartens in Kawerau and Wairoa have shut... [Another] kindergarten in Wairoa closed at the start of the year... One in five kindergartens is at risk because of financial pressures... [caused by] an inappropriate funding system... [They] usually face having to raise between \$12,000 and \$20,000 each year, the difference between Government funding and running costs. Traditionally they ask for a donation but do not penalise parents if they are unable to pay... The fate of one of Kaikohe's two kindergartens will be discussed[tomorrow] at a public meeting...

Bundles of joy are expensive to look after... The cost of childcare is the new bone of contention for... double-income... families... with... pre-schoolers... The only recent survey of fees... in 1994... found that the average cost was between \$100-\$140 a week. Childcare providers agreed that was probably too low now... [because t]he cost of... daycare five days a week is... up to \$220... for one child in some inner-city centres... Home-based family daycare is also provided by organisations such as Barnardo's which provides basic training for caregivers who look after children... The cost with Barnardo's is \$2.80 an hour for the first six hours, and \$3.60 an hour after that... [In comparison,] the cost of having a nanny look after children in your own home... can... [be] up to \$15 an hour... One area of childcare where little seems to be happening, despite a big need, is after-school care... For people who don't have a lot of money to spend... the most popular option is for a neighbour or relative to look after the children at home [for free]...

The cost to parents of putting their children through the "free" state education system is skyrocketing. In six years, annual charges for primary school pupils have risen 163[% from]... \$187... to an average \$491... The rise in costs to parents has run in tandem with a fall in real Government

funding since 1990... [Total Government funding to schools was '\$722 per student in 1990, but is \$713 today.'] A survey by the Council of Education Research... in 1990 showed 20[%] of... primary school principals... thought... Government money... was inadequate but that figure has risen to 76[%]... Schools in poorer areas are dipping into their savings to help parents who cannot afford the fees.

...[her] report cards show better grades this year but her success comes with a sacrifice – she travels more than 350km to school. The 15-year-old... is part of a Government-funded scheme that puts children from low-income families into private schools. She attends Diocesan School for Girls in Auckland and returns to the family's leased farm during the holidays. Funded by the Ministry of Education, the Targeted Individual Entitlement scheme began last year when 160 students from families earning less than \$25,000 annually were placed into 43 private schools around the country. A decision on the future of the scheme will be made before next year's budget... The Diocesan principal... said the scheme benefited the pupils and the school... [T]he Government allocates... \$5995... each year for [the 15-year-old's education, but her parents] have to meet travel and boarding costs. [Boarding assistance is, however, normally 'available to school pupils who need to live away from home in order to receive their education. The value of the school boarding bursary was \$1990 in 1995.'

...The PM indicated yesterday] that the Government was considering giving more money to private education – although he did not say how much more the 130 or so independent schools might get. Private schools already have some Government funding. The grant is paid in two categories. About \$700 is paid for each student up to form four, and about \$1000 for students from form five to seven. The grants totalled about \$29 million in the last financial year.

...Why is our kids' education becoming a private matter? As N[Z]ers, we've always believed in fairness in education: in a system that allows anyone with ability – regardless of their background or the money their parents earn – to take their study as far as they wish. As taxpayer-funded investments go, enabling our kids to learn has always seemed a pretty sound one. We've never felt the need to question the public provision of the education system. Just as we've never asked for it to... be run along privatised lines. So why do we now have a government that is constantly looking at ways of doing just that? ...It all has a familiar ring to it. The same philosophy inflicted lasting damage to the health system. Also familiar are the circumstances... no mandate, no discussion, no openness... [Proposals are] drawn up behind closed doors and kept under wraps as if it were a state secret. The public education system belongs to us all. Bit by bit, through this kind of stealth, it's being taken away.

...“We had a good system in the past. They took away something that worked very well, and now for eight months there has been chaos reigning[,]” said the... principal of Nawton School in Hamilton... [when asked to comment on the recent announcement that s]chools are dipping into operating funds to pay teachers' salaries because of a problem-plagued payroll system. Now, complaints about mistakes in teachers' pay have reached a new high as payroll servers struggle to load the details of 17,000 new pay packets... [to the computer file of] 67,000 teachers and support staff... The ongoing problems prompted the Ministry of Education in October to review its decision to hand over school payrolls to Datacom. The review[, which was]... reported back in December, found that the ministry had rushed the contracting process and inadequately managed it... Some teachers had not been paid at all, and others had not got what they should have... Subcontractor Multi Serve, which deals with primary schools north of Turangi, has sent principals a letter asking them to bear with it during a “difficult start to the year.” The Multi Serve chief executive... said the... increased mobility of teachers meant the agency was struggling to meet needs.

...the teachers' union... is taking the Ministry of Education and its contractors to the Employment Tribunal... in a... legal bid to recover \$1000 in backpay owed to an Auckland teacher... The[NZEI] president... said the woman had been owed money for months and, despite repeated requests, the contractor had not paid up... The mix-up is one of many that plagued [the woman] for several months after the Ministry... contracted out the school payroll last year. Mistakes included odd amounts of money going in and out of her bank account, pay being missed altogether and money banked into a Westpac account when [she] had never banked... [with that company. In December last year] she asked Multiserve, the sub-contractor for the Auckland area, for her time and wage records. She has yet to receive them... The Multiserve chief executive... said he was not aware of [the woman's] case. He said the company owed just a “handful” of teachers money... [The NZEI president] said further legal action would be mounted on behalf of other teachers in similar situations if they were not paid promptly... Unpaid teachers were being forced to pay interest on overdrafts and loans and were being penalised for late payments of mortgages and other bills. The Labour Party claimed in Parliament last month that a teacher aide was forced into bankruptcy after not being... paid, and tabled in Parliament another 900 complaints from school staff... The Labour education spokesperson... [suggested that] schools were wasting precious administration hours on payroll problems... [At the time a] ministry spokesman... said no one should be short-changed because teachers who were not paid properly could draw on an emergency fund set up by the ministry.

...The Ministry of Education has paid about 1600 teachers from its own funds in the past three days after being deluged with complaints about its payroll system... The ministry's chief internal auditor... said he was “far from satisfied” with Multi Serve's performance and had docked its pay as part of its contract obligations. He would not say by how much, but said the company was now responding pretty well to the problems... The company had taken on about four or five new staff and put on more hardware... [Incidentally, Labour's] Education Minister when Tomorrow's Schools was introduced... to increase the power of the community in education... has accused the Government of penny-pinching... and compromising the aims... “I saw Tomorrow's Schools not in terms of cutting back but as laying the foundation for a growing investment in education... A few boards have run into trouble. That is only to be expected... Teachers and parents are asked to do a lot, but they should not be held accountable if they fail to do the impossible... [Furthermore,] the bureaucrats have seized the opportunity to create a paper war which is the very antithesis of what Tomorrow's Schools anticipated... Tomorrow's Schools did not abolish zoning... National... abolished zoning. Tomorrow's Schools did not do away with compulsory teacher registration. That was[also] the choice of... National... We hear continuing complaints about the number of suspensions. Tomorrow's Schools originally had a Parents Advocacy Council which was going to deal with problems like suspension. It got the axe.” ...[the former Education Minister] said Tomorrow's Schools also set up mechanisms to cope with truancy, but they were removed.

...Schools in poorer areas should be given more money to chase truants, according to Huntly College. Its truancy funding from the Ministry of Education fell from about \$20,000 last year to just under \$6000 this year. The Huntly truancy officer... quit his job this month after the college reduced his hours from 40 a week to 25... Huntly College rated bottom of the ministry's 10-point scale devised to measure the socio-economic status of the community and school services.

...The... Ministry of Education's rejig of socio-economic ratings given to the country's 2608 state schools, [will] take into account the latest... census data from households with school-aged children within [each] school's catchment area... Schools will find out by post next week whether they are one of the 1700 schools to change ratings and therefore funding levels... half have gone up and half down... The 18 rating levels, known as deciles, are used by the Government to allocate target funding, and to determine the schools' special education and careers information grants... The decile scale goes from one for the poorest area to 10 for the most affluent, with deciles one to three also divided into three. Each decile covers 10[%] of the country's schools... Those schools which lose funding will have that offset by a budget boost to the targeted funding for schools, from \$62.6 million this year to \$81 million in 1998. With this extra money, only 421 will receive less funding than in 1997. From next year schools in the lowest socio-economic areas could receive up to \$397.50 for each student, while the wealthiest schools will get \$33.50 at the most.

...Schools in upmarket areas will be tempted to flog off surplus... land and buildings... and keep half the spoils under a Government policy announced today... The Minister of Education... said that, until now all sale proceeds had gone to the Crown. “This land tended to become frozen. It seemed to just sit there because there was no incentive for an individual school to dispose of the land.” The new policy found favour with school principals, boards of trustees and even the Labour education spokesman. However, the Alliance spoke out against “back door” state asset sales and

cautioned schools against selling off valuable educational resources that they would never get back... Parents on school boards might approve a property sale so their children could benefit, instead of considering what was best for the long-term future of the school... But the... [ministry]'s property manager... said schools had to prove that the property they wanted to sell would not be required within the next 10 years. Schools without surplus property also stood to benefit because the ministry's share of proceeds would be ploughed back into new property projects... The principal of one Auckland school was last night sizing up the opportunity to make money on the real estate market... Rangitoto College... might one day sell off a chunk of land that was unsuitable for educational purposes. The steep gully – about the size of a rugby field – would fit up to 12 houses, some of which would possibly have views of Rangitoto, he said. The new policy caught one Auckland school with prime cliff-top harbour views by surprise, although the board chairman... said Takapuna Grammar had no spare land.

...*Spare land sell-off will be golden windfall to schools...* Real estate signs could soon crop up on school land... Some schools stand to make more than \$1 million from the move... [T]he principal of Murrays Bay Primary School on the North Shore in Auckland, said his school's options were "endless." The school shares a site with Murrays Bay Intermediate and the hill between the two commands sweeping views of the Hauraki Gulf and Rangitoto Island... Selwyn College... sitting on 16.4ha... in Kohimarama, Auckland... is surrounded by a ring of... enough excess land to build a mini-subdivision, but may have to offer it back to its original owners, the Anglican Church. The land was taken under public works legislation when the school was built... Meanwhile, rural schools are eyeing their empty school-houses and former horse paddocks... with a view to bringing in extra cash... [The paddocks, originally] used to keep horses that children had ridden to school... are often now let to neighbouring farmers for peppercorn rentals... Ohaupo School, near Hamilton, had already decided to get rid of a surplus school-house and resigned itself to the proceeds going to Wellington. Now it could collect about \$20,000... The principal... said several country schools around Hamilton had sold houses in recent years. Most staff owned their own houses in the city and school houses had become surplus burdens requiring maintenance... [● Yesterday,] more than 1200 property projects... [a]cross the country... were approved for funding next year. Halls account for \$13 million of the total funding, general upgrades \$17 million and projects including swimming pools, work on school grounds and Maori culture \$12 million.

...Rangitoto College, one of Auckland's biggest secondary schools, is to sell... \$5 million... of land... as part of a \$13 million roll-growth programme. The Mairangi Bay school has around 1950 students, but the Minister of Education said yesterday that it would expand by a further 550 within the next 10 years... The funding covers enlarging the administration block, building a new gymnasium, library and music suite, upgrading the technology block and extending the hall. New sports fields will be built, including an all-weather surface... [T]he money assigned to expanding Rangitoto College was significantly less than the cost of building a new school... Earlier this month the Ministry of Education announced 35 new schools for the wider Auckland area during the next 13 years.

...A cash-strapped primary school in Ngaurawahia wants to erect... a 6m by 3m... advertising billboard on its grounds in a fundraising initiative that has been condemned by education groups... The billboard... which... would... border busy State Highway 1[, will] earn the school up to \$15,000 a year. The principal said the school board... has... approved the billboard because the school needed the money. The president of the [NZEI]... said the school's stance showed the Government was pushing schools towards privatisation. The president of the School Trustees Association... said it would be a "sorry day" when school grounds became littered with billboards.

...Bairds Primary School in Otara has changed its name to Bairds Mainfreight Primary School to secure long-term funding from... its corporate sponsor in a groundbreaking move that has cleared the way for others to do the same. The Ministry of Education approved the move last month... The... school... offered to adopt the name as a way of repaying the company for everything it had done... Mainfreight had donated more than \$130,000 since it became involved with the school about three years ago. It also paid for a \$60,000 computer room and had funded the Books In Homes programme to the tune of several thousand dollars a year... The move would cost the school "a few hundred dollars" for new road signs and a new school stamp but uniforms already bore the company logo... Under the two-way agreement, the school could drop the name if the company withdrew its sponsorship; made inappropriate or unreasonable demands on the board or principal; or acted in such a way as to bring disrepute on itself and the school.

...[‘Forget J1 or Standard Four – or Year One or Year Six for that matter. Today’s primary school children could soon be known as Ronald McDonald class or Year Reebok. Several NZ schools have formed sponsorship deals with businesses since the moving company Mainfreight began the trend in 1993, but Bayswater School, on the North Shore, plans to take education sponsorship to a new level with a scheme to sell its way out of its money woes. The primary school hopes to attract a “family” of sponsors by offering them painting, signage, and naming rights to the school’s buildings for \$3000 a year. For \$15,000 an investor can have the rights to the school’s name. All sponsors will be guaranteed “product exclusivity” and advertising rights at all school events and in all school publications.’ In related news, a] South Auckland school praised for its success by the E[RO] has spent \$10,000 so far this year on advertising in a desperate bid to recruit more pupils... Before 1990... Bader Intermediate’s... roll registered up to 800 names. Now, it has a mere 210. Two years ago, the school was on the brink of being closed by the Ministry of Education. Officials in Wellington wanted Bader to merge with other schools in the area... The principal... blames the declining role on negative publicity about troubled kids in the 1980s, lack of ministry support and neighbouring primary schools which hold on to their pupils until they are secondary school age... He said morale among staff and pupils remained high. “We are one of the very few schools in South Auckland that can boast to being free of truancy.” ...Since [he] was appointed principal... in 1995... the[ERO] report said, the school had achieved commendable progress. Teachers worked extremely hard and programmes were outstanding. Those included technology programmes, homework centres... and... ethnic language classes... Among the new initiatives is the free consultation to doctors who visit the school weekly, where medicine is also supplied. Through a council scheme, Bader organised a free-lunch strategy for those that needed it. Sensing the school was in crisis... parents[have] formed a support group to raise funds for various projects to boost... [it]s appearance, such as... cultural projects and... sports gear... In sports, Bader has been Auckland champion in netball and rugby league.

...Rich city schools poaching sports talent from smaller provincial schools have prompted... [one principal] to call on the Government to initiate a sports ethics committee where applications and complaints could be lodged. The practice of professionalism in school sport was “pretty widespread” under Tomorrow’s Schools... said... [the] head of Trident High School in Whakatane... Success on the football fields was a powerful marketing tool and it was not just elite Auckland schools that were luring players with scholarships and bursaries.

...A nationwide competition for schools is launched today. Schools will receive brochures on how to enter the School of the Year Awards this week, with a prize pool of about \$150,000 put up by [a corporate sponsor]... Judges will look at academic progress, community relations, cultural or sporting progress and social and environmental programmes.

...*Schools in battle for teachers...* Primary schools are struggling to replace teachers who resign, says the [NZEI. In just over four weeks]... 193 schools had reported the resignations of 156 teachers... Of the resigning teachers, 100 said they were “unlikely” to return to primary teaching... “Fed up, hours too long, salary too low, rewards too few” was typical of the explanations principals supplied. One principal, who described a resigning teacher as having “an uncanny knack of getting difficult/slow children moving,” simply wrote “had enough.” The national secretary of the institute... said the wages of primary teachers were scandalously low. “Primary teaching is a very tough, highly skilled job. How can schools hope to retain good people when they are being paid a pittance? Pay parity [with secondary teachers] is essential if we are to keep quality teachers on the job.” ...Forty-one principals said they would have difficulty filling their vacancies permanently... The union said it... [is also concerned about] short-term reliever shortages. “Some schools have to phone as many as 36 relievers before one can be found to do the job. Most schools give up after 20 calls and either double up classes or use the principal as a reliever,”...

The secondary school teachers' union has withdrawn from Government talks on a unified pay system and warns of unprecedented levels of industrial action if such a system is imposed... [T]he Post Primary Teachers' Association president... rejected a statement by the Associate Minister of Education... that no difference existed between primary and secondary teaching. As long as the minister held that view, the PPTA would refuse to be part of the talks... The Minister of Education... last night accused the PPTA of reneging on its commitment to play a constructive part...

The Government is pressing ahead with plans for pay parity between primary and secondary school teachers, despite threatened strikes. The Minister of Education... told 700 primary school principals in Auckland yesterday that the Government was committed to coming up with a unified pay system by February when teacher contracts expired.

...Education unions said a \$46 million pay package from the Government... designed to keep principals from leaving schools, would not be enough to stem the flow... School heads were last night turning their noses up at average pay increases of 9.4[%] for secondary principals and 13.4[%] for primary[principals, who were also shocked that pay]... parity... was to be phased in over three years... They had not had a pay rise since 1990, and had been promised pay parity from next February... The unions also condemned a move to introduce five-year contracts for principals. "This means no principals in N[Z] would have permanent job status,"... But the Minister of Education... said it was only fair that the generous remuneration offered to principals... was underpinned by measures for performance and accountability... which applied throughout the public sector... The "old-time job security" was gone, he said... [while touting the] pay package... as one which gives principals a chance to earn more than \$100,000 a year.

...Principals on salaries of more than \$100,000 will be few and far between despite ministerial rhetoric to the contrary, says the Principals' Federation... To earn \$103,000 they would need to be in charge of a school with more than 1600 students and qualify for a \$11,000 performance bonus, plus the \$5000 grant paid to schools in lower-socio-economic areas... [By the way, t]he income gap between[a] primary school teacher... and her secondary school teacher husband is about to close. And while the Aucklanders may never earn the same as her more senior teaching husband, her pay slip should look \$8000 healthier next year... The final report of the Unified Pay System Working Group recommends that teachers should be paid on the basis of skills, qualifications, performance and responsibilities rather than whether they work at primary or secondary school level... The... [NZEI] was thrilled with the report... But not all education bodies were pleased. The P[PTA's]... associate president... said the report indicated the Government planned to bring down secondary teachers' salaries and to fill the secondary teacher shortage with primary teachers... The primary teachers' package does not cover principals[, who]... were offered a separate package with secondary principals, but this included a longer phase-in period for pay parity than they were prepared to accept.

...Teachers will not compete against each other for performance pay, says the Minister of Education... In a speech to an Auckland Deputy Principals and Associate Principals meeting yesterday, [the minister] said any system to reward teachers would have "fair and transparent" benchmarks for teachers to meet. At present a rigid system prevents teachers moving up more than one step on the pay scale in a year. This means an excellent teacher and a poor teacher who start on the same day will be promoted up the pay scale at the same rate. [The minister] said... the present system worked against schools because it did not allow them to hold on to talented young teachers by moving them up the pay scale faster. A performance pay system would also allow schools to pay experienced teachers more to stay in the classroom rather than move on to school management after reaching a certain pay level.

...South Auckland school principals are angry that next year they will no longer be able to attract better teachers by paying bonus allowances. The Ministry of Education has decided to cut the staffing incentive allowance – about \$1000 a teacher – at 26 schools in Manukau East, Mangere and Manurewa... The cuts made a mockery of the Government's plans to improve education in the area... said... Labour's spokesman on education... But those claims were rejected by the Minister of Education... who said the Government was committed to improving education in South Auckland. [The minister] said it was spending \$30 million on supporting problem schools throughout the country.

...a \$30 million lifeline for schools struggling to cope... with the Tomorrow's Schools reforms, which centred on greater self-management... may be the key to a brighter future for pupils in the country's poorest schools. Seven schools have been earmarked by [a] Ministry of Education... report [which] said many students might arrive at these schools late (if at all), hungry, unwell, unable to see or hear properly, tired, stressed, abused, or influenced by alcohol or drugs... The principals said the funds would go towards better... facilities and programmes to get more parents involved with school initiatives.

...Situations Vacant: Multi-talented people sought for highly challenging positions with responsibility for million-dollar budgets. Remuneration: \$2.57 an hour. No, it is not a misprint, as thousands of school trustees across the country will realise. The campaign to encourage parents to stand for election at their local school next April was launched yesterday... The Auckland School Trustees' Association president... said it was fair to say trustees were not in it for the money. A recent report by the Council for Educational Research showed trustees spent an average of 3.4 hours each week on school business, for an average monthly meeting allowance of around \$35. Some trustees waived the allowance altogether. However... there were many other rewards. For many trustees it gave the chance for greater involvement in the education of their children. For others it was the experience gained from running a business... Many people made "huge leaps" personally and professionally through their work on boards... [O]ver the years boards had begun to work more smartly and many were co-opting parents with particular skills... Parent trustees expect the elections to be a time of change. After nine years of Tomorrow's Schools, boards would be losing many long-serving trustees who had been involved since the start, because their children had finished school or moved on to other schools... [However, the] national School Trustees' Association president... said more than half the existing trustees nationally intended to stand again... [The ASTA president] saw trustees being invited to temporarily join boards at other schools to fill gaps in experience or help members get up to speed on their responsibilities.

...The School Trustees Association fears industrial unrest among teachers will deter people standing for positions on school boards [(which are already)... alarmed at their inability to cover additional costs stemming from a wage increase for support... staff, such as teacher aides and clerical workers, settled last September]. A PPTA)... call for two days of strike action in the first term next year if employment contracts aren't settled... will be discussed at union meetings being held around the country... Secondary teachers are claiming a basic scale of \$33,000 to \$53,000, an increase on the present \$29,000 to \$47,100. The union also wants 1200 more teachers, 200 of them Maori... The union will re-enter contract negotiations on Tuesday, but has already said it expected the Government to be "difficult."

...Secondary teachers are forecasting strike action during pay talks if the Government does not halt the bulk funding of teacher salaries.

...The P[M]... last night torpedoed secondary teachers' hopes of a compromise... in the bitter eight-year ideological war... over the controversial alternative pay system... direct resourcing (bulk funding) for all schools... [He] told Auckland University business students that power and influence were rapidly moving from central Government to individuals and communities. "...We want to give schools more autonomy through direct resourcing... [G]ood teachers must be supported and poor teachers should go. Monopolistic teacher unions following old-fashioned union tactics have no place in the provision of modern education." ...The president of the P[PTA]... described the comments as incredibly unhelpful and said they would be seen by association members as provocative... [but] hoped some neutral ground could be found in the lead-up to renegotiation of the collective contracts covering... primary and secondary schools... The wage round, complicated by differing views on how to achieve parity between primary and secondary teachers' pay is shaping up as potentially the most disruptive yet... Bulk funding, adopted by about 12[%] of schools – around 45 of the 350 secondary schools – allows schools to pay teachers directly from their Government grants rather than salaries coming from a central agency. Most schools that moved to the system gained more funding... [F]urther "bribes" of between \$85 million and \$100

million would be offered this year to entice school boards into bulk funding... [However, most] boards are not interested... [A] School Trustees Association survey shows... [65%] said they wanted to remain centrally resourced... The survey was responded to by 1130 boards, or 48[%] of those in the country.

...Teachers have started striking in protest at boards of trustees pushing through decisions on how they are paid. And staff at many schools are opting not to become involved in extra-curricular activities out of anger at their boards' decisions to accept bulk funding.

...Howick College yesterday joined Long Bay College in opting for bulk funding of teachers' salaries, provoking a strong reaction. About 90 of Howick's 105 teachers immediately went on a wildcat strike and last night picketed the senior prizegiving. The principal... who promoted the board of trustees' decision and voted in the 5-4 secret ballot, said it would mean an extra \$200,000 for the school, enough for six more teachers. But furious teachers said the college would need a lot more staff than that for the extra work they would now refuse to do... The teachers... vowed to boycott all school activities outside normal hours, including parent-teacher interviews, lunchtime tutoring, school camps, sports and educational trips, and all sports coaching and cultural activities. [The president of the PPTA warned last night that the consequences could be severe. In Britain, when teachers pulled out of extracurricular activity as part of industrial action in the 1980s, they never went back. "Sport there has suffered ever since."]

...Britain's most prestigious school, Eton College, is so wealthy it ranks among Britain's 20 most valuable private companies. New public disclosure rules have forced Eton to disclose it is worth \$US131 million.

...Three years into his stint as... the first non-British headmaster of Eton in 553 years... the N[Zer]... says the future for private or independent schools is "a very strong one. Seven per cent of children in the British Isles go to independent schools and in the south-east it is about 10[%]..."

...The future of funding for independent schools is uncertain in the present volatile political climate, says the leader of an Auckland private school. The chairman of the King's School board... said the Labour caucus had signalled that if it became the government, it would not support independent schooling and would reduce funding immediately. "They... fail to see[that] many independent schools are under so much pressure, any reduction would seriously affect them and could result in them being forced to integrate."

...[it's there in black and white, in that distinctly sober and unambiguous legislative prose: "Every person who is not a foreign student is entitled to free enrolment and free education at any state school during the period beginning on the person's 5th birthday and ending on the first day of January after the person's 19th birthday." The people who wrote the Education Act thought it important enough to put it right up the front, in section 3 – preceded only by that long list of definitions where they tell you what they mean by "student" and "overcrowding", for example. They probably believed it when they drew up the 1964 act and its predecessor, which dates back to the days of WW1 – when education was a luxury for toffs, and youngsters ached to leave and find a job within the first few minutes of asking around. But the people who wrote the 1989 act – the one that launched the educational "reforms" – must have been laughing up their sleeves as they cut and pasted that old clause into the new bill. Paying tax-deductible fees for "free" education is nothing new. But when Pentium computers are essential tools and schools compete for the students who bring with them funding entitlements, fees are a school's lifeblood.]

...The NZJ School Trustees Association is pushing for a big increase in operations grant funding for schools... School boards claim they can not balance the books.

...The Ministry of Education has released figures showing that... [73% o]f the 90[%] of schools which had filed financial statements for 1996 showed... an operating... surplus. That was up from 71[%] in 1995... Schools may be balancing their books better, but the buying of textbooks and computer equipment is suffering as a result, say school organisations... The head of the School Trustees' Association... said the ministry's figures did not reflect the income from foreign fee-paying students or local fundraising activity... The president of the P[PTA]... said the improvement was only because schools were cutting resources.

...Personal grievance claims... against the board and principal... have financially strained a Far North intermediate school, forcing it to cut back on resources... An [ERO] report released this week said serious disharmony between the previous board and the principal, the principal and the previous deputy principal, and between staff and senior management resulted in tensions that had "hindered the effective governance and management of the school." The board resigned after clashes with the principal... [In related news, a teacher] has finally admitted destroying school bank statements and a cheque book nearly 18 months after a board of trustees was forced to pay him \$14,000 for [saying he'd destroyed them].

...Northcote College is considering suing its former finance manager... who admits embezzling more than \$1.2 million from the school[although]... \$516,658 had been repaid... [The manager], aged 37, was described in court yesterday as a man who stole so he could live the high life. He also admitted having sex with a 16-year-old girl in his care and firearms, kidnapping, and assault charges, laid after he confronted the girl with a loaded shotgun at the Northcote College swimming pool.

...When the... scandal hit Northcote College teachers joked [that the former finance manager's] next trick would be to pull a gun. Weeks later, on August 26, with the former school manager already facing embezzlement and sex charges, the jibes proved prophetic. The tubby Rothesay Bay father turned up with a loaded and cocked shotgun, walked into the girls' changing room and announced: "Guess what." [As h]e grabbed hold of his victim, [the]... shotgun was fired into the changing room walls. What followed was a dramatic sequence of events which ended with the fugitive... being arrested at Auckland Airport after a live radio chat with[a current affairs] presenter... He later told police he had wanted to kill himself in front of the girl, ending a once apparently normal life which had rapidly spiralled downwards when his crimes were exposed... [H]e held his head in one hand as details of the... 129 charges, including... fraudulently obtaining more than \$1.2 m... were read out in the... District Court.

...A Christchurch principal accused of obtaining more than \$438,000 fraudulently by overstating the number of students at his school has been committed to trial... Cashmere High School[']s principal] pleaded not guilty at a brief dispositions hearing yesterday[and expects to be cleared]... - 1997

In 1976 our roll reached a maximum of 1413; this year it is 1353 and unless the employment situation results in an unusually large number of returners, the estimated roll for 1978 is about 1300... Like most other schools, we find that the annual General Purposes Grant from the Government of approximately \$27,600.00 is insufficient to meet rising costs and to maintain and improve existing facilities. As in the past, we have to obtain about \$21,000.00 per annum from school subscriptions, stationary... a series of fund raising activities... and canteen profits to subsidise the... Grant because it has failed to keep pace with inflation... During the past five years, and arising from ideas and suggestions from a large number of our teachers, many changes... have been introduced at Cashmere in an attempt to provide an education better suited to the needs of our students... I am confident that we will continue to accomplish much of value to this community... Schools never have been perfect... and we acknowledge that however hard we try we will never attain perfection – but we are resolved to do our best, within the resources that are available to us... - PRINCIPAL'S REPORT

We... The Right Honourable... Minister of Education... The Honourable... Minister of Finance... The Honourable... Minister of State Services... [and] The Honourable... Associate Minister of Education... are pleased to present... our Review on Education Administration. During the last six months we have had the opportunity to consider more than 700 submissions and to meet and talk with many people and organisations... Our investigations convinced us that the... education... portfolio... requires specialist management of the highest order... We observed few incentives for excellence, and few opportunities to improve skills in administration and resource management. We did, however, observe the presence of disincentives. We

were told of district authorities which overspend allocations and are “rescued” by being given extra funds. The effects of that process on efficient managers are entirely predictable. At the very least such an outcome builds resentment. - ADMINISTRATING FOR EXCELLENCE

N[Z]... participates in the education activities of the U[N] Educational, Cultural and Scientific Organisation (UNESCO), the Commonwealth Secretariat... the Education Committee of the OECD, and a large number of other international organisations... The Ministry of Education has responsibility for the government’s policies relating to the internationalisation of education[, which]... helps build links between N[Z]’s curriculum and qualifications systems with those of other countries... Each year, teacher exchanges are arranged between N[Z], the United Kingdom, A[US], Canada and Germany... There are also opportunities for study visits by N[Z] teachers to Japan...

N[Z] and Japanese leaders compare notes... Perhaps the [NZ P]M... could be forgiven if he exhibits that familiar look of self-satisfaction about him right now. After all he has two world leaders calling on him, two weeks in succession: today the Japanese P[M]... and next week Germany’s Chancellor... Japan is N[Z]’s second largest export destination. Trade issues will be discussed but officials say there are no problems big enough to warrant a place on the prime ministerial agenda. It is the fourth time in 18 months that the pair have met... The No1 domestic issue in Japan is economic and social reform; and in many of the areas... N[Z] has “been there, done that.” ...Given the size and complexity of the Japanese economy (the combined annual sales of its four largest supermarket chains exceed N[Z]’s GDP) it is arguable whether N[Z]’s experience in economic reform and deregulation offer valuable lessons... In a keynote translated speech to the opening session of the Diet [(Japanese Parliament) this year, Japan’s PM] acknowledged that reforms would cause pain for some – that once-protected industries “will be exposed to the maelstrom of competition. However, slackening or postponing the pace of reform out of a fear of pain will not be forgiven,” he said.

...JAPAN’S coddled consumers and businesses – long insulated from the pain as well as the benefits of wide open financial markets – are getting a wakeup call to the potential of fallout from Tokyo’s “Big Bang” reforms. When [the PM first]... announced the reform plans... [and said] he wanted to restore Japan’s status as the world financial centre, the details were hazy. Now the plan has been fleshed out with a detailed timetable of reform broadly modelled on the deregulation moves pioneered by N[Z] in the mid-’80s followed by the US and Britain. The blueprint is designed to break down the walls among banks, brokers and insurers by 2001 and boost competition in the nation’s stodgy financial sector. The reforms, which are sure to cause a huge shakeout with corporate failures along the way, have two broad aims: To remove restrictions on the products institutions may offer; and to create more competition between different types of institutions by removing or lowering barriers between them. Although the name “Big Bang” is the same as UK reforms, the motives in Japan are quite different, according to [a] Tokyo analyst... The goal of financial deregulation in western countries was to increase efficiency, competition and give customers a better deal... “In Japan that is obviously a desired end, but the main function is the opportunity to get rid of some of the system’s crippling excess capacity,” she says.

...a Japanese minister convicted... in 1986... [for accepting] a two million yen... bribe in 1972 from All Nippon Airways, one of the key players in a corruption scandal involving the purchase of U[S] Lockheed aircraft –] ...Japan’s biggest political scandal since W[W2 –] ...resigned yesterday amid intense pressure from ruling and opposition parties... The... Social Democratic Party and the small centrist party Sakigake, which champion clean politics, vowed to withdraw their support in Parliament to the Liberal Democrats... following his controversial appointment 11 days ago... as state minister for management and coordination with a special task to spearhead... the P[M]’s... touted drive for administrative reforms... The Liberal Democrats hold a razor-thin majority in the House of Representatives and still need outside help in the House of Councillors... [R]eversing earlier resistance, [the minister] tendered his resignation when he met the P[M]... after a weekend of soul searching when voter support for the Government and the ruling Liberal Democratic Party plunged... [The minister] has never been far from controversy since entering politics in 1963, three years after he was found guilty of election fraud. Japanese newspapers allege he once punched a reporter in the face for asking a question about the election fraud and that he now has the worst attendance record for committee meetings in the Japanese Parliament.

...[the Japanese PM’s] disastrous decision to name a bribe-taker as minister of reforms is threatening the reforms themselves... [S]ome of the ruling party’s so-called parliamentary “tribes” – zokugin – have... started submitting proposals to derail some reforms. The tribes are the groups of politicians whose close affiliation with key industries and the bureaucrats who control those sectors has been at the heart of Japan’s repeated bribery scandals and bid-fixing scams in recent years. These lawmaker-lobbyists thrive in the construction, agriculture and transport industries – not coincidentally, areas traditionally most protected from foreign competition... Japan’s traditional pump-priming measures, modelled after Roosevelt’s New Deal of the 1930s, are designed to put cash into the economy through public works, which are gobbled up by construction firms... By far, the biggest target of the tribes is [the PM’s] plan to form 12 ministries out of the current 22 – a plan that would throw the whole tribal system into disarray.

...Last month, [the Japanese PM] was having trouble with his Health and Welfare Minister... However, it was not his own portfolio that set the minister off. Long an advocate of privatising the country’s postal services, he could see his boss in retreat and was threatening to resign if the cabinet did not endorse privatisation. Postal services in Japan cover savings and insurance as well as mail delivery. A [PM]-led reform council suggested privatising the insurance and savings sections but retaining state control of mail delivery. There are Liberal Democrat and Social Democrat factions committed to keeping all three services in state hands. That battle continues. A health note in passing. For the third consecutive year, the Government intends to cut by about 10[%] the official drug prices paid under the national health-care system. The drug bill, equivalent to about \$[NZ]100 million, takes up a third of Japanese health costs. Strong opposition is expected from pharmaceutical companies. They could check [NZ] for an ad campaign.

...The A[US]n Government gave a clear signal in last night’s federal budget that it intends continuing down a N[Z]-style road of economic reform. This will include using cash raised from privatisation... to rid the nation of debt. Documents outlining the strategy of the budget brought down by the Treasurer... said N[Z], after a decade of structural reforms – including labour market reforms – had rapidly reduced unemployment from a peak of almost 11[%] in 1991 to less than [6%], although growth in domestic product had lagged A[US]’s. A two-year study by the OECD of the impact of reform programmes in its member countries had also provided important policy lessons. “Countries pursuing comprehensive reforms – such as the United Kingdom and N[Z] – had achieved the best results,” the papers said. “This includes sound macroeconomic policies, as well as microeconomic reforms. The challenge for policy and for A[US]n businesses and workers will be to continue moving forward at a faster pace than other countries, laying foundations for more jobs and higher living standards.” - 1997

The major public sector union has sent the federal Government a warning of strong opposition to expected funding cuts in the... budget with its decision to strike today. The Community and Public Sector Union... representing 65,000 public servants, received the go-ahead to organise the action at stopwork meetings around the country on Tuesday... The [union] believes the proposed funding cuts w[ill] result in 15,000 job losses... The employees voted to extend their industrial action and ban Government initiatives such as the dole diary. Last week the Social Security Minister... announced that jobseekers would be forced to keep a detailed diary of their efforts to find work or lose the dole... The Federal Industrial Relations Minister... urged public servants to ignore the strike... w[hich w]ould disrupt all Government services, including airport Customs, social services, the tax office, Department of Employment, Education and Training and the Commonwealth Employment Service. All states except

Victoria – which... strike[s next week] – are striking for 24 hours today. [The minister] said it remained to be seen whether the strike action would be effective.

...A[US] tonight faces what is likely to be one of the harshest budgets in years, sobered by the aftermath of a pitched battle at the doors of Parliament House in Canberra... At the height of [the] battle lasting almost three hours, rows of police using riot shields and pushed from behind by about 300 other officers and security staff rushed in as reinforcements held... at bay... thousands of demonstrators... protesting against a broad range of Government policies... Rioting protesters have already severed for now the fragile links remaining between the conservative... Government and the union movement... Inside Parliament House, cleanup operations will continue this morning, centred on the shattered entrance to the Marble Hall... [The P]M... says the budget will be strong and fair, rather than tough. His Treasurer... seeks a massive \$9 billion in spending cuts... The [G]overnment... intends to reduce the Commonwealth Public Service by up to 30,000. New entrants will receive less favourable superannuation benefits... A new tax regime is expected for superannuation – a complex system already beyond the understanding of most A[US]ns. The Government is also... expected to increase the national medicare levy (1.5% of income) for those without private health insurance earning more than \$56,800 annually... It has been revealed reductions in overseas aid[will] contribute to \$454m of savings in the Foreign Affairs and Trade Department... But the defence budget is exempt from cuts.

...Unbowed by violent demonstrations at Parliament House on Monday and citing “strong” employment growth in N[Z, the AUSn] Government reaffirmed its determination to forge ahead with labour market reform. It also continued... with a renewed programme of asset sales and departmental frugality... The Treasurer... has based his 1996-97 budget on expectations of a weaker economy in which growth will ease slightly... private consumption will dip, wage pressures will continue, and unemployment will ease only marginally... [He] intends... to reduce the underlying deficit by about \$A4 billion this year, and \$A7.2 billion over two years, to return the budget to balance... The loudest squeals come from the higher education sector. It is suffering severe indigestion – in administration, finance and quality – having increased student numbers by 73%... in the past 12 years. Now it faces \$945m in cuts to operating funds over four years and has been refused funding for a current academic pay claim. Most controversial are rises in some fees paid by students...

The A[US]n Government faces a hard battle to push its budget through a Senate controlled by opponents who have criticised the measures... as “deceitful” and designed to inflict pain with little compensating gain. Political outrage has been joined by a broad coalition of unions, Aborigines, doctors, students, community, welfare and youth organisations angered at deep cuts to education and job programmes, increased health costs, imposts on the aged, and broken election promises... The Council on the Ageing said... the elderly... would be hit by... means testing for nursing homes... and... the end of free dental care... But the... Chamber of Commerce and Industry said... business generally applauded the budget... - 1996

The A[US]n Government, while slashing spending almost everywhere else, wants to spend \$A500,000... to move a chair 800m. The P[M]... wants to move the historic House of Representatives Speaker’s chair from former Parliament House to the chamber of the new building, up Capital Hill. The elaborate Gothic-style chair, a gift from Britain, includes 200-year-old timber from the flagship of British hero Admiral Horatio Nelson. It was left behind when Parliament moved in 1988. If moved, the chair would get 80 days use a year. A former Labour minister... told Parliament the old chair would look frightful in the new Parliament House, which he described as “this art deco modern monstrosity. Some idiot has spent \$A12,000 of hard-earned taxpayers’ money having a consultant look at the possibility of doing it at a cost of 500,000 bucks.”

...The besieged Government of [the AUSn P]M... was rocked yesterday by the resignation of two cabinet ministers caught in [the] scandal over false travel claims. The Transport Minister... [-] one of the bright lights of the National Party... [-] had... claimed \$A29,205 for 144 nights away from his Goulburn home, about one hour’s drive from Canberra. He repaid the money but, unlike Labour MPs in a similar boat, no notation of the correction was made when the amended claims were presented to parliament. The latest blow to hit the Government, reeling under attacks at home and abroad over its greenhouse policy, economic direction and unemployment levels, reduces even further the credibility of [the PM’s] much-vaunted determination to lift the ethical profile of the nation’s politicians... [The Transport Minister,] denying any impropriety, said he had resigned to save the Government from any embarrassment... However, the Auditor-General has now been instructed to investigate.

...The travel rorts scandal which this week claimed two A[US]n ministers last night reached the office of the P[M]... and threatened the... Science and Technology Minister... The latest revelations have struck hard at a Government which already has reshuffled its ministry three times in the past year and suffered the loss of two senior ministers to a breach of ethical standards, in addition to this week’s resignations...

The Sword of Damocles hangs over A[US]’s political elite this weekend as the Labour Opposition wields leaked documents that may claim the heads of more of... [the PM’s] shredded cabinet. That the Opposition has such papers was proved beyond doubt when the Shadow Industry Minister... used detailed air charter records to force yesterday’s resignation of the Science and Technology Minister... a millionaire landowner who saw his career wrecked over a \$NZ1700 bill for beds he never slept in and a plane he never took... Parliamentary insiders say the most likely source of those documents is within the Department of Administrative Services, responsible for keeping detailed records... of Government travel. It may be no coincidence that the department has been decimated by [the PM’s] small-government policies, and many in it have long loathed the P[M] and his colleagues... But for the Government, the source is now a second issue. Vast damage has already been done... The... police are now investigating.

...A[US]’s travel rorts scandal claimed another victim yesterday as the... resignation of a middle level policy adviser in the Department of P[M] and Cabinet... was accepted after her belated recollection last week that she had failed to pass on suspicions of misdeeds to [the PM’s] office.

...The... A[USn P]M... announced... major changes to his ministerial team yesterday... [as a result of the] scandal that forced three ministers from office... The... Attorney-General... was promoted into cabinet... “The new ministry is a strong team which reflects the depth of talent available to the [Liberal-National coalition,” the PM said. However, the... Labour opposition leader... disagreed, telling reporters in Sydney: “[The PM] has shown that the paucity of talent on his backbench means that he can’t have the fresh start that he needs...”

...[an AUSn politician... was rushed to hospital yesterday after attempting suicide in a shocking twist to a travel claims abuse scandal that has rocked both sides of A[US]n politics. The opposition finance spokesman[-] target of a bitter Government attack this week... over[his] claiming \$A46,000... in travel expenses while staying with his mother... [-] was in a stable condition in a Canberra hospital, said the shaken and distressed Labour leader... Asked why the Senator had chosen such action, [the Labour leader] said: “I think that is an impossible thing to speculate on.” Aside from the controversy over travel claims, [the Senator], like many of his colleagues, had suffered a marriage break-up.

...In a suicide note to the domestic A[US]n Associate Press news agency, [the Senator] said he was too ashamed to return to his... home state of Tasmania after Parliament finished... [His] suicide attempt could end... the... bitter travel allowance abuse scandal which has rocked both sides of [AUSn] politics, politicians and analysts said.

...The turmoil embroiling the A[US]n Government continued yesterday as the Senate agreed to subject the Attorney-General... to an inquiry that could lead to criminal charges... [Meanwhile,] the... MP accused of driving away from his home and sleeping in his car so he could claim a... travel allowance, has been ordered to stand trial for fraud.

...The... [P]M... yesterday blamed internal party brawling rather than the travel rorts affair for... [his p]arty’s disappointing performance at the South A[USn state legislature] election on Saturday... The Liberals were left hanging on to government by a thread in S[A], with their total number of Lower House seats reduced to... 23 from 36. Labour now has 21 Lower House seats and the National Party one. There are two independents.

...A[US]'s conservative Government was dealt another blow yesterday with... an... opinion poll showing a surge in support for the Labour opposition, putting it well ahead of the Government. The *Australian* newspaper's Newpoll showed primary vote support for Labour at 45[%], a leap of six percentage points since the last Newpoll survey... In comparison, support for [the] Government dropped four points to 39[%]... It was Labour's highest result since the P[M]... became Liberal party leader in January 1995. It was also the first time that Labour was ahead of the Liberal-National coalition in almost three years... The latest poll compares with the Government's primary vote of 47.3[%] and Labour's 38.8[%] at the March 1996 election which swept the conservative coalition into office after 13 years of Labour rule.

...There is something to be said for standards – having them and proudly maintaining them even when circumstances may dictate differently... [The former AUSn PM] all but vanished off the face of the earth after he and his Labour Government were ousted in last year's March 2 election. Since then, he has pursued a private life, shunning publicity like a man possessed in his pursuits as company director and investment guru specialising in Asian projects. In a statement to a Sydney newspaper a couple of months ago... [he] protested against continued scrutiny of his life. "I was P[M] once, I'm not now. I'm a private person. I'm entitled to privacy. If I want to subject myself to that public scrutiny, then I'll nominate for Parliament." [However, despite] his dislike for public life, the good old masses continue to help pay costs to keep him in the manner to which he has been accustomed. To be fair, A[US]n taxpayers foot the bill for "entitlements" for all five of the country's living former P[M]s, in recognition of their years of service... Former PMs are entitled to unlimited first-class free air travel in A[US], the use of Government cars and hire cars, free phones and – in the first year out of office – a couple of extra staff to assist them with the transition to a mere mortal... But last year these expenses totalled more than \$A1.54 million... almost half a million more than ever before. Who made up more than 40[%] of that? The new boy on the block... [His] bill of \$A624,314 last year eclipsed the previous record of \$A391,459 set... in 1993-1994... while his wife... took the dubious honour of being the most expensive spouse-of-a-former-P[M], charging \$A11,857 for her air travel. Yet, in his defence, [the new boy] is a busy man. He took an average of more than three flights a week between Canberra, where he lives, and Sydney where his main office is (and remember, flying first class is essential when you're in the air for all of a gruelling 30 minutes). Still, there is a reason for everything: ...the millionaire businessman notorious for his arrogance and abusive tirades at the Opposition while in power... said renovations to his \$3 million Queen Anne-style property in Sydney's well-heeled suburb of Wollahra require his "almost daily supervision." Imagine the exhaustion. So once you arrive at your destination, why mimic the masses with a taxi? Why not book a Government car, save precious seconds in a cab queue and maintain some sense of importance at the same time. [His] *modus operandi* saw him book a Government car on average almost twice a day every day for the entire year, spending more than \$A1000 a day on them on at least 10 occasions... [The total cost was] \$A156,000... The Sydney *Daily Telegraph* tabloid newspaper... [has dubbed] him "Limo Man"... A spokesman [for the new boy] (presumably one of the fairly well taxpayer-paid staffers) defended the high costs, saying they would ease once his children finished school in Canberra... What the heck. What really seems to rile the many who love to hate him (not least the media) is his sheer determination to remain firmly outside the spotlight. Picture it from [his] viewpoint: they loathed him when he was in it and now he annoys them for being out of it... [Some people have begun suggesting that the new boy] might consider quitting his penchant for dipping in the public purse and try the waters at Portsea instead... This coming week is the 30th anniversary of the actual disappearance of a former P[M], Harold Holt. Holt went for a swim in heavy surf at Portsea, south of Melbourne... and was never seen again... That he was not considered a strong swimmer and most likely became yet another drowning statistic was simply too insignificant... [T]he gravity of the situation meant that accepting the obvious explanation was insufficiently momentous and a raft of conspiracy theories blossomed, one that it had all been prearranged and he was picked up by a Chinese submarine, going on to direct an espionage programme against A[US].

... 'one minute before noon Harold Holt, 59, plunged into rough seas during a visit to Cheviot Beach with his clandestine lover (his wife had stayed behind in Canberra), her daughter, the daughter's boyfriend and a young Englishman – and vanished, apparently swept out by the vicious undertow. A massive search was undertaken, which lasted three weeks but found no body. Did the country's leader drown accidentally, or was he so stressed by the worries of office he committed suicide? For years after his death even more bizarre theories circulated – that he had somehow been killed by the CIA, who feared he was about to withdraw AUSn support for America's role in the Vietnam War; that he was murdered by drug bosses; that he was alive and living in Brazil. The most plausible explanation is believed to be that, anxious to impress his younger companions as well as his lover, he misjudged the surf and – hampered by a nagging shoulder injury – did not have the strength to struggle to safety. Marine experts now believe he was eaten by sharks, or perhaps voracious hordes of sea lice destroyed the body within days. Harold was AUS's third PM to die in office, but the only one whose death is shrouded in mystery.' Returning to the present, AUS] recorded a second straight[monthly] surplus on international trade in goods and services with the Government reporting an \$A873... million surplus... Economists had forecast a surplus of \$A200 million... [As a result, AUS]'s current account deficit narrowed to \$A2.446 billion... in the June quarter from \$A3.972 billion in the March quarter, the A[US]n Bureau of Statistics said.

...The... A[US]n P[M]... yesterday unveiled a sweeping new industry policy designed to accelerate long-term economic growth past 4[%] a year, boost corporate health and promote the nation as a regional financial centre... Under the... "Investing For Growth" package... the Government will commit \$A1 billion... to business innovation over the next four years... More than \$150 million will be provided to... expand commercial access to state-of-the-art technology and to Government science agencies.

...N[Z] suffered the pain of economic reform but so far has missed some of the gains. In contrast, A[US] ducked radical reform but has still markedly improved its economy. That's the view of... one of A[US]'s most respected industrialists [– the] chairman of Amcor, the paper and packaging company, chairman of the Wallis Inquiry, which proposed sweeping financial sector reforms this year, and president of the Business Council of A[US], the equivalent of [NZ's] Business Roundtable. "Most of us would accept that N[Z] has been more aggressive and radical in the reform process than A[US];"... But... N[Z] had to take the radical route, [he] argues, because its problems were large but its economy small and short of competition... A[US], however, was able to make headway without radical change because its economy was much larger, had a big natural resource base and was open to domestic and foreign competition. "The red-hot poker of competition has been driving our progress."

...The new age of competition in... services... [foreshadowed by the] dawning of a fully deregulated telecommunications market in A[US] has left AUSns feeling... deeply cynical that they will see any real benefit. Many believe they will simply be stuck for more money for services of dubious value. And who can blame them? ...Telstra remains a giant in the industry and, like all such beasts, is a lumbering organisation which likes to tread on those who get in its way. It has a legacy of poor service, high charges and dinosaur-age technology. Just like Telecom N[Z] or British Telecom, it is difficult to see how real competition can occur when governments are content simply to privatise the businesses of such... monoliths.

...The days of trust have ended for A[US]n MPs... Fresh revelations... in the biggest perks investigation in A[US]n political history – nicknamed 'Travelgate' –] ...show another 140 national members of Parliament, including more ministers, have been ordered to explain discrepancies in their travel claims... A[US]ns have for years quietly tolerated a bit of fiddling by their elected representatives as a kind of unofficial compensation for their low salaries and long hours. But the travel allowance scandal... has focused the spotlight on the extent of MP's privileges and the lack of accountability... A[US]'s national MPs get a base salary of almost \$A82,000... about the same as a middle-ranking business executive. But that salary is topped up with "no questions asked" travel allowances of up to \$A320... a night, the best pension scheme in the country, free domestic air travel, electorate allowances up to \$A38,000... a year, some free travel for spouses, and a first-class, round-the-world airfare every three years... The travel allowances – free of the 48.7[%] income tax MPs pay on their salaries – can significantly boost annual earnings. Some members claim more than \$A50,000... a year... [Furthermore, in] Canberra, the 224 members of the national Parliament are ensconced in a billion-dollar building, pampered with a private gymnasium, spa and sauna, subsidised bars and restaurants and room service provided by chefs from the nearby Hyatt

hotel... One politician used to stay in a Canberra caravan park for a few dollars a night while claiming the \$A145... a night for stays in the capital. Others buy houses or apartments with their allowances... All of this is legal, but a review is under way... [A] former independent MP who campaigned against special privileges for politicians, says the whole system is rotten. "What we have seen so far is only the tip of the iceberg..." For the ordinary voter, some struggling to bring up families on the minimum wage of \$A340... a week before tax, apathy is turning to anger. "When are the politicians of this country going to stop stealing money and behave like decent citizens?" asked one... letter to the editor of a daily newspaper... [A] poll in *The Australian* [reported that the PM's popularity] had plunged to its lowest level since his election... However... the Opposition [leader's popularity has also] been diminished... On Thursday the *Sydney Daily Telegraph* headlined its front page: "A pox on both your houses." In the nine days A[US]'s leaders had bickered, the newspaper said, foreign debt rose \$A765 million, 540 small businesses went bankrupt, 1500 fulltime jobs disappeared, 60 women died of breast cancer, 58 people committed suicide, and 50 people died on the roads... Cartoonists echoed the sentiment. [One] in the *Sydney Morning Herald* depicted... [both leaders] as rival Neros duelling with fiddlesticks while A[US] burned...

Three separate investigations have been launched into the disastrous demolition of an old Canberra hospital that... turned a picture-postcard Sunday afternoon into a war zone... and... left a 12-year-old girl dead, at least 13 others injured, dozens seeking counselling and the possibility of massive compensation claims... The implosion of the eight-story hospital, being demolished to make way for the controversial new National Museum of A[US] on prime lakefront acreage, had been heavily promoted in advance as a family spectacle. Most radio stations urged people to watch the building go down. Thousands picnicked on the grass verge of the lake opposite the hospital, more than 400m distant and twice as far away as the 200m exclusion zone determined by the contractors and explosives experts... But the job went tragically wrong. Delayed by 30 minutes by trouble with the circuits, the explosions ripped the hospital apart, toppling a huge incinerator tower outwards instead of into the rubble, and shooting a deadly broadside of debris more than 600m... No one had any warning. Boats were rocked as huge spouts of water erupted around them as bricks and other rubble plunged into the lake... [S]pectators on the shore froze at first in disbelief, then fled in terror... [A] construction union official... [accused the AUS]n Capital Territory Chief Minister... of rejecting safer means of demolition in the hopes of using the spectacle to boost her chances of re-election... The demolition had been contracted by an ACT government agency, Totalcare Industries...

Israeli authorities suspended for one day the Olympic-style... games for Jewish athletes yesterday after a bridge collapsed, killing two A[US]n competitors and injuring 43 others... Leaders of the closeknit A[US]n Jewish community of 100,000 were questioning how such a thing could happen. Many were also angry that the opening ceremony for the 15th Maccabiah games went ahead, even as the rescue operation continued. Organisers later said they were unaware of the severity of the disaster. [The] head of the A[US]n delegation, told a news conference that the team was demanding an official investigation... But the... 370-strong... A[US]n team last night decided it would stay on and compete... The specially built bridge across the Yarkon River leading to the stadium at Ramat Gan near Tel Aviv gave way as the A[US]n squad was crossing it. The... Army had offered to build the bridge at a cost of 300,000 shekels (\$[NZ]129,329), but the contract was finally given to a private company for 75,000 shekels.

...The bridge collapse that took the lives of two A[US]ns... this week has evoked an unusual measure of self-criticism in Israel, sometimes amounting to self-flagellation, about the very nature of its society. What appears to have been shocking sloppiness in the bridge's construction has been taken by many commentators and members of the public as an analogy for something fundamentally amiss in the Israeli national character... Many linked the bridge collapse to other fatal accidents like the crushing of three youths to death two years ago at a music festival because a gate had been shut... and the deadly accidents that periodically afflict the Army... "We're a clever people," wrote... the daily newspaper *Ma'ariv*... "but to tell the truth we've got some national characteristics that are pretty miserable: exaggerated self-confidence mixed with no small measure of braggadocio suitable to people who know everything; irresponsibility and an almost religious faith that everything will work out in the end, somehow." ...A... former Speaker... said the apparent lack of safety precautions reminded him of the night P[M] Yitzhak Rabin was murdered... "Negligence and insensitivity have become the credo of Israeli society."

...A bridge that collapsed during the Maccabiah Games, killing four... A[US]n... athletes, was built without design plans or a foundation, a committee of engineers investigating the accident said in Tel Aviv yesterday... "certain individuals" will be charged over the collapse...

[Another AUS]n has died as a result of the bridge collapse... earlier this month... [The 47-year-old victim] had swallowed polluted water after falling into the Yarkon River. The team plans to increase its \$US500,000... compensation claim from the Israeli Government.

...The Israeli Government used emergency laws yesterday to order thousands of public sector employees back to work... [because the] nationwide strike... has paralysed the country. Strikers who refuse to heed the order face up to two years in prison and nearly \$US3000... in fines. [Incidentally, 'politicians are taking advantage of a weakened Israeli PM to make extortionate budget demands – including demanding that he put his promise in writing. For some, even that was not good enough. Never have Israeli political leaders shown such blatant distrust of a PM. It is an astonishing fact that most politicians in Israel, including his political allies, believe the PM cannot be taken at his word. His survival test this week is the budget and he seems likely to pass through it safely. The next crisis is doubtless not far off.'

...the Israeli P[M]... has ordered a \$US850,000... refit of a plane so his family will not be deprived of creature comforts when travelling abroad. A... double bed... is to be installed for [him] and his wife... on an Israeli airforce Boeing... [In related news,] the Chancellor of Germany... [–] arguably Europe's most influential politician... [– is coming] to observe aspects of N[Z] that have captured German attention... [H]e is already the most durable Chancellor since... W[W2], steering Germany on a steady path towards a leading role in Europe and post-unification stability... Under his leadership, Germany has emerged from a period of Cold War tension to dominate debate on Europe. But in recent months there have been signs that the wheels may be falling off the economic wagon. Despite a healthy \$US65.1 billion... trade surplus, Germany's growth rate has slowed to 1.9[%], and there has been a blowout in the budget deficit to 3.9[%]. And though inflation remains low at 1.5[%], a post-war unemployment high of 12[%] in February, 4.6 million people, is a major worry... Germany is looking for answers to mounting economic problems, and... N[Z] has been prominent in the German consciousness. N[Z]'s move from a centrally controlled, heavily regulated economy to full deregulation has caught the eye of officials in Germany, and also private sector industries who are still subject to a raft of restrictive legislation... The media has also taken notice, with mass-circulation magazines *Stern* and *Spiegel* both featuring articles on N[Z]'s economic reforms. N[Z] diplomatic sources in Bonn say that Germany is now looking at N[Z] as a model on which to base its own reforms, while at the same time wanting to consolidate relationships in the Asia-Pacific region... [The Chancellor] will... be accompanied by the Minister of Science... and a group of leading business figures all keen to take a close view of N[Z]. They will also be interested in the way Germany is viewed in N[Z], an important consideration with N[Z] increasingly being seen in Europe as a gateway to lucrative Asian markets... and N[Z] recently topped a survey of Germans' preferred tourist destinations.

...So much for the perks of high office... Even after a decade and a half comfortably ensconced in Germany's top job, [the Chancellor] still has the common touch. He likes to get around by bus. The no-fuss German Chancellor... has caused some surprise during his N[Z] visit by forsaking the politician's preferred conveyance, the limousine[, and]... taking a more humble seat on the bus which is normally reserved for the overflow of underlings who accompany heads of government on such visits. On Wednesday this choice prompted the strange sight of a... bus heading the official motorcade from Wellington airport to Parliament Buildings, instead of trailing respectfully behind. Yesterday [the Chancellor] again took the bus... for the nausea-inducing trip over the Rimutakas to... where he toured... [a] vineyard. Earlier the 67-year-old leader... used the bus for the short hop from his Wellington hotel to the National War Museum for a wreath-laying ceremony. Officials said the Chancellor frequently preferred to take the bus on such occasions... [during] his swing through A[US], Brunei and Hong Kong. "He needs a lot of space," said one journalist,

making an unkind reference to the Chancellor's obvious bulk. But the reporters also said that back in Bonn, the German capital, [the Chancellor] got himself to the office in a very large Mercedes. "I suppose you could call that a bus," joked one.

...[the German Chancellor's Christian Democratic Union faces financial ruin with debts of 100 million marks, says a party chief, although he denied the CDU was likely to go bankrupt. Parliament's speaker last month fined the CDU 41.3 million marks for running illicit slush funds. Meanwhile, the prosecutor's office in Bonn has denied a *Der Spiegel* newspaper report that the prosecution has proof the Chancellor was siphoning off money from his party. The Chancellor has refused to reveal names of donors to illegal funds run from 1993, and for which he is under parliamentary and criminal investigations. He insists he gave his word not to betray these donors' anonymity and cannot go back on it.]

...German budget plans have been thrown into question by major shortfalls in estimated tax revenue... Revised official estimates predicted nearly 18 billion marks (\$NZ15.3 billion) less income for the federal, regional and local authorities this year than they were counting on...

TAXES are up, wages are down, unemployment is high and optimism is fading. Western Germans blame their brethren from the former communist east for a falling standard of living and eastern Germans feel betrayed by the free market economy imported from the west that has left every fifth worker without a job... [O]pinion polls... show a remarkably high degree of dislike between easterners, derogatorily called "Ossies" by westerners, whom easterners disparagingly call "Wessies"... Divisions in Germany are sharper than at any time since the country's euphoric unification on October 3, 1990, and many marking the anniversary said the marriage was suffering from a severe "seven-year itch". Even [the] Chancellor... normally an incurable optimist on the subject, admitted uniting the communist east with the capitalist west had been harder than he expected. "The four decades of division have left their marks on the spiritual and cultural life of our country... East and West Germans had completely different experiences – you couldn't find greater extremes. That can't be fixed overnight." ... "I genuinely doubt unification will ever work out," said... a retired rail worker from Nuremberg who came to Stuttgart to celebrate Unity Day with 500,000 others... [A] 46-year-old Stuttgart housewife, said... "All the costs of unification are being paid for by ordinary workers." Westerners have been increasingly annoyed at the solidarity tax taken from wages to rebuild eastern roads, railways, schools and buildings.

...A GLASS dome now crowns the Reichstag building, soon to reclaim its place as the seat of Germany's parliament... The \$10 billion move that will transfer Germany's government over the next two years from Bonn to Berlin is gathering momentum. Nearly 50,000 politicians, civil servants, lobbyists, diplomats and journalists are preparing to depart the tranquil town on the Rhine... near the Belgian border... for the sprawling Prussian metropolis... 80km from Poland... New embassies for... Britain... the U[S] and France... are sprouting up next to the Brandenburg Gate, where the Wall that fell in 1989 divided the one-time heart of Berlin... Not surprisingly, France is fortifying ties with Spain, Italy and other southern partners known as the "Club Med" to build a counterweight to a potential Teutonic bloc.

...A TIDE of scandal is moving closer to [the French] President... and the inner cabinet of his ruling Gaullist RPR party. The ties of scores of public officials and elected politicians to an alleged web of institutionalised corruption in the French capital are being exposed. Many date back to the tenure of the Hotel de Ville – the seat of municipal power and patronage – by [the President, who was Paris'] mayor for almost 20 years. As a small team of investigators dig deeper into the mess, the scandals are becoming increasingly baroque. Take the case of... [the] director of a municipally financed housing authority... [A]ccountants concluded that the housing authority's \$2.2 million deficit was attributable to the sumptuous lifestyle of the... low-level civil servant earning less than \$35,000 a year... They noted his penchant for luxury hotels and rented limousines and his occasional dips into the petty cash... [The President and his] long-serving No2 in the Hotel de Ville and his automatic choice for [PM]... have made themselves even more unpopular with the voters with some profoundly misjudged public relations initiatives. In [a recently] televised... address... the... [President] seemed ill-at-ease as he tried to convince the French that the economy was not in such bad shape after all – although unemployment has just touched a post-war peak – and called, without a whisper of the scandals besetting the RPR, for a new "culture of responsibility"... In the left-leaning *Liberation* newspaper, [a] journalist... argued that [the President] and co were approaching a "moral crunch" as the public turned away in disgust. Much the same thing happened to the Socialists during [their former President's] second term, he noted... [Incidentally, Quebec's Premier is on the move] – and his mood and message seem to change as swiftly as the scenery. On a January trip to Asia with a delegation of Canadian premiers, Quebec's leader played the moderate. He ducked confrontations with fellow premiers on the explosive issue of Canadian unity and vigorously promoted his province's industry and expertise... [in order to help] eliminate a [US]\$2.4 billion deficit by the year 2000... He even shared a slice of cake to celebrate the birthday of his chief political rival, [Canada's PM]... Less than a week later, back in the bedroom suburb of Laval, outside Montreal, he had reverted to nationalist mode, pounding the lectern for separatism... [– even though s]upport for sovereignty (with some kind of association with the rest of Canada, as suggested in the 1995 referendum) [has] dipped to 45%... "I feel that you are ready for the victories to come," he vowed in a speech that brought Parti Quebecois hard-liners to their feet. "We are ready for the decisive step. We are ready for sovereignty." Since then, [the Premier] has picked up the pace... To those familiar with [the Premier's] canny ways, the high-voltage peripatetics can mean one thing: an election in the offing.

...[Parti Quebecois has been returned to power in Quebec's provincial election. The result was a humbling defeat for the 40-year-old leader of the Quebec Liberals, who just a month ago was touted as the "saviour of Canada" and the best hope of those who want to halt the secessionist drive. The win dashed the hopes of English-speaking Canadians and heightened the chances of another referendum on independence for the French-speaking province (which is four times the size of France).] Speaking of France, NZ's PM visits Paris for a two-day official visit... [following] his visit to Britain this week... He will meet [the French] President... the new French PM... – for the... first... meetings between top N[Z] and French leaders... in 35 years... [–] and the Ministers for Overseas Territories and Veterans.

...[our PM]... will underline N[Z]'s desire to keep its close ties with Britain when he meets the... British PM. He will also... meet... the... Foreign Secretary... be [a] guest at a luncheon hosted by the Deputy PM... – a regular visitor to N[Z] – and... will meet the Queen at Buckingham Palace... N[Z]'s experience with proportional representation is expected to be a major area for discussion, with the [proposed] Scottish Parliament and Welsh Assembly both to have MPs elected under proportional representation... [Our PM] will use his 45-minute meeting with [his British counterpart] tomorrow to get a feel for the British PM's aspirations... in relation to his domestic political agenda... [T]he two are expected to use the visit to focus on the similarities between the two countries and their populations.

...an article in... a leading English newspaper... tells Britain that N[Z] is not a good example to follow... The... *Independent*... said Rogernomics... [–] as the N[Z]ers christened their [economic reforms –] ...worked politically, but not socially and has left a people who believe their Government betrayed them... N[Z] is now an unhappy, edgy country, with a less equal, less safe society... "It does not much feel like a model. A lot has been made of the way N[Z] contracted out services and introduced competition into its public sector... But there is no hard evidence that services are delivered any more efficiently there than elsewhere. On the contrary: if the central measure of effectiveness of a state is public trust in and appreciation of its Government, N[Z] is a case study in failure – levels of mistrust of and outright disdain for government are at an all-time high." ...some of... the economic reforms begun by the 1984 Labour Government... were necessary... [the newspaper] said... But... N[Z] is a lesson in a Government being taken over by theorists and hard-liners from the neo-liberal right-wing. "N[Z] shows how, eventually, radical right-wing Government is self-defeating..." ...[however, the article pointed out that] there was no denying the success of the revolution, led by... the architect of the reforms... and... a group of Treasury civil servants, the Business Roundtable and other lobbyists. Within a decade the radical right had smashed the welfare state, despite public support for its principles. "...the revolutionaries did not... care to foresee that the reforms would create a new class of high-rolling consultants and business executives for whom greed was good and some of the most attractive features of a pastoral, egalitarian

society would be lost forever.” ...in the early 90s there was an economic boom that reflected what was happening elsewhere in the world but it was now over. N[Z] had little to teach the world in matching low inflation with jobs and growth. - 1997

...the British Parliament... consists of the House of Lords and the House of Commons... Until 1911 the House of Lords had legislative powers comparable to those of Commons; since then Commons has been supreme, though the House of Lords still wields much influence... [It] comprises the archbishops of Canterbury and York, bishops of the Church of England, and peers (dukes, marquesses, earls, barons, and “life peers”). Peers have their status by hereditary right, or are created by the sovereign on recommendation of the prime minister.

[NZ’S] PARLIAMENT and the NZ Constitution are deeply rooted in the British Westminster system... From the passage of the 1852 Constitution Act until 1950, Parliament in NZ had consisted of the House of Representatives and the Legislative Council (an Upper House to which members were appointed, at one time for life). But the first National Party administration, which won office in 1949, decided to eliminate the Legislative Council because of the practice of packing it with party supporters when new administrations were elected to achieve the ready passage of administration. It helped vote itself out of existence as from the beginning of 1951. It was to be replaced by an elective upper chamber but nothing has been done and there is little likelihood of such action now. A result is that, although important constitutional legislation is protected by conventions that have developed, the authority to make or change law in NZ is now entirely in the hands of any governing group which can move legislation through the House of Representatives with a majority of votes, no matter how slender that majority.

Apart from the lack of an Upper House, another modern difference between the British and NZ political systems is that the latter usually holds parliamentary elections every three years instead of every five. A notable similarity is the way both countries have seen political policies go round in circles as each of the two major parties, upon becoming the ruling party, reversed the legislation of the previous Government (a consequence of the citizens’ tendency to vote out, rather than vote in, their ruling parties – i.e., ‘Government’s lose elections – the Opposition don’t win’). The ‘first British Labour Government was elected to power in 1924 but it didn’t survive out the year. The next Labour Government wasn’t elected until 1945 but the Conservatives regained power in 1951. Labour got another chance to rule between 1964 and 1970, then from 1974 until 1979.’

From 1979... the Conservative Party... oversaw a social revolution in Britain that left no one indifferent and no one unaffected. Britain sent its Army to the Falklands and won. But when the Government sent police to battle rioters in Trafalgar Square it was forced to back down and abandon its new method of local government funding – the reviled poll tax. Market forces were introduced into all areas of British life. Telecommunications, gas, water and electricity were among the utilities privatised, raising more than £70 billion... for the Government and turning millions of ordinary people into shareholders. But economic dogma was taken to unpopular ends. The coal-mining and steel industries were decimated. Attempts to privatise the railway system and introduce the market to the much-loved National Health Service caused uproar. The unemployed, at one time more than three million of them, were told to “get on their bikes” and look for work, while yuppies working in financial markets earned breathtaking salaries and widespread scorn as they flaunted their fast cars and champagne lifestyles... [T]he middle classes stepped over the homeless living in shop doorways on their way to dinner parties where gloating conversation turned on the apparently never-ending upward spiral in the value of their homes. But house prices did come down, rather rapidly, as the 1980s became the 1990s. Voters who had switched to [the Conservative Party when it] promised them a foothold on the capitalist ladder turned against the Conservatives when their houses became worth less than their debt. The Conservatives bundled [their leader] out of office in 1990, fearing she would lose them the 1992 election, but [the replacement] was a grey image of the Iron Lady...

[The Iron Lady] has publicly backed... her successor as P[M], calling on the Conservatives to pull together before the general election due by May next year... [S]he believed that if the Conservatives could pull off a fifth consecutive election victory “we will have killed socialism for good.” ...However, the applause from delegates... at a reception during the party’s conference... lasted a modest 40 seconds or so, considerably less than she has been accustomed to... - 1996

“...where there is despair may we bring hope.” The words [of St Francis of Assisi were commandeered by the Iron Lady when she was first elected in 1979, but they] were hardly appropriate for what became Britain’s most radical political reforms since... W[W2. Her ideology] was all about free markets and private enterprise. The Government took on the unions and won, and it sold much of the industry Labour had nationalised... Unemployment soared... and, in 1981, [she] was rated the most unpopular P[M] since opinion polls began. But victory in the Falkland’s War sparked a surge of national pride, sweeping her back to power in 1983. However, she wasn’t around to celebrate the Gulf War victory eight years later. She was pushed out by party leaders who sensed the country was tiring of her strident leadership. The man chosen to replace her was widely seen as a political lightweight, virtually unknown outside Britain. In 1992 [he] won a fourth term for the Conservatives... But today the Tory Party [have] reached the end of the road...

A SPEEDING van was driven straight at police as rioting swept through Central London... Riot police fought to contain increasingly violent clashes as scores of yobs bombarded them with rocks and bottles. Paving stones were torn up and shop windows smashed by youths chanting hate slogans. Horrified restaurant owners locked their doors, barricading diners inside as the riot approached... The clashes started outside Downing Street...

DARKNESS and evil spread with astonishing speed. How many of us would have believed, 10 years ago, that a woman could be gang-raped and almost drowned by a gaggle of near-children on the streets of London? In a... radio discussion – about whether the [50]s really were a golden age – I was asked what we would be nostalgic about 25 years from now. I replied: “Having glass in the windows of our houses, instead of corrugated iron.”

...[the Iron Lady’s] model local council leader and her deputy were ordered to pay \$78 million after being found guilty of electoral corruption yesterday... The sum to be paid was reduced from the \$88.5m ordered by [an] auditor... The ruling brought to an end a corruption scandal that hit at the heart of [the Conservative Government] when allegations appeared 10 years ago.

...[yesterday the Iron Lady] put herself at the front line of the Tory election campaign with a determined battle cry. “I’m here to fight for Britain,” she declared – more than once. Her first port of call was Christchurch, Dorset, a Tory stronghold from 1910 until voters defected to the Liberal-Democrats in a 1993 by-election. But the Tory faithful turned up in their dozens to welcome her at a local garden centre. [The Iron]Lady... drew fanatical applause and obviously relished being centre stage again. “I campaigned in 11 elections,” she told the crowd, adding: “[My success]or’s had a good five years and we want to make sure he’s got another five.” ...One of the Conservatives’ weakest points in this election has been the so-called ‘sleaze factor.’ Top Tories have been involved in a series of sexual and financial scandals, and that’s prompted [a]long-time BBC journalist... to stand as an anti-sleaze candidate... “...he’s handled war zones and they’ve very much prepared him for this, and this is going to be a particularly nasty war zone indeed...”

...A row over sleaze hijacked the British [PM's] election campaign when[a] former minister... confronted an anti-corruption candidate trying to force him to stand down as a candidate for the ruling Conservatives... The two, standing inches apart and surrounded by a forest of cameras and microphones, traded verbal thrust and counter-thrust in a surreal stand-off.

...[the beleaguered PM's] election campaign has again been overshadowed by sex and sleaze allegations that have persistently be-devilled the ruling Conservative Party... The Conservatives, buoyed by low inflation, falling unemployment and a strong economy, had hoped to concentrate their fire on the opposition Labour Party's links with the trade unions.

...The London Underground will be privatised if the Tories are returned to power, according to sources close to the British Transport Secretary... A host of international bidders would be expected to enter the contest to take over the troubled Tube. The sale of the 134-year-old network, which includes 260 stations used by 2.5 million passengers a day, would raise up to £13 billion... for the Treasury. Options include selling the entire network as a single company or disposing of it service by service, with tracks and stations forming separate businesses, as happened with Railtrack in the British Rail break-up. The Labour Party says it will oppose the sell-off "every step of the way."

...The British Labour Party is tipped to embrace a policy of privatising remaining state assets in a break from its traditional stance... The Conservatives said the reports showed Labour was now "in full retreat." ...However, the Labour Party is still 20 points ahead of the Conservatives, according to an opinion poll...

In the last days of the campaign scare tactics have emerged in force. Tories say that people should be afraid of Labour because there will be a re-emergence of trade union domination, a return to the past policies of high public expenditure and a destruction of the economic gains made in recent times. Labour says that the Conservative Party will increase value-added tax on heating and apply it to food and children's clothing. The rejections of these accusations come rapidly, accompanied by the predictable doses of wounded righteousness and anger. [The]Labour leader... insists that he is the architect of the "modern Labour Party" – its name of New Labour ringing ironically in... N[Z] ears... But the N[Z] Labour Party had gone through the British experience much earlier and in a more profound way... Certainly it did not have a Clause 4 about the socialisation of the means of production, distribution and exchange in its constitution... This is the challenge to the British Labour Party. It was fortunate to be able to attempt to work it out while in opposition... It remains to be seen whether the modernisation is substantial enough to endure in government... The question, which is still not fully answered in either country, is what does a social democratic party offer the electorate which is distinctively different once the constraints of a global economy and international competitiveness have been accepted? Do those policies simply look like a kinder, gentler version of the Conservative line, blending privatisation with more effective safety nets?... "The Tories and Labour seem to be coming much closer together..." ...Labour's... line to reassure the public that there is nothing to fear in voting Labour rests entirely on the notion that "New Labour" is very different from "old Labour." ...this means that generally acceptable values, similar to motherhood and apple pie, are now fundamental principles of modern socialism. These values, shared equally by many Conservatives, are the conclusion of... Labour's... modernisation process. This is meant to rehabilitate socialism and show it to be appropriate to contest modern ideas, especially the neo-liberalism which is so prevalent internationally... [Labour's leader] has gone in search of an electorate, trying to find out what it is they want and then promoting it rather than taking to them something new and vibrant which inspires them with new confidence in Labour. The accusation of being the same as the Tories is often repeated because in the process of gaining electoral support the search for common ground with "middle Britain" has resulted in a reduction to the lowest common denominator, to which no one can take exception. That has made the election campaign tedious for most Britons and may well be reflected in low turnout at the polls...

[A] former editor of Marxism today, wrote... [about] the Labour leader... in this week's Microsoft News: "In the face of attack, his instinct in each case has been to retreat. The impression has been of a weak leader who refuses to stand his ground and fight." [Another commentator writes that 'Labour's leader is "able to say things that don't tell you much but sound good. He's into free enterprise, he's into entrepreneurialism. He's changed Labour to make it comfortable for former Tories. Consequently, it's very difficult to pick between the two policies.'"]

...the Labour leader] likes to call his new, flexible approach to politics, "The Third Way". He'd better be careful. Other political forces that have used that strange designation include the authoritarian syndicalist movement of Argentinian strong-man Juan Peron, the Russian Army's tough "shoot first, ask questions later" politician... a neo-fascist party in Bulgaria and the dreadful PUMM party in Moldova.

...I AM afraid of some of those who surround [the Labour leader]. They have grown so used to ordering people about in their own party, and being obeyed, that it would not be wise to let them near real power. Our unwritten constitution's one fault is that it assumes Britain will be governed by gentlemen, who believe, above all, in fairness. And these people do not believe in fairness. I am sure they could not have gained control of the Labour Party without their regime of fear and intolerance, and their crude policy of reward and punishment. But now this coarse attitude has spread from the backrooms, where ambitious courtiers plot, to infect solid democrats who ought to know better.

...IN THREE weeks' time, either [the Labour leader or Tory leader] will be supping at the sweet fountain of victory. The loser will, with traditional stiff upper-lip, graciously admit defeat, while doubtless wishing he could use the brief concession speech of an American senator who declared: "The people have spoken – the bastards!"

...The flush of victory is warm on [the Labour leader's] cheeks... For Labour this victory is like the birth of a child after many disappointments. Joy is unconfined but in a few hours those responsible for the happy event will be aware the hard work does not end with a successful delivery... [The new PM], aged 43, made few specific promises during the election campaign, beyond vowing not to raise income taxes for five years and to keep a tight grip on public spending. Many of his policies seemed to be carbon copies of the Conservative's... [F]or the economy... [the change in Government] would be almost seamless... Both [parties promised] not to raise taxes and not to interfere with the free market, and both wish to meet the Government's inflation target – 2.5%... But millions of Britons voted Labour because they were fed up with [the Conservatives]. They may not be life-long Labour voters but they voted for change. Britain's youngest P[M] this century will face popular pressure to change the government of the country as much as he has changed his party since becoming leader in 1994. Only four members of his cabinet will have held a Government post, all at junior level in the Labour Government ousted in 1979... It will be the most inexperienced cabinet of the 20th century. [The PM], a member of parliament for 14 years, has never held a ministerial position. Unlike most of his Labour predecessors he has not held an executive post in union or local government politics, being a lawyer before entering politics. The new cabinet's ignorance of the levers and pulleys of Government have been alleviated by backroom meetings with senior civil servants over recent months, but ministers are bound to run into problems with the basic mechanics of decision-making. [The PM's] biggest problems over the early months may well come from the expectations of both party and people, some of whom want a seamless transition and others radical change... He wants two terms in government to impose New Labour policies on the nation. But a softly-softly approach will not endear him to members of the left wing of the party. They have largely kept quiet since July 1994 as [he] squeezed socialism out of Labour and repositioned the party in the centre ground. The left will now expect a payback for their tameness during the election campaign... "Our problem will be to prevent a rootless Labour Government moving further to the right to gain impetus... Stopping that will be the responsibility of old Labour," said [a Labour] member of parliament... late last year. Few tears were shed in Europe over [the Conservative's] thumping defeat... Europe hopes[the] victorious Labour leader... will usher in an era of cooperation in European affairs, but is not deluded that all will suddenly be well in cross-Channel relations. "On key sovereignty issues – money, borders and armies – no one expects a change in the short-term," said one diplomat... [Both parties had made a] promise not to let Britain join the E[U]'s proposed single currency without a referendum... Nothing Labour has said it will do seems likely to... crimp corporate profits – with one group excepted... UK utilities, once state-

owned and sold to private investors by successive Conservative governments. Labour is not threatening to nationalise them again, but is threatening to impose a so-called windfall-profits tax on them. Labour officials have said the tax would bring in... from £3 billion to £10 billion.

...In a whirlwind start to government, [Labour's] ministers have instituted a number of significant changes, including allowing the Bank of England to decide interest rates... [Labour] has unveiled an "ambitious but practical" legislative programme... The package tackled Labour's five main election manifesto pledges – to cut primary school class sizes, shorten hospital waiting lists, mete out swifter justice for persistent juvenile offenders, get 250,000 young people off welfare into work and create conditions for "lasting prosperity." But there was also a number of eye-catching constitutional reforms to decentralise power, make Government more transparent and clean up politics after a string of sex and money scandals during the Conservatives' last years in power. Referendums will be held to approve plans for a tax-raising parliament in Scotland [– a poll last year 'found that 51% of Scots felt such a parliament should have tax-raising powers' –] and a less powerful assembly in Wales. But the Government did not put forward a bill to remove the voting powers of hereditary peers in the Upper House, one of its aims... The legislative programme, was formerly announced by the Queen in a glittering, ages-old ceremony in the upper House of Lords... Britain's new P[M]... claimed... "Our mandate is clear: to modernise what is outdated, to make fair what is unjust; and to do both by the best means available, irrespective of dogma or doctrine, without fear or favour." ...Saying the defeated Conservative Government had lost touch with the "instincts and aspirations of the British people," [he] said the new Government would reunite the country... He told a packed House of Commons he would run a "people's government, rebuilding trust between government and governed."

...The... [new British PM's] popularity rating has soared to 93[%]... says a private party poll. The figure, reported by the *Independent on Sunday* newspaper, was thought to be a record for any democratic politician but aides were quick to quash any triumphalism or complacency... [The PM] has a thumping 178-seat majority in the 659-strong Parliament[, which now contains less than 170 Tory MPs]...

Tory leadership contest a battle of mediocracy... The Conservatives will begin electing their new leader today, but the candidates appear to offer little inspiring for voters in the next century... [N]one of the five leadership candidates... seems to be much more than second-rate. That may be a bit harsh, but it's true... [By the way,] the *Times* newspaper ran a front-page cartoon this week that showed a pollster asking "Do you think [the PM] is a) terrific; b) wonderful; c) sensational?" ...As [the]... popularity of Britain's leader hits record levels, [some wonder how long it]... can last... "Rarely in recent history has a political leader amassed such goodwill so quickly," [a former US] Secretary of Labour... wrote in Sunday's *Observer*... "[He] is capable of being one of Britain's great [PM]s... but the real test has yet to come." ...The art of politics, like journalism, consists of judging what you can get away with...

Britain's Labour Government, which opposed the use of endocrine-disrupting chemicals during the election campaign, has changed its stance... [and now] will oppose an international attempt to ban "gender-bending" chemicals blamed for falling sperm counts and growing rates of testicular and breast cancer... Britain will join France and Spain as the only nations resisting the listing of some 50 endocrine disrupters... [The] environment Minister in the new Labour administration, said Britain would "stick with" the Tory Government's line... In March, [he] told the House of Commons that a Labour Government would support an international treaty to "reduce and eliminate" hormone-disrupting chemicals. "The banning of these highly toxic chemicals... must not be subject to haggles over trade. They are environmental absolutes." ...The stance has dismayed environmentalists and scientists who claim the "sex chemicals" pose as big a threat to our future as global warming... Friends of the Earth said: "How can we trust a Government that, weeks before a general election, calls for tough action on these chemicals and then at its first opportunity to take action just follows the Tories and perpetuates the United Kingdom's reputation as the dirty man of Europe?"

...A suicide note penned by a despairing British Labour parliamentarian less than three months after his party's landslide election victory may lead to an electoral setback for [the PM] this week... Voters will go to the polls on Thursday in a byelection to choose a successor... [to the] MP for Paisley Park[–] part of... the central Scottish county of Renfrewshire... [– who] left a note alleging[that a] fellow Labour legislator... had spread false rumours that he was a homosexual before gassing himself in his garage. Although an internal Labour inquiry has cleared [the fellow legislator], he is suspended from the parliamentary party pending the outcome of an investigation into sleaze in Labour's ranks in... Renfrewshire. Pundits do not expect Labour to lose the seat... [but publicity surrounding the] death and the sleaze probe could result in an embarrassingly large cut in its... handsome majority of almost 13,000.

...Britain's ruling Labour Party has ordered a police investigation into allegations that one of its new members of Parliament bribed rivals in the May 1 general election... The bribery allegations... [have cast a shadow over Labour's] Government, which was helped to its election victory by charges of financial and sexual impropriety involving Conservative politicians... The *News of the World* alleged that... Britain's first Muslim MP[– who]... won the Glasgow constituency of Govan... [–] paid £5000... to [an] independent Labour candidate... also a Muslim, to get him to ease off campaigning so as not to split both the Labour and Asian vote... The... [MP strongly denied the] claims... "The allegations about me... are totally false... I will be consulting my lawyers tomorrow about taking out a writ for defamation," he said... A second Govan candidate... who stood as an unofficial Labour candidate... later told *Sky News* that he, too, had been offered money before the election.

...BRITAIN'S Labour Government sank further into embarrassment on Friday as... the... row over political donations... refused to die down... [The] Public Health Minister... who has taken most of the heat over... a... policy switch on... Formula One motor racing and... tobacco advertising, stayed away from an anti-smoking group award ceremony. Labour embarrassment deepened with publication of research which said boys who were big motor racing fans were twice as likely to become regular smokers... A party renowned for its skill in handling the media[, Labour] repeatedly turned down requests for interviews; one BBC programme, *Newsnight*, on Thursday showed an empty chair in the studio to make the point... Political commentators said it was... [the PM's] worst week in office... Most accused him of naivety rather than corruption... [Earlier in the week, Labour's Muslim MP for the Scottish constituency of Govan had] admitted he gave money to a rival candidate but insisted it was a loan... [Incidentally, t]he "hidden problem" of Scottish racism against the English is to be investigated by Britain's Commission for Racial Equality after a sharp increase in attacks on the so-called "white settlers." The commission, which has backed legal actions brought by English people in Scotland, has asked a lobby group called English Rights Scotland to compile a discrimination dossier detailing evidence. English Rights was set up this year by [a Newcastle-born settler] who sued his Fife employer for failing to stamp out anti-English racism. "We are getting calls all the time from English people who are being discriminated against in the workplace and in other more subtle ways," he says... A commission spokesman said officials were taking [English Rights'] evidence "very seriously." ...English people are protected under the 1976 Race Relations Act... "and the number of claims of anti-English discrimination is rising." ...[such] cases now account for 10[%] of the... commission's workload in Scotland... Anti-English sentiment has been growing as more and more southerners have abandoned London and other English cities in search of the good life in the glens and hills, provoking resentment among locals... Shadowy ultra-nationalist organisations such as Scottish Watch and Settler Watch have been blamed for attacks on English homes and businesses. Some English families have abandoned their homes after suffering verbal and physical assaults.

...Centuries of struggle against English domination form the emotionally charged background to referendums on "home rule" this month in Scotland and Wales. The names of heroes... are being invoked by the pro-devolutionists who want their countries to take the best opportunity for generations to grab a measure of power back from London... The new Edinburgh parliament would be a far cry from the sovereignty once enjoyed by the Scots, whose Kings and chieftains were ever-ready to defend their domains against the English invader... Wales has only fitfully existed as an independent nation... the last time... [was] in the early 15th century... at the height of which the Celtic nation held the only Parliament in its history... Edward 1 was the first English King to claim sovereignty over the whole of what is now Britain when he declared himself feudal overlord

of Scotland in 1290, installing John Balliol as his vassal King. By that time, Welsh-speaking princelings had been fighting for more than a century to resist repeated incursions by the Normans, who had long conquered England, into their territories... Revolts... [in] Scotland... by William Wallace... and Robert the Bruce were eventually crushed by the weight of English arms. They were followed a century later by the great Welsh uprising... [When] the Tudors, a Welsh family, ascended the English throne... their countrymen [were given] brief hope that the tables were to be turned on the English. But the Tudors showed scant respect for their roots, and in 1536 passed an Act of Union declaring Wales to be “forever and henceforth incorporated and annexed” into England. On the death of the last Tudor monarch, Elizabeth I, in 1603, the English throne passed to James VI of Scotland. For more than a century after this, Scotland had its own Parliament, which was united with that of England in 1707. The Jacobite rebellions of 1715 and 1745, the latter led by Bonnie Prince Charlie, marked the last military efforts by the Scots to overthrow this arrangement, and were bloodily put down... Schoolchildren in Wales were forbidden to speak Welsh in class while their Scottish counterparts learned the names of the English Kings starting with William the Conqueror in 1066 rather than those of the Scottish monarchs Macbeth, Malcolm III or Donald Bane... Scotland is... now... in the unusual position of being part of a larger nation state, but having its own legal system. Certain parliamentary bills are framed to apply either to England and Wales, or to Scotland... The demand for some transfer of power from England was hammered home in the May 1 British general election, when not a single member of Parliament was elected in either country for the Conservative Party, the only major political force resisting constitutional change.

...Seven hundred years ago on Thursday, the Scottish Army led by Sir William Wallace defeated the much larger English Army at the Battle of Stirling Bridge. This... September 11... will herald the start of... the devolution referendum, and all suggestions indicate a majority will... vote “yes”... But there is still debate as to whether [a] new Parliament will have real powers, or whether it will simply be a large, regional bureaucracy able to make no major decisions... Apart from the establishment of a Parliament, [a] second question asks voters to decide whether it should have the ability to vary taxes. Recent polls have shown public support for that idea has fallen below 50[%], a worry for the politicians. It seems the people of Scotland have realised they can have their Parliament, but rather than pay for devolution themselves through higher taxes, all of Britain can help fund it. Business leaders have campaigned against different levels of tax in Scotland and England, warning of a move south of industry and commerce if taxes are raised. The other major issue is that of the Constitution. The Scottish Nationalist Party has used the devolution debate to highlight its hopes that a new Parliament is only the beginning, and will lead to an independent Scotland. Labour does not want that... But just to make sure, they have retained constitutional powers in Britain, so even if Scottish MPs vote to form an independent Scotland, constitutionally they cannot break away from the United Kingdom without the support of England’s politicians.

...The Labour Government’s white paper published last month proposes a parliament in Edinburgh of 129 members – 73 elected for constituencies and 56 on a proportional basis. It would have an executive and a chief minister. Eligibility would be based on residency. The number of Scottish seats in Westminster, 71 at present, would “be reviewed.” Scotland already has block votes of money from Westminster for health, education and other expenditure categories. This is administered by the Scottish Office, based in Edinburgh... So, apart from a separate assembly in Edinburgh, what would change? Well, the range of block votes would expand and the parliament would have the power to raise or lower the rate of income tax imposed by Westminster by up to 3[%]. This would amount to a tax variation of \$NZ1125 million either way and would be “indexed to maintain its real value.” The Scottish Office already has a large public service staff which would mostly be transferred to a new parliament. Additional running costs are estimated at between \$50 million and \$75 million and would be met by the assigned budget of the Scottish Office.

...Scots voted in a three-to-one landslide in favour of a... plan to give their country its own parliament... A slightly smaller percentage, 63.5[%] said “Yes” to the second referendum question asking whether the parliament should have tax-varying powers... Turnout among the nearly four million electors was 60.4[%], which is... relatively low for Britain... 71[% voted] at the general election... The... government bill setting up the new assembly would be ready for the end of this year and would be passed by the British Parliament next year, with the first elections in the middle of 1999... Another referendum on devolution of power from London will take place in Wales next week.

...The people of Wales began voting yesterday... Opinion polls in the run-in to the referendum pointed to a vote for greater autonomy but many... voters were undecided right up to the last minute... The... proposed... assembly... would contain 60 members [and] control an annual budget of £7 billion... From schools to sport, housing to hospitals, the assembly would run daily life... for some three million people... but would hold no sway over finance, foreign affairs, defence or law and order. The last time Wales was offered its own assembly, in 1979, people voted “no” by a stunning four to one margin. But the mood in Britain has changed after 18 years of centralised Conservative rule...

Six hours after the polls closed, officials declared victory for home rule after an exhausting and exhilarating night that pitted 559,419 “yes” votes against 552,698 saying “no.” ...Yet opponents of the assembly said the tightness of the vote ensured the long-simmering issue... was far from resolved, with large patches of Wales opposed, undecided or too apathetic to vote... [T]urnout... was... at 50[%]. In related news, conscientious... peers have narrowly failed in their bid to have daily attendance allowances of nearly \$[NZ]80 forfeited by colleagues caught snoozing during debates in the House of Lords. This dozing-off... is a well-established tradition – possibly because of the mind-numbing tedium of the speeches. And that reminds me of the apocryphal story of the elderly earl who dreamt he was making a speech in the Lords. Then he awoke and found he was.

...Britain’s Labour Party last night kicked off its first conference in power since 1978 with a vow to get tough with jobless youngsters and single mothers as part of its goal of restoring full employment... “We will end the Tory paradox of an army of unemployed youngsters living in a nation full of un-met needs,” [the] Foreign Secretary... told the opening session of the conference... [He also] nudged Labour closer to a commitment to stripping hereditary peers of the right to vote in the House of Lords... “Before Britain enters the 21st century I want us to be free of the medieval lumber of hereditary peers...”... Labour has just 15 hereditary peers, compared with 326 for the Conservative Party. Another 23 are Liberal Democrats and 274 do not follow any party line. Together they make up almost half of the upper chamber’s membership of 1280. Few hereditary peers vote regularly but the Conservatives occasionally called theirs in from their country estates to great effect during their 18 years in power to ensure the passage of bills or to block Labour-backed measures... His comments provoked the Duke of Buccleuch to remark that hereditary peers were appointed by God... “Somebody ought to tell the Duke that the divine right to rule went out 300 years ago...,” said the Foreign Secretary.

...[‘any NZ politician who suggested his son should have the automatic right to succeed him in Parliament would be laughed out of the Beehive. It is a concept so out of step with democratic principles that a modern politician would have to have spent hours propping up the parliamentary bar to even suggest it. Yet what we see as laughable is an entrenched cornerstone of Britain’s parliamentary system: the right of hereditary peers to sit in the House of Lords. The New Labour juggernaut is determined to bring that right to an abrupt end. A “short but momentous” bill is before the British Parliament to do just that – and, in the arcane language of the upper chamber, is “now in the middle of its passage through another place.” Translation: the House of Commons passed its second reading by a massive 246 votes, 69 above Labour’s nominal majority. It is difficult to argue, even in Britain, for the retention of hereditary rights in this day and age. The *Daily Telegraph*’s political editor sums it up: “Whatever their useful expertises, a genetically transmitted right to legislate is intellectually indefensible.” The Speaker of the House of Lords is the Lord Chancellor. A Labour life peer, he told me: “We don’t have hereditary rocket scientists; we don’t have hereditary football coaches and we don’t have hereditary Lord Chancellors either. And so, I think, whatever is right, the hereditaries are wrong. So I am completely unapologetic about removing them as a first self-contained act. As for phase two, well, that will be considered by a royal commission.” So what model for an upper chamber will be recommended by the 12-strong royal commission, drawn from across the political spectrum? The White Paper “Modernising Parliament: Reform of the House of Lords” suggests four possible models: a nominated chamber, a

chamber directly elected by voters, a chamber indirectly elected by an electoral college, or a mixed chamber. One wonders why Britain is intent on unravelling one intellectually unsustainable part of the institution before it has a worthy substitute to put in its place.'

...The Upper House of the British Parliament, which is to be purged of hereditary nobles under sweeping reforms by the Government, yesterday approved an amendment to the main legislative bill, sparing the seats of 92 aristocrats from abolition until a new chamber is established. The bill ending the 700-year-old right of Dukes, Marquesses, Earls, Viscounts and Barons to sit and vote in Parliament has already been approved by the House of Commons. The amendment, proposed by a former Speaker of the House of Commons, was backed by 352 votes to 32 – one of the biggest majorities this century. It means 75 hereditary aristocrats, or one-tenth of the total of 759, will stay on. Fifteen places will be reserved for deputy speakers and committee chairmen and a further two for the Earl Marshal and the Lord Great Chamberlain. Meanwhile some Lords – who 'must each justify their position in 75 words or less (the law making them do so is 82 words long') – 'have vowed to bow out of Parliament by defeating as much of the PM's legislation as possible.'

...The British P]M... has bluntly told his Labour Party critics they cannot duck the tough spending decisions needed to prepare Britain for the new millennium. Five months to the day since he swept to power on a tide of euphoria that has yet to recede, [the PM] was facing the first real test of the willingness of rank and file Labour members to back his intention to blast away some of their most cherished ideals[– such as]... free university tuition and... the renationalisation of Britain's railways. Both issues are dear to the hearts of left-wing activists. An unpaid ministerial aide... begged [the PM]... to reconsider his plan to make university students pay part of their fees. [However, ministers] are confident of winning the vote on tuition fees. The outcome of a debate urging the Government to spend up to £4 billion... to buy back the railways... is likely to be much closer. But [the PM] said he would ignore any demand to renationalise the railways. "It ain't going to happen," he said... [during an] hour-long address, in which he promised to turn Britain into a beacon for the world and a model 21st century country... [He also] dropped further hints, saying that people in future would have to look to a combination of the basic state pension and a private second-tier pension for their needs in old age... The centre piece of the speech was... the need to overhaul Britain's welfare state and its £90 billion... a year budget... He made no apologies for serving notice that the days of blank welfare cheques were numbered. "...the way back to a decent standard of living... [for] the vast majority of... people that are poor or unemployed or disadvantaged in our society... is work. It's just work they need." ..."The people's premier gives us all heart and hope," said the *Sun*... [while] the left-leaning *Guardian* said talk of hard choices was a barely concealed code for a wholesale attack on the welfare state... Proof that [the] post-election honeymoon is still going strong came on Thursday with an opinion poll giving Labour 59[%] backing, more than the 44[%] it polled on May 1 and one of the highest ratings ever for a governing party... The Tories... go to their conference in the northern English seaside resort of Blackpool next week with a young, untried new leader... and a popularity rating of just 25[%].

...Britain's opposition Conservative Party set sail on a new course yesterday, reaching out to single parents and gays as part of an effort to cast off the uncaring image that it admits cost it the May 1 election. Setting the tone for his keynote speech to the party's annual conference, [the] new party leader[, who] is just 36... enthusiastically endorsed frank criticism by[a] former defence secretary... "Tories were linked to harshness, thought to be uncaring about unemployment, poverty, poor housing, disability and single parenthood, and considered indifferent to the moral arguments over landmines and arms sales. We were thought to favour greed and the unqualified pursuit of the free market with a 'devil take the hindmost' attitude,"... said... [the] right-winger who lost his seat at the election... [Meanwhile, the PM] has appointed... an MP with a record of drafting novel solutions to welfare problems, as a Junior Social Security minister with a brief to "think the unthinkable." The *Times* quoted a Government source as saying [the minister] was about to come up with a plan to force all workers to pay into a national fund to finance nursing care for Britain's growing army of old people.

...Rebellious Labour Party members of Parliament dealt... [the PM] a huge blow yesterday when a junior minister resigned in protest at cuts in lone-parent benefits... of up to £11... a week... and then 48 of his 419 MPs voted against him... In addition... two MPs who acted as unpaid aides to senior ministers quit... [However, the rebels] lost by 457 votes to 107. The opposition Conservatives voted with the Government... The rebels could in theory face expulsion from the... Labour Party, but political sources said in view of their numbers, such drastic action was unthinkable.

...Only days after [the British PM] urged voters to trust Labour his deputy was reported as saying it was sometimes acceptable to mislead the public... [The deputy's] embarrassing admission was the latest blow to a... [party that is] already rocking from a string of policy U-turns... and... infighting over strategy...

The British Government has scooped six out of the nine Golden Bull awards presented each year for incomprehensibility. The Department of Trade and Industry was given special mention for its definition of a pram as "a wheeled vehicle designed for the transport in a seated or semi-recumbent position of one or two babies or infants or any carry-cot or transporter thereof." The awards are presented by the Plain English Campaign... [Incidentally, the PM and the US] President... cemented their warm personal relations yesterday by declaring themselves political twins from a new generation with no use for "yesterday's ideology." ...visibly relaxed in... [the PM's company as he] became the first US President for almost 30 years to address the British cabinet[, the President]... said there was an "unbreakable alliance" between the two countries. - 1997

An important difference between British parliamentary government and the U.S. government is that whereas in Britain the prime minister, or chief executive, holds office only by virtue of his [or her] leadership of the majority party in Parliament, and is retired when that party loses its majority, in the U.S. the President is elected separately and has a tenure independent of Congress.

Congress, the legislative body of the U.S. It consists of two houses sitting in Washington, the House of Representatives, which normally consists of 435... members elected by the states according to population, and the Senate of 100 members, two from each state. The houses sit separately, but the consent of both is necessary to [introduce new legislation (in addition, the US has got separate state and federal legislatures – like AUS).] Senators are elected for six years and representatives for two... Its legislation may be pronounced unconstitutional, and therefore invalid, by the Supreme Court. The President can veto its legislation, but Congress can overcome this by passing the vetoed measure again by a two-thirds majority... Members of the President's cabinet are not members of Congress.

A President must be at least 35 years old, have lived within the U.S. for 14 years and be a "natural-born citizen" – [although] the last phrase [hasn't been] legally defined as a presidential qualification... The candidate must win more popular votes than any other nominee in enough states and the District of Columbia to give him a majority of the electoral votes. If he does... he has won the right to the office of President of the United States...

In September 1788, Congress called on the states to choose electors who would cast votes for the newly established office of president. They unanimously elected George Washington on February 4, 1789, and the American political institution of holding presidential elections every four years – as established by the U.S. Constitution – was begun. Who, in 1988, will become the 41st president of the U[S]? That answer will finally be known after a long, arduous campaign that, for some candidates, began a year or more earlier... The presidential election has four phases. The first is the selection of delegates – where the Republican and Democratic parties select delegates and commit them to a specific candidate... The second is the campaign for the "nomination" – the official endorsement by each party of the favored candidate. To win the nomination, a candidate must get the majority of votes at his or her party's national convention. Conventions are held in the middle of each election year. The third phase is the

campaign to win the final election. The final phase is the vote of the Electoral College, when “electors” in each state go to their state capital and fill out official ballots. The electors vote for the same candidate who won the popular election in their state. The ballots are mailed to Washington, opened and counted in the U.S. Congress, and the winner is announced... The 1988 presidential campaign will end on November 8, Election Day, when Americans enter voting booths across the country and select the individual they believe can best govern the U[S]... Each state has the same number of electors as it has U.S. senators and representatives. In addition to two senators each, states are divided into congressional districts of about 520,000 people, and each congressional district sends one person to the House of Representatives. Therefore, even the smallest states in population, such as Utah or Alaska, have three electoral votes (two senators and one representative). Since California has the largest number of congressional districts – 45 – adding two senators gives it 47 electoral votes... Prior to the election, the Republican and Democratic parties in each state... choose a slate of electors. If, for example, the Republican presidential candidate wins in a state, the Republican slate becomes the electors for that state. As loyal party members, the whole slate casts its votes for the Republican presidential candidate. The result is a winner-take-all system. Under the Constitution, if no candidate gets the required 270-vote majority in the Electoral College, the election is thrown into the House of Representatives. An election can end up in the House of Representatives, however, only if a candidate from a third political party wins one or more states, thus robbing the leading major-party candidate of a majority. Because of the strength of the two parties, third-party candidates seldom win a significant number of electoral votes in any national election... A direct popular election always works to the advantage of the majority; the Electoral College usually does. Most often it has enlarged the margin of the popular vote leader... The Electoral College contains a number of built-in biases. The most significant of these stems from its winner-take-all voting method. This benefits the largest states not only because of the number of electoral votes they cast but because the votes are cast in a block. By giving an edge to the larger states, the Electoral College also benefits groups that are geographically concentrated within those states and have cohesive voting patterns. Thus, those who live in the central cities and suburbs have a particular advantage... In general, states in the Far West and East are aided by the Electoral College, but those in the South, Midwest and Rocky Mountain areas are hurt by it. Additionally, the system works to the benefit of the two major parties and to the detriment of the minor parties, which find it difficult to accumulate enough votes to win an election. To have any effect, third-party support must be geographically concentrated... Naturally any system that aids some and hurts others will have its supporters and detractors... Over the years... [the] Electoral College... has been the subject of a continuing debate. Those who favor the system see four principal merits... It provides for geographic balance. No one can win an Electoral College majority without support from a number of areas of the country... It is consistent with the federal character of the U[S]’s political system. It gives the states direct representation in the national vote for president... It isolates voting problems. A dispute over the vote in a particular state does not spill over to other states nor is it likely to affect the outcome of the election unless the electoral vote is very close... It is a system that has met the test of time... The last disputed election occurred in 1876 and the last undemocratic result took place 100 years ago in 1888. Not only has it usually been decisive and democratic, but by enlarging the president’s margin of victory, it legitimizes the results and enhances his mandate for governing. Those who oppose the system, however, point to some real and potential problems... It is undemocratic in conception and practice. All votes are not equal; those living in the large states are advantaged. Candidates concentrate their resources in those states... It has been undemocratic in result. In two elections the popular vote winner has lost in the Electoral College. In several others, the popular vote winner has almost lost. The potential is always present for the candidate favored by the majority to lose... Voters do not understand the system of indirect election. They believe they are voting directly for president. At least theoretically, the electors can always undermine a popular mandate by exercising their own judgement. (Sixteen states and the District of Columbia have laws that require electors to vote for the candidate who wins the popular vote, but it is questionable whether these laws conform to the Constitution.) ...The system is an anachronism. It does not work as intended, nor does it accord with the growing nationalization of American politics: the national media, finance laws, campaigns and policymaking... Several plans to alter the structure of the Electoral College, change its electoral biases or preclude an undemocratic result, have been proposed. The simplest one would eliminate the electors but retain the College system of voting. This would remove the danger of electors substituting their own judgment for the people’s... The system that has received the greatest support in recent years is direct election. In 1969 the House of Representatives actually voted for a constitutional amendment to directly elect the president, but the Senate failed to muster the two-thirds vote needed to propose such an amendment to the states. A direct popular vote would, of course, remedy a major problem of the present system – the possibility of electing a president who did not receive a plurality of the vote. It would better equalize voting power both among and within the states. The large states would lose some of their electoral clout by the elimination of winner-take-all voting. Party competition within the states and perhaps even nationwide, would be increased. Turn-out should also improve. Every vote would count in a direct election. However, a direct election might also encourage minor parties, which would weaken the two-party system. A very close popular vote could also cause problems in a direct election. The winner might not be evident for days or even months. Voter fraud could have national consequences. Moreover, it is also possible that the plurality winner might not be geographically representative of the entire country. Organized groups that are geographically concentrated in the large states would have their votes diluted by direct election.

No other election in the world lasts as long... marshals such legions of workers... or... costs as much... as a U.S. presidential election.

Do you realize how much it costs to run for office? More than any honest man can afford.

Don’t laugh. Two... very rich men tried... [to] buy the presidency of the U[S]... in recent elections with self-financed campaigns, on which there is no legal spending limit... [One spent nearly] \$100 million in 1992 as an independent presidential candidate and [the other] forked out \$58m... trying for the... 1996... Republican nomination. For the 1996 general election, both [of the major party candidates will spend their] \$95m cap in federal funds. Additionally, [they are expected to spend \$65m and \$58m respectively]... in the primaries... It probably would cost in the \$750m range for a self-financed independent to have a real chance at the presidency[(the US has only had ‘one independent president’ – the second: John Adams, 1797-1801).

...the US] President... and his wife... earned over \$US1 million... last year, according to documents released yesterday, with the \$US742,852 royalties from her book *It Takes A Village* dwarfing his \$US200,000 salary... [However, the President and First Lady’s] Whitewater-related legal bills... debt has grown substantially in the past six months, say administrators of their legal defence fund. In January [the President] said he was technically broke from legal bills... [At the time the President] and his wife... owed \$US1.2 million... to lawyers. Now the debt is \$US1.7 million despite payments of \$US350,000 in the past six months... [The President] would owe lawyers even more were it not for the fact that his liability insurance covers costs of the... case, defence fund officials said.

[The First Lady] is being sued for \$US90 million... for allegedly using confidential FBI files in an attempt to obtain damaging information about former White House staffers under the [previous two] Administrations. She is one of a number of people named in a class action lawsuit.

...Fifty-two per cent of Americans believe [the] President... did something illegal in the Whitewater scandal and 56[%] think he probably tried to cover up wrongs that were committed, according to a new poll released yesterday. Both are the highest numbers recorded... since these questions

were first asked in February 1994. But the poll added that only 22[%] of all adults said they felt worse about [the President] because of Whitewater... [Last month 3 of the President's] former associates were convicted on fraud charges related to the failed Whitewater real estate deal...

Where are most of the tough political decisions made? On the golf course if you are President of the U[S], it seems... The World's Most Powerful Man... is a self-confessed golf fanatic and he now plans to play 100 rounds of golf in his last year in office if he gets re-elected... [He] is after the record set by the late *Dwight D Eisenhower* who played 800 rounds during his eight-year term... The golf bug goes even further in the White House... Former president *Warren G Harding* had to be taken off the golf course to sign the resolution ending W[W1]. Naturally, he then returned to the course to complete his round... Only in America.

...[America's] President... yesterday claimed election-year credit for new figures showing a further decline in the U[S] budget deficit, saying it was evidence that his economic policies were working. At campaign rallies in Missouri, Minnesota and Illinois, [he] trumpeted the news that in his four years in office America's red ink spending has dropped 63[%], more than meeting his 1992 campaign promise to cut the deficit in half... The decline in the deficit to \$US107 billion... this year also gave [the President] the opportunity for a rare direct response to [the Republican candidate's] appeal to Americans to "wake up" and reject [the President] in the November 5 election because of a raft of ethical problems. "My friends, America has heard a lot of calls in the last several days," he told a rally earlier in St Louis. "I would say that these results prove America is awake and moving in the right direction." [A]White House spokesman... took a harder shot at [the Republican candidate], saying his drumbeat of attacks showed he was "flailing." "It's increasingly becoming less necessary to respond as the shrillness and the absurdity of the remarks accelerates," he said. Republicans contended [that the President] deserved no credit on the deficit because they had to drag him into making reductions in Government spending after they took control of Congress two years ago... Analysts said both Democrats and Republicans had helped to reduce the deficit with various actions in raising taxes and cutting spending over the past six years. [Editor's note: 'The Republican Party is one of the two chief political parties in the USA (the other being the Democratic Party). It was formed in 1854 to resist the extension of slave territory; Abraham Lincoln was the first of its leaders to become President. It is now chiefly identified with business interests and favours restrictions on central power.']

...Lacking campaign battles over big issues, America will get again and again precisely the kind of campaign it has endured – one dominated by greed, character assault and slick stratagems designed to obscure the lack of true political differences among the candidates. The defining innovation of this campaign has been the targeting... of Asian magnates and corporations as the source of campaign funds. Like banks, [members of the existing administration] have simply gone where the money is.

...[the Republican candidate] announced yesterday that he would campaign day and night for the last 96 hours of the... presidential race in a herculean effort to prevent the re-election of [the]President... "The last time I fought round the clock for my country was in 1945," [he]said... "I will once again fight round-the-clock for America's future..." ...He had decided to roll the dice in California, figuring he could upset the President nationwide by stealing the state's 54 electoral votes, which are one-fifth of the 270 needed to win in the indirect U[S] system. He poured \$US1.5... million a week into television spots and spent seven days in the state. In doing so, [he] pulled television advertising money out of other crucial states, virtually conceding them to [the President. Nationally, he narrowed the President's] lead to 7.7 percentage points in the latest... poll... [S]upport... for... the... Reform Party candidate... [(whose \$100m outlay in 1992 gave him '19% of the vote')] has been creeping towards the 10[% mark.

...the President's] re-election endows him with historic stature, the first Democrat to win a second term since Franklin D. Roosevelt 60 years ago. His recovery, deemed almost impossible for most of the first three years of his often chaotic presidency, has been the ultimate revenge of the Comeback Kid on those who always write him off too soon. [He] came to the White House by a series of accidents and strokes of luck, and at least four years before he was ready. He decided to run in 1992, knowing the traditional rule that the voters liked to take a first look at a candidate before entrusting him with the highest office... Moreover, [his opponent was]... basking in Gulf War approval ratings of almost 90[%]... Then everything fell into place when the favoured candidates all decided to duck the 1991 race. [He] became the unexpected front runner in a singularly undistinguished field. Had there been a halfway decent Democratic alternative in February 1992, when... [his] campaign crumbled under the twin embarrassments of [an alleged illicit affair] and his record of avoiding the Vietnam draft, his ambition would have stopped dead. Then came the second stroke of luck, the intervention of [a]Texan billionaire... with his pathological loathing of [the 41st President] and his bottomless moneybags, spending lavishly to attack the President's unimpressive economic stewardship. [The 41st President] himself provided the final unexpected boost to [the Democratic candidate's] quixotic campaign. He was tired and sometimes disoriented by his Halcyon sleeping pills, jetlagged to the point of public nausea in Japan, and simply not prepared to believe that the voters could ditch him for a draft-dodging womaniser. [Furthermore, 'the power of incumbency is illustrated by the fact 96.1% of incumbent representatives and 96.9% of incumbent senators were re-elected in 1990.' The 41st President's] campaign was dispirited to the point of feebleness. Catapulted into the most powerful job in the world with a mandate of just 43[%] of the vote, [the 42nd President] was an innocent in Washington with a thin talent pool among Democrats who had been excluded from Government experience for 20 of the previous 24 years... [However, he] built on his luck... in the timing of the economic cycle... that was only just emerging from a tough recession[– thereby]... benefiting from the steady and sustained economic growth that produced 10.8 million jobs during his presidency... As he learned his business [the 42nd President] scored some serious achievements, from securing the withdrawal of Russian troops from the Baltic states and persuading Ukraine and Kazakhstan to give up their nuclear arsenals... But... he... brought naivety to the politics of Washington, assuming that the Democrats in Congress would be loyal and the Republicans open to persuasion that his main promises of health and welfare reform were "neither liberal nor conservative, neither Democratic nor Republican." Ironically, the Republicans were to be the saving of [the 42nd President]. They over-reached, lured by their own rhetoric. They twice refused to vote essential funds... which saw the federal Government twice closed down... The Republicans tried to blackmail the President into signing their draconian budget. Instead, they liberated him. [He] stood forth as the only man who could stop them savaging the budget for education and the environment. The Democrats had nowhere else to turn but to their President, even when he began distancing himself from them to show that he could work and pass legislation with the chastened Republican Congress. In the end, [he] could claim to have governed as he had promised on the 1992 campaign trail. He had been a centrist and a moderniser. He had pushed his country into an enthusiastic embrace of the global economy. The rich and the upper middle class had done well from the [42nd President]... But they had not voted for him.

...While[the 42nd] President... won a sweeping re-election victory... his Democrats' failure to take the... Congress from the Republicans has guaranteed a divided government. That may signal a return to the bitter battles of the past... Republicans easily retained control of the Senate and narrowly kept the House of Representatives... By returning a closely divided Congress, the American people were "sending us a message. Work together, meet our challenges... When we join our hands... America always wins[," the President said. He also said: "I have been more blessed than any American in my lifetime," and "Thank God I'm an American."] - 1996

NOT SO GREAT EXPECTATIONS THE STREETS of Washington DC were an odd mix of shivering restraint and half-hearted festivity last week as the U[S] capital prepared to celebrate... [t]he second inauguration of... [their President]. More than 250 private jets flew into Washington's National Airport, ferrying in [the President's] supporters for a \$100 million feast of parties, highlighted by the 14 official inauguration balls – the [First Couple] visited them all – and dozens of other functions, such as the Gay and Lesbian Inauguration Ball. The past few days have provided

plenty of reasons for [the President] to feel smug about his prospects as he enters the fifth year of his presidency, traditionally the year that offers any president his best opportunity for bold action... Opinion polls give [the President] a 57% approval rating, a level he has reached only once before – soon after his first inauguration. Ten days ago, he revelled in his election victory by awarding his... Republican... [presidential] challenger... the nation's highest civilian honour, the Medal of Freedom. Twenty years ago [he had described the challenger] in a letter to a friend as “the biggest prick in Congress”, and just last week his former adviser... revealed that during the campaign, the President privately described [the challenger] as “an evil, evil man”. But as he prepared to renew his lease on the White House and resume his combat with a Republican-run Congress, [the President] was shrewd enough to reach out to [the challenger] and his supporters, now calling him the embodiment of main-stream American social values. A few hours after the medal ceremony [the President] had the pleasure of watching a Congressional committee slash his most aggressive opponent, [the House Speaker... down to size for cheating on electoral funding rules and then lying to Congressional investigators about his sins... The... first Republican re-elected as speaker in 68 years... had already agreed to accept a reprimand, a technical solution that would allow him to remain Speaker, but the committee threw in a \$[NZ]430,000 fine.

...In a historic and humbling rebuke to its leader, the U[S] House of Representatives voted over-whelmingly... to reprimand [the Speaker... and order him to pay \$US300,000... for violating House rules... He was not in the chamber for the 395-28 vote, the climax to two years of bitter partisan charges and counter-charges that undermined his authority... The pugnacious 53-year-old... Republican, who appeared an unstoppable force when he took over his post two years ago, became the first House Speaker in U[S] history to be punished for misconduct by formal vote of his colleagues... “This penalty is tough and unprecedented. It is also appropriate... No one is above the rules of the House of Representatives.” ...Republicans still back him but the vote raised questions as to whether he would last the two years of his Speakership. A reprimand does not require him to step down... his offences were of a category between a reprimand and the censure that would have almost surely forced him out... [By the way,] Washington politicians are not as rude as they used to be according to a “vulgarity index”... Members of the House of Representatives used 1076 expletives in 1991 but only 943 last year.

...*Old White House tapes reveal more dirty tricks*... Two weeks after the 1972 Watergate break-in, President Nixon directed his aides to vandalise his own party's headquarters and pin blame on Democrats, the *San Francisco Examiner* said at the weekend. The plot, which was not carried out, was described in White House recordings among more than 200 hours of tapes released by the National Archive... The late Republican President, who resigned over the Watergate scandal, was heard on previously analysed tapes ordering audits of wealthy Jewish Democratic contributors, break-ins of various institutions, and surveillance of leading Democrats... Much of the talk is hypothetical... In a July 1, 1972 Oval Office conversation... [with his] chief political aide... Nixon envisions... damage done to his own party's offices: “...it may be that what they want is to get in and sort of get at files in retaliation against us... You know, the young people. I was thinking, if they made that error – and I would consider it an error – if they get in one night... and tear it to shambles, what would you think if that happened?” ...“Nixon often said exalted things that people didn't think would have to be done,” [the] Secretary of State under Nixon, told the *Examiner* last year. After Nixon resigned... [his chief political aide] pleaded guilty to obstruction of justice. [The aide] now heads the Christian Prison Fellowship in Virginia [but] refuses to comment about his tenure as Nixon's assistant. [Nixon, who ‘spent more than \$40,000 for balloons at his nominating convention’, has been described as ‘a driven man full of self-pity and fuelled by paranoia.’ ■ Among *TIME*]... readers who registered their reaction to the \$300,000 fine levied against [the Speaker] [Jan. 27] for violating House ethics, the nays far outnumbered the yeas. Most of those who wrote[to] us thought the Speaker got off too easily... “Not only should [he] be forced to resign as Speaker of the House,” wrote [one reader], “he should be made to pay the... fine in community service. Maybe he could start in one of the areas that suffered cuts from the famous Contract with America.” ...[another reader] thought it odd that [the Speaker] didn't lose his job... “Most of us would have been fired or at least suspended if we had done something bad enough to be fined \$300,000. There's something wrong with America when pro basketball has higher moral standards than Congress.” But even after the controversy, [the Speaker] still has his supporters – including... [a Californian] who likened him to American heroes of Revolutionary times. “[The Speaker] will emerge as a patriot... The nation, yes, even civilization, would have been ill served if, like other zealots, [he]... had been removed from office.”

...*the baby-boomer twins leading American politics are... on [a] seesaw sleaze ride*... American politics have always operated on the two-year cycle of the congressional elections, when all 435 representatives and one-third of the senators face the voters. This two-year cycle has been intensified by the phenomenon of those identical baby-boom twins of our day... whose fortunes rise and fall every 24 months. [The President] has timed his well, at his peak in the presidential election years of 1992 and 1996, and at his trough in the mid-term congressional elections of 1994, when [his political twin] soared on the wings of [a] Republican revolution to take control of both House and Senate for the first time in 40 years. [The President] is now descending from triumphant re-election into what will become a new slough of scandals emerging from his unprecedented money-raising operations. They will be made worse by the unfinished business of Whitewater, according to lawyers involved in the inquiry who predict his wife... will be named an unindicted co-conspirator by the special prosecutor. It would be much worse for the [First Couple] were it not for the President's political twin being in the depths of his own cycle. Just before Christmas, [the Speaker]r... admitted to the House of Ethics Committee that he had misled it (he blamed his lawyer) about a college course he taught and financed through a tax-exempt foundation. Being tax-exempt, it should have been an apolitical course. It was not. He also claimed his political organisation Gopac was not involved. It was. Indeed, [the Speaker]r... once boasted that, through wider distribution on cable television, the course should produce “200,000 committed activists nationwide before we are through.” The Republicans are closing ranks... be[hind the Speaker – whose re-election was]... exactly what the Democrats and the White House want[ed]: to be confronted by an ethically bruised and somewhat chastened Speaker, whose presence stands as a constant reproach to Republican attempts to pursue [the President] for his own embarrassments. [The Speaker's fine and] public apology may not end the matter. The evidence accumulated by the ethics committee inquiries has unveiled offences which may lead the Internal Revenue Service to bring its own charges. And [the Speaker]'s operations have involved what looks like looting charities. His Earning by Learning scheme, which pays \$2 to inner-city children for each book they read, has delivered less than a third of the money raised to children. More than half of it went to... a biographer and adviser to [the Speaker]r... Then there was the Abraham Lincoln Opportunity Foundation, another tax-exempt charity supposed to help inner-city children. Between 1990 and 1993, it raised \$259,000, almost all of which went to fund television workshops to recruit and train conservative activists. This sticks in the throat when you recall the pious speeches [the Speaker]r... makes about “the bloated bureaucracy of the welfare state.” ...[the author of *The Decline of the West* wrote that: ‘He who is out for purely economic advantages – as the Carthaginians were in Roman times and, in a far greater degree still, the Americans in ours – is incapable of purely political thinking. In the decisions of high politics he is ever deceived and made a tool of, as the case of Wilson shows – especially when the absence of statesmanlike instinct leaves a chair vacant for moral sentiments.’] The only credible defence to the charge that the American political system is thoroughly corrupted is that there is nothing hole-and-corner about the endemic peddling of financial influence. There are no secret price lists in this mercenary political culture, and the voters have no excuse if they decline to display concern. A night in the Lincoln bedroom at the White House can be yours for a mere \$250,000 to Democratic Party funds. It is not clear whether the price automatically includes breakfast with the First Family, but on the record so far another \$100,000 should ensure it. Unless you would rather spend the \$100,000 on ensuring an invitation to one of the dozens of quiet dinners with the President which were arranged at the Jefferson Hotel. The [40th] Administration... was credited with turning the daily work of presidency into a permanent political campaign. [The 42nd President] has taken this to the logical conclusion of mounting the permanent presidential fund-raising operation, and must now know that he has brought the White House into something wretchedly close to disrepute. The cartoonists who display the presidential mansion with a placard saying For Sale, or with a neon

motel sign flashing Vacancies, are bang on target. We would be drawing parallels with the thoroughly corrupted administrations of Presidents Ulysses Grant and Warren Harding were it not for the openness of it all, and were it not for the equally unsavoury embarrassments of [the Spoke]r... And it is no accident that the two pre-eminent politicians of the day have each been pioneers in the use and abuse of fund-raising... [Both came] from a broken home and [were] raised by an alcoholic stepfather, each managed to avoid conscription to Vietnam, to “cause pain in my marriage” and to have been embarrassed by siblings. Neither has held any job except for undistinguished university teaching and paid political office. Even without the curious fact that each has a 1966 Ford Mustang convertible, as a private car, the parallels between them are uncanny.

...riding high on the success of the U[S] economy, the President has set his agenda... by urging... [other] industrialised nations... to abandon old ideas and take up the tools that helped America relaunch itself... [He] said the... economic boom over which he has presided was created by a new approach to economics based on balancing the budget, investing in education and expanding trade. Just four years ago, [he] was roundly criticised... for an economy that was stagnating under the weight of massive budget deficits. Now he was ready to boast: “America’s economy is the healthiest in a generation and the strongest in the world. All the countries in the world face the same choices we do. They have to decide: can they reduce their deficit and still invest in their people? Can they target people programmes; can they maintain a social safety net? Can they still grow their economy and reduce spending? You bet they can,”...

The U[S] President... yesterday sent Congress a \$US1.69... trillion spending plan that cuts taxes for the middle class, provides billions of dollars to upgrade education and health care and still claims balance in 2002... The Administration’s budget proposal[also] envisages savings of about \$US400 billion over the next five years... Most of the savings would occur in the plan’s final two years, after [the President] has left office... The US Department of Education’s budget would grow from \$US28 billion this year to \$US32 billion in the fiscal year of 1998, and level off at about \$US36 billion each year after that... [T]ens of billions of dollars more... would be set aside... for \$US1500 annual tax credits and \$US10,000-a-year tax deductions for college students, to boost grants for low-income college students by \$US300 to \$US3000, and to increase funds for school construction, classroom computers and reading initiatives... [The President] portrayed the five-volume set of documents as a good-faith offer to opposition Republicans to achieve the top priority of his second term, balancing the budget after three decades of red ink... [However, the] deficit would grow to \$US126 billion this year and \$US121 billion in 1998, a pattern that congressional Republicans have warned they would oppose... [The President also] pledged to restore \$US16 billion... in cut welfare funding, but Republicans are in no mood for changes to the new law... All this uncertainty, however, did not deter [the President] from grand thoughts of how he might be one day remembered. [Second-term presidents usually ‘concentrate on international affairs in order to try to make their mark on history.’]

...Beginning his first visit to South America... [the US] President... arrived in Venezuela yesterday and used Columbus Day to declare a “new world” was in the making throughout the Americas, based on economic and democratic growth... Invoking the memories of former U[S] Presidents John F. Kennedy and Franklin Roosevelt – who both stressed a commitment to Latin America – [the 42nd President] said: “Today I proudly follow the footsteps of both men...”

...a former nightclub singer who claims [to have] had a 12-year extramarital love affair with... [the 42nd President back] when he was governor of Arkansas in the 1980s... was questioned on the record yesterday by lawyers... [representing the woman who claims he] exposed himself... in Little Rock in 1991... [According to the accuser’s complaint, he] sat down on a sofa, lowered his trousers and underpants and invited her to perform oral sex. Whereupon she... [said] she was “not that kind of girl,” and headed for the door. Before she left, she claims, [he] told her, “You’re smart. Let’s keep this between ourselves.” ...[the President’s] \$1000-an-hour private lawyer, has... [dismissed] her story as “titillating allegations which really are just tabloid trash.” ...[she and her sisters were] brought up... according to a strict interpretation of the... Old Testament... No make-up, no jewellery, no tampering with the hair, which was to be worn long. No movies were allowed, no dancing or any other unsupervised fraternising with boys. As a further precaution against pollution of the mind and flesh, there was no TV in the house... To keep the inclement fates at bay, the [parents] would sit down every night with their girls to read the *Bible* and pray. To deter the girls from sin, [their mother] would dispense daily whippings with the branch of a wild cherrytree... One day in 1985[the father]... keeled over while playing the piano in church and died. According to the folks in... Lone Oak... the transformation took place overnight. The girls’ skirts shot up their thighs[they]... painted their nails, permed their hair, wore blue eye shadow, drank at home, stayed out late... A year on [the President’s accuser] posed in a G-string for a photographer boyfriend who, much later, after she had become famous, sold the pictures to *Penthouse*...

The Excelsior Hotel, a big marble and glass skyscraper on the banks of the Arkansas River, provides the closest thing to stylish living in the hot, corrupt city of Little Rock. It’s the place where... the... man who won a historic second term as President is accused of exposing himself in a sordid attempt to obtain swift sexual gratification. But alas for him, his alleged victim is a proud, religious woman... [The victim even claims she] is not interested in money: all she wanted was for the President to say sorry... Around 2.30 pm... May 8, 1991... the best-known figure in Arkansas... the state’s Governor for 12 years, strode through the [hotel’s] foyer, accompanied by his squad of state trooper bodyguards. As he passed the reception desk, he veered for just a minute and stopped, smiling directly into the face of... a small, dark-haired 24-year-old state clerical worker... Before he went into the main conference centre, [the Governor turned to a] trooper... and gave him... instruction[s to go]... to the manager’s office and request... the key to one of the suites, saying “the Governor needs a room for an hour – he’s got some urgent calls to make.” Thirty minutes later... [the trooper] sidled up to [the 24-year-old] and whispered... that... the Governor wanted to see her in an upstairs room. When... [she] asked him what it was all about, he replied: “It’s OK, we do this all the time for the Governor.” ...[the bemused 24-year-old followed the t]rooper... into the lift, assuming she was to be part of a thank-you reception. What happened in the next 16 minutes only [the accuser and the Governor] know for sure, and one of them is lying. But when... [the accuser] arrived back in the lobby, she immediately blurted out the story to[a] friend... who described her as shaking and in a state of shock. Within the next few hours she told another friend... and that evening she told her mother and two sisters... Her mother... has never doubted her; but... the... lay preacher[’s wife]... told her... daughter... firmly to say nothing. “These are powerful folks, honey, and it won’t do you no good to mess with them,” she advised. Like the dutiful daughter she is, [the accuser] agreed to say nothing; and if it had not been for the actions of others... she would have certainly remained silent... In December 1993, [the former Governor who was now the US President] suffered the biggest setback of his philandering career. Five of his Arkansas troopers, angered that he had not delivered on promises of promotions and better perks, decided to go public with a devastating exposure of his sexual conquests in a right-wing magazine, *American Spectator*. The 10,000-word article gave names, places, times and graphic descriptions of over a dozen affairs, varying from having sex in car parks to visiting the bedrooms of wives of his friends. Buried in the text was a reference to an incident involving... the picking-up of a woman at the Excelsior Hotel. It gave only [the accuser]’s first name but [the trooper] clearly implied that the woman in question was more than willing to indulge the Governor’s request for sex. [The accuser] made a basic error in her first move: she hired a lawyer who immediately scented money. He made a crude demand for compensation from the White House and began to discuss book and film deals. Faced by such demands, the White House damage control team moved into top gear, turning the words of old boyfriends and schoolmates to build up a portrait of what they called “a trailer park floozy hustling for a buck.” [The accuser] came close to collapse but she was saved by two respected Washington lawyers... who came to believe that the President had not only abused the rights of one of his employees, but was also a particularly vicious pervert. [The President] hired the services of... one of the highest-paid lawyers in America, whose first move was to try to settle out of court – an attempt which, when it later became public, was deeply damaging to... [the President, who then] agreed to a statement that “he had no recollection” of meeting [the accused]... While denying “any improper

sexual conduct,” the President was willing to state that he regretted any untrue assertions that may have been made about... [the accused, who] today... has reduced the damages sought in her sexual harassment lawsuit against [the] President... by \$525,000... from \$US700,000.

...[she] was vilified as a white-trash gold-digger when she claimed [the former governor] had sexually harassed her in an Arkansas hotel. Now... she looks set to humiliate, and perhaps even destroy, the American President... AS the egalitarian are wont to say, even the powerful put their pants on one leg at a time. In the case of [the] President... there may be even more to be humble about. The latest salvo in the... sexual harassment case came when the American media obtained [the accuser's] affidavit to the court in which she details what she claims to be the President's "distinguishing characteristics." These, reportedly, are confined to three things. His erect penis is about 5in... long, has the circumference of a quarter... and heads off at an angle. Which leaves the dire possibility for [the President] of the judge in the case ordering a medical examination to verify the claim. And despite the best efforts of [the President's] lawyers to defuse the political time bomb, the case will be tried next May... Like the celebrities in... Hollywood, [she] has become a prisoner of her own fame, rarely daring to go out in public... But much as... she may crave the return of her anonymity, she is determined to see the case through. "I want him to admit what he did... I'm not going to give up." ...The... President... yesterday emphatically denied all of the allegations made against him... and urged a federal judge to dismiss the case.

...Hoping to head off a major embarrassment until he leaves office, [the US] President... is asking the Supreme Court to delay... [the lawsuit. T]he justices are weighing whether [the President's accuser] can pursue her claim now or must wait until the President becomes a private citizen in four years... The Supreme Court ruled in 1982 that Presidents cannot be sued for damages involving their official duties, even after they leave office. The prospect of such lawsuits could harm a President's decision-making, the court said. But the justices have never said whether a sitting President can be forced to answer a lawsuit over acts unrelated to his official duties.

...A Supreme Court judge hearing a sexual harassment lawsuit against [the 42nd US] President... expressed scepticism yesterday about the [President's] argument that a President has a full-time job and should not be disturbed. "I don't find that terribly persuasive," said [the judge]... adding that Presidents find time to play golf, for example... Lawyers for the two parties in an encounter that allegedly occurred in an Arkansas hotel room in 1991 argued their cases for one hour before the nine judges... The... case... raises important political and constitutional questions[– such as]... should... the President... be placed above the law... [Incidentally, l]ong-silent Secret Service agents detailed John F. Kennedy's insatiable sexual appetite only after the 1994 death of his wife...

John F. Kennedy had sex with call girls in the... White House and on out-of-town trips... and an aide won their silence by threatening to have them thrown into an insane asylum, says a new book by... [a journalist who] wrote the first account of the US soldiers' massacre of Vietnamese peasants in My Lai... [and was the] winner of the 1970... Pulitzer Prize... for international reporting... The book, *The Dark Side of Camelot*, also says the... President suspected his wife, Jackie, of having an affair with Aristotle Onassis to get back at him for his own infidelities... [The book's author] had to delete a chapter about the President and Marilyn Monroe when it was discovered last month that documents [he] was using were forged. The documents said that Kennedy was paying Marilyn Monroe to keep silent about their alleged affair.

...[Monroe seems to have been unable to keep silent about the fact that she was having sex with 'the most powerful man in the world' ('Marilyn discovered in the President the perfect vehicle to play out her own emotional contradictions'). Not long afterwards, the actress was found naked and dead in her own swimming pool. The official verdict was suicide ('the diagnosis fit Marilyn to a tee'), but some conspiracy theories proclaim that she was killed by 'a lethal injection administered via her anus by CIA agents.' The CIA is also alleged 'to have been involved in the assassination of John F. Kennedy.'

...IT always takes Hollywood a while to catch a trend, but [the] latest movie, *Conspiracy Theory*, is as unobvious as its title... [It's about] a cab driver who lives in fear of a shadowy "They," the unelected power brokers who really pull the strings of government, the media and the public. It's been done before, and better, as anyone who's seen *The Parallax View* or *The Manchurian Candidate* can attest. But the marketing types had it right: conspiracy theories fit into the zeitgeist of our ...Pre-Millennium Times... Blame it on technology. The Internet buzzes with weird stories... Theories breed like rabbits and spread faster than Ebola plague... It doesn't mean they are true, but the one common requirement of any bone fide conspiracy theory is that it is impossible to confirm or deny. N[Z] doesn't have anything as wonderfully complex as the Kennedy assassination theories, which must fill entire libraries now. But... [among] my favourites is the one that says [the former PM] Norman Kirk could have been murdered by the CIA. I find that entertaining and intriguing. I also find it possible because the CIA was actively involved in getting rid of [AUS's PM in 1975]... The Vietnam war was nearing its end at that point and certainly [he] was having some real behind-the-scenes battles with the CIA and the A[US]n Security Intelligence Organisation. Documents have since been released officially and testimony from agents proves the CIA was involved in removing [him] from power. Did the CIA kill Norman Kirk? Well... [both PM's] shared a common theme as regards American [policies.

...as the PM] of Pakistan... vows to fight against the "conspiracy" facing his nine-month-old Government[(formed after his predecessor was sacked – r:p200, ln68), his counterpart across the border in the world's most populous democracy]... has been forced to resign by the Congress Party... - 1997

India's Congress Party, already embarrassed by the corruption charges levelled at its president and former [PM]... washed its hands of... a [another] corruption scandal yesterday after the seizure of... 36 million rupees (\$NZ1.5 million) in unaccounted cash from... houses of a former minister[. who]... was in London, reportedly for a medical check-up, and no arrest warrant was immediately issued. The Central Bureau of Investigation said it was easily the largest seizure of cash it had made from a politician. It took 20 detectives nearly 24 hours to count the numerous stacks of... rupees in various denominations... "I fear people may at this rate lose faith in the system," said... [a] spokesman for the governing United Front coalition. "Corruption grows when it is condoned. This is unfortunately what is happening in this country."

...Two people died in scattered violence yesterday as voters turned out for the second day of a three-stage local assembly poll in India's Uttar Pradesh state. Voting ends on Monday. - 1996

India was plunged into political turmoil yesterday when the federal cabinet decided to turf out the Government of its most populous state which had just won a confidence vote after a violent debate in the assembly... and imposed direct rule... The... decision was made after a report from the state governor that law and order was about to break down... Members of the Uttar Pradesh assembly threw chairs and microphones at each other during the voting in the state capital, Lucknow. The tussle pitted deputies of the... Hindu Bharatiya Janata Party... against centrist and leftist opposition groups. The opposition groups eventually walked out, leaving BJP to win... [A]nalysts said events in the state, which accounts for a maximum 85 seats in the 545-seat federal Parliament, could influence electoral alliances and eventually the composition of India's... Government.

...India's divided coalition government tried to defuse a political crisis yesterday by overturning its decision to sack a key state assembly... [The P]M... agreed not to dismiss the... state government in Uttar Pradesh... bowing to pressure from the Indian President... after a marathon meeting... Some... groups... [had] argued the brawl, which left 45 people hurt... was not a valid pretext for dismissal... [Meanwhile,] in the Indian state of Bihar... [h]undreds of men armed with sticks, spears and swords took to the streets... to enforce a general strike following the arrest of a scandal-tainted former chief minister... Thousands of paramilitary troops and police were put on alert across the eastern state to prevent violence.

...*'Kitchen cabinet' sparks political uproar in India...* The uneducated wife of a scandal-tainted Indian chief minister, chosen by him as his successor after he was forced to quit, assumed office yesterday amid all-round ridicule. Marxist allies of India's ruling coalition... lent voice to the condemnation of [the] former Bihar state chief minister... [The] Communist Party of India (Marxist) leader... said: "[The chief minister's] wife has never been in politics, she has nine children and she is not a member of the state assembly. What can we expect from such a replacement?"

...Unperturbed... [the chief minister]'s wife... aged 41, assumed office and addressed a meeting of top state Government officials before a cabinet meeting. "Work sincerely. Control the floods and look after the poor," she said... [The] Home Commissioner... said: "There may be some hiccups in her taking over. There is this cabinet meeting today which she will have to face alone... Let us pray God will give her the strength." ...[the chief minister] sparked a national political crisis on July 5 by splitting [the PM]'s party in the coalition and launching his own group. The move, which led to divisions within the multi-party coalition, was interpreted as an attempt to force [the PM] to protect him from investigations. When that failed, [the chief minister] finally agreed to quit – but only after deciding to make his wife Bihar's new chief minister. The *Asian Age* newspaper said [the wife], who barely completed primary education, had kept silent throughout a press conference on Saturday while [her husband] answered for her. When she failed to stand up during the national anthem and struggled to take the oath, [he] said: "I will train her within two days." [A] spokesman for the Congress[P]arty which keeps the [PM's] coalition in power with its parliamentary backing, said: "What do we do now? Democracy is being made a mockery of in Bihar and the P[M] has no answer." [The chief minister] is among 56 Bihar politicians and bureaucrats accused of stealing... \$472 million... from a cattle fodder fund... Bihar... a state of 100 million people... is one of India's poorest and most troubled... Per capita income in Bihar... is the lowest in India and most residents are without electricity, good roads or safe drinking water. The social structure is feudal, with money concentrated in the hands of politicians, bureaucrats and landowners[– who]... maintain private armies in the resource-rich region.

...India yesterday faced the prospect of fresh elections as the country was convulsed by a frenzy of political gamesmanship. The only real question appeared to be when, not whether, the new polls would be held... The strings are being pulled by the Congress Party, which is using an investigation into the 1991 assassination of its leader, Rajiv Gandhi, to make an audacious bid for power... Congress, which has ruled India for all but five years since independence in 1947, is chafing at playing second fiddle... The BJP is the single largest party... but with only 162 seats it is far short of a majority. Congress has 138 seats... The party provides sullen support to [the PM's]... shaky 15-party coalition while not holding any Government posts... Now Congress rebels are... [demanding that the PM's] coalition jettison the southern Dravida Munnetra Kazhagam (DMK) party... Newspaper leaks of [a] report say the DMK is accused of sympathising with Sri Lanka's Tamil Tiger separatists who were blamed by Indian officials for... [the suicide bombing that] robbed Congress of the last of the Nehru-Gandhi dynasty that had given the party charismatic leadership... The Tamil Tigers have never claimed responsibility... Commentators were harsh in their verdict on the political ructions... The turmoil is hurting India's economy...

INDIA'S fractious... coalition government has fallen after its key Congress party ally withdrew its support following 10 days of deadlock.[The] President... accepted the resignation of [the P]M... and ministers of his United Front coalition of free marketeers, regional and communist parties, but asked them to stay on... [However, the President must now cho]se between inviting parties in the fragmented parliament to try to form a new government or open the way to national elections 3 1/2 years early... so sending India's 600 million voters to their second election in 18 months.

...India has a new P[M – its]... fourth in a year... [–] after weeks of political upheaval. [The]77-year-old... was sworn in just over an hour ago... [In related news, the Pakistani P]M... has said his Government plans to strip the President of his powers to dismiss P[M]s and their administration. He said the plan has the approval of [the current]President... The last four governments were dismissed by a President using this provision.

...From a distance the political crises in India and Pakistan may appear as double acts in the theatre of the absurd but there is a difference. Whatever its political turmoil, Indian democracy remains secure, whereas in Pakistan there is the fear that farce may easily degenerate into tragedy... Things have drifted dangerously for several months now amid speculation about the moves and counter-moves by the two highest officers in the state... and the economy is in a shambles... The bizarre spectacle... on Friday... when... an unruly crowd of thousands of [the PM's] supporters stormed the Supreme Court... while the police stood by watching helplessly... seems to complete the impression of a breakdown. So far the Army has not played an interventionist role but the Army chief, who is expected to keep a discreet distance from the political hurly-burly, is increasingly finding himself playing a central mediatory role in this crisis. But in Pakistan the Army has taken over in far less distressing times and on flimsy grounds... [T]he most recent... period... of martial law... [ended] in 1985... Unfortunately for Pakistan – where excessive authority is vested in the unelected office of the President and the Army chief – the past has once again come to haunt democracy.

...Pressed... [in] 1947... for a date to announce the formal transfer of power, Lord Mountbatten looked on the calendar, paused for a while and – as the fable goes – circled August 15... Since the... day the two nations of India and Pakistan were born, there... has been a social and economic revolution... [However, if] one is to circle a critical date for India it would perhaps be July 24, 1991, when... the finance minister [to] the then P[M]... presented a budget which ushered in what is now popularly described as an era of liberalisation. With one stroke the suave, turbaned Sikh ended four decades of the Nehruvian model of Fabian socialism and vigorous state intervention. The [finance minister's] complete absence of any previous political experience – touted by many as his biggest disqualification... [–] in fact turned out to be his main asset, as no Indian politician would have... dared to turn the Nehruvian legacy on its head... [The results of] Indian red tape capitulating... are quite dramatic. In a country where most items in the luxury sector were in short supply and substandard, there was a sudden glut in the market. Consumerism boomed as multinational corporations lined up to supply everything from fast cars to fancy electronic gadgetry. Foreign banks also opened shop, offering loans and other facilities to further fuel the economic boom. It was all a culture shock to Indians, most of whom grew up being tutored by their parents on the virtues of the Gandhian maxim of simple living, high thinking. But the consumer boom has changed all that and a new class of mortgaged, in-debt Indian has taken root. He doesn't give a damn about the homilies from his elders and would rather have his goodies now and pay later. It would take reams of paper to have a proper debate on the liberalisation process in the India of 1997, still only six years down the open market economy lane... But what does one say about small and medium-sector industries which have either been finished or are on the verge of extinction by the onslaught of multinationals? This is particularly true in the consumer sector where industry is in a state of depression. There is an argument about only the fittest being able to survive and there being no room for mediocrity. But the fact remains that the protectionist environment allowed mediocrity to thrive in the country for more than 40 years. Is it now fair to suddenly expose the local industry to international competition, without giving them an even playing field in terms of resources and expertise? And in a country where a third of the population still cannot read and write and more than half of whom cannot get a square meal twice a day, what is more important – a computer-wise, highly efficient and productive workforce or jobs for as many as possible? There are no easy answers... But as... a respected Indian columnist and editor of the weekly *Outlook* magazine, writes, the... coming millennium has nothing to offer except more of the same. Many will argue that [he] has painted a rather gloomy picture. A more accurate one may be painted through a tired cliché: that India at 50 is perhaps best compared to a half-full glass. More important is whether in the next 50 years this glass gets filled or the gains made to date are also squandered... [Incidentally, t]he Pakistan Army intervened in a constitutional crisis last week but has denied it is seeking power. According to an Army statement, the Chief of Staff... had cancelled a visit to Turkey last week and returned to find [the] Government preparing to impeach... the President... for failing to endorse a law making it easier for... the P[M]... to defend himself against charges of contempt of court. But the Government dropped the motion at the last moment, causing media speculation that [the Chief of Staff had persuaded the PM] against the step... before his... Supreme Court trial for contempt of court was due to resume... [The PM's] defiant stand... [had threatened to prevent an] early resolution of a constitutional crisis which has... also split the judiciary, with an attempt to unseat... [the] Chief Justice... paralysing the Supreme Court and stopping the P[M's] trial. The PM blamed the President] for... the crisis... and said... [it] was costing the country \$36 million a day.

...Pakistan's constitutional crisis deepened... when a Supreme Court bench suspended the chief justice... who immediately issued an order cancelling his suspension. Last night the status of the orders was unclear... [In further news from the Asian continent,] Taiwan's *National Assembly* has resumed its customary brawling. In the worst melee in the legislative session that opened three months ago, politicians hit, shoved, kicked and wrestled each other in a battle that resulted in two deputies being hospitalized. The scrap began when opposition New Party legislators rushed the podium to stop discussion of their Kuomintang and Democratic Progressive Party rivals' proposed constitutional amendments.

...Singapore's ministers and senior bureaucrats, among the world's best paid, will have their salaries cut... b[y] between 2 and 7[%]... to keep them in line with the private sector, the Government said yesterday... The Singapore P[M]... currently makes more than \$US1.2 million... and Singapore's top ministers and civil servants also earn several times more than their counterparts in the U[S], Japan and Europe. The Government said junior grade ministers would get \$36,200 a month after the change... Bureaucrats at the most junior grade in the administrative service would get \$12,900... This is the first time the Government has cut salaries of ministers and senior officers since it adopted a formula in 1994 linking their pay levels to wages of top private sector executives... The... revisions were based on 1995 income data which showed the average principal earned income of the top four individuals from selected private sector professions had fallen by 18[%], Singapore officials believe the city state's high Government salaries... prevent talent from being drained away by the booming private sector... [and] help maintain honest leadership.

...[two former Italian PM]s whose Christian Democratic party was wiped out by huge corruption scandals in the early 1990s have been ordered to stand trial on charges of graft and illegal party funding... Prosecutors allege that they received bribes from businessmen seeking contracts to build a plant for state electricity group Enel in the late 1980s.

...[Italy's] President... is embarking on the complex job of finding a new... government to resolve a potentially disastrous crisis sparked by the resignation of... [the PM and the collapse of] Italy's 55th government since the war... after a dramatic parliamentary debate in which [the PM's] hardline left-wing ally, Communist Refoundation, refused to accept a compromise deal on the 1998 budget.

...World leaders mainly concerned to stay put... [T]he unfolding of the first decade after the Cold War has brought to the fore leaders who do not pursue grand principles or ideas that they push forward by reaching compromise with opponents. They pursue compromise, to stay in office and to enjoy its attributes. They turn incumbency into a specialisation... [O]ne of the great compromises to stay in power has been made by the aged Leninists who run China and who have sacrificed Marxism to buy public acquiescence to their repressive rule. The transformation of Russia's economy has come to a grinding halt as the governing team has abandoned any serious effort at economic reform. The objective of [its] Government has become perpetuation of the transition, and the vast fortunes it has created for some insiders, permanently if possible. The great inequalities in income and unfair ownership arrangements of post-Soviet Russia could once be seen as unfortunate but temporary hardships needed to get a capitalist system jump-started there. But it has become clear in the past 18 months that the excesses are the objective for those who run the system. They are doing nothing to bring them to an end and everything to prolong them... [T]he young chief of staff... who headed a privatisation programme that in retrospect must be judged as a disaster of historic proportions, spends all his time struggling to stay in office rather than in pushing reform... [The P]M... finds himself in the same boat as he shuts off wage and pension payments for months to keep inflation at bay so the [I]MF will lend new money to Russia. "The new ruling elite is neither democratic nor communist, neither conservative nor liberal... It is merely greedy and rapacious." ...The Israeli and Russian leaders, men of different generations and principles, have this in common with their American [counterpart]: ...Ideology is secondary to them; staying in power is primary, even if that power is constrained by circumstances or their opponents... Ideology is also out in Britain... In France[the] President... has made a series of false starts towards domestic change that he has quickly abandoned in the face of public protest... T[hese 'are the days when men of all political faiths seek the comfortable and the accepted; when the man of controversy is looked upon as a disturbing influence; when originality is taken to be a mark of instability; and when, in minor modification of the scriptural parable, the bland lead the bland.' T]hose who debate whether leaders create history or history creates the leaders it needs can suspend their deliberations in this era of opportunistic incrementalism. Today's political leaders create themselves – as an act of will. That leaves them free to be what they need to be, on a daily basis if necessary... [T]hey... bend rather than shape their times.

...“WHAT IS MORE IMPORTANT TO YOU. STAYING IN GOVERNMENT OR STICKING TO YOUR MAIN PRINCIPLES?” “STAYING IN GOVERNMENT IS ONE OF MY MAIN PRINCIPLES.”

...[‘Did Labour’s 8-week PM (r:p213, ln17) really once say, “I’m an extreme moderate?” Apparently. We have the author of A DICTIONARY OF NZ POLITICAL QUOTATIONS to thank for this and other bon mots culled from his extensive reading of political writing for the Dictionary of NZ English. It is an odd comfort to find that from the days of George Grey to the present, the practise of politics has highlighted the petty, meanspirited and stupid.’

...a] Victoria University political studies researcher... has conducted the first poll to rank N[Z’s PM]s... according to their positive contribution to... government and society. Caretaker [PM]s, those who served for less than six months, or who never faced an election, were eliminated... That reduced the pool of P[M]s being rated... [by] historians, political scientists, current and former MPs, journalists and group sector leaders... to 30... Dying in office enhanced a P[M]’s popularity – all five PMs who died at the helm (Ballance, Seddon, Massey, Savage and Kirk) are in the top 10. 1. *Richard Seddon* (1893-1906): “King Dick” ...was the overwhelming choice among respondents as greatest [PM]... “His legislative achievements changed the NZ political culture for a century”... wrote one... Seddon has never been rivalled in his ability to win elections – five in a row... [– or in] his mastery of parliamentary business and his handling of crises. 2. *Peter Fraser* (1940-1949): ...the unanimous choice of the former and current MPs... Fraser was a ruthless cold and autocratic leader; he introduced conscription in W[WI]I after being jailed for opposing it [during WWI]. But none doubted his devotion to duty, enormous capacity for hard work, or phenomenal administrative skill. 3. *Norman Kirk* (1972-1974): ...had the good fortune to inherit an economy lifted on the tide of a global commodities boom and he died before the inflationary pressures created by that boom made themselves truly felt... For many who remember the man, the famous scene of his taking the hand of a young Maori boy at Waitangi still epitomises the promise of a future reconciliation and partnership that was snatched away by his tragically early death. In many ways, Norman Kirk is the N[Z] equivalent of John F. Kennedy. 4. *Michael Savage* (1935-1940): No N[Z PM] has been as loved as Michael Joseph Savage. For decades after his death, his benign portrait adorned the walls of thousands of Kiwi homes. His cheerful, non-nonsense attitude encouraged hope throughout a country forced to its knees by the Great Depression... Through the 40-hour week, guaranteed dairy prices and social security, his government created the “cradle-to-grave” social welfare state to ensure that all N[Z]ers shared the rewards. 5. *John Ballance* (1891-1893): ...became leader of the first great reform administration. He was a big man among a Cabinet of big men. With his party in power, N[Z] pulled out of the creeping depression of the 1880s. His achievements are all the more remarkable given the fact that, like Savage, he was dying of cancer throughout most of his brief term. 6. *Keith Holyoake* (September to December, 1957, 1960-1972): Today, the 1960s are commonly regarded as years of lost opportunities, an era in which N[Z] was content to live off the sheep’s back and ignore the ominous tide of global events. For these reasons, the contribution of Sir Keith Holyoake has often been underrated. The Holyoake years were in fact mildly progressive in economic and social terms. The most controversial aspect of his administration remains the commitment of troops to Vietnam... 7. *Sir Julius Vogel* (1873-1875; February to September 1876): N[Z] at the end of the 1860s was exhausted by war and depression. It needed someone with a magic touch to get moving again. That someone was Sir Julius Vogel. As Treasurer, he unfolded his vision quite simply: “We recognise that the great wants of the colony are public works...” His incredibly ambitious borrowing and investment programme opened up N[Z] with roads and bridges... “He may have been too fond of personal power, erratic in his course and his ideas too novel for many of his contemporaries, but his contribution to N[Z]’s development was both permanent and beneficial.” 8. *William Massey* (1912-1925): The political career of William Ferguson Massey... [– N[Z]’s

second longest serving P[M –] ...was devoted to advancing the cause of the N[Z] farmer. But Massey commands respect for his unflinching approach to the challenges which rocked N[Z] during his administration. No N[Z PM] was ever more tested in the role of crisis management. Working entire teams without a parliamentary majority, he... held the country together through the unprecedented strain of W[W]I, the 1919 influenza epidemic and the boom-to-bust economy of 1920-22... 9. *Robert Muldoon (1975-1984)*: It is doubtful whether any N[Z PM] polarised the country to the extent of Sir Robert Muldoon. While he was in power, many would say absolute power, it was impossible to escape him (other than by going into voluntary exile overseas, as many did). All political, social and economic debate centred around him as he struggled to hold together the old order, the N[Z] he remembered, in a changing world. None who contributed to the survey questioned Sir Robert's political skills, his dominance of caucus, his mastery of parliament. But some found it hard to separate political skills from the purpose for which they were used... "Muldoon I voted outstanding largely for the sheer force of the man, but I think his legacy almost entirely bad."

...The foul language emanating from in and around Canberra recently has to be heard to be believed. Profanities such as "interventionist" and "incentives" are being heard coupled with "industry assistance," "free-trade zones" and "business programmes" in a new lexicon which market economists believed had been banished in the early 1980s. But no, it appears that politically correct terminology such as "market economy" and "level playing field" are in danger of being tossed out. If the Government, and powerful sectors of industry, including the Metal Trades Industry Association, have their way then the nation is going to be re-educated as to what is acceptable industry policy and what isn't. Having embraced programmes in recent years to slash tariffs, bounties, quotas and other such industry-specific schemes, the hands of the clock are being turned back to the 1950s, 1960s and 1970s. What happens to globalisation, regional trade blocks and the World Trade Organisation, we are yet to discover... The budget papers, released just two months ago... noted: "Industry assistance in the form of tariffs and quotas imposes economic costs by distorting the patterns of production and consumption, and results in lower aggregate output. The effects of such assistance include higher consumption prices for some goods and higher input and production costs for other producers." ...Now, we have a P[M] who... seems set to embark on schemes to spend tax money to pick winners. The prospect is truly alarming... There are plenty of people waiting to see how [the PM] argues his way out of that one. One way of easing his lot could come through... a recent newspaper article, [in which] he defended criticism that industry assistance was tantamount to business welfare by saying that it was an investment in A[US]'s wealth. "The objective of these programmes, if they have any validity of course, is to create wealth, which makes us more competitive," he said. "It's only where they have failed in terms of delivery or in terms of the design, that they could be construed as being a hand-out." How times change... [or could it] just... be... that our collective memories are becoming short... Has it been forgotten that... many of the industry schemes created [in the past] were regarded as wasteful and ineffective? Since when has any government ever been able to pick winners? At least N[Z]ers will be in a position never to cast off lightly the legacy left behind by the late Sir Robert Muldoon and his Think Big fiascos. Those projects should stand forever as monuments to political stupidity. - 1997

Here we go again; another flip through the photograph album of Rogernomics. Journalism might be, as someone said, "the first draft of history," but a dozen years after the event, journalism ought to be capable of more historical perspective than was evident in the first episode of *Revolution* (TV One) last night... Another way would examine the proposition that N[Z]'s terms of trade were in terminal decline in the 1970s and that the all-pervasive Government direction of economic investment was slowly crippling the country's prospects of sustaining any sort of social security. Some interesting people could be found to debate that proposition today and maybe say something new and stimulating about our economic experience in the 1970s and since. Instead *Revolution* has settled for narrative and, on evidence of the first instalment, it is the same old story, same pictures, same favourite film clips, same heroes and villains we have watched countless times now. The villain of the "Fortress N[Z]" last night was Sir Robert Muldoon of course. We heard (again) the standard glib criticisms of his outlook and style, including, gratuitously, his drinking habits. The series actually opened with a cheap shot on that score, demeaning itself more than him... [The] documentary arrives with some unwanted baggage[, which] was the reason given by TVNZ for refusing to screen another study of the subject, *Someone Else's Country*... before the election... In its own way *Revolution* ("and it was our revolution") is as overwrought as *Someone Else's Country*. We became "the laboratory for an experiment"... "around the world gurus of market-driven economic theory watched in envy as a small South Pacific country did an about-turn..." What tosh. There was nothing experimental about N[Z]'s early reforms. We started later than Britain, the U[S (as of the early 1990s, the 'trend to withdraw the Federal government from civil life had been ongoing for 20 years') and AUS,] and we started in worse shape than any of them. The reforms that attracted world interest are mainly in monetary and fiscal management, not the orthodox deregulation and market liberalisations that the series will probably feature. Still, there were some interesting moments last night... [A] minister in the Muldoon Government, attributed much of post-war policy to the fact that the Great Depression had scarred the self-respect of males of Muldoon's generation and they found it again in the shared sacrifice of... W[W2]... There was a former head of the Treasury... admitting that he... conceived think big "in Bahrain of all places" on a visit with Sir Robert after the second oil shock. [He] also revealed that Treasury managed to stall the wage and price freeze for six weeks before Muldoon made his last, hopeless, stand against the tide. Muldoon might have been wrong but he did know what he was doing (with the possible exception of the snap election). He made countless speeches in those years about the "human" side of economics which he believed politicians understood much better than the Treasury. It is time his reputation was at least given credit for good intentions and time that Muldoonism was examined in more than comic form. *Revolution* had ample time to do so last night. Instead it cantered lightly over the period before 1984... The rest, as they say, you know. But that is not going to stop *Revolution* reciting it all again. It will be good to look at the pictures again but I suspect the series will leave us none the wiser. [By the way, Muldoon was unkindly nicknamed "piggy" – a reference both to his facial features and physical stature. His political predecessor, Labour's Norman Kirk, also 'fought a personal weight problem all his adult life.' Muldoon's successor, David Lange, the Labour MP who 'became PM only seven years after winning the Mangere seat in a by-election', made NZ nuclear-free, and was once likened to Muldoon because 'they loved frivolous things,' is another person who had problems with self-control around food. Indeed, he eventually resorted to having his 'stomach stapled' – then, after losing weight, dumped his 'wife (and mother of his children) for his speechwriter'!

...Former Labour PM David Lange] has ruled out... an active return to politics "in any shape or form." Speaking to the National Press Club in Wellington yesterday, [he]... also ruled out standing for the mayoralty of Manukau. "Those of you who are familiar with it will know that it's a very demanding job; it requires giving greetings in 12 languages in a very loud voice and visiting 83 bowling clubs for their opening and closing ceremonies and I am not cut out for it." In addition, he would be forced to deal with south Auckland's Pacific Island Christian leaders who, in a recently televised documentary, he criticised for 'spending millions of dollars of congregation money on building new churches while most of the local children live in poverty'. "What I am going to do in future is to write more, to advance business on Indian connections and to speak, overseas probably more than here... [Certainly] I have no desire to chair the board of Television New Zealand... [A]ny political figure that appointed me to have any part on the board of... TVNZ... would be totally nuts..."

...A director of a crown company such as T[VNZ] is appointed by the cabinet, usually after its decision has been rubber-stamped by all Government MPs at their weekly caucus meeting. It would be wrong to assume, though, that filling a vacant seat on a board is simply a matter of dipping into some imaginary register of long-serving party lackeys. The process of putting suitable names in front of ministers is lengthy. It is handled by a stand-alone body called the crown company monitoring advisory unit, which has a database of people from a range of backgrounds who meet the "director profile." Independent, but serviced by the Treasury, the advisory unit monitors the performance of 57 crown companies, including state-owned enterprises and crown health enterprises. The appointment of directors covers about 340 positions. Directors are usually

appointed for three years and can expect to serve two terms... Once appointed, the candidate for a directorship is expected to carry out a “due diligence,” basically a sussing-out of the state company. No one wants to risk his or her reputation if the books look bad. But the candidate is also expected to check out potential conflicts of interest.

...David Lange[the former Labour PM who wa]s tipped to be offered the chairmanship of T[VNZ, has]... confirmed he was aware of the suggestion and understood it originated in National Government circles. But he said while he still had outstanding court action with TVNZ, an offer was not appropriate. Asked if he would consider appointments to state corporations or other governmental work, he said: “I’d consider appropriate work, but I’m not seeking political indulgence.” ...[an example of the type of work he considers to be *appropriate* is narrating television advertisements, such as the one targeting juvenile audiences in which he says: “]Once upon a time there were seven dwarfs. Every day they got up, had cold leftovers for breakfast and went off to work in the spinach mines. Not surprisingly, their names were Angry, Dodgy, Surly, Fury, Ugly, Snide and Pathetic. Then one day, as the seven were spending a quiet evening hanging each others’ hats out of reach, a beautiful young girl called Snow White came by selling packets of *Rices*. They were never the same again. In fact, they all went off to Hollywood, changed their names to Ecstatic, Silly, Funky, Groovy, Smilely, Floppy and Unbelievably Short, even by their standards, and made a fortune! The moral of the story is: eat your *Rices* all the time if you think spinach tastes like slime.”] ● ‘AUSn media face another six-figure bill from David Lange after his recent \$A100,000 out-of-court settlement of a protracted defamation action. His lawyer says the costs awarded are likely to total at least \$A200,000.’

...‘Former PM David Lange once said he would rather laugh off an insult than sue over it, but he felt compelled to sue for fear that people would assume it was true. And sue he does, although not always right up to the courtroom door. Instead, over the years the man who is unequalled at directing his devastating wit at other public figures has extracted apologies and confidential out-of-court settlements from, for example, Radio NZ, TVNZ, the *NZ Herald* and even the incumbent PM’ – who doesn’t have a problem with his weight but, instead, subconsciously ‘mimics the accent of people he talks to’ (an embarrassing habit for a diplomat)]...

Imitation, as they say, is the sincerest form of flattery... Suddenly, [NZ’s PM] is talking about “building a bridge to the 21st century.” And if you think you have heard someone else use that... catch-phrase before, you have. [The PM] has grabbed it from[the US] President... who was busy “building a bridge to the 21st century” at the Democratic Convention in Chicago just two weeks ago... [The PM] stamped the phrase across Tuesday night’s leaders’ debate on TV3, deploying it at least three times... [T]he President should now feel well flattered. Actually, National Party strategists take a far more pragmatic view. It’s an effective television “grab,” so why not use it?

...He’ll make you laugh, he’ll make you cry: it’s N[Z]’s own Mr Show Business... His head flicking like a tennis umpire’s from one autocue to the other, the P[M] tripped from comedy, through sickly sentimentality, to tragedy and back... yesterday... [during a] speech to a ticket-only audience of mainly party members at... [a t]heatre in Takapuna... This veteran of the political boards doesn’t always look poised or comfortable, and he risked arrest at times for committing indignities with the language. But give him... the adrenalin-overload of... a true-blue crowd, [plus]the glare of the floodlights and... he’ll try boldly to inject new life into a familiar script... In the verbal equivalent of a chocolate-box picture, he... talked about feeding orphan lambs and seeing again the sparkle in a child’s eyes. Together now: Ahhhhhh. Turning hammy mimic... [he] then... tried some horror stories, pretending to be a newsreader telling the disasters visited on the economy by a three-headed Government of the Left... [Indeed, the speech] concentrated on attacking what he calls the “gloom gang” – the... o[pposition] party leaders – and their “rehash of tired socialism.” ...[unfortunately, the PM is another who] has little new to pull out of the hat. And that is his problem. Even if he had, that would simply run counter to the key theme National has sought to project – no-shocks stability... He also reaffirmed National’s commitment to building the “decent society” – its 1990 campaign slogan that left a bitter aftertaste with many voters... [However, he] stressed social policy could not be divorced from responsible fiscal policy – “they’re opposite sides of one coin. It is no good having a warm heart if you don’t have the money to pay for it.” - 1996

[The incumbent NZ PM] began his career in Parliament with an eloquent plea for more subsidies. [The National MP] wanted the... Labour government to spend more, lots more, in his King Country electorate... The young farmer MP... praised the former National government’s big rural subsidy, the quaintly-named sheep retention scheme. “It was an investment in N[Z]’s major industry,” he explained... Twenty-five years on... [he] has been scoffing at the bad old days of big government. Last week, he recalled Finance Minister Rob Muldoon’s assurance in 1972 that prices for butter, milk, sugar and bread would be held. “Imagine – a government still decreeing what the price of sugar would be across the country,” he chortled. But in 1973, [he] was... like all the others. Since then, of course, the world has changed utterly and so has he. Nobody expects politicians to hold the same economic views now as they did then. But in [his] case... the changes of tack have been spectacular and increasingly frequent. The great anti-nuclear campaigner bitterly opposed the Labour government’s anti-nuclear legislation. In opposition he swore to cut the surtax and in government he increased it. The politician who last year was denouncing [the NZ First leader] as a racist rabble-rouser formed a... friendship with him after the election... While the PM is nowadays a great fan of [its president, an ANC member], his earlier stand on South Africa was different. When [the Labour PM visited the] ANC vice-president... in Lusaka in 1985, [he accused the Labour PM] of “consorting with terrorists”... His enemies say this proves he is a mere opportunist, if not a hypocrite. His admirers say it shows his ability to adapt. Anyway, they say, his principles haven’t changed even if his policies have... [They call him the] great helmsman... an ironic title conferred by city-slickers who thought he was a bumpkin. And certainly the PM, who left school at 15 without sitting School Certificate, has a somewhat strained relationship with the English language. Welcoming the Czech president... [he called his country] “Checkalabaka.” He once referred to halcyon days as “helicon days”... He [has] a special problem with words beginning with “con”. The first letter [gets] turned into a sort of gurgle and the whole syllable [goes] into his nose and [comes] out like a honk. The trouble [is] that “con” words are an integral part of political discourse... His speechwriters are said to have ransacked the thesaurus looking for suitable synonyms – to no avail.

...A political trivia starter for 10: Can you name this obscure N[Z PM]? He is, according to various accounts: a) “A pragmatic, down-to-earth successful politician; the supreme manager.” b) “Skilful in behind-the-scenes manoeuvring and in administration... but certainly not charismatic.” c) “A man who will do *anything* to stick in office.” Ring any bells? The man in question was Sir Edward Stafford, effectively N[Z]’s first P[M] in 1856. Usually confined to the footnotes of history, Stafford has lived in the shadows of more famous politicians... But yesterday the present P[M]... in a speech... to the Auckland Chamber of Commerce... titled *Renewing our Democracy*... revealed his vision to follow in Stafford’s sadly neglected footsteps... Describing Stafford as the country’s first statesman, [the present PM] said he had been determined to bring all N[Z]ers together as one nation. “Can we dare to be as radical as Stafford was?” [he] asked his audience of mainly Auckland businessmen. “Can we envisage a N[Z] in which all people have a genuine chance to have their voices heard?” The audience was more interested in cutting fringe benefit and entertainment taxes, judging from the applause which greeted these earlier suggestions from the chamber’s chief executive...

Approval of the P[M]... among business leaders has dived in the past three months, says the *National Business Review*. The newspaper polled 2000 chief executives... Forty-eight per cent... ranked [his] performance as poor or very poor, 23[%] thought he was doing either a good or very good job. In March, most chief executives were either neutral or supportive of the P[M]...

The PM] is... taking advantage of the two-week parliamentary recess... [by] going on the offensive this week in a bid to... reassert his leadership in a crucial... “scene-setting” speech in Auckland... [A]t a press conference... [he] said the honour of being P[M] came to very few in any generation... “I hope that... I have and will continue to make a significant contribution to the development of our country.” ...Asked about his greatest achievement, [the PM], for a moment, reverted back to the Great Helmsman by saying he could go from A to Z, before saying the grandiloquent

stage of the world had been great but resolving the problems of little people had been special too... He certainly [has shown] great skills as a political survivor in difficult times. But he can hardly claim to have delivered the Decent Society... On social issues, curiously, there is now a kind of consensus of concern. All sides... worry about social breakdown. Dealing with that, he said in his review speech last week, is “the hard task ahead”... He said it was important that N[Z]ers... focused their minds on the future... [Incidentally, NZ’s PM]s are not directly elected... Historically, the major parties’ leaders have been selected only by those members of the party elected to Parliament (the caucus). Even under MMP it is likely that the P[M] will continue to come from one of the major parties, meaning that only a very select minority have a say in who becomes the elected head of the country. There are some good reasons for selecting the leadership in such a way. For example, the possibility of having a party leader whom no one in caucus wants to work for is reduced by making the position reliant on caucus support. But in the MMP environment it is worth stopping to ask: is there a better way? ...the present leadership selection process of the two major parties is conducive to cloak-and-dagger lobbying, number-crunching and backroom horse-trading. While that process continues we can expect backstabbing and deal-making when leadership challenges arise... In other countries, including those with parliamentary democracies, party leaders are elected... by all party members. In Canada, for example, the governing Liberal Party holds national conventions where all sections of the party are represented through a delegate system – constituency, youth and aboriginal groups all contribute not only to policy formulation but to leadership selection as well. There are three ways of initiating a change of leader under this system. At each biannual convention party delegates are asked if they feel a leadership review should be held. If they demand one a leadership convention is called. The party leader may also call a leadership convention to seek a renewed mandate. A leadership ballot is also taken automatically at the first national convention after losing an election. In this way the party leader is regularly held accountable to rank-and-file members... If the major party’s MPs are really keen to know when N[Z]ers want a leadership change, perhaps they should divest themselves of one of the last vestiges of first-past-the-post privilege and open the leadership selection to all party members. Then [PM]s could claim to have been elected by more than just caucus colleagues. And with greater say in who ultimately leads the country, the public might come to feel that joining a major party is a worthwhile exercise.

...[NZ’s PM recently remarked] to reporters... “it is a tremendous thought that the son of an immigrant farm worker can be the P[M of NZ].” - 1997

NZ’s PM also said on TV during 1997 that ‘in politics you can’t drop those who don’t come up to standard’ (and added that ‘one of the jobs [of a PM] is explaining away the mistakes of colleagues’)! NZ’s general public can only remove a PM by voting its party out in parliamentary elections or via assassination (no NZ PM has been assassinated, officially – in comparison, four US presidents have been assassinated, the 40th survived an assassination attempt, and a further four presidents died while in office). But, if discontent is obviously widespread, the Queen’s representative – the Governor-General – has authority to insist the PM stand down. The Governor-General can also instigate such a request at its own discretion. A NZ PM has yet to be removed from office via this process – whereas, in 1975, AUS’s Governor-General ‘dissolved both houses of Parliament and appointed a caretaker PM.’

Employees in AUS and NZ are protected from unfair dismissal by legislation. To legitimately sack an employee, an employer has to first issue a number of *proper verbal and written warnings* (which expire after twelve months). Therefore, an informed employee knows that it has to commit a number of offences within a certain period of time before its position is threatened. This has led to protests like: *the law makes it hard to sack workers and that discourages employers from hiring new staff*. Some circumstances, though, can still justify instant dismissal. Obviously, an employee who commits criminal acts (e.g., theft of company property; attacking customers or other staff) would have little chance of defending a claim in the Employment Court that its dismissal was unjustified. Another no-no for employees is lying to, or deliberately withholding information from, their employers. However, while PMs (and MPs) clearly are the employees of the public (as they proudly declare), they constantly lie to, or keep secrets from, the public. Winston Churchill once declared that ‘in war the truth is so important it must be protected by a bodyguard of lies’ (in recent years ‘thousands of Americans have been publicly exposed for lying about their military records to gain jobs or impress people’) – but politicians often give the impression that the truth must also be protected in peace!

Papers stuffed and forgotten in a tattered old carrier bag, an out-of-date passport found in the bottom of a drawer – these are the crucial pieces of evidence which the Crown says will be the nemesis of... [the] Lord... of Weston-super-Mare, the politician and millionaire author accused of concocting a false alibi in the 1987 libel action he brought over the *Daily Star*’s claims he had sex with a prostitute... [T]he former deputy chairman of the Conservative Party walked away from that trial, pocketing £500,000... in damages, and rehabilitated himself in the highest Tory ranks...

[Lord] found guilty of lying in libel case [A d]isgraced British politician and best-selling novelist... has been found guilty of perjury and perverting the course of justice after a sensational trial at London’s Old Bailey court. The flamboyant... peer in the House of Lords... was brought to trial as the result of a chain of events put into motion when he decided to run for the Conservative Party’s candidate in London’s mayoral race...

[Britain’s PM] was this week trying to relaunch Labour... after another damaging gaffe by... [his deputy, who declared that:] “You can’t tell the truth all the time. Nobody does,”...

ACCORDING to a survey conducted by psychologists, we all tell... a lie every eight minutes, making a total of 200 a day on average... A study... at the University of Southern California... found the worst liars were those who had the most social contact or who were forced to make demands on people, such as getting information. Shop assistants, doctors’ receptionists, politicians, journalists, lawyers, sales representatives and psychologists all fell into this... category... This is the most heartening news I have heard for some time. Lies have always been underrated but they are the mesh that holds society together... “Society would be terrible if people started telling the truth. Anyone who did would be a subversive.” ...People who tell me the truth always say it is in my best interests. Knowledge is power, they piously intone after Francis Bacon – the politician, not the painter. Given the choice, I would rather remain powerless... The Caesars used to have their childhood chums executed, on the grounds that they knew the truth and were all too disposed to tell it. This is the best excuse for murder I have ever heard. [● ‘A Reader’s Digest poll of west Auckland readers found that we put pilots, nurses, pharmacists, police, the military and doctors top of our trust rankings – with car salesmen and politicians at the bottom.’

...‘When the US President tells lies, he is not abusing the privilege of his office, but exercising the privilege of his species. You can put your money on it: the President is a liar through and through; has been from earliest childhood. Examples? You don’t need examples, because you are in the same boat, and so are all of us. You know exactly what I mean. The oddity was George Washington. “Father, I cannot tell a lie” indeed. You would think he was mad, a horror, some terrible mutant, were it not for the fact that he was obviously lying. Without the faculty of lying, we would become inhuman; literally so, because the ability to dissemble is what distinguishes us from brutes. The cobra spreads his hood, the dog’s hackles bristle, the bull’s head goes down, while we smile and smile, judging the moment to slide in the knife. Eliminate lies and business would disintegrate, negotiations collapse, the normal intercourse of friendship crumble, and nuptial beds turn to thorns. The law would disappear, it being no more than a codified system of acceptable lies. Defence and prosecution alike talk exaggerated nonsense which they know to be untrue; the reason they get away with it is because they are allowed to, within the parameters of the law. Politicians agree to lie to us, giving us cause for hope or its equally satisfying (though less comfortable) sibling, despair; in return we agree to vote for them so that we don’t have to go to the trouble of thinking up our own lies. “Britain will be great again, people will become better, taxes will not go up, the war on terrorism will be won – as will the war on drugs – there will be no more hunger or poverty or horrid insects or nasty

children shouting in the street, we will be better than the last lot”: lies which we need, because without them we have to face the truth of our own insignificance and the emptiness of our lives. Even the foundations of statecraft are laid upon lies: the lie that there’s something special about the Queen, the lie of the oaths sworn upon the ghosted memoirs of a fictional Middle Eastern god, the lies of ritual and the lie of diplomacy, one hand extended in friendship while the other, behind the back, is busily loading the gun. It is about time we learned that the truth is greatly overrated; and we can begin by acknowledging that even John Lennon didn’t dare, in his wispy, cuddly, strawberry-pink-bonbon song, imagine a world without lies.’

...The FBI yesterday released previously censored files on former Beatle John Lennon, who was under surveillance in the early 1970s because of fears he would incite anti-war violence. The move was hailed as a victory by the American Civil Liberties Union of Southern California, which filed suit 14 years ago to have the files on the murdered rock star made public... Its executive director... said: “This is a victory for every person in the U[S] who is worried about excesses of the Government.” At a news conference, [a] historian... who had sought the documents under the Freedom of Information Act, said the FBI investigation appeared to have been based on the Nixon Administration’s fear of Lennon’s influence over voters in the presidential election. Richard Nixon was seeking re-election, and the unpopular Vietnam War was at its height. “The Nixon Administration wanted to silence John Lennon... But all he was saying was Give Peace a Chance,” said [the historian], whose book *Come Together: John Lennon in His Time* was published in 1985. Besides releasing 80 previously censored pages, which the FBI had earlier said contained information that was confidential or related to national security, the agency agreed to pay \$US204,000... for [the historian’s] legal fees and costs.

...[the US government for decades “needlessly and wastefully” withheld millions of records about the assassination of President John Kennedy, causing Americans to mistrust their government, a federal review panel has concluded. Such secrecy “led the public to believe that the government had something to hide. Change is long overdue and the review board’s experience amply demonstrates the value of sharing information with the American public.” The Assassination Records Review Board closes shop this week after gathering and releasing a mountain of detail about the assassination. The board spent more than \$US8 million to gather and release the records. It got more than 60,000 documents from the FBI and other federal entities and private collections, some which gave them up reluctantly. The records will be kept at the National Archives. Some still must be processed before the public can inspect them. Remaining blacked-out sections on some records will come to light at different dates between now and 2017 when all records will be fully disclosed.’ By the way, a descendant of] the Emperor... BONAPARTE... who served as Teddy Roosevelt’s Attorney General... [came up with] THE IDEA... TO INVENT THE FBI IN 1908... and once initial suspicions were allayed that it would turn into some big, secretive, czarist police force, it did precisely that. The bureau quickly built its empire of white men in white shirts, chasing anarchists and Bolsheviks in the ’20s, gangsters and bootleggers in the ’30s, fascists in the ’40s, communists in the ’50s and civil-rights leaders and antiwar protesters in the ’60s. The enemies, always changing, are changing still, and the agency that confronts them now faces problems that [will] bedevil any FBI director trying to drag the agency into the modern age... For the better part of a generation, both political parties have thrown money and laurels at the FBI... Under [the current Administration], while agency after agency saw its budget dwindle, the FBI’s jumped 25%, to \$2.9 billion. Congress paid for 3,600 new employees, new computers, new field offices. Law-and-order Republicans were there first, but [the incumbent President] and the Democrats joined in until there was simply no constituency that didn’t see the FBI as the all-purpose answer to voters who routinely listed crime among their top concerns. For America, whose greatest enemy is suddenly within, the FBI has become the Pentagon of the post-cold war world. This means, like the well-protected Pentagon of 20 years ago, virtually... [any] lawmaker who raised concerns risked being flayed as soft on crime. But without accountability, several things happen, all of them bad. Money gets wasted. Officials get sloppy.

...[the US] President... said yesterday that he was kept in the dark about an FBI warning last year that China might try to funnel money into the U[S] election campaign, and is now trying to find out why... His disclosure added a bizarre new twist to a campaign financing controversy dogging [the]President... and his Democratic Party, and one with potentially troubling foreign policy implications. It is illegal for foreign governments to contribute to American political campaigns... China said the charges were unfounded...

Federal law-enforcement officials have found... “strong evidence” that... China secretly funnelled nearly \$US1 billion... into the U[S] to influence policy and politicians... [as] part of an “urgent new offensive” designed to counter “Taiwan’s successful US lobbying.” ...[the] President... said yesterday he felt “sick at heart” when he first learned his Democratic Party accepted... contributions from foreign sources and was angry that donations were not checked more carefully... [H]e was confident that more careful scrutiny... would have exposed the illegal contributions before they were accepted.

...“SOMETIMES,” [the US]President... mused on Friday afternoon, “there is a difference between what is legal and what ought to be done.” And with that... [the former] lawyer... offered a guided tour of Washington’s favorite hideaway – the fertile, foggy valley that lies somewhere between what is wrong and what is illegal. You don’t have to be a lawyer to get in, but it helps to think like one. [The First Lady’s] top aide... was spending the day there in March 1995, when [a] Californian businessman walked into her White House office one morning and handed her a cheque for \$50,000. It was just “a rather unusual circumstance,” [the President] explained last week. She didn’t actually ask... for the money as the price of admission to sit in on the President’s radio address two days later. She wasn’t “receiving” contributions on federal property; she was just passing them along. And she certainly didn’t “solicit” them, which federal law prohibits. Or does it? ...[the businessman’s] lawyer... told TIME that [his client had approached the aide’s] aide... the day before, hoping to arrange a cosy lunch in the White House for some Chinese businessmen and a later meeting with the First Lady. Somehow the subject turned to Democratic Party needs. [The aide’s aide] remarked that the President’s party had to cover the costs of political events held by the First Lady at the White House, although [the aide’s aide] “does not recall” that conversation. So [the Californian businessman] came back the next day and handed [over] that “unsolicited” \$50,000 cheque for the Democratic National Committee. According to [the Californian businessman’s lawyer, his client] did so with the understanding that it would help him gain access for his guests, who indeed dined in the mess and had their pictures taken with [the First Lady] the next day. But what makes last week’s spectacle truly rich is that the President doesn’t have to make excuses for [the aides]. And... he doesn’t even have to parse the legal delicacies of their actions. Based on what has come out so far, nothing they did that day or the next in the White House appears to have broken the law. What’s more, when [the] Vice President... sat in his office calling up businessmen whose careers and companies depended in part on decisions the White House could make, urging them to support his party’s efforts, he wasn’t breaking the law either... In one press conference after another, the... President and his top lieutenants... tried to explain that they were proud of what they had done, and now that they had been caught, promised never to do it again... [W]hatever pleasure the Republicans felt in watching the White House thrashing was offset by fear that... [an] investigation of campaign finance would wind up biting them too. After all, the Republicans raised \$200 million more than the Democrats last year without Air Force One or any presidential bedrooms to proffer.

...A... transcript of dozens of intercepted pager messages sent to... [the US president’s] Secret Service detail was posted on the Internet on Friday by a computer hacker. The messages included minute-by-minute updates about the president’s whereabouts as well[as] instructions to agents to call the White House switchboard, love notes, basketball scores and notification that [the president’s daughter] was on hold for her father. According to time stamps, the messages were intercepted on April 27... The White House said it knew its pager messages had been monitored but declined to say whether the transcript was genuine... [Meanwhile, the president’s] choice to head the troubled CIA... and... its 12 companion espionage outfits... acknowledged yesterday that his former National Security Council aides left him in the dark about an alleged Chinese plan to influence the U[S] elections improperly... But... in reply to later questions, [he] referred to the two former counterintelligence experts... as “very fine career officers.”

In his statement at the start of six days of hearings, [he] vowed if confirmed to head the sprawling, \$US30 billion-a-year... espionage apparatus he would promote "from day one a climate of total accountability" for management failures.

...A matter of intelligence... Spying is not what it used to be. Gone is the ideology, gone is the efficiency. The FBI last week arrested three middle-aged former student radicals and accused them of spying... for the East Germans[. initially.] and then for any government that wanted their services... It was also reported that the CIA and the National Security Agency mounted a bugging operation on international statesmen, many of them America's staunchest allies. Such was Washington's trust in its friends that even a boat taking the leaders attending a Pacific Rim conference on a fishing trip was loaded with eavesdropping equipment. In Bosnia, the Americans bugged everything the U[N] command in Sarajevo transmitted. But fellow spies cannot be surprised that the Americans do not trust their allies, for they do not even trust each other much. The CIA and the diplomatic service were often in conflict, with the State Department and its ambassadors demanding to see all communications between the agency and its men in the field, and the CIA in turn spying on even the U[S] Ambassador to Zagreb. Nor does [the most powerful organisation in the world] seem to have an exalted view of its own agents. Inside its vast headquarters in Langley, Virginia, there is a gift shop. Outside is a notice advising staff: "Do not wear CIA-branded merchandise if operating undercover." ...This is not a good time to be a spy. MI6[also] has image problems. The agency has been forced to negotiate a "sweetheart deal" with "Mr T," a disgruntled former operative, buying his silence before he sold his story. There are times when staff feel its headquarters, a futuristic building on the Thames at Vauxhall Cross, London, is a useful metaphor for MI6 itself. It is glamorous on the outside but cramped within. It is not like the old premises in Mayfair where staff used to grow tomatoes in window boxes... Nowadays staff enter their brash HQ with a swipe card and code number, and find themselves in a hive of corridors unmarked and directionless, except for signs saying "Exit." Staff are not allowed to discuss their work with colleagues – even when they are in MI6's secure (and mediocre) canteen... The 2000 people – mostly men – who work for MI6 like calling themselves spies and are very much at the sharp end of the business. They have to deal with defectors from nasty regimes such as Algeria and Libya. Their job is to "turn" diplomats or disgruntled terrorists who have valuable information. There are another 2000 people in MI5, Britain's domestic intelligence service, many of them women, except in the section dealing with counter-surveillance in Northern Ireland where most have been drafted in from the Special Branch. There are also 6000 at the GCHQ, a listening and monitoring centre, and a number of Military Intelligence agents. "GCHQ should be shut down, what it provides is so banal and obvious," said the former agent. "It is obsessive about government communications in Russia. Its eavesdroppers loved telling us where the briefcase containing the nuclear button was located." The Russians are little better. Their equivalent of GCHQ is called Fatsi and they, too, snoop on their own nationals from a network of listening posts. Imagine the embarrassment, therefore, when it was discovered a "top secret" Fatsi report to the Russian Security Council had been copied from local newspapers.

...Russia's spy agencies pointedly declined to join the CIA's 50th-birthday celebrations this week, maintaining a frosty silence worthy of Cold War relations. From its inception after... W[W2] to the demise of the Soviet Union in 1991, the CIA made the thwarting of Moscow its prime aim. Since then it has been struggling to adapt to its new role. The pains of transition have been as keenly felt in Russia's post-Soviet intelligence fraternity... "Our position is no comment," a spokesman for Russia's Foreign Intelligence Service (SRV) said testily. "It is their anniversary, and there is no need to turn the spotlight on us. And we will not be sending them any official greetings." The domestic intelligence agency, the Federal Security Service (FSB), showed a similar reluctance to comment... It may be that the KGB knew – and its successor agencies still know – more than the American people about the CIA... [Furthermore, the US President, while leading] ceremonies on Tuesday at CIA headquarters... told employees: "The American people will never know the full story." ...It is also noteworthy that several spies working for the CIA have been caught and convicted this year... But despite its pride at having had two moles at the heart of the CIA until fairly recently, [the KGB] still has lingering regrets at having "lost" the Cold War[, and in]... an interview in a Russian weekly newspaper on Wednesday... [the FSB's] Major-General... bemoaned at least one aspect of the new role of his own service... He said the FSB faced a challenge from ex-KGB agents who now worked for private security firms, spying on competitors and even the Government for better pay than their former comrades got. Money seems, as ever, to be at the root of one of the oldest professions in the world, whichever side you are on. "According to informed sources, CIA employees being lured to work for the FSB or other Russian intelligence services attract a price of \$2 million,"... [Russia's] Itar-Tass news agency... said. "In the U[S], Russian turncoats, by some accounts, are half the price."

...[yesterday Russia's Itar-Tass] news agency reported that... Soviet dictator Josef Stalin served as an agent in the Tsar's secret police in the years leading up to the fall of the Russian monarchy... Stalin, who ruled the Soviet Union with a iron fist from 1924 until his death in 1953, supplied "important information" to the Tsar's secret police from 1906 to 1910... Despite his alleged role with the secret police, Stalin was arrested and exiled on several occasions before the Russian Revolution... [Incidentally], construction crews are working in secret to clean up one of the biggest embarrassments of the Cold War... 2km from the Kremlin... [i]n the U[S] Embassy compound, a six-story curtain surrounds the chancery building that was once supposed to be the top-secret nerve centre of US operations in the Soviet Union... Soon after construction began in 1979, the State Department discovered Russian workers employed for the job were planting listening devices in the structure... US officials said they thought they would be able to render the bugs ineffective before the building was occupied. But in 1985, when work on the chancery was nearly complete, they realised hidden microphones embedded in the blocks and building materials were so numerous and so cleverly designed that there was no way to remove or neutralise them without demolishing the structure. The chancery became known as the "Great Transmitter" and was unoccupied for more than a decade... The building... was... part of a deal in which the Soviet Union and the US built new embassies for each other. After the revelation of the bugging, US officials refused to let the Russians occupy their new chancery in Washington until 1994, nine years after it was completed... [As] part of a plan to make... the Moscow structure... usable... the "top-hat solution"... is to take off the two original top floors and build four new ones, increasing it from eight to 10 stories. The new floors will be used for top-secret activity, while the lower six levels... will be used by staff doing non-classified office work. At \$240 million, the remodelling work will cost nearly twice as much as the original building and the exterior will be clad in curved glass and marble instead of red brick... Like the Berlin Wall, some of the bricks are being sold as souvenirs for charity... The embassy is scheduled for completion by mid-1999... What is the reason for all the secrecy? No one is saying. That's secret too.

...[The CIA turned cats into walking bugging devices to try to crack Kremlin secrets during the 1960s, say recently declassified documents. The operation, codenamed Acoustic Kitty, involved surgically wiring a cat with transmitting and control devices. "They slit the cat open, put batteries and wires in. The tail was used as an antenna. They made a monster," said a former CIA man. Unfortunately, the would-be eavesdroppers wandered off the job when they got hungry. "So they put another wire in to override that." In the end, the re-engineered cats came up a whisker short and the CIA abandoned the programme.]

...A former member of Britain's MI6... with dual N[Z] and British nationality has appeared in court charged with disclosing information about the agency to outsiders... If found guilty he could face two years in prison... The last MI6 officer to be arrested on an official secrets charge was... sentenced to 42 years' jail in 1961 for spying for the Soviet Union. [That officer] escaped from jail five years later and now lives in Moscow.

...The N[Z]-born former spy... aged 34... has pleaded guilty to breaching Britain's Official Secrets Act by planning to publish a book about service with MI6... [He] was remanded in custody for sentencing at the Old Bailey.

...A N[Zer] who was... dismissed from the British secret service has been sentenced to jail for 12 months for threatening to publish material about his years with MI6... He is the first person to be charged under the... Official Secrets Act, 1989... He said afterwards that he had wanted to plead

not guilty, but “[the time I’d have spent on remand waiting for trial would’ve been longer than the eventual time spent in prison if found guilty’, and] the draconian nature of the... Act ma[de it] impossible. I would have been guilty even if I had disclosed the colour of the carpets in the office.”

...Britain’s public servants take note: The days of “obsessive secrecy” are at an end. “To get any information into the arena in Britain you’ve got to literally drag it out of government departments,” the... new Labour Government... Public Services Minister... said in Auckland yesterday. He... is visiting N[Z, AUS], Canada and the U[S], to see how existing laws covering government information work. N[Z]’s Official Information Act dates back to 1982... while the U[S] law is a decade older... Apart from some private members’ bills, which went nowhere, there has been no serious attempt by any British Government to adopt a more open official information policy... Britain has what are known as 30-year and 100-year rules for sensitive information... [to find] its way into the public domain... The 100-year rule particularly makes it “virtually impossible” to get information now relating to the two world wars. He cites as an example the difficulty of researching events that affected N[Z] soldiers at Gallipoli.

...A bill that would make public all U[S] Government records on Nazi war criminals compiled since... W[W2] has been introduced in the Senate.

...Nearly 100,000 U[S] troops were exposed to trace levels of nerve gas from a demolished Iraqi ammunition dump during the Gulf War, and 26 reported symptoms consistent with nerve gas poisoning, the Pentagon said yesterday. The latest figure was a dramatic increase over the Pentagon’s calculations last year, which placed some 20,000 troops within a 50km radius of the... dump... The Pentagon insisted for years that no U[S] troops who served in the Gulf War were exposed [to] Iraqi poison gas... It was also the first time the Pentagon had disclosed that any troops who were exposed to nerve gas reported symptoms. By the way, during ‘August 1990, British Airways flight BA149 to Kuwait was delayed in London for two hours due to a “mechanical fault”. However, just before it took off nine or ten young men boarded and sat at the rear. BA149 continued on its journey despite the fact that Iraq began its invasion three hours before the plane was due in Kuwait. The mysterious group of men vanished within minutes of the plane landing in Kuwait, leaving the civilian crew and passengers to be captured then held hostage by the Iraqis’ (‘some French and American passengers have since received more than half a million dollars in compensation’)...

I[n 1974... the 1100-tonne fishing trawler and factory freezer ship Gaul... [and its] crew of 36... vanished in the freezing Barents Sea off the top of Norway. Although an inquiry found it sank in 16m waves, many relatives never accepted that such a sturdy vessel with \$200,000 of communications equipment could have floundered without even sending out a distress signal. The trawler vanished near a Soviet submarine base and a television documentary in the 1980s fuelled relatives’ suspicion that it was a spy ship using unknowing fishermen to disguise an intelligence-gathering mission... [A] witness alleged that four naval officers joined the vessel after it had set sail... Among the relatives... [is] an Auckland advertising manager who immigrated from Aberdeen 11 years ago after meeting her N[Z-born] husband. On Wednesday, the past caught up when her sister telephoned from Scotland with news that a British-Norwegian television expedition had found the wreckage of the ship under 270m of water... 110km north of... Norway’s northern tip and near Russian waters... [The Auckland] said the news came as a great shock after so long, but it had not completely extinguished hope that her brother might still be alive. Although the chances certainly appeared dimmer, there was still a possibility that the crew had been captured and the ship then scuttled. [She] said her 82-year-old mother and relatives of other missing crew members had been haunted for years by anonymous telephone callers promising to free their loved ones from Siberian jails for large fees. She acknowledged it might be better knowing for sure that her brother was dead rather than living with endless uncertainty. “But Mum still has... hope that one day he will walk in the door – she is an old lady now and that is probably what keeps her going.”

...A “strange mistake and misunderstanding” over a letter to Indonesia from [the]South African President... resulted in international friction when it was sent to the Portuguese embassy in Pretoria and its contents leaked. The... letter [described] a proposal to free [an]East Timorese rebel leader... Portugal was the colonial ruler of East Timor until 1974. The following December Indonesian troops moved into East Timor with tacit Western approval and it was incorporated as Indonesia’s 27th province the next July, in a move not recognised by the U[N]. Armed guerrillas are still fighting Indonesian rule.

...Red-faced A[US]n politicians are ducking for cover after a briefing paper blunder... A[US]’s Acting Leader of the Opposition and former foreign minister... said it was no ordinary breach of security. “It’s the daddy of all security breaches – 15 countries offended in one go.” ...Classified... “AUSTEO” meaning... for “A[US]n Eyes Only”, the papers... include comments about various... leaders... [that] would cause grave offence in the South Pacific... [and damage AUS’s reputation. The] blunder... could spread to Kuala Lumpur... Malaysian logging companies... [are accused in the] secret document of corrupting several island nations... A copy of the document was left lying on a table outside the Cairns hotel conference room where Pacific economic ministers... met last week. Compiled by A[US]n foreign affairs staff to aid [the AUS]n Foreign Minister... and [AUS’s]Treasurer... before the forum, it was picked up by a Reuters journalist who assumed it was for general release... In a scathing indictment of mismanagement, corruption and... personal habits... the... 93-page document... divides the... island states into six groups, based on economic and social conditions, with headlines such as “Melanesian mayhem,” “Imprudent Micronesians” and “Bottom of the heap.” ...A[US]n officials would not comment on the paper or its contents, but a senior official privately confirmed it was genuine... Even though the paper reflects the reality that A[US] cracks the whip harder than N[Z] on Pacific Island economic reform, the A[US]n Government is trying to distance itself from it. It is pointing the finger of blame at bureaucrats. And it has instructed its High Commissioner in Wellington... to convey the message that such material is not necessarily the A[US]n Government’s view... [The commissioner] said the paper was a setback for A[US.] which regarded its engagement in the Pacific as a serious one and one in which “we are making serious mistakes.” ...A[US and NZ] are the forum’s biggest economies, dwarfing the poorer island nations... Most South Pacific economies are afflicted by low growth, high debt, bloated public sectors, growing populations and weak or virtually non-existent private sectors... “Pacific leaders will continue to flirt with easy solutions to their economic problems, especially quick-fix, easy-money schemes and over-exploitation of natural resources...,” the briefing said... Nauru... was in[the] worst shape, despite a once-rich phosphate industry and compensation for phosphate mining from former trustee A[US]. Nauru’s financial assets have tumbled to \$A200 million... from \$A1.2 billion in 1991... “Mismanagement is hurting, with... Nauru... the Solomon Islands... and the Cook Islands on the brink of insolvency... Financial collapse is imminent, the only question is timing.” ...The Cook Islands... set a precedent by being the only country that pays its parliamentarians more than 3[%] of the Government’s total operating budget... [of] \$NZ39.9 m... Salaries and allowances paid to the 25 politicians total... \$1.265 m... a year – and there’s an armload of other perks... that would increase this figure considerably.

...two[of the] nations judged to be at the bottom of the heap by a secret A[US]n briefing paper have questioned the quality of advice being given to A[US]n ministers. The... President... of Nauru... who is also the[country’s] finance minister... said he regretted that A[US]n ministers were being “so badly and inaccurately advised by their officials.” ...The P[M] of the Cook Islands... said claims [that his country] was being mismanaged were both unfair and untrue, citing a programme of economic reforms the country was already implementing. In the past 12 months the Cook Islands Government had laid off two-thirds of its public service... and begun state asset sales... However... the Minister of Finance... [for the] Solomon Islands... said yesterday... [that his country] could not meet its commitments... blaming the crisis on bad decisions by Government policy-makers... [T]he Government’s total debt stood at \$US234.2 million[including]... outstanding external debts... [of] over \$US116 million... Around 220,000 Solomon Islanders will today elect a[new] 50-member national Parliament despite[the] cash-flow problem... The Solomon Islands Electoral Commission had expressed doubts over whether the elections could be held after the Government was slow in paying the \$US1... million budgeted for them... [Meanwhile, a senior AUS]n Treasury official has lost a performance pay bonus of at least \$A10,000... because of the bungle... The official, who has not been named, was one of four Treasury officials disciplined over the security breach... [T]hree junior officials had received disciplinary counselling... [The] senior Treasury officer... [is likely to be] transferred to the U[S].

...‘some AUSn soldiers seconded to the CIA took part in so-called counter-terror programmes in which tens of thousands of people were killed in Vietnam. The troops were members of the AUSn Training Team Viet Nam, formed after a government decision in May 1962 to send military advisers to Vietnam. Some were involved in programs of profligate assassination. Yet AUS’s then PM says he was never told. More than three decades later, the sound of a bullet in a distant hut is no more likely to carry to a paneled prime ministerial office.’

...‘Elite NZ Special Air Services troops carried out orders to kill Viet Cong prisoners during the Vietnam War, says a book published in AUS. The shock allegation is in a biography of a former AUSn Deputy PM, a Vietnam veteran. Politicians and Army chiefs in NZ have dismissed the claims but the AUSn war veteran who says he gleaned the information after intercepting a radio message in 1968 has publicly backed them. The veteran claims he was with the other veteran, a second lieutenant with the 1st Battalion, Royal AUSn Regiment, when they overheard a message between a NZ SAS patrol and its headquarters. “The Kiwis were reporting three VC KIA (killed in action) and two WIA (wounded in action) and wanted the prisoners lifted out urgently as they were still in a bad situation. The advice to them was that there was no helicopter available. So, after a heated argument, the after-action report was amended to five VC KIA, and the patrol was moved out. I wondered what sort of war I was in.” The vice-president of the ex-Vietnam Service Association and the NZ SAS troop commander at the time, said the alleged radio message appeared to have been concocted “over a few cans of VB (Victoria Bitter).”

...the NZ ‘government misled NZers over plans to send more soldiers to the Vietnam War, formerly top secret AUSn cabinet papers have disclosed. The 1967 archives, issued yesterday by the AUSn Archives under the 30-year-rule, show that the then NZ PM discussed in Canberra proposals to send more troops while publicly denying that the government was considering the move. The NZ PM told the AUSns he was able to cloak the proposals because they involved officials only and had not gone before the cabinet. It was not the first time he had misled the country over Vietnam. In 1964, before the involvement of NZ combat troops in Vietnam, the 36th US President’s special envoy visited NZ, saying publicly he would not ask for military aid. The envoy met the PM, who confirmed afterwards that the envoy had not asked for aid, but AUSn government papers released decades later revealed that the envoy said at the meeting he would welcome an artillery battery, a tank company or anything NZ could provide. Later the same month (April, 1964) the PM rejected speculation that an artillery unit might be sent. Papers later showed that the cabinet had decided in principle nine days earlier to commit combat units. The latest AUSn documents indicate that NZ’s decision to double its infantry in Vietnam was more than the AUSns had expected. Canberra had believed NZ would send only a Special Air Service unit to join the artillery and infantry already deployed, rather than another full company of infantry. Wellington sent both, despite serious economic and military problems. The cabinet papers show that while agonising over the future of their commitments to the defence of the two fledgling nations, NZ and AUS believed they needed to do more in Vietnam to ensure the US security umbrella continued to shelter the South-east Asian region.’ Incidentally, m[aterial from N[Z] intelligence helped to form the damaging A[US]n assessments of Pacific leaders and countries, say high-level A[US]n sources. The [NZ P]M... would not comment on the suggestion, which was reported yesterday in the *Sydney Morning Herald*. But N[Z] departments and intelligence organisations commonly share information with their A[US]n counterparts. And N[Z] is credited with having better intelligence and insights into the Pacific than A[US]. The... author of *Secret Power*, a book on international spy networks, says... [AUS] reports on P[NG] while NZ’s responsibility within the western alliance is to spy on most of the South Pacific Forum countries... [“NZ] makes it its business to be the source of sometimes very sensitive information about all those countries there for A[US], the US] and Britain,” said [the author]. “There are people who are doing that five days a week.”

...AN UGLY industrial building in inner-city Wellington is the Security Intelligence Service’s bugging and surveillance centre, the *Sunday Star-Times* can reveal... Cars and utility vans used by SIS surveillance staff are kept in the... two-storey building in Kaiwharawhara Rd... behind a huge roller door. Some of the vehicles are registered to SIS front companies to conceal their identity. A reporter visited the building yesterday but found no sign of life. Spies, it seems, don’t always work on the weekend. The surveillance centre is one of a number of long-standing SIS secrets uncovered by... the *Sunday Star-Times*... espionage writer... This investigation has also confirmed that the break-in last year of a flat belonging to [a] left wing activist... in Christchurch was the work of the SIS. [The writer] says that this bungled operation raises the possibility that the SIS was acting illegally. The inquiry has uncovered details of the service’s internal structure and shows that a very large part of the SIS resources were devoted to spying on Iron Curtain embassies and local communist groups. But now that the cold war has ended... the SIS has very little to do. One source describes the SIS as “a service without a cause”. But the spies... have managed to dupe the politicians and save their own jobs.

...[the *Sunday Star-Times*] exposure of the SIS was shocking. Do you not give a thought to the safety of N[Z]? The world is still a dangerous place and you put the people of N[Z] under great risk, taking notice of pacifists and fellow travellers who have their heads buried in the sand and who wish to ridicule and do away with the SIS. You have not learnt the lessons of W[W]II.

...A previously classified chunk of N[Z] history is being brought into the light up to half a century after it was buried in restricted archives. The Ministry of Foreign Affairs yesterday announced the release of 1250 volumes of its files dating from... W[W]II in the first stage of a massive project to declassify 40,000 documents... While some were top secret in their day, the events many recorded were now well-known... The... archives research policy officer... said the ministry had set itself the task of screening 11,000 documents before August 1, 2000. He had four former ministry staff assisting him in the time-consuming task... [The officer said s]ome documents... would remain restricted because they contained material... from foreign governments, which was still deemed too sensitive for general release. However, researchers could... apply to the ministry to see restricted material.

...Government departments and ministries are being told to smarten up their acts in replying to requests for information from the public. The Chief Ombudsman... said in the Ombudsmen Quarterly Review that an increasing number of people were complaining about the time it took departments and ministries to answer requests. Under the Official Information Act public bodies are required to respond to requests for information “as soon as reasonably practical,” and in no more than 20 working days. One extension is allowed, and it must be for a good reason. One complainant said ministers and officials were abusing the act. “In many instances they appear to use the 20-working-day maximum as the minimum.” ...Radio N[Z]’s education correspondent... who has written a paper about the act, said politicians’ key trick to dodge requests from journalists was stalling. By the time the information was received it was out of date and useless... [A] senior researcher for the Royal Forest and Bird Protection Society, said: “It’s very rare that you actually get something quickly. In fact the... response is usually well after the time allowed.” ...the director of the law commission reviewing the Official Information Act, said the issue of time-frames was being tackled...

If questioning authority lies at the heart of a democratic system, taxpayers may well appreciate the more than \$1 million run up in the past six months providing... parliamentary answers... The P[M]... recently went public with gripes about the amount of time and money spent replying to parliamentary questions for written answer[s. Then a]... National MP... took up the challenge. He asked every minister how much it had cost their ministries and departments to answer questions since the election. The results added up to a grand total of \$1.1 million, with about 18 departments, including inquiry heavyweights such as Health, Finance, Housing and Courts, unable to provide costs. Education was the most sought after department, answering 517 questions at an estimated cost of \$362,000. The Defence Force estimated it cost \$87,846 to answer... 93 questions... But the answers were rendered virtually meaningless by the different ways agencies calculated the cost of staff time, which ranged from \$23.22 to \$100 per hour. Departments also took vastly different amounts of time to answer... Inland Revenue estimated its staff took 1.14 hours to answer each one; the Ministry of Forestry took four hours... The majority of questions are lodged by Opposition MPs, and have long been used as a way to dig up uncomfortable facts from the Government.

...Cabinet ministers have confessed to irritation with aspects of the Official Information Act which force them to release documents they would rather forget... Cabinet ministers are reported to have instructed public servants to destroy documents because of fears details would be revealed...

[T]hey did not want it known they were going against advice from officials, or that particular policies were not getting the expected results... [T]here was no evidence that the practice was common... One of the main purposes of the 1982 act was to increase "the availability of official information in order to promote good government." The Ombudsman... said... "Very clearly ministers need to take advice from officials and that is a very necessary part of operating government..." ...the Attorney-General... said it was worrying that advice between ministers was now viewed as official information... He said the review of the Official Information Act by the Law Commission would... include the provision of... allowing "free and frank expression of opinions by or between or to ministers from officials" to remain outside the public domain... People on both sides of the fence are quoted as saying that the Official Information Act has made officials less free with their opinions, often stopping them giving ministers advice they might not like. But suggestions that the act should be tightened to prevent such advice becoming public met opposition yesterday from representatives of some of the journalists who frequently use the act to get information. The executive director of the Newspapers Publishers Association... said that the law was already abused by politicians who did not want the public to know what went on behind the scenes. Politicians frequently delayed responding to requests for the maximum time... then asked for further clarification and finally refused the request, forcing journalists to seek the intervention of the Ombudsman. Even then there were still delays, as ministers were slow to respond to the Ombudsman's recommendation to release the information... "Then it arrives and large sections of the report – usually all the interesting bits – have been cut out," he said... A journalists' advocate... said that any move to tighten the act would be a return to the "bad old days" of the Official Secrets Act. "In those days a public servant could be sent to jail for releasing the most trivial piece of information[.]" H[e]... said that the Official Information Act already contained plenty of scope for sensitive information to be withheld... He was horrified to hear that some politicians had allegedly circumvented the system by destroying embarrassing documents. "If the documents don't exist then no-one has a chance to decide whether they should be in the public domain, and that's an abuse of the system,"... More than 1000 people a year appeal to the office of the Ombudsman after being declined information...

The P[M] is considering charging for information under the Official Information Act... [In related news, t]he Government is issuing secret instructions to state-owned enterprise boards on how to run their businesses... Traditionally, all financial instructions to the enterprises have been contained in annual statements of corporate intent, which are tabled in Parliament and therefore are public... In a new, unannounced policy, the Government is moving to control the companies outside the framework of the 1986 State Owned Enterprises Act. The Minister of S[OE]s... is responsible for the change, which is being implemented by the Treasury and Crown Company Monitoring Advisory Unit... A spokesman for the... Unit... said the detail contained in the strategic statements was likely to be too sensitive to be released... It is understood the instructions have also upset some directors, who were appointed because of their business management experience, but now face being told how to do their jobs. Instructions on how to operate as a board were apparently developed because of the extremely poor performance of some crown health enterprises. But they are being sent to all boards, although some have turned non-performing departments into extremely profitable companies.

...The S[IS]'s work now involves zeroing in on international money-laundering operations and terrorists masquerading as refugees. Those two "important" functions were outlined by the P[M]... in Parliament last night during debate on a doomed Alliance measure seeking to increase public scrutiny of the intelligence agencies... Lacking support from any other party in Parliament, the Alliance measure was defeated by 106 votes to 13... The P[M]... rarely makes any mention of the agency's activities. "Unfortunately... there are nasty people in the world," he told Parliament. He said many terrorists would like to use N[Z] as a "relatively soft haven." - 1997

The N[ZSIS] was given statutory recognition on Sept 11, 1969, although it had existed as an informal State service from W[W]II. According to its enabling Act, the NZSIS was to be a passive gatherer of intelligence with no powers or enforcement function. On Nov 16, 1977, an amendment which was possibly the most publicly contested piece of legislation in NZ's history was passed. This gave the NZSIS powers to intercept or seize communications and information by electronic means and the responsible minister, usually the P[M], power to issue interception warrants relating to a matter "prejudicial to security".

[The P]M... indicated yesterday that the law might be changed to allow... SIS... agents to break into people's houses. This follows the Appeal Court ruling that an SIS interception warrant did not give the agents power to enter a private residence. It also ruled that a certificate from [the PM] explaining why documents from the SIS were withheld did not explain, with sufficient precision, the reasons for those documents being withheld. The judges... ruled that... [the PM had seven weeks] to supply a certificate to satisfy them or to provide the documents for a judge to consider whether national security meant they needed to stay secret. [One]Justice... said that "courts today are not prepared to be awestruck by the mantra of national security." ...[the PM] said the Appeal Court ruling had raised a question as to whether the law was sufficient... A[n A]lliance MP... said the Appeal Court judges had acted as watchdogs of democracy and their judgment was a good one. "Clearly, democracy has won and [the PM] should accept that outcome with good grace and not be tempted to change the law..." ...[a p]olitical activist... had appealed against [a]High Court ruling that denied him access to SIS documentation. [The activist] is suing the SIS, [its]director... the officers involved, the Crown and police for \$150,000 for trespass or compensation for a breach of the Bill of Rights after two SIS officers were caught entering... [his] house in July 1996.

...To discover [the activist]'s views there is an easier way than breaking into his house: search the Internet, or flick through the pages of metropolitan daily newspapers over the past few years. If there is one thing that can be said about the 32-year-old who has captured the attention of [the P]M... and the S[IS], it is that he is public. Intelligence organisations have gone to great lengths to conceal their interest in him, but [the activist] has made no secret of his interests... [The] London-Pakistani who immigrated to N[Z] in 1988 for personal reasons... is against free trade, for workers' rights and is an advocate for the rights of indigenous people... His lawsuit against the SIS... has prompted new legislation giving the service the power to enter private homes. "This new law change is a declaration of war on dissent... [over] the free-market... religion... they want everyone else to follow,"... It has been suggested that the SIS agents may have been interested in [the activist]'s associates rather than in him. The service politely declined to comment when approached yesterday, and its leaders have remained tight-lipped throughout [the]court proceedings...

Labour['s] leader... has let slip why intelligence agents broke into... [an activist]'s house, saying they were not actually after him. Her disclosure of sensitive security matters is understood to have left the Government and the [SIS] fuming, although both refused to comment yesterday. [The MP], who as Leader of the Opposition receives regular briefings on state security, refused to comment further yesterday. In a magazine interview she said two S[IS] officers who were caught breaking into [the activist]'s Christchurch home were interested in overseas visitors staying with him. It is the first time anyone in authority has alluded to the reason for the bungled 1996 break-in. The details are deemed so secret that the Government is arguing through the courts that it should not have to reveal them to a High Court judge in private... But [the activist]... said the only person staying with him at the time was... a Mexican researcher and campaigner... [who] had been invited to a free-trade conference organised by [the activist] and fellow anti-Apec campaigners in Christchurch... [H]e doubted the service would have been interested in... the Mexican[, who] had not even been invited to N[Z] at the time the P[M] signed a warrant authorising the SIS operation.

...The SIS Amendment Bill was due back before the House last week but the Security and Intelligence Committee, headed by the... [PM, has] asked for another fortnight... apparently because [the] parliamentary committee has not decided who should issue the warrants. As it stands, the bill leaves the decision in the hands of the Minister in Charge of the SIS... [- in other words, the PM. A]n overwhelming number of those who appeared before the committee argued that it should be up to a judge to decide... The committee... has come under fire for not travelling outside

Wellington to seek the public's view. Two days were set aside for submissions last month... A[fter the A]uckland Council for Civil Liberties said it used up the last of its money flying to Wellington to support its submission... [an]Alliance MP... has revealed that the Government spent \$18,000 flying out the former head of British intelligence... to be an expert witness before the committee. "It is ridiculous that the committee refused to travel to Christchurch for hearings, when it was happy to squander \$18,000 on bringing an ex-British spy to [NZ]..."

...Legislation giving SIS agents explicit power to break into private homes will be rushed into Parliament today. The move comes a day after the Privacy Commissioner... recommended the removal of some S[IS] privileges under the Privacy Act. The Government has support from Labour, meaning the bill's passage is assured, despite Alliance... MPs'... reservations... Critics labelled the bill a "declaration of war on dissent"...

It's open home at your place Civil libertarians are disturbed at the Government's proposals to legalise the covert entry of private property by S[IS] agents... Yet N[Z]ers long ago surrendered the sanctity of their home. Either through complacency or ignorance, or in some cases necessity, we've let slip through without whimper more than 300 statutes and regulations which contain authority for some form of entry or search under warrant by the representatives of state agencies and other services. The best known is obviously the police, empowered by a search warrant issued by a judge. Less known is the authority given local bodies, health, agricultural, fisheries, environmental, postal and customs agencies – and bureaucrats who may not like what you read or watch on film or video in private. Exactly how many rights of entry exist is not known...

The Director-General of the S[IS]... has briefed top politicians about the level of [local] espionage from other countries' agents. "We have identified a number of intelligence officers from foreign nations living and working under cover in our country... They have been sent to target senior Government officials as well as their own communities of expatriates and emigres to pursue their homeland policies, often to N[Z]'s disadvantage." A list of more than 100 people alleged to be agents for Britain's MI6 has been posted on Internet sites around the world and includes the name of a 49-year-old first secretary at the British High Commission in Wellington. Publication of the list has been blamed on a disgraced... N[Z]-born... former spy... [However, the NZer] denied involvement yesterday, telling British newspapers his former bosses had linked him to the scandal in a bid to discredit him and make him look like a traitor.

...A High Court appeal has prevented extracts from the... book written by [a NZ]-born former spy... appearing in a British newspaper yesterday. But British Government lawyers seem to be losing their battle to maintain secrecy after a High Court case on Friday gave the *Sunday Times* the right to publish extracts from the book once it was in the public domain... [The] book's official launch [is] in Moscow today... The paper had tried to get altered a 1996 undertaking that prevented the newspaper from publishing anything from... [the NZer]'s experience in MI6... [The NZer] was dismissed from MI6 six years ago. He maintained his dismissal was unfair, and wanted his case reviewed by the employment tribunal. He was sent to prison for breaching the Official Secrets Act... after writing a synopsis of his book and showing it to a publisher. In the book, *The Big Breach: From Top Secret to Maximum Security*, he outlines how British spies hide their identities when posted abroad under diplomatic cover. Britain is convinced Russian intelligence is behind the publishing deal.

...The British intelligence services MI5 and MI6 – which previously were 'not answerable to the British legal or democratic systems' – [have been ordered to open their secret files to public scrutiny. Every British citizen will, in theory, have the right to look at his or her file. The Data Protection Commissioner... has ordered the services – and GCHQ... – to comply with data protection laws after years of frustrating failed negotiations... [A] 1984 act – which incorporates the data protection principles into British law – requires that data be collected fairly and lawfully, be accurate and kept up to date, and be used only for the purposes stated in its entry on the Data Protection Register. But after the new, tougher... Data Protection Act came into force in March this year... the commissioner informed intelligence chiefs that they could face court action if they failed to comply... The intelligence agencies are certain to seek to resist each application on the grounds of national security. It appears that the commissioner is determined to tackle each application on its merits – as with other organisations such as the police. This would result in a huge additional workload for the intelligence services and their overseeing ministers. Under the... act, a refusal... to disclose personal records "in the interest of national security" has to be endorsed by a certificate issued by a minister. A refusal can be challenged before a data protection tribunal. If all citizens can ask the intelligence service to see their files, the agencies may be faced with having to scrap many files of people they suspected in the past but who do not fit the exact terms of MI5's, MI6's and GCHQ's current remit... The MI5 security service alone holds approximately 440,000 files, according to a parliamentary reply from the Home Secretary... but unofficial estimates have put the figure much higher... [By the way, m]ore than 100 staff at... the Government Communications Headquarters at Cheltenham... have received compensation... of up to £20,000... because too much eavesdropping on the enemies of the West has damaged their hearing, the *Sunday Telegraph* reports. Staff... blamed their hearing loss on having to "turn the volume... on headphones... up to full if foreign transmissions were hard to understand."

...MI6's offices at Vauxhall Bridge has been dubbed by some staff as "Ceausescu Towers" after the former Romanian dictator with a penchant for grandiose and inhuman architecture. The offices, the target of a terrorist missile attack on Thursday... originally cost £240 million... to build. But to accommodate its strange new occupants a further £86 million of public money needed to be spent to cope with the secret service's needs... The cost of the... building[... which was opened]... in 1994... has left MPs gasping. The expenditure and high annual running costs have been criticised by Parliament's overseeing body the Commons Foreign Affairs Committee... As the attack shows the fortress like quality of the building is not misleading. The walls and windows have been specially modified to stop bomb and missile attacks... There is triple glazing installed on all windows as a safeguard against laser and radio frequency flooding techniques. [In addition, t]he building is... specially screened with metal shielding and wiring to prevent eavesdropping on its computers or the conversations that take place in the offices. For top secret meetings there is a special "silent" room deep in the centre which is designed to prevent any conversation being monitored... [T]here is also a secure command and control room to run major operations like those in Bosnia where war criminals were tracked and arrested by SAS personnel... [Speaking of the SAS, a] former... sergeant's book about his nine years in the elite British regiment... has become the biggest-selling war book, according to publisher Transworld. More than 1.5 million copies were sold in Britain (it still averages 7000 sales a month), 700,000 in the U[S], and has been translated into 16 languages. His follow-up autobiography, *Immediate Action*, was top of the non-fiction bestseller list for 18 weeks. It told of waging war in Northern Ireland, of two years as an undercover agent in South Armagh, of overt and covert action for the SAS on five continents. For that reason he hides his true identity. He has had two death threats. "They're not the problem, it's the others who say nothing – but you can't worry." ...ON THE street you wouldn't give him a second glance: average, passable, casually dressed, a pleasant enough, ordinary sort of bloke – except for the eyes... They are the eyes of... [someone] who shot up Britain's enemies to order, and who was brutally tortured by the Iraqis when captured during the Gulf War. Did he do it for honour, for Queen and country? "No mate," he says in a quiet London accent, "it was a job." Job or not, [he]... has cashed in and become a millionaire writing about his nine years as a member of... 22 SAS Regiment... Now he's written his first novel, which he is in Auckland to promote... In *Remote Control*... [–] a taut thriller with a Northern Ireland "Troubles" theme... [–] the central character and survivor, Nick Stone, at the end examines the motives of "the players" (as those taking part in terrorism and counter-terrorism are called in the trade) and the perfidy of those who control them. While they want to win, they're not doing it out of sense of altruism, of justice, of right or wrong. They are not interested in peace. There's no money or power in that. That is why every time some progress towards a settlement is made there's another outrage. Is that how it really is, how McNab sees it having been a real-life player, that there's a great conspiracy to keep "the industry" going? "Absolutely. It is an industry. Look at the whole power base of the terrorists and the benefits they get. There's guns, prostitution, gambling, drugs, authority. Then look at the military. Every year they sit down with the [British] Government and say we need more money. If they've got a conflict, they're going to get it... [Now I] look at what was going on during the Gulf War. The Brits were selling shells to the

Jordanians knowing that they were going straight across the border to the Iraqis to fire back at us [British and American] soldiers on the ground..." He left the SAS and the Army in 1993 and it was the regiment that suggested he write about his Iraq experience because there was so much misinformed conjecture in the media about what happened in the Gulf War.

...*Bravo Two Zero*, a book by [a former] British SAS sergeant... describes the activity of one NZSAS soldier – known only as “Mark the Kiwi” – in Iraq during the Gulf War. He served in a unit sent to attack communications facilities, pipelines and Scud missile sites. The mission was a shambles... [Intelligence gathered by others] proved dangerously inaccurate – [the unit was] dropped right next to an Iraqi military position and their radio did not work. On their first morning in Iraq they were spotted – by a boy herding goats – and from then it was a case of just trying to survive and escape. But they had almost no food and water... only light clothing, and nearly froze to death in snowstorms. They did, however, have a staggering arsenal of weapons and tried to shoot their way out. One escaped, four were captured and three killed. They estimated they killed or wounded about 250 Iraqis. Mark the Kiwi returned to Britain on a stretcher. Defence sources quoted elsewhere say no N[Z] SAS died during the Gulf War but three were killed in an incident in another, unnamed, country shortly after... NZ’S... Special Air Service... is... now being sent[back] to the Persian Gulf... [NZ’s PM says this time the NZ] SAS will be used only for search and rescue operations. All the SAS’s history suggests otherwise. The SAS is trained to fight and kill, not just to pick up stranded American pilots. What’s more, the SAS has been consistently “economical with the truth” about its real operations... The SAS needs to be recognised for what it is: An overseas intelligence and covert action organisation – the nearest thing to a local equivalent of agencies like the CIA and MI6... THE SAS has been fighting other people’s wars for more than 40 years. It has fought in a series of “dirty wars” in the Third World designed to promote the interests of the U[S] and Britain rather than N[Z]. It has helped prop up dictators and quell independence movements... SAS patrols... can travel by commercial transport or enter by parachute or small boat... There are a little over 100 N[Z] SAS members... The troops are moved between... two squadrons, one of which is trained and equipped for counter-terrorism operations and the other for commando-style “special warfare” operations. Each squadron is divided into small groups which are trained to operate independently... Even after leaving the NZSAS, members can remain on the payroll for up to five years, going on occasional training and being available for special operations. In recent years SAS has received nearly \$5 million of new communications equipment, including compact satellite communications units and “special warfare equipment”... [used for] sabotage, assassination and guerilla-style hunting of the enemy... On its first overseas tour in Malaya in 1955-57 the NZSAS was attached to the British 22nd SAS Regiment... In two 13-week operations in the Fort Brooke area they killed the opposition ASAL leader Ah Ming and his deputy, and in the mountainous Negri Sembilan area killed resistance leader Li Hak Chi. The deployment was regarded as a great success in a report from the time, with a total of 26 “terrorist eliminations”... The NZSAS was disbanded when it returned from Malaya, but was re-established in 1959.

...*Top NZ fighters shine in world hot spots*... More than a dozen former N[Z] SAS soldiers are believed to be serving with elite forces in politically sensitive areas overseas. Former SAS officers say these soldiers have resigned their N[Z] commissions before being employed as individuals by foreign Governments. Their resignations enable Defence Force staff quite correctly to deny any Government-sanctioned N[Z] armed involvement in conflicts around the world. N[Z]-trained SAS soldiers are highly regarded by armed services in Britain and A[US], said one ex-SAS officer. “Our guys have a lot of common sense... They are more independent and resourceful. A high percentage are Maori and they have instinctive bushcraft skills.” He said Maori soldiers especially could sense the presence of other people when on bush patrol, a potentially vital attribute. He likened their overseas service to that of a surgeon wanting to hone his skills. “They want to go and train and get the best experience... Their fitness is up with, or more than that of a triathlete... [but t]hey need a lot more strength. They have to be muscled because they will be carrying heavy loads and rock climbing in many circumstances. They have all got to be A-grade rifle shots. Some will do the sniper course. They are all good with pistols and small-calibre weapons. Most of them will have worked in our accident and emergency wards as part of their training. They are reluctant to retire. It is such an exciting job. Normally most of them leave because their bodies pack up... in the early to mid-thirties.” Another former SAS soldier disputed suggestions made on TVNZ’s *Assignment* documentary on Thursday of official cover-ups in the deaths of three N[Z] SAS soldiers overseas. He said the two incidents, one in the Philippines and the other in Zimbabwe, were “definitely accidents” during training exercises... Lance-Corporal Dan Flanagan... [was officially] stomped by elephants on a covert mission in Zimbabwe... in 1995... [T]wo Papakura soldiers, Sergeant Dennis Terry and Warrant Officer Dave Heywood, were killed while on a secret commando mission in the Philippines in 1981. They were among 23 people from the U[S, AUS] and the Philippines who died when their modified US Air Force craft mysteriously crashed into the sea.

...*When [our subject] became the youngest ever recruit to Britain’s Special Boat Service, he entered a world in which SAS men were considered amateurs*... In the middle of a stormy night in the late Seventies, when the North Sea, lashed with rain, was as black as ink, 20 members of the S[BS] leapt out of a helicopter. Fully armed and equipped with state-of-the-art “bubbleless” breathing apparatus, they were performing the first part of their mission: to rendezvous with a nearby submarine. Waves were crashing over the boat, but all 20 finally made it. They huddled in a trench on the outer casing of the sub, attached themselves to breathing umbilicals, and braced themselves as the sub dived to 60ft to take them near their destination. Because of the turbulence, the experience was like being strapped into a washing machine during the spin cycle. After an hour, the sub stopped, and a series of bangs from inside indicated that they should switch to personal breathing sets and fin up to the surface. Their leader, [our subject], was carrying rather more in the way of kit and hi-tech devices than the other men, and when he attempted to ascend, he found himself sinking under his pack’s anvil-like weight. He was about to ditch it, when a powerhouse of a swimmer doubled up with him, and together they reached the surface. They were now just a mile away from their destination – an oil rig overrun by a terrorist group. The rig workers had been taken hostage, and the SBS intended mounting the platform via the legs, “neutralising” the terrorists and rescuing the hostages. Such an assault and rescue had never before been attempted. The last mile was easily managed, with the raging current fortunately carrying them along at a terrific lick. But attaching themselves to the rig’s greasy legs, in 40ft waves, wasn’t so simple. Using leashes and a link system, the platform was finally reached, and the hooded SBS men began their task. All the troopers wore throat microphone communicators, and each knew which part of the labyrinthine rig to take out. Doors were hurled open, explosives, gas and guns were used, and a dozen terrorists were quickly mown down, with no SBS losses. Soon, just two terrorists were left: a flash bomb was thrown into the room in which they were hiding, and two SBS men shot them from behind. But one of the men wouldn’t lie down... It was... a senior NCO with the S[AS]. The whole operation had been a rehearsal, with the “terrorists” played by SAS men... Until now, the S[BS] have got on with their jobs, content to let the SAS be the glory boys of the British armed forces. But after years of obscurity, [our subject, who is now a] former SBS operative... has spoken out about life in the crack unit. “The main reason I wrote the book was to let people know that the SBS is better than the SAS,” he says. “Thanks to all these books and films, the world knows all about the SAS. But the final straw was when a friend of mine, who’d been in the SBS for 15 years, told me he’d just lost a job to a guy who’d been in the SAS for a couple of years. What was the job? Setting up a waterborne security force! ...But their guy got the job... First off, SBS men are recruited solely from the Royal Marines, one of the finest units in the world... They take soldiering skills very seriously. You must have served three years before applying for the SBS. The SAS take their men from all the armed forces... and some of them really aren’t very good. They’re all turning up to try for the SAS, and all they’ve got to be is fit. So, the first few weeks with the SAS is basic soldiering, like map-reading. The SBS don’t need that! They know the Royal Marines can already do it! At the end of our training, we fire live rounds. The SAS have to fire blanks, otherwise they’d end up shooting each other.” The two special forces are in the process of being merged into one unit, but [our subject] still believes the SBS have the edge. “...You ask the Ministry of Defence who’s best, SBS or SAS, and they’ll always say, off the record, ‘SBS, of

course.” It certainly wasn’t always so. When [our subject] joined the unit in 1975, the SBS was regarded as little more than a beach reconnaissance unit. They had acquitted themselves well in campaigns in Aden and Borneo, and in WWII the “cockleshell heroes” had paddled up to enemy ships and stuck limpet mines to their hulls. But they were losing many men to oil companies, who paid top dollar for them to work as rig divers... Threatened with being disbanded... [b]ecause of the shortage of manpower... its commanders decided to transform the unit into the finest special service of them all. “Why the SBS leapt ahead was mainly because the men became more involved... Everyone is encouraged to contribute to technology and tactics. Regular army guys are told when to eat, sleep and shit, but special forces are paid to think, to figure it out and learn... Security is big business, and if countries or corporations want the best, Britain is the first place they shop... Nearly every anti-terrorist incident in recent years has had an SAS or SBS operative advising... The Americans are all about technology, but comparatively, their men are useless. Every operation they’ve been involved in for 20 years has been disastrous.” But even the SBS has had problems. During the Falklands War, four operatives had the task of yomping across the barren landscape until they reached a rocky hilltop, from where they would report Argentinean activity. After several hours, they weren’t certain of their location. For every patrol’s operating area, there was a buffer zone which was out of bounds to that patrol and all others. If anyone came in, they were presumed to be the enemy. That night, the area adjacent to the SBS’s was manned by an SAS team. Both teams were slightly out of position, and the result was that Kiwi, the SBS team leader, was shot dead by the SAS. When the tragic error was realised, no words were spoken between the two units. But after the conflict, the patrols were on the same ship coming home. A fight took place, and, to avert mass murder, the SAS were helicopter[ed] to another boat. That apart, the Falklands had been good for the SBS, mainly because the SAS came out with a black mark against its name. The regiment had used its satellite communications system to report directly back to headquarters in Hereford, which [the Iron Lady] regarded as a severe breach of procedure. Thereafter, she sided with the SBS, and they began to be chosen over the SAS to conduct operations in volatile areas throughout the world.

...Meet the first special force – the Long Range Desert Group Between 1940 and 1943, the L[RDG] carried out close to 200 operations behind Axis lines, setting standards for special forces the world over. The LRDG was the brainchild of an English explorer, RA Bagnold, who had crossed the Egyptian Sand Sea in a Model T Ford in the Thirties. Bagnold invented a condenser to recycle water, and a “sun compass”. He proposed forming a motorised force to engage in “piracy on the high desert”, so in 1939 the War Office posted him to... Kenya. However, a naval accident stranded him in Cairo, where he rounded up a bunch of N[Z]ers and Chevrolet trucks. The LRDG was born. Bagnold recognised that the Sand Sea was just that – an ocean in which Axis garrisons were marooned, and that, like the Royal Navy in the Caribbean centuries earlier, a handful of skilled men could control vast areas. Within months, Bagnold, his Kiwis and a handful of desert-loving Brits were raiding airfields and fuel dumps, as well as lying up on “road watches”, providing precious intelligence. They went so far as to purchase two aircraft, on which a touchy RAF refused to allow them to paint British roundels. Operating in the desert for months at a time, the LRDG even began to look like pirates, adopting Arab dress and flowing beards. But it was the unit’s “taxi service” which was to have the most lasting effect: picking up the survivors from the SAS’s first, disastrous desert parachute drop in 1941, the unit’s professionalism so impressed SAS commander David Stirling that he remodelled the regiment around Bagnold’s men. The SAS soon took up the offensive from the LRDG, who focused on reconnaissance until the end of the desert war in 1943.

...The British Army has destroyed 90,000 copies of its own magazine, *Soldier*, after an article inadvertently revealed sensitive details about the SAS mission to free hostages in Sierra Leone. The Ministry of Defence ordered the glossy copies of this month’s edition be called back and pulped at a cost of more than \$[NZ]210,000. New copies were printed with the offending parts of the article... removed. A ministry spokesman yesterday told the *Herald* the magazine’s editors made a genuine mistake in breaching the hard-line defence policy of not publishing details of SAS or Special Forces operations. The ministry says the ban is so soldiers are not put in any danger. In the Sierra Leone mission, codenamed Operation Barras, the SAS freed six Royal Irish Regiment hostages from the West Side Boys militia... One SAS soldier, Brad Tinnion, was killed in the raid, and at least 25 West Side Boys died. The gaffe comes as the British Government tries to stop a former SAS soldier, a N[Z]er known as Mike Coburn, from publishing a book about his experiences in the botched Bravo Zero Mission during the Gulf War. Coburn has asked the High Court at Auckland to overturn a British interim injunction stopping him publishing... [Since] February 1997... 57 books [have been] published about the SAS – 22 by insiders and vetted by the ministry. The ministry has probably spent more than \$1 million fighting Coburn’s appeal.

...The British Government is sending a team of high-powered witnesses to N[Z] to block the publication of a book about the Gulf War by a former SAS soldier. The N[Z]er, now back living in Auckland, has written a manuscript called *Soldier Five* under the pseudonym Mike Coburn... The British are trying to stop the book even though two worldwide bestsellers about the... SAS patrol called Bravo Two Zero... have already been published. Two years ago it spent more than \$1 million in vain trying to block a TVNZ *Assignment* programme about Coburn. The Aucklanders’ take on events differs from that in the other two books. He wants to put the record straight about the [patrol]... Coburn’s role has already been publicised, first as the tree-trunk legged *Mark the Kiwi* in [*Bravo Two Zero*], and again in *The One That Got Away*... Both [authors] made millions by selling their stories... Coburn’s lawyer... [s]ays... “My client is not doing it for the money. He’s seeking the right to publish because he has something significant to say.”

...The story of Corporal Mike Coburn – or “Mark the Kiwi” – ...has all the elements needed for a brilliant war yarn. Coburn, now in his late 30s, worked under callous commanders in a career spent operating under false names (to this day his real identity is under wraps), showed courage under fire and endured almost unendurable hardship, cold and torture. Throw in a 100km car chase, a stray goat herd and “slotting” (SAS slang for killing) hundreds of Iraqis. But trying to tell his story of a botched SAS raid during the Gulf War has put Coburn on the wrong side of his old bosses – and the law. Even now it is impossible to tell Coburn’s story directly. Instead it must be clipped together from books, articles and broadcasts already in the public domain. What we know for sure is that the eight-man British mission was a shambles from the start. On January 10, 1991, days before Allied planes began bombing Iraq, the squad was deployed to Saudi Arabia. A few days later, a RAF Chinook helicopter dropped them a good 15km from where it was supposed to, and basically on top of the proposed target – an Iraqi Army encampment – 300km [nor]th of the Saudi border and 120km [sou]th of Syria. There was no cover in the tablecloth-flat, freezing desert, nowhere to take up position. Because the squad was sent out with the wrong radio frequencies, they could not communicate with their base. When they immediately ran into skirmishes with Iraqi soldiers, they did contrive to get a message to their leaders... through Guardnet, an emergency frequency that communicated directly to the SAS base in Saudi Arabia... but the SAS made a calculated decision not to get them out... “Without the shadow of a doubt, we were expendable.” The squad[, which] was headed by Andy McNab... started by following wadis – ancient river beds that twist through the desert – and shooting their way out of “contacts,” fighting for their lives every kilometre. The first night the patrol was split up. Three of Coburn’s mates walked on ahead out of contact and were killed. The remaining five, under McNab’s orders – and despite Coburn and the others’ misgivings – made a run for the Syrian border. They hijacked a yellow taxi and headed north. When they ditched at a checkpoint around 10km from the border, the team was surrounded by thousands of Iraqi soldiers... [W]ith the Syrian border – and freedom – in sight... they came under fire from Iraqi gunners. Coburn thought he was a goner... “The first round when it hit was like a huge wave of nausea went over me, I mean really intense... It was like somebody taking a sledgehammer to my ankle. Another round went through my arm and then the pain sort of came along and I started... screaming my head off.” Next came boots in the head, punches, blindfolding, interrogation and intermittent beatings. Because the Iraqis mistook Coburn’s tanned complexion and circumcision as proof that he was Israeli, he was singled out for particular torture. For weeks, while he was held in solitary in a foul cell, he was tormented by interrogators who refused him medical treatment for the gaping wound in his foot and indeed prodded the wound to cause him further pain... Unlike McNab, Coburn is bitter about his bosses’ decision not to rescue the squad... He felt

that he and the three who did not make it back had been betrayed by the very people whom they were bonded to trust their lives to. Getting involved in counter-espionage was what young Mike Coburn had in mind from the time he was 18. He grew up... on the fringe of West Auckland, and despite the fresh air and rugby lacked the excitement he craved. He was bored at university, and after watching news broadcasts on the SAS siege of the Iranian Embassy in London he saw an ad for the SAS and decided to give it a go... After earning selection, then qualifying in the N[Z] SAS squad, Coburn was hungry for some real action. He... headed for England... and... flew through the British SAS selection process[then] joined Andy McNab's squadron just before the Gulf War. Coburn's first stint in action in the Gulf was a shattering experience – both physically and mentally. He underwent six months' rehabilitation... Coburn's troubles with the authorities started back in London, where he was working with MI5 when his SAS bosses tracked him down to sign a new confidentiality agreement. By then – late November 1996 – most serving and attached SAS soldiers had been obliged to sign the agreement. The only way out was to be sent back to their regiment – an ignominious fate for daring, blood-and-guts SAS soldiers. Coburn, along with most of his co-workers, signed. Soon after, he resigned from the SAS... Coburn then joined the "circuit" of security jobs that tend to be filled by former SAS soldiers – and wrote *Soldier Five*... Coburn intends sharing any profits from his book... with the families of [his] fallen comrades-in-arms. That is if the British military Establishment does not stop him publishing.

...One week into a High Court bid to stop a former SAS soldier... publishing a book about his experiences in the botched Bravo Two Zero mission... the motives of both parties begin to crystalise... On one side... is a soldier who says he wants to salvage a dead colleague's reputation. On the other side... the British Ministry of Defence (MoD) is trying to... save face... Like Coburn, the SAS is most unhappy with the portrayal of "the desperate"... patrol in two big-selling books and movies. It says that although it holds Coburn in highest regard as a soldier and a man, an example must be made. Driving this heavyweight attempt to gag Coburn is a bid to keep SAS morale intact – and the Service competitive.

...It is the latest chapter in a war of words that is threatening to tear apart the most feared fighting unit in the world: the SAS. On Wednesday, while Britain was sleeping, a former member of the regiment was celebrating a court victory in N[Z] that will allow him to publish his account of one of the murkiest episodes in the history of the S[AS]. Already, four books have described the doomed mission of Bravo Two Zero... Now, because of the ruling in an Auckland court, a fifth will be published. So, what's wrong with that? Plenty says the M[od]. Because *Soldier Five*... will accuse officers of leaving their men to die and label the authors of at least two of the other books as liars... That is sure to embarrass the MoD.

...Modern France's most sensational political murder – a bloody case involving a vengeful king, secret agents and the Paris underworld – has taken a bizarre twist. For more than 34 years, the final resting place of Moroccan opposition leader Mehdi Ben Barka has been a mystery... Barka was kidnapped in daylight by French police and secret agents, who killed him in a house in a village south of Paris. That much was disclosed by arrested gang members, but the location of his body has never been resolved. The answer, according to the weekly *Paris-Match*, lies under a mosque. In an act of contrition, it suggests, the grieving monarch built the mosque on the site of a wood where his former foe was buried... Barka had once been the king's maths teacher and was on good terms with him. He became president of Morocco's National Consultative Assembly in 1956 after independence from France. But [a] shift to the left [by Barka] poisoned their relationship... Barka went into exile in 1960 and was sentenced to death in absentia after allegations that he had tried to assassinate [the king] and backed Algeria in a border dispute with Morocco. Against this background... [the then] Moroccan Interior Minister Mohammed Oufkir decided to get rid of Barka. In 1965 he sent an envoy to Paris who recruited a team including two members of the French secret police, the SDCE... President Charles De Gaulle angrily accused Morocco of orchestrating Ben Barka's death, insisting that France had "only a coarse and subsidiary [role]." But the police investigation, subsequent trials and a string of unexplained deaths have left the suspicion that the SDCE men and police acted with official approval. Four members of the team fled France, probably for Morocco. Five others were acquitted. Only two were convicted. One... a former secret agent who is the last known survivor in the affair... got eight years; the other... the senior policeman who whisked Ben Barka away, got six years. A trail of corpses could make investigation impossible. One gang member, Georges Figon, was found dead in a Paris flat in 1966, a bullet in the back of his head. It was classified as suicide. The two Moroccans – Interior Minister Oufkir and Chief of Police Ahmed Dlimi – were in the villa on the night Ben Barka was killed. Dlimi was acquitted; he died in a mysterious car accident in January 1983. Oufkir slipped back into Morocco and was never prosecuted. He died in 1972 – officially, another suicide – as he was implicated in a plot against [the king].

...The world's press was manipulated by British intelligence as part of a plot to overthrow Indonesia's President Sukarno in the 1960s, the *Independent on Sunday* reported yesterday... [I]t had obtained a Foreign Office document which revealed the full extent of a "dirty tricks" campaign orchestrated from London... to destabilise Sukarno by suggesting his rule would lead to a Communist takeover... "The disorder fostered by the British led to... [the present] dictatorship, and a wave of violence unseen since... W[W2]," the weekly said. Cabinet papers relating to the time were uncovered by... a historian at the London School of Economics, whose research is to be published this week in the journal *Intelligence and National Security*.

...The super-secret U[S] National Security Agency says its computer systems suffered a serious problem affecting their ability to process intelligence data for three days last week. The agency, which eavesdrops on conversations overseas to monitor possible security threats to the US, said the problem had been resolved and it was confident "that no significant information had been lost." But it noted that it took technicians thousands of hours and about \$US1.5 million... to get the computers running again... The incident follows the failure of a critical U[S] spy satellite system... [In related news, the US] military spied on A[US]n peace activists in 1989 amid fears that public hostility might force Washington to close a spy base in South A[US], says a new book... [The AUS]n Defence Minister at the time, [who is now the]... Opposition leader, said that while... he was not told about the surveillance... he was not surprised by the revelations. "If we had a base overseas and there was any particular threat to the security of the base or our personnel there, we would have an assessment of it... The only thing I note about it is they evidently decided the A[US]n Government was handling it well enough." Results of the 1989 investigation are classified and it is not known if they involved covert operations... [P]rotests at Nurrungar in the late 1980s... triggered concern at the highest levels of the American military at a time when Washington considered Nurrungar to be a vital link in its global military network.

...N[Z] is part of a satellite spying system now causing international uproar. Inquiries are under way in Europe and America into the Echelon network, which includes the Waihopai spy station near Blenheim... THE world's whistleblowers are puffing up a symphony over spy satellites. In this they are following the foremost whistleblower of all... [A NZer] literally wrote the book about the secret Echelon network, which can intercept phone calls, faxes, telexes and emails throughout the world. His 1996 work, *Secret Power*, hit a wall of official silence in this country. But now Echelon is under fire internationally. The E[U] and several European countries have launched inquiries into claims that the U[S] used it for industrial espionage. In the US, a congressional committee is to hold hearings on Echelon following claims it has been used to snoop illegally on American citizens... [NZ's PM, while somehow refusing] to even acknowledge Echelon exists... insists the information gathered at the Waihopai spy station is not being misused... [C]ritics ask: how does [the PM] know? Much of the information obtained at Waihopai, they say, is automatically forwarded by computer to the other four countries in the system – the U[S, AUS], Britain... and Canada... "Anyone who thought the Americans wouldn't spy on N[Z]ers would be grossly naive. They do it to their own people, and all their other allies. Why should they spy comprehensively on Europe and have high scruples about N[Z]?" ...The power of the system is awesome. Echelon, says... [the] author of a report on surveillance technology to the EU last year, intercepts "billions of messages per hour".

...N[Z] supplies intelligence collected at its top-secret electronic bases to overseas agencies, but it does not include information on its citizens, an official report has found. The Inspector-General of Intelligence and Security... [- a] retired... judge, appointed to monitor N[Z]'s spy agencies[-] was asked to investigate claims that the [GCSB]'s stations at Waihopai and Tangimoana operated at the direction of international partners.

...the peaceful, quiet Waihopai valley. It's a small farming community in the Marlborough foothills, not far from Blenheim... Farming is harder these days, but there are still compensations, like good neighbours and a beautiful environment. Until, that is, the government stepped in and made [one] neighbour an offer he couldn't refuse. To a struggling farmer in a depressed area a chance to sell part of the family farm at a good price is too good to be true. He sold off a substantial section. Now, the... neighbour is the Defence Department. The... view is security fences, operations buildings and huge 18m high satellite dishes. And there's not a thing [neighbours] can do about it. Any other developer would have to apply for permission to do something outside the District Scheme. People affected would at least be able to make objections and be heard... The people of Waihopai Valley were not consulted; they had no opportunity to submit objections or an alternative development proposal based on the needs and concerns of their community... Waihopai is a government satellite spying base and the Government Communications Security Bureau (GCSB) is exempt from normal planning... Not only do Waihopai's closest neighbours have no say in its location, let alone whether it should exist at all, neither does anyone else. There is little information and no public debate... [The GCSB] is not in fact accountable to any of the N[Z] public except through the P[M], its nominal head... The GCSB is so secret that there is no annual report, budget or other means of accountability to the tax-paying public... Despite the Official Information Act, a great deal of information remains secret and restricted. The GCSB appears to be unaccountable to the public, to Parliament, even to Cabinet. Only the P[M] and the Minister of Defence are given information on the GCSB. They can refuse to give answers and the system allows such abuses. Clearly there is every chance that some material will be classified "For GCSB Eyes Only" and even the PM will miss out on it... Waihopai is just one example of current attitudes to defence and security... The anti-nuclear policy of 1984 has led to the breakdown of the ANZUS military agreement. N[Z] is supposedly now pursuing a more self-reliant defence policy. Yet with Waihopai, N[Z] will be gathering information of use only to a military alliance and giving that information to America, either directly or via the A[US]ns. Two steps forward, one step back. ANZUS has merely been replaced with alternative secret defence arrangements linking USA, UK, A[US], Canada and N[Z] – an international intelligence and military network. The controversial purchase of frigates is also a part of these alternative agreements... The process of law in N[Z] is supposed to uphold democracy and individual rights. Yet the experience of... [Waihopai] shows the government can ride over those rights if it so chooses... True democracy depends on access to information, so people can make responsible decisions. When a few people possess information and use it to maintain control and power over others, this is not democracy... [Furthermore,] Waihopai will be in breach of the International Telecommunications Convention, which N[Z] signed in 1982. - 1989

Beware: Big Brother is watching... Fuelling fears of paranoid people, a secret squirrel expert yesterday shattered any illusions that we lead private lives... [T]hat old black marker... was no longer the cover-up tool it used to be – computer equipment... [can] expose secrets once blacked-out by pen... That digital cellphone conversation you think cannot be intercepted? Bad news. "The code's been cracked." ...[in addition, carrying] a cellphone was a simple way of ensuring that you could be tracked. Every few minutes, the phone sends out a pulse indicating where it is. "Those movements are being recorded and a history of those movements can be made available to whoever is willing to pay as well as law enforcement [agencies]." ...Okay, but we can rely on the Internet for private chit-chat, can't we? Wrong. "It's like sending a postcard." ...Be careful with nasty notes, written and then deleted from a computer. They can easily be obtained in back-up systems... Oh well, how about just slipping into a darkroom, away from cameras we see everywhere for a clandestine conversation? Don't count on not being seen. "The cameras come as big as my thumbnail." And combined with the latest technology, infrared lighting can expose all... Then there are the interception devices which can pick up images from a video display unit up to 1000m away. "Moreover, it is virtually impossible to detect certain bugging devices." Espionage of this type was usually motivated by commercial reasons, he said. But no one was safe. "Anyone can be bugged. It does happen here in N[Z]." Incidentally, N[Z]... is paying its dues to Washington by giving the top-secret Waihopai spy station in Marlborough sweeping new powers and technology to tap into the international phone calls which foreigners make across the Pacific. Waihopai's satellite intelligence-gathering capacity is to be doubled in a move understood to be a pay-off to the U[S] for the continuing warming of relations in the wake of the break-through visit to Washington in March 1995 by the P[M]... A special exemption to the Crimes Act will allow Waihopai to intercept the "private oral communications" of a foreign state, foreign organisation or foreign person which might yield foreign intelligence... [T]he exemption to the Crimes Act was a "startling" development because until now Waihopai had legally been able to intercept only non-voice communications such as faxes, e-mail and telex messages. The law change effectively meant any call between a N[Z]er and a foreigner could be intercepted... [The PM] said the new powers would be strictly confined to foreign communications that contained or might "reasonably be expected to contain" foreign intelligence. The GCSB was still forbidden from "intentionally" intercepting N[Z]ers' voice communications. [The PM] refused to supply a detailed explanation for the new powers, except to say the need for intelligence that supported the Government's foreign, defence and trade policies had, if anything, increased in recent years... [T]he new antenna would enable N[Z] to monitor the two Intelsat satellites that carry the bulk of communications across the Pacific. Under previous intelligence-sharing arrangements, N[Z] had been responsible for monitoring one of these satellites. Waihopai would now monitor both satellites, freeing-up an A[US]n sister station for other tasks. Opposition parties have been briefed on the Waihopai expansion, but the Alliance was the only one to criticise the doubling of the size of a spy base designed to serve "foreign spymasters."

...Greens want to stand under their own colours... The Green Party is on the verge of creating a separate identity for itself outside the Alliance – a challenge that will prove a far greater test of the five-party grouping than the crisis posed by [one of their list MPs going independent]... The Green Party proposes to... form a coalition between itself and the grouping. Its three MPs would be known as Green MPs, not Alliance MPs. The co-leader of the Greens... yesterday confirmed that this was his party's preferred position... Since the Greens helped to form the Alliance in 1991 "that organisation has evolved to a point where we aren't happy with the current structure." ...Also admitting to troubles is the leader of the tiny Liberal Party... who yesterday said he had problems with the Alliance's structure and hierarchy. "We face a crossroads and it will take all our patience and goodwill to get through this successfully," he said. The Greens' position was crucial to his own future... "The Greens are pivotal for the outcome for the Alliance. If the Greens can be accommodated, we can all be accommodated. If they can't we are facing a new ball game."

...Delegates to a Greens special conference in Wellington yesterday voted 59-19... to leave the five-party Alliance and field their own candidates next election. They rejected the offer by the other parties to stay with a guarantee of 30[%] of a joint list... However, the three Green MPs will remain members of the Alliance caucus, sharing resources, staff and accommodation, until Parliament rises just before the next election... [Furthermore, the] Greens list MP... has given notice that she intends to stay with the Alliance at the next election... The huge gamble the Greens have taken... may see the party lose all its parliamentary representation next election instead of improving... [T]he party is unlikely to win an electorate seat without persuading Labour and the Alliance to stand aside... The Labour leader... has not been enthusiastic for... the Greens... [and] noted the party's previous success coincided with a higher profile for green issues: "It's yet to be seen whether the Greens can recreate that kind of magic. It may be that the Alliance is the party which proves to be the stayer rather than the Greens." - 1997

The accepted remedy for many of our social problems is “economic growth”. Greens do not accept this remedy, and we point out that this priority has played a large part in bringing us to the brink of disaster. We believe that we urgently need a new approach, one based on “being a part of” rather than dominating the planet; on intelligent co-operation, not ruthless competition... Greens would encourage co-operation, rather than competition, for everyone’s benefit... Greens believe that socially and environmentally responsible development are more important than short-term monetary profit... Sharing society’s wealth is important too... Greens believe every person is entitled to an individual Social Dividend... We feel it is essential that ordinary people take responsibility for changing the world... It is not enough for individuals to be hard-working and responsible – understanding and involvement in community affairs are necessary too... Urban decay is a symptom, not a cause, of conflicts that have been happening for centuries. Physical decay – of the beaches, of the streets – is the result of society in conflict with its own environment... [S]ocial decay – gangs and glue-sniffers on the one hand, the bored and wasteful wealthy on the other – is the symptom of conflict within communities. As people we seem incapable of caring for anyone other than our immediate families, sometimes not even then. We plan our towns for commercial convenience and industrial growth, not human needs and a multicultural mix. Do we really want to live this way? ...The aspirations of huge numbers of ordinary N[Z]ers should not be seen as a “wish-list”, but as the basis for planning social and economic policy... The Monetarist theory is that profit will pay for all other needs – Green thinking is that that is not necessarily so, that other needs have to be a part of the plan from the beginning... Economics should be taught as a tool for society to use to allocate its resources fairly – not a rigid system that controls society as in: “Economics dictates...” ...Most people need to feel useful and be rewarded. Unemployment breeds crime; crime brings fear. When people are unwanted in the commercial process, they feel failures. They turn on those who seem to have what they want, they turn on each other. They become less human – as do those who succeed in the system. Already, the rich are building their own ghettos, guarded by the up-market versions of the gangs’ barbed-wire and dogs. While rural areas are losing their services and their valuable people, urban areas are being stretched beyond their capacity to cope with the influx. Both suffer. Our whole society has become a battleground for survival, for the best-paid jobs, for the biggest slice of the pie. In all struggles, there are winners and losers – the present political attitude which encourages competition contributes to the problem. It’s the micro version of the cold war. - NZ Green Party, 1989

Economic activity is a root cause of ecological crisis. To solve our environmental problems we must also transform our economy. A green model would be based not on the nightmare of continual material expansion and waste but on sustainability, cooperation, justice and respect for nature. Although change is never easy and often uncomfortable, the green route is the only one that would lead to both ecological and economic sanity... The thing that makes our vision quite revolutionary is that we see economics as a tool for human progress, and the restoration of harmony with nature, and not as an end in itself... Only the Greens have looked at the economic roots of our ecological problem and found ways of achieving ecological sustainability without damaging economic stability... The Greens’ greatest challenge will be to deliver prosperity without pollution, to create an economy that provides material security as well as fulfilling ecological aims. - A Green Manifesto for the 1990s

...the most radical [Green aim] seeks nothing less than a non-violent revolution to overthrow our whole polluting, plundering and materialistic industrial society and, in its place, to create a new economic and social order which will allow human beings to live in harmony with the planet. In those terms, the Green Movement lays claim to being the most radical and important political and cultural force since the birth of socialism... - Green Political Thought

The restructuring of the economy along the lines proposed by the Greens will offer tremendous opportunities for human creativity, entrepreneurship, and initiative. There will be plenty of growth in the new economy, but all growth will be qualified; it will proceed in the direction of small-scale, community-based enterprises and of new forms of technology that incorporate ecological principles and are consistent with a new system of values. - Green Politics: The Global Promise

[Due to unresolved conflict between the conservative (or Light Green) faction and the radical (or Dark Green) faction, t]he Greens’ vision of how we shall live in an ecological, nonexploitative society is no better developed than their economic vision for the future... The party lacks a clearly articulated model of an ecological economy, at both the micro- and macro-level, and for the most part lacks even comprehensive theoretical visions...

Contrary to the conventional wisdom, Greens believe that competitive and cooperative inclinations are both natural. Diversity, though it seems on the surface to drive nature towards competition, may also be a powerful force working for unity. And the drive for unity, especially if it levels diversity into uniformity and sameness, may well lead to bitter competition and conflict. To the Greens, conflict is a natural part of life. They do not anticipate some future glorious time in which there will be some magical “graduation of humanity” to a perfectly harmonious existence. - The Greens and the Politics of Transformation

[Some people] were deeply concerned that members of the party who had ‘opted out of the formal economy’ were gaining strength. An alleged group of anarchist/decentralists who ‘simply do not accept the mainstream party-political objectives of the organization of which they are members and exercise undue influence at conference because our customs allow them to do so despite their patent lack of a constituency’ were also singled out. The party was accused of collective incompetence and weaknesses that would prevent it from becoming an important national political force. Another area of concern was that of image and leadership... Again, as far as romanticism is concerned, Green politics has little time for individualism or for geniuses, and one suspects (although this will be disputed by members of the movement) that the nonconformity so beloved of romantics would be a pretty scarce commodity in Green communities... In 1985... the most famous ‘fundamentalist’ in *die Grunen*, left the party. He argued that by then the party had ‘no basic ecological position’ because ‘what people are trying to do... is to save a party – no matter what kind of party, and no matter for what purpose. The main thing is for it to get re-elected to parliament in 1987’... [He] is here articulating the experience of a fundamentalist Green who has seen the party colonized by the demands of the very system that it originally sought to overcome. His conclusion ran as follows: At last I have understood that a party is a counterproductive tool, that the given political space is a trap into which life energy disappears, indeed, where it is rededicated to the spiral of death. This is not a general but a quite concrete type of despair. It is directed not at the original project which is today called ‘fundamental’, but at the party. I’ve finished with it now... And so we find ourselves back at square one: the radical Green demand to call today’s industrial order into question. But how to do it? ...The first point to note about ecologism and social change is that very little serious thinking has been done about it... ‘one reads very little about how to get there from here’... and it is noticeable how many conversations about Green politics very soon dry up when the issue of change is broached. Several reasons for the lack of material might be advanced. In the first place there is the belief that the changes required are so far-reaching that nothing short of an environmental catastrophe could produce the political will needed to bring them about: ‘it is quite “unrealistic” to believe that we shall choose simplicity and frugality except under ecological duress’... Second, amongst more optimistic observers there has been a tendency... to believe that the delivery of the message of impending catastrophe would be enough to generate social change. After all, how could a humanity aware of the threat to its existence fail to act in its own best interests? This certainly seems to have been the line taken in the original *Limits to Growth* report: ‘We believe that an unexpectedly

large number of men and women of all ages and conditions will readily respond to the challenge and will be eager to discuss not *if* but *how* we can create this new future'... Contrary to its authors' expectations, however, the publication of their report has not of itself produced the changes for which they argue.

For those of us who prefer the Government's role in the economy to be strictly limited, it is pleasant to come across a book that persuasively argues that the Government's role should be even more strictly limited than one had previously thought. This happened to me recently with a cracking new book... entitled *The Economic Laws of Scientific Research*. Though a scientist himself, [the author] has become something of a hate figure among publicly funded scientists – and one can see why. Not only does he suggest that the Government has no role in subsidising technological development (a conclusion not difficult to come to), he also argues that it has no role funding pure science either. To support his case he employs a commendable economic literacy and a good grasp of history. Everyone agrees that new technology creates wealth. But [the author] argues that subsidising science in the hope of stimulating economic growth puts the cart entirely before the horse. It is private property, trade and exchange – in a word, markets – which drive technological progress, science and economic growth, not the other way around. The human race had technology before science. Stone Age man was taming fire and shaping tools long before there was any "science" in today's sense. But technological progress was still painfully slow for very long stretches of time in the ancient world. Why? Because most of the great ancient civilisations were essentially totalitarian states in which economic freedom was minimal or non-existent. Those islands of comparative economic freedom – such as the early Greek city states, and the seafaring Phoenicians (who gave Europe its alphabetic script) – made technological advances quite out of proportion to their size. Have you ever wondered why the ancient Romans invented so little, despite long being head honchos of a large empire? It is probably because Rome did not really have a market culture, but a plunder culture based on slavery. By contrast, the so-called "barbarians" who eventually overran that empire, though doubtless barbarous in their table manners, actually had more fluid societies than the ossified late Roman Empire. Not surprisingly, the barbarians gave Europe many valuable inventions, from soap to the saddle. The same story of economic freedom driving new technological advances is repeated all through history. The end of feudalism was hastened by a commercial revolution in the late Middle Ages, in which the independent city states of northern Italy developed banking, insurance, double-entry book-keeping – and the crucial idea of the patent. The agricultural revolution of the 17th and 18th centuries brought big increases in agricultural productivity through innovations such as different crop rotation systems. It is no coincidence that this revolution happened in England and Holland – the two countries where the commercial revolution had gone the furthest. The late 18th century saw the beginning of the industrial revolution, a development whose impact on living standards was to be utterly spectacular by the standards of all previous human history. Tellingly, this revolution did not happen in France, although the French Government was heavily subsidising science. True to its tradition, France was then a high-tax, chronically regulated economy that would put off any entrepreneur. The industrial revolution happened in England at a time when the British Government was spending scarcely a penny on "helping" science and technology. England offered something vastly more important: the rule of law, low taxes and a largely free-market economy. [The author] demolishes the myth that the early industrial revolution involved recent scientific developments being given practical application in the form of new technology. There had certainly been important advances in pure science. But these had very little to do with the new technology. The pioneers of the industrial revolution were largely ignorant of science. They were simply taking advantage of their economic freedom to experiment, and mostly thought up new ways to improve old technology. For instance, the steam engine – that very symbol of the industrial revolution – owed nothing whatsoever to pure science; the succession of men who developed what became known as Stephenson's "Rocket" were largely semi-literate. - 1995

How far can a government be privatised? To the point where every politician is sponsored by a business? (Some people would say most politicians are already sponsored by businesses!) Would *those of us who prefer the Government's role in the economy to be strictly limited* prefer there to be no government at all? If privatisation is allowed to continue to a logical conclusion, *no government* might be the end result (i.e., politicians may eventually make themselves redundant by transferring all the decision-making power to business executives – guided by existing legislation or 'having no laws or no enforcement of them'). Would private enterprise do a better job of managing a country than people selected by public election?

Responsible N[Z]ers are entitled to wonder about their country's future... That populism is no substitute for principled leadership is demonstrated in our political system in many ways... Electorate disillusion with political institutions and the people who run them is universal in the parliamentary democracies. Influence peddling by members at Westminster and murky circumstances surrounding corporate contributions to their parties feed cynicism in Britain. France is seeing a round of indictments of established figures on major corruption charges and Italy witnesses a revolt by law enforcement agencies against institutionalised corruption. In Tokyo and Washington the political establishments and their financially free-wheeling ways are under critical scrutiny as never before... Corruption of politicians is not unknown in A[US. Political corruption]... is not a great concern in N[Z], although we can only speculate as to why no state secret is half as well kept as all information about donations made to political parties by business... A curious common element in all this is that the institutions themselves seem to be immune to the evolutionary forces continually at work in the societies they preside over. The only change of consequence in several centuries has been that disinterested, gratuitous public service in government has become a thing of the past. Professional politicians, the huge cash flows generated by modern economies to satisfy the taxes those politicians levy, and the economic power they wield by the exercise or withholding of influence and patronage, make up an unfortunate combination... N[Z] taxpayers provide, and the state spends, an amount which will soon reach \$10,000 annually for each man, woman and child in the country. Utopia? By no means. Considering the scale and range of problems our society faces it is clear that we get very poor value for our money from our political system and the people in it... The... speechwriters' efforts to persuade us that their[political] masters have overnight become inspired social reformers and champions of fiscal responsibility are silly. Voters will pay attention when they see proof. - 1997

Poor economic management is inexcusable; letting politicians persist with it is national flagellation.

NZ's voter turnout has remained above 80% since 1960 (with the exception of 1975 – when it was about 70%), which suggests that NZers are enthusiastic supporters of their political system. This could be related to the fact that the ratio of MPs to voters is relatively low by international standards. The existing 'formula, which works from the requirement that the South Island must have 16 seats, requires that North Island electorates have between 51,006 and 56,374 voters.' The formula also allocates Maori seats according to the number of Maori electors who opt to be on a separate Maori roll.

The Government will pay up to \$10.50 for each Maori voter who registers on the electoral roll. But its new campaign has been denounced by the Opposition as an "electoral bounty." The Electoral Office has contacted several Maori trusts and groups to conduct a "face-to-face" campaign encouraging Maori to enrol or re-enrol. The groups will get between \$5 and \$10.50 for each voter enrolled. The... incentive is part of a \$2.4 million enrolment campaign which starts on April 2 and runs for four months. Just over \$450,000 of the budget will pay for the national campaign to encourage Maori enrolments... Under the Maori Electoral Option, Maori can register on either the Maori roll or the general roll.

During 1997 '53.6% of the 336,997 Maori electors' opted to be on the Maori roll (thereby raising their allocated number of representatives from 5 to 6 – or one MP for every 30,000 voters).

[THE] NATIVE REPRESENTATION ACT (1867)... created four Maori parliamentary seats... bringing the Maori nation into the political system of the self-governing colony. The... Act was originally intended to be temporary. When Maori landholdings were converted from tribal to individual ownership, the Maoris were to have joined the general electoral rolls. Because of the difficulty of dividing the Maori holdings, however, the act was made permanent in 1876. According to its terms, the Maoris received universal male suffrage 12 years before it was granted to the European[s]...

[Prior to universal male suffrage, a European] over the age of 21 was entitled to vote in any electorate in which he owned a minimal amount of property. This compounded the influence of the wealthy property owners who could be on a number of electoral rolls.

Unlike in AUS, where it is 'compulsory to vote', 'it's not illegal to not vote in NZ, although it's an offence not to be on the electoral roll – you can be fined.'

More than 200,000 voters are not enrolled for the October 12 election. Only 68[%] of voters aged between 18 and 29 have registered. This compares with 80[%] of middle-aged voters and 94[%] of those over 60... The deputy chief electoral officer... said last night that... MMP was expected to produce a heavy voter turnout... In 1984, 93% of those registered voted... The last election in 1993 saw an 85% turnout...

The votes counted – excluding special votes – show a turnout of 1,836,030 people, 76.36[%] of those enrolled... In the general seats the highest turnout – 82.79[%] – was in Dunedin South. The lowest was in Manurewa at 66.37[%]. In the Maori seats the lowest turnout was the 34.94[%] in Te Tai Tonga, but the uncounted votes will add to that... Some 220,057 special votes, about 13,000 overseas votes and 21,739 Maori votes have still to be counted... and... these would add 10 or 11[%]... Based on past trends, about 20[%] of the special votes could be invalid... An electoral staff of 65 returning officers and 15,640 staff supervised the election in 7584 booths... Politicians, television commentators and voters complained on election night about having to wait well into the early hours of Sunday morning for results... Votes could be counted electronically in future to avoid the long delays... The chief returning officer... said supermarket-style scanners could be used to read votes from bar codes on ballot papers... [T]here had been no chance to test the technology for this election [because] the risk of a computer crash holding up the whole result was too great.

...[Party leaders are pressing for a quicker count of votes in Indonesia's election, but reports of irregularities have been coming in faster than results. As of last night, barely 3% of the votes had been counted, causing party leaders and angry voters to bombard the General Election Commission with complaints. Indonesia spent over \$US80 million installing a high-tech computer system to record and release results as they came in from polling booths. But rather than shedding light on the counting process, the new system has created more confusion. The commission's system of double and triple checking the tallies have slowed the process down considerably. An inadequate system of communications at the subdistrict level has also created a bottleneck for incoming results. Political analysts warned that further delays would raise public suspicion on the validity of the results. For what it was worth, the Indonesian Democratic Party of Struggles last night was leading the poll with 40%, the National Awakening Party had 23% and Golkar 18%.']

...The Japanese P[M]... began courting coalition partners yesterday after voters refused to give his Liberal Democratic Party a clear mandate in general elections... Like N[Z], it was the first under an MMP-style election, in which the Diet has 300 seats decided under... first-past-the-post... and 200 under proportional representation... The election... had offered Japan the chance to end the lethargy caused by three years of unwieldy coalition wrangling. But the hopes fizzled out into an inconclusive result likely to lead to more years of politics as usual and hamper efforts to reform the economy and bureaucracy... In the end, Japan's 98 million voters decided to... stay away from the polls in record numbers, which led to a 59[%] voter turnout, the lowest since... [WW2, and below the previous] record low of 67[%] for a lower-house vote, set at the last election in 1993... Only 45[%] of the electorate voted in last year's election for the less powerful upper house of Parliament...

Our recent election was astonishingly tame compared to the one culminating today in Thailand. Much of the \$1 billion-plus spent by candidates, says the Rajapak Research Institute, went on bribes – with the going rate for a vote being nearly \$12. Seventeen campaign workers have been attacked by gunmen, believed to have been hired by rival parties, and seven have died.

...[it used to be that a Mexican candidate could draw a crowd by serving sandwiches and soda pop. As the electorate becomes more sophisticated – and races become more competitive – the price of wooing voters is rising. So in the buildup to Monday's election, candidates have given away televisions, tool sets and washing machines, or delighted crowds with pop concerts, circuses and strippers. All this in a nationwide election many observers say is Mexico's cleanest. Some gift-giving appears to be legal, such as when candidates act on their own initiative and with their own money. Other practices are more dubious, such as when Government officials hand out gifts bought with taxpayers' money. Most of the accusations have been lodged against the Institutional Revolutionary Party, or PRI, which has been known for vote-buying throughout its 71 years in power. "It seems there's a calculation of the votes needed to make a difference, and a decision they can be gotten more easily by paying for them than by convincing people," said the director of the watchdog group Alianza Civica. "Unfortunately, there's a sector of the population that defines its votes by the question: What are they giving me?" Meanwhile, this month's b]otched local elections... have thrown Serbia into chaos... Some 40,000 people protested... against[the Serbian] President... on the streets of Belgrade yesterday for the ninth day running... A march in Belgrade drew 100,000 protesters on Saturday and leaders of the Zajedno (Together) coalition of opposition parties planned today to take control of seven cities where they claim to have beaten the ruling socialists in elections this month... [The] socialists admitted being defeated by Zajedno but balked at surrendering power and organised new ballots which secured their return to power in a blatant display of vote-rigging... Saturday's demonstration included parents who brought their children in to witness a disciplined show of opposition. One mother said... "...I want [my children] to learn what democracy is... I want them to remember this." Marchers... pelted [the]state-controlled Serbian television[centre] with fruit, paint... eggs and smoke bombs but stewards ensured there was no violence... [T]he protesters also accused the U[S] and other Western powers of dealing with the devil by supporting [the President] in exchange for his help in keeping the peace in Bosnia. - 1996

A government can limit freedom of expression in very subtle ways. But the beating... a small, lean woman in her early 30s... took from Serbian police on the evening of Dec. 27 wasn't subtle in the least... [She] suffered kidney damage, severe contusions on her face and legs, a cracked rib and a concussion... It happened in downtown Belgrade at the end of another day of massive demonstrations against Serbia's ex-communist ruling party. As [the woman] and a few dozen other protesters lingered on their way home, riot cops fell on them with rifle butts and boots, and with little warning... The government's message was clear enough: Think twice before you raise your voice in protest, and don't forget that when the day's demonstrations are done and the international TV crews turn off their cameras, you still have to walk home in the dark... As it turned out... [the woman was a] user of one of Serbia's small but growing number of commercial Internet services, [which meant] she had access to a global medium far more personal – and potentially more powerful – than television. Within hours of the assault, a local friend of hers sent E-mail to a few acquaintances outside the country describing [the woman's] condition and warning of the government's increasing violence. The message spread; recipients forwarded it to colleagues, mailing lists, electronic newsletters, Webzines. By the second day following the beating, a steady stream of

supportive E-mail was [mak]ing its way from strangers in the U.S., Canada, Germany, A[US]... and elsewhere to the home computer of a grateful [assault victim]. Almost from the moment Serbian demonstrators... took to the streets in late November, the technology of cyberspace has been helping keep the protest alive... The... freedom... movement itself has already been nick-named the Internet Revolution.

...[the Serbian President] has come under strong pressure from the U[S] and other countries who have warned he cannot expect financial aid to resume unless he respects democracy[. By the way, 'one of the world's smallest republics, San Marino, is a 62-square-kilometre dot of rocky terrain surrounded on all sides by Italy. San Marino is so rich and has so many citizens living abroad that it pays 75% of the fare of these citizens to return home to vote in general elections. Half heed the call']...

Some of the world's poorest and most chaotic countries, such as Albania and Angola, have voting rates that outshine many developed democracies, according to a world-wide survey. The Institute for Democracy and Electoral Assistance compiled figures from more than 1400 parliamentary and presidential elections in 171 countries since 1945... The study's mass of statistics does not provide clear indicators of what accounts for high turnout, but does challenge some conventional wisdom about voting patterns, such as the belief that high literacy equates with high election participation... It shows Malta, the Seychelles, Albania and Uruguay with turnouts of more than 90[%] in the 1990s. Angola was fifth-highest with 88.3[%]. NZ ranks almost level with the ravaged African republic – our turnout last year was 88.28[%]... At the bottom of the list were Guatemala, Egypt, Senegal, Burkina Faso, Djibouti and Mali – all with turnouts of less than 30[%]. The US ranked 139th, at 44.1[%]. - 1997

[In 1980 the 40th US President] was elected... with only 28[%] of the eligible vote; hopelessness and fearful apathy carried the majority.

The number of 'eligible voters in the US during 1992 was 189,524,000, while the number who actually voted was 104,425,000 (or 55.1%). The number of votes cast for the winner was 43,682,000', which meant he was only supported by 23% of those eligible! How low would support have to go before it is decided that no one has a mandate to become President? Although this is unlikely to ever occur, it is also unlikely to cause a problem.

...if no nominee gets a majority of the electoral votes... the House of Representatives... chooses a President from among the... candidates... Each state delegation casts one vote. A majority of the members of each delegation determines how the state's single vote will be cast. If members of a delegation are evenly divided, that state's vote is not counted. A majority of all the states... is needed for election. The five non-voting delegates from the House of American Samoa, the District of Columbia, Guam, Puerto Rico and the Virgin Islands take no part in this process.

Voter apathy in the US is more prominent when it comes to electing members to the House of Representatives. Only '36% of the eligible vote supported the 1994 election. Since 1932 the peak turnout for congressional elections is 58.5% in 1960 and the lowest turnout is 32.5% in 1942' (but, because this was during a war, the official *lowest turnout* should go to the 33.1% for 1990).

The nation has endured stretches of low turnout in the past. America's first five Presidents, from George Washington to James Monroe, won elections in which only 4 to 6 percent to the eligible electorate participated. Voting was a difficult enterprise in the early days of the republic: it was hard to get information about candidates or find out where polling places were... Turnout shot up to 57[%] in 1828 and reached 80[%] by 1840. For the remainder of the nineteenth century, the rates only once fell below 70[%] (69.4... in 1852) and sometimes exceeded 80[%]... For the first half of the twentieth century, turnout in presidential campaigns ranged between 50 and 60[%]. In the 1950s, it began trending back upward, as America became better educated – a factor that has always correlated with higher turnouts. The rate reached its modern peak of 63.6[%] in 1960. Since then, voter turnout has declined by more than a fifth, to 1988's 50.16[%]... the lowest in sixty-four years... Among the wealthiest fifth of the population, the turnout rate has ranged between 75 and 80[%] in the last three presidential elections[(1980, '84 and '88)]; among the poorest fifth, the rate has hovered around 40[%]... - See how they run

"My back is spineless, my belly is yell[ow] – I am the American non-voter." "...don't you think..." "Ah, Lisa, the whole reason we have elected officials is so we don't have to think all the time, just like that rain-forest scare a few years back. Our officials saw there was a problem and they fixed it, didn't they?" "No, dad, I don't think..." "There's that word again!"

"What I think this country needs is..." "Don't tell us – have your say on election day."

Saint, sinner or lotto winner, your vote is worth exactly the same as the next person... unless you don't use it, then it's worth nothing.

A study into N[Z]ers' values has found confidence in politicians is at an all-time low and many people might not bother voting [next election (when, due to population and electoral roll figures, there will be '7 Maori MPs and one more North Island MP (but, to counteract those increases, the number of list MPs will decrease by 2)']. Fifteen years ago half of us were bursting with confidence in our Government, but that figure has dropped to 16[%]. Even fewer (6[%]) have confidence in political parties, and hardly anyone thinks people have control over what politicians do... The... study... said the events of the past decade had done nothing to increase people's faith in government representation... [A] co-author... of... the... study... said... "The... dissatisfaction... levels[which include]... disillusion... with MMP, ...are so high that this has to be seen as... rather disturbing... It is hard to avoid the suspicion that it is linked to the changes that N[Z] has been through, the often speedy and forceful way they were brought about, and the often minimal regard for the social consequences." ...Anger was widespread at what people saw as the economics of greed, and poorer voters especially were annoyed at exorbitant salaries for chief executives. The authors said the satisfaction of voters was of profound importance as a reflection of the health of the democratic process. "Where [this is] faltering, the fibres of national life begin to unravel."

While some voters find it hard to understand why anyone would want to be a *non-voter* (or to at least have the freedom to choose to be a non-voter), some non-voters find it hard to understand why anyone would want to vote in the first place!

I've said it before and I'll say it again – democracy simply doesn't work.

Fair elections the key to democracy... Democracy, which literally means "the rule of the people" in Greek, is a system of government by the whole population, usually done through elected representatives... The idea of political representatives developed through the middle ages, when kings and queens would choose representatives from the nobility and clergy to advise them. In the 1600s, Englishman John Locke formed political theories on which much of the British Parliamentary system and some of the United States constitution is based. Locke claimed that, in their natural state, all people are equal and independent and the state should be governed by that natural law. The political theories of Frenchman Jean-Jacques Rousseau in the 1700s further developed ideas of democracy. Rousseau claimed the general will of the majority of rational people would lead to the

common good, a philosophy which influenced the American and French revolutions. Since the mid-20th century, many of the world's political systems have increasingly conformed to the ideals of Western democracy with multi-party systems and free and fair elections.

A democracy is a nation in which the citizens, either directly or indirectly through representatives, decide their own affairs... The earliest democracies were the Greek city-states, which were sufficiently small for each citizen, or freeman, to take a personal part in deliberations...

In the later fifth century, Athens was a democracy. We are told as much by the Athenians of the period, so we presumably cannot doubt it... The courts of democratic Athens appear to be one of her most democratic institutions. Membership of the juries, which might contain as many as 501 persons, was open to all... [T]hey constituted large assemblies of amateurs who were at once juries and judges, and received no professional advice, for the Greek court had no professional judges or lawyers. - MORAL VALUES AND POLITICAL BEHAVIOUR IN ANCIENT GREECE

After... the... 411 B.C... revolution... [t]he sovereign Assembly was to consist in future not of the whole people, but of a body of Five Thousand, those who were strongest physically and financially... The Five Thousand were to be divided into four parts, and each part was to act as Council for a year in turn. The Council would elect the higher magistrates from its own number. Thus the difficulties of administration which arose in the double system, where the Council's action was hampered by the Assembly, would be done away with; and the inclusion of the generals and magistrates in the Council was a necessary consequence. Under the democracy, the holders of office could influence the Assembly against the Council; under the new scheme there would be no room for such collisions. One fatal defect in this scheme was the size of the administrative body and if it had been tried we may be sure that it would not have worked. But it was never tried. It passed the Assembly as a scheme to come into force in the future; but in the meantime a further proposal of the Hundred Commissioners enacted that the state should be administered by a Council of Four Hundred, in which each of the ten tribes was to be represented by forty members. - HISTORY OF GREECE, J. B. Bury

Plato... considered democracy to be one of the worst forms of government because when it deteriorates, it degenerates into mob rule... Aristotle condemns [it] because in a democracy each person strives for his own self-interest.

It is inaccurate to use the word DEMOCRACY to describe the political system of NZ, for example – because while every eligible adult can stand for election (but generally just those who are VAIN – ‘1. conceited, especially about one's appearance. 2. having no value or significance, unsubstantial. 3. useless, followed by no good result’ – want to), only about one out of every 50,000 of them can actually win the election and just over half of those go on to participate in the political decision-making process (which could be called democratic if it wasn't for the fact that most MPs merely follow the instructions of their party leader when voting in parliament). This means that approximately 99.98% of NZ voters only get to participate in their political system for 1 day every three years (or roughly 1 day in a 1000). Therefore, for those 99.98%, NZ's political system is only 0.1% democratic (less if the fact that voters aren't directly participating in parliament is taken into account – although referendums and local body elections could offset that reduction). Yet, even if NZ's political system was 100% democratic, it would still be *one of the worst forms of government* – because democracy presumes that every voter is qualified to make important political decisions (when selecting representatives or acting as one). This presumption would be valid if all the adults were wise – but that hasn't been the case for any human society to date! If 49% of adults are wise, under MMP they could, at least, expect to have some influence. However, what if the adult population was 4% wise and 96% unwise? Would anyone in parliament care about the opinion of the 4%?

LYSIMACHUS: I am going to ask this favor of you, Socrates, as is the more necessary because the two counselors disagree, and someone is... still needed who will decide between them. Had they agreed, no arbiter would have been required. But as Laches has voted one way and Nicias another, I should like to hear with which of our two friends you agree. **SOCRATES:** What, Lysimachus, are you going to accept the opinion of the majority? **LYSIMACHUS:** Why, yes, Socrates. What else am I to do? **SOCRATES:** ...If you were deliberating about the gymnastic training of your son, would you follow the advice of the majority of us, or the opinion of the one who had been trained and exercised under a skillful master? **MELESIAS:** The latter, Socrates, as would surely be reasonable. **SOCRATES:** His one vote would be worth more than the vote of all us four? **MELESIAS:** Presumably. **SOCRATES:** And for this reason, as I imagine – because a good decision is based on knowledge and not on numbers? **MELESIAS:** To be sure. **SOCRATES:** Now too, then, must we not first of all ask whether there is any one of us who is an expert in that about which we are deliberating? If there is, let us take his advice, though he be one only, and not mind the rest; if there is not, let us seek further counsel. Is this a trifle which you and Lysimachus has at stake? Are you not risking the greatest of your possessions? For children are your riches, and upon their turning out well or ill depends the whole order of their father's house. **MELESIAS:** That is true. **SOCRATES:** Great care, then, is required in this matter? **MELESIAS:** Certainly. - LACHES

As Socrates expresses it in the *Protagoras* (319D), in professional matters the Athenian assembly demands expert advice, but in business connected with the policy of the State it is ready to listen to anyone... To Socrates the successful pursuit of any occupation demanded the mastery of a particular knowledge, skill, or technique; and this was above all true of the direction of the city's affairs, on which questions of peace and war, and the whole happiness of the citizens, necessarily depends. By his criterion Athenian democracy stood condemned. The political implications of this seemingly innocent procedure were not lost on the Athenians. The craftsmen, said Socrates, had their own expertise, but were at a loss when it came to an understanding of the large and important conceptions of ethics or politics. Athenian democracy, on the other hand, was based on just the opposite assumption, namely that all citizens alike, whatever their daily occupation, were equally well qualified to deal with questions of public policy, which was not a matter of any special skill.

Socrates implied that rulers should be men who know how to rule – not necessarily those who have been elected.

...my blessed Crito, why should we care so much for the opinion of the crowd? It is the best men, rather, who deserve consideration... But, Socrates, you surely see that we have to reckon with the opinion of the crowd as well. The present situation makes it clear that the crowd can work, not very little evils, but well-nigh the greatest, when anyone is slandered among them... Would that the crowd did, Crito, have the power to work the greatest of evils, for then they could also work the greatest good, and all would be well. As things are, they can do neither. They cannot make anyone either wise or foolish, and they do whatever they do by chance.

It should be safe to assume that modern voters fall into one of three categories: they either know nothing about the history of human politics; are intentionally trying to make history repeat; or simply choose to support what is available because they can't think of a better alternative.

Whoever it was who said “while democracy may not be the ideal form of representative government” they couldn't think of an alternative that looked better, was an analyst of real quality.

“...the system doesn’t work.” “I don’t know a better one, do you?”

...the system survived... only because there was no evident alternative and certainly none that was better.

...there [must] be better plans but none that I could ever understand...

...nothing is forever there’s got to be something better...

...I’m trying to think of a new society... don’t know what it will have but it won’t have...

I know you see the problems. The thing is, I just don’t believe you have the solutions.

“...this is America, and in America you’re never finished as long as you’ve got a brain in your head because all a man really needs is an idea.”
“Well, I’m licked.” “Me too!”

There has to be a better way. And in Britain, at least, intelligent and concerned minds are feeling after it.

...when people pride themselves on having a pedigree of [25] ancestors, which goes back to Hercules... he cannot understand their poverty of ideas.

The **he** in the above quote was Socrates – a man who could *see the problems* with democracy but, apparently, also shared in everyone’s *poverty of ideas*.

Socrates then, who started out, as he claimed, in all humility to learn from others, decided in the end that, whereas he and they alike knew nothing, he was to this extent superior, that he was aware of his own ignorance. And since no one will try to find out what... he thinks he knows... already, the task was to convince others too of their ignorance. Then together they could start the inquiry with some hope of success.

When a student of Socrates once said, “I cannot refute you, Socrates,” Socrates replied, “Say, rather, that you cannot refute the truth, for Socrates is easily refuted.”

Socrates himself repeatedly denied the role of teacher, and he never bores us with the wagging didactic finger.

In his discussions it was always the other person who put forward a thesis for examination, never Socrates himself. It was always the other person’s ideas that were being tested. Socrates’ famous irony consisted in... his constant refusal to claim to... have any settled philosophical views of his own. Considering the stringent requirements which... he imposed on true knowledge, this refusal seems only prudent... He seems actually to have claimed for himself the role of midwife to others’ ideas... Just as midwives are past the time of childbearing themselves, so Socrates, the intellectual midwife, could have no brainchildren of his own.

Socrates served as a hoplite, a heavy-armed soldier, in several Athenian campaigns, and as such had to provide his own equipment... Socrates had no special interest in political affairs, although, as his military record shows, he readily and honourably performed his civic duties. In 406 he was one of the presidents of the Boule, the executive council chosen by lot from among the mature male citizenry, when an illegal attempt was made to condemn en masse the generals who failed to pick up survivors after the naval victory at Arginusae. He alone insisted that the motion should not be put to the vote. During the short-lived oligarchy of the Thirty Tyrants (404-403[BC]) he again showed his strength of character by refusing to bring another citizen to them for execution as ordered. Despite all this he was himself condemned, under the restored democracy...

The irony of the trial and death of Socrates still challenges us. He had repeatedly risked his life on the battlefield... Yet he... [became] the gadfly of the state and... outraged citizens by asserting the superiority of individual reason over conventional wisdom... then... gave his life willingly in deference to the laws of his little community.

[Socrates] belonged to no party. But he held unswervingly to the idea of law in the historical form of the Athenian polis.

Socrates was a true patriot who felt that he could best prove his devotion to Athens by setting his face resolutely against the attractions of specious and popular, but deadly false theories of public and private morality.

Socrates may have appeared dangerous to Athenian democracy, but what he defended were the foundations of that democracy.

Although Socrates allegedly *defended... the foundations of... democracy* and *was aware of his own ignorance*, he apparently also knew of a superior form of government to democracy (r:p281, lns51-9) – which implies Socrates may have been wiser than Albert Einstein!

My political ideal is that of democracy. Let every man be respected as an individual and no man idolised... The thing that has brought discredit upon the prevailing form of democracy in Europe today is not to be laid to the door of the democratic idea as such, but to lack of stability on the part of the heads of governments and to the impersonal character of the electoral system. - Einstein

According to a previous statement *it takes many virtues to become wise*. This suggests that rather than being *wiser than Albert Einstein*, Socrates simply possessed one or more virtues that Einstein lacked (and, therefore, Einstein wasn’t completely wise). However, Socrates also *wasn’t completely wise* (r:p26, ln45) – because he apparently lacked at least one virtue that Einstein possessed!

War seems to me a mean, contemptible thing: I would rather be hacked in pieces than take part in such an abominable business. And yet so high, in spite of everything, is my opinion of the human race that I believe this bogey would have disappeared long ago, had the sound sense of the nations not been systematically corrupted by commercial and political interests acting through the schools and press. - Einstein

In 1939 [Einstein] wrote a letter to President Roosevelt, at the request of several prominent physicists, outlining the military potential of nuclear energy and the dangers of a Nazi lead in this field. His letter greatly influenced the decision to build an atomic bomb, though he took no part in the Manhattan Project. After the war he spoke out passionately against nuclear weapons and repression.

An old woman sits in your lap for a minute – it feels like an hour. A young woman sits in your lap for a hour – it feels like a minute. That's relativity. Einstein, at the end of W[W]II an American citizen, loved this new Jewish joke. It was one of the best explanations of his crucial theory he'd heard. But while his laughter rang out, the FBI were ineptly trying to crucify him as a communist, his famous $E=MC^2$ formula had just been used to kill thousands of Japanese... and the bright young things of the physics world were deriding him for not accepting the bizarre realities of Quantum theory. The archetypal scientist, Einstein admitted he was a failure as a father and husband. But he was hardly naive... Realistic enough to warn other pacifists to beg the Allied governments to take up arms against the Axis powers, he pulled every string to help relatives, friends and complete strangers escape the fascists... Speaking out against any oppression, he made enemies on all sides – fascist and democrat. As he wryly pointed out, fascism rules by coercion and lies – democracy by lies only... With a “distaste for violence and clubmanship”, he was against “nationalism, even in the guise of patriotism”.

The reason *Einstein refused the presidency of Israel*, despite championing *Zionism*, was more likely to have been due to a desire to continue working on his scientific theories than a lack of interest in politics and social issues.

IS IT ADVISABLE for one who is not an expert on economic and social issues to express views on the subject of socialism? I believe... that it is. Let us first consider the question from the point of view of scientific knowledge. It might appear that there are no essential methodical differences between astronomy and economics: scientists in both fields attempt to discover laws of general acceptability for a circumscribed group of phenomena in order to make the inter-connection of these phenomena as clearly understandable as possible. But in reality such methodological differences do exist... Science... cannot create ends and, even less, instil them in human beings; science, at most, can supply the means by which to attain certain ends... For these reasons, we should be on our guard not to overestimate science and scientific methods when it is a question of human problems... If we ask ourselves how the structure of society and the cultural attitude of man should be changed in order to make human life as satisfying as possible, we should constantly be conscious of the fact that there are certain conditions which we are unable to modify... Man is, at one and the same time, a solitary being and a social being. As a solitary being, he attempts to protect his own existence and that of those who are closest to him, to satisfy his personal desires, and to develop his innate abilities. As a social being, he seeks to gain the recognition and affection of his fellow human beings, to share in their pleasures, to comfort them in their sorrows, and to improve their conditions of life. Only the existence of these varied, frequently conflicting, strivings accounts for the special character of a man, and their specific combination determines the extent to which an individual can achieve an inner equilibrium and can contribute to the well-being of society... Man can find meaning in life, short and perilous as it is, only through devoting himself to society... The economic anarchy of capitalist society as it exists today is, in my opinion, the real source of [social problems]... It is only a slight exaggeration to say that mankind[now] constitutes... a planetary community of production and consumption... [which] is carried on for profit, not for use... We see before us a huge community of producers the members of which are unceasingly striving to deprive each other of the fruits of their collective labor – not by force, but on the whole in faithful compliance with legally established rules... Unlimited competition leads to a huge waste of labor, and... [the] profit motive, in conjunction with competition among capitalists, is responsible for an instability in the accumulation and utilization of capital which leads to increasingly severe depressions... [while] capital tends to become concentrated in few hands... The result... is an oligarchy of private capital the enormous power of which cannot be effectively checked even by a democratically organized political society. This is true since the members of legislative bodies are selected by political parties, largely financed or otherwise influenced by private capitalists who, for all practical purposes, separate the electorate from the legislature... Moreover, under existing conditions, private capitalists inevitably control, directly or indirectly, the main sources of information (press, radio, education). Thus it is extremely difficult, and indeed in most cases quite impossible, for the individual citizen to come to objective conclusions and to make intelligent use of his political rights... I am convinced there is only *one* way to eliminate these grave evils, namely through the establishment of a socialist economy... A planned economy, which adjusts production to the needs of the community, would distribute the work to be done among all those able to work and would guarantee a livelihood to every man, woman, and child... Nevertheless, it is necessary to remember that a planned economy is not yet socialism... The achievement of socialism requires the solution of some extremely difficult socio-political problems: how is it possible, in view of the far-reaching centralization of political and economic power, to prevent bureaucracy from becoming all-powerful and overweening? How can the rights of the individual be protected and therewith a democratic counter-weight to the power of bureaucracy be assured? - Einstein

If Socrates was a *midwife to others' ideas*, Einstein can be called a midwife to socialism – which, because socialism has yet to provide *the solution to some extremely difficult socio-economic problems*, might explain why he tends to ask questions rather than answer them!

We can imagine what life according to the [Iron Lady's] gospel of free enterprise, patriarchal respectability and authoritarian order would be like. We know how we would be expected to bring up our children, make them manage their pocket money; how women should live; who should have babies and under what circumstances; how teachers in our classrooms should dress and what lessons are to be read in the religious education hour – as well as what the Public Sector Borrowing Requirement should be. It is an 'alternative future'. It is a philosophy of life. The one thing nobody knows is what Labour conceives to be an 'alternative way of life'. It currently possesses no image of the future. It provides no picture of life under socialism. It has failed so far to construct an alternative 'philosophy' of socialism for modern times. In its profound empiricism, it has mistaken adaptation to the present as progress towards the future. - The Future of the Left

Marx, Engels and Lenin, who theoretically substantiated the principles on which the concept of socialism is founded, did not seek to give a detailed picture of the future society. And this is in general impossible to do. - Perestroika

At no time did [Marx] concern himself greatly with the practical problems of how the socialist society should be run; his interest was in the revolution itself.

...the political and economic theory of... Marx[i]s... that, as labour is basic to wealth, historical development, following scientific laws determined by dialectical materialism, must lead to the... overthrow of the capitalist class and the taking over of the means of production by the proletariat. Events would then progress towards the ideal of a classless society, but the initial transition could not be affected without violent revolution.

Both the failure to foster socially responsible technology management and the failure to achieve more equitable distribution of wealth grow directly out of a central weakness in the free-market system – its inability to place public needs above private gain. Socialist industrial states can apparently distribute wealth and regulate technological impact more successfully than states that are more dependent upon a free-market system, but socialist states pay for their gains by having to rely more heavily on central control, with its attendant risks of bureaucratic stultification and authoritarian inflexibility.

On this point we want to be perfectly clear: socialism has nothing to do with equalizing. Socialism cannot ensure conditions of life and consumption in accordance with the principle “From each according to his ability, to each according to his needs.” This will be under communism. Socialism has a different criterion for distributing social benefits: “From each according to his ability, to each according to his work.” ...Heroes of Socialist Labour... want... to earn more, which is entirely understandable... This desire is totally in a socialist spirit, so there should be no restrictions – whatever a person earns he should receive... Such is the only reasonable way for a further advance of European material civilization... At the same time, we should not allow a person to receive what he has not earned. - Last Soviet General Secretary; the author of *Perestroika* and recipient of the 1990 Nobel Prize for Peace

“To each according to his need” has been a frequent battlecry of socialists, but many of them would in fact settle for a society in which each would be paid in accordance with his contribution to the commonwealth, provided that society would first assure all citizens minimum levels of housing, clothing, and nourishment as well as free access to essential services such as education, health, transportation, and recreation. Socialists also proclaim the need for more equal political rights for all citizens, and for a levelling of status differences. They disagree, however, on whether difference of status ought to be eradicated entirely, or whether, in practice, some inequality in decision-making powers might not be permitted to persist in a socialist commonwealth.

In its earliest forms, socialism tended to be little more than a romantic vision held by a minority of social reformers, many of them well-to-do philanthropists.

In France... [the] term socialism... was applied to the writings of... the Saint-Simonians and... Francois-Marie-Charles Fourier (1772-1837), a lonely and neglected thinker who was more than a little mad... Possessed by an inordinately wide-ranging imagination, he argued that the regenerated world to come would be characterized not only by social but also by natural and even cosmological transformations. The ocean would be changed to lemonade, and wild animals would turn into anti-lions and anti-tigers serving mankind. With meticulous and obsessive care, Fourier set forth plans for his model communities, the *phalansteres*, the germ cells of the good society of the future. In these communities men would no longer be forced to perform uncongenial tasks but would work in tune with their temperaments and inclinations. They would cultivate cabbages in the morning and sing opera in the evening. Fourier’s was an antinomian vision in which human spontaneity made outside regulation unnecessary. Whereas Saint-Simon called for the rule of experts, Fourier was convinced that love and passion would bind men together in a harmonious and noncoercive order.

Socialism is an economic system, a political movement, and a social theory... The word... was first used in the early 1800’s. At that time, socialism meant opposition to the selfishness that some people thought was the root of any *capitalist*, or *free enterprise*, system... The... Industrial Revolution in western Europe caused severe social problems. For example, many factory owners made their employees work long hours with low pay and under unhealthy conditions. Socialists claimed that... free enterprise systems are inefficient and wasteful... [while] public ownership or control of resources would ensure fairer treatment for all members of society... [They also] believe that a country’s resources should be used according to an overall economic plan formulated by manufacturers, farmers, workers, and government officials working together. By such planning, socialists hope to adjust production to the needs of the people... During the early 1800’s... socialists were frequently called *utopians*. This term comes from the book *Utopia* (1516) by the English statesman Saint Thomas More. *Utopia* is an account of an ideal society that provides equality and justice for all its members. *Karl Marx*, a German economist and social philosopher, became the most influential socialist of the 1800’s... During the late 1800’s, several socialist political parties were formed in Europe and North America. In time, these parties became united in an international organization with a single set of beliefs inspired by the writings of Marx. Between 1890 and 1914, the socialist movement grew strong, and socialist parties nearly won control of the government in several countries. But beneath the seeming strength, deep divisions existed. The movement included moderates, radicals, and revolutionaries. In addition, some socialist leaders rejected the doctrines of Marx. The international organization even included groups or parties that were non-Marxist. For example, the Fabian Society, a socialist group in the United Kingdom, derived its beliefs from Christian ideas and long-established traditions for achieving reforms. After W[W]I began... the international socialist movement collapsed. Socialist leaders had to decide whether they were loyal to the movement or to their country, regardless of who governed it and how. Most socialist leaders decided to place patriotism above their socialist convictions. Following the Russian revolution... revolutionary socialists founded new parties, which they called Communist parties. Since then, democratic socialists and Communists have become bitter enemies... In addition, the countries in which Communist parties control the government are sometimes called *socialist*, but most socialists reject this use of the term... Members of Communist parties consider socialism as a stage in the development of Communist societies. During this stage, a Communist party is in power in a country, most private property has been eliminated, and the economy is run on the basis of a national production plan. However, the nation is not yet rich enough to give all citizens all the material benefits they need, and the government must *coerce*... people to work hard for little reward. In a latter stage, the nation will be wealthy enough to satisfy everyone’s economic wants. That stage of development is Communism. Communists claim that coercion by the government will disappear under Communism. Democratic socialists... believe that some government coercion is necessary because some people must be forced to be good citizens... Unlike Communists, democratic socialists believe in democratic processes and do not wish to get rid of all opposition parties... Today, socialists disagree on many important points. Some want a strong central government running the economy. Other socialists favour as much local control as possible. Still others believe that there should be no government in a socialist society. Some socialists argue that socialism can be achieved only through revolution and violence. Others believe that socialism must come gradually, within the framework of existing political institutions. Most countries today have socialist political parties. Many nations have socialist governments, and almost all countries have adopted some of the ideas and methods that have been part of socialist programmes... Most socialists today are more critical of the writings of Marx than were early socialists. As a result, socialism can no longer be described as a Marxist *ideology*... The idea of *collective ownership*... of property dates at least from the time of ancient Greece. In the 300’s B.C., the Greek philosopher Plato proposed that a ruling class own everything in common, putting the welfare of the state above all personal desires.

Greeks contributed more to art, architecture, drama and government than any people before or, in a comparable period, since... Greek philosophy and scientific thought... has permeated the entire fabric of Western civilization... The ancient Greeks called themselves Hellenes... In the 5th-3rd cent. B.C., federations of... Greek... cities were formed... The threat of the vast Persian empire... aroused many Greeks to a sense of common

danger... As a result, two great powers emerged: the land power of Sparta, centered in Peloponnesus, and the naval power of Athens and the Confederacy of Delos. Rivalry among these groups resulted in the Peloponnesian War... after which Sparta became dominant until... 338 B.C.[, when] Macedonia had become so strong that it was recognized as leader of all Greeks, and thereafter no city or state was independent for long. The Macedonians under Alexander and his successors conquered large parts of the “barbarian” world, spreading Greek culture... The Greek term *barbaroi* had originally no disparaging connotation, signifying only “non-Greek”... The end of Greek freedom came with the rise of Rome and incorporation of Greek communities, nominally liberated from Macedonian rule, into the all-encompassing Roman empire after 146 B.C... The... Roman contribution... [to the civilization of west] Europe and, therefore... the entire Western world... was that of collecting, assimilating, and passing on elements of earlier cultures... The Romans borrowed much from Greek culture but either patronized or enslaved its cities and people... Historically, Rome had its beginnings in a number of prehistoric villages, settled by Latins and Sabines... in the 1st millennium B.C., which gradually... dominated other Latin communities. Subsequently, the defence of a growing territory led to the organization of central Italy under Roman control by 290 B.C... In the next period, that of the Punic Wars, defence turned to aggression, and Rome acquired its first provinces outside Italy; Sicily, Sardinia and Corsica, and Spain were annexed before 200 B.C. Simultaneously, Rome began to intervene in Hellenistic affairs, initially as a result of Pyrrhus’ invasion of [southern] Italy in the 3rd cent. B.C., then provoked by Macedonian ambitions... Macedonia was defeated, 168 B.C... At the death of Attalus of Pergamum, 133 B.C., that kingdom, by legacy, became the Roman province of Asia. Thus, the *Roman empire* was formed... The resulting riches and prestige involved Rome in chronic internal strife... culminating after Caesar’s assassination, 44 B.C., in the civil war between... 42-29 B.C... The looting of Rome by Alaric... signaled the collapse of the empire...

Alaric... (c.370-410), king of the Visigoths... invaded first Greece (395-6) and then Italy (400-3), but was checked on each occasion by the Roman general Stilicho. He invaded Italy again in 408 and in 410 captured and sacked Rome... [The Visigoths,] the western branch of the Goths... a Germanic tribe... eventually established in Spain a kingdom that was overthrown by the Moors in 711-12.

Although Socrates thought that his peers were ignorant, they – or at least their immediate descendants – somehow managed to build an empire. However, as if to prove that this event was due more to chance than design, the ancient Greeks were unable to maintain their empire indefinitely. *The Romans borrowed much* from those ignorant people – including the inability to maintain an empire indefinitely! The Visigoths also managed to prove themselves equal to the ancient Greeks in this respect, as have many other communities since – including the Soviet Union (although the Soviets could claim to be superior because they managed to build and destroy an empire within the space of one century). Now the former Soviet republics are adopting the ways of the Western nations. Because the Western nations are, in many respects, simply modern versions of ancient Greece, it shouldn’t be hard to predict their future.

Man has gone through... cycles in history over and over.

...I’ve got the weirdest feeling that I’ve walked this path before... it all looks so familiar... but I can not quite be sure... still I’m coming back for more... I must be blind...

...don’t know what I’m doing but I know I’m gonna do it again...

...IT would be nice to think that we learn from our mistakes, that we progress, that we don’t give the impression of wandering in mindless and ever-decreasing circles, stumbling occasionally over the same hazards that impeded us earlier in the journey.

During its comparatively brief political history NZ has tried an economic system based on free enterprise, then one based on welfare, followed by free enterprise again. There is, however, a major difference – originally, NZ’s political structure was young but growing, whereas today it is old and shrinking.

Though the changes in the past 10 years or so have been touted as giving more choice to individuals in reality they have been about governments off-loading their responsibilities onto anyone handy. Regional health authorities have taken over health decisions, services provided by the Government have been either privatised or corporatised so responsibility for satisfactory service is off-loaded elsewhere and even something as inflammatory as the quality of petrol is left to the oil companies to monitor. Services to schools have been axed – and all this took place over a period when the tax take was doubled and user charges were introduced. Finally although monetary policy is fundamentally flawed, many politicians still cling to it because it allows them to pass the buck on an economic mess to the Reserve Bank. I wonder how politicians have the gall to pick up their pay packets.

...The nation’s chief inflation fighter, the Reserve Bank governor... need have no worries about his own personal money supply. For keeping watch over our economic destiny, [the governor]... earned between \$350,000 and... \$360,000 a year. That is nearly twice the P[M]... The Reserve Bank’s annual report, released yesterday, says... 21 other staff get... more than \$100,000 each. - 1996

The *Reserve Bank* was established in 1933 as a privately owned institution but three years later became a fully state-owned central bank with gradually expanding powers of control over the financial system... [Its] functions... are... to manage note and coin issue, public and local debt and foreign exchange reserves... to operate the banking functions of the government... and... its trading organisations... to advise the government on matters relating to monetary, banking, credit and overseas exchange policy... to give effect to the monetary policy of the government... to control by recommendation, or directive if necessary, and supervise the operations of trading banks and all other financial institutions.

The NZ Reserve Bank tends to stick to recommendations (perhaps *because it allows* [the bank] *to pass the buck on an economic mess to the rest of society?*), which generally follow the trends of economic forecasts, and are meant to assist businesses and individuals in making economic decisions.

The economy sits more in the Governor of the Reserve Bank’s office than it does in your head – but it sits in both places. While [the Governor] has his hands on some big levers... he... reacts to economic trends which are created by the decisions we all make every day – to save or spend, to trade-up the car, the fridge or the house, to start up a small business, to expand or contract an existing one, to take on new staff or to lay people off.

...WHILE several businesses were preparing plant closures and lay-offs, [NZ’s] Reserve Bank Governor... was last week... genially tolerating a further easing of monetary policy. Alas, few of the hundreds of people rudely bundled into unemployment are likely to find new jobs in a hurry... Companies are trimming costs and will cut them harder as their profit margins are narrowed by... rising local interest rates... Reserve Bank officials check their Monetary Conditions Index, to judge if it’s time to tighten, loosen or stay put, while the money markets decide the mixture of movements in bill rates and the exchange rate. If one comes down, the other must rise to offset the inflationary effects... Underlying inflation in the December quarter was 0.6[%], making... the... annual rate... 2.4% in the 1996 calendar year.

...The Reserve Bank is keeping monetary conditions way too tight and risks tipping the economy into recession [a] chief economist... said yesterday. Despite extra Government spending, tax cuts and easier monetary conditions, he does not expect the economy to grow by more than 1[%] this year and 2.5[%] in 1998. But even those growth rates would only occur if the Reserve Bank was persuaded to significantly ease monetary policy in the near future... He blames the bank's overly cautious stance on a preoccupation with restoring its credibility after breaching the then top of its inflation target range last year. But its current policy – which has the perverse effect of pushing short-term interest rates to “harmful” levels when the economy is in the trough of its cycle – was not credible either... Foreign investors had long concluded the bank's strategy was not sustainable, as the now strongly-inverted yield curve testified. The dogmatic application of the bank's 2:1 rule of thumb was inappropriate at this stage of the cycle... This ratio, enshrined in the Reserve Bank's monetary conditions index, says that a 2[%] fall (or rise) in the dollar is equivalent in its effect on inflation to a fall (or rise) of 1 percentage point in 90-day interest rates.

...MARKET reaction to news of the latest inflation statistics was another kick in the guts for exporters. It pushed up the exchange rate again... [The d]isappointing... inflation figures... signalled that [there wouldn't be] any relief for home mortgage-holders this year... The monetary markets had been poised to continue the sharp fall in wholesale interest rates that has taken place since October. Instead, rates for 90-day bills, a key source of funding for mortgages, increased slightly to 7.45[%]... The consumers price index rose by 0.7% in the... quarter... This was just 0.1% above the Reserve Bank's expectations.

...Inflation numbers out yesterday were bang in line with expectations and gave neither the Reserve Bank nor the markets any advantage in their current game of chicken. The consumer price index rose a bare 0.1[%] in the June quarter, pulling the annual rate down to 1.1[%], its lowest level for three years... The result disappointed those in the currency market who had looked for an even better outcome that might have excused a further easing in monetary conditions... [R]etail sales data for May, due tomorrow, may yet encourage the market to test the Reserve Bank's resolve by easing further... The most significant increase by a single item in the... CPI... was electricity, up 2.15[%] for the quarter. [Annual inflation is still way below 'NZ's maximum of 16.9% in the 1970s' but p]rices have risen 4.46[%] over the past year and 30.21[%] over the past five years.

...Any hopes of a fall in interest rates in the near future were effectively dashed yesterday when foreign exchange and money markets ignored a Reserve Bank warning that monetary conditions were too loose.

...The Reserve Bank yanked the financial market's leash yesterday with a warning that monetary conditions had loosened too far. Both the dollar and wholesale interest rates rose in response to the bank's statement, which caught the market unawares, coming as it did only 11 days before the bank is due to deliver its[next] monetary policy statement... [F]actors expected to reduce inflationary pressures are the prospect of cheaper petrol and ACC earner levies... On the other hand... wages growth is stronger than expected and... underlying inflation... was still a brisk 0.61[%]...

The Reserve Bank is to stop calculating its own measure of “underlying” inflation, by which its performance in conducting monetary policy is gauged. Instead, the new Policy Targets Agreement signed yesterday by the bank's governor... and the Treasurer... redefines the bank's inflation target in terms of the consumers price index excluding credit services (CPIX), which is compiled by Statistics N[Z]. Under the previous agreement, the bank was given the target of keeping the [CPI] between 0 and 3[%], but was permitted to exclude interest rates, one-off external shocks (for example, oil prices) and significant government charges. In practice, the difference between the headline inflation rate measured by the CPI and the underlying rate the Reserve Bank worked to was usually interest costs. By expressing the bank's target in terms of the CPIX, that difference would largely disappear, and the bank need no longer calculate its underlying inflation measure.

...Publishing the inflation rate is a bit like predicting the weather – sometimes the experts can't get it right. The Reserve Bank just could not make up its mind yesterday about the rate of underlying inflation. First it published a quarterly figure of 0.61[%], with an annual rate of 1.72[%]. A correction was published 20 minutes later, putting the quarterly rate at 0.56[%] with an unchanged annual rate. Proving that half an hour is a long time in economics, the bank published a third figure 30 minutes later, saying that the quarterly figure was indeed 0.61[%] but the annual rate of underlying inflation was 1.77[%]. “I think it was just a fat thumb on the keyboard,” a source said.

...The... economic forecasters' worst nightmare is volatility in their own forecast view... The reason? People think you're stupid if you change your mind too often. And loss of credibility costs: in income if you're a private sector forecaster; in economic growth and living standards of everybody if you're the Reserve Bank... In its latest economic forecast the Reserve Bank raised its growth expectation yet announced we can have easier monetary conditions. Such a combination is rare... A combination of new methods used by the bank's researchers to determine just what the full capacity level of the economy is... is the rationale. Seldom before has the bank put its credibility so starkly on the line based on the efforts of its research team.

...The Governor of the Reserve Bank... has a phalanx of highly skilled economists to advise him. Surely with such support his decisions that so crucially affect our interest rates and general economic well-being will be well-founded? Well, it depends. It is true that the group of research economists at the bank are an impressive bunch, at the standard of a good university economics department, and well ahead of their counterparts at Treasury. But, like Treasury... the bank has a tunnel vision which limits the value of its policy advice to the extent of possibly costing N[Z]ers billions of dollars in lost output, profits and well-paid jobs. In policy research as in everything else the value of an answer depends on whether it answers the right question. The right analogy here is of a drunk in a dark street endlessly looking for his lost keys under a lamp-post “because I can see better here.” The monetarist doctrine that illuminates the Reserve Bank's analysis does indeed shine clear and sharp, but what if the key to our economic dilemma is to be found somewhere else? ...In order to avoid doing grave damage to reality, the forecasting and policy modellers have had to graft onto their system what used to be called a “fudge factor” – an adjustment which is quite ad hoc or even “wrong” in orthodox theory, but which seems to work in practice. [The Reserve Bank's] fudge factor... states that it is harder, in terms of the changes needed in output and unemployment, to squeeze inflation down than to get it up. There is asymmetry in the economic system... Now, the Reserve Bank economists simply assume that this asymmetry is centred around the... 1.5[%] per year... target rate of inflation. But what if it isn't? What if the particular institutions of the economy are such that its natural rate of inflation – at which normal economic growth can proceed comfortably – is a bit higher...? Then we must confront the ghastly prospect that [the Reserve Bank] has been forcing us onto the awkward part of the asymmetry for the past eight years – inflicting substantial losses in output and employment – just to make the economy do something it really doesn't want to do.

...It could just be the world's most tightly run central bank and its right here in N[Z]. The Governor of the Reserve Bank... might be best known as inflation's scourge but he also heads a bank whose tightwad administration regularly attracts attention from all over the OECD... and... [in] studies by the I[MF]... usually comes out on or near the top for economical management... Indeed the Government could be forgiven for reappointing the Governor last week to an unprecedented third five-year term just because his Reserve Bank actually returns a profit, something central banks aren't really designed to do. It is a little known fact that the Reserve Bank gave a present of \$135 million to the Government this year out of an operating surplus of just over \$145 million. The bulk of that comes from seigniorage – fees for printing banknotes. Not that the Beehive is grateful; the Government has screwed down the Reserve Bank's operational budget even more tightly for the current financial year. However... the Reserve Bank is... confident of shaving... more than \$5 million... [off the budget of] \$39 million... In the latest financial year, for example, it spent \$4.7 million less... than was provided... The overall savings have... been achieved without turning the central bank into a sweatshop[– although staff numbers declined during the past]... five-year period... by 40 to the present 290... The pay scales cited in the annual report show that... [a] total of 24 staff earn \$100,000 or more... Reserve Bank employees earn salaries comparable to the wider industry... [and the Governor's] salary is... hardly an excessive amount for a central banker whose reputation is probably second only to his American counterpart...

[The] Federal Reserve chairman... says the U[S] economy is close to the holy grail of price stability... as prices rose at the slowest rate since the 1960s... Gross domestic product expanded... but the Fed has yet to make up its mind whether or not the world's largest economy had entered a so-called "New Age" of strong growth and high levels of resource utilisation.

...U[S] retailers rang up unexpectedly strong sales... last month... [It was] the fourth straight monthly increase... [The trend is worrying investors, who had been] hoping that slower growth would hold inflation in check.

...These are trying times for economists. The U[S] economy is performing amazingly well, but even the world's most important central banker... cannot explain why. "Many observers, including us, have been puzzled," he said in his half-yearly... testimony to Congress last week... [The Federal Reserve Board chairman] is not the only one who appears at a loss. "I believe that the recent performance of the economy is to some degree a puzzle," agreed[a] Federal Reserve Board member... in separate testimony to a House committee... Is this the new age of economics? ...Well, yes and no, analysts say. Most economists advise against consigning those well-thumbed macroeconomic textbooks to the scrapheap... [One said,] "I've seen this before. We're having luck and some good management... It's primarily temporary." ...But other economists are not quite as convinced. "This economic success isn't a result of only temporary factors or luck, but rather derives in large part from good economic policy choices and from favourable structural shifts," [a] chief economist at Chase Manhattan said in his own testimony to the House Banking committee this week. He said today's workers produced more in less time, primarily because the large-scale use of computers was helping them to do a better job... Experts site the strong dollar, which helps to keep import prices down, and low oil prices as among the key reasons... The old jokes are proving partly true – if you ask 10 economists what is going on, you will get 10[different] answers... But whatever the right answer might be, it works for the average American. The economic picture at United States Inc is almost too good to be true... But few insiders appear ready to surrender fully to the boundless optimism. Both analysts and Federal Reserve officials are now sitting tight, watching for the first signs that the old models might, after all, not be as dead as some seem to believe.

...The U[S] economy is slowing from its strong first-quarter pace but still faces the risk of higher inflation down the road... "We certainly have clearer signs that the economy is slowing, but we still have a tight labour market,"... [the] Federal Reserve vice-chairperson... said. That means that the central bank will again face a "tough call" next month in deciding whether to raise interest rates further... After raising short-term rates in March in a bid to keep the economy from overheating and head off inflation, the central bank held rates steady at its last meeting in May amid hopes growth would slow. That is what seems to be happening. Retail sales have fallen for three months in a row as consumers have cut back after a first quarter spending binge that powered the economy to its fastest growth in more than nine years. Federal Reserve policy-makers are to meet at the beginning of [next month] to weigh their next move and Wall St analysts are betting it will again be to keep rates unchanged... "We still have these two things going on at once... We have an economy which is really slowing and we still have inflation risk. It could be that way for months." [The vice-chairperson] confessed that the current economic situation was "quite mystifying" but nevertheless welcome... Besides the tight labour market, she pointed to the ebullient stockmarket as another area of possible concern. "You have to be quite optimistic about [corporate] earnings to justify these kinds of [share] prices," she said. With stock prices so high, there is a risk investors will respond sharply by stepping up their purchases of consumer goods, spurring growth too much and fanning inflation... Although retail sales have ebbed in recent months, consumer confidence is strong, personal incomes are rising and employment is high... "It looks like a very strong economy... The main risk is inflation." ...She noted many companies continue to report having trouble raising prices because of stiff competition from domestic and foreign rivals.

...Producer prices have fallen for five months in a row in the US, a cumulative 2[%] drop in prices so far this year. This is a streak unmatched since 1952 and is great news for that economy. So ingrained in our psyche has become the equivalence of price deflation with economic depression, that there is a shortage of explanation for this current US experience. Nobody would suggest the US is in a depression right now. Indeed it is quite the opposite... Over the decades of permanent inflation we seem to have forgotten that there can be a range of circumstances which deliver a fall in the price level. Not all of these are symptomatic of an imploding economy, as say was the case during the 1930s Depression. Arguably the advent of the Industrial Revolution... with its technological revolution of mechanised production led to many decades of falling prices as the productivity benefits were captured... The US, being the most free and competitive market on earth, is getting the deflationary fruits of [the modern technological] revolution rapidly and its households are benefiting... So a strong economy, one where competition and productivity improvement is delivering benefit to households in the form of cheap goods, can be expected to experience widespread price falls, even to an extent that these show up in general price indexes... Such circumstances of productivity-inspired price declines can present headaches for a central bank as it tries to maintain overall price stability. In particular, under conditions of rapid and widespread technological change, prices can drop generally and at such a pace that monetary authorities fail to adjust their policy sufficiently. The net result is that the central bank keeps untoward pressure on the interest and exchange rates, forcing the economy to grow below its potential, or non-inflationary rate. I am not suggesting that this is happening in N[Z] at present... Central to the rapid dispersion of the benefits are deregulated and deep markets which enable the competitive processes of creative destruction to vent their wrath on the economic structure... With our deregulated international borders there are few barriers presented to rapid infusion of the benefits of the technological age into our society. Once here though there are significant impediments to those fruits spreading rapidly... and a... government (central and local) sector which is not responsive to market pricing present a formidable drag on realising our potential. To boot, our central bank has not done a great job in reducing inflationary expectations... sponsoring inflation outcomes above the mid-point of its so-called target (which was 1.0 and is now by virtue of ill-informed and misguided political influence, 1.5). So throughout our productive sector there is still a tendency to raise prices rather than lower them. How often do we see the following sort of communication from firms: "We have not raised our prices for more than two years, but we regret we are unable to hold the line any longer, and as a consequence... we will be lifting prices by 3[%]." It is as though they expect congratulations for holding their price rises off. Such an admission is evidence that our firms still operate on a cost-plus mentality and see pass-through as a profitable practice. If the Reserve Bank had succeeded in its mission, firms would not have this attitude – they[d] be too scared of substantial loss of revenue. Rather, they would as an alternative concentrate on productivity as the source of greater profits... One day, if and when price stability is achieved, the Reserve Bank will perhaps face a different challenge...

A[US]'s Reserve Bank yesterday confirmed widespread market predictions and slashed 0.5[%] off official cash rates in response to last week's better-than-expected news on inflation and wages. The cut, to 5[%], is the fifth since the[change in] Government... last year. N[Z] money markets were volatile in the wake of the A[US]n rate cut... With N[Z] short-term interest rates now more than 3[%] higher than those across the Tasman, some switching from A[US]n to N[Z] dollars was occurring, dealers said. "The kiwi is starting to outperform the Aussie on interest rate differentials alone," one said.

...OVERSEAS hedge funds, we are told, put the skids under the Kiwi dollar last week... The term hedge fund has become associated with freewheeling investment vehicles taking big leveraged bets, particularly within liquid global currency and interest rate markets. They are attracted like bees to honey by unsound, politically driven policies... Whether it's hedge funds, banks or our own producer boards bidding down the currency is immaterial. The currency is falling because it was forced up previously – and responsibility for both the rise and now the bumpy fall lies at home. Journalists are fond of describing[the] Reserve Bank governor... as the country's most powerful financial figure. That shows a shallow understanding of what the good doctor does. Supported by advice from his own team of economists and armed with just two modest weapons – control of short-term interest rates and the ability to communicate his views to financial markets and the public at large – he ventures out to slay the inflationary dragon... In practice a Reserve Bank governor, in economic management matters, is fairly inconsequential... Our

Reserve Bank Act passed day-to-day responsibility for monetary policy implementation to the governor. Contrary to much misinformation, it did not take any responsibility for overall economic policy away from our elected politicians. They determine the budgetary (fiscal) balance, the inflation band and, in turn (with technical assistance from the governor), the country's economic health.

...[the new British PM's] first act was a surprise. He made the Bank of England entirely responsible for monetary policy. This is part of a trend to "central bankism" and the eradication of inflation. This is puzzling since the immediate cost will be more unemployment, less welfare and damage to business, while recent literature suggests that inflation is less harmful than previously thought. "Central bankism" is a cult with a deity of hard money, a devil of inflation and temples such as the Bank of England and the German Bundesbank. The central bankers enjoy lengthy periods of office which are sometimes extended to reassure financial markets. The trend is to make them more powerful and more aloof from political interference. Their pronouncements are closely scrutinised by the markets. They often detect the heresy of inflation in new releases of retail sales or employment statistics. These pronouncements have political effect. Bankers sometimes stop "inflationary" policies in their tracks. The dogma that inflation is dangerous and hurts society is widely believed. Everyone knows that high inflation is undesirable. But in 1996 the Bundesbank refused to cut interest rates (when inflation was 1.5[%] and unemployment high) and justified its stance by reference to the hyper-inflation of the 1920s. And the Dutch criticised the Germans for signs of laxity. Despite an unemployment rate of 12[%], the Bank of France prides itself on financial rectitude. The U[S] is more inflation-tolerant. The Nihon Ginko (Bank of Japan) has urges towards rectitude but is dominated by the Ministry of Finance. The ministry has been obsessed by bad debts since the 1990 crash and to get the economy moving had driven down 90-day rates to 0.5[%]. Forceful governors of the Bank of Japan have been dismissed. Central bankers have acted to manage their currencies through interest-like movements and also "open market" operations in which they engage in warfare with traders by trading currencies. Sometimes they act together to punish speculators... or to realign a currency. In Europe, the role of central bankers will grow as Europe edges towards a single currency. Admission to the European Monetary Union requires that budget deficits do not exceed 3[%] of GDP; that inflation rates be within 1.5[%] of the average of the best three performers; that interest rates also keep in step, and that public debt does not exceed 60[%] of GDP. It implies sharp deflation for much of Europe and a brutal slashing of budgets. Moreover a European Central Bank is being created... The European Central Bank will be quite god-like because it will receive no instructions from member countries or the E[U's institutions ('the EU squanders more than US\$5 billion a year – almost 6% of its budget – through poor accounting and slack controls on money movement')]. From January 1, 1999, the European bank will have total control over the monetary policy of all its member countries. These are extraordinary powers. An unelected body will control interest rates and credit. Moreover, it will be able to prohibit many financial and budgetary actions. For example, loans on favourable terms to public or private bodies are not allowed... and guarantees of some debts are prohibited. Perhaps the most disconcerting critic of central banking... argued... in I[MF] staff papers... that inflation has different effects when it is high and when it is low... More than 8[%] a year is very bad, but... low inflation is not malignant enough to justify stamping it out entirely... and... can be beneficial for growth... Similarly an important study... on American labour markets estimates that low inflation... would increase American unemployed by more than two million. Moreover, [a] prominent economist... has committed the ultimate heresy of arguing that if inflation is too low, growth will be damaged. Top British financial journals naturally denounce this "disease." The British establishment has been captured by "central bankism" and regards any inflation as evil and addictive. They want to root it out lest inflationary expectations mount. Although the criticism appears high-minded, there are excellent reasons to doubt that bankers have the qualifications to determine a nation's fate. Should they decide on how much is spent on welfare? Should they set the parameters of budgets, the level of national debt, credit creation, interest rates and foreign exchange rates? ...Europe seems unlikely to enhance the free trade mode which is proving successful elsewhere... [because] central bankers have a very limited view of freedom. Often freedom means that they are free of political restraints to intervene in the economy and set their own prices... not at a level which satisfies supply and demand but at a level that should (but often will not) bring about their target in the next few years... As Keynes wrote penetratingly a year or so before the Depression: "A proportion of them [savings] has been wasted, spilt on the ground, by the unwillingness of central banks to allow the market rate of interest to fall to a level at which they can be fully absorbed by the requirements of investment." - 1997

"One of the reasons why federal deficits usually turn out bigger than predicted is that the government had budgeted on the basis of prices at the beginning of the fiscal year. By the time the year ends, prices are a good deal higher – causing the government to go further into the red to cover the costs. And, of course, the added deficit is financed by inflation. So the government is much like a cat chasing its tail. It inflates, suffers higher prices because of the inflation, and so must inflate further, but then suffers even higher prices, requiring even more inflation..." ...When the Government spends more than it takes in, it's no different to you and me. It has to pay its bills... The easiest way politically for the government to operate, is to borrow money from the Federal Reserve. It just signs "notes" (bonds, certificates, etc.) which it sells to the Federal Reserve, and the Federal Reserve creates (out of nothing) a bank deposit for the government to draw on... just as though it were real money. *This dilutes the value of every dollar in circulation.* It's as though you were at an auction, and everyone present was given 10% more money. You can bet that prices would be bid up at least 10% higher... The theory is that this new "money" is backed by increases in the amount of goods and services produced in America. Even if this were true, which it is not... the... Federal Reserve has a vested interest in continued Government budget deficits. Why? Because it is a privately owned banking system whose principal income is derived from loaning the government money to finance its deficits! In 1971, the Government sent over \$18 billion into the pockets of the bankers who own the Federal Reserve banking system, as interest payments on Government securities owned by the banks – the interest on the national debt! And the Federal Reserve is not subject to audit or any kind of accounting! Attempts by Congress to pass such laws have been beaten back... The only solution that will really reduce inflation is to reduce government spending, and retire the national debt. This, however, means millions of government workers out of jobs, government subsidies eliminated, government contracts cancelled, and the worst depression in our history. No politician wants to be blamed for this.

depression, in economics, a time of crisis, when the business cycle is at its lowest.

Britain's economy appears poised on the threshold of a new era of steady non-inflationary growth, but many economists fear it could instead slip back into the damaging "boom-bust" cycle that has plagued it for decades. - 1996

Japan watchers talk about a sense of pessimism among the public that has come with the realisation that the economical miracle did not last forever and that its heyday is over. - 1997

Histories of human population don't show sustained growth over the centuries, but booms and crashes in good times and bad; these jagged curves depict immeasurable human grief. No longer is economic growth to be seen as guaranteeing increments in prosperity from generation to generation[(even ignoring 'that phenomenon you see all through history of the person who has the bright idea, makes a fortune and then perhaps the second generation maintains it only for an irresponsible heir to complete the cycle back to poverty in the third generation')]. At best it is more like climbing step by step up a stairway of S-curves built on new technologies; at worst you find yourself sliding down into periodic slumps.

By the mid-1960s western... Europeans who'd lived through hardship after [WW2] had become addicted consumers... [I]ncome had doubled since the war[(incidentally, 'Henry Ford had doubled the wages of his workers in 1914 to \$5 a day, a move which spread like wildfire through American industry')]. But one of the main assumptions underlying the long boom was about to change. Ever since the war both America and Europe had relied on cheap oil. It had helped to pay for the mass consumption and full employment. Suddenly they saw how dependent and vulnerable they'd become... The shock came in 1973 when the Arab oil producers quadrupled their prices. It marked a turning point and an end to the heady confidence. For twenty years they'd lived with little care for tomorrow but now the cheap petrol and the certainty that the West dominated the world was over. It was the beginning of the end of the greatest boom of the century. - PEOPLE'S CENTURY

The next major element of the changed world situation, in short, is the paradoxical situation known as stagflation. In contra-distinction to cyclical depressions as we know them (with the Great Depression of the 1930s as the worst of its kind) we now see unemployment accompanied not by falling but rising prices: stagnation of production and employment, combined with inflation. The Keynesian remedy against unemployment, namely to raise the demand for goods and services by credit or money creation, now tends to cure unemployment only at the price of more inflation. Hence several years of hesitation in socio-economic policy have brought stagnation to the world at large...

Money also brings problems of its own. In the last half century, it has been the apparent cause of many national and international crises... Often... we see the world's statesmen scurrying from capital to capital in frantic attempts to deal with the latest exchange crisis. Basically, this usually means that one (or more) currency has, in the eyes of the people using it, become worth more, or less, than the official exchange rate. The crisis is usually solved, after a great deal of anxiety and ill-feeling, by re-adjusting the exchange rates... Inflation hurts us all. Prices continually rise. However hard or conscientiously we work, we find that the promised wage or salary buys less than we expected. Young couples need to borrow money when they wish to buy a home. Yet often they are unable to do so because the building societies have no money to lend. So they have to go on living in unsatisfactory accommodation. As a nation, we seem always to be running into difficulties with our balance of payments. We are selling to other countries less than we buy from them and have to make up the difference out of our reserves. We are like a man living beyond his means who has to keep drawing on his savings to make ends meet. It is a situation that cannot continue indefinitely... Easy credit has helped to bring about an undreamed of improvement in the standard of living... [- but e]asy credit... contributes to inflation.

Eventually, of course, there will be no more capital to draw on and the real situation will become apparent. The dynamics of the system are such that, as capital exhaustion approaches, and as the rate of inflation increases exponentially as people try to maintain their spending power by more and more wage demands, eventually the system must collapse.

Purchasing power of currency increases in times of deflation, and decreases in times of inflation. Hence, labor sometimes tries to have wages made contingent on cost-of-living increases. On the international level, a purchasing power parity for foreign exchange is sometimes computed. In times of depression, the purchasing power of consumers usually declines because of unemployment, while the purchasing power of money is high.

Consumer dollar going far... Been thinking for a while about buying a new television? Tossing up whether to replace that old washing machine? If appliance retailers are to be believed, now might be the time to part with your hard-earned cash, or load up the "plastic fantastic." The combination of a strong N[Z] dollar, lower manufacturing costs and fierce competition in the local market means many appliance retailers are struggling to make a profit, and are therefore dropping their prices to attract more customers. The head of the company which owns [two appliance retailing] chains, glumly admitted yesterday that it was a buyer's market. A year ago, consumers were paying \$399 for a 14in television, he said. "Now you can buy a good brand TV at \$299." The joint chief executive of[a] Wellington appliance retailer... agreed. "It's a very good time to be a consumer... It probably won't get a whole lot cheaper." [He] said retailers could not afford to drop prices any lower.

...Ask anyone who has bought a... major appliance in the past few months whether they were happy with their purchase, and they will almost certainly smile... While consumers have been grinning, however, retailers have barely been able to conceal their frowns. Despite the bargains to be had, appliance sales have remained static over the past 18 months. The appliance industry, most agree, is in the doldrums, and most do not expect the situation to improve in the near future. Like other forms of retailing, appliance stores have undoubtedly been the victims of a slump in consumer confidence... However, there are other issues facing the industry too, such as over-capacity. According to a recent survey, N[Z]ers have one appliance store for every 3500 people. In A[US], the figure is one for every 14,500 people while in America, it is one for every 55,000 people. Fierce price wars among retailers... [- which, for example, resulted in] 14-inch colour [TVs] with a remote control[selling] for less than \$300... [-] have also reduced margins, at a time when many costs, such as property and advertising, have been increasing.

...Remember when a tiny television set cost more than \$1000? Television rental companies certainly do - or at least what is left of them. Plummeting prices for electronic equipment and an increasingly competitive retail market have seen the number of TV-hire companies dwindle over the past decade. And it now looks likely that only one major player will soon be left. - 1997

It's surprising what a difference a little healthy competition makes. Prices come down, standards of service go up.

But if COMPETITION leads to a situation where there is *only one major player* left, standards of service could go down and prices back up! However, even if competition in NZ's appliance industry remains healthy, the retail price of a 14in TV, for example, won't continue falling until it reaches \$1 or less. The price will eventually 'bottom out', then start to ascend again. The price of some products (e.g., apples) rises and falls throughout the year - because, although the supply of these products usually remains constant, they have to be sourced from outside the district when they're out of season locally - while the price of most products rises steadily (and even the lowest annual price of apples gradually increases over long periods of time - i.e., the lowest retail price of apples is unlikely to ever again match the lowest retail price of 1897).

...your penny rock will cost you one dollar...

The story is told of the modern Rip Van Winkle, who goes to sleep in 1974 and wakes up in 1984. His first thought is to find a pay phone and call his broker. He checks on his IBM stock which was worth \$25,000 when he went to sleep, and finds to his delight and amazement it is now worth \$3,000,000. Just then the operator breaks in and says, "Your three minutes are up. Please deposit \$7,000!"

A stock market is essentially a group of brokers each of whom has bought a "seat" on the exchange and is thus entitled to buy and sell securities, with its privileges and under its regulations, for fixed commissions... The price of a seat on the New York Stock Exchange... has varied from the low of \$17,000 in 1890 and 1942 to the high of \$625,000 in 1929.

The stock (or share) market – a sector of society that central banks have virtually no control over – can be both affected by inflation and itself cause inflation. It also has the potential to slash the price of most goods and services virtually overnight!

In the 1920s Americans were enjoying the fruits of a new prosperity. The greatest industrial nation fizzed ahead in a post war boom. For those who had money it was a time to get rich quick. Believing they could only win, a million Americans had their money in the stock exchange. In just 4 years their shares roared up 400%. “There was rank speculation... everybody was going to have two automobiles, and everybody and his uncle would be calling me up buying stocks. They never asked what price they were gonna pay – you just bought them and that was all.” Then, on the morning of October 24th 1929, the unthinkable happened. “All of a sudden these orders started up... sell... everything... the market kept going down.” ...Investors who’d been counting paper profits found themselves plunging into real debt. Teenage telegraph boys... were sent door to door delivering the bad news. “The people... would open it up and go into a state of shock. Most of the telegrams would say the same thing... We need more money to hold up your interest. Give us more money or else you’re kaput... you better hurry... we’re going under... [I]t was the same [people] getting telegrams left and right, until finally they just shut the door because they knew what it was. And it was shortly after that that we found out that people were jumping out of windows...” The crash affected people far beyond Wall St. The greatest victims were not the wealthy but working people around the world. Capitalism had promised progress and prosperity for all. Instead it delivered mass unemployment and the breadline... Within a year 2 1/2 million had lost their jobs... “...in New York city... a soup-line [had] 500 people then two days later a thousand people, the same line... kept on growing and growing...” Laid off men were driven to despair. Victims of a process they couldn’t understand... As people had less to spend and trade slowed, more factories closed in one country after another. It seemed unstoppable forces were at work which individual governments could do nothing to control. In South America, countries like Chile suffered immediately because they depended on trade with the U[S]. Chile’s copper miners had prospered in the 1920s but the good times were over... “...nothing like it had been known before... [T]o us it all seemed very remote... New York was a long way off, but when your own boss... [says] you haven’t got a job any more, then you really felt it.” Copper brought in 80% of Chile’s foreign earnings. Tens of thousands worked to prize it from the biggest man-made hole in the world... “...factories in the U[S] closed and they stopped buying copper... This paralysed the market here, so directly affected the entire working population... it was a crisis.” The slump was even more devastating for Chileans who produced nitrates, shipped to farmers all over the world as fertilizer... “...and what could the poor people do... who could we turn to?” Thousands of unemployed miners headed to the capital... The Government, now bankrupt, was overwhelmed by the demand. “...we looked out of the window and saw them lifting people up by the feet and arms... piling them into a cart... they’d died of hunger.” Chile’s plight was echoed around the world. Trade collapsed. Without copper, nitrate or any other cargoes to carry, merchant shipping was idle, and no new ships were needed. Britain had been the biggest ship builder in the world. Towns like Jarrow in the northeast were entirely dependent on the industry... The owners of the oldest shipyards were paid to close down for good, so the newer ones would have less competition... 3 out of 5 Jarrow workers were now unemployed. The Government said the only way to end the slump was to cut public spending and wait for what they called “natural recovery.” [The PM said.] “We must all join as a united nation and bear equitable sacrifices to see the present crisis through. And so I appeal to you all, do your bit like men and women cheerfully and heartily.” But there were no grounds to be cheerful in Jarrow. The only help from the State was the dole, guaranteed for just six months... In the U[S] there was no dole. In Chicago the new poor tore the wooden blocks from the city streets to use as fuel... “...tens of thousands of people [were] evicted from apartments... They could starve to death because there was no social security... no unemployment insurance. There was nothing.” ...By 1932 more than 13 million Americans – 25% of the workforce – had no job... “We’re talking about professional people – scientists, doctors, lawyers – all these people were thrown into this pit.” ...Angry farmers sometimes dumped their produce. Prices had almost halved. By destroying food they hoped to reduce the stocks available and so stop prices falling even further. “...There was a huge destruction of food in the U[S] at the same time that millions were starving...” All over the world the same contrast... was repeated. In Belgium there was plenty of coal at the pit-heads but Belgian miners had to break into their own collieries at night to scavenge for waste coal to use as fuel... The men’s pay had been slashed and then they’d been sacked after going on strike... “...potatoes, that’s all we were given. How did we live like that?” And all over the world, governments said the same thing – that there was little they could do to ease their peoples’ suffering... Hoover, President for the first three years of the slump... told Americans they had to let the crisis run its course and tighten their belts.[An American economics student recalled a lesson by his professor: “He said] cycles are part of the capitalistic... [system. H]e reached in his pocket and... pulled out a rubber band... pulled it all the way out and said boom, then he let go... and he said bust... [B]oom and bust[is, he explained], an inherent ingredient of the free enterprise system. To me this made no sense at all because I saw... the [factories] closed down... the people wanting to work... the people who couldn’t afford to buy anything... [Y]ou had a kind of vicious circle operating and nobody was prepared or willing to undertake major measures.” While Western governments stuck to the line that the world economy was something they had no power over, their citizens grew increasingly impatient. Some governments were shaken and others brought down. Bewilderment turned to anger... “...something was rotten with the whole system... this is the result of capitalism gone bananas...”

After the stock market crash, his land is worth less than he owes on it (though why that’s so isn’t clear to him)...

Although modern money is often made out of paper, the saying that ‘money doesn’t grow on trees’ continues to be widely used. However, people who have seen their economic worth grow via the stock market could be forgiven for thinking that it would only be easier to become wealthy if you could pick dollars straight off a tree! Consider the hypothetical example of an investor who buys 1000 \$1 shares which eventually rise in value to \$10 each. The original investor then sells all of the shares to 10 other people in blocks of 100. Each of the new owners will have paid \$1000 and the seller will have pocketed \$9000 (once his initial investment has been deducted). The \$9000 has, effectively, been plucked from the sky. Another way to describe the transaction is to say that the \$9000 was WON from the new investors. They now have to sell to someone else at an equal or greater price in order to WIN their money back. Stock markets seldom follow such well defined mathematical formulas but this example serves to expose the similarities between the legalised stock exchange system and illegal – at least in NZ – pyramid money-making schemes (where someone gets on a list by giving half the purchase price to the person currently at the bottom of the list and half to the person at the top, then sell two lists with its own name at the bottom in the hope of eventually being sent a lot of money when its name reaches the top of many lists – therefore the system mirrors capitalism, which requires a large base to support its small top).

When the world’s stock markets crashed in 1929, the shares didn’t suddenly disappear (unless the company that issued them went out of business). Some people got to buy shares *at rock bottom prices*. The people who sold at the lowest price probably did so because they had no money and, therefore, were desperate enough to accept whatever was being offered. The people who had money to spend were those who became rich before the crash without the aid of shares; or who sold their shares immediately prior to the crash, then had enough sense (or luck) to be able to avoid buying back into the market before it reached its lowest point. If a crash was to cause the \$10 shares from the hypothetical example to shed 90% of their value, and all of the 10 new investors sold back to the original investor at this price, that person would have regained the 1000 shares for their original cost price and still have \$9000 profit left over. Meanwhile, another 10 people have spent \$900 each but got nothing to show for it (apart from any dividends paid while they held the shares)!

Fortunes have been made by... individuals who have been able to manipulate stock prices through maneuvers ranging from company take-overs to the precipitation of mass hysteria by buyers and sellers... In the stock market... there is a certain amount of manipulation by heavy investors and insiders who control millions of dollars in mutual funds and pension funds, but the ebb and flow of the market is also influenced by the millions of small investors who follow blindly after the leaders... The stock market runs in cycles. Ideally, one buys at the bottom of the cycle and sells at the top. In order to do that, however, one has to be at the head of the pack, which takes courage, conviction, and an intelligent analysis of economic, social, political, and psychological conditions. The timid investor will wait until it is clearly evident that a bull market has been under way for a substantial length of time before risking any money. By the time all the sheep are convinced that the market is the place to make money, it is often too late. The peak has been reached and the market is on a downhill slide. The masses of unsophisticated small investors then panic and sell for whatever they can get, and drive the market still lower. By the time the market has reached bottom and there are bargains galore, these same people cannot be persuaded to invest. They may righteously proclaim that it is impossible to make money in the stock market – and hold onto that belief until the market is near the top of the next cycle.

Down in the trading pits of New York it's a constant battle between the bulls, the optimists, and the bears, the pessimists... It's said that when Wall St gets a cold the rest of the world starts sneezing.

The 1970s had been a dreadful decade for the [NZ] stockmarket. Share prices rose only 8.7[%] compared with a 216.9[%] increase in house prices and inflation of 172.7[%]. There]... was little to indicate that... the market... would have a major impact in the 1980s... The speculative boom began in earnest in 1983 when... 27 new companies were listed and spectacular share-price performances began to attract individual investors back to the market... [which,] on September 18... 1987... reached an all-time high of 3968.89... Black Tuesday 1987 was the day investors' dreams turned to nightmares... When Wall St sneezed heavily in October – the... trillion dollar... fall in its share values was twice that of the 1929 Crash – N[Z]... caught the flu... Empires fell... [as one now retired stockbroker] was watching. The newspaper photo of him became an emblem of the Crash: The stockbroker frozen on the floor of the Exchange, his finger plunged into his mouth, the whites of his eyes flashing. Dapper Dealer confronts the Face of Doom... [H]e remembers Black Tuesday for the silence after the first selling frenzy. "I was just totally stunned by how quiet it had gone... There was this... huge moment of... utter stillness..." And then the madness began again... For... [him, however, the Crash was] not completely personal: He had sold most of his shares. After a big plunge in May 1987, he told his clients to sell "and I put my money where my mouth was"... Legions of small shareholders... [were not so fortunate. They] followed the corporate princes into the swamp... [One businessman] was in his office... on October 20... and says he was not surprised. "I said to all my staff that morning, 'This is the Crash; this is the thing we've been long awaiting'..." He watched as 90% of his fortune burned to ash. "It was a very sad moment, because some of the companies I was involved with were very badly hit." ...A year after the Crash, [his corporation's] shares had sunk... to a mere 16c. The *Wall Street Journal* named it as the world's worst stock. When it delisted in 1992, the shares were worth only half a cent... Now he and his son-in-law... run a much-reduced [organisation]... "It's a very good company... It's going to go on forever." ...Like all human disasters, the Crash hit everyone from a different angle... For[one] investment banker... Black Tuesday was a good day. The previous 18 months had been "hellish": While he had been cautious, competitors had run with the bulls and done better than him. "When that happens for quite a long time... it undermines your confidence." He felt sure the runaway market "would end up in a big heap", but how come the end was so slow in coming? When the Crash finally did arrive, "I remember feeling just suddenly switched on. I felt energised – suddenly all my Christmases had arrived at once." ...not [everyone was interested in] being interviewed... The chairman of the now defunct... Chase Corporation Ltd, synonymous with glittering high-rise commercial developments, which had a market capitalisation of \$1.4 billion before... it was worth less than \$20 million... said... "but please report I politely declined." He... was an accountant... when he teamed up with two others to form Chase in the early 1970s. They each put in \$1000 to form the property development company. They called it Chase Holdings Ltd after someone made a joke about being chased by creditors – prophetic. In between times [he] is reputed to have personally amassed \$250 million on paper... Today, in conjunction with some other shareholders, he heads a private company, the Symphony Group, engaged in "property development, adding value and re-sale." Not that much different from Chase of 1987? "Oh, quite different in some ways. We're selling everything we produce. We're a true developer..." ...[the '87 Crash] still stands as a defining moment in our history: A bigger date in N[Z], in fact, than in many other countries. For the meltdown here was far greater, and the fallout lasted much longer, than almost anywhere else... [While the] rest of the world[only] experienced a stock market correction... N[Z] suffered a collapse of its economy... [from which] \$24 billion disappeared... Recovery was hard. A year after the disaster... Wall Street was 22% below its pre-Crash high, London 25% and Tokyo only 4%. But N[Z] was still down 50%. The Crash is still with us, as myth and object lesson. It showed that sober bankers could be fools and madmen, and captains of industry dreamers and crooks... In the euphoria of the fourth quarter of 1986... [there] were one or two new listings every week and investors who were lucky enough to obtain shares were making immediate returns of at least 100[%]... It didn't matter that overnight interest rates were 16[%]... and five-year Government stock 15.6[%]. The most important point was that N[Z] business was on a roll. Only fools and pessimists were not investing in the N[Z] sharemarket... The... professor of accountancy at Victoria University, recalls warning his students that a float "had no merit of any sort. 'All you're doing is putting money in... and the promoter is going to make a great killing'. But of course it would come on the market and zoom... [T]he students clearly felt I was being academic. I was criticising the gods! I described one float as a rip-off and then I got a phone call about an hour after the lecture from the company chairman. My heart sank, I thought, 'Oh boy, am I in trouble now'..." ...[the professor] says he "made a lot of money at the time of the sharemarket boom. It was pleasing for me to enjoy that but I didn't do any investing after about August 1986 because I thought it had reached its peak then..." ...the banks "were feeding the frenzy. If [an investor] wanted money he had no trouble at all in getting it... [T]he banks wanted to lend as much money as possible to maximise their profits." ...He... publicly criticised the property companies and sharemarket analysts for treating big gains in their... values "as part of income for reporting purposes. A lot of those gains were just inflation, just hot air"... There was a new breed of young entrepreneur who could bamboozle bankers and company directors... "Those directors... didn't want to show ignorance and they nodded wisely when they probably didn't have a bloody clue what was being proposed." Brokers and bankers were caught up in the frenzy – and so were the media. Journalists "fell down" at the feet of the new entrepreneurs: "These guys used to make announcements that announcements were going to be made." ...[He also] warned investors publicly that the boom could not last. For this, he was spurned as a nay-sayer and a Cassandra... About a week before it collapsed, [he] recalls... Judgecorp issued its accounts showing that "all its financing was from short-term sources, short-term commercial bills". It was inevitable that the company would die: When the Crash came, the banks called in their money and it was all over. But [the]Professor... admits that he "nearly bought a lot of Judge shares myself. Based on the projections of what it could earn, it was a damned good buy." If professors of accountancy could go so close to disaster, what hope was there for the mum and dad investors? ...No one group could be blamed for the crazy state of the market. "It was absolutely nuts and it makes everybody, just everybody, look totally stupid." ...[one property] tycoon... was playing tennis with [an art dealer on Black Tuesday]... In four hours... [the tycoon's] personal wealth plunged by hundreds of millions. "I don't think we really took it that seriously," he says now. "We treated it as if it was the news that one of the ferries had sunk, (that) sort of thing. Life was going to go on. For three months, there was a general expectation that commonsense would prevail and we'd all be back again." ...[previous to the Crash, while the tycoon was advising a professional tennis player] on his finances, "he turned to me and said, 'Gee, you must be worth a bit', and I had honestly not thought about it – we

were just caught up in the whole game. And we sat down and measured it – I was worth just under \$700 million on the share price... it was extraordinary. I remember running inside and saying (to my wife), ‘...Christ, listen to this!’ She wasn’t very interested, she said, ‘Oh, that’s nice’. It was never a consideration.” [He] says that in a way he regrets not selling up and pocketing the \$700m, “but I cracked it when I was very young; I’ve always had heaps of money, so money didn’t drive me”... [He doesn’t accept the professor’s] criticism of companies such as his... “we weren’t crooks... [or] stupid... The game is a capital exercise, it always has been and always will be... It was certainly ego, and it was fun... You could do anything.” ...It was a wild time where deals worth many millions could be done over the phone and “astonishing things” happened... “GREED is... good.” The catch-cry of *Wall St* – [the] 1987 morality tale about the perils of spiralling out-of-control capitalism – was one taken up in earnest by the “nouveau nouveau riche”... of the 80s. Running rampant on the profits churned out by the munificent Monopoly money-making machines called the stock exchange and the property market, they chanted the newly learned mantra with the fervour of the freshly converted. Conspicuous consumption was in; saving for rainy days of old age inconceivable... [The head of one corporation] had flown from Queensland to Christchurch en route to Queenstown for an investors’ conference, says [the tycoon], “and there was a slight delay with his plane. So he walks into a [car showroom] and spends \$200,000 for a Mercedes Benz – and then just left it there when he got back”. On another occasion a businessman from A[US] fell for a waitress in Christchurch. He persuaded her to come with him in his private jet, but “she said, ‘I’ll have to work until 5pm’, she wouldn’t just walk out. So he said, ‘Well look, I’ll go over and send it back for you’... [I]t flew him to A[US] and came back for the tart.” Some of the brokers at the time were naive and untrained. [The tycoon] remembers asking one how long he had been in the trade and the man replied that the year before he had been driving a crane in Auckland. “He referred to being headhunted, and he was quite serious...” ...OF all the names of the 80s... [the] founder and chairman of Equiticorp, was probably the biggest loser in personal terms. In 1993 he was sentenced to six years’ jail after being found guilty on 11 charges of conspiracy to defraud involving \$67 million, [after being] adjudged bankrupt in July, 1991, with debts totalling \$597 million... Some of the money he made was hidden in family trusts, the assets of which remain secret (a loophole in the law which still exists; assets placed in trust two years before bankruptcy cannot be touched)... He was automatically discharged... in mid-1995... and will[soon] be eligible to freely manage a company again... “You can bet your bottom dollar that about once every 50 years the market’s going to... be totally and... ridiculously overvalued and crash... It is beyond our control.” ...By then, those who had lived through 1987 would be retired or dead, and the lessons would have died with them... In hindsight, the Crash looks as inescapable as death. The new Labour Government of 1984 freed up the economy “and opened up a Pandora’s box,” says [the man] who recently stepped down after nine years as chairman of the Stock Exchange.

After three years in power the Labour Party was losing its traditional voters but... the N[Z]... middle classes felt they were getting richer... Nine weeks after the[1987] election the New York stock market collapsed. The... N[Z]... economy went into recession but that didn’t stop the progress of the new right agenda. [The Finance Minister said,] “I believe that the events of... [recent] weeks mean that we need to accelerate the process of reform rather than stop it.”

On the stock market its... PARTY TIME AGAIN! - 1989

The bull market for retail stocks... [on t]he NZSE Retailers Capital Index... lasted... to February 1994, when interest rates went up. After that, the sector became a dud... Underground Fashions is the screaming disaster of the retail grouping. Listed in 1994, the shares have [gone] down from more than 110c to hover just above 20c. If the company survives, the present share prices may attract those looking for a potential recovery stock. Omnibus retailer The Warehouse has also been a sharemarket black hole. Listed in 1994, the company was for a time a sharemarket darling. On a price basis adjusted for bonus issue, it quickly soared from around 210c on listing to 550c. Twice in a short time, the share price has crashed, once in December 1995 and again in May... The company seems to have persistent financial problems, as it announced the intention to sell off branch buildings before tenant business broke even. This year the stock hit lows of 200c before lifting to the 250c mark, but at this stage must be branded as speculative. [By the way, ‘the respected Financial Editor of the San Francisco Chronicle, said in his column “*The Money Game*” on July 20: “It isn’t only the rarefied level of short-term interest rates that continues to bug the stock market. It’s also the great credibility gap over corporate profit. Company after company has reported gains, some startlingly large. But there’s little or no market reaction. Let a company slip just slightly, though, or even show gain but one slightly below expectations, and its shares hit the skids. You’ve seen it happen again and again.”]

...Trans World Airlines, just emerging from its deep financial troubles, is likely to put on hold plans to ask investors for more money following the crash of Paris-bound Flight 800 last Wednesday... The crash occurred just hours after the airline reported a five-fold increase in profits during its most recent quarter, suggesting the airline was turning a corner, albeit with some uncertainty... TWA’s stock, which had traded as high as \$23.75 a share earlier this year, has been falling recently and dropped another \$1.37 to close at \$9.87 in the wake of the crash. The employee-owned airline has been on delicate financial footing for years. It has been in bankruptcy twice in the past five years, and last emerged from Chapter 11 in 1995 with a reduced debt load after a massive financial restructuring.

...TNT has distanced itself from its origins in announcing it will cut back its A[US]n general freight operations. The troubled transport giant has been under increasing pressure to speed up restructuring with its share price reaching the lowest level since September 1993... The company’s 50[%] stake in Ansett Australia has also been a drain on the company, with the airline losing \$9 million before tax for the months to 31 March... [In local news, the NZSE-40, which has been] out of step with global markets for more than two years, has strolled ahead in the past month and analysts say it may stride further while other markets pause or retreat. “I’d be pretty confident the stockmarket will be higher and I’d pick 10[%], which, with income, means a 20[%] total return before tax on a 12-month view,” said... [one fund manager. T]he historically light weightings institutions have in shares could drive the market higher, with sellers scarce. “It’s hard to see where the major selling is going to come from,” he said... The index has been a dismal performer compared with world markets, gaining just 3.8[%] in the past year against the Dow Industrials’ gain of 19[%] and 2.4[%] over two years against the Dow’s huge 47[%] leap. However, since June things have turned around, with the NZSE-40 up 7.3[%] while the Dow has fallen. So what has changed in N[Z]? “It comes down to political risk. There is much reduced concern on the political front which is reflected in lower yields, which in turn is reflected in shares,” [the fund manager] said... Bond yields had risen steeply in fear of the conservative National Party Government being ousted by a left-leaning coalition. But a series of polls last month showed a reversal in fast-rising support for the populist N[Z] First Party... N[Z] also appears to be a step ahead of most of the world in the economic cycle. It went through a spurt of rapid growth in 1993-94 and has been cooling off since. Analysts believe the economy is near bottom and will pick up again as government tax cuts bite and as the Reserve Bank unscrews its very tight monetary policy clamps.

...[US s]tocks rose sharply for the fourth straight day on Friday, after a lower-than-expected July employment report capped a week of data that quelled fears of the Federal Reserve raising interest rates... The Dow Jones index closed 85.08 points, or 1.5[%], higher at 5679.83. The index gained 206.77 points for the week – the largest weekly points gain on record. The index had recovered well over half of July’s losses. The Nasdaq composite index closed 26.07 points higher – its second-largest gain ever – at 1124.92, a rise of 2.4[%]. The rally began after the Labour Department said the unemployment rate rose to 5.4[%] in July, from June’s six-year low of 5.3... The economic news also cheered the bond market, where long-term rates dropped, which in turn bolstered stocks... Gains in technologies and stocks sensitive to interest rates led Friday’s rally.

...Industrial stocks rose sharply toward the 6000-points milestone on Friday, with the Dow Jones index closing 60.01 points higher at a record 5992.86... The Standard and Poor's 500 composite broke the 700-points barrier for the first time and closed... at 701.46... In LONDON, the sharemarket rose... on the back of Wall St. The FTSE-100 index set a record trading high of 4025.1 points, topping the[previous] record, set earlier in the week... - 1996

Wall St stocks blazed higher on Friday, propelled by fresh evidence that the U[S] economy was enjoying robust growth with low inflation. The Dow Jones index surged 83 points to close at 6856, just 27 points shy of their all-time closing high... [W]ith every step higher, the market has also exhibited increasing wariness. That skittishness was apparent during the session's frenzied afternoon, when comments about the dollar by[the] US Treasury Secretary... sent the markets gyrating... British shares soared to a record finish on Friday – the second time this week and eighth time in the first six weeks of 1997 – as investors continued to believe interest rates on both sides of the Atlantic would not rise in the near-term. The FTSE 100 index closed 41.9 points higher at 4307.8... [B]ut the strong dollar and pound could be the undoing of both the Dow Jones and the FTSE indices... according to... a strategist... The market could be in for a nasty shock next quarter if the strong dollar has an impact on earnings, he said.

...Inflation and interest rate fears in America have contributed to one of the biggest one day falls on the New York share market. The Dow Jones plummeted more than 160 points... The knock-on effect was a 24-point fall on [NZ's] share market.

...FINANCIAL markets face a volatile week as investors around the world sweat over whether[the] US Federal Reserve chairman... will raise interest rates on Tuesday. But N[Z] brokers believe the local sharemarket should prove reasonably resilient to any buffeting of prices on an overheated Wall Street... A[US]n and British markets (which correlated 90% with their US counterpart) had far greater potential to be affected... “You also need to remember that our market, unlike Wall St, has been trending down in recent months,” [an analyst] said... Three months ago, market watchers were saying N[Z] shares were the investment opportunity for 1997. Now analysts are advising clients to hold more money in cash to take advantage of possible further rises in interest rates... [R]ecent sharemarket prices had fallen by roughly the same amount as company profits were short of expectations, indicating a fairly priced local market... “If interest rates in the US do rise this week, then it will impact on us if for no other reason than psychological. But there is no great level of debt in the US market, there is still a huge funds inflow, and so any movement would be in the nature of a correction, and not the big shakeouts of the past,”... [The analyst also] said the 10% fall in the[NZ] sharemarket this year was largely on the back of a volatile Telecom share price and a down in the forestry cycle.

...NZ Forest Products held a 17[%] stake in... listed investment banker Investment Finance Corporation (IFC)... which in turn held 25[%] of refuge company Environ Corporation, 22.3[%] of Venture Pacific, 6.7[%] of Hawkes Bay Transport and 7.8[%] of Panz Corporation... [This is a] good example of the web of ownership among the listed companies of 10 years ago... Many of the listed companies in the investment category were floated to the public with no other aim than to buy stakes in other companies, some of which were themselves investment companies established previously with the same aim... Unfortunately, [late]... in December 1987 the N[Z] sharemarket, still] reeling from the wipeout of the October crash, had another major shock when... IFC... called in the receivers. Some smaller listed companies had already gone into receivership by then, but IFC's receivership was a major collapse[– though it was only] the first of many. By the middle of 1989 more than 40 listed companies had collapsed into receivership, liquidation or statutory management. Some, like Chase Corporation... and... Equitcorp... were household names. Most were not. [Nearly t]en years later it is a struggle to remember many of the companies and what they did.

...One day in 1987, I watched with hundreds of others as the sharemarket crashed. Crowded against the big glass windows overlooking the trading floor in Queen St, we witnessed a scene of pure frenzy playing itself out from inside the glass cage. From the distance, you could see the fear in the traders' eyes. You could hear the panic in their voices as they tried frantically to sell their clients out of a crashing market, or to snap up a bargain, depending which side of the deal they were on... Many people who lost a lot of money in those days, and those who witnessed others losing money, lost confidence in many aspects of the market. Stockbrokers were no longer respected for their advice, and the stock exchange itself was perceived by many to have allowed things to get out of control. [A decade] later, a great deal has changed. The trading floor is gone and shares are traded over computer screens from within the grey offices of the many stockbrokers making up the market. This has done wonders for its efficiency although, from a marketing point of view, some would argue that by closing the trading floor the stock exchange gave up its most potent visual symbol... The trading floor was the living embodiment of the market. It reflected both the market's excitement and its dangers... [I]n every way, the sharemarket has advanced and improved since the late 1980s. We undoubtedly have a higher quality market. The standard of conduct demanded by the stock exchange is higher, the requirements for a company listing are steeper... Yet research commissioned by the N[ZSE]... late last year, showed that the perceptions of 1987 are still deeply ingrained... The stock exchange, which is a business in its own right, reporting profits and comprising professional managers, is a guardian of the market... Much work has... gone into explaining the broader role played by stockbrokers nowadays. On the apparent assumption that no[-]one is doing the market any justice, the stock exchange has even produced a colourful share-price table which it is trying to convince newspapers to run in preference to their own versions.

...ONE of the “must follow” trends for investors and analysts over the next five years will be the fortunes of passive, or index-tracking funds. They hit the N[Z] market about a year ago, promising lower fees and taxes than actively managed funds.

...in life, people need security, rather than relying on private sector fund managers, many of whom are incompetent, according to... [a NZ property] investor... and political commentator... “Believe me, this current proposal will lead to tears... I know the funds industry. These fellows (fund managers) are not Einsteins – and I'm being awfully kind when I say that.” ...Today's fund managers believed that “this time is different”, an adage going back to the 1929 crash, [he] said... “Once you hear ‘this time is different’ being quoted, it's time to get out.” ...[Incidentally], using the team name Command and Conquer, [a]... Rangitoto College seventh-former... and his mate... have come second in a sharemarket game for secondary schools around N[Z]. The pair]... attribute their success... to adopting a high-risk strategy aimed at making maximum capital gains as quickly as possible. That strategy saw Command and Conquer... turn a nominal \$50,000 investment in March into \$70,463.99... But... [the 7th-former] was unable to attend the ceremony to pick up his \$800 prize from the chairman of the [NZSE] yesterday. This was because he is barred from school functions for the rest of the year as a punishment for trying to organise... a party after the school ball... The 17-year-old... entrepreneur... planned to charge students \$25 a head to go to the party. But he was sprung before it got started when the parent of another student contacted the school about the party... The national winner[of]... the sharemarket game... [-] a team from Wellington's Onslow College called Just Speculate [-] turned \$50,000 into \$72,936.55. [Editor's note: A sharebroker firm is promoting '\$5 portfolios for children under the age of 6'.]

...A NEW breed of novice is set to swamp the sharemarket and potentially take private share ownership in N[Z] to a new high. But these novices are not like those of 10 years ago, when green-horns bought shares on the strength of a tip from a neighbour, got horribly burnt, and fled the market. Now, all they will have done is to simply tick a box on a form provided by their life insurance company requesting shares instead of cash, and pop it in the post. They know little about the market and have probably never dealt with a broker. They are becoming shareholders for no other reason than they've been given the opportunity to swap their membership in a mutual society... for free shares... “By any account, small N[Z] investors were more ravaged by the crash of '87 than those in any other country... Having been so bitten, they will naturally be shy, but this development (life companies becoming public companies) can only be a positive in that healing process. Just how positive, we don't yet know. But I am sure it will not be another negative.” The negatives as far as private shareholding was concerned were seen in the float of power companies back in 1994-95, when power companies quickly bought back free shares issued to thousands of first-timers... In 1991, around 40% of the value of

our sharemarket was in the hands of smaller, private shareholders. That has now dropped to around 18%... Registry Managers, which looks after the share registries of about 85% of N[Z] companies, calculates around 350,000 N[Z]ers, or one in every 10, owns shares. But demutualising life offices have the potential to change that... AMP, due to list on the sharemarket in the second half of 1998, will be the daddy of them all. It has between 350,000 and 400,000 N[Z] policyholders and, hence, potential shareholders.

...DEMOGRAPHIC changes throughout the developed world resulting in a much greater proportion of retirees has created a growing awareness and concern about retirement funding. We see this in N[Z] with the debate about compulsory superannuation, while in the U[S] it has manifested itself in a dramatically increased interest in saving. These American savings are chasing the historically abnormally high returns on the sharemarket there. This has created a number of excesses that need highlighting, and a market that may strike a chord with a lot of N[Z] investors. N[Z]... is in something of a unique situation compared to other sharemarkets as it still sits well below its pre-'87 crash levels. It is now hard to identify the crash on longer term charts of the Dow Jones... Footsie (Britain) or Nikkei (Japan) indexes as the rapid recovery and subsequent substantial highs leaves the crash as a brief, albeit deep, correction in one of the longest bull markets seen... Having recovered from its steepest bear market since the Great Depression, in 1974 the sharemarket climbed a wall of worry from low valuations and low expectations to finally rising with the full support and expectation of most everyone... The major question for domestic N[Z] investors is: did our bear market end in 1990, or is there still room for more pain if the largest market in the world (U[S]) is perhaps only now starting to peak? To answer this, given the magnitude of N[Z]'s '80s bull market, a very long term perspective is required... After much research it has finally been put together using monthly data released annually from 1926 by the Department of Statistics and a combination of the [old Barclay's and new] NZSE40 indices... The chart shows that for 50 years – 1930 to 1980 – the N[Z] market was in a very steady uptrend with tight boundaries marking overvaluation and undervaluation. It wasn't until 1983 that the market started to dramatically disregard where it had come from and start the parabolic rise that would achieve in four years what it would take Wall St until now to achieve. Any market that is driven by people and therefore fear and greed tends to correct extremes. A correction can ultimately travel as far in the opposite direction, but this process can take a long time. Other major bear markets have taken up to 12 years or more. The bear market in N[Z] after 1987 may only have corrected the immediately preceding parabolic rise. But what if that rise was the final blow off of the much longer bull market that started at the 1932 low? Then a much longer bear market would be required that would bring the market back to a "fair" historic valuation or even an undervaluation as seen in the 1950s and 1970s. While it seems hard now to imagine what could cause this sort of move in N[Z], given that it hasn't enjoyed the same post-1990 bull market as the rest of the world, it's even harder to see N[Z] holding up if the rest of the world were to suffer a long overdue bear market. A few snapshots of the current situation on Wall Street may give some N[Z]ers a sense of déjà vu, and given the overall size of the US market and the heavy ripple effect it can have, some reason for continued prudence and some scepticism. The bull market in the US is now one of the longest. Economic expansion is continuing, inflation is at its lowest level in decades, the budget deficit is shrinking, the dollar is in its strongest rise since 1985 and the US leads the world in technology and efficiency. This sounds like the best of all possible worlds and has resulted in a widespread acclaim for a new "Golden Era". Now experts are working to justify the market's lofty valuations by adjusting previously valid tools to reduce how expensive the market looks... Ironically, all this is occurring after 20 years without a bear market. This has raised the US public's expectations and... its interest in the market to unprecedented levels. A total of 43% of all households now own shares and surveys show that they expect returns for the next 10 years to match the abnormal 14%-15% of the last 10... A total of 90% of all the money in mutual funds is from new investments made over just the last five years. Caution and fear are almost totally absent from the US market now... If the extremes in the US now are at all what the peak in N[Z] was like, then the risk of its first bear market for over 20 years is high. The increased global reach of US investors mean the effect of this will be more than a ripple around the world.

...[a billionaire US] financier... fears that the world stock markets' bull run will be followed by a massive crash... "Lots of the new investors have little experience of stock markets. If these inexperienced investors are all seized by panic and quit the market together, there will be a crash,"...

A DECADE ago when another US bull sharemarket was gathering pace, comparisons were made between circumstances then and the 1920s, the time of the previous accelerating sharemarket rise... This became a more popular pastime the longer the 1980s' sharemarket rise tracked that of the 1920s. Once the 1987 crash so neatly tracked that of October 1929 it seemed almost inevitable to many that a depression, or at least a severe recession, must follow. Hordes of investors cashed in their mutual funds in the US during late 1987, vowing never to invest again with the future so clearly mapped out in front of them... Of course, once recognition of the future had become this widespread the market was almost certain to follow a different path. And it did. By late 1988 the market hadn't started a second decline, the economy hadn't started to collapse and the 1920s' road map for the market became useless. It was certainly an interesting period that clearly showed that history can repeat itself for short periods, particularly in emotional markets and times... What is most interesting is that history may be repeating itself again... How similar are the last five years to the 1920s and 1980s? In all three moves the first 18 months saw a steadily rising market. The next 12 months was a period of consolidation, with a range of 50% of the previous rise. For the next five quarters the markets accelerated, followed in 1986 and 1996 by six months of consolidation... [T]he first quarters of 1929, 1987 and 1996 saw about a 10% correction. In all cases the market quickly recovered from this and in 1929 and 1987 the markets peaked within five months. One major difference between now and 1987 is that the resemblance between the current bull market and that of the 1980s has been generally unrecognised, even though the crash was less than 10 years ago. That is nothing compared to the nearly 60 years between the last two crashes. Certainly memories have got progressively shorter the higher the market has risen. Perhaps the eventual breaking down of the pattern in 1988 has stopped others from looking for similarities again. The most worrying feature of all is that because the pattern did break down in 1988 and the market left the crash behind as a brief correction, the public that vowed never to invest again has "learnt" that a correction is [a] great buying opportunity, not a portent of worse to come. If history was to repeat itself, the current bull market in [the US] should end soon and begin falling sharply before the end of August. In both 1929 and 1987, the initial drop took the market down to the level it was 12 months earlier – about a 20%-30% fall. This all sounds most unlikely. However, the market rarely accommodates most people by following its hoped-for or anticipated path.

...The lowest US unemployment rate in 24 years sparked... Wall St stock and bond markets on Friday. The Dow Jones... closed... at a record 7435.78... which eclipsed the mark set on May 27.

...YET another U[S] market watcher was in town last week predicting a 10% correction in super-hot Wall St, with implications for financial markets here. But can we believe him? ...[he] is the latest in a line of visiting US experts who have been saying that sort of thing since early 1996. But Wall St has powered on, with the Dow Jones... index rising more than 1000 points – or 15% – this year. What has changed to finally make imminent the long-awaited day of reckoning? If he had to pick a single factor, [he] would point to the unexpected fall in the US unemployment rate to 4.8%, which had raised the possibility of inflation as workers pressed for higher wages. And he said all the rules of thumb were suggesting the US economy was growing unsustainably... "It will take two or three quarters before the inflationary impact of the unemployment figures works its way through. But the fact is the US economy is inflating, fed by consumer demand, high wages and appreciating financial assets. I believe the US Federal Reserve will respond, very likely some time between August and December, and when it does financial markets will be hit hard." ...N[Z] and AUS[n] fund managers will be hoping [he] is right. Earlier this year they decided it would be best to go underweight in North American shares in anticipation of higher returns elsewhere.

...Last week the Dow Jones... briefly popped over the 7800 mark. It wasn't that long ago that the Dow eclipsed the 7000 mark (February 13) or even 6000 (October 14, 1996). The latest rally has extended a bull market that began in October 1990. The Dow has climbed 226% since then – the longest period without a 10% decline since 1914... Some analysts, meanwhile, are revising their forecasts for the Dow, predicting it will pass the 8000 mark later this year. "This is a lot like the late 1920s' blow-off that preceded the famous market crash," said... [a] chief stock strategist... "Even though the market is very expensive, it is going higher." He... wouldn't be surprised to see the Dow top 8500... but it was not time to gamble by pouring more money into stocks... [T]he Federal Reserve, alarmed at how much stock wealth was encouraging consumer spending, would raise rates to cool the market and the overheating economy. [The] treasury secretary said: "My sense is we're in a remarkable period right now." Investors had to weigh the combination of economic and monetary conditions... "and I think conditions are likely to be good at least as far into the future as I want to look... Maybe the sharemarket is too low relative to your view of conditions, maybe it's too high, or maybe it's at the right place. What[the] Federal Reserve Chairman... was doing in the speech in which he raised the question of 'irrational exuberance' was reminding people... what the risks are." [One] fund manager... said the sharemarket was proving to be a "runaway freight train...". He said stocks had broken all conceivable valuation parameters. "We are in the brave new world. As a value investor, this market is extremely challenging, uncomfortable and distressing... Maybe one day risk and fear will re-enter the marketplace... [I]nvestors are driving prices to levels that are going to prove to be unsustainable." [A] professor at University of California-Berkeley, [who is a] former chief financial adviser to [the] President... said... "We are in uncharted territory in some ways, and in other ways we're not." One major factor she said set the current economy apart from past expansions was the emergence of technology. But she had a warning: "I worry that an increasing number of people are in the marketplace, and that those people as a consequence (of never having lived through a major correction) might have expectations about future gains which may be disappointed..."

...The bulls were running on the sharemarket yesterday, rocketing the NZSE-40 to a post-crash high. After months of lagging behind[the] world... enthusiasm finally flowed into the market and pushed the NZSE-40 up 58.74 points to 2501.96 on hefty turnover of \$128 million... But with overseas markets pushing new highs, there was a certain amount of catch-up in yesterday's rally. While the Dow Jones and the all-ordinaries indices are now trading above their pre-crash peaks, the NZSE-40[still] is not... Yesterday's rise pipped the previous post-crash high of 2455, which was reached in September 1989, when [an AUSn funds management company] spent \$200 million-plus buying up N[Z] stocks only to see the market slump when its order was completed...

The puzzle as to why... [a NZ] entrepreneur... has spent \$A264 million... buying a stake in the ever-shrinking A[US]n foods group, Burns Philp, has come to the fore... after the latest round of bad news... [He]'s not respected or feared enough for people to trust that he has spotted something they have missed... [The entrepreneur], who holds a 19.9[%] stake in the company, is already down around \$40 million on his 250Ac entry price... (47c above the last trade)... after the shares dipped to 216c on Monday before they were suspended ahead of yesterday's announcement... [of] a harsher-than-expected writedown of the company's herb and spices business... Most had been expecting it to be written down to between \$A350 million and \$400 m... But the company took a more drastic step... down by \$700 m... to \$150 m... The writedown brings the company's total net loss after abnormal items for the year to... \$A873 m... Analysts were expecting the... group's shares to plummet when trading opened today... Burns Philp is [his] first investment since he sold Whitcoulls for around \$NZ320 m... last year. The bulk of that booty has been shelled out on Burns Philp... [F]rom an operational point of view the... 117-year old... company still has good underlying businesses... It is the largest producer of yeast in the world... [However, with] Burns Philp now riding on the charity of the banks... [his] investment might be in for a further buffeting.

...When [a NZer] booked a cool \$320 million profit on the sale of Whitcoulls in July last year, he said, "You can be sure I have not cashed up to put my money in the bank." The funds gathered interest for a year before he came true to his word... However, that fateful move by one of N[Z]'s wealthiest men has so far cost him \$191 million following yesterday's 126Ac plunge in Burns Philp's share price to 90c... If [he] does not have... a partner... lined up, or an unfriendly party comes aboard, he stands to be a pawn in a game in which he had set out to be king... At 90c, Burns Philp is valued at \$477 million... [K]nown in N[Z] for his thorough research, [he] must be kicking himself as his... investment would have given him virtual control... It is a shame that Burns Philp is not into poultry, because [he] would be right in his element. He is the biggest turkey strutting the bourse... [However, he] is not the only loser... As one of the nation's major wealth creators, his setback will adversely affect [NZ's] current account deficit... The A[US]n Securities Commission (ASC) said yesterday it was examining... the... Burns Philps & Co \$A700 million... writedown... of its herbs and spices assets... [Meanwhile, another NZer] has about \$47 million to play with after selling just under half his shares in US Office Products... "I could have sold all my shares if I had wanted to but I have kept a large investment in the company." ...[he] was US Office Products biggest shareholder after the sale of Blue Star, the[NZ] office supplies company, which he built from scratch in 1990 after leaving a post of divisional manager with Xerox Corporation... US Office Products shares have traded between \$US25 and \$US44 in the last year.

...Disney[']s... chairman... cashed in [his company stock] options to reap a windfall of \$US565 million... last week.

...THREE associates... through a sale and buyback procedure... are to make a total of £394 million by selling their holdings in Adidas, the highly successful sportswear company... Adidas released trading figures alongside the sale. It expects to post a pre-tax profit of not less than £83.9 million in the first quarter of this year – compared with £61 million in the same period in 1996. Sales in the first quarter rose 43[%] over a year earlier to £600 million... [T]he only Briton among the [three associates]... is said to have netted £427 million in total from his Adidas investment.

...Yeah, that was my best deal. I bought a 12% stake in... 1991 for \$1.9 million. Five years later the company was sold for \$720 million.

...CONVENTIONAL wisdom says hold on to your shares long enough and you'll make money. But analysis of five-year returns from [NZ's] 40 biggest listed companies shows actual results depend very much on which shares you hold. An investor buying shares five years ago... would have made an average pre-tax annualised return of 18%. But returns from individual shares differed markedly... The worst was meat, losing 7% a year. The best sector to be in was finance and banking (50%), followed by building (42%), media and communications (35%) and energy and fuel (33%). Still, investing in shares five years ago has proved to be a smarter move than playing safe and buying government bonds. A five-year government bond bought in 1992 would have returned 10% a year.

...The A[US]n Sharemarket has over time consistently outperformed traditional forms of investment such as property and fixed interest. Thus the A[US]n Sharemarket represents one of the best investment opportunities for N[Z] investors in the world today. So why are you not making the most of it? Chances are, it's because you haven't got the \$50,000 or more that'll give you a really worthwhile investment. Also you might be concerned that the risks are too high, or that you haven't got the necessary financial expertise to buy the right shares. In which case Macquarie's Geared Equities Investment is perfect for you... Macquarie provide you with A\$50,000 or more, which you can use to buy a range of over 70 blue chip shares for a one, two, three or five year loan term. What's more the money you borrow is protected. So if, during your loan term, the value of any of your shares falls below their original purchase price you will not be responsible for that loss. Macquarie will simply take back the unprofitable shares as full repayment of that portion of your loan. Macquarie will not offset any unprofitable shares against those that have made a profit.

...The A[US]n sharemarket jumped 1.3[%] to a record high yesterday as money continued to be shifted away from resources and into industrial stocks, particularly the banks... [By the way, a] third of A[US]n adults – 4.7 million – own shares, and of those, a third earn less than \$44,000, according to the A[US]n Stock Exchange's latest annual report. The average share portfolio value is \$37,000, but half the shareholders have less than \$11,000... The N[ZSE] does not keep comparable figures...

['The NZ and AUSn exchanges are in the preliminary stages of merger discussions. The NZ Government has already said it will help with any legislative changes. There are a range of possibilities in how joining with AUS could be done, said NZ's Minister of Commerce. The final shape of the merged entity could be one exchange and one set of rules for both countries. It could be the same rules with two exchanges or there could simply be protocols. The chairman of the local exchange said members of the NZ exchange would get an update at the annual meeting on Wednesday. The chairman says the NZ sharemarket's lack-lustre performance will not be solved by merging with its AUSn counterpart.' ■] **A combination of heavy buying, positive economic news and the potential of a large cash injection from offshore** [has] catapulted the A[US]n sharemarket to another record closing high... at 2745.9... Despite the sharemarket's claims to the contrary, there has been no investment safer or more profitable than houses... [R]esidential property has performed 50[%] better than the A[US]n sharemarket over the last 10 years, according to ANZ's *Investment Monitor*. But the report warns that over the short to medium term, the sharemarket has reversed that statistic, outperforming residential property by a similar margin. The danger now... is that global equity markets have risen too high and could be set to fall. "Investor optimism has [caused the US] equity market to double over 30 months. These sort of returns cannot be sustained in the medium term,"... said [the] ANZ Funds management chief investment officer...

When the Dow Jones average index of 30 industrials fell 192.25 points on a recent Monday and regained 153.80 on Tuesday, many financial journalists were prompted to use such verbs as "plunged", "plummeted", "soared" and "skyrocketed" to describe the three-figure moves. Such words [are] wearing thin, not only because of overuse but because price changes of this size are becoming more common place and therefore less significant... [Here's a piece of] advice for anybody troubled by the Dow's recent fluctuations and those of the market over all: "If you think it would do any good, go ahead and worry about it – but psychiatrist bills are expensive." ...people who feared a declining market should not worry about huge drops, even several in a row. A market in a decline – extended or short – presented the opportunity to buy stocks more cheaply. Of course, it [is] becoming more difficult to tell whether a market downturn [has] begun... When the Dow fell 700 points – or about 10% from March to April, there were many who said they believed a long-term slide had begun. Considering the Dow's rise since then, however, apparently that was not the case... As the Dow and the market rise in value, 100 points translated into percentage terms become smaller... A 100-point drop in the Dow when it stood at 2000 would have been a 5% drop. At the index's recent level of 7900-plus, that same 100 points translated to 1.2%. When the Dow fell 508 points in the 1987 crash, the fall was 22.61%. At 7900, the drop was only 6.3%... international sharemarkets [have] been returning around 7.7% annually for the past 10 [years]...

So far this year, Russian stock indexes have far outstripped all other general market indexes worldwide. The Russian/Stake Press general index of the 100 largest public companies has risen 196.42[%], while Brazil's Bovespa index is second at 76.13[%]. The Russian index also was the world's top performer last year with a gain of 142.8[%].

...China is rushing] to replace strict communist central planning with a market-style economy. Investors ranging from rich entrepreneurs to taxi drivers have pumped funds into volatile infant stock markets in Shanghai and the southern city of Shenzhen... A rush to the sharemarkets by China's leading companies is predicted to change the super-power's economic drivers within 15-20 years... [In related news, the US] sharemarket's main indicator breezed through the 8000-point milestone on Wednesday[, closing]... 63.17 points higher at a record 8038.88... and the Nasdaq composite index scored its highest one-day gain ever.

...Wall St stocks fell from their dizzying heights on Friday as investors cashed-in profits to end a record-shattering week... The Dow's fall came only a couple of days after it topped 8000 for the first time... "Without a doubt, it's profit-taking," said... [a] managing director of institutional trading... "This market is nervous at the moment,"... [a] chief investment strategist... said... The A[US]n sharemarket followed the lead of Wall St to close down, with profit taking and figures arbitrating causing the fall.

...The Dow Jones index rose to a record high on Tuesday after[the] Federal Reserve chairman... did not deliver the... speech that Wall St had feared. The Dow closed 154.93 points higher at a record 8061.65... and set... its 33rd milestone for the year with its fourth-heaviest gain in its history. In his Congressional testimony on the economy, [the chairman's] speech was devoid of the mentions of market bubbles and irrational exuberance – the sort of alarm that sent financial markets reeling last year... In LONDON, shares rebounded from two days of heavy losses... tracking gains on Wall St... Market nerves were steadied from the opening by Monday's firm close on Wall St...

NOW that the Dow... has punctured the 8000-point mark, the debate has switched to whether this milestone will be seen as a new blastoff point, a grazing pasture or a cliff. The atmosphere is a lot more upbeat than a year ago, when the market fell after a barrage of corporate profit warnings... But another rally on Wall St would push the ratio of share price to earnings beyond traditional comfort levels. "It's moved beyond the realm of predictability," said... a market-analyst... "All the technical indicators are off the map. One by one they've fallen by the wayside. I don't know what to look at to say this thing is over-done. It'll go down when it's ready to go down. Sooner or later, people will say, 'It's too high, I won't pay that much'. But tell me when that time will be." Many experts said this bull market was behaving more like an animal about to embark on a stampede rather than settle down for a rest. The Dow's record-setting rise had been accompanied by heavy volume and growing interest in mid-sized and smaller companies. The implication was that more investors were venturing beyond the perceived safety of the blue-chip sector as they sought values in a pricey market. That type of surge in investor confidence can result in what's called a "melt-up" or a "buying panic". "The Dow industrials could explode for several hundred points in a few days," said... [a] chief technical-analyst... He cautioned that "any subsequent sell-off would be accompanied by fearsome free-falls"... When the Dow hit 7000 in February, most observers expected the Federal Reserve to protect against higher inflation by slowing the economy – and profits – with a sharp boost in interest rates. Instead, inflation had eased and the Fed lifted rates only slightly. "If earnings are good, Fed monetary policy is good and inflation is still behaving, you'll see more multiple expansion," said... [a] chief investment-strategist... [However, someone else said: "If the] Fed... chairman... was concerned about a bubble with the Dow at 6200, what's he going to think at 8000?"

...Stocks rolled to another record close on Tuesday, boosted by a strong performance in the bond market... The Dow... closed... at... 8174.53.

...Stocks slumped [yesterday] as investors – lulled by recent signs of mild inflation – were shocked by surprisingly strong reports on U[S] employment and manufacturing activity. The market again proved its resilience, however, and shook off most of the day's fall to close with moderate losses... [at] 8194.04... The late recovery all but erased an early sell-off that dragged the Dow down as many as 120 points... [B]ut even so, analysts pointed to the heavy early losses as evidence that the market was ill-prepared to withstand any unpleasant surprises... [Incidentally,] British and American investors who have poured money into Asia's markets, have seen much of their capital evaporate in the past year as it has become apparent the region is living beyond its means.

...South-east Asia's sharemarkets are in crisis. A stampede to sell stocks in Malaysia, Singapore, Indonesia, Thailand and the Philippines has wreaked havoc not seen since the Gulf War or the October 1987 crash. Over the past two trading days, the Philippines market has fallen more than 12[%]... Thailand about 5[%], Indonesia about 10[%] and Malaysia more than 7[%]. Confidence is badly shaken and will take time to mend. Malaysia is the main culprit behind this week's turmoil... This week's rampage... came after Malaysia's P[M]... sanctioned rules to curb what he termed was speculative selling on the stock exchange. The region's markets toppled like dominoes. Malaysia's new rule governing the trading of 100 stocks require those wanting to sell to first deposit them into the Central Depository, a warehouse to clear scriptless trading. Those buying must pay up within two days after the trade, against the normal five-day settlement period. While [the PM] wages war with the speculative bogeyman, international fund managers, fed up with Malaysia's whimsical handling of the stockmarket's problems, are making a mass exit... What international investors dislike is Malaysia's insistence of approving mega projects which add no value to the economy while the current account

deficit grows... Malaysia is in a race to build the world's largest hydroelectric dam... mega bridges and mega malls. Economists have advised that Malaysia should first address its current account problems... "We don't know who is advising the P[M] but he is not listening to us," [said] one senior Government official...

South-east Asia's stockmarkets, once the darlings of international investors, are now pariahs following a region-wide currency attack which spooked investors already worried by Asia's inability to digest its rapid industrial growth. Over the past week, Malaysia, Thailand, Singapore, Indonesia, and to a lesser extent, the Philippines, saw their stockmarket and currency markets sold down... Malaysia's stocks are down 32[%] in the year to date in U[S] dollar terms... Some regional market watchers described last week's selling as a sort of capital flight... But... NatWest Market's regional economist, said that Malaysia had not done enough to cool the property, sharemarket and consumer bubbles in the economy. Offshore sellers were merely correcting what they saw as a mispriced market, he said. With industrial production growing faster than exports, Malaysia was uncompetitive. "Offshore people can't affect change in the domestic policy... But they can certainly whack the currency because it is internationally traded. What they are basically telling Malaysia is that, either you fix it on your end, or we'll fix it for you on the external end." ...Better returns from other emerging markets, like Eastern Europe and Latin America, also reduced foreign interest in the region while the U[S] stockmarket's bull run had kept funds preoccupied at home... [However, the] Singapore-based regional strategist for[the US-based brokerage company] Merrill Lynch... likes the Thai stockmarket and thinks the country's economic woes could be over.

...A FORMER stock exchange messenger has become one of London's highest earners. [The person] who began his career as a tea boy in the exchange, is believed to have been awarded a \$9.3 million bonus in his job as deputy head of American-owned investment bank Merrill Lynch International. The bonus is one of the highest known in London, where more than \$1.75 billion was handed out in bonuses at the end of last year. The Bank of England, still smarting over the collapse of Barings two years ago at the hands of[a] "rogue trader" ...last week fired a broadside at the high-risk, high-reward bonus culture. Its warning came as another "rogue trader" surfaced at NatWest, which announced a \$116m trading loss in the department that traded in interest rate options... After the spate of incidents where lone "rogue traders" caused serious financial damage... the authorities are trying to discourage the adrenalin rush caused by the prospect of huge bonuses. [However, l]ast Christmas, around 1500 London bankers and brokers were promised incentives of more than \$1.16m each... [The former tea boy] declined to comment on his payout. "I do not believe these things should be personalised," he said. It is thought some of his bonus is to be paid in New York, rather than London, and is partly in shares in Merrill, which he will have to hold for five years before he can sell them. These are common arrangements among American firms to stop top executives from leaving when they have made their millions. The payout came after a record year for shares in London...

Thirty Wall St brokerages have agreed to pay \$US910 million to settle a class action lawsuit alleging they colluded to fix prices on the Nasdaq market, says the counsel for the plaintiffs. Many of the financial world's best-known names are involved in the proposed settlement. According to the *Wall St Journal*, the biggest payout – about \$100 million – would come from Merrill Lynch... [Meanwhile, the t]hree... cases of insider trading this week are a reminder that the crime is very much alive and difficult to prevent, securities industry executives and attorneys say. Federal authorities charged former employees at J.P. Morgan and Co, Bankers Trust Securities and Smith Barney with trading on confidential information to make profits of more than \$1 million over the last three years. "...you are never going to stop it," said... a securities attorney who used to work for the Securities and Exchange Commission. "There are leaks all over the place, and people are willing to take the risk." ...Ironically... two of the people charged this week... were former compliance officers, employees responsible for preventing insider trading by colleagues at their security firms... Active SEC insider trading investigations have doubled in the past decade to 339 last year... Several factors accounted for the increase. The record level of corporate mergers provided ample temptation for some investors to make big money using information not available to others. The seven-year bull market, fuelled by the retirement savings of... baby boomers, had also boosted the number of investors and potential inside traders.

...IF YOU want exact dates for the long-expected boilover on Wall Street, [a] former global equities trader... has some for you – any time between the day after tomorrow and October 1. So hit the phone, big gambler. The word for your broker is sell, sell, sell! At the same time, [the former]... head of... Merrill Lynch's US equities business in London... admits, he has no way of really knowing what will happen. So don't rush the phones yet. It's just that his comparative plotting of U[S] share prices before the crashes of 1929 and 1987 have shown an uncanny similarity to what [is] happening on Wall Street now.

...The Dow Jones index... closed 247.37 points... lower... on Friday, partly shaken by an earnings warning from consumer-products giant, Gillette... It was the Dow's... steepest points fall since October 19, 1987 – the so-called "Black Monday" when the Dow sank 508 points – or 23[%] – to 1738.74. In percentage terms, however, Friday's fall... [was only 3.1%. In London, the] FTSE-100 index shed 2.5[%] – ...its heaviest one-day percentage drop since October 1992... For its part the... N[Z] sharemarket... closed just 1[%] lower. However, local investors]... are bracing for big falls when sharemarkets [overseas reopen] today...

[T]he Dow has fallen 7.5[%] since its August 7 record high of 8340.14... A market correction is usually considered serious beyond 10[%]... But some analysts said that with more people back buying and selling in the markets... this week after vacations and the holiday weekend... volatility could ease...

Financial markets around the world suffer less severe shocks these days from a sharp drop in the Dow... than they did in the 1987 Crash[, the]... chairman of the New York Stock Exchange, said yesterday. A Dow correction has "a psychological impact" on traders and investors in foreign markets but "they have become more sophisticated in separating out cause and effect. They look at value drivers behind their local share markets." ...U[S] investors' appetite for foreign stocks would double in the next few years to \$US750 billion, he said. To fulfil its ambition to be the first global stock exchange, the NYSE is seeking more foreign listings. They have risen from fewer than 100 in 1990 to 326 today. With domestic stocks, the NYSE has about 3000 listings. [The NYSE hopes to attract more foreign listings by 'extending the Dow's trading hours from 5am to midnight, thereby expanding its reach.'

...This week the] Federal Reserve chairman... sent U[S] share and bond prices tumbling when, appearing before a Congressional committee, he cast some doubt on the sustainability of the country's strong economic performance. Some observers have looked at the fact that the N[Z] sharemarket is now more than 50[%] owned by overseas investors (for blue-chip stocks the ratio is even higher) and concluded that that makes us more vulnerable... [than] 10 years ago... should there be another landslide on Wall St... [Speaking of landslides, Hong Kong's] Hang Seng index has fallen for five straight days[, creating]... a total drop of... 13.65[%]. The chief reason for the fall has been sales or redemption of Asia-invested mutual funds by overseas investors wary of the outlook for Asian currencies, interest rates and equity markets... [The slide comes as] China Telecom... is set to shake the... sharemarket... with the bourse's biggest-ever initial public offering.

...The Hang Seng index ended a five-day losing streak yesterday, closing 309.68 points, or 2.31[%], higher... but trading still showed wide and confusing intraday swings in sentiment... In TOKYO, stocks closed higher but sentiment remained bearish[, while in New York the]... Dow Jones... chalked up its highest one-day-points gain in history[– closing]... 257.36 points higher... [The figure] topped the 186.84-points rise on October 21, 1987... The[N[Z] sharemarket ploughed through its post-crash high... and it closed eyeing 2600... London's stock market closed at a record high... advancing by 160.1 points or 3.16% to end at 5225.6 points. It followed[a] report... of possible British participation in the European single currency much sooner after its 1999 launch than had been thought likely... [However, the British PM's] office dismissed the report as "speculation."

...LAST month, when... Malaysia's [PM] accused... the international financier[(r:p294, ln37)] of being a "moron" and trying to force a devaluation by speculating against the Malaysian ringgit, nobody paid any attention... But when he then accused [the financier] and others of trying to undermine the Malaysian sharemarket and announced that short selling was "akin to insider trading", the world took notice... The rout sent ripples around the world, helping to drive European and American markets lower. [This caused Asia to take another] tumble, with Jakarta dropping [a further] 16.8%... Europe and America again followed the downward trend, awakening fears that a sharp global correction could be under way. The Sultan of Brunei... waded into[the Asian] stock markets... buying hundreds of millions of pounds of shares in an effort to stop the regional collapse... Most Wall Street analysts see no reason to panic... But what does worry some analysts is that Asian investors may begin pulling their money out of US treasury bonds and repatriating funds to prop up wobbly finances. If that happens on a large scale it could be catastrophic for America, which has a low 4.4% savings rate and would have to jack up interest rates to attract new buyers. That, in turn, could be a signal for a much bigger sell-off in world share markets.

...Malaysia's P[M]... has a novel idea to prop up Malaysia's bourse by buying shares from local investors at a premium, and has set aside \$31.95 billion to do that. He will also buy shares from foreign sellers – but only at the market price. Global fund managers deride the move as nonsense. They say [the money] will quickly disappear down the plug hole and fail to stem a falling market. Earlier, [the PM] banned the short-selling of blue chip shares in an effort to prop up market confidence. All it did was send more foreign investors running.

...the Tokyo Stock Exchange yesterday... sank below 17,000 points for the first time since August 1995. Brokers attributed the fall to worries about the outlook for Japan's economy. The NZSE went in the opposite direction, closing at a post-crash record of 2612.90.

...WHEN sharebrokers around the country party tomorrow night to mark the 10th anniversary of the 1987 crash, they'll be drinking without fear... Doomsayers have had a field day pointing out uncanny similarities in trading patterns on Wall St today compared with 1987 and indeed 1929. But[, barring]... a bloodbath in the US... the Auckland Regional Stock Exchange... doesn't see any likelihood of a 1987 repeat... [Therefore,] if sharebrokers have a headache this Tuesday morning, it's likely to be nothing more than the after-effects of a few drinks the night before.

...Concerns over quarterly corporate earnings and a trade dispute caused blue-chip stocks... [on the] Dow Jones index... to fall 2.46[%]... 10 years after the October 1987 stockmarket crash... "A lot of things cause bear markets,"... [one analyst] said. "One thing that doesn't is the calendar."

...[yesterday the AUS]n... sharemarket plunged as much as 2.7[%] before recovering to end down 2.5... as... [the] Hong Kong bourse sank 14[%] in morning trade and panic selling spread to other Asian markets[, then]... touched off a world-wide chain reaction... that pulled London's FTSE-100... down by... £28 billion[, or 3.1%]... and Germany's... Dax index down 4.7[%]. NZ]... share prices plunged 5.35[%], the local market's]... largest points fall since the '87 Crash... wiping \$3 billion off the value of the market... The Dow Jones... closed 186.88 points lower...

CRASH, dammit, *The Economist* magazine urged global sharemarkets in an editorial in the issue for the week ending October 24. Market analysts had sniffed condescendingly at suggestions the 10th anniversary of the '87 crash had any bearing on what might happen 10 years later. Ridiculous to think anything as complex and hi tech as modern financial markets could be at the beck and call of something approaching superstition. But, as *The Economist* said, whether as tragedy or farce, the tendency of history to repeat itself is well documented. So come on the crash, "get it over quickly, is a common feeling – the sooner we can fill out boots with cheap shares." Hey presto!

...Landing home in Hong Kong yesterday... [the] head of the local government, stepped off the aircraft and said all would be well... The local stock market, slam-dunked by investors for a 23[%] fall in the first four days of this week, bounced up nearly 7[%] on the fifth. Crisis over? No. The Asian miracle growth story, too good to be true on the way up, is proving deeply damaging on the way down... Thanks to steep currency devaluations and \$US17 billion of IMF support for Thailand some semblance of stability returned earlier this month. But real economic change has yet to start, with every sign that politicians in Thailand are too weak willed and in Malaysia too angry with foreigners to take the necessary medicine. At least devaluations have made these countries more competitive again, conversely making China and Hong Kong less so... [E]vents this week were only the opening skirmish. The battle will be bloody for Hong Kong, particularly as Singapore and Taiwan caved in this week to devaluation... World financial markets are in for a rough ride.

...A new worry for world financial markets surfaced yesterday as the Hong Kong stock market lurched down again... [by 5.8%, which nearly wiped] out the market's... recovery on Friday... Trading was stopped... for the first time in the [Dow's] history... triggered by losses reaching 350 points... Trading resumed after half an hour. But it took just 25 minutes for the index to plummet another 200 points, triggering an hour-long halt that finished trading for the day... [The points total represented the Dow's] biggest ever one-day fall.

...The N[Z] sharemarket plummeted yesterday in its second-largest drop in history as fallout from Asian economic strife continued to ricochet around the world. The NZSE-40... closed down 12.46[%], worse than all expectations. This compares with 14.7[%] on... October 20, 1987... The sharemarket meltdown was greeted with surprise by institutional investors who saw it as a gross over-reaction to overseas events – not helped by retail investors spooked by memories of 1987... The A[USn sharemarket also] suffered one of its biggest plunges ever, with around \$27 billion wiped off the market's value... Shares in... Burns Philp tumbled again, to a low of A18c before recovering to A27.5c... Late bargain hunters lifted the market[, which has lost]... \$41 billion... in the past three days... In HONG KONG, stocks crashed to their biggest point loss ever... The Hang Seng index plunged 1438.31 points, or 13.70[%]... A Hong Kong science teacher, still clutching his share certificates, leapt 28 floors to his death after losing his savings... In LONDON... the FTSE 100 responded on opening with a slide of 9[%]. In related news, the]... automatic trading halts invented by two Harvard University professors after the 1987... crash... [to limit US investors' losses, has] left some analysts wondering if they had just delayed the inevitable. "The long halts actually did more harm than good," said one economist.

...First, the good news. Global stock market prices are heading back to realistic valuations... The U[S] was the biggest culprit... US shares were... last week... worth... 130[%] of the value of the net corporate assets they represented. That was three times the value a decade ago, twice the long-term average and the highest value since 1920. N[Z] escaped this euphoria because it suffered not a correction but a crash in 1987 and the years thereafter... but at least share market valuations remained realistic. Now the bad news. We can't stand in splendid isolation if the world losses its head. N[Z] equities, worth a mere 0.2[%] of world stockmarket valuations, are flotsam on a cruel sea... Lastly, the really good news. Either way, some foreign investors will quit N[Z] equities. Thus, we can buy back great chunks of corporate N[Z] at rock bottom prices.

...Ever more people in Hong Kong, devastated by losses on the stock market, have been jumping from buildings, hanging... or gassing themselves. This is despite assurances from Hong Kong's Chief Executive... that they have no reason to panic. [Meanwhile, for 'sharebrokers – who earn commissions on every sale – it's been their best week']

...Sharebrokers were talking warily of a "dead cat bounce" last night after the... NZSE40... staged its best comeback ever. The market... had improved 9.9[%] at the close... but brokers shied away from predicting the market's next move... Hong Kong's Hang Seng... made the largest rebound, surging 18.82[%] by the close of trading... Shares rose strongly... [on the] Dow Jones... to a record gain amid heavy volume... as investors swooped to buy shares, apparently convinced the impact of Asia's financial crisis would be limited on Wall St... A[US's sharemarket also]... did a backflip... as it recovered from Tuesday's \$27 billion loss and bargain hunters flooded the bourse... A total of 62,497 trades were recorded, 2497 more than the trading system's... capacity. This compared with a record 50,979 previously... "I believe we've seen the worst and people now realise there is nothing wrong with the economy in A[US or the US," one broker said. But the] Macquarie Bank head of equity trading... attributed the surge to "mums and dads" returning to the market... [L]arge institutional buying appeared not to be as strong. He predicted "a lot more turmoil."

...Wall St was cheered by... the US Federal Reserve [chairman's]... comments that recent market turmoil would eventually be seen as healthy. He also said that Asian economies should be able to sustain "above-average" economic growth "for a very long time." ...[However, his soothing] words... were not enough to keep Asian markets from falling[again] last night.

...FOR[local] investors, it was a week that began in hell and then climbed to heaven. Now experts are trying to decide whether purgatory is next on the list – and not just for shareholders. The average N[Z]er who does not own shares could still be hit by fall-out from sharemarket volatility through job losses, uncertain interest rates, lack of confidence and possibly lower economic growth... Half our manufactured exports go to A[US], whose economy was more exposed to Asia than N[Z]'s... Lower consumer confidence... could feed through to lower business confidence, which... was not as firm as bullish bank surveys revealed... [However, last] week's sharemarket gyrations did little to dent US confidence levels. A *Time/CNN* poll over the weekend found that 77[%] of those surveyed did not change their opinion... on the markets. And only 28[%] said they were now more worried about the country's economic future, compared with 46[%] who felt that way after the 1987 crash.

...DEEP within the DNA of every investor there's a gene that indicates investment stupidity. Unfortunately, most of us have it; our instinct is to do the wrong thing. We [sell on the rumour and buy on the news], which generally means we] buy when shares are high, and we sell when they're going down. The result: We shoot ourselves in the collective foot by cementing in place losses that would otherwise remain on paper only. Whether that maxim still holds true... after the momentous events of last week, depends on who you talk to. Fund managers... say small investors showed heartening maturity last week... "Our advisers took the initiative and rang clients on Tuesday morning to reassure them about value added to their investments in the past, and what was being done now to minimise any potential losses,"... [However,] the story is different... [according] to brokers... "Unfortunately we saw some pretty stupid selling on Tuesday when the market was at its worst... Unlike managed funds where you have to fill out forms to quit investments, it takes only a telephone call for brokers, and we have to complete orders that are given to us. Some people lost a lot of money and others made a lot. But that is the market place."

...The first little piggy went to market. His life savings were invested in blue stock... The second little piggy stayed home. She did the washing, stewed some rhubarb, went to the school to help with the "Trees for Survival" unit, came home, made muffins, wrote an article for the local paper on chemical poisons in the environment, planted a couple of dozen trees, weeded the potato bed and re-set the possum trap. After lunch she started to read the paper, but fell asleep before the Business Section... Before dinner, Piggy Three and Piggy Four went out to feed the chooks. They watched them rushing to the first dish, then racing to the next dish leaving the first dish half full, and then backwards and forwards, pushing and shoving, till every last pellet was eaten. "Just as well they lay eggs," said Piggy Four, "because they wouldn't get any credits for social responsibility." When they went inside, Piggy One and Piggy Two were watching the news. It was all about the market, slumps and slides, rallies and rises, predictions and prophecies. "Boring..." muttered the twins, [who] started arguing about how much it was worth to lay the table and do the dishes, and then went off to try to bribe Piggy Five to take over their chores for a week. Piggy Five was absorbed in two books – one on chaos theory and one on the bell curve... Over dinner Piggy One said he was worried about his blue chip nest egg. Piggy Two said it was silly to have all your eggs in one basket... Piggy Five said that her theory was that market forces could be explained, and probably predicted, by calculating intersection points between randomly generated fractals and a standardised bell curve. They all looked at her for a moment. "And anyway," she went on, "they all just behave like pigs in troughs. Or hens in feeding dishes... The Market Place is a Myth – a euphemism for insane, irrational greed on an international scale." There was a moment's silence, and then the rest of the family started talking all at once about *Shortland Street*...

Asian stocks are braced for another week of extreme volatility, with concern that instability in other world markets could put further pressure on the region's wildly fluctuating exchanges. A huge assistance package for Indonesia, engineered by the I[MF] and estimated at up to... \$US23 billion... was expected to offer a hint of stability to the region.

...The U[S] is ready to provide up to \$US3 b... as part of a back-up plan for an [IMF] loan package to help Indonesia regain its economic balance.

...Investors, fund managers, monetary authorities and government leaders have barely digested October's... turmoil – now more shocks have surfaced... Some Japanese financial institutions... are troubled... [and the IMF] this week investigates South Korea...

Angry South Korean investors demanded a halt in stock market trading as prices plunged yesterday to their lowest level in 10 years, with no signs of recovery... Dealers said the market was in serious trouble as panicky investors kept dumping shares in the belief that things would get worse once the IMF and the South Korean Government worked out details on an economic bailout package. - 1997

South Sea Bubble, speculative scheme intended to liquidate the national debt of England. A joint stock company, the South Sea Co., chartered 1711, was granted an annual interest payment and a monopoly of trade in the Pacific area in return for assuming the debt. Shares rose, 1719-20, to about ten times par value. Uncontrollable speculation was abruptly ended by attempts to prosecute rival and bogus companies; the crash ruined thousands. Inquiry revealed extensive fraud in the company's operations, involving cabinet members.

Thinking in money is always, in one way or another, trade or business thinking. It presupposes the productive economy of the land, and, therefore, is always primarily acquisitive... With money-traffic there appears between producer and consumer, as though between two separate worlds, the third party, the *middleman*, whose thought is dominated *a priori* by the business side of life. He forces the producer to offer, and the consumer to inquire of him. He elevates mediation to a monopoly and thereafter to economic primacy, and forces the other two to be "in form" in *his* interest, to prepare the wares according to *his* reckonings and to cheapen them under the pressure of *his* offers. He who commands this mode of thinking is the master of money. In all the Cultures evolution takes this road. Lysias informs us in his oration against the corn-merchants that the speculators at the Piraeus frequently spread reports of the wreck of a grain-fleet or of the outbreak of war, in order to produce a panic. In Hellenistic-Roman times it was a widespread practice to arrange for land to go out of cultivation, or for imports to be held in bond, in order to force prices up. In the Egyptian New Empire wheat-corners in the American style were made possible by a bill-discounting that is fully comparable with the banking operations of the West. Cleomenes, Alexander the Great's administrator for Egypt, was able to book transactions to get the whole corn-supply into his own hands, thereby producing a famine far and wide in Greece and raking in immense gains for himself.

Futures, commercial contracts calling for the purchase or sale of specified quantities of commodities at specified future dates. The origin of futures contracts was in trade in agricultural commodities, and the term commodity is used to define the underlying asset even though the contract is frequently completely divorced from the product. It therefore differs from a simple forward purchase or sale in the cash market, which involves actual delivery of the commodity at the agreed time in the future... The common characteristics of futures markets are that they can be made in any commodity that enters into trade on a scale large enough to provide the necessary liquidity, that is available to a broadly standard specification, and that is traded in free market conditions that allow price fluctuations based on the interplay of supply and demand factors and that preclude dominant producers from controlling the market... There are two basic types of traders in a futures market: hedgers and speculators. Both are necessary to the market in order to generate a sufficient volume of two-way business. Hedgers seek to avoid or minimize the financial risks associated with their current commercial activity by in effect taking an insurance policy in the shape of a future contract against adverse price or interest rate movements. On the other hand, the speculator, in the expectation of making a profit, seeks risk by committing his funds to back his own view of higher or lower prices or interest rates. It is the speculators who supply the necessary liquidity to the futures markets and are

instrumental in allowing buyers to be matched with sellers, although the actual contracts are made through the market's central clearinghouse. It is the intervention of the clearinghouse which removes the credit risk and permits standardization of contracts to allow easy buying and selling... Futures developed originally to provide cheap forms of banking and insurance... Bankers and financiers can also use futures to insure against changes in interest rates and currency exchange rates.

Money, which in itself has essentially no value, exerts more power over human lives than any single commodity... Theoretically, the economic value of money is determined by the government that issues it. At one time in the U[S] the value of a dollar was pegged to a certain amount of gold or silver held in reserve by the federal government. Ultimately, however, its value is determined by the law of supply and demand. Money is worth what someone is willing to give in return for it. Because the U[S] government has so determined, a dollar is always worth one hundred cents, but, at different times, it may be worth eight, ten, or eighteen eggs – depending on their availability.

The long-term trend of most currencies in modern times has been inflationary, and almost all important currencies have been devalued, a number of them repeatedly. In contrast to this common reason for devaluation, the devaluation of 1934 in the U.S. aimed primarily at forestalling deflationary tendencies by raising prices. Devaluation may involve the issuing of a new monetary unit... One result of currency inflation is that official exchange rates with foreign currencies become unrealistic, overvaluing the currency's comparative purchasing power in world markets. The currency becomes undesirable to foreign businesses or governments when used, at these official exchange rates, to settle debts owing to them. Devaluation makes such a currency competitive (realistically valued) once more.

1984... Certainty in the financial and business community that the new Labour Government would devalue the NZ currency resulted in a serious balance of payments crisis. Muldoon was reluctant to accept Treasury and Reserve Bank advice to devalue and it appeared that there might be a constitutional as well as a financial crisis if he refused to do what Labour, which had not yet taken office, instructed him to do. However, Muldoon reluctantly took[the Labour leader David] Lange's advice and devalued by 20%. At the same time all restrictions on interest rates were lifted, leading to considerable rises... Eventually the currency was "floated".

It seems that N[Z]ers are starting to get bored with keeping down inflation. And the means of keeping it down are likely to continue to divide Aucklanders from other N[Z]ers. The]... Governor of the Reserve Bank... would... like to see the dollar come down soon. And when the country has only one currency to work with, and N[Z] still wants low inflation, then the dollar coming down means interest rates have to go up. N[Z]'s largest city may soon be asked to sacrifice its low-interest-led boom for the benefit of the rest of N[Z]... Much of Auckland's economy right now is thriving on the fact that N[Z]'s monetary policy is having relatively less effect on interest rates than on the high dollar. The longer a low-interest, high-dollar regime goes on the more likely Auckland house prices are to keep on rising, for example. But the sooner a high-interest, low-dollar regime arrives, the better for most of the rest of the country... But need there be only one currency to work with? Can a civilised country have more than one currency? Advocates of micro-currencies... claim there is often conflict when different cities and regions have to share one currency and that for most of human history it was normal for each city to have a currency of its own. Today, a local money need not replace the national money people use every day. A micro-currency for Auckland would be something that would circulate in the city alongside, not instead of, national dollars... An Auckland micro-economy would enable participating local companies to put extra credit to work even if interest rates had to tighten nationally. It would allow Auckland to fund its own growth at its own speed... It would need a group of city firms enthusiastic about the concept but motivated by healthy self-interest, and it would need a lender – either an Auckland bank or city council already having to bear the costs of some non-repayment, either of bad loans or unpaid taxes... Micro-currencies come from seeing that the N[Z] dollars just circulating in Auckland wastefully tie up cash... If local IOUs were circulating inside Auckland instead of some of those dollars, some firms would have more national cash for important things like importing investment goods. If creating an extra currency zone sounds crazy, imagine it in the other direction. Would tying the N[Z] dollar to the A[US]n dollar benefit businesses in N[Z]? Alternatively, we could follow the lead of 'Argentina and other countries which have suggested switching their currency to \$US.' Incidentally, the US]... dollar fell against most major currencies on Friday... When trading opened in New York... disgruntled currency traders, impatient with the dollar's failure to rise, began to sell.

...Kiwi on top of the world The N[Z] dollar has been dubbed "the strongest little currency in the world" after an *Economist* magazine survey found it had performed better than any other against the U[S] dollar in the past nine months. Dealers and analysts were not surprised by the finding, which they attributed to N[Z]'s high interest rates... "And that attracts international investors, who have to buy our currency to invest here." ...High interest rates were also behind the Italian lira's ranking as the second-best performing currency... The A[US]n dollar, underpinned by a raft of dual currency Samurai bond issues, was the third-best performer. The dealers and analysts doubted the kiwi would hold its status... for long, as N[Z]'s interest rates were... likely to fall... over the next few months. That would reduce overseas investor interest and probably reduce the kiwi's value[(\$NZ1 is currently valued at '\$US0.71' – a level it last reached during '1988')].

...Overseas investors have been pumping money into N[Z] to take advantage of our very high interest rates... As the demand for Kiwi dollars increases, so does their price... [T]he Reserve Bank is using high real interest rates as a weapon in its fight to keep inflation down. Inflation is a problem because the economy is growing too fast. If interest rates are high, people will have less money to spend, and businesses will find it more difficult to invest. So growth will be contained. Paradoxically, a high dollar is a symptom of a strong and growing economy. *Who is hurt by a high Kiwi dollar?* Exporters... find that what they send overseas now earns them less money. And in a country like N[Z] where exporting plays such a large role in the whole economy, a high dollar can impact on us all. *Who benefits from a high dollar?* People who import goods which now cost less, and the people who buy those goods if the lower costs are passed on... [T]he Government... can intervene in the foreign exchange market [and] sell Kiwi dollars to try to lower their price. The problem here is that it risks being swamped by the huge global foreign exchange market which can easily negate its actions. Any losses the Government makes in such foreign exchange deals will be borne by the taxpayer. The Government could also change the tax rules on overseas investment to try to stem the flow of money from offshore. But that would lose it international credibility – it wasn't that long ago it loosened the rules to encourage more funds from offshore... [T]he Reserve Bank's continuing tight monetary policy will bring inflationary pressures firmly under control, allowing it to ease interest rates and thus make our dollar less attractive to overseas investors. *What is the likelihood of that happening soon?* Crystal ball, anyone?

...PROVINCIAL N[Z] is facing an economic crisis that may force farmers off their land... "No matter what the powers-that-be in Wellington think, this nation depends on exports... We have been saying for some time that a crisis is looming but no one wanted to listen..." said... [the] Hawke's Bay Chamber of Commerce president... The... Federated Farmers... national president... [agrees:] "We are in a bit of a recession, very clearly the export sector is having a really tough time and that does flow through and affect retailers and jobs. The rural economy goes through recession first, and we just hope 1997 brings some cheer, although that looks a bit premature." - 1996

THE high N[Z] dollar... is hurting exporters and bringing warnings of job losses... N[Z]'s climbing exchange rate reached its highest point in nearly a decade last week and if you believe what some of our exporters say, the high dollar is pushing N[Z] towards a precipice... [A] downturn in

exporters' fortunes means less money to spend and fewer jobs, said[the] Manufacturing Federation chief executive... And with imports cheaper, local manufacturers face greater pressures to keep their prices in check... But are lower import prices being passed on to the consumer? ...prices of imported consumer goods – taking into account exchange rate movements – fell an average of 4% in the year to June 1995. In the year to June 1996 they stayed the same... Like the Government, the Consumers Institute... doesn't keep track of import prices at retail level.

...In spite of the restructuring of the past decade, N[Z] remains a trading nation – exporting a relatively high proportion of its production and obtaining a similarly high share of its consumption needs from abroad. The health of the country is never too different from the health of its exporters. And they are in trouble. In the past few months a succession of export groups have put hard dollar estimates on the losses they are having to absorb as a result of a rising N[Z] dollar – dairy, fishing, wool, boatbuilding and apples to name but a few. These exporters are largely captive; they extract value from the natural endowment of the country and cannot relocate to a kinder economic climate. Manufacturers, on the other hand, can. And they are. In only two months last year, cuts, closures or relocations to A[US] were announced by [13 major companies, including]... Ford, Toyota... and... Bluebird Foods... Alarming... researchers estimate that “about... 85,000 manufacturing work-places are marginal.” ...If exporters' lobbyists will not confront that reality they should stand aside for people who will. The occupants of those 85,000 “marginal” manufacturing work-places certainly demand that they do.

...The overvalued dollar is hurting. The squeals of pain from farmers, manufacturers and exporters at least represent a frank admission that the exchange rate is now doing real damage to our productive sector and that something needs to be done. There will always be macho voices who say that those who complain are wimps and that a high dollar should simply be a spur to greater efficiency. This is to ignore the great wealth of evidence which shows that overvaluation is not only just as damaging to our competitiveness as any other price increase but will, if sustained for any length of time, undermine the profitability and therefore investment capacity of even the most efficient firm... If interest rates and therefore exchange rates have to rise to counter inflation we necessarily inflict damage on the real economy by pricing our goods out of world markets... For our customers on the internationally traded goods sector, a price increase is a price increase. We can assure them that we are keeping our costs down until we are blue in the face but they will still go elsewhere if a rising exchange rate means that our prices rise faster than those of our competitors. That is why we have seen the recent rash of closures and moves to A[US], why our trade balance is in bad shape and why growth is slowing dramatically... The more trouble our economy is in, and the higher interest rates have to go, the better the return to the speculators and the higher the dollar will go... It is one thing to state the problem but quite another to decide what can be done about it. The P[M] tells us that it is the markets which decide what the dollar is worth. He is, of course, right, at least in the sense that any attempt to defy the market, or to intervene directly to push it in a particular direction, would be bound to fail... [At least we aren't the only country being hurt by the value of its currency. Yesterday] British Airways Plc said the strength of the pound is crimping its earnings, joining other leading British companies that have complained about the problems caused by the currency's strength... British Steel Plc said the pound – up almost 24[% since August 1996] against a trade-weighted basket of currencies – is eroding profit and undermining competitiveness.

...A fall in the value of the N[Z] dollar in key exchange rates is not a quick cure for the economic woes of farmers and exporters, warns a Napier financial consultant. [‘Unless you can get orders, a lower dollar doesn't mean very much.’ He also] said a recent OECD study showed N[Z] was now one of the least attractive places in which to practice agriculture... [T]he removal of all support for primary producers while other farming nations retained generous subsidies had simply strengthened the position of the country's international competitors.

...Exporters are being advised to quickly take advantage... and sell at least some of their overseas earnings at relatively favourable rates... following a[nother dive of]... more than 1c... in the value of the dollar... The kiwi was [now] worth a shade under US65c... its lowest level in two years... “We haven't seen this sort of level in the kiwi for a while and it might be a correction that doesn't last for too long,” [the] executive director of treasury advisers Bancorp said... Banks are watching the[currency] market closely... and are expected to pass on steep increases in wholesale interest rates to borrowers... That could spell the end of the golden weather for the housing market...

The golden Asian growth story is becoming tarnished because of a change in economic circumstances which will affect countries with a dependence on exports... China, Indonesia and the Philippines were cited, while Malaysia and Thailand were expected to suffer the most... Malaysia's total indebtedness is rising, it was about 96[%] of nominal GDP last year compared with Thailand's 120[%] in 1995... two factors that had fuelled Asian growth – low American interest rates and an appreciating U[S] dollar – were shifting into reverse. Weakness in the U[S] dollar between 1985 and 1995 forced Japanese investors to invest heavily in Asia... European and U[S] manufacturers also looked to Asia for salvation.

...Heroes, it seems, are ready-made for times of economic crises and national self-doubt. They are sought out eagerly; often in sports, other times for deeds which transcend the national circumstances. They rise quickly, often individuals from obscurity, with no ties to the power brokers who manipulate events safe from retribution. And that is how, for a few weeks[a]... struggling Bangkok taxi driver... became Thailand's hero, praised for returning \$US25,000... in cash to a foreign visitor who had left it in his taxi. His tale became a symbolic challenge to the shady political and business ethics of Thailand's troubled economic times... Bangkok City presented [the taxi driver] with a certificate of honorary citizenship; he received plaques and national awards as a “dutiful son” from the Social Welfare Commission. He made guest appearances on talk shows, was showered with cash rewards of more than \$US5570 and offered free hospital treatment and a new taxi. For a man who finished only the equivalent of primary school education, this was a dream. But the dream became a nightmare when the “hero” was sentenced to 18 months' jail and ordered to return the money to “damaged parties” he had deceived. The truth was there was never any lost money or a foreign visitor – only a poorly planned hoax that nearly duped a country... [which has seen] 17 coups or attempted coups, the last in 1991[since becoming] a constitutional monarchy 65 years ago... The King of Thailand[– who is]... claiming the world record for the number of honorary university degrees[(h)e has 136, surpassing the previous record of 131 accumulated by... [the] president of Notre Dame University in the U[S] –] ...aged 69... has fallen ill because of his country's political and economic crisis, according to his personal physician.

...An IMF-sponsored \$US17 billion... rescue package for Thailand appeared to be a shambles yesterday as the Finance Minister threatened to resign after key elements were reversed... [by] minor parties within the six-group coalition Government... However, the... Thai military has blocked moves by [the P]M... to enact a state of emergency... The volatile political climate... has sent the Thai bhat plunging on regional exchange markets... Political analysts say the situation will put further pressure on... [the P]M... to step aside. The P[M] is due to travel to N[Z] early next month.

...CURRENCY speculators have been blamed for much of Friday's dramatic fall in the value of the N[Z] dollar and corresponding rise in wholesale interest rates... A number of investment banks in the US had been calling for the N[Z] dollar to go lower, and many North American fund managers had been less confident about Asian economies and had been reducing their exposure there... “The Aussie and Kiwi dollars get a bit of a backlash from that.” The other factor forcing the N[Z] dollar down was that it tended to follow the A[US]n currency very closely and that had been under a lot of pressure... However... a fall in the N[Z] dollar was expected[, although the]... Bancorp Treasury Services executive director... believed the dollar would soon begin to settle again and picked the long trend was for it to go back up.

...[yesterday the] Thai... bhat... rose... to 39.00 to the U[S] dollar after... the resignation of... [Thailand's PM. His planned trip to NZ has, obviously, now been cancelled. By the way, t]he fall in the[NZ] exchange rate over the past month has given exporters the equivalent of a 5[%] price rise, and is good news for firms competing with imports too. But the flipside is... [that] the dollar's tumble has come at the wrong time of the year, during the off-season for agricultural exports... But a 65USc dollar, if it sticks, would be a lot better than the 69c average last season... The extent to which

that benefit is offset by higher interest rates would vary widely depending how much debt a farmer was carrying... Grief for the domestic economy will outweigh relief for exporters, at least in the short term, if the dollar and interest rates stabilise at present levels, economists say.

...Comments by the Minister of Finance... after the local foreign exchange market closed sparked a[nother] fall in the N[Z] dollar last night.

...The vulnerability of the N[Z] dollar to the whims of large international investors was again clearly evident yesterday as it plunged in early trading under heavy selling from New York. The selling took the kiwi... to a low of 64.75c... Foreign exchange dealers said the ferocity and weight of the early selling from New York had taken the local market by surprise. The reaction of the local market was largely to withdraw from trading until the selling died away when the U[S] market closed for the day... Some dealers thought there might be some good support for the kiwi around the 64.5c level, but others suggested the kiwi had turned the corner from a multi-year uptrend to a multi-year downtrend which would see it reach new lows... "There's very little support for the kiwi at these levels," said one Auckland dealer. "The next big level for the kiwi is 64.3USc, and if it drops below that it is dire straits." ...Foreign exchange dealers said the currency was being sold by big American fund managers with billions of dollars under their control. "These are the guys who have stuffed several Asian currencies in recent weeks," said one dealer. Further depreciation of Asian currencies is expected[, which]... will dent economic growth across the world, but[it will] hit Japan twice as hard as the U[S] or Europe, OECD officials say.

...The kiwi came under attack again yesterday in what dealers said was U[S] hedge funds selling as well as financial markets continuing a cat-and-mouse game to induce the Reserve Bank to further ease monetary conditions. A bashing of the A[US]n dollar by offshore investors disenchanted with that country's monetary easing also added to the kiwi's volatility, dealers said... The A[US]n dollar fell almost half a cent to 72.77USc... The kiwi... lost nearly one per cent of its value overnight, to trade at 63.57USc late yesterday... its lowest level since March 1995, with no quick bottom seen ahead... "It [the kiwi] still looks pretty weak although it has come down quite substantially," one dealer said... [T]here were sellers at higher levels, giving the kiwi little chance of a sustained rebound. One market participant took a more sinister view, saying the current weakness of the kiwi could be a case of "the big boys" pressuring it to get their clients into N[Z] assets at a low entry level... [The] executive director of Bancorp Treasury Services, said... demand for N[Z]-dollar assets was healthy despite the doom-and-gloom surrounding the economy... Bancorp is forecasting the kiwi to return to the 68-69USc territory within three to six months. [However, a] US investment house... predicted 62c for the kiwi.

...The rapid globalisation of financial markets is vividly illustrated in the estimate that \$1.3 trillion is traded across international markets each day. This is equivalent to 100 times the value of world trade. Such a vast pool lubricates the laundering of money, especially from the drug trade, which with a \$500 billion annual turnover, thrives in today's deregulated environment.

...[the] record fine imposed on a man who set up a pyramid-selling scheme should serve as a warning to people against getting involved, says the Commerce Commission. A[n A]uckland... was convicted in the Henderson District Court on Wednesday of breaching the Fair Trading Act by operating a scheme called Black Magic. He was fined \$15,000 and ordered to pay \$2,000 in costs... [Incidentally, b]oth the N[Z and AUS]n dollars dived in value yesterday as... fallout from [a]Korean currency crisis spread... A[US] had been more strongly affected because Korea was A[US]'s second largest trading partner, but only N[Z]'s fifth largest, dealers said.

...South Korea will tonight unveil a long-awaited package to stabilise its fragile financial system. The package follows the sacking of the finance minister and another maximum permitted daily fall of 2.25[%] in the value of the won, to 1035.5 to the \$US. [The new] finance minister... said the government will consider seeking aid from the IMF "if necessary".

...South Korea said yesterday it would seek regional co-operation to resolve its financial crisis rather than go to the... IMF... for emergency help... On Wednesday, the Finance Minister unveiled a package of measures that included opening the country's \$US200 billion... bond market wider to foreign investment and buying 10 trillion won of bad debt from financial institutions this year. South Korea's total foreign debt is \$US110 billion... as of last March, more than two-thirds of it due in a year or less.

...South Korea is set to turn to the [IMF] for the first time, seeking... \$[NZ]32.5 billion... to contain a financial crisis that threatens to cripple the world's 11th-largest economy... The size of Korea's economy - slightly bigger than Spain's - guarantees that a full-scale collapse would reverberate around the globe. Foreign banks alone have \$200 billion of investments or loans there, bankers said... Over time, Korea may need as much as \$100 billion, a bailout that would rank among the largest since... W[W2]. The most recent bailout of a comparable size was the '\$80 billion'... extended to Mexico in 1995... Meanwhile[, a]... proposal to create a special bailout fund of up to \$100b for Asia was rejected at meetings among 15[Asian] countries in Manila... But they backed the idea of co-operative financing arrangements that could supplement the IMF.

...YOUR sharemarket is nosediving, your currency is sinking fast and investors are bailing out of your country. Who you gonna call? The [IMF, that's who. The]... IMF... is like a global credit union. It was created at the end of W[W]II as part of the U[N] system. It's job is to promote international financial co-operation and trade, and to bring order to unstable economies. It has 181 member nations... Each pays a quota based on its relative economic size into the common fund... The IMF has about \$US190b... in total reserves... Loans typically are repaid in one, three or five years. Loans are never written off as lost... [and no] nation has ever defaulted on an IMF loan. To do so would ruin its credit in the global economy, repelling investors.

...South Korea's troubles deepened... this week... as the won weakened further and... more companies collapsed... But... [a] last-minute dispute... [with the IMF] over how and when troubled financial institutions should be liquidated has delayed a formal announcement on a \$US20 billion rescue package...

South Korea's financial crisis deepened yesterday as the government closed more merchant banks and the country's battered markets dismissed government stabilisation measures. For average Koreans, especially those with money in the closed... banks, the bitterly cold day was filled with despair. One woman standing outside a... merchant bank in... Seoul that was ringed by riot police said to anyone who would listen: "Why won't they give me my money. It's all I have." It was unclear when she would be able to withdraw her money, although the government has guaranteed all deposits with financial institutions... Meanwhile... members of a leftist group rallied... downtown... [to] demand... the government renegotiate the IMF rescue package... [which means] South Korea will have to open its financial markets and allow mergers and acquisitions by foreigners.

...The South Korean President... has urged Koreans to "share the pain" of... the country's bankrupt financial and industrial companies[, which surely means]... decades of almost total job security... is about to end... [In an] apologetic... nationally televised address, [he] said the price of the... IMF... rescue... would be slow growth, higher unemployment and smaller pay increases... Seven of the nation's top 40 conglomerates are either bankrupt or unable to pay their debts, and a record 15,000 companies have filed for bankruptcy protection.

...South Korea will elect a new president on Thursday... With so much pain and helplessness ahead, perhaps it is not surprising that the campaign dwelled so little on the economy. None of the candidates wanted to admit that if elected he would raise taxes, cut spending programmes and sack workers. The governing party's candidate... spent a good deal of the campaign trying to prove that his sons had not evaded military service by dishonestly saying they were underweight for their height. One of his sons was even summoned to Seoul from his studies at Harvard to have his height measured publicly and show his father was not lying about it. That same day, the won currency nose-dived to a record low, interest rates soared to a 16-year high and another five insolvent merchant banks were closed... This election is viewed as a milestone in the development of South Korea's democracy, analysts say. The last election in 1992 was the first to elect a civilian president in more than four decades... The [incumbent]P[re]sident... is barred by the constitution from running again.

...The first full week of [the new president's] transition to power... will start dramatically today with... an amnesty for[two] former presidents... and 23 of their associates jailed in connection with a corruption scandal, a 1979 coup and an Army massacre a year later... Analysts said the move would please conservatives and help unite disparate political groups at a critical time. Families of the victims of the 1980 massacre in the southwestern city of Kwangju had agreed to accept the Government's decision to free the former presidents[who]... were convicted of mutiny, treason and corruption in August 1996. In April, the Supreme Court upheld an appeals court decision to commute [the] death sentence to life in jail [for one of the men and cut the other's] 22 1/2-year sentence to 17 years. They were also found guilty of taking bribes worth hundreds of millions of dollars while in office... [In related news,] Indonesia's financial woes have intensified despite a huge aid package from the [IMF] five weeks ago, but analysts say much of the troubles are beyond the Government's control. In the past week, the rupiah currency slipped past the 4000 to the U[S] dollar barrier for the first time, representing a fall of about 40[%] since the middle of the year.

...Indonesia's rupiah crashed past 4500 to the US dollar when rumours that[its] President... was ill created panic buying of the U[S] currency.

...*Indonesian rupiah goes into free fall*... The rupiah fell as low as 5555 to the US dollar... its lowest since the current account was liberalised in 1971. Indonesian officials have estimated that for every 100-point drop in the rupiah, the country's debt burden swells by \$US500 million... [Elsewhere in Asia, Thailand's] monarch... marked his 70th birthday by calling for economic self-sufficiency, amid the country's most severe downturn during his 51-year reign. In his birthday message, broadcast nationally on radio, [the]King... said the nation needed to remain united during the crisis, and be prepared to "step back" in development... [His] speech comes as up to 58 suspended finance companies face permanent closures... Unemployment is set to escalate by the end of the year with forecasts of about 3 million people losing their jobs... Members of Thailand's ruling coalition have agreed to a 20% cut in their parliamentary pay to help the country beat its economic slump...

[Yesterday,] South Korea, Thailand and Indonesia had their credit-ratings cut to "junk" status by... [a US] credit-rating company... as plummeting Asian markets erode their ability to repay debt.

...All but two of the 58 finance companies suspended by Thailand to win IMF approval for a rescue package will close[throwing]... 6000 out of work on top of the 20,000 who have already lost their jobs as a result...

The [IMF] has defended its handling of Asia's financial crisis, arguing that there is no easy way out for debt-laden economies... The IMF[also] said it would ask member states to cough up extra cash as Asia's worsening financial problems drain its resources. A... bailout for Indonesia... [has risen to \$US]40 billion...

The... IMF first deputy managing director... said the IMF would still have \$(NZ)73.3b of usable, uncommitted resources after paying out its \$35b share of the... \$95.84 billion bailout for troubled South Korea... [but] new crises could force the fund itself to beg for cash...

The U[S] must do what it can to help Asia through its economic crisis, [the US]President... said as he urged Congress to bolster funding for the IMF... However, US lawmakers said [the President] faced a struggle to win support.

...The president of the Korean Society of N[Z]... said local Koreans had given more than \$2 million... to save their homeland... The money was contributed during a two-week campaign... organised by the society and the Kook Min Bank in Auckland[which]... dropped its \$25 transaction fee charged to customers wanting to send money home... The society has about 17,000 members nationally, with about 15,000 living in Auckland.

...[an honest, hardworking woman, intent on building a new life, faces a deep sense of embarrassment when told by suppliers that, from now on, payment will be "cash only." No credit. No warning. No discussion. That she was a Korean-NZer in Auckland rather than a citizen of Seoul does not matter. She is Korean and a credit risk. Headlines about the economic crisis in Korea can seem remote but, in little and large ways, Korean-NZers all feel the ripples of the economic meltdown in their home country. Koreans have even coined a term for the situation – they refer to it as "the IMF season." I don't know what is more scary; the fact that an Asian powerhouse can be humbled so quickly or that people already have a name for the tragedy. Those here know it's worse in Seoul. At the airport staunch nationalists protest and hiss at those embarking for overseas destinations. On the once-busy roads of the metropolis there is a sense of quiet. People in Korea are not driving their cars. Once this nation bought more new vehicles than the US. But petrol prices have doubled, then tripled. People are taking pay cuts and redundancies. Fear is in the air. However, any misfortune can be seen by others as an opportunity. Foreigners and expatriate Koreans alike are taking advantage of exchange rates to buy up container loads of products at dumping prices to turn quick profits overseas. The local markets are bare because these sharks have already worked their way through. Perhaps some financial pundits did predict the economic crisis. Perhaps Koreans borrowed too much, expanded too quickly and after years of hardship and frugality came to love expensive imported products too much. Korea, it seems, became a nation that forgot its history of hardship and struggle for identity.' ●] The IMF executive board has adopted a new short-term loan programme that will rush funds to countries facing immediate debt repayment problems or low foreign currency reserves. The new mechanism could be used to speed delivery of a second payment to South Korea worth \$US3.6 billion... The... country... [has an] estimated \$US171 billion in foreign debt... [However, the IMF announcement failed to prevent the won falling 12.5%] to 1961 against the U[S] dollar... its biggest one-day decline...

[NZ] is pitching \$60 million of taxpayers' money into an international financial rescue package for South Korea as fallout from Asia's economic crisis begins to pound the local economy. Top-level conference calls in the early hours of [yesterday between]... the ministers holding the Treasury, Finance and Foreign Affairs portfolios[and]... officials both in Wellington and the U[S, sealed NZ's]... involvement... It is understood N[Z] will dip into its financial reserves or raise a loan of its own to fund its contribution[which]... is greater than the total the Government spends each year on promoting exports globally through Tradenz... The risk for N[Z] is that the Koreans will not be able to pay it back... However, it emerged yesterday that there had been approval in principle to pay three times that amount... [The o]fficials and ministers agreed that it was in N[Z]'s interest to be involved... Exports to Korea rocketed from \$672 million in 1990 to more than \$1 billion in 1996, and thousands of tourists... arrive weekly.

...“Over here please, this way please, over here!” On a chilly grey afternoon at Seoul's Kimpo airport, a flight from Tokyo has just landed, and the clerk at the Korean Exchange Bank is leaning over her counter, hustling for foreign currency in Japanese, Korean and English. It's an undignified scene that would have been unthinkable a few weeks ago in... a country that was proud of its rapid rise through the ranks to become the world's 11th largest economy. But the paper signs taped over the electronic rate boards with the latest low prices for the won currency said it all... Last week, the won fell against the U[S] dollar by its maximum daily limit of 10[%] on four consecutive days and hit... a record low...

The... Malaysian... ringgit, down 20[%] in three months, hit an all-time low of about 33USc... yesterday...

[‘You Can Profit From a Monetary Crisis’] Fancy a flutter... on the foreign exchange markets? It's simple. Try it next time you go on holiday to, say, Malaysia... You don't even need hard cash – a credit card will do nicely. If you believe our currency will strengthen against Malaysia's, pile all your overseas purchases on your credit card. If you're right, then you'll need fewer dollars to pay them off when you get home. The gains are tiny... But you have played the forex game without incurring the wrath of Malaysia's P[M, who]... argues, the US\$1260 billion of daily global foreign exchange trades far exceeds the value of real cross-border flows of goods, services and investments. Thus the weight of speculative money is dictating exchange rates. That's naive... And when speculators get it wrong, it costs them. For everybody who makes a buck, somebody loses a buck. Ask the Malaysian central bank. It bet the wrong way in the 1992 UK currency crisis and lost heavily.

...The war of words... [between Malaysia's PM and a] US financier... over the plunging value of some South-East Asian currencies hit a new level at the weekend... “The poor people in these countries will suffer, and these are the people that have to be protected from [the financier (r:p298, ln1)], who has so much money and power but is totally thoughtless. We have worked 20 to 40 years to develop our countries to this level, and along comes

the man with a few billion US dollars, and within a period of two weeks he has undone almost [all] the work we have done.” ...The selling was originally prompted by economic problems in Thailand. But responsibility for the declines is hard to pinpoint because local banks as well as outsiders have been involved in the selling... [However, the PM also said the financier] was using his financial might to... keep... the Association of South-East Asian Nations (Asean)... from admitting Burma as a member because of its human rights record... [The financier] has denied that his Open Society Foundation, which promotes democracy in Burma, has any connection with or influence on his financial dealings... [O]nce dubbed “the man who broke the Bank of England”, [he] has earned a fortune from speculative currency plays in the past... [He gained] his... title... after he gambled about \$US10 billion... that Britain would be forced to devalue the pound. Faced with a wave of speculators selling the currency, the bank gave in. [The financier] walked away with an estimated \$US1 billion. That same year, when more of Europe’s currencies were battered in a trading frenzy, European officials muttered darkly about speculators... Overwhelmed by speculators’ money, European governments were forced to weaken the links binding their currencies – a blow to dreams of a unified European currency... Speculators have never had a good press. Almost 30 years ago, British politicians found it convenient to blame the “gnomes of Zurich” for a big devaluation of sterling. Nowadays London itself has become the world’s biggest foreign-exchange market...

[The billionaire US financier] wants to meet the Malaysian [P]M... to discuss [the PM’s claims that he] was responsible for recent attacks on Southeast Asian currencies... [He] said it had been malicious of [the PM] to liken him to a drug dealer, but he did not intend to take that issue up with the [PM]. “I don’t need another enemy...” ...[he] said that except for selling about \$US10 million... of Thai bhat, his group has not sold any Southeast Asian currencies in the past two months... Meanwhile, in London, over the weekend it was revealed that... one of [the financier’s] leading fund managers, has been awarded a pay rise of more than £500,000... a week. [The employee], who manages the £1.8 billion Quota investment fund for [the financier], would collect £80 million a year, after the rise.

...These days... [the] billionaire financier... has been winning headlines for giving away money, not making it. His \$350 million in gifts last year made him America’s leading philanthropist. And he has been stirring controversy by directing his dollars to an array of hot-button political causes tied to his personal ideal of... free-market capitalism... [T]he Jewish, Hungarian-born... 66[-year-old]... who has lived under both Nazis and communists... backed the dissidents of Czechoslovakia’s Charter 77 and Poland’s Solidarity, helping topple totalitarian regimes in those countries... His Open Society Fund... has spent hundreds of millions of dollars more trying to nourish democratic practices and the rule of law throughout the former Soviet bloc.

...[the US] billionaire... has plunged \$US2 billion... into Russia on the strength of the Kremlin’s pro-market liberals. In a speech marking the 10th anniversary of his philanthropic Open Society[he said: “I sense] that the Government [is] determined to move beyond the phase of robber capitalism and establish legitimacy;”... [Incidentally, t]he world’s richest man, intervened in Asian currency markets last week to support the Malaysian and Singaporean currencies. Both recovered from historic lows after the move and held up in later New York trading. The cost to... [t]he Sultan of Brunei... was estimated by market dealers as hundreds of millions of US dollars, with \$US300 million being spent in support of the Singapore dollar alone.

...[the president of the] World Bank... says the crisis in South-east Asia’s financial markets has been largely contained... by the... IMF... rescue packages... and is unlikely to spread outside the region.

...The kiwi dollar crashed... yesterday to... 62.85USc... following... reports on the possible effects of the Asian currency crisis on A[US]... Foreign exchange dealers said the situation would have been worse but for some very heavy buying by local exporters during the afternoon session. “They really got stuck in,” said one dealer “and why not, it’s the lowest its been for some time.”

...yesterday... [the NZ] dollar fell... to a three-year low of 62.16USc... [following the AUS]n dollar’s dramatic decline to 68.95USc... But[the] Macquarie Bank... said... A[US]’s... dollar had been driven down by sentiment rather than fundamentals and was now oversold.

...[as the kiwi dollar falls, NZ bonds are faring worst among major bond markets. In US dollar terms, NZ bonds maturing in 10 years or less have tumbled 13% (British bonds have turned in the best performance, gaining 17% in US dollar terms’).

...last night US] bonds fell in Asia... after a senior Japanese Government official said it was possible Japan could sell the securities to raise cash for Japanese banks... [and] promised to act to prevent the yen from falling too far... “If necessary, we will not hesitate to intervene in the market in a way which would be surprising to the market.”

...The A[US]n dollar sank to a four-year low as distressed Japanese institutions dumped assets and headed home... The latest lunge took the A[US]n dollar to 68.00c against the U[S] dollar... The N[Z] dollar strengthened half a cent to 90.57Ac.

...The N[Z] dollar was dragged to its lowest level against the US dollar in more than three years yesterday by an A[US]n dollar weakened by a higher than expected current account deficit. The kiwi ended at 61.09USc... The A[US]n dollar finished... at 67.78USc... The kiwi cross rate[also] weakened to 90.18Ac... Dealers said the kiwi’s fall reflected a lack of buying rather than any concerted selling pressure.

...The N[Z] dollar was devalued by 2.8[%] against the U[S] dollar yesterday following the Reserve Bank’s policy statement. The kiwi ended the day at 57.43USc... Foreign exchange dealers said that [there] appeared to be... [no] hope for any recovery... “There is no one to buy it any more... There is no indication that this is the bottom.” ...In a commentary... a chartist with ANZ Bank, said he expected... the kiwi to resume its multi-year decline to all-time lows of below 42.5c. [Editor’s note: NZers generally expect their \$ to be worth about half a \$US (50USc) – although few, if any, understand why this is normally the case. What appears to be an unfair economic situation (for NZers) is confirmed by comparing the average wages of both countries. During ‘1994, the Average Earnings of Year-Round, Full-Time Workers (for persons 25 years and over) in the US was \$41,118 for males and \$27,162 for females’ – which, excluding the probable variance in numbers of male and female workers, gives an average wage of over \$US34,000 (the ‘median household income in 1994 was \$US32,264’). NZ’s average gross income during 1997 was \$411 for people over the age of 15 per week, which equals \$NZ31,372 per annum (alternatively, the figure is \$702 a week before tax – or \$NZ36,504 per annum). Therefore, it is possible to assume that two workers – one living in the US and one in NZ – could have the same qualifications, perform the same tasks and both earn the same annual wage of \$40,000. Now, suppose these two workers save up to go for a holiday in the other’s country and, after purchasing their airline tickets, each has \$10,000 to spend. The USer flies to NZ, where its holiday budget turns into \$NZ20,000, while the NZer flies to the US, where its holiday budget is worth \$US5,000!

...‘World Bank figures for 212 countries show that our average income per person has slipped from third in 1960, after the US and Switzerland, to 9th in 1994, 18th two years ago and 22nd today. At current exchange rates, AUS’s income per person is now 50% higher than ours; the US figure is 128% higher.’]

...A sharp fall in the kiwi dollar will be hard felt in the pockets of N[Z]ers heading across the globe... Now the exchange... [with the US] is close to two for one and it takes almost \$3 to buy £1... At the beginning if the year the kiwi bought... 42.15p... [In related news, p]reviously-secret details of [Britain’s] foreign exchange reserves would soon be released... [the] Chancellor of the Exchequer... said yesterday.

...Britain’s Chancellor of the Exchequer... is on the verge of ruling out British membership of Europe’s single currency during the current five-year parliament, the *Times* newspaper reports. However, [the chancellor] did not make a specific pledge.

...It is increasingly accepted in Europe that eight to 11 countries will join to create a common currency, dubbed the euro, at the beginning of 1999... Europeans admit that the creation of the euro, which will not replace national currencies in daily life until 2002, is still an experiment. But... U[S] policy-makers must now ask seriously what impact this new money will have on the... dollar – the medium of exchange for half of all international trade transactions today.

...Europe's [GDP] last year, \$8.6 trillion, overshadows America's \$7.6 trillion. Europeans today do not think or talk about creating a U.S. of Europe, a federal superstate, but they are getting ready to take control of monetary policy and interest rates from their sovereign nations and turn it over to a European Central Bank... This is very much a revolution from above, while ordinary citizens are increasingly rebellious. For the moment they are more resentful of the price of the monetary union – budget cutting and unemployment – than of its audacious surrender of national power.

...European corporations stand to suffer a heavy blow to their bottom lines as a result of the costs associated with a single currency, a new survey by KPMG Management Consulting said on Monday... The results of the survey, which covered 302 corporations across Europe with more than 5000 employees, showed a total bill of \$US50 billion... for conversion to the euro, with the average cost per company of about \$30 million. While 77[%] of respondents believe economic and monetary union... will have a positive long-term effect on profitability, KPMG... said there appeared to be a lack of awareness of the shorter-term implications.

...EU leaders ending a two-day summit in Luxembourg... agreed to open the 15-nation bloc's doors to six new members early next century, while reassuring five other ex-Soviet satellites that they, too, could begin the long road to EU membership, though at a slower pace... Turkey, excluded from that group and at best a long-odds bet for EU membership, was, however, invited to join the candidates and current members at a ceremony in Britain next spring to launch the enlargement process... Once complete, the expanded union will form a single market stretching from the Atlantic to the Black Sea with nearly 500 million consumers and no duties, quotas or restrictions to hinder the flow of trade.

...[the Turkish P]M... predicted yesterday that Cyprus would end up split for good unless the E[U] reversed its latest snub of Turkey's decade-old bid for membership... [He accused the] Chancellor... of Germany of secretly trying to turn the European bloc into a "Christian Club" that would unfairly bar predominantly Islamic Turkey... "Of course, the German Government will deny it," [he said. The]... German Foreign Minister... says Turkey has no one to blame but itself... The EU cited Turkey's human rights record, the presence of its troops on Cyprus and its sour relations with Greece, an EU member, as obstacles to inclusion.

...A key architect of closer transtasman trade is urging N[Z] to join forces with A[US] to create a single currency and a European-style common market across both countries... In an A[US]n article to mark next year's 15-year commemoration of the... closer economic relations (CER)... agreement[, the]... former Minister of Trade and Industry... claims the move is essential for the economic survival of both countries... The idea has received a luke-warm response from the[NZ] Minister for International Trade... who said last night that it was more theoretical than practical for transtasman business... [A] shared currency, which would require a single central bank for both countries, was "a long way off yet."

...[NZ] 'manufacturers say the diplomatic efforts required to create a single currency with AUS would not be worth the trouble, even though a larger economy would be good in principle. They took the view that one currency would work but only if AUS brought its economic policy more in line with NZ's and allowed our Reserve Bank to manage monetary policy. The secretary of the Council of Trade Unions said yesterday that the Government's approach of "open slather on the NZ economy" was in stark contrast to the AUSn's policy of protecting and assisting theirs – a policy which is unsustainable, according to the chief executive of the NZ Manufacturers Federation.' However, 'the executive director of the AUS-NZ Business Council said: "NZ would obviously have to run a monetary policy in line with that of AUS."'

... 'top-level Government officials have been given the nod to discuss setting up a single Anzac currency. The taskforce is being led by the head of the PM's Department and Cabinet and his AUSn counterpart. The NZ PM cautiously confirmed yesterday that the taskforce, announced when the AUSn PM visited last month, was looking beyond the CER issues then outlined. The NZ PM was at pains to emphasise the issue was at exploratory stages only. But as dim as the green light for discussion might seem, Anzac-dollar proponents are delighted. It signals an acceptance at the highest level that a single currency can be raised more seriously in future. And with 70% of our banking assets AUSn controlled, that sector could be expected to be enthusiastic. Merging the currencies – or what some say would be more an AUSn takeover of the NZ currency – would take two to three years, says the director of the Massey University's Centre for Banking Studies, a lot shorter than the eight years it will have taken to introduce the euro. However, he added that pundits predict as few as three world currency blocs within 20 years, and perhaps NZ might be better off linking with larger blocs in Asia or the US.'

... 'From 1 January 2002, the euro will replace the national currencies of 12 EU countries. There will be 7 euro banknotes: 5, 10, 20, 50, 100, 200 and 500 that will be uniform throughout the euro zone. There will also be 8 coins – 1 Cent, 2 Cent, 5 Cent, 10 Cent, 20 Cent, 50 Cent and 1 and 2 euro. While each coin will feature a common face, the reverse will be decorated differently to represent each Member State.' The coins will 'contain high levels of nickel. EU officials agreed to include the metal despite warnings that allergy to nickel affects up to one in 7 people, particularly women. The British Journal of Dermatology warned that the coins could cause eczema among 45 million people. Bank tellers and shop assistants will be advised to wear gloves for work.'

... 'The "Maori Government of Aotearoa", which has profited by selling its own passports and driving licences to immigrants, is preparing to print its own money. The money will be called putea, meaning fund, but the Aotearoa "prime minister" is not prepared to place a value on it before it is introduced. She hopes it will be accepted internationally by other indigenous peoples. Section 29 of the Reserve Bank Act bans anyone other than the bank from making or issuing bank notes or coins, and imposes a \$300,000 fine for organisations and a \$100,000 fine or three-year jail sentence for individuals.' By the way, last year the Reserve Bank issued '2 million new \$5; 1.7 million \$10; 1.15 million \$20; and 20,000 \$100 notes.' The only other note in circulation is the \$50.]

...The Reserve Bank is considering removing the 5c coin from circulation and replacing the \$5 note with a coin within the next three years... Reasons for abandoning the 5c coin were partly financial. At present a 5c coin cost the bank 3.5-4c to mint. "There's not much in it. If it was costing us more than the face value to mint, then you have a loss to the taxpayer,"... said... [the] currency department manager... "You'd have to think very seriously [about dropping the coin] at that point." Swapping the \$5 note for a coin would also save money. A coin, though more expensive to mint, lasts 20 years. The average life of a note is only 15 months. The \$5 note, in particular, is given rough treatment by consumers. Half of all \$5 notes returned to the Reserve Bank are shredded and replaced... [However, 'in a move to increase durability and beat counterfeiters, the bank is switching to new polymer plastic material notes – the first of which will go into circulation on May 3, 1999 (AUS introduced polymer notes in 1992). At 9c a note, the new Melbourne-made bills cost about twice as much as the paper variety – but last about four times longer. "We would ask people not to put staples in them, but they are pretty indestructible."'] As well, the bank's currency department is looking at trimming the size of 20c and 50c coins, matching overseas trends towards smaller coins and saving minting costs... and a desire for the coins to be more user-friendly... Changes to the currency are usually controversial... In 1990 the bank phased out 1c and 2c coins, and a year later introduced \$1 and \$2 coins... New banknotes introduced in 1992-93 were the first without the Queen's face on each note['next month the Reserve Bank will follow its AUSn counterpart and begin minting coins with the Queen's new dour, double-chinned effigy – her third makeover since she first appeared on our coins in 1953; the other makeovers were in 1967 and 1986']... Any move to axe the 5c coin is likely [to] be opposed by retailers who would be forced to round the price of low-cost items to the nearest 10c. It would also come under scrutiny within, by the Reserve Bank itself, because of the possibility of rising inflation.

...The trouble with small change is that it keeps getting smaller. The public's opinion of the 5c coin has dropped to such a level that it is failing the Reserve Bank's unofficial test: If you saw one on the street would you pick it up? Apparently not. Why would one anyway, when the bank estimates that on average we already have 120 each?

...The Reserve Bank is expected to call today for public feedback on scrapping the... 5c coin... The coins are lost or hoarded in piggy banks, forcing the Reserve Bank to mint an extra 15 million to 20 million a year... The bank has also looked at... the 20c and 50c coins[, although a]... problem will be to find a size and shape unique to N[Z], to prevent people using overseas currency to feed poker and dispensing machines. To overcome this, the shape of the coins may be varied to five, nine or eleven sides. Even-sided coins will not roll easily down slot machines... Another

[consideration is]... varying the metal used in the coins – or putting a hole through the centre. Royalists, however, might object to a hole being drilled in the Queen's head... If the changes are confirmed, the 5c piece could be withdrawn in the middle of next year. The new 50c piece would be introduced at the same time and the new 20c a year later. The estimated cost of minting the new coins is \$9 million, but the bank would gain roughly that by selling the withdrawn 5c, 20c and 50c coins for scrap... After a year or so, the old coins would no longer have to be accepted by retailers, but would still be redeemable at the Reserve Bank... [P]eople still bring in buckets of 1c and 2c pieces. And while the changeover will have some effect on older parking meters and slot machines, most appear to have already moved to modern models which take \$2 coins. The... \$2 set-up... allows punters to build up credits for the 10c, 20c and 50c games... The Auckland City Council said most of its parking meters are now electronic – which weigh the coins – rather than the old slot type. Reprogramming of the weight mechanism would be required...

Proposals to axe the 5c coin have sparked fears of across-the-board price increases – especially when it comes to children's lollies... [However, the] manager of the Reserve Bank's currency department... said... some large retailers had told the bank they would put all prices down. As for lollies, he said at one corner dairy only one piece of confectionery cost 5c – the rest were more expensive. The bank... was consulting the Foundation for the Blind about whether blind people would be able to recognise the 20c and 50c coins, which would be indented. [The manager] said there had been few negative comments about the changes to the larger coins. A 25c coin had been suggested. Some people had even called for a return to pounds and pence. - 1997

A security man swung open the massive doors of the Queen St branch of the Auckland Savings Bank yesterday and a four-year-old girl, weighed down on one side by a bulging piggy-bank, marched in to open the bank's first decimal currency account... The bank, of course, was officially closed, but its staff is always ready to welcome a new account. Besides, they were dying to show off their new decimal currency hostesses, an attractive band of 80 girls dressed in silver, whose job is to help the public with the changeover. Dressed all in red, with a new red ribbon in her hair, [the girl] climbed on a chair, poured out her savings to be counted, changed to decimal currency and the amount entered in a brand-new pass book... [H]er savings totalled £2 6s 6d, or \$4.65c. There was 4d left over, so because 6d (5c) is the least the bank can take, [she] was given a new elephant [piggy]-bank to put it in. Meanwhile, bank staff were completing the job of changing over 500,000 accounts... after what has been the busiest banking week in N[Z] history. Incidentally, 2)... masked men held up the Oratia postmistress and her 13-year-old son at rifle-point last night and made off with... £100... Half the money stolen was in decimal currency – the first armed robbery in N[Z] involving dollars and cents... - 1967

When NZ changed from using *pounds and pence* as a currency in 1967, the £NZ was almost equal in value to the £UK (the difference was 'exactly 1p' – in '1933, £UK1 equalled £NZ1.25', but the 'NZ pound had been restored to parity with the British sterling in 1945'). At the same time, both £NZ1 and £UK1 were considered equal to approximately \$US2.80. £NZ1 effectively became \$NZ2, which would, therefore, have made \$NZ1 approximately equal to \$US1.40. One of the first things the NZ Government did was to devalue the \$NZ 'by 19.45%'. NZers can still take £NZ1 to banks and receive \$NZ2 in return, which makes the conversion easy for banks but rips off the customer – because \$NZ2(1967) doesn't equal \$NZ2(1997)!

For two decades... [a] sheep-farmer from Turangi... collected trading banknotes, dating back to a £1 bill signed by [the]Governor... in 1844, with the ambition of accumulating the finest collection of N[Z] banknotes ever. According to Melbourne auctioneers... he succeeded. They describe his collection as "without doubt the best to ever come on the market." And when they put up his collection for auction... they expect it to sell for more than \$A200,000... It follows the years when the Spanish gold doubloon was the only trustworthy foreign coin in the colony, the run of trading banknotes until the Reserve Bank took over all note printing in 1934, and the change to decimal currency... N[Z] coins include a... 1933 shilling – one of only two in private hands, worth an estimated \$22,600.

...The Department of Internal Affairs has intervened to prevent the auction of four extremely rare N[Z] trading banknotes worth about \$NZ20,000 in total. They are part of a 140-note collection of N[Z] notes which... are due for auction in Melbourne tomorrow night. But after publicity about the auction, Internal Affairs told [the seller] four of the notes must be withdrawn because they were "antiquities." Under the Antiquities Act, it is illegal to take out of N[Z] any chattel more than 60 years old without a permit. [The seller] said he was unaware he needed a permit. "Nobody here wanted to buy them..." He said he had offered the collection to the Reserve Bank.

...A record price of \$A17,000... was paid for a N[Z] banknote auctioned in Melbourne on Wednesday. The £100 note was issued in 1928... [In related news, a] lucky pensioner has hit a gold mine after discovering hundreds of Saxon coins in a country field... during a metal detecting session... Each coin is worth anything from £100... to £2000 and the discovery could net... [the] retired train driver... close to £750,000.

...A large collection of ancient coins has been discovered in a bank vault where it rested unclaimed for 40 years, officials confirmed yesterday. Although the state-controlled Ionian Bank refused to comment on the collection's value, Greek media placed it as high as 150 billion drachmas (\$[NZ]785 million)... Under Greek law, the contents of bank vaults can be appropriated by the state 40 years after the depositor stops paying the storage fees... Greek police have[also] seized 54 pieces of priceless gold jewellery dating back as far as 5000 BC and arrested two people for allegedly trying to sell them for \$US3.6 million... - 1997

Money is an easily manipulated means of exchange, hastens the transfer of goods and services in national or international commerce, and serves as the basis of a nation's fiscal system and as a unit and measure for rates of exchange. It functions also as a convenient instrument for temporarily storing material value... Through the ages different kinds of commodities (shells, furs, tobacco, etc.) have been employed as money, replacing the primitive mode of exchange – barter... Coins were developed... – probably first by the Lydians, 8th cent. B.C. – to replace barter... Coins struck from precious metal became the most widely accepted medium, since such qualities as uniformity, portability, relative great value despite small size, durability, divisibility, recognizability, stability, and the fact that their bullion value may correspond to their money value make coins the most satisfactory type of standard money yet devised. For many centuries silver coins were the chief form of metallic money. Gold coins were minted but to no great extent until the 19th cent. when they became the generally accepted standard of value. These coins were given a value equal to the value of their actual metal content. Coins that lacked this intrinsic value (e.g. silver, nickel, and copper coins) were only token coins; their value depended on the solvency of the country that issued them. In 1914 gold and silver coinage became inadequate to meet the needs of a world at war, and European governments issued paper money on an enormous scale. The result was that gold coins fell more and more out of use. This large increase in paper notes led to an almost universal adoption of noncommodity money, whose physical value does not correspond to the money value.

Inflation-hit Turkey will introduce its biggest-ever banknote, worth five million lire (\$NZ66.77) today to reduce printing, transport and accountancy costs. With inflation running at more than 80[%] Turks have had to carry brick-like stacks of notes to do business.

...If imitation is the highest form of flattery, the counterfeiters of Brazil have paid the country's financial reformers a big compliment. During August, sacks of poor copies of the Real coin were passed over counters in the country's rich central-south region. The scale of the operation was not big but its symbolism was. During the country's "lost decade" of the 1980s when hyperinflation destroyed the cureizo currency, forgers could not keep up even if they wanted to. New note issues – with a few more zeroes – were frequent as the giant of Latin America was ravaged by inflation sometimes topping 100[%] a month. Savings were wiped out in days for those unable to make a profit out of inflation. Banks indulged in

wild speculation as the financial sector boomed while millions living in or near poverty would rush to exchange what little money they received for something they could eat before its value was wiped out... [T]he Real Plan is based on a new unit of currency which, within a tight band, trades on par with the U[S] dollar... And inflation has plunged... to an estimated 14[%]. In local news, detectives]... seized about \$200,000 in counterfeit \$100 notes in South Auckland yesterday but say there could be thousands more in circulation. - 1996

Auckland police believe a printing press was used to produce counterfeit \$100 and \$20 notes plaguing shopkeepers around the North Island. The fake bills, which have no watermark when held up to the light, were initially thought to have been made by a photocopier or laser printer... [M]ost of the dud money carried the same serial numbers... Some notes had even been accepted by bank staff. The fakes have yet to appear in the South Island. A number of arrests have been made in connection with the bogus bills. A 17-year-old unemployed youth appeared in the Auckland District Court yesterday charged with having \$20 notes in his possession which he knew were counterfeit. The youth, who was granted interim name suppression, allegedly tried to offer the seven false notes in the central city earlier in the day. He pleaded not guilty to the charge – which carries a maximum sentence of seven years' imprisonment. The youth was remanded on bail... on condition that he reported to the police three times a week.

...Police fear that the latest distribution of counterfeit money is more widespread than expected, as... fake... notes surface across the North Island and as far south as Christchurch... Police intelligence sources suggest that counterfeiters have produced up to \$1 million worth of the fake... notes[, of which only \$300,000 has been]... recovered... "If they are going to go to the trouble of printing them, they are not just going to do a few hundred of them," said the head of the Auckland regional crime squad investigating the bogus bills... "They are not good enough to get into the banking system officially,"... Because the fakes are easily picked up by bank money checking machines, individual retailers bear the losses... [The crime squad head] tested the effectiveness of the forgeries by offering one to a service station attendant as payment for a packet of cigarettes – it was accepted without question "but I took it back and paid him with real money." He said \$100 notes had been accepted for purchases such as hamburgers and other cheap items. Sometimes the dud bills were passed with genuine bills... The production manager for the Security Print Group in Auckland... said the availability of new technology meant the biggest headache for counterfeiters would be getting the colours right. Counterfeit notes made in such a manner "would fool most people at the speed that money is passed." Making money involved specialised printing skills "but there are thousands of printers out there... a lot of unemployed ones, too." The manager of policy and supply for the Reserve Bank in Wellington... said the bank checked about two million of the 63 million notes in circulation each day, using seven machines in Auckland, Wellington and Christchurch. About \$1.6 billion in notes was in use at any one time...

The spate of forged \$20 notes has largely dried up, the Reserve Bank says. Its... processing machines detected 1100 counterfeit notes in the [financial] year... up from 70 the previous year... [In international news, s]even south Florida residents have been arrested on charges of trafficking in more than \$245 million in counterfeit bonds purportedly issued by the Central Bank of Venezuela.

...Three men appeared in a London court on Saturday on forgery charges after British police and U[S] secret service officers said they had uncovered a scam involving \$800 million in fake US Treasury bonds. The three, a Briton, an American and a Taiwanese-American are being held in jail pending a further hearing.

...AMERICAN hotels and shops[have] refused to accept \$50 notes issued by the US Government. The printing was so poor, with smudges on the face of General Ulysses Grant, they suspected these were forgeries. The Treasury has now destroyed 156 million of the notes...

A U[S] secret service agent visited Auckland to investigate a counterfeiting operation which could have produced \$US50 million... in forged American banknotes, the Auckland District Court heard yesterday. Police busted the businessman behind the counterfeit scheme before he could print any of the \$US20 bills at his sophisticated South Auckland workshop... His plan to produce... the banknotes was foiled when two slip-ups – which the police would not reveal – led detectives to the workshop... The court heard that in late 1994 the 32-year-old bankrupt, who described himself as a business consultant, brought three printing presses. He also completed a polytechnic printing course. In May 1995 [the defendant] began negotiating with overseas paper companies to buy up to 10 tonnes of vellum, or rag paper... American authorities sent a secret service agent who told police that the operation was the most elaborate he had seen for a sole operator and that 2.5 million fake notes could have been printed with the amount of paper... ordered... [The] Judge... said that if [the defendant] had succeeded a huge amount of forged foreign currency would have been in the system. A deterrence factor was necessary.

...Fake \$50 notes... are fooling Auckland retailers... The fakes are virtually indistinguishable from real cash as the forgers used paper similar to bank paper. The notes are worn, making it more difficult to tell if they are fakes... "They are unusual in that they look, feel and smell like the genuine article," said... a police media spokesman. "...These are very, very high quality. We are talking top-of-the-line laser printers." ...[Meanwhile, d]etectives... have charged a self-employed Auckland graphic designer with forging \$20 and \$100 notes. - 1997

The man with the long black hair paid for the \$1.80 packet of noodles with a \$100 note. [The shopkeeper] hesitated, and then carefully counted out the change across the counter of his Howick Japanese-Korean grocery. He took the note, felt it, and realised he had been done for \$98.20... "I went to give chase but I couldn't; I was alone in the shop. It makes me very angry. Normally I give kindness to all my customers and I was also kind to him, but he gave me lies." The "lies" were turning up in tills all round the country... "[The fake money] is still in circulation – we already have in excess of 1000 complaint files and there are three coming in each week..." says the head of Auckland's regional fraud squad... The paper does feel wrong. "Plasticity, slippery," says the owner of the Thunderburgers bar in Mission Bay, which was taken in twice during busy periods despite warnings to staff. Real money is printed on cotton-based paper not available to the printing industry in N[Z] – but... the... forgers used light ink and silver pens to imitate the watermark of the Queen's head and the metallic thread – the very traits introduced to protect against counterfeiters... There is no way of knowing how many times the notes changed hands, but... it was mostly small businesses... that got burned. "The dairies, service stations, bakeries and supermarkets – some would count back change and lose half the day's profit." The negatives, plates and printing press that were used to forge the notes have never been found. Police believe that they and bulk quantities of notes have been stashed for future use. The counterfeits were front-page news on December 5, 1996. A man named "N," now on the police witness protection programme, recognised the artwork... N's evidence would later nail a 27-year-old graphic designer... as a ringleader of the operation... [N] had been caught outside the Kelston McDonald's with a plan to rob it by threatening the manager with an imitation pistol. N wanted to do a deal with the police and told them he would plead guilty to all charges... According to N's evidence, [the ringleader] scanned images of real banknotes into his computer and then transferred the images to the film required to make printing plates. The notes came off the press of a legitimate West Auckland printing business, for which [the ringleader] had a key. He... worked at night without the knowledge of the owners, downing tools in time to tidy up... [T]he money was then distributed by criminal networks, mostly through gangs, particularly Black Power... The... [ringleader] was sentenced yesterday to five years' imprisonment... half the maximum penalty... [He] maintained his innocence throughout the trial, portraying himself as another victim of the forgery ring. His parents... and his fiancée... believed him... An appeal will be considered.

...TEENAGE counterfeiters are using classroom computers to print fake \$50 and \$100 bills... The gang is believed to then sell the fakes for around \$5 each... Wanganui retailers have been fooled by the forgeries and shop and bar staff have been warned to look out for the fake notes... One youth has been arrested and a computer seized. Police are wanting to talk to other teenagers about the case... Police... admit that progress in

the case has been slow and the counterfeits are realistic. “I scanned a \$10 note on to the computer and printed it out. It looked pretty good but does not have the same texture as the real thing,” an officer said.

In the spring of 1696, [Isaac] Newton was appointed Warden of the Royal Mint. It required him to live in the Tower of London, and his task was to prevent clipping or shaving of the coinage of the realm. Months later, Newton – who had just begun his study of comets – appointed [Edmond] Halley as Deputy Comptroller of the Mint at Chester... Halley spent two miserable years at Chester supervising the mechanized production of milled coins out of the old hand-made ones. When he and his local Warden discovered two clerks skimming precious metals for their own gain, they spoke out – unaware that their own superior, the Master of the Mint of Chester, was getting a cut from the clerks. An acrimonious feud followed and there were threats of a duel; but the Mints were closed in 1698, and Halley was free to return to London. He arrived just in time for a more agreeable assignment.

That *more agreeable assignment* was timely for Halley – his experience with handling money, and honesty, could instead have led to him being *headhunted* by the recently established Bank of England.

Some banking activities were engaged in by the Babylonians, Egyptians, the Greeks, and, particularly, by the Romans. Though the collecting of interest was held in ill repute during the Middle Ages, banks were founded at an early date in the flourishing commercial cities of N Italy, where they were mainly connected with the market in foreign exchange. Among the first public banks to be established were the Banco di Rialto of Venice (1584) and the Bank of Amsterdam (1609). Until the establishment of the Bank of England, 1694, such banking as there was in England was carried on by goldsmiths, who received deposits of money and valuables and issued negotiable receipts. In the 18th cent. numerous private banks sprang up...

The first difference between communism and capitalism in the 20th century was that capitalism won. The second difference was that the world, led by the U[S], was, in the end, always prepared to bail capitalism out. It had, you might say, no alternative. The mammoth rescue operations now being organised in Asia, under the aegis of the [IMF], may raise eyebrows. Many of the greedy and the impetuous will be protected from the consequences of their actions... A British Government economic adviser... says: “What is surprising, in retrospect, about the 90s financial turbulence... is not that exchange rates came under pressure, but that Governments were able to get away with unsustainable policies for so long...” ...But, in the end, banking systems have to be preserved, or societies will be cutting off their nose to spite their face.

...[due to increased use of cheque accounts and the advent of technology such as credit cards, Eft-pos terminals and automatic teller machines (ATMs – which] sell... for between \$US10,000 and \$US80,000... [each], banks are losing their *human face*. ‘Robert the Robot’ has even replaced humans in TV advertisements for the Auckland Savings Bank (ASB) – although it likes to be known as ‘Your future bank’. Now a [u]utomated walk-through kiosk-style bank branches are expected to open in supermarkets and shopping malls[throughout NZ] before the end of this year... BNZ opened the first kiosk-style branch, in Newmarket in Auckland... But the concept ha[s] developed greatly since then... About six big banks in A[US have] set up trial kiosk branches... The... move to kiosk banking was driven by retail banking’s shift to a 24-hour day, seven-day-week business.

...[‘BankDirect has no branches, so we don’t have doors, so we never close them.’]

...BankDirect, a fully-automated 24-hour virtual bank accessed by phone, the Internet and [ATM]s, was launched yesterday by ASB Bank... The bank’s low overheads would be reflected in competitive rates and fees... [There is] a \$10 join-up fee and \$2 a month [for maintenance]... Activity fees start at 15c per electronic, or dial-direct transaction, 25c per ATM withdrawal or transfer. Account “sweep” facilities or transfers done over the phone by an account manager cost 50c. The bank says it provides a more attractive fee structure for high-value customers... [However, customers] for Internet services were proving hard to recruit, the Bank of New Zealand[(BNZ)], said yesterday. Since it launched its own Internet service – Direct Banking – ...it had signed up only 15[%] of the high-value customers it had targeted against the 30[%] it had forecast.

...BIG banks are being strongly tipped to follow Ergo Financial Services’ decision to allow NZ Post to become a de facto bank branch network... Service stations, power company offices and supermarkets could soon become part of the retail outlet for banks and other lending institutions desperate to cut the costs of their own expensive branch networks. Ergo, a telephone bank which has no branch network at all, last week signed a deal allowing... NZ Post’s 297 shops... to collect money from depositors who still prefer to deal over the counter rather than electronically... While banks talked about the continuing importance of maintaining a branch network, the fact [remains that branches are] declining in number, and would continue to do so at an accelerating rate. Between June 1995 and June 1996, the number of bank branches in N[Z] fell by... 7.3%, to 1361. Biggest falls were recorded by ANZ Bank, whose branch network fell from 340 to 280, and the B[NZ], down from 290 to 267. Since then Westpac and Trust Bank have merged to create Westpac Trust with a total 412 branches, but rationalisation... was already under way... [which] could mean a final branch network of around 270...

[‘Banks are creaming customers and leaving heartland Kiwis in the lurch, says a small town businessman. He runs a Lotto and book shop in Patea – a Taranaki township abandoned by the billion-dollar banking corporations. Patea’s 1400 residents have to make a 54km round-trip to use the nearest cash machine. The town handed several major banks a petition of 900 signatures asking for an ATM but they were ignored. ANZ was the last bank to pull out of Patea. A company spokesperson said: “Where we have closed branches we have increased the service provision in surrounding areas and we are expanding new banking services like phone and the internet.” But Patea townsfolk are less than impressed with the big banks – especially when they are announcing record profits and raising service fees.’]

...Strong profit growth among[NZ] banks tapered in 1996, while underlying earnings actually fell, a Reserve Bank review of the sector says. Net profits for the industry as a whole totalled \$1.02 billion, up 1.1[%] on 1995 and a far cry from the double-digit growth since 1992 when sector profits were just \$313 million. While net-interest income was little changed in 1996, competitive pressures were revealed by its decline as a percentage of total assets... However... the Reserve Bank’s banking system department, said... restructuring... would, in the longer term, improve the sector’s efficiency... [B]ank margins were declining and all banks were addressing this with efforts to substantially improve... ANZ’s interest margins in N[Z] have declined to 2.6% in March 1997, from 3.5% in 1993, while those of N[Z] banks on average had declined to 2.8% from 3.1% in 1993... ANZ’s operating expenses as a percentage of average assets had fallen to 3.6%... from 4.4% in 1993... Much of the efficiency drive had been focused on removing cross-subsidisation between retail products and services and in developing new technologies, with electronic delivery through [ATMs (of which NZ now ‘has one per 2398 people – in comparison, the UK has 1:2794, AUS 1:2345, the US 1:2143 and Japan 1:987’)], eftpos, and telephone and Internet banking gathering pace... According to Bankers’ Association data, there is now one eftpos terminal [in NZ] for every 78 people, compared to one for every 132 in A[US, one for every] 474 in the U[S]... and... one per 4413 in Japan... However, it was ironic that, although leading the world in the number of eftpos terminals per head of population, N[Z] also had one of the highest ratios of bank branches... There is... one branch for every 2818 people, compared with one for every 4400 typical of OECD nations [(‘US = 4467; UK = 4737; Japan = 8287’). The AUSn figure is 2782]... This makes it more expensive for banks to operate [in Australasia], because operating branch networks is their second biggest expense. This gives the banks a powerful financial incentive to trim their branch networks wherever they can... IT is not just small rural towns that risk... losing their local bank branches... While mergers like ANZ-Postbank and Westpac and Trustbank have resulted in many branch

closures, the trend is far from over... There has already been considerable rationalisation within our banking industry, driven mainly by two factors: Technological change and deregulation... The next few years should see the rate[of branch closures] pick up considerably, driven by two new factors. The first is that the A[US]n banking industry is facing deregulation, opening the way for mergers or takeovers, with flow-on effects for N[Z]... The second major influence is another new wave of technology. In the 1996 Bankers' Association annual review... the chief executive of ASB Bank, pointed to the next generation of plastic cards – so-called “smart” cards able to store money and be topped up. The other change is in the way banks clear transactions. Eftpos has already greatly reduced the use of cheques. According to the Bankers' Association, the number of cheques is declining by about 9% each year. But this[technology] has mainly been for transactions by individuals. Soon banks will introduce a system linking companies with their own computers, allowing them to pay each other by instantaneous computer link... The growing familiarity of the younger generation is developing with computers almost makes it inevitable that they will want to conduct their banking affairs via this medium. Customers understandably focus on their local branches when assessing the services their banks provide. But the bigger challenge in the future may be to ensure they get a fair share of the bigger profits that the move to electronic banking can provide, in the form of lower loan costs and fees and higher investment returns.

...Banks have been enticing us into the push-button world of banking, wooing customers by charging less for electronic transactions. Customers who have so far resisted the move away from paper banking – cheques and over-the-counter withdrawals and deposits – have in most cases been penalised with transaction fees nearly double that of electronic ones. But news that Westpac has slapped a whopping \$2 charge on one of its electronic transactions sent alarm bells ringing this week. Consumer watchdog organisations wonder if the honeymoon is over for push-button banking. Are any other charges waiting in the wings? Westpac[– which]... has... also raised account-keeping fees by 40[% –] ...defended its move with the explanation that the new \$2 charge simply brought its policy in line with the former... Trust Bank, which the A[US]n-based banking giant merged with last year. Trust Bank has always charged \$2 to customers who make cash advances on their credit cards from other banks' [ATM]s. Now Westpac customers have to pay the charge too. [Westpac's]Public relations manager... said the \$2 covered the cost of processing the credit card transaction through two outside agencies – Westpac paid a fee to the bank which owned the teller machine used in the transaction, then it had to pay a processing charge to the credit card company. He did not disclose exactly how much each charge was. However, an academic who specialises in banking speculated that similar charges could follow for debit cards... [He] said charges could be coming for customers who used other banks' teller machines for any electronic transaction. Westpac said it had no plans to do this at present, but the bank's reply was not totally reassuring... “I'm not aware of any talk at Westpac at this time but that does not rule out that it will happen some time in the future.” It was a common practice overseas for banks to pass on to the customer the “interchange fee” which banks charge other banks for each non-customer transaction on their teller machines. Indeed, charges for using another bank's teller machines are fairly common practice across the Tasman – and Westpac's charge is one of the highest among the A[US]n banks. Westpac customers are charged \$1 if they use another bank's machine, and other banks' charges range from 30c to 75c. So, are Kiwis about to lose the luxury of being able to use other banks' teller machines free of charge? ...[the academic, a] senior banking lecturer at Massey University... said... [NZ b]anks... had held off... charging for using debit cards in other banks' ATMs... while electronic banking became established in this country. And more and more people are getting hooked on electronic banking... Paper banking transactions cost twice as much as electronic transactions at most banks, but... the gap between electronic and manual transactions could widen further. As well as increasing the cost of electronic transactions, banks could also bump up the charge for paper banking to more accurately reflect the cost. Most banks had been reluctant to do this... Banks had been absorbing the cost of both electronic and paper transactions... subsidising the cost from the interest earned on residential mortgages... ANZ/PostBank, however, does stand out. Its key saver and connect accounts charge \$3 for a teller transaction[(excluding deposits)] compared with 75c for an electronic one [if the account's balance is] less than \$300... [Furthermore, the bank] is to replace standard... cheque accounts with an account called ANZ Access, or PostBank Access[, for which the]... monthly administration fee would rise to \$3. The previous... transaction fee of 25 cents would become 25c for an electronic transaction and 50c for manual, and customers would lose their five free transactions. [Retired people] who had their superannuation direct credited and customers with average monthly balances of \$5000 would not pay fees... Current fee exemptions would be maintained and interest would be paid on balances of more than \$2000... However, any fee increases will be closely monitored by the Consumers' Institute, which is in the process of conducting its own study into bank fees... The[institute's] chief executive... said... “If we suspect the banks are exploiting the position of the consumer we would ask the Minister of Commerce for an independent inquiry... It could be that WestpacTrust is putting its toe in the water and has picked on a relatively small area to apply this \$2 charge, but we would want it justified... It seems extremely high for an electronic transaction.” Electronic services save the banks money, he said, and this should be passed on to consumers. “Banks can't have it all ways, and we are not going to let them.” [However, consumers let them get away with introducing service fees. Furthermore, ‘banks are not obliged to open an account for everyone’ but NZ's ‘Income Support pays benefits only by direct credit and a steady trickle of beneficiaries have been unable to open accounts because they could not save the minimum deposit required by banks (some beneficiaries used the account of another person, who sometimes spent the money’) – which vary from ‘no minimum’ (National Bank) to ‘\$500’ (ASB Bank). The cost of purchasing modern banking technology has made low-value accounts unprofitable for banks to maintain!

...‘As part of a survey, a consumer magazine set up a cheque account with seven banks and one savings institution. After a year two banks had negative balances of \$10 and \$8 respectively after the initial \$100 deposit had been “gobbled up” in bank fees, while the most left in the other accounts was \$76.’

...Back when the concept of asking customers to pay a fee to do things with their own money existed nowhere but in a banker's wet dream, banks could make a profit by simply paying depositors a lower rate of interest than was collected from borrowers. But after banks had invested in technology – partly to save money spent on accounting – they found that it could be used to do extra accounting calculations (e.g., computers enabled bankers to perform such activities as automatically calculate the interest owing on every customer's savings account at the end of each day, and to alter the rate of interest according to daily account balances), including recovering its cost via the introduction of fees. Because the technology could keep track of every transaction, banks were also able to offer high-interest accounts that encouraged saving by penalising customers for making any, or more than a set number of, withdrawals. For example, the ASB has 3 savings accounts: ‘the Accelerator (which pays 7% interest on balances over \$1000 – but deducts 1.5% interest for the first withdrawal each month and \$5 for subsequent withdrawals); MoneyMaker (\$2 monthly fee for balances below \$500, 5% interest, 50c for ATM transactions, \$2 for teller transactions); FlexiSave (as for the MoneyMaker except that ATM transactions cost 25c each and the interest rate is below 2%). All deposit transactions are free.’ In comparison, the BNZ offers 5 accounts: ‘Ready Money, which has a \$3.50 monthly Account Management Fee but no free transactions (electronic transactions cost 35c each; ATM, Cheques Written, and Freepost Deposits cost 50c each; staff assisted transactions cost \$1 each); Cash Draw Saver, which offers 100 prizes per month, pays at least 1% interest, has a \$2.50 monthly management fee and the first 2 withdrawals per month are free (after that, electronic transactions cost 60c; transactions via ATMs, etc., cost 75c; staff assisted transactions cost \$1.25), as are all deposits; Call Account, which has no monthly management fee but pays a low interest rate (0.0%p.a. for \$0-\$4,999, rising to 4.25% for balances \$500,000+), while all withdrawals are free with an average daily balance of \$5,000 or more a month (only the first 3 per month are free if the average monthly balance is less than \$5,000 – then each non-deposit transaction costs \$2); Achiever Savings, which pays between 2.5 to 5% interest as well as having no management fee and allows one free withdrawal per month (subsequent, non-deposit transactions cost \$2 each); Silver Service, a no fee account for superannuants’...

‘Not so long ago, customers at Wells Fargo bank in San Francisco just had to cope with mechanical faults and quirky operating hours when trying to extract cash from their dispensing machines. Now they have to put up with film trailers and advertisements. Starting this week, Wells Fargo is operating

three high-tech machines in and around the city that will be wired for commercials and news headlines as well as passing out money, and hopes to be operating 800 of these bank machines by the end of the year. Eventually the adverts will be tailored to the buying habits of each consumer withdrawing cash. This may be the banking wave of the future, but the first customers to undergo the experience were less than enthusiastic. "I just want to get my money," complained one. Yesterday's *San Francisco Chronicle* inveighed the notion that "even before you extract your cash, the machine tells you how to spend it. That's a lot of gall, even for avaricious bankers, who should junk the commercials in favour of machines that work, that spit out bills and transaction records – even on weekends – with no charge for retrieving our own money." While banks in the US forge closer links with the advertising industry, NZ's banks have entered the lottery business by offering prizes in addition to interest on accounts (e.g., for every \$100 a customer has in the designated account during the month, it goes into the draw for extra cash, a new car or overseas holiday, etc.).] **As the competition for their money gets more intense, bank customers can expect to be offered services they never dreamed of... A French bank has begun selling customers sports tickets, among other things, to boost profits.**

...[the] **blurring of the traditional distinctions between financial services providers is becoming ever more apparent with banks now capturing sizeable chunks of the life insurance market...** [Furthermore, plastic cards – which once were merely a] **medium for making payments[–] are fast becoming the bestowers of all kinds of goodies as competition drives financial service companies to stay one step ahead of the competition.**

...Telstra has launched the first A[US]n national smartcard system, beating the main trading banks by more than a year. The first cards – already supported by Cabcharge, Coca-Cola vending machines, Smiths Snack Foods, and Time Zone entertainment arcades – will be disposable cards, but they will be followed in December by reloadable cards. To take advantage of both types of cards[– smart and phone –] Telstra has begun replacing all A[US]'s 30,000 payphones with new phone technology that will eventually allow users to programme their rechargeable cards with their choice of loyalty schemes and partner programmes. Most new phones will be in by December. The new phones will also have capability for data transmission, allowing users to plug a notebook into a phone jack, to pick up Internet E-mail and other data-based tasks... The initial disposable smartcards will be available with \$5, \$10, \$20 and \$50 values from the outlets that stocked Telstra old-style phonecards. Like the more advanced rechargeable cards they are designed for amounts too small to be economical on the eftpos network... Telstra expects to make a stream of announcements regarding future uses of the cards, including use in parking meters, transport systems, cinemas and fast-food chains... Users will be able to top up reloadable smartcards by using one of 10,000 Telstra terminals, to be positioned in outlets selling the cards. The terminal will work similarly to an eftpos terminal, taking value out of a user's bank account. Technically, there is no limit to the value that can be loaded onto a card, but... Telstra had imposed a limit of \$300... If a reloadable card is lost or stolen, unused credit will be recoverable if the user can give the serial number of the card. Telstra would issue a new card with the remaining value... Telstra has been consulting various consumer groups, but was still to provide the final terms and conditions for the reloadable cards... A smartcard code of conduct was being drawn up and should be ready by the year-end... The new phones will take coins and Telstra smartcards but initially not standard credit cards... [W]ith current credit card calls "there's a flagfall of \$1. We're uncomfortable with that and are trying to negotiate a way out of it. Our view is that everyone should pay the same for a call, regardless of the way they choose to pay for it."

...Telecom is considering whether to follow... Telstra in installing a network of smartcard-operated payphones to replace its magnetic stripcard phones... Telecom's nine-year-old payphones are only slightly newer than those being replaced by Telstra... Telecom has 5000 payphones compared with 40,000 in use by Telstra.

...In town last week were representatives of VeriFone Australasia, which in partnership with Datacraft NZ, wants to put an ATM in your kitchen. You need a personal ATM – or something like it – because of the imminent arrival of smart cards in N[Z]... The \$100 personal ATM... could... do things like access sharemarket data... [and] will also allow you to make automatic bill payments, if you're bored with the present arrangement all banks have with their customers. ['According to a report commissioned by the Information Technology Association last year, payments of social services benefits will probably be made using smart-card technology within five years.'

...research showing how simple equipment can be used to break into Government and banks' confidential electronic files was kept secret for months to allow the Bank of England and other institutions to review their security arrangements. A Cambridge computer expert broke the code for smart cards, once thought to be the ultimate security device. He found ways of attacking the smart cards allowing the contents to be read completely within minutes. "The most expensive items of equipment needed, such as electron-beam testers and ion-beam workstations, can be rented by the hour and there are a number of universities which have them for research purposes," the expert said. The British Government recently announced plans to hold information about tax, pensions, social security and driver's licences on smart cards' (and to 'give every child up to £1000 in an attempt to rebuild Britain's savings culture').]

...Frustrated with carrying round piles of plastic credit, loyalty and incentive cards? New smart technology might soon reduce your wallet bulge, according to Relationship Marketing Services[which]... is getting closer to the launch of a "VIP Infinity" smart card which will combine a community-based customer loyalty card with a range of other cards such as those offered by BP, Foodtown, The Warehouse and... possibly the Mondex "cash purse", all on the one piece of plastic... [A] recent announcement by a consortium of leading silicon manufacturers and smart card companies, including... Hitachi, MasterCard and Mondex International, provides a crucial link to make [this] proposal a reality. The firms are joining to introduce Multos - an "open systems" high-security operating system for smart cards which enables a number of different products or services to be held securely and independently on a single card. Smart cards differ from magnetic stripe, stored-value or memory cards in that they contain a tiny microprocessor which can carry out a variety of functions... [M]ost recent retail EFTPOS terminals were already equipped with the ability to read smart cards. Multos security features allow consumers to download new products or services on to the smart card via the telephone, ATM or the Internet, and allow card issuers to update, add or change applications while the card is still in the hands of the customer... The VIP (Village Interactive Platform) Relationship Marketing scheme involves a community (village) of retailers issuing customers with cards that, as well as offering individual benefits and prizes to their customers, com[es] with a matched 1/2c-in-the-dollar pledge for community projects. When a... card [is presented] to a contributing shop, retailers will be able to see the customer's name and address details and what recent purchases [i]t... has made in their shop if they have a PC-based terminal. Shops with ordinary EFTPOS terminals will simply accrue points to the customer's card.

...For customers, the ever expanding opportunities for eftpos use can take its toll on their cards... A spokesman for the ANZ Bank... said the ANZ had a policy to replace cards every three years, but customers who experienced problems could have new cards issued immediately. He did, however, issue a warning for eftpos cards to be kept away from magnetic fields, which could deactivate the card's magnetic strip. Among the worst offenders were the magnetic clasps on women's purses, he said.

...['cashless payments at the door by Eftpos – for everything from plumbing to pizza delivery – are on the cards. And BellSouth could beat Telecom to the draw in this virtually untapped market for mobile Eftpos service. To make mobile Eftpos cheap and reliable enough for the likes of tradespeople and taxi drivers, Telecom is planning a new cellular service dedicated just to electronic payments in the first half of next year. But its competitor said it will have mobile Eftpos ready for public use by the end of this year. A spokesperson for BellSouth said yesterday that its existing cellular network was based on a technology quite different from Telecom's and needed none of the modifications that Telecom's network needed. BellSouth has an agreement with an AUSn Eftpos terminal manufacturer, Keycorp, which set up a subsidiary in NZ last August. The transfer processing company Electronic Transaction Services Ltd (ETSL) estimates that NZers make more than 23 million Eftpos transactions a month.'

...some shoppers may soon pay up to \$1 every time they make an Eftpos transaction. This follows the decision by ANZ Bank to raise the fees it charges retailers. Other banks have not followed ANZ's fee rise, which one Wellington dairy-owner says will raise his monthly Eftpos bill from \$24 to \$200. He

has already warned that he will pass the cost on to customers. The man, who did not want to be named, said he would get rid of his Eftpos machine if customers balked at the charge. An ANZ spokesperson, said the bank's contract with retailers did not allow them to pass on its charges. If retailers did this, the bank would review the matter seriously. However, the Retail Merchants' Association said the alternative for retailers looking to recoup their costs is to raise prices. The association's chief executive said retailers, particularly smaller businesses, were annoyed because "they're actually doing the bank's job and being sluggish for it."

...Businesses charging customers who pay by Eftpos may face legal action if they fail to advertise the fee. A few outlets have for some time charged customers for cash withdrawals, but complaints about charging consumers who use Eftpos to pay for goods and services have led to a new warning from the Commerce Commission. It says it is legal for businesses to charge customers who use Eftpos to pay for goods and services and to withdraw cash – but customers must be advised beforehand... The commission has successfully prosecuted several companies... Most retailers absorb Eftpos costs but a few impose fees ranging from 50c to \$1 for the service. The commission's fair trading manager... said: "Businesses need to be careful when adding extra charges which consumers would not normally expect to pay." It was not sufficient to advise a consumer of the fee once he or she had agreed to enter into the transaction. "Signs indicating that there is a fee need to be clear. The print needs to be large enough to be seen and bold enough to catch the customers' attention." ...the general manager of E[TSL], which manages 80[% of NZ's] Eftpos machines, said consumers usually boycotted outlets that imposed a fee.

...The operator of the country's main Eftpos retail payment system wants to know why the telecommunications component of its service is not returning the same efficiencies as other parts of its business. "We see telecommunications as a larger percentage of transaction costs than it should be," E[TSL's] general manager... said... "Transaction volumes and technological efficiencies contribute to lowering the price of the transaction cost, but we are not seeing the same efficiencies in the communications area as we see in the central processing switches for example." ...ETSL, owned by the ASB, National, Westpac Trust and BNZ banks, handles about one-third of N[Z]'s retail spend through its Eftpos terminal network... "We need to fully investigate costs and technology such as ISDN, mobile solutions and anything else that might improve performance,"... ETSL was trying cellular Eftpos as a possible option but so far had found it not fast enough... ETSL established a national structure suitable for its business and negotiated a five-year contract with Telecom. "We are now into year two of the second five-year contract,"... [The general manager's] comments come at a time when the Telecommunications Users' Association is pushing for reforms to the Commerce Act to provide more open competition to the industry to drive down prices. The association claims competition is lacking in significant parts of the industry, including the local loop, ISDN, Centrex and other value-added services.

...Retailers are demanding answers about an Eftpos breakdown after millions of consumer dollars were affected yesterday. An estimated 100,000 transactions at 15,000 terminals were paralysed yesterday morning when... [ETSL] suffered a major computer malfunction. Massive queues formed at many shops after retailers were forced to hand-write dockets for two hours instead of using the machines which electronically transfer money from buyers' bank accounts to the shop. The breakdown happened at the worst moment for many retailers as shoppers and families jammed shopping malls for respite from the wet Queen's Birthday holiday weather. The system eventually started working just after midday. Today the Retail and Wholesale Merchants' Association plans to ask [ETSL] what went wrong and how to prevent it happening again. The association's chief executive... said last night that retailers were already struggling in an extremely competitive market. "We don't need these type of things to make life difficult... There are still ways around it through the manual system but it's obviously not desirable and holds the whole transaction process up." The Manukau branch manager of The Warehouse... said shoppers had faced considerable delays. [He] likened the situation to an accident on the motorway – the initial problem may be fixed but the backlog lasted hours. "It's usually at the most inopportune times – like on a very busy weekend or at public holidays." Other retailers, who did not have any dockets, asked customers to withdraw cash from automatic money machines... [while some service stations 'siphoned back petrol from the cars of customers who had no means of payment after their electronic transaction was declined'. A] shop assistant at... the Hamilton Chartwell Square shopping mall, said most customers were tolerant about the delay. "They know there's nothing you can do about it,"... It is thought that one of [ETSL's] eight processors had failed and back-up computer software, which should have taken on the extra workload, had not been activated. Data records had been sent to the company's U[S] supplier where experts would analyse the reason for the malfunction. An answer was expected within the next few days.

...[a paraplegic man fled from an attacker in his Whangarei home by wheelchair, pushing himself more than half a kilometre down city roads while still bleeding from his wounds. The police have been criticised for a slow response to the incident, which led to the arrest of a 37-year-old Whangarei woman who faces assault charges. Last night the 32-year-old victim was in a stable condition at Whangarei Hospital. The man had arrived at the Maunu Superette about 6.20 pm with his attacker in pursuit. The superette owner said the man wheeled himself in and wanted someone to call the police. The owner said he did not want to get involved. "However, my wife rang the police, who took a long time getting down all the details. It was holding us up because we couldn't use the Eftpos." In related news, negotiations are under way to improve N[Z]'s Eftpos system, after [the breakdown which] paralysed about 100,000 retail transactions on Monday... [ETSL] has blamed the breakdown on a rare computer malfunction that coincided with a bug in the Eftpos software. The chief executive... said it was bad luck the two problems coincided... He said the company was in a strong position to "negotiate aggressively" a better deal from its overseas supplier, following the breakdown. He hoped to reorganise the Eftpos system through a number of separate networks, so if one failed the others would continue unaffected. Suppliers usually sold licensed packages as a whole, and it was expensive to operate different packages within the same shop... But N[Z] was a comparatively big player in the Eftpos world, and he hoped to convince suppliers to unbundle their packages to suit our market.

...Bank officials have fingers crossed that a computer glitch which stopped about \$1 billion of pay going into employees' accounts yesterday has been sorted out. But banks cannot guarantee that customers will be able to withdraw money which should be in their accounts or avoid having eftpos transactions declined... All banks were affected by the... largest... computer breakdown... to hit the[NZ] banking industry in recent years... The chief executive of the Consumers Institute... said banks were liable for any financial losses customers incurred as a result of the failure[, which]... was blamed on computer changes at the... processing centre, run by EDS.

...Banks were criticised yesterday for failing to guarantee customers immediately that they would not incur any costs from this week's big computer breakdown... But the Bankers Association said the cautious response was to be expected in such a highly competitive industry... Thousands of bank accounts remained empty or plunged into the red on Wednesday after[the] breakdown... The B[NZ] was one of the first to assure customers they would not be penalised... followed by WestpacTrust, ANZ, PostBank and Countrywide[– which]... went one step further, promising customers left out of pocket that they would be compensated for both direct and indirect costs... ...Direct debits, credits and payroll transactions were under threat last night following a wildcat strike by staff at the... American-owned EDS company... after an impasse in contract talks.

...Fears that millions of dollars of... pay and benefits might not be paid into personal bank accounts today because of [another] computer glitch were last night played down by... EDS... [T]he company... said... [a] corrupt computer disk... caused a power cut... But it admitted that the impact... would not be known until early today and it could not guarantee that pay would go through.

...Thousands of frustrated shoppers were left waiting for their... pay and benefits yesterday... EDS said yesterday's delay was not related to last month's inter-bank payments fault... [S]even million transactions totalling \$126 million were being processed... when the breakdown occurred.

Staff managed to fix the glitch by 5am yesterday, and it was then up to the banks to process their files. [By the way, if a bank error works in your favour and you deliberately or inadvertently spend that money, you can be charged with theft!]

...a Norwegian man briefly became the richest person in the world after a mystery bank error dumped 9,999,999,973,885 Norwegian crowns (\$NZ2515 billion) into his account. The newspaper *Verdens Gang* said the 29-year-old from Oslo noticed the astronomical sum – which would far eclipse the wealth of the world's richest man – when checking his account']...

More than 380 million cheques were processed last year in N[Z]. And financial experts concede that, because of the pressure, our banks could follow the pattern set by the Big Four in Britain. They've stopped checking signatures on personal cheques for amounts below £1000. A series of tests, which has won praise from the Consumers' Association, showed that Barclays paid out on a cheque... which was signed "Albert Einstein"... [and] the Midland Bank paid £10 from the account of a man... because of a cheque apparently signed by... H. G. Wells.

...[NZ service] stations are following the lead of supermarkets and starting to limit the number of customers they allow to use cheques. Mobil Oil – stung by \$120,000 worth of rubber cheques each year – is the first oil company to... [introduce] a new policy that customers can only use cheques if they have made prior arrangements... Figures collated by the Bankers Association showed cheque use had declined in recent years, from just over half of all non-cash payments in 1993, to a third last year.

...Criminals do not seem to be getting the message that "plastic payment" is cutting the proceeds of armed robberies... The use of Eftpos and other types of card payment means that cash is now used for only 46[%] of transactions at outlets such as supermarkets and bottle shops... Plastic payment had a high average use – 60[%] – in service stations, "and I know that the oil companies encourage their staff to offer cash-out to Eftpos customers specifically to reduce the amount of cash held on site..."... said... [the] general manager of [ETSL].

...\$15 million was taken in one... hit. No threats, no guns, no getaway car, just the stroke of a few computer keys... Bank robbers would be doing well to take \$1.5 million in one hit... The case of the Russian hackers who penetrated the veil of security around the Citibank system in America in 1995... sent shockwaves through the financial world. "They all think it only happens in America," said a computer security expert at Otago University... "You cannot say that just because we are in N[Z] we are safe. You can reach out and touch anybody, anywhere. Who would do a bank robbery if you could hack and get \$400,000 to \$500,000?" ...He said there were people in N[Z] with enough skill and knowledge to be top hackers. "...and they probably are doing it." ...Cracking programmes are available on the Internet and they sometimes contain information which would enable people to beef them up... [The Otago University lecturer] is one of two leading experts who have spoken at recent conferences – on the need for N[Z] companies to protect their computer-stored assets... "More and more people are working with modems, maybe from home. Anybody who considers their data to be confidential to their organisation should consider what electronic security means," said [the] product manager for [a] security equipment supplier... Many simple fixed password-based systems are inadequate. Last month, a hacker... cracked 100,000 passwords around the world, including some belonging to the A[US] Navy. The supplier... said computer-users had to set up their own defences... Banks in A[US] and N[Z] have adopted stringent security measures to ensure their systems are safe... But banks are not the only targets for cyberspace bandits... Even sales representatives should consider how safe their laptop communications are... Price lists, company plans, confidential communications – all stored on laptop – are valuable commodities for competitors. Stripping that kind of information from computer systems would give a rival company a jump in the market. Bank account details and other financial records could even give a criminal an easy source of a quick income... This week, 1000 hackers and security experts gathered in New York for a conference which drew international involvement. A *Wall Street Journal Interactive Edition* article quoted hackers as saying they were looking for knowledge, not trouble when they broke into computer networks. They complained they had been given a bad name by the minority among them who have damaged or stolen goods.

...[two hackers who broke into a bank computer network and stole 260,000 yuan (\$NZ61,000) have been sentenced to death by a Chinese court. The Yangzhou Intermediate Court in Jiangsu province also confiscated 40,000 yuan from the brothers, one of whom was formerly an accountant at the Zhenjiang branch of the Industrial and Commercial Bank of China. The two opened 16 accounts under various names in a branch of the bank. The brothers then broke into the branch to install a controlling device in a computer terminal. They used the device to electronically deposit 720,000 yuan. Later they withdrew money from eight branches of the bank. All the money was recovered.' In local news, *lawmakers are moving to close a legal loophole allowing fraudsters to raid bank accounts by phone without committing a crime. The 38-year-old Crimes Act, passed before electronic banking, is to be tightened so prosecutors can deal with abuse of common-place procedures such as phone transfers or direct credits. As the law stands, some dishonest actions are not offences if payment involves the direct transfer of money between bank accounts. If they involved cash or cheques, the offender could be charged with theft or obtaining credit by false pretences. But it is not illegal to transfer money out of a bank with voice or touch-phone banking systems, using someone else's Personal Identification Number[(PIN)]. The loophole was exposed by the Court of Appeal this year when it overturned fraud convictions against a businessman charged with duping financial institutions. The court overturned some... [of his] 10... convictions ...[or] obtaining credit by false pretences... because false-pretences charges must involve tangible property. All five judges held that a credit in a bank account was not a tangible thing, and therefore could not be stolen. A Law Commission report said this "yawning gap" needed urgent attention. "It is manifestly wrong that criminal liability on a charge of obtaining by false pretences should turn on the chance of the particular mechanics of payment employed." The... Bankers' Association declined to comment on the report.*

...I haven't been going out much lately. The invariable pattern of drinking to the point of stupidity is rapidly losing its charm for me. But last weekend I made an exception to celebrate a friend's house warming with cocktails. By 2.30 am I'd had enough and prepared to call a taxi. "Don't!" my friends cried in their best debauched fashion. Determined to keep the night "alive," they propelled me down the street on foot, in search of an open bar. I was, however, quite resolute, and home being only a few blocks away, my friends bid me a cavalier adieu... But... [shortly afterward] I realised I was being followed. I turned to face my attacker and saw a stocky skinhead running towards me. I started screaming but before I knew it, he had grabbed my handbag, and he and his accomplice were already far away. While my situation could have been much worse, I was disturbed by the fact that no local residents were roused by my cries for help, and in the end I had to enter a stranger's house to call the police... All I had in my purse was a measly \$10, yet the damage these muggers caused me extended into the hundreds. After the event came the drudgery of cancelling cards and changing locks.

...["Stop, thief!" I yelled after the man who had snatched my black leather backpack. But he was already in his car and roaring off down the road. I managed to get his rego number before he disappeared. Still shaking, I dialled 000. I gave the police the rego number and they said the car had been stolen the day before. Then I called the bank and cancelled all my cards. A few days later I called the bank to get a statement and to my astonishment, \$800 had disappeared. "But you came in earlier today," the cashier reminded me. "You produced a health care card as ID." I shook my head as I explained the card had been stolen along with my bag and after filling out a few forms, the money was returned. "That should be the end of it," I told my mum that night. "I hope so, hon," she said. "Oh, Nan says she sent you a parcel." When the parcel didn't arrive, I contacted the post office. "I haven't received any mail recently – not even bills," I told them. "That's because you redirected it," they pointed out and my heart sank. Soon after, my impersonator withdrew \$850 from my account by changing all my bank details. The impersonator had even changed my password so that only she could use it. I expected apologies from the bank. But to my horror, they suspected me of criminal activity and refused to hand over any of my cash until the matter had been fully resolved. I left the bank, deflated and broke. It was another week before my stolen cash was returned and by the following weekend, my impersonator had taken it again. "I don't think I can take much more of this," I told mum, and then I heard a knock at the door. It was the police. Perhaps they'd caught my impersonator. "We're here about a room in a Surfers Paradise hotel trashed by a woman with your name who also stole a playstation and left without

paying her bills.” I was just starting to believe she’d had enough when a bill for \$1000 arrived from a posh hotel. I closed my bank account after another \$850 disappeared’]...

The rules say that if someone steals your credit or cash flow card and uses it wrongfully to withdraw money from your account, then your liability is limited to \$50. But banks will make you pay the lot if you’ve been careless with your PIN number. Which is where the debate begins. Being innocent until proved guilty apparently doesn’t wear with bankers. “If you lose your card, which is then used by someone else who enters the correct PIN number first time, it’s hard to argue there has not been carelessness,” sa[ys the]Bankers Association chief executive[. But the]banking ombudsman... clearly disagrees. “I take the view that the general rule is the customer is entitled to the protection of the \$50 limit,” she said in her latest report. It was for the bank to provide evidence that customer carelessness had contributed to the loss, she said. “While using the card with the correct PIN number may be significant, it is not conclusive evidence...” To prove her point, she quoted the case of a woman whose card was stolen from a handbag left in a car. After unsuccessfully searching for it, she drove to the police station to report the theft, and then drove home and telephoned the bank. In just under three hours, 16 Eftpos transactions totalling \$1500 were made using the stolen card. The bank refused to pay up, claiming the PIN number was clearly known to the offenders and must have been disclosed by the woman. But it was a random number not written down by the woman, who lived by herself and was at a loss to know how anyone got hold of it. [The ombudsman] said there was no evidence the woman had been careless, and successfully argued with the bank that it should meet its obligations by seeking no more than the initial \$50. But the bank was able to successfully argue the woman should also pay another \$290 – the price for being “careless” by leaving her card in a car.

...[an ‘81-year-old Auckland pensioner is delighted with a settlement reached yesterday with WestpacTrust over \$6000 drained from her modest life savings after the theft of her automatic banking card. The settlement, which neither party wants to disclose, followed an initial refusal by the bank to take responsibility for the losses after learning that she had kept her PIN number in her wallet. The pensioner, who has banked with WestpacTrust or its predecessors for more than 40 years, said she only reluctantly accepted the card in the first place and kept the number in her wallet to show a helper needed to guide her through cash withdrawals because of her failing eyesight.’ In this instance the customer was clearly to blame. However, i]n some countries, merchandisers were found to have Eftpos terminals connected to a scanner which read PIN numbers.

...[she had] arrived in England with her boyfriend that Saturday... at the start of their two-year trip. They had holidayed in Bali en route, were met at the airport by friends and... stopped at a local pub... [while driving to Cambridge. When she] reached down for her handbag [as they were about to leave, she found it] was gone and with it her ASB Bank Visa card. There was \$5000 in the account – her only travel fund. After a frantic search she telephoned her mother... at the family farm at Te Kauwhata. It was a little after six on Sunday morning N[Z time when her mother] dialled ASB Visa’s free-phone number to cancel [the] credit card and have a new one issued. Several days later when... [the daughter] tried withdrawing money with her new card, the transaction was blocked and she was told to contact ASB Visa in Auckland. It was then she learned her \$5000 had gone and she was \$839 in overdraft. It had taken the thief seven minutes to gut the account, making 12 withdrawals from a single ATM machine, in amounts varying between £50... and £500[(‘in NZ there is a \$500 daily limit on cash withdrawals with ASB Bank Visa cards’)]. The ASB Bank said thieves must have found [her PIN]... written on a piece of paper in her handbag, or that it matched birthday details found in her passport. To the bank that is enough customer negligence to absolve it from having to cover the loss. [She] denied negligence, saying her PIN was a random number she had never wrote down... Neither [she] nor her parents were prepared to pay the \$839 overdraft or the 19.25[% interest. Their]... lawyer... wrote to the ASB Bank alleging N[Z] banks are well aware of sophisticated international fraudsters who can either discover or bypass the PIN but that there is “a conspiracy of silence between the banks preventing such information being made public.” He added that the banks are unlikely to admit they are “negligently operating a system which can be accessed fraudulently[. it]... is in the bank’s own interest to claim ignorance... and it is against [the bank’s] interest to actively pursue the obtaining of knowledge about the existence of a fraudulent system and how it operates.” The ASB Bank was given 14 days to reply. On deadline day the N[Z] *Herald* sought its response. We were asked to wait another day. Soon after, the bank contacted [the lawyer] to advise him it would be accepting liability after all – [the lawyer’s client] would get her \$5000 back and the bank would cover the overdraft. In a reversal of its earlier position it said [she] had in no way contributed to the fraud. How then was [she] parted from her money? Even if the ASB Bank knows it cannot tell us, says [its] general manager of information services, because the Privacy Act prevents him from discussing an individual customer’s affairs... But[the] Consumers’ Institute chief executive... suspects the banks of trying to cover-up the degree of credit card fraud that is possible. “They don’t want more claims than they receive now,” he says. Many British computer experts agree... alleging banks either don’t understand their own technology or are ignoring the problems.

...Plastic card fraud is costing businesses billions of dollars worldwide... an A[US]n study says. And the protection once offered by isolation for countries such as N[Z and AUS] is being rapidly eroded... In A[US]... losses were last year estimated to have cost banks between \$5 m... and \$6 m...

...credit card fraudsters will soon target N[Z] unless the security of our card is improved, say senior executives of Visa International. The group... said magnetic strip technology, which had been used on credit cards for more than 35 years, was proving too easy... to copy. The way to combat this was to replace the strip on the back of the card with a computer chip at the front... The chip card technology was being trialled in Britain and Japan, and was likely to be introduced in other countries... As that happened it was inevitable the international fraudsters would target countries still using the old technology... The challenge for all credit card issuers was to develop worldwide standards for the chip cards... The introduction of card verification value in 1991 had reduced fraud by encoding a secret identifying number into the card’s magnetic strip. But recent years had seen an increase in the incidence of “skimming”, where criminals used recording equipment to produce a full replica of a card’s magnetic strip... [The] director of chip card for Visa International Asia-Pacific... described the battle between fraudsters and the developers of card technology[as] “an arms race”, with the good guys getting ahead, only for the bad guys to catch up. Credit card fraud as a percentage of transaction value, was now “extremely low” in N[Z, even by the]... already low Asia-Pacific standards... [of] only 5c in every \$100... The costs of fraud in the Visa system worldwide was 8c in every \$100... However... Eftpos fraud[in NZ] had leaped almost 70% between 1993 and 1996, much of it committed by bank staff and shop assistants who recorded PIN numbers and engineered multiple transactions.

...N[Z]ers have again been among the targets of a credit-card scam by a team of Nigerian fraudsters operating in the United Kingdom. The... BNZ... yesterday confirmed it had issued about 100 of its Visa card holders with new numbers after 50 or so had been found to be illegally used to obtain goods from mail order merchants in London.

...Since the early 1990s, the Central Bank of Nigeria (CBN) has endeavoured to combat the scourge of Advance Fee Fraud... being perpetrated by fraudsters via letters, telefax, telex, etc., both locally and overseas, through publicity campaigns, seminars, press statements, and co-operation with law enforcement agencies. To date, the CBN has placed advisory advertisements in over 80 newspapers and magazines in 12 languages in 36 countries, in its effort to forewarn all corporations and individuals who are likely to fall prey to the scam and thereby help stamp out the proliferation of Advance Fee Fraud, aka “419”... Unfortunately, the scam has continued unabated, even with increasing sophistication, because of the criminality, avarice and greed of the so-called victims of the scam, who are also villains... The use of fake Government, C[BN], Nigeria National Petroleum Corporation, etc., documents is a common practice... On numerous occasions, the so-called victims... have brought law suits against the [CBN], all of which the Bank has defended successfully... **YOU ARE THEREFORE, WARNED AND ADVISED, IN YOUR OWN INTEREST, TO IGNORE THE “GET-RICH-QUICK” BUSINESS SOLICITATIONS...** For the avoidance of doubt, it should be restated that the C[BN] will not accept responsibility for any loss sustained by any person or corporation that fails to heed our warnings.

...Years of underfunding have left the Securities Commission emaciated. Yet the need for a watchful agency to maintain standards of hygiene in the securities markets has never been greater. A greying population is daily exhorted to save for retirement and the variety of investments on offer expands constantly. The same modern communications which have brought our capital markets within reach of international investors have also seen the more gullible among us preyed on from as far away as Nigeria... A review by a former auditor-general three years ago said a strong case could be made for increasing the commission's staff and funding by 50[%]. Instead it was effectively frozen. And now another review, by the Ministry of Commerce, is gravid with the possibility that the commission's funding crisis be dealt with, at least partly, by stripping it of its role in advising the Government on business law reform. Admittedly, its advocacy of law changes in the past has often failed... But, as a constant and disinterested observer of the markets, its views deserve to be taken seriously... And a wise Government values contestability of advice.

...Levies on public companies and higher fees for those seeking exemptions are options to boost the cash-strapped Securities Commission's funding suggested in a review of the commission by the Ministry of Commerce... A study by Coopers and Lybrand... concluded that the commission's financial position was unsustainable beyond 1997/98 and it would either have to shed staff or secure additional funding from the Crown or third parties. For several years it has had to top up its income by drawing on reserves, which are now near exhausted. The commission devotes about 35[%] of its time to monitoring and investigating securities markets and there is a case for market participants contributing to those costs by means of a levy, the ministry review says. It points out that when public issuers file their audited account they pay a levy towards the cost of the Accounting Standards Review Board, and that listed companies pay a levy towards the costs of the stock exchange's market surveillance panel. In 1996/97 91[%] of the commission's \$2.1 million income came from the Crown, and the balance of \$180,000 from user charges from those seeking exemptions from the securities regulations. Considering exemptions represents about 30[%] of the commission's workload. Not all of that relates to applications it receives; it sometimes spontaneously issues generic exemptions, as earlier this year on equity warrants, in order to ensure new products meet the market without undue delay. A potential risk in adopting a more user-pays approach to this aspect of the commission's funding might be that it would become more reluctant to grant class exemptions. The other 35[%] of the commission's time is spent on reviewing and commenting on business law, and on its public education role.

...Staff at a London bank have discovered a mummified pygmy in a [securi]ty deposit box in their vaults... A burst water pipe in May led the mummifying process to start to reverse, the *Daily Telegraph* said, and the box began giving off an unpleasant smell... Workers were said to have been disturbed that there was a body in their working environment.

...[France came close to being the world's first cashless society this week as banks and post offices ran dry of money, hit by a national strike by security guards demanding higher pay and better protection after a bloody wave of robberies. At the start of the week, 40% of ATMs had run dry as the strike, launched 12 days ago, started to bite. By midweek, some banks reported that 60% of their machines were empty. In Paris, thousands of shoppers, some bemused and others angry, had to write cheques or use credit cards to buy a baguette or a bottle of milk. In contrast, supermarkets worried as they stockpiled wads of money with no one to transport it safely. French shops do not give cash with Eftpos transactions. After two guards had been killed and nine injured in seven robberies in less than six months, union leaders said an attack in suburban Paris in which three guards were injured and 23 million francs stolen was the last straw. Guards, who are paid 6000 francs (\$NZ1700) a month – just above the minimum wage – and who are armed with at most a .38 pistol, started walking off the job. Their union is demanding that the profession be classified as risky, enabling retirement at 50 and 1500 francs a month more. Employers have offered 400 francs but no early retirement. "In the old days, the only people you had to look out for were small-time crooks," says a 52-year-old driver's mate who has been in the business 23 years. "These days, you are talking about major criminals who are tooled up with Kalashnikovs and dynamite." The gangs observe the routes of trucks and use equipment to jam their radios and monitor police frequencies. After sandwiching trucks fore and aft with lorries, they use gelignite or even rocket-propelled grenades to blast open the rear doors, not giving a moment's thought for the guards inside, who were often reduced to shredded meat.' In local news, 'a massive manhunt is under way after two security guards were ambushed at an ATM and robbed at gunpoint in Wellington early yesterday by four balaclava-clad criminals, who left the guards tied up but unharmed then calmly took their keys and fled in their van. The holdup happened as rush-hour Wellingtonians walked by oblivious to the drama. Police aren't saying how much was taken but some ATMs hold two canisters of about \$80,000. Detectives were also silent about what else was in the van but said the robbery had the hallmarks of a planned crime. ■ NZ's largest security van holdup, in Paraparaumu last year, was worth over \$600,000.'

...Wellington's \$1 million security van heist is emerging as one of the best-planned and most expertly executed crimes in NZ history. No witnesses have come forward to say they saw the robbery or the Chubb van leaving Willis St some time before 8 am. Almost 40 hours later a motorist travelling up the Ngaio Gorge, about 3.5km from the money machine, noticed smoke coming from a historic 1879 brick military ammunition store. Inside, the Chubb van and all the valuable forensic evidence from the heist were blazing. The isolated warehouse is set among a Wellington City Council bush reserve. Its only vehicular access is a 300m private road which, because of vandalism, was blocked with a padlocked heavy metal swing gate. When the Fire Service arrived, they had to saw through the gate to get to the blaze. It appeared the criminals used a key to unlock the gate, drove the van into the warehouse and torched it, then fled and locked the gate behind them. In another strange twist, when police recovered the 12-odd keys from council parks and property staff with access to the warehouse road, none of them matched the gate. A council spokesman said that staff do not visit the site often and it appears the lock was changed mysteriously a couple of weeks ago. The criminals have so far proven so meticulous in covering their tracks that the police are asking the public for leads and the Chubb security firm has posted a \$10,000 reward for information.' ● IN 1963, a mail train travelling from Glasgow to London was robbed of more than \$10 million in notes destined for Bank of England furnaces. Most of the robbers were found, but not much of the money.'

...the '26-year-old who last month began a 10-year jail sentence for overseeing NZ's biggest armed robbery dreamed of achieving fame and fortune as a professional wrestler. More than \$250,000 was never recovered from the robbery – some of it burnt in the security van when it was torched to destroy prints.'

...sometimes thieves use heavy machinery to pull ATMs from their wall, although at least one robbery was solved after 'police followed a trail of gouges that an ATM had made while being dragged to the thieves' hideout'!

...two Britons were found guilty yesterday of fraud after tricking bank customers into using a home-made "hole in the wall" cash dispenser. While people tried without success to withdraw money from the cash machine installed in a street in east London, the two secretly recorded their bank details and PIN number. They then used this information to withdraw £120,000 from the customers' accounts.' In local news, 'a woman who used the identities of dead babies to forge documents admitted fraud charges totalling almost \$500,000 when she appeared in the Porirua District Court yesterday. The 43-year-old student pleaded guilty to 158 charges after police withdrew seven. She had enrolled false identities as voters and obtained drivers licences, tax numbers and four passports. She even invented an advertising business that provided identification such as pay slips and character references on bogus company letterhead. A sergeant said the student had told police she considered the fraud, involving at least 17 identifications, as her "job," and she was motivated by greed. She was remanded in custody for sentencing. Her lawyer called for a pre-sentence psychiatric assessment.'

...a NZer 'who used the names of dead babies to obtain 22 birth certificates, which she then used to receive 14 credit cards, has been jailed for fraud.'

...a former executive director at Macquarie Bank has been found guilty of fraud in AUS's largest ever insider-trading case. The 10-week trial at Sydney's Downing Centre District Court heard that the director visited 15 banks on one day in September 1996, withdrawing cash and buying cheques in a series of transactions aimed at avoiding reporting requirements. The 39-year-old was accused of using the cash and cheques to boost his personal fortune by \$A2 million through the use of confidential information about a \$A2 billion takeover bid that the Marquarie Bank, AUS's only publicly traded investment bank, was a corporate adviser to. The director could face a maximum jail sentence of five years on each charge.' In related news, 'a US financier sought in

relation to the disappearance of at least \$US300 million from several insurance companies has been negotiating his surrender, a Connecticut newspaper reported yesterday. The Hartford Courant said the financier was believed to be hiding in Europe, but had been in contact with federal prosecutors through a defence lawyer. The US Attorney's Office in New Haven declined to comment. Interpol, the international police organisation, has issued its highest alert to 177 member nations: a "red notice" to stop and arrest the financier. A lawsuit filed by some of the 11 insurance companies put the loss at \$US915 million. Also missing is as much as \$US1.98 billion from the St Francis of Assisi Foundation, which the financier established in the British Virgin Islands. Investigators suspect the charity was merely a front for fraud. Police are also looking for at least six people who worked out of the financier's sprawling Greenwich home, part of which he converted into a securities trading floor. Authorities found a hand-written to-do list in the house that included "Launder Money,"...

'International money-laundering has never been easier for big-time criminals – and the South Pacific has become one of the most popular destinations for their ill-gotten gains. The world has suddenly shrunk around NZ. At the tap of a computer key, local criminals can tap into a rapidly expanding cyberweb that can take in black cash generated from drug deals, robberies and a dozen other major crimes, launder it, and deliver it back as clean, legitimate money. For the moment at least, the US Bureau of International Narcotics and Law Enforcement believes we are still small fry, and that dirty money from serious players can be cleaned far more easily elsewhere. Money-launderers have been given golden opportunities by the proliferation of overseas financial centres, increasingly set up by poor countries as a means of siphoning off some of the hundreds of billions of dollars flowing around the globe. Most of these centres lack stringent regulation and supervision, and can be set up and operated on the Internet. Almost 20% of the drug traffickers, terrorists, money-launderers, tax evaders and other criminals operate in the Asia-Pacific region, including our close neighbours the Cook Islands, Nauru, Samoa, Niue, Marshall Islands and Vanuatu. The islands also allow international business companies to be set up. These, the bureau says, present impenetrable barriers to law enforcement. It says money-laundering and tax evasion are reaching a scale that threatens the security and stability of entire countries. Russia's precarious economy has already been rocked by the illicit export of vast sums of money. Rocked by the rise of the Mafia, over-regulation and economic turmoil, the flight of capital – and the resulting loss of tax revenue – has soared to an average estimated rate of \$US25 billion a year'...

'Something's rotten in the tiny tax haven of Liechtenstein where money laundering accusations are rife Desperately fighting international accusations that it is a haven for South American drug money and Mafia loot, the tiny European principality is now on the brink of an abdication crisis. His Serene Highness, regarded as Europe's richest and most authoritarian monarch, has announced he will hold a referendum on constitutional reform. If it fails, he will pack up and move to Vienna. With German secret service leaks implying that Liechtenstein's banking industry is teeming with crooks, these are dark days for the statelet on the banks of the Rhine with just 32,000 citizens but 80,000 registered companies. Germany would love to do away with such tax-havens'...

'Monaco is a rogue state which connives in the laundering of drug and mafia money claims a French parliamentary investigation. Although the accusation is not new, the severity of the language and the official nature of the inquiry makes its findings deeply embarrassing for the authorities in both Monaco and France. The report accuses the tiny principality, surrounded by France and the sea, of having no proper system of "banking ethics," of allowing its celebrated casino – whose directors include the head of state – to run "out of control" and refusing all serious cooperation with international efforts to control suspect flows of capital. The committee of inquiry suggests that France, which provides almost all senior officials in Monaco, including the chief minister, is partly responsible for allowing this situation to arise. It calls on the French Government to scrap all fiscal and judicial arrangements negotiated with the principality in 1963. Monaco has 6,000 registered companies (it also has 300,000 accounts for 30,000 people). Large sums of money pass in and out of the companies, without the judicial authorities in Monaco having any right to seek information on their activities.'

...Fallen from Grace When its head of state married film star Grace Kelly, everything seemed roses in Monaco. But it's no secret that a lot of dirty money sloshes around this 195ha piece of prime Mediterranean real estate. The principality's banks have no duty of disclosure and are famous for accommodating strangers carrying large amounts of cash. Interpol, which attempts to track the global movements of suspect money, says that everybody from the Sicilian Mafia to Colombia's Medellin cocaine cartel has some kind of account in Monaco. There are 10 times as many bank accounts in Monaco as there are residents, and the spinoff from this intense and sometimes volatile concentration of capital has helped to make it one of the richest places on Earth. But this summer a furiously worded report from a committee of the French Parliament alleged that corruption in Monaco reached far higher than generally thought, and for the first time the 78-year-old head of state and his family were accused of direct responsibility for the territory's state of rotteness. France, Monaco's protector and patron state, is threatening to tear up the 82-year-old treaty by which it recognises the principality's sovereignty. It would then, hinted the French, pass laws to administer what a former Justice Minister calls "a dose of reality." If that happens, Monaco may be finished. Reality hasn't been given houseroom for 700 years. A couple of expat-British brokers are worried. One won't give his name, but he will tell me what he thinks of Monaco: "It's fantastic. That's why they're out to screw it." The British are highly regarded in Monaco, where their financial skill helps to keep the cogs of the principality's money machine spinning profitably. And having virtually invented the Riviera as a destination 150 years ago, they tend to feel settled here. Or they did until recently. "It would be a tragedy to see this place go down the pan," the second broker says. "It's all dross on the Riviera these days. The French resorts are rubbish, but Monaco still has some style." And there is truth in this. There is no litter or graffiti and no beggars on the beautifully kept streets, bathed in 300-days-a-year of sunshine at an average temperature of 16 deg C. During one 10-day period last year the most serious crime was a nightclubber firing a champagne cork into another man's eye. Statistics show an average of one murder every 12 years. Police wear 18th-century uniforms and still salute when spoken to. Blondes in mustard-coloured Bentleys swoosh idly between the Beach Club and the bar of the Hotel de Paris. At its best, Monaco is a romantic curio, a throwback to the days of kings in castles, fortune-hunting bounders, raffish dandies and fairytale princesses. Its follies and scandals have entertained the world for years, but the tawdry realities of modern life have been slowly catching up and lately its archaism has ceased to be funny. The principality has survived the Black Death, the French Revolution, two world wars, the antipathy of General de Gaulle and the loss of Grace Kelly. When Monaco's independence was first accepted by France, Guy de Maupassant described the territory as being "peopled by the scum of all continents and society." Any poke around the place confirms that nothing much has changed – but it might be about to.' Meanwhile, 'in a report entitled "The Effects Of Technology On The EU Banking Systems", the European Central Bank said: "Internet banking is expected to have the highest future growth potential of all remote channels and market participants already anticipate that it will expand considerably within the next two to three years. The overall trend seems to be that more and more financial companies are moving along this path to promote increasingly sophisticated products." Such developments presented both opportunities and risks for the banking sector, the ECB said.'

...Secure Internet banking and credit card shopping may arrive here sooner than expected now that both Netscape and Microsoft have permission to export 128-bit encryption capability in their Internet browsers. Previously, Internet browser software outside the U[S] was restricted by the U[S] Government export controls to the relatively easily hacked 40-bit encryption... [By the way,] five young crooks... beat a computer security programme to get credit card numbers, which they used to order electronic equipment worth thousands of dollars. But... the monthly statements sent to victims detailed the purchases – and where they'd been delivered. And the fraudsters had used their own addresses.

...A[NZ] woman in hiding from her violent ex-husband was forced to flee to another secret location after her bank breached her privacy by sending him her bank statements. The woman was shocked and distressed to learn that he could trace her whereabouts by monitoring the locations of her electronic banking transactions. This case, highlighted in the Banking Ombudsman's annual report, led to the bank paying \$1200 compensation to the woman. The ombudsman... said it was a good example of the new powers she had been given in the past year making it possible for her to recommend compensation not only for direct financial loss, but for... embarrassment, humiliation and distress. [She] said it was of concern that someone other than the account holder could notify the bank of a change of address. "It was of even more concern that Mr R had

been able to secure a change of address given that the bank branch was on notice from Mrs B of the problems within her marriage and her desire to have nothing to do with Mr R,"... This year has seen a 30[%] increase in the number of complaints to the ombudsman... [T]he complaints tended to show that bank staff were poor communicators, possibly because of job insecurity or stress from the fast pace of change within the banking industry. "I am seeing more cases where the complaint, or an element of the complaint, relates to staff inattention to detail, failure to give appropriate explanations, inconsiderate behaviour, and in the worst cases, plain rudeness to a customer." [Editor's note: 'The post of Ombudsman was established on Sept 7, 1962, with the power to investigate complaints against government departments and report, with recommendations, to Parliament. Further legislation in 1975 provided for the appointment of a Chief Ombudsman and an unspecified number of other ombudsmen.'

...THE NZ] banking industry's performance has dropped significantly in the past three years, says the Consumers Institute. In... 1994... 29% of respondents rated their bank's overall performance very good. This time only 24% did. Customers satisfied with service fell from 43% to 36%... Consumer recommended... N[Z]'s only locally owned bank, Taranaki's TSB Bank... as the top service provider, followed by ASB Bank and BNZ... British research... found more than half of... customers[in that country] thought their banks were greedy, not to mention inflexible, complicated, condescending, arrogant and staid... [Incidentally, investors] in the Tower Spotlight Europe Fund are getting an average 10% compensation payment following trading irregularities in the British-based... European Growth Trust last year. Tower's fund invests in the... [trust,] which had to be bailed out to the tune of \$360 million by its parent Deutsche Bank. After the bailout, the... trust agreed with a British industry watchdog to pay compensation to investors in the fund between August 1 1995 and September 5 1996... About 2000 investors will receive compensation.

...Creditors of failed merchant bank DFC New Zealand will receive final payments of about \$1 billion on October 15 in accordance with a debt restructuring effected in December 1990... [The] \$1 billion will be repaid in full out of the proceeds of N[Z] Government zero-coupon bonds which mature on... October 15... The percentage recovery on... [the] debt was 129[% in NZ] dollar terms.

...Buy now, pay, well, whenever... Market leader Visa says one in three N[Z]ers now has one of its cards... Credit card transactions have doubled [in NZ] in value from \$3 billion to \$6 billion since 1993... [I]f you're in meltdown about how much you've got on your plastic you're probably not alone. N[Z]ers currently owe \$1.7 billion on their credit cards and that equates to \$472 for every man, woman and child[- or]... an average of \$1120 a card... Music to the ears of bankers.

...Consumers worldwide bought a record \$US1 trillion... in goods and services with Visa credit and debit cards in the year ended March 31, as more people found more uses for plastic payments. Visa, the world's largest payment system, said total purchases rose 23.7[%]... Visa issuers increased the number of debit and credit cards 12.8[%] to 572 million worldwide. "An increasing number of consumers are relying on bank cards as the best way to pay,"... In the U[S], total Visa cards generated \$467.7 billion in sales, capturing 51.5[%] of all card sales... The increased purchasing was accompanied by a slowing in the number of credit card write-offs in the... [U.S. W]rite-offs, when a company admits that customers will not pay their bills... declined to \$842 million... in May... from \$846 million a month earlier... Companies usually wait about 180 days before writing off an account. Debit cards... which draw funds from a bank account rather than a line of credit... were the fastest growing part of the card business, with purchases rising 40[%] to \$305 billion...

THERE'S a psychology behind credit card use that banks well understand, and can play to our disadvantage... Interest-free credit - what more can you want? And if you need a little longer to pay if off, interest rates will kick in, but the effect of that can be minimised if you decide to pay it off quickly... Interest rates on credit card purchases are still annoyingly high. With mortgage rates under 10%, and inflation around 2%, credit card rates are still around 19%-20%. Banks justify the high credit card rates because the money is lent as unsecured credit and is hence a risky business. They also have to offset the losses they make because of the disciplined few who pay their bills within the allotted time... But the... ASB Bank, for example, has a low interest credit card that charges 13.9%... The catch is you pay a quarterly fee of \$17... The ASB maintains it works fine if what you're buying costs more than \$1000. The [BNZ] offers tiered interest rates on its standard MasterCard. On purchases up to \$249, you pay the top rate of 19.75%; between \$250 and \$999, 15.75%; \$1000 plus, only 13.75%.

...At MasterCard we believe our Gold Cardholders are worth their weight in gold. So we're giving them a chance to win it... From now till August 31... every US\$100 you charge to your card entitles you to an entry to MasterCard's Win Your Weight in Gold Sweepstakes... At the end of the promotion, a draw will be held. Lucky winners at this draw will get an all expenses paid trip to the Gold Coast, A[US], to be part of the golden moment - the awarding of... his[or her] weight in real gold... [E]ach runner-up gets a solid gold MasterCard worth US\$10,000... You could discover you're worth a million dollars. Or maybe even more... So start using your Gold MasterCard for everything you buy... The Future of Money.

...[a small business supplying healthy lunches to 28 Auckland schools was hit by the ASB Bank with cash-handling fees of hundreds of dollars a week. The founder of the Cool School Lunch Company says the fees would have snuffed out the business if she had not found a cheaper way of banking through security firm Chubb-Securitas. Almost all Cool Schools' takings are in coins, with prices ranging from \$1.20 for crackers and Marmite to \$3 for a ham or chicken roll. The company banks more than \$2000 daily, all but a few hundred dollars in coins. Since February 28, ASB has charged \$3 to handle every \$100 in coins above the first \$100 a day, and \$3 for every \$1000 in notes above the first \$1000. On \$2000 in coins a day, Cools Schools would be paying \$285 a week in cash-handling fees (Chubb charges only about \$90 a month). "I just can't believe that the bank feels that it can charge those sorts of rates when a commercial business is making a profit that is just a tiny fraction of that. It's just crippling. I guess someone overseas has decided it's time we didn't have cash. Well, you tell that to 5-year-olds. I think it's criminal." An ASB spokesperson said some customers with large cash receipts had negotiated exemptions from the cash-handling fees. She said the ASB felt obliged to introduce the fees because other banks were already charging them, and their customers were bringing in cash to the ASB and then writing cheques to transfer the money to their main banks. However, the ASB appears to be the only bank that charges extra for coins. Meanwhile,' the ASB's 'profits are soaring.'

...ASB Bank has capped its 150th year in business by reporting a 29[%] leap in after-tax profit to a record \$92.5 million for the year ended June... [and the bank's managing] director... said the new year had got off to an exceptional start with the typically slow month of July being the best in the bank's history... Despite a slowdown in the real estate market and a continuing squeeze on interest rate lending margins, the bottom line jumped from \$71.8 million in 1996, helped by a 17[%] rise in operating income to \$408 million... While retail advances were up 18[%], the bank's \$2.3 billion growth in new home lending was slightly down from the \$2.5 billion in the previous year... Business and rural advances were up 34[% and 29[%] respectively... Total loans and advances rose 22[%] to \$9.3 billion, while deposits were up 21[%] to \$10.3 billion... The return on equity was 18.3[%] while the return on total assets was 0.9[%], just short of the traditional 1[% benchmark. 21[%]... growth in total assets, to \$11.0 billion, place ASB ahead of Countrywide's position as N[Z]'s fastest growing bank but for WestpacTrust, which doubled its size by acquisition.

...WestpacTrust has reported a net profit of \$333 million for the... year, just \$2 million short of the... record annual profit for any N[Z] bank reported last week by the... [BNZ. WestpacTrust's] result was... 162[%] up on... the 1996 year... [Also reported yesterday was t]he National Bank['s 68%]... rise in after-tax profit to \$73 million for the six months to June 30. It attributed the rise to new savings products, improved cost containment and management of margins. Last year the bank shed about 300 staff to turnaround its worst trading in five years... The latest result... was achieved on a 17[%] rise in revenue to \$320 million...

More branch closures and job losses loom for WestPacTrust staff despite the merged bank's making a near-record profit for a bank of \$333 million... A bank spokesman... said yesterday that another 50 branches would close and only 65[%] of the 4500 jobs in branches were guaranteed.

The other 1575 branch staff would go through a selection process over the next nine months. [The spokesman] did not know how many would keep their jobs but said... [m]any were being lost through natural attrition... Restructuring was due to be completed about... August... next [year]...

Westpac Corporation pulled itself back from the brink of extinction through a low cost re-engineering process... [T]he turnaround in 1996 to \$[A]1.13 billion profit could be largely attributed to efficient use of technology... In 1992 the bank set a record for having the largest corporate loss of \$A1.7 billion, and was rated among the 10 worst performing banks in the world. The other nine no longer exist... The... Westpac... chief executive... received total payments of \$A2.15 million... This included \$750,000 in salary... and... the same amount in bonuses... The second most senior executive... took home \$984,000, and the chairman... a more modest \$260,000.

...Westpac bumped ANZ Banking Group from third to fourth... [as AUS's] best performing bank... last year... A[US]'s most profitable bank... was... National Australia Bank... which is... the parent of... [the BNZ. NAB] made a net profit for... 1996-97 of \$A2.22 billion... up 5.8[%] on the previous year... [In comparison,] ANZ Banking Group... reported an 8[%] drop in annual profit to \$1.024 billion... Behind NAB, Commonwealth Bank of Australia maintained second place... [while the] Victorian regional Bank of Melbourne [was] the best-performing [minor] bank...

Bank of Melbourne is poised to bow out as a fully fledged regional with a... 6.5[%] decrease in net profit to \$85.2 million. The board did not declare a final dividend, given the 90c fully franked special dividend included in Westpac Banking Corporation's proposed \$1.4 billion takeover offer. The deal is due to be completed late next month... [Bank of Melbourne's] chairman... joined the chorus of bank chiefs warning of ongoing intense competition... [In related news, 'the AUSn treasurer – the junior minister responsible for banking policy – resigned last night following controversy over his ownership of shares in the ANZ bank.'

...ANZ NZ] reported a 7.2[%] increase in net profit after tax to \$126.9 million for the nine months to June, producing a return on shareholders' funds of 23.8[%]... "This is a good result in a competitive market..." [its]managing director... said... ANZ's costs as a proportion of income at around 72[%] are... high when compared with other banks which typically have ratios between 61... and 66[%]. One contributor to ANZ's high cost structure has undoubtedly been PostBank which, despite being acquired in 1989, is still not fully integrated... Another is an expense bulge as the bank invests in new delivery mechanisms. [● In 1996 the self-professed "Yes Bank" said "No" to a pay claim for 6% by its staff. 'ANZ paid less than other banks and wanted the right to put new employees on lower pay and conditions' (a move which led to 'a one day strike by bank staff in October').

...AUS]'s new banking players could be heading for a fall, according to the outgoing chief of the ANZ Banking Group... [There]s some evidence that new players had misread the market and this could lead to a late-80s-style bad-loan crisis for some... [B]ut... ANZ had improved its standards.

...China's already shaky banking system faces more non-performing loans risks because of high exposure to property lending. Property loans in Shanghai and Beijing are estimated to total more than \$US4 billion... China's non-performing loans to real estate are thought to be anywhere from 20... to 40[%] of all loans... Borrowing from the non-financial sector could be particularly expensive, with interest rates as high as 20 to 30[%]. When this cost of funds was put in the context of very low commercial-building occupancies and falling rents, the financial risks become very high... Occupancies in China's main commercial districts were 20... to 30[%] in many instances... Despite these near-term risks... [vacancy] rates... would go higher... China's major cities were in the grip of a property boom, the scale of which the world had probably never seen before... In Beijing alone, new office supply could total 1.3 million sq m by the year 2000... In Shanghai, property building was most rampant in Pudong[, which]... is immediately east of the old Shanghai city centre and was in 1991 designated as the new financial centre. At the end of 1994, office stock in Pudong stood at 250,000 sq m; it is now 1.25 million sq m and is forecast to grow to 2.4 million sq m by 1999... Across the river in Puxi and Hongqiao, [another] 52 commercial buildings have been completed, or are expected to be completed, in the next few years... [Shanghai's objective is to be] Asia's premier financial capital outside Japan... in 10 to 15 years...

AWARE [GDP] growth – which hit a healthy 2.5% in 1996 – is likely to slow this year, the[Japanese] government has been pushing ahead with deregulation and a "Big Bang" overhaul of the financial system. This will tear down the barriers between commercial banks, security houses and other financial institutions by 2001. It will also force banks to stand on their own two feet, instead of being propped up by the government when they get into trouble... "A third of the financial institutions will survive. The rest will merge or join with foreigners or go bankrupt." Last year the government allowed the first bank to collapse since 1945. But it got cold feet last month when Nippon Credit Bank, saddled with \$15,340m of bad loans from property lending, looked as if it might go under. The finance ministry ordered several other banks to bail it out, and allowed Bankers Trust to enter into an unprecedented alliance and take over \$26.1b of NCB's overseas assets. The bailout has annoyed the strong banks, which have seen their shares plunge as a consequence. The property market, down 70% from its peak in 1991, fell another 3% last year, making it impossible for the banks to recover their loans by selling repossessed properties. The government has announced plans to try to bolster prices by securitising mortgages and getting local councils to buy more land. But there is no guarantee this will bring any quick improvement. Most of the banks' assets are in the form of long-held securities, but the local stock market, down more than 50% since 1990, has been as unhelpful to the banks as the property market. Nevertheless... the... big industrial companies have performed well. Benefiting from the strong dollar and the weak yen, car producers are expecting record earnings and an average net profit rise of 65% for the fiscal year... Unfortunately, Japan's smaller companies have rarely been in worse shape. More than 1000 collapsed every month last year... A high proportion were financial firms. Economists have warned their collapse could have a knock-on effect for the rest of the economy and produce an even higher number of bankruptcies this year. But what worries analysts most is the effect the latest Nomura scandal could have on Big Bang... "Here you have the biggest player in the market turning around and saying you cannot enforce the limited rules you have now. What hope do they have of enforcing the rules after deregulation?"

...There were tears before bedtime as one of Tokyo's 'Big Four' broking houses collapsed, threatening to plunge the country back into recession and deepen Asia's financial crisis... The collapse of Yamaichi Securities is the largest corporate failure in Japan since 1945, and has left the country stunned. It's also true that the collapse – only the latest twist in Japan's seven year saga of financial woes – is part of an oft-predicted and ultimately inevitable shakeout in the nation's financial sector... A former chairman of... Yamaichi... has admitted hiding... losses of more than... 200 billion [yen]... He added that he felt he had no choice but to conceal the debts to maintain the brokerage's credibility...

His face contorted with tears and his voice quivering, the president of... Yamaichi... begged for mercy: not for himself, but for his workers. [The] plea for jobs drove home for many the dire realities of the Yamaichi fiasco, especially in a nation where massive lay-offs are extremely rare and major corporations aren't supposed to go under. But now, thanks to a mix of old-boy networking and a new brand of market-driven corporate self-interest, the sinking Yamaichi has found itself inundated by job offers... [I]t has received 9000 offers from some 1000 firms – Yamaichi and its affiliates employ 11,000. The offers... have taken the edge off the gloomy economic headlines that have dominated Japan's media over the past months. Still, some analysts say the response smacks of the old-style, Government-led approach Japan is supposed to be shaking off.

...An employee of a firm affiliated with failed Japanese brokerage Yamaichi Securities Co Ltd killed himself yesterday by leaping from a seven-storey building in Osaka... [In the aftermath of the Yamaichi collapse, r]etrenchment from costly and competitive overseas operations, established in the boom years of the late 80s, was inevitable for most Japanese banks, analysts said... with... [some warning that because of the] financial strife at home... many may not return to the international scene for another 10 years.

...Foreign firms are eager to apply to Japan their overseas experience in bundling and selling as securities everything from credit card debts to home mortgages... [One company] aims to buy as much as 500 billion yen... in bad loans backed by real estate from Japanese banks in a bet that Japan's real estate market will soon hit rock bottom... Real estate prices have been falling for seven years... "Now is as good a time as any to step in the market if you have a long-term perspective,"... a company official in Tokyo said.

...It may not have been the big bang, but... a... major overhaul of A[US]'s \$A40 billion... a year financial services industry has opened banking to new players and removed regulatory powers from the Reserve Bank. Overseeing existing banks and new competition from credit unions, insurance companies and superannuation funds will be a separate organisation, the A[US]n Prudential Regulation Authority... The inclusion of building societies, credit unions and friendly societies requires the agreement of state and territory governments... In moves designed to increase choice, boost competition and lower costs, a new watchdog called the A[US]n Corporations and Regulation Authority will be responsible for the integrity of market conduct... and... consumer protection... A third new body – the Corporate and Financial Services Commission – will absorb powers from a range of other bodies... The revamp... has been criticised heavily by banks...

While A[US] continues to agonise about allowing a degree of foreign ownership of its leading financial institutions, N[Z] went that way long ago. The [local] banking sector is now dominated by A[US]ns, with the consequence that decisions about the N[Z] banking environment are increasingly being made in Melbourne and Sydney. Both ANZ and BNZ are in the throes of group reviews which are likely to see many of their operational functions transferred across the Tasman... BNZ's review, announced to staff a few weeks ago, is aimed at seeing what functions can be shared with... its A[US]n owner. The logical extreme is that the BNZ finishes up as simply the regional (ie N[Z]) brand of N[AB]... ANZ is already moving its computer facilities to A[US], a simple enough task given the reach of modern telecommunications, and further such developments would be no surprise as a global restructuring of the group proceeds.

...The tropical island of Bali is hardly synonymous with the leading edge in retail banking. But as the host to some of the world's leading bankers last week, it was the venue for consideration of the major challenges faced by the industry. Two issues were at the forefront of the bankers' minds: rapid change and the virtually unpredictable nature of the industry in the next five years. As in many industries, traditional bankers are facing commoditisation of their services prompted by unfamiliar... new entrants seizing opportunities as the industry worldwide is deregulated. The problem for the old-timers is that the new entrants are making no attempt to behave like banks in the traditional sense. They are not setting up bricks and mortar branches, they are making no effort to offer a comprehensive service and they do not have the legacy [of] computer systems which are proving a burden to their long-established competitors. Indeed, they are relying on the huge savings in costs made possible by exploiting telecommunications to keep in touch with customers as they pick off specific market segments... With a low-cost base enhancing their capacity to offer loans at favourable rates, and higher interest on deposits, they are... forcing... the... [industry's] incumbents into a profound reappraisal of their own businesses.

...IT'S easy to see why banks love the home mortgage market: It's huge (around \$50 billion in N[Z]), it's profitable (banks leaning towards residential loans have been market leaders of late), and it's safe (as houses). No wonder, then, that others want to get in on the act. Barely a week goes by without another non-bank mortgage lending hopeful seeking a slice of the action. Last week it was the turn of a joint venture between financial services company National Mutual and realtor Harcourts Group. Mortgage Express NZ Ltd, as the new company is known, will kick off in November with around 20 mobile mortgage managers using their car as their office and a laptop connected to the Internet to get final loan approval for prospective home buyers... [The] chief executive of the new company... said banks still controlled about 88% of the mortgage market in this country. "In A[US], non-bank players now have 30% of the market, and that's the kind of market share [local] non-bank mortgagors should be working towards,"... Mortgage Express hoped to have \$1b of the annual \$14b worth of new mortgages originated each year within three years... Mortgages from his company would be different from those offered by National Mutual's direct-selling company, Freedom Financial Services... He said Mortgage Express would seek to be innovative in sourcing funds for its mortgage products, as well as being competitively priced. [By the way, a 'West Auckland couple are blaming stress from a bank error for having to sell a rental property next to their woodland home. For 12 months, the ANZ Bank mistakenly levied an unheard-of penalty rate of 24.15% on the bulk of their \$204,000 mortgage, leading to overcharges of \$24,976.99c. Not even when someone in the bank discovered in June last year that they were being charged too much were they told of the error. Their interest charges were simply adjusted back to a contracted fixed rate of 8.95% and they were none the wiser until their accountant told them eight months later that something was woefully amiss. Their bank manager arranged a refund of just over \$25,000 after accepting they were being charged too much, but it was not until this month that the ANZ recalculated its figures and admitted it owed them a further \$2412 in compound interest. The couple wonders if the bank would ever have owned up to the error had they not challenged it, and resents a suggestion by the ANZ that they should have done so sooner. The bank blames the mistake on human error compounded by a change in its accounting systems.'

...[H]uman error is the biggest cause of mistakes in banking... Ever suspected your bank might be overcharging interest on your loan or mortgage...? ...An A[US]n accounts bureau service claims 93[%] of overdraft accounts investigated have revealed errors... The chief executive... [of] Interest Savers... designed... software... to quickly check loan statements... after his own experiences as a banker of 14 years. On one occasion, while working in commercial loans, he claimed to have discovered errors that, left uncorrected, would have totalled \$A22 million... in overcharges. Since his programs have been sold, there have been countless examples of businesses and individuals finding overcharging on their loan and savings accounts... [One] customer found overcharges in 30 of 54 monthly statements... [while a]n insurance broking firm found that a trust account for its customers that should have received interest at different rates depending on the balance had received the lowest rate... over the whole term, amounting to a \$60,000 underpayment.

...N[Z]ers are paying, through higher interest rates, for their reliance on the savings of others, says the deputy governor of the Reserve Bank... If the substantial investment required by the forestry industry, for example, had to come from foreign savings, balance of payments deficits would inevitably continue... [However, the] Reserve Bank believes N[Z]ers have lost some of their sense of economic security and will put a higher priority on saving than spending over the next two years... [U]sing the most recent OECD numbers, for 1994, N[Z]'s savings rate was 20[%] of GDP, compared with 16[%] in the U[S], 17% in AUS, 13% in Britain, 21[%] in Germany and 31[%] in Japan. When people have a *sense of economic security*, an alternative to spending their money is 'withdrawing it from savings institutions to look for a better return – called disintermediation.' This can occur if 'inflation increases beyond the rate of interest that banks pay depositors.'

... 'Generally speaking, national saving equals national income minus national consumption and is identical to net national investment. Although data on saving are imperfect for statistical and conceptual reasons, they throw important light on the nature of the different groups of savers and the various forms of savings.' As for the adequacy of N[Z]'s savings performance, high... national savings are not the panacea to all economic problems – countries with impressive savings histories have their share of woes... Japan had high national savings but it had seen almost a decade of recession due to problems inflicted by inefficient parts of the economy which enjoyed high protection. Countries like China... and... Indonesia... might have high domestic savings, but they have problems in managing their economy... Malaysia and Thailand, which have [a] credible savings rate, have current-account and asset-inflation problems... What is more important is that a country keeps its economic house in top shape, economists say... "The classic example is the U[S]," a chief economist... said... "The savings rate is very low compared with the OECD average and yet it is the strongest economy in the world."

...the U[S] was rich enough and large enough to withstand the... \$US300 billion savings and loans debacle... - 1997

...on[c]e... SAVINGS AND LOAN ASSOCIATIONS... [were] financial depository institutions dedicated to promoting thrift and home ownership.

How did... the cleanest little savings & loan in Texas become the government's black hole... [and how was \$US]250 billion... stolen, squandered and finally sucked down the drain in a scandal that *Newsweek* has called "the biggest financial mess in U.S. history"? ...The main reason for the problems was inflation. Ever since the Vietnam War, the government had been fighting rising prices... Economics texts are littered with culprits in the losing battle. Some historians pin the blame for the problems on President Lyndon Baines Johnson's guns-and-butter economic policies. An equally convincing case is made that the Federal Reserve board during the [37th and 38th] administrations made America safe for inflation. Regardless of who is right, though, one thing is clear: The policies of the times provided few incentives to control inflation; Republicans and Democrats alike engaged in an extraordinary round of economic mismanagement that would literally destroy many savings and loan operators like [Vernon Savings]... Set on the flat, red, dusty plains of north central Texas, Vernon (population 12,500) is a hardscrabble town full of hard-working folks who for decades placed their life earnings in the hands of... [an old man who, with] a Bible in one hand and a butcher knife in the other... ran the local thrift in a manner befitting the S&L's Golden 3-6-3 Rule: Pay depositors 3[%], charge borrowers 6[%], and be on the golf course by 3 o'clock... By mid-1977, [the old man] had lured \$45 million worth of deposits into [his company's] vaults... But the status quo was turned upside down in 1981 when... a native son turned highrolling-Dallas-real estate developer, sweet-talked [the old man... into selling his beloved business... Over the past two decades, the savings and loan business had been good to him. Years of hard work had produced the rewards that a man of his era had come to expect in America – a nice home... the vacation place near Austin, an Oldsmobile in good repair, and enough Vernon[Savings] stock to make him a wealthy man... But making good money in the S&L business was getting tough, particularly with the government's erratic economic policies. Interest rates were 12[%] one month, 18[%] another. Inflation raged like a summer storm. Things were no longer predictable. People had stopped putting their money in a savings and loan forever; they'd pull it out six months later to get a better deal in... money market funds, which were really unregulated savings and loans with no deposit guarantees. To [the old man's] way of thinking, all of this was no good. It seemed excessive, greedy – the work of Satan. In just three months' time, Vernon Savings would post the first loss in the thrift's twenty-one-year history. Selling Vernon Savings definitely was... the [sensible option. As for the highroller, he] had a game plan for Vernon Savings... A bunch of low-yielding home loans buried in Vernon's portfolio wasn't the [prize]. The important thing was getting [the old man's] signature on a piece of paper... For a real estate developer, owning a savings and loan was about to become a mixture of bare necessity and golden opportunity... [The old man] signed the deal. [The highroller] had acquired his hometown savings and loan for \$5.8 million in cash. The price was fair – about 1.4 times the association's book value... [while, just] before the sale closed... Vernon's deposits totaled about \$72 million... [However, in] its current condition, Vernon Savings was no prize catch. But [the highroller] was looking toward the future... [T]he competitive advantages of an S&L were nothing compared to the potential they held... [Under new] rules that permitted him to average his deposits, Vernon had to set aside only \$7.4 million in reserve. In other words, [the highroller] could lure an additional \$750 million in federally insured deposits into Vernon Savings to be invested in his deals. But he had to invest only an additional \$2.8 million of his own money in capital. Best of all, [the highroller] didn't even have to put up cash as his contribution. The definition of capital had been expanded to include land, stock, or other assets... Once he took over, Vernon grew rapidly... By late 1983... Vernon's deposits stood at an astonishing... \$800 million... Nationwide, Vernon ranked second in profitability... [and] *Dunn's Business Month* would soon cite it for its professional real estate investment acumen... Owning a [S&L] had been a dream deal for decades, particularly in Texas. From its very inception, Texas had been a capital-importing state with a voracious appetite for borrowed money. Part of the reason was the state's oil and cattle industries, both of which require a lot of upfront cash. Texans had a penchant for thinking big, too... The state legislature was well aware of Texas traits when it passed the laws authorizing state-chartered [S&Ls]. To encourage a vibrant local industry, the lawmakers in Austin also passed liberal regulations that gave Texas S&Ls latitude to invest depositors' money in loans for a wide range of money-making ventures... The federal government, which guaranteed the safety of S&L deposits, didn't want financial institutions engaging in the kind of destructive competition for deposits that had characterized the Great Depression. So it adopted laws that limited the interest rates any federally insured S&L could pay depositors. Thanks to the liberal rules implemented in Austin, though, Texas S&Ls had a leg up on their counterparts in many other states... But S&Ls chartered in Austin had it even better: They got deposit insurance by paying a minuscule premium to a government-backed insurance fund, but they could invest more of their federally insured deposits in ventures such as oil and gas loans, which carried a far higher potential for profit. The legal anomaly created a Texas [S&L] industry that was more entrepreneurial but also more parochial in nature and spirit. Every once in a while, some faceless federal bureaucrat in Washington would frown upon the more liberal powers in Texas and try to crack down. But Texas S&L men would simply turn to their supporters in the state legislature. Pretty soon a bill would sail through the Texas statehouse preempting the Dudley-Do-Rights in Washington... It was hard to maintain a family, a big mortgage, three cars, a pleasure boat, and a small lake cabin on a legislator's salary... [an] anonymous Texas lawmaker explained to the *Dallas Morning News*... "It's hard to be pious because in all honesty I could use the money," he said... [However, by the 1980s, federal lawmakers were finding it equally hard to be pious. As a result, a] sweeping financial deregulation bill... [was approved by Congress which meant that] a developer who picked up an S&L could continue to operate a development business. It was unbelievable. Why borrow money from a commercial bank at 2 or 3[%] over prime, which was then 15[%]? A developer who wanted to build a twelve-story hotel in Coconut Grove could simply have the S&L set up a development subsidiary and use FSLIC-insured deposits to fund the venture... In effect, the new rules would allow [the highroller] and several hundred others like him to treat federally insured [S&Ls] as if they were personal piggy banks, borrowing billions of dollars at bargain interest rates for all sorts of ill-conceived projects. Building hotels would soon prove the start of something big. Why not hunting lodges, too, or ski resorts, or golf courses? ...If religion struck your fancy, go build a church on spec... It doesn't take long for someone with deep pockets and a [S&L] full of money to become well loved in the Catholic Church... Best of all, thanks to the [40th President's] administration and Congress, [the highroller] and his ilk would never have to worry about a shortage of funds. Even though it deregulated the industry, the federal government would continue to guarantee that all depositors in federally insured S&Ls would get up to \$100,000 of their money back, no matter how the S&L had invested the funds. In other words, the government deposit-insurance fund bore all of the risk. And if depositors started pulling their money out, all the owner had to do was raise interest rates a little, and the funds would rush back in. Those fellows in the [40th] administration sure understood the free market. They were [the highroller's] kind of guys... True... men wanted to get the government off everyone's back so entrepreneurs could earn real profits and make America No. 1... "All in all," said the President as he set down his pen after signing the bill into law, "I think we've hit the jackpot." ...In all, four government agencies engaged in federal financial regulation – a job that [a former] Federal Reserve Board Chairman... once called a competition in laxity. The comptroller of the currency in the Treasury Department regulated national banks; the Federal Deposit Insurance Corp. watched over state banks; the Federal Reserve monitored bank holding companies; and the bank board rode herd on [S&Ls]. By almost every measure, the bank board was the worst of the lot. Created after the bank runs of the 1930s, the board's duties included prevention of financial failures at [S&Ls], enforcement of the law, and the prevention of conflicts of interest. The President appointed the three board members, who had to be confirmed by the Senate, and he named the chairman... Being named chairman of the system was a bit like running the Metropolitan Sanitary District in Chicago. You were pretty important to people with sewer problems, but most citizens had never heard of you... At least one of the members had to be from the opposite party, and they presided over a network of twelve regional Federal Home Loan Banks, whose stock was owned by the local [S&Ls] in their regions. On paper the board was a powerful organization that could pull a thrift's charter, examine its books, pass sweeping regulations, and set board policies for the industry, such as the standards for minimum capital. Actually, though, the whole system functioned as an industry booster under the thumb of the trade associations, particularly the U.S. League. It was virtually impossible to be named bank board

chairman without the support of the U.S. League, and the industry financed the entire system through annual fees and assessments paid by federally insured [S&L]s. No government money was involved. In other words, the thrift industry actually owned its own regulatory system. It could tell the watchdog when to bark and knew how to pull its chain. The government's only exposure to loss in the system was through the U.S. Treasury's backing of the S&L deposit-insurance fund – a guarantee of solvency that would turn out to be fatal for American taxpayers... Entry-level examiners at the bank board earned a mere \$14,390 a year, far less than at the other bank regulatory agencies... [The salary] didn't exactly attract Rhodes scholars... Unfortunately, [the bank board]... not only resisted pay and staff increases, they pressed for reductions in the size of the examination force. It was all in the name of deregulation. The examiner staff actually fell during the years when the industry experienced its most rapid expansion. Examiners had faced a struggle when they were merely scrutinizing institutions full of home loans. Suddenly they were expected to analyse far more demanding and complex land transactions. They didn't have a chance. Since the whole system was financed by the industry, the... [staff] cutbacks saved the taxpayer nothing... Nowhere was the sentiment for financial deregulation stronger than in the Treasury Department, headed by... [a] former head of the Merrill Lynch & Co. brokerage firm... Stockbrokers traditionally viewed the thrift industry with a mixture of envy and disdain. Brokers figured the money that poured into thrifts would have been theirs to invest were it not for the safety provided by federal deposit insurance... Thrifts were viewed as a coddled, inefficient industry that needed a dose of free enterprise... [The Treasury Dept. head's] old employer on Wall Street[also] had a vested interest in seeing the government remove the regulatory wraps on the thrift industry. Merrill Lynch made a lot of money scanning the financial markets looking for the best interest rate available for clients who had megabucks – deposits of \$100,000 or more, sometimes called brokered funds. Prior to 1982, the megabuck market had been limited by a federal regulation that said brokered funds could not exceed 5[%] of a S&L's deposits. But... the DIDIC committee, led by [the former Merrill Lynch employee], removed the 5[%] limitation. Suddenly Merrill Lynch had plenty of places it could invest... [Vernon Savings] and other S&Ls in Texas drew huge deposits into their vaults from outside their area simply by taking out ads in the *Wall Street Journal*... offering investors high interest rates... A broker with a client who wanted to deposit \$900,000 in Vernon Savings to capitalize on a one-quarter-percent interest-rate advantage would split the money into ten \$90,000 accounts, thereby qualifying for federal insurance on accounts of \$100,000 or less. The high-cost deposits fuelled a surge in demand for riskier loans that carried the higher returns needed to pay the interest to the big depositors. Thrifts started investing in the futures markets[and] financial options... A few days... [after the sale of Vernon Savings was signed, the old man was informed that instead] of \$5.8 million in cash, [the highroller would give him] and a handful of minority shareholders \$1.1 million in cash and a note for \$4.7 million[, which]... would be paid off in quarterly instalments over the next seven years at 8[%] interest. It would personally be guaranteed by... a company that reportedly had a net worth of \$19 million. [The old man] didn't know what to think... [The highroller] seemed like a fine young man. He dressed in expensive clothes, drove nice cars, and always seemed to have plenty of money. He hired... lawyers... from... one of Dallas's leading and most reputable law firms... To [the old man's] way of thinking, proper law firms... didn't take on unsavory clients. They simply had too much to lose... On July 10, 1981, [the old man] signed another contract accepting [the] new terms... Prior to the 1980s, developers had never been able to own federally insured [S&L]s. Under the prevailing wisdom, allowing a developer to own a [S&L] was considered crazy... But common sense took a beating when Congress passed the 1982 laws deregulating financial institutions... Even before the laws were passed, entrepreneurs... had started snapping up S&Ls like they were used cars, licking their chops at the prospects of what was to come... [I]nept U.S. Government policies had... by 1981... pushed the price tag on a barrel of crude to \$34.30... a staggering 1,000[%] increase in less than ten years. The rising prices sent the freewheeling Texas real estate market into orbit, too. In contrast to the gas lines and recession that formed around other parts of the nation, Texas saw new office buildings, condominiums, homes, and apartment buildings sprout from the ground. The state became a global symbol of prosperity... Building permits in Dallas would soar from \$4.3 billion in 1976 to \$17 billion by 1983... Vernon's prodigal son simply... figured out that he – and the [S&L] – could make a lot of money by acquiring... land and then selling it at inflated prices to private investors, who could borrow all they needed from the friendly S&L... There was none of this mumbo jumbo about adding value or creating a profitable concern. Inflation in land values and a little deal called a "land flip" would take care of everything. To one degree or another, it was a path that... many others would follow... The profits from the land deals were astonishing. On one day, an Empire[Savings] subsidiary bought eighty-two acres of land... for \$1.86 million, or fifty-two cents per square foot, and sold a few hours later to [a couple of property developers] for \$3 million, or eighty-five cents a square foot. That was a lot quicker way for an S&L to make money than by sinking it in thirty-year fixed-rate home mortgages. [The property developers] would then turn around and sell the land again to some of their cronies... More than one hundred investors had flocked to Empire deals, and more were waiting in the wings... [The property developers] soon started hosting Saturday breakfasts at [a grillhouse] on Interstate 30... "It was a rah-rah type thing. But it quickly changed in a month or two when... you got the politicians coming out here in droves." ...Once breakfast was done, a big ten-gallon cowboy[hat] would be passed among the throng to be stuffed full of cash for the visiting politico in case things got out of hand and everyone needed a friend to cool things off. "If two politicians showed up, they'd pass the hat twice... The message was clear. You've got to contribute if you want to get into any more deals." ...A... contribution from each would net a quick \$100,000 for a cash-starved political campaign... Faced with the prospect of huge profits, investors figured the political contributions at the breakfasts were a small price to pay... The deals struck by... [the property developers] were crude models for dozens of other S&Ls like Vernon... [A] group of investors at... Point West "flipped" four acres of land they had acquired weeks earlier, [before] marking up the price sharply and selling it to [four new investors] for \$4.50 per square foot. Empire Savings lent [the four investors] all the money they needed to close the deal. "The way it broke down was, on the first tract of land, which was just over one acre, we built thirty-two condos." Empire also provided the construction loan for the condos, and its alter ego, a subsidiary named Statewide Services Co., became a fifty-fifty partner with the [four investors] on the project. "[Empire] would take the sale of sixteen of those condos and pay off the construction loan and the land loan on all four acres... That left us with the remaining three acres and sixteen condos free and clear. Statewide got eight of the condos and we [the four investors] got two each... You wound up with sixty to ninety thousand dollars' worth of property you could sell or rent." That was just the first wrinkle to the deal. The[original] developer had originally set aside fifty cents per square foot from the land loan for development costs – things like utilities and streets. But he needed only twenty-five cents per square foot. So... the[West Point] development kicked back twenty-five cents per square foot to the[four] investors. That meant [the four investors received a further cheque] for about \$12,000 for going along with a no-money-down deal in which they [had already] made a bundle... Real estate agents used to making \$15,000 a year hustling single-family homes could suddenly make that much money on a single deal. "It was like a drug. All of a sudden they had fifty percent more income. A lot of these people got in on six or eight deals..." [one of the four investors] said. They bought Ferraris and Rolls-Royces; new homes, boats, jewelry, and dreams. At times, it seemed as if anything were possible... Everyone involved in the scheme had made money... "They had their builder in there. He's doing all the construction. You wanted to do business there, you used their builder. They sold ...t[h]e contractor all of the lumber. They had landscaping... everything. I discovered the concrete contractor is supposed to pour streets that are four inches thick, but he's only pouring an inch and a half. At some point in time, I discover I'm paying... nineteen dollars a yard for eight-dollar-a-yard carpet." [The four investors] overlooked the profiteering... The deals[also] generated extraordinary fees and paper profits for the S&Ls... Empire not only got condos; it had charged [the four investors 18 to 20%] interest on the loans plus... a 12[%] fee... for financing the deals... [The S&Ls] then dipped into their federally-insured deposits to pay fat dividends to their owners. The deals would eventually generate an unprecedented glut of unsold condos, but no one seemed to care... That was a problem for tomorrow. Besides, inflation would eventually drive up the land value and bail everyone out. This was Texas, land of opportunity and oil... The new era of liberal rules and financial deregulation made it all seem so dynamic. S&L regulators in

Washington thought it was a miracle. A few of the federal regulators who showed up to view the Dallas spectacle felt some nagging doubt tugging at their guts. But they ignored their instincts. "I went down there," one federal official explained, "and this Texan showed me this piece of land and told me how this guy had sold it to that guy, and that guy had sold it again, until it had been sold about six times, and I said, 'My God. That's terrible,' and he said, 'Only if you're sixth.'" ...The euphoria was everywhere. Other investors clamored to get in on deals. At one point... tables were lined all of the way down the hall of an office building... and the investors were lined up in front of the tables. The loan officers would close one sale and pass the papers to the next guy, who would close another sale at a higher price. It was unbelievable. It looked like kids registering for college. If an investor raised a question, someone would come over and tell them to get out of the line, they were out of the deal... [I]t was not unusual to see thrifts such as Empire quadruple their outstanding loans in a year or two... "...I remember how the S&Ls had coffee cups that said, 'You Do the Work; I Bring the Money and We Split 50-50.'" ...Vernon[Savings] gave developers... 100[%] financing and then some, a technique permitted under Texas law... A developer with a big project could not only borrow the \$10 million he needed for a deal, but also enough money to pay Vernon's fees and the first two or three years' interest. At closing, the three years' worth of interest would be set aside in a separate interest-reserve account. As each monthly or quarterly interest payment became due, Vernon's employees would simply transfer the money from one account to another to pay the interest and keep the loan current. Even better, usually included in the loan proceeds was an up-front developer's fee of 2 to 4[%]. In other words, a developer could borrow \$10 million with no cash down and take anywhere from \$200,000 to \$400,000 immediately as compensation for his management of the project... The thrift's earnings soared because it charged loan renewal fees twice as high as the rest of the industry, routinely rolling over loans every six months instead of the standard one year... During a twenty-month period starting in April 1982, Vernon officials approved \$706 million in construction loans, including seventeen that totaled more than \$10 million... On paper, the board members were the guardian angels of Vernon shareholders and the public citizens who placed their savings in the institution. They had obligations – legal and moral – to protect the public's interest against harm and ensure that the people running the place didn't violate state and federal regulations. In practice, though, the board was a joke... By mid-1983, Vernon was in danger of violating federally imposed limits on loan volume despite the more lenient rules under deregulation... None of the board members seemed to understand how Vernon operated under the new regime... For the most part, the directors were small-town, naive folks who... ran music stores, funeral parlors... ranches... and... had spent more than twenty years approving relatively simple home loans. Suddenly... [they were] faced with complex development loans that involved interest reserves, profit participations, and exotic ventures in far-off places... Yet the directors and the employees at the thrift didn't object. Vernon had taken on a new philosophy. Everything was geared to profit. "Anything that was done that was not profitable was just kind of a no-no around here," one employee would later tell federal regulators. Vernon Savings couldn't miss. As long as inflation drove land prices upward, Vernon and its customers could always unload the most ill-conceived deal at a profit... But Vernon also attracted borrowers who couldn't get loans elsewhere... [Furthermore, things] had changed dramatically since... the early 1980s. The Texas economy was no longer booming. Oil prices stood at \$26 per barrel... A prudent businessman might have cut back once he saw signs of an economic slowdown. But real estate developers don't think that way... Practically every... developer in Texas... continued to expand... [However, condos] are far different from residential housing projects. A homebuilder can start a sixteen-house development and quit midway through if the economics turn against him. Once a condo project is started, though, it has to be finished. "If you say you are going to build 146 units, you have to build 146. That's the law,"... By late 1983, though, there were too many condos and not enough buyers... [T]he Dallas-area developers had created a 12.5-year oversupply of condominiums... Vernon subsidiaries that had passed their profits up the line to the parent company... soon found [themselves] in deep trouble, with hundreds of unsold units... [and] now faced the prospect of passing their losses on to Vernon Savings... A wintry chill lingered in Washington when... [the] chairman of the Federal Home Loan Bank Board... assembled his staff in a sixth-floor conference room to decide if Empire[Savings] should be declared "hopelessly insolvent." A decision to shut down the place would create the largest insolvency in the fifty-year history of the deposit-insurance fund, which stood to lose a staggering \$165 million. No Texas thrift had ever been declared insolvent by federal regulators... [But] Texas was not the only place with problems... By year-end 1984, fifteen more federally insured thrifts had failed... One of them, San Marino Savings in California... which went under with \$812 million in assets... would cost the FSLIC... \$35 million more than Empire... If things were bad on the federal level, they were worse at the state... [level. Despite this, by] mid-1985... Vernon had set up a money desk so government agencies, pension funds, other S&Ls, and banks could bypass money brokers and invest their spare funds directly with Vernon Savings via a simple phone call. The consistently high interest rates it offered savers drew huge deposits from... well-heeled investors in New York, California, Florida, and Washington, D.C... Indeed, by the summer of 1985, Vernon's techniques in Texas and nationwide had propelled it to the top of the heap. The lead story in an August 1985 *National Thrift News*, the S&L industry's trade paper, carried a stunning headline: "Vernon, Tex., Tops ROAA at Big S&Ls." ...In fact, Vernon's financial performance was almost twice as good as the next most profitable thrift in the U.S., according to the figures... The trouble was Vernon's financial report was a joke... It was the old quality-of-earnings argument... [L]oans to developers were coming due, and Vernon's borrowers couldn't repay them. Some of the projects were incomplete and generating no rents; some were burdened by cost overruns; some couldn't attract sufficient rents because of soft real estate markets; and some were... fiascos that should never have made it off the drawing boards. Instead of foreclosing and taking over the properties, though, [the highroller] kept the developers afloat with the Vernon shuffle – he would simply refinance the loan and lend them more money. A developer with a troubled \$12-million loan would borrow an additional \$2 million in federally secured deposits... including about \$400,000 in loan fees... that Vernon would deduct from the proceeds and book as income. The loan also included enough money for interest to keep the loan trouble-free for another year. The thrift – in short – was borrowing its earnings from depositors. Thanks to the Vernon shuffle, it now had \$14 million of its depositors' money loaned on a project of dubious value in a sinking real estate market instead of just \$12 million... By mid-1985... Vernon had put scores of those \$14-million loans on its books. Overall, the thrift reported it had taken in about \$910 million in deposits and invested the money in assets that Vernon valued at \$1.03 billion... But... state examiners and [the highroller's] own auditors... questioned the accuracy of the financial report. No one doubted that Vernon owed depositors \$910 million. That much was clear. But there was considerable skepticism that its assets were actually worth \$1.03 billion. About 80[%] of the money... had been invested in risky assets... Despite their concerns, the state regulators didn't act against the thrift. They sent Vernon one of those... letters that expressed regulatory concerns but meant nothing. Vernon's outside auditors... also signed off on the thrift's financial statement for fiscal 1985... As a result... Vernon Savings remained able to cover up its problems and report record earnings, prompting investors to shove even more money into its vaults and vastly increasing the cost of eventually shutting down the place... Had the Texas economy turned around and had oil prices boomed as everyone had hoped they would, the whole mess would probably have been covered up. But the economy didn't go along with the sham... Between 1985 and 1986, oil prices fell 50[%] to \$12 a barrel. Texas's oil-based economy was devastated just as hundreds of new office buildings were coming onto the sales market... Between its inception in 1934 and 1979, the FSLIC had been forced to help only 124 savings institutions, mainly by quietly merging troubled S&Ls into healthy ones. In that forty-five-year stretch, only 13... institutions had actually been closed – the action that triggered a depositor payoff. By contrast, in just six years ending 1986, the FSLIC rescued 166 S&Ls and closed 49. The industry had never seen anything like it, and the worst was yet to come... Just two years earlier, the insurance fund had \$6.4 billion set aside in reserves to cover potential failures at [S&L]s with \$667 billion in insured deposits. That wasn't good; it meant the government had about one dollar set aside for each \$100 in insured deposits compared to \$2.07 per \$100 in 1970, an all-time high. By 1985, FSLIC-insured deposits had risen 26[%] to \$844 billion, mainly because so many troubled S&Ls were jacking up interest rates... But the insurance fund reserves had fallen nearly 30[%] because of the huge losses incurred covering failures such as

Empire. The agency had only fifty cents in reserve for each \$100 in federally insured deposits. If the FSLIC had to pay off depositors because of a few more large insolvencies like Empire, the fund could run out of cash. The system that had successfully stood behind S&L deposits since the Great Depression was threatened with bankruptcy... [T]roubled S&Ls were being kept alive by accounting gimmickry and financial sleight of hand because the industry didn't have enough money in its... fund to shut them down... [These S&Ls] eventually would account for billions of dollars in losses to the insurance-deposit fund... By the time the FSLIC moved to close Vernon the... [old man] had lost more than the institution he had founded. He feared he had also lost the nearly \$2 million... owed him... [by the highroller, who] filed for protection from his creditors in bankruptcy court in southern California... "I'm devastated by this," he said. "After all, this represents about sixty-five percent of my life's work and I can't start over." [The old man] was almost as disgusted with the government[... which]... seized Vernon's assets... [even though it had] helped create the problem... But government lawyers would also fight [the old man's] efforts to get his money back, arguing that anything left in Vernon or in [the highroller's] bankruptcy case belonged to the deposit-insurance fund. The... [old man didn't] lose hope, though. Every morning, usually at nine A.M., he would sit at his kitchen table, grasp his wife's hand, and pray for the man who owes him so much. "[That highroller] needs to know the Lord," he would say, bowing his head in prayer. "Dear Father, we all sin and come up short in the glory of God. But we ask for your forgiveness." ...The nation's first [S&L] had opened... about 130 years before Vernon appeared on the scene. The fledgling... institutions originally operated like neighborhood credit unions, often serving Americans ignored by the banks... At the time, anyone wanting a house had to save his own money or borrow the funds from a rich person. As a result, not many Americans owned their own place. The folks who formed... the Oxford Provident Building and Loan Society in Frankford... had a different idea; if they pooled their savings, they figured they could assemble enough cash for one of the members to buy a house. On January 3, 1831, the thirty-seven organizers of Oxford Provident each contributed an initial deposit of five dollars to the institution and pledged to continue depositing three dollars a month thereafter until all members had obtained the funds they needed... On April 11, the neighbors drew straws to determine who the lucky first borrower would be... He borrowed \$500 and used \$375 to acquire a house... [then] used the remaining \$125 to remodel it... He was supposed to repay his loan so another neighbor could draw a lucky straw. In an ominous sign for the future of the nation's thrift industry, [the first borrower] had a little trouble... and his relatives had to bail him out. - THE DAISY CHAIN

credit, trust given by the possessors of capital or other assets in return for a debtor's guarantee to repay in the future. The terms of the repayment are mutually agreed upon. The creditor's risk, taken in order to make a profit, is lessened by inquiries as to the debtor's reliability (credit rating) and by the deposit of property or securities (collateral) with the creditor. The credit system is an important aspect of business practice and facilitates the exchange of commodities, banking, and the development of enterprises. Credit is classified according to the agent granting it (bank credit, personal credit), the purpose for which it is given (consumer credit, investment credit), or the period it covers. Credit instruments are drafts, che[que]s, promissory notes, and instalment purchase contracts. The credit theory of business cycles maintains that the volume of bank credit is responsible for inflationary and deflationary trends. Instalment buying is a form of consumer credit which has played an increasingly significant role in the U.S. economy. In 1940 total consumer credit outstanding stood at c.\$8,340 million, of which c.\$5,500 million was instalment credit. By 1960, the comparable figures were \$52,100 million, and \$40,200 million... Consumers may now write che[que]s against bank credit, much as they are traditionally written against deposits. In the late 1950s there was a boom in "clubs," or credit-card organizations, whose members can charge purchases of all kinds of merchandise or pay for services at various retail outlets around the world, and pay later through a single remittance to this sponsoring club... Almost 90% of all the exchange in the U.S., as far as value in dollars is concerned, is transacted in che[que]s and other short-term credit instruments.

Savings institutions are primarily involved in credit extension... Of the total 66,945 banking offices in the U[S] in 1990, 63,130 were commercial banks and 3,785... savings banks. Of the commercial banks, 38,201 were members of the Federal Reserve... The 1980s represented both the best and the worst of times for U.S. commercial banks... [but the] nation's 3,500 savings institutions were hardest hit by the recession at the turn of the decade... In 1990, they had net losses after taxes of \$8.6 billion and their return on assets had deteriorated to -1.08% from 0.57% in 1970. Delinquent mortgage loans cost these institutions \$36.3 billion in 1990, when 52,800 mortgage loans were foreclosed... Outstanding mortgage debt reached \$3.858 trillion in 1990, compared to \$474 billion in 1970. Nonfarm residencies accounted for \$3.017 trillion. In 1991, the mortgage delinquency rate was 5.02%... The Federal Deposit Insurance Corporation (FDIC) identified 1,069 problem banks in 1991, compared to 217 in 1980; also, 127 banks were closed in 1991 compared to 11 in 1980. Net income of all banks grew only slightly from \$14 billion in 1980 to \$18.6 billion in 1991. The percentage of banks losing money grew from 3.7% in 1980 to 10.8% in 1991... In 1991, U.S. bank loans overseas amounted to \$87.912 billion. Japan was the largest borrower with \$16.082 billion, followed by the United Kingdom with \$15.688 billion... Over the past 20 years, U.S. banks have lost their former preeminence in the world banking system and have been overtaken by Japanese and German banks. Of the largest 500 banks in the world in 1990, only 96 were American compared to 185 in 1970... Among the top 10, Japan is dominant... In the number of banks, the U.S. share was reduced from 27% to 19% during this period... In 1990, there were 288 foreign banks operating in the U[S]... The most numerous were Japanese banks, which numbered 45... The U[K] was second with 11 banks... [T]he U.S. share... [of an] estimated... \$15.854 trillion... [in total] bank deposits worldwide... was 8%[, whereas the Japanese share was]... 37%... In 1989, 72.7% of all [US] households carried some debt, compared to 69.9% in [1983]... The median debt in 1989 was \$15,200, compared to \$13,400 in 1983... The Public Debt is that which originates from the Treasury Department, but it excludes debt incurred by public agencies, such as the Tennessee Valley authority... The public debt in 1791... [was] \$19.21 per capita. By the time of the Civil War, it had been reduced to \$2.85 per capita. The Civil War and the half century following saw an expansion in public debt, but it came down to the very low level of \$11.99 per capita by the start of W[W]I. Thereafter it rose steadily, crossing the \$1000 per capita mark in 1944. In 1992, with a gross public debt of \$4.077 trillion, per capita debt stood at \$16,140. - DATAPEDIA of the United States 1790 - [1996]

Although the US Government managed to achieve a 'surplus of \$150,000 during the period of 1789-1791', it hasn't been out of debt since the term of its first president! The closest it ever came to being debt free was the '\$38,000 owed during 1834-35.'

national debt, amount owed by a nation for funds borrowed; specifically a funded debt as distinguished from the floating debt of current expenses. It is also distinguished from public debt, which is considered to be the total debt incurred by the national and local governments. The largest additions to national debts are from the cost of war, and of defense programs during peacetime... The national debt of the U.S. dates from the American Revolution. In 1791 it was \$75,463,000. After the Civil War it was \$2,773,263,000, and after W[W]I it passed the \$30,000,000,000 mark (including state and municipal debts). At mid-century it exceeded \$250 billion. Its rapid growth has been viewed with alarm by some economists, who consider it a threat to the financial stability of the nation, and with less concern by others, who contend that a rising national debt is not of necessity dangerous as long as the nation's productivity increases correspondingly. There is a statutory ceiling on the national debt, and as the debt continued to rise during the 1950s the president repeatedly was forced to request revisions of this ceiling from Congress. The \$275 billion limit was raised temporarily in 1954, and again in 1955... In 1958 the ceiling was raised temporarily to \$288 billion... In 1959 the ceiling was raised

permanently to \$285 billion, in anticipation of debts at the end of both 1959 and 1960 at about this level. In 1960 a temporary, one-year ceiling was established at \$293 billion; this was extended further in 1961.

In 1973, the [US A]dministration was compelled to devalue the dollar that had underpinned the economic order established at Bretton Woods. The U[S] thereby capitulated to an ascendant Japan and an emerging European economic community the sharing, on not yet resolved terms, of its hegemony over the world economy. Now the “rearmament” that began in 1980 has brought insolvency to the current accounts of the U.S. economy, redressed by the sale of assets. The Federal deficits incurred by military procurement have sustained a sluggish growth and moderated recurring recession, in accordance with the prescription of J. M. Keynes. The world’s largest creditor has become its largest debtor... Saving was long ago disjoined from investment in new productive capacity by the write-up of the consumer’s price to cover depreciation and the otherwise retained earnings that have been building and rebuilding the country’s industrial plant since before the middle of the century. In recent years, the managements of the biggest industrial enterprises have been putting these funds to other uses. The binge of merger, acquisition, and junk-bond buyout that closed the 1980s confounded equity with debt. The swapping of paper for paper had become more lucrative than the swapping of goods. The stock exchange, in the metaphor of [a] Cambridge University economist... has dropped its “saving for investment” fig leaf. Thrift has been disjoined from consumption as well. At \$300 billion, the debt incurred by U.S. consumers equals their country’s much deplored national debt. The instalment plan makes ownership of chattel property ambiguous. Title in real property is qualified by mortgage debt and by the public interest in what owners do with their real estate in this ever more crowded world.

And how much danger is there of a world-wide economic collapse caused by the huge US governmental, commercial and household debt, twice the size of each year’s [GDP]? ...Or from stock-market trading in ‘derivative securities’? This trading, most of it unregulated, has an annual volume approaching the combined [GDP]s of the U[S], Europe and Japan, so that... ‘observers have begun to worry that a major misstep could vaporize financial markets’.

While their country remains in debt, USers don’t need to worry that a major misstep could vaporize financial markets – because, if this were to occur, they won’t have to repay the creditors! NZers are equally fortunate in this respect because, as a collective, they also are debtors instead of being creditors. In 1991, NZ’s overseas debt was ‘\$NZ50,980 million (or \$15,000 per head of population)’; by 31 March 1994 it had risen to ‘\$70,068 million, of which the government’s share was \$29,370 million.’

Any N[Z]er closely following the turmoil in the U[S] over the ballooning federal debt can be excused a sense of déjà vu. The situation in the U[S] bears remarkable similarities to the debt crisis N[Z] faced up to in the 1980s. But N[Z]’s parliamentary system enabled the economic reforms... and the adoption of then radical moves like the elimination of rural subsidies, the sale of state-owned enterprises and the introduction of GST. America already has sales taxes and there are few state-owned businesses it can unload. The Washington system is based on a balance of power between the executive and the legislature – the president and congress. This provides a bulwark against autocratic rule from the White House, but mitigates against radical decision making. America seems like a society in denial... Politicians and voters are having a hard time coming to terms with... reality. Having the most powerful military machine in the world disguises the fact that the U[S] is losing the economic battle. Unless radical spending cut-backs can be implemented, it’s likely the U[S] will be unable to service the interest bill on its accumulated national debt within 20 years without imposing severe social strains. Pessimists are talking of a Brazil-like situation on a massive scale within a generation. For the last 25 years the U[S] federal government has spent more than it took in. [The 40th President] inherited a federal debt that equalled less than 25[%] of the gross national product. By the end of his second term in office in 1989 the debt had tripled to nearly \$3 trillion, largely because his administration cut taxes but did not reign in spending. In eight years the debt had climbed above 50[%] of the gross national product. Now at \$4.5 trillion and growing by about \$200 billion a year, the debt is expected to exceed \$5 trillion by the end of the decade. To cover the shortfall the government borrows on the international financial market. The annual interest bill is now \$235 billion, the third largest item of expenditure after social security and defence. Total annual government spending is \$1.5 trillion... Polls show that Americans are concerned about the debt but when it comes to specific cuts which would affect them support falls away. There is fierce debate over how to cut the deficit but little indication that the average person is coming to grips with the issue. Sound-bite journalism and entertainment news have taken over the electronic media. This does not lend itself to in-depth coverage of a complex issue. There’s no shortage of tough talk about deficit reduction, but little real progress. The new Republican majority in congress tabled an amendment to the constitution which would require the government to balance the budget within seven years. The amendment easily passed in the House of Representatives but failed by one vote to win a two-thirds majority in the Senate. Balancing the budget would require massive cuts in areas where politicians of all shades are reluctant to make change – social security, Medicare and farm subsidies. To compound the dilemma, the Republicans offered the electorate tax cuts and increased defence spending in last year’s mid-term elections, to win over the white middle class who proved to be the decisive voters. They have to cut even more from federal spending to meet these promises... To do this they will have to cut into the spending programmes their staunchest supporters enjoy. Pensions for retirees make up 70[%] of social security spending, the nation’s single biggest expenditure at \$310 billion a year[– but to] introduce entitlement caps for relatively well off retirees is political dynamite. Retirees are a rapidly growing section of the population and they generally vote Republican. Social security recipients are also the country’s most powerful political lobby. Nearly 43 million Americans receive social security benefits and they strongly oppose cuts in entitlements. Medical aid schemes like Medicare and Medicaid on which many Americans rely for health-care coverage in the sense of a national health system, are another obvious target. But they, too, largely benefit retirees and social security recipients. These medical entitlements cost over \$200 billion a year and are growing by 10[%] annually, due to escalating costs of medical care for the elderly... [L]arge numbers of Republican congressmen are from farm states. About \$15 billion is handed out annually to the nation’s farmers. Just as the National Party kept up this welfare line to its supporters in N[Z] in the 1960s and 1970s, so conservative rural politicians in America are loath to touch this guarantee to farmers’ incomes. There’s no shortage of hand-wringing about the federal debt issue. “We are living on the hog and are forcing future generations to pay for our excessive spending,” says [a] Senator... of Iowa. “We are borrowing from our future and that of our grandchildren.” The supporters of the balanced budget amendment maintain the country has to be forced by law to stop spending more than it takes in... Opponents counter that a constitutional amendment is not needed. “The constitution should not be trivialised with an amendment that addresses a problem that arose from a bout of temporary fiscal insanity in the 1980s,” says [a member of the House of Representatives. The 42nd President]... began his term in office two years ago by reversing some of [the 40th President’s] tax cuts and by slashing defence spending. It was a bold start and it cut the annual deficit he inherited by about 20[%]. There was even grand talk of major taxes on energy consumption to raise more income... and of cutting government bureaucracy, but the momentum was lost. Americans like their petrol cheap and there was fierce opposition to adding taxes above the current 14 cents a gallon. Putting a dollar a gallon tax on petrol and cutting government expenditure by 5[%] across the board would virtually eliminate the annual deficit... But for [the 42nd President] all the early talk of major debt reduction has faded, even though some prominent Democrats strongly backed the balanced budget amendment. Now concentrating on surviving in power, [he] seems to have lost his nerve and has backed off serious deficit reduction. He’s even taken up the Republican mantra of offering tax cuts for the middle class[, and ‘on Monday the White House proposed a

record \$7.3 billion bailout for agriculture – a pre-election-year “life raft” to keep farmers afloat (the largest amount of special aid ever given to farmers was the \$5.4 billion provided in 1988’)]. When the Republicans won Senate and House majorities for the first time in 40 years in November a lot of new members came in with guns blazing. They were going to cut taxes, balance the budget and rebuild defence spending. Brandishing the Contract With America they were going to reduce government and give more power to the individual. Now that reality has set in even the young guns of the Republican Party are feeling the heat. So far they’ve announced only \$17 billion in already controversial spending-cut proposals for the 1995 budget, including slashing funds for low-income housing, food stamps, school lunches and [the President’s] national service programme. The unease over cuts is spreading to state capitals. Local politicians are realising that big cuts in federal spending will inevitably cut deeply into aid many states receive from Washington. One estimate is that a balanced budget would require \$70 billion in cuts to federal grants to states each year... To compensate for this loss most states would have to hike state taxes by about 10[%] or substantially reduce funding of education, policing and social services.

The U[S] federal budget deficit shrivelled to \$US10.87 billion... for the first nine months of the fiscal year as a vibrant economy generated a record surplus for [the 3rd quarter], the Treasury Department said. The monthly report bolstered the notion that the surprising vitality of the economy could raise enough revenue to wipe out the deficit by the end of next year.

...The A[US]n Bureau of Statistics said the seasonally adjusted current account deficit... deteriorated... by 55[%] to \$A4.63 billion... in the... [latest quarter. AUS]’s net foreign debt rose by 4[%] to \$217.13 billion... [In contrast, t]he big gap between what [NZers] earn overseas and what we owe is narrowing. In... December the deficit fell to just over \$900 million. That’s an improvement of \$105 million. [However, ‘NZ’s total level of overseas debt rose by \$3.6 billion during the quarter to \$74.7 billion, mostly because foreigners were depositing more money in NZ banks and buying local bonds. The ratio of total overseas debt to GDP was 84.7%, up from 81.1% in 1995.]

...Credit rating agency Moody’s Investment Services has confirmed its Aa1 rating for N[Z]’s sovereign debt (Moody’s top rating is ‘AAA’)]. The agency noted that the current account deficit... [i]s... now 5.7[%] of GDP (‘NZ’s Standard and Poors rating is AA+’). ‘The rating affects the cost of borrowing not only for the Government but for private sector borrowers as well. ■’ A] welfare group is accusing a loan company that charges \$190 in fees and interest to borrow \$200 of preying on struggling beneficiaries. The company, Direct Cash Orders, opened a branch 10 weeks ago next door to the Newtown office of Income Support in Wellington. It said setting up next to Income Support was a coincidence... The company’s general manager... said it opened the office because it wanted to compete with other cash loan companies in Newtown. It was next to Income Support because the suburb had a shortage of good office space. He defended the high charges and interest. “It’s a very high-risk area. We are not in the business of losing money.” ...Borrowing \$1000 for 31 weeks costs an extra \$518 in charges and interest. Borrowing \$3000 for 100 weeks costs \$1530 in charges and interest. If borrowers get behind on payments, the company charges a \$25 fee for sending reminder notices and 3[%] a month extra in interest... A co-director of Downtown Community Ministry... said the ministry was having to help beneficiaries who had borrowed money from loan companies. “It’s just predatory. It’s designed to prey on the weakest and the least fortunate,” he said of the new branch... [S]ome beneficiaries were forced into borrowing from companies because Income Support was denying them special needs grants.

...Advising beneficiaries to get an overdraft if they needed extra money for food is abhorrent, says the Labour Party... [T]he Income Support operational manager... had said in a letter: “There are times when it may be appropriate for a customer to be referred to a bank to see if an overdraft facility can be arranged.” Yesterday he said that such times were rare... In the year to October... [1996 about 29,000 people who] applied for special needs grants... were turned down.

...[at the end of 1996, ‘about 143,000 beneficiaries owed NZ’s Income Support Service \$237 million for advance benefit payments, grants, fraud and overpayments’ – or a ‘total of \$662 million when outstanding debts by beneficiaries and liable parents is added.’] Non-custodial parents owed nearly \$200 million in child support payments... a rise of 16[%] since... last year, says the Labour Party.

...Clients of the N[Z] Federation of Family Budgeting Services owed up to \$33 million nationally in overdue accounts last year, statistics show. The number of clients using the service rose from 34,000 to 43,000.

...Debts of more than \$40 million have been run up by people who cannot repay them, says the Federation of Family Budgeting Services.

...[a character in a recently released movie declares that: ‘This is the 90s – you don’t pay, you reorganise your debt’! However, the] Citizens Advice Bureau... says it is concerned that people resort to credit and Income Support debt as a survival tool when they are impoverished... and... warns that easy credit is deepening the poverty trap for people with low income.

...Freedom Financial Services is a whole new approach... It’s all about making it easier for you to get the things you want. With Freedom CashLine... an unsecured revolving line of credit... you can access up to \$20,000, whenever you need it, at a very competitive interest rate of 16% p.a. And you’ll pay no fees whatsoever, just interest on your outstanding balance... To see how much you could borrow, call now.

...IN GOD WE TRUST (ALL OTHERS GET A CREDIT CHECK.) Sadly the time[for] trusting someone purely on face value is long past. A bad debtor can cost you thousands. [However, a] call to Baycorp’s telephone credit check system [– which ‘daily updates each customer’s credit information’ –]will cost you only \$20 (excl. GST).

...Baycorp Holdings[, NZ’s]... biggest debt collection agency[, has been]... turning bad money into profit... [Now the company] is moving into the mortgage business... [after] signing a major contract to... administer the Mortgage Express loan portfolio... Baycorp [would] not carry any risk...

The chairman and managing director of information and collection company Baycorp Holdings got pay rises of 71 and 25[% respectively – raising their salaries, respectively, to \$120,732 and] \$372,502... the company’s annual report shows. The report also warns shareholders to expect a rise in directors fees soon.

...Personal debt on rise with card use... Mismanagement of personal debt is “disturbingly high” reports the Ministry of Commerce, and budget-advice agencies say much of the blame lies with ready access to credit cards issued by banks and stores. They reported extreme cases of people holding up to 20 cards, with six “the norm.” ...Bankers wouldn’t reveal how much of their business is card-related, or the level of credit card debt and yearly write-offs. They claimed they were careful about vetting applicants for credit cards and that about 40[%] of applications were rejected. The banking industry did not have a system to check who had issued cards to whom. There was nothing to stop a person from holding the same brand of cards with several banks, although application forms did ask for details of other cards held... “The problem is you’re dealing with a competitive and profitable product and each bank is going to make its product as attractive as it can[,” said a spokesperson for]... the Bankers’ Association... [The spokesperson also said] that information about individuals could not be traded between banks, because of privacy laws[– although t]he banks did make inquiries about applicants with credit agencies and other companies within their group. However, there was no industry-reporting on bad debt or the number of cardholders in trouble. Baycorp Holdings Ltd was the... debiting collecting and credit rating agency used by most banks and companies offering credit facilities. Baycorp’s chief executive... said that over the past four years there had been a trend to use credit cards as opposed to hire purchase and time-to-pay deals, particularly for purchases up to about \$1500. The company had noticed a rise in credit card defaults over the past six months. [He] put it down to retailers saying to customers “put it on your card” rather than using hire purchase which required a credit check. “It’s the sheer convenience [of] cards that catch some,”... He said the majority of N[Z]ers had “matured” over the past 15 years in the way they handled credit[, but the] commercial affairs division of the Commerce Ministry said that in the past two years the U[S] and Canada had experienced bankruptcy surges on the back of consumer credit growth and it looked like the same

situation might develop here this year... [There] were... 2393 cases[of bankruptcy in NZ] last year compared to 2023 in 1995... [But] personal bankruptcy did not happen overnight. It caught up with individuals over several years and unemployment, illness and marriage breakdown were circumstances which could tip them over the edge. "By the time they get to us they're in a pretty sorry state,"... [a solicitor for] the ministry... said. "Increasingly we're getting more and more coming to us for a pre-bankruptcy interview [more than 2500 in the last year] and we seek alternatives for them to satisfy creditors and get advice from the budgeting agencies." The solicitor with the commercial affairs division... said credit cards were "a risk and temptation" because there was so little control over their use. When companies like Visa first started here they lost money because N[Z]ers, coming from a prudent financial heritage, tended to pay off their cards monthly, thereby avoiding credit fees. "That's changed dramatically... We're catching up with the bad habits of North America where consumer bankruptcy has reached such epidemic proportions that they've taken a different approach to insolvency law. For example, the stigma of bankruptcy... [-] that sort of quasi criminal approach that if you went into bankruptcy you were somehow no good[-] ...has been lost... [I]n today's American terms it means nothing more than that you have problems managing your finances." ...Americans had adopted the approach that insolvency law had to be supplemented with better consumer education by school and advisory agencies and the banking and financial sectors... [In NZ] the law need[s] changing to make those providing credit more responsible for checks, and more protection for consumers when repossession was enforced... The ANZ Banking Group's product manager for cards... said... "However, if people get several cards from different institutions there's only so much we can do to protect them from themselves and any over-commitment..." It was expensive to issue credit cards and the last thing the bank wanted was the further cost of recovering debt... [T]here was a time when the banks were more lenient and would waive interest charges to help to recover the principle... Two agencies giving budgeting advice to thousands were the Citizens' Advice Bureau and the Federation of Family Budgeting Services. They were staggered by the ease with which people could get credit cards. "If those issuing cards say they're acting responsibly, how come people with so few real assets have so many cards?" said... Budgeting Services['] spokesperson. He went on to point out that[... the ease with which credit was granted, plus the range of payment methods including Eftpos, debit billing, telephone selling by credit card number and store cards, had added to people's problems in keeping track of their finances. "It seems to us that some of the business providers especially are relying on repossession and guarantors as their safeguards in the process rather than the credit check on a client. The repossession scenario also adds to the problem of how much the person at the end gets back on their goods. They can still be up for payments because the resale didn't cover the debt... We need the advisory services and responsibility at the top of the hill rather than bankruptcy procedures at the bottom waiting to pick up the pieces after the crash."

...a former bricklayer who built one of [Germany's] largest real estate empires... went on trial on Monday... accused of causing one of the country's largest corporate scandals... [A] bankruptcy court judge said banks lost 2.2 billion marks... in the debacle... Lawyers have not yet decided whether officials of major banks, embarrassed by the apparent ease with which they doled out their billions, should be called to the witness stand... Germany's biggest bank, Deutsche Bank, which bore the brunt of criticism for loose lending and lax supervision, accepted the resignations of four executives as a result. [In local news, 'Alister Keith Finlay, a tractor salesman, took his life because of shame over being bankrupted by the Inland Revenue Department, his daughter says. In February it was revealed that Kapiti businessman Ian Mutton had taken his life in 1996 as a result of a ballooning tax debt. His 13-year-old son, Trevor, also killed himself after his father's death. The department did not believe it was responsible for Mr Finlay's death.']

...Inland Revenue has denied claims that it is largely to blame for the recent rise in bankruptcies. The claims were made in the *Sunday Star-Times* two weeks ago by Auckland-based Independent Business Foundation, and were supported by tax specialists. [The foundation's] executive director... said his organisation had evidence that many forced business closures were being initiated by Inland Revenue who were often first in the line of unsatisfied creditors... [The] Commerce Minister... said... "The advice I've had is that one of the major causes for the change [in the number of] bankruptcies) is actually a change in policy with IRD debtors. That's probably... why the figures have climbed up a little bit,"... The Commerce Ministry collected bankruptcy and liquidation figures. But Inland Revenue... produced figures which it said refuted the claim. The number of petitions filed by the IRD to recover money owed by taxpayers in the 11 months to May was down by over 40% on the previous year. Action was taken in only 0.15% of its debt cases, it said. The figures "clearly indicate that the actions of other parties had a far greater bearing on the recent rise in bankruptcy cases," said the IRD's group manager of customer services... Inland Revenue's policy on taxpayers with outstanding debt has not changed. Bankruptcy and liquidation proceedings were used only as an action of last resort... The IRD was endeavouring to intervene earlier to collect outstanding debt and this should result in fewer bankruptcy actions being taken... he said.

...Under [NZ's] Insolvency Act 1967, anyone can voluntarily declare him or herself bankrupt by applying to the High Court. The court will appoint an independent trustee, known as the Official Assignee, who will then look at your case. The Official Assignee has the power to investigate your past financial affairs to see whether you might have breached insolvency law. For example, you could be prosecuted if it can be proven you intended to borrow money without any intention of paying it back. You may be required to attend an interview and be questioned under oath. If you do become bankrupt... [all] your assets become the property of the Official Assignee and it will be up to him or her to decide whether anything should be sold to pay off your debts. He or she can inspect your house and you may be left with as little as \$2000 worth of furniture and personal effects, and \$400 cash. If you own your own house, the house can be sold if a valuation shows there will be money left over after the mortgage has been repaid. The Official Assignee can also decide whether or not you get to keep your car. If you are earning wages of any kind, you may be required to pay some of those to the Official Assignee to help pay your debts. You will continue to be responsible for any court fines, maintenance and child support payments, and any debts incurred after the date of your bankruptcy. You will be required to disclose to the Official Assignee any change of address or employment... Once you are discharged, you start afresh in the world. But that doesn't necessarily mean all your problems are behind you. - 1997

[An ex-bankrupt] blames a near-fatal heart attack on the shame and stress of not only being declared bankrupt, but also the "leper mentality" with which the financial community has treated him ever since. [Another's] 18-year-old daughter was refused a loan to buy a car after the bank discovered his previous bankruptcy, even when her grandfather offered to be the guarantor. It would not even open an account for her... Three years after serving the standard three-year "time" for bankruptcy... banks still refuse to open a cheque account for him, and have even turned down his wife. One... was told by a bank that if it gave him a loan to see him through a period of retraining, he would have to sign a document promising to repay his earlier debt to the bank, even though it had been written off in the bankruptcy and the bank had no legal claim to it. These are just some examples of how a declaration of bankruptcy can dog a person, and the innocent victims surrounding them, for years after they have been discharged... [O]nce a criminal has served his sentence, he is able to re-start the game of life on Go, "but former bankrupts start five squares back." [Ironically, humans are often conditioned for adulthood by the games they play as children, and few of the children who've grown up in NZ since the 1960s would have avoided playing the board game *Monopoly* – which is based on the premise that whoever manages to bankrupt everyone else wins!] It... takes an enormous amount of effort to crawl back from bankruptcy, "but it's like crawling with sandbags on, because of the burden and disadvantage of having that declaration on your financial record for the rest of your life." The fact that none of the former bankrupts interviewed was willing to be identified is an indication of the stigma attached to the declaration... IT raises the questions of whether the bankruptcy label should be removed from a person's record after a certain period of time to avoid ongoing discrimination; and why banks place such weight on previous bankruptcies when they don't investigate clients' criminal records for offences such as fraud, or even bank robbery... [I]t was easier for a

person with a fraud conviction to gain a loan than it was for a former bankrupt... The Ministry of Commerce is reviewing the three laws which cover bankruptcy... and... the “anomalies” that affect bankrupted people are being considered. “We still have the attitude that bankruptcy is a crime [it is a civil procedure], but among bankrupts are many consumer debtors who, through no fault of their own, simply couldn’t make ends meet. It could be proposed that they not be declared bankrupt at all, but face some other procedure that does not give them such a label. There is also a big difference between bankrupts – some pay their creditors no money at all, others pay back everything with interest – yet at the moment they’re all dumped in the same basket...” ...[between ‘1960 and the mid-1980s, NZ’s rate of bankruptcies never rose above 30 per 100,000 population’, or 1000 people in total during a single year.] They peaked at 2624 in the 1992 calendar year, as the effects of the sharemarket crash and the subsequent lull filtered through, then declined to 2037 in 1994... The number of bankruptcies in N[Z] started to level off after several years of decline... [However, our rate of bankruptcy is low compared to the US – currently, each year 6 NZers] in every 10,000 suffer the declaration compared to 44 per 10,000, or one in every 250 Americans[(which, statistically, means that during their life as adults – a period of approximately 50 years on average – 20% of Americans will be declared bankrupt)], and that figure is up 25[%] on two years ago. But there is not the same stigma attached to bankruptcy in the [US], and some people use the declaration to shield assets before instigating divorce proceedings... Americans refer to bankruptcy as “going through the car-wash,” because they can have their affairs sorted out and be back doing business in as short a time as six months. In N[Z], bankrupts do it hard. For three years they must not be self-employed, work for a member of their family or be involved in the management of a company without consent; leave N[Z] without consent; or raise credit exceeding \$100 without disclosing that they are bankrupt. During the initial asset stripping, all the bankrupts spoken to lost their businesses, homes, cars, appliances, even paintings. [One] says he was left with the clothes he was wearing, his watch, a car trailer, a handful of tools and a few pieces of furniture. He, his wife and their three school-aged children moved to another town to start a new life. Five years later he is still paying, and will continue to do so for as long as Baynet... retains a record of his bankruptcy on its files for a standard term of seven years... [B]anks are not obliged to open accounts, and can close them at any stage without having or giving a reason... None likes the idea of bankruptcy records being wiped after a certain period of time, saying they would prefer to know that a person had been through that “experience.” ...Yet none of the banks investigated applicants’ criminal histories, with most thinking that fraud convictions would show up on Baynet’s records. This is not the case. Baynet’s operations manager... says it is too difficult to gain information about convicted people, such as their home address, to accurately identify them, unlike details of bankrupts, which are listed in newspapers’ public notices... The Privacy Commissioner... says... “The argument is not quite the same as for spent convictions, where it could be said that, after a period of time, previous, minor convictions are not a very good predictor of someone’s ability to do a job or whatever, so should be erased. With bankruptcy, your previous performance in relation to credit is relevant in people’s judgments of whether to deal with you...” ...the Privacy Act is of some help to former bankrupts in that it gives them the right to see[a] bank’s files on them, and include their own version of affairs beside any information they feel is inaccurate, misleading or irrelevant. The Human Rights Act does not cover discrimination on the basis of prior bankruptcy, so the main course of redress for an aggrieved former bankrupt is to lay a complaint with the banking ombudsman... “...I would look into [a complaint] to satisfy myself that the bank was adhering to its own criteria...”

...A man in his third bankruptcy admitted obtaining by false pretences credit of more than \$80,000 from Christchurch businesses... and finance companies... - 1996

Insolvency laws may be amended to force students declared bankrupt to pay off student loans. The Ministry of Commerce will consider whether bankrupts should have their student loans written off when it reviews the laws. The suggestion has been called unfair by students, and extraordinary by lawyers... [because] it would make the Government a “privileged creditor.” When a person was declared bankrupt their debts were usually wiped – regardless of who they owed money to... [T]he proposed law change would mean a bankrupt could be forced to repay debt to the Government while other creditors missed out. “It’s hard to believe that it is only the Crown who suffers this kind of abuse... students can diddle anyone,”... said... [one] Auckland University law lecturer... “What makes a student loan any different from a mortgage or a bank loan? The Government would reserve for itself powers it doesn’t give anyone else.” ...A recent article in the Auckland University magazine... suggested students declare themselves bankrupt to avoid repaying loans. It began: “Declare yourself bankrupt, spend the next three years fruitpicking in the South Island and you’re home and hosed.” ...The president of the University Student’s Association... said very few students would deliberately enter into a state of bankruptcy because it had serious financial and lifestyle consequences... The Minister of Education... agreed that the number who acted on such advice was small and the idea was being explored to see if any legal loopholes existed. [Meanwhile, ‘the prospect of debt has already seen a fall in university enrolments this year.’ ● Last year, the ‘Auckland Central MP – an Alliance Party deputy leader – said “the student loan debt mountain” (which, at the time, was \$292.9m) would affect the community for years to come. “Many graduates will be paying 10c in the dollar above the tax rate for the rest of their lives. Furthermore, those with loans will not be able to get mortgages and will have low credit ratings.”’]

...FORMER students entering the workforce are finding it harder to get home loans from banks because of the size of debts incurred while at university or polytech. The... Banking Ombudsman... said she believed bank staff did not properly take into account the unique nature of student loans – repayments were income-based and did not need to be made if the debtor’s income fell below \$14,300 a year... However, at the current applicable interest rate of 8.2%, graduates with the average loan of \$21,831 would need to earn \$32,500 annually before the deductions even covered the interest being applied to the loan. If their income was below that, the total amount they owed would keep increasing.

...Appalled at huge debts being incurred by students, the... Federation of University Women... plans to lobby the Minister of Education to reduce the interest rate for loans... to 2.2[%], and wants... the promised system for student living allowances to be introduced without delay... [The] federation president... also said the maximum draw-down for loans should be \$400 a month, so students were not tempted to borrow more than they needed. “Once the first draw-down on the loan is made, further funds are available simply by making a phone call,”... [● A story] in last week’s Money section incorrectly said the average student loan debt was \$21,831. The correct figure is \$9100. The error was the result of a wrong interpretation put on data provided by the Ministry of Education.

...Threats of legal action by the Minister of Education... did nothing to dampen a protest march by about 600 Auckland University students yesterday... over... promised universal student allowances... The students had planned to burn effigies of [the minister and the Treasurer], but they were warned by police that they could be arrested for disorderly behaviour. Despite the warning, a few... threw eggs at the effigies. The vice-president of the students’ association... said the march showed how deeply students felt about being betrayed by the coalition Government... “They did promise us allowances and we were prepared to give them the benefit of the doubt, but now they are ratting on it... Without allowances students are starving; this is not melodrama, this is a reality that students have to face every day.”

...Up to 400 students are queuing daily at Christchurch Polytechnic for subsidised fruit, vegetables and bread packs. The students’ association says long delays for student loans are leaving students struggling for money... [By the way, student allowances will rise by 2.55[%] from April 1. From then, [they will range between \$97.40 for] students aged 16 to 24 living at home... to... \$146.13... [for] students 25 and over living away from home[(‘the full allowance is paid to students whose parents earn less than \$28,000 annually, then decreases incrementally as parental income rises’)]...

The Minister of Education... has conceded that the student allowance scheme is open to abuse by wealthy students. Universities say a loophole in the rules means wealthy new migrants are being paid allowances while poorer students miss out. They also say that rich N[Z]ers are using “legal, but morally offensive” income diversion schemes to meet allowance criteria. The University of Waikato’s loans and allowances manager... said any

money new migrants brought to N[Z] had to be ignored. It was counted as an asset, and students over 25 were only required to declare how much they expected to earn during the next university year. [The manager] said a large number of Asian migrants came to the university seeking \$118-a-week student allowance payments. "Then we see them race off in a sports car;..." The Education Department has decided to take on a second fulltime staff member to investigate student fraud complaints. Of a total of 900 complaints of suspected abuse and fraud of student loans and allowances over the past two years, 200 have involved recent migrant residents... However, [the minister] said it was "almost a moot point" because the... coalition Government... had pledged to reintroduce universal student allowances... before the end of its first term in office... [In the meantime,] fraudsters would still be pursued but it would be "very difficult" to change the [existing scheme to] test the assets of students and parents.

...More Auckland students are taking out loans to cover their study and they are borrowing larger amounts than in past years... [However, fewer students are taking tertiary courses, and some experts blame increased student fees... While a drop in the number of secondary school leavers in 1996 might account for... 843 fewer first-year student... numbers in 1997, the University Students' Association says "second-chance enrolments" are also falling... The chairman of the Vice-Chancellors' Committee... said... [the situation was disappointing. "But] I don't think you can be particularly surprised. If you put up the price of fees sharply demand will be affected by that." He said tertiary institutions had been forced to increase student fees in response to funding cuts from the government... Tertiary students... [currently] numbered 193,844... The release of the figures coincides with a survey by the [OECD] that shows N[Z] trailing other Western countries in tertiary participation... Since 1990 N[Z] has fallen from sixth to 12th place... for the participation rate of 22 to 25-year-olds [with 13.9%] of the population in that age bracket enrolled in tertiary study... [Our participation rate is] similar to Portugal and Switzerland, but ahead of Britain and Turkey. For the 18 to 21-year-old age group, which encompasses most school leavers in tertiary education, N[Z] ranked behind Canada, the U[S] and France in 1994 at 30.9%...

In 1989 – the year before the student loans scheme was introduced by NZ politicians (who, in many cases, had benefited from a free tertiary education system) and a book was published which declared that 'higher education, far from being freely available to all, is fast becoming a prerogative of the rich' – 1st-year tertiary students not only had their courses paid for (excluding miscellaneous costs of a few hundred dollars, including Student Association levies), depending on their age they also received a basic grant of between \$200 and \$264 a fortnight (in comparison, the adult unemployment benefit in 1989 was about \$160 per week) plus any additional allowances (e.g., accommodation). To enter a NZ university, a student had to have completed the 7th form – 5th year of high school – or scored below a total of 13 points in at least four 6th form subjects (where a grade 1 is the highest mark, followed by grade 2, 3, and so on through to a grade 9). Anyone over the age of 21 could 'apply for special entry'. Tertiary education in NZ 'officially became a user-pays system in August 1992'. Incidentally, [the lack of summer work at Auckland's Student Job Search [was a source of concern for] staff and students. The number of jobs available was down about 20[% to] 4635... while student enrolments increased... [to 13,608. Nationally, SJS] recorded the lowest number of... job offers in five years – 12,213 to go around nearly 45,000 students... The Auckland manager... said... "Students feel if they haven't got a job by [the time they finish their exams in November] they're not going to get one. They get very disheartened, and I don't blame them."

...[over the summer holidays] Wellington students... proved they will do anything to earn an average \$10 an hour... except, said one job search co-ordinator, jobs in massage parlours... although the budding lawyers, accountants, teachers and doctors... [could earn a day's pay in an hour at such places!] "We had a group dress up as vegetables for an outdoor fruit market promotion and a company offered a student \$20 to free a pigeon from a chimney. I wouldn't know what 'technoheads' are, but TVNZ wanted four of them for a television skit," she said... For thousands of N[Z] students waging war with the... bank balance... jobs such as these are their only means of saving to pay[for the] next year's tertiary fees... [In addition, during the year at] least 20 or 25 hours[of employment] a week are needed to pay for flats... and sometimes families...

Tertiary students should find it easier to get work during their[end-of-term] holidays later this month because job offers have increased at Auckland's S[JS]. The service has received 347 jobs... compared with 226 for the same period last year. But student enrolments are up 12[% to 7731. In related news, secondary school students]... are coming to school tired because of their part-time jobs... to save for tertiary education... says the principal of Western Springs College... The jobs worry her, "because of what it means to our kids and the pressures put on them." In newsletters sent home with students the school emphasised the importance of not letting part-time jobs get in the way of schooling... [A survey by the college] last year revealed 204 students, aged 13 to 16... held... part-time jobs... Most worked regularly in shops... catering, cleaning... and supermarkets... Only 33 said they had signed employment contracts... [but the average] hourly pay was \$7.50... The school's careers and transition teacher... said most... worked between five and 10 hours a week, mainly on Saturdays... Senior school staff, including its nurse, had met some of the main employers, such as supermarkets, to make them aware of the school's concerns... A member of the human resources team of the Woolworths supermarket chain... said store managers relied on students coming in part-time... [but added that] Woolworths had much experience in balancing the needs of the store with the students' needs for school, exam and social time... The president of the Auckland Secondary Schools Principals' Association... said student jobs had not been raised as a problem, though she was amazed at the hours worked... A standard finishing time at supermarkets seemed to be 11 pm for... week nights and weekends... But principals could not stop students working outside school hours, she said.

...secondary school pupils are signing up for student loans without checking with their parents or teachers first. In a Western Springs College newsletter, [its]principal... warns parents that students over 16 do not require a parent's signature on the application for student loans... [and] there is no "cooling off" period during which a student can change their mind as there is with a hire purchase agreement or insurance policy. She writes: "Once a student loan form has been filled out and signed, it passes quickly through the system..." Her caution comes after a school pupil signed up for a loan to do a course at a private training institute without telling anybody what she was doing first. When she told the school about the loan and enrolling for the course, staff tried to intervene on her behalf. But, they were told the enrolment was a private contract between it and the new student, and wasn't open for discussion with a third party. The school was unable to negotiate a lower course fee or reduced loan. "Nobody has done anything to break the law, but normally if you sign up for finance under the age of 18, you need a guarantor... Here, a pupil is taking a loan out like an adult but is only 16." The school contacted the teens' advocacy group, Youth Law Project, to see how widespread the problem is. Project staff say they can only intervene on a student's behalf when the student believes he or she has been wronged, and not because others believe they have done something ill-advised.

...Pound wise – debt foolish... YOU don't want your kids to be tightwads... [or] become... profligates, who seek to comfort [them]selves by shopping till... [they drop, and who] spend right up to the hilt of their income – no matter what that is. Then, when disaster occurs, they have to use their credit card and find they can't pay it off... But you don't want them to grow up to be spendthrifts either. So what can you do about it?... "Most p[arents] haven't got a clue. They open an account at the bank, or buy a piggy bank, and think they are teaching their kids to save. But they've got to teach them how to spend money wisely... If you can get your children to save rather than go into debt to buy things, you have won a major victory,"... After children have negotiated the monetary pitfalls of childhood, adolescence can bring a new set of problems. At tertiary level, the younger generation is not being encouraged to use money wisely, says[an] Act MP... She believes lump-sum student loans have a very bad effect on young people. "Other beneficiaries don't get lump-sum, three-monthly payments – so why should students?" she asks. "They get this money and go on a spending spree. Then they are broke... and can't pay the rent... When you are their age, living for here and now, this system encourages a sense of irresponsibility towards money." [Editor's note: A cartoon published during 1989 in the magazine NZ Listener showed a man who sees money on the ground. As he picks it up, more money falls from the sky. As the man hurries to gather the money he starts to transform into a rat and, because he keeps looking at the money instead of where he is going, he eventually falls into a hole in the ground. The dazed rat climbs out of the hole and slowly changes back into a man – then sees money on the ground]...

WIN THE RAT-RACE... *futureproof* [yourself by enrolling for a course at the]... MANUKAU INSTITUTE OF TECHNOLOGY...

['The world is like a giant pie. The trick in life is learning how to get your share. To get a bigger slice of the pie phone Unitec' ...

'Advertisements enticing people to study at tertiary institutions have reached "saturation levels," two student associations said yesterday. Figures released to the unions, under the strict proviso that the source and institutions wouldn't be identified, showed advertising and marketing spending at six institutions had increased more than 58% during the past two years. "We seriously question whether public institutions should be allowed to spend student and public money in this way," said the University Students' Association president' (likewise, 'schools shouldn't be using their money on advertising to compete for pupils').

... 'THE multicultural, good-looking (but not too good-looking) students are always smiling or appearing earnestly intellectual as they gather in cafes clutching laptops or in corridors that echo with prestige and ivy-covered knowledge. They're enjoying themselves in a way you might aspire to if you were 18. They're all over the booklets, brochures and ads on which universities are spending millions of dollars to attract seventh formers making big life-choices about whether or where to continue studying. If you're considering a degree course you're supposed to want to join them. At their campus, not someone else's. Otago (whose advertising budget is at least \$1.1 million this year), for example, wants you to Get Over It (Cook Strait, perhaps?) while Massey (\$1.15m) wants you to know there's a whole universe available in the Manawatu. They're the latest examples of the increasingly aggressive competition for students that began in 1990 when the tertiary sector became a free market and every tertiary institution became financially dependent on how many students it enrolled. From October 1991 to October 1992 the total rate card advertising spend by universities, according to an advertising expenditure monitor, was a mere \$82,757. Of that, \$57,965 was by Massey alone. The latest figures available show the total has reached \$7 million for the first time. What's more, in an unprecedented move Southland Institute of Technology – which spends 2% of its total budget on advertising – will charge students absolutely no fees next year, marking the first time an institution has relied so heavily on price for its competitive advantage, ahead of branding exercises emphasising quality teaching and lifestyle which are favoured by other institutions. The battle for students is heating up.'

... *As universities and polytechs battle for students and funding, what checks are in place to measure quality – and allow students to make informed choices about their education?* MOST tertiary students... swapped study for paid work over the[summer] holidays to save for this year's course fees, but how can they be sure they... get value for money? [An 'information vacuum leaves the average 17-year-old unable to make informed decisions about where to spend thousands of dollars, and between three and four years, studying. The choices were once much easier when only the truly brainy with means and ambition went to university']... Concern has been exacerbated by complaints from universities and polytechs over funding cuts – and the possible impact on the number of teachers they can employ and how well resourced their libraries are. There is some debate over whether the British system of rating university departments on a scale of one to four should be adopted here so that students can see, for example, whether Auckland University's English department is considered better than Otago's. "Seventh formers have a right to know whether the history department of a certain university is poor, before they invest \$2500 in finding out," says the president of the national University Students' Association... By law, each of N[Z]'s 38 tertiary institutions has to produce a charter, following community consultation, for approval by the Minister of Education... Tertiary institutions here undertake their own internal reviews; must report to government on their objectives and success in reaching them and must have new courses accredited by bodies representing their relevant tertiary sector. Universities are also undergoing the first round of a new audit procedure run by the Academic Audit Unit of the Vice-Chancellors' Committee... [(the unit i)s considered a model for tertiary quality assurance around the world)]... The students' association also produces "alternative calendars" for five of the seven universities from surveys done of students' experience of courses. None, however, compare institutions as a whole or by department... The British university "league tables" – a name coined in reference to the English soccer league – can have enormous impact on the number of students enrolling at particular universities and, therefore, the amount of government funding the institution receives, its ability to attract top staff, and – in the case of separate ratings for research achievement – its acquisition of extra grants. A top research rating can add anything from \$200,000 to \$750,000 a year to the budget of a single department. But even [the student association's president] was sceptical about the value of trying to make such comparisons in a country the size of N[Z]. Furthermore... a former British academic who heads the Academic Audit Unit, said that the British rating system was flawed and gave a distorted picture of education quality at various universities. Departments were graded in relation only to the objectives they set for themselves, so a department with low objectives might get a high score, while a more ambitious one received a low mark. When it came to research assessments, a department needed to only nominate the work of its best researchers, to receive a high score even though the bulk of its staff was average or worse. [A member] of the Vice-Chancellors' Committee said a similar system tried in A[US] resulted in some outside organisations being sued by universities dissatisfied with their ratings. "A publisher, [who 'is looking to expand its operation into NZ'], got into trouble for putting out a book called *The Australian Good Guide to Universities*, which was not unlike the *Australian Food Guide*. When you take a superficial approach like that, you can affect the... viability... of universities..." ...The vice-chancellor of [Wellington's] Victoria University... said he was confident his institution's system could pick up inadequate courses, despite two appearing to have fallen through the cracks – one in environmental studies... and another in international relations for which nine students were each repaid almost \$400 by the university after complaining about the course's lack of resources. [He said: "It's always difficult to get things right 100% of the time. There's a danger that people start a new course, only to have it emerge later that it could have been better resourced. That sort of thing is happening more often now because of the funding restrictions." Universities are losing funding at the rate of 1.5% a year in line with the Government's intention that students pay 25% of the cost of tertiary education by 1999.

... *Tertiary education should not be[held] hostage to fickle market forces...* In a recently leaked paper to the Ministers of Education and Finance, officials in the Ministry of Education recommend a radically new system for funding tertiary education based on vouchers and full-cost fees. Under present arrangements public tertiary institutions receive Government funds in annually determined block grants. These grants are related to the number of full-time equivalent students attending the institution, with adjustments for the costs of different courses. The bulk fund covers both tuition and research costs. Students contribute about 25[%] of average course costs. Under the proposal the costs of tuition and research would be funded separately. The Government would no longer fund institutions directly for tuition. Instead, it would fund students through a voucher-type arrangement. Each student would receive a flat-rate entitlement, the equivalent to some five years of full-time study. Students would be able to draw on this entitlement to fund up to 75[%] of their course costs. The remaining 25[%] would have to come from private sources or the loan scheme. In effect, all students would have individual "learning accounts" with the Government... A further critical feature of the scheme is the suggestion that the "entitlements would be limited to a total amount of resource and that this could be reduced over time as the number of students participating increases." In other words, there would continue to be a budgetary constraint and if the demand for courses increased the funding for each student would fall... According to the report's authors, a voucher scheme of the kind proposed is likely to "promote further participation, improvements in responsiveness of providers to students, greater innovation and flexibility and more diversity." They assume that students know what is best and that competition promotes allocative and productive efficiency. Assessing the validity of such claims and assumptions poses serious problems... [because] there is no scheme of this kind anywhere in the world. There is nothing with which to evaluate the possible implications for participation rates, the structure of student demand, the range and quality of courses, the viability of various institutions and so on... One reasonably certain result of the proposed changes is that tertiary institutions would charge full fees for most, if not all, courses. Inevitably this would witness much greater variations in course fees: many expensive courses, such as medicine and engineering, could well exceed \$10,000 a year or more (depending on the level of research funding). Thus, unless scholarships were provided, students taking expensive courses would expend

most of their probable entitlement within two to three years, leaving many little option but to borrow significant sums in order to complete their courses. Potentially, this would have serious implications for equity. A voucher scheme would also create significant difficulties and uncertainties for tertiary institutions. In effect it would change the planning horizon from a year to a semester. Further, it would also make it much more difficult to cross-subsidise courses and, for instance, preserve courses which have high academic merit but, at any given time, relatively few students. Moreover, if student demand for particular courses varies substantially from year to year there would be major implications for staffing and research as well as the financial viability of certain institutions. To those who think a much fuller application of market forces will be good for the tertiary sector it is worth noting that many of the best universities in the world are significantly sheltered from the dictates of the market through large endowments. They are thus not at the mercy of rapid shifts in student demand. Such institutions regard this as being critical to their autonomy and the preservation of academic freedom. Since few N[Z] tertiary institutions have substantial financial reserves they will have little choice but to be slaves to the market.

...The Government's discussion paper on tertiary education was made public this week... While the paper held few surprises after an earlier draft was leaked last month, it provided more options on resourcing and managing tertiary institutions. However, controversial sections in the... draft were watered down in the official version, with the Government backing away from talk of voucher-funded students attending profit-driven privatised institutions... [But private training establishments still] have a lot to gain if [the] proposed changes to the tertiary system are adopted.

...Do the proposed tertiary education changes mean better value for money or are they a thinly disguised privatisation bid? ...The... N[Z] University Students' Association president... said... the report would lead to higher student fees – shutting out of study the very people the Government says it is trying to reach. He said the average student fee had increased more than 100[%] in the past five years and the paper completely failed to tackle the problem... But... the... Education Minister... disagrees... [He argues that] the present system... [provides] few incentives for institutions to be more efficient because when their costs increased they passed them on to the Government through seeking more money, and to students through higher fees... However... the... Association of University Staff is also skeptical of the discussion paper and says the earlier "half-baked" leaked paper has now "emerged from the oven covered in cream and icing." ...In contrast the Association of Polytechnics says it will probably support the main thrust of the paper... At present the Government spreads... money between all students regardless of age or how long they have been studying... Under[its] entitlement option... system those who had had the least tertiary education would receive the highest subsidy, and students who used up their entitlement would pay higher fees. The paper says it would encourage students to use their subsidy carefully... [– or, at least, discourage them from taking a lifetime to complete their degrees!] Student empowerment and institutional accountability are the important themes of the... review... But... [students can't do] whatever course they like. There will still be caps on course numbers and academic requirements to be met... The Ministry of Education has given N[Z]'s seven universities and 25 polytechnic institutions until December 15 to respond to its document... One thing shines through the paper. The Government wants more people to participate in tertiary education, but at the same cost as at present... A touch optimistically, the green paper envisions a time in the near future where support from alumni and corporations creates an endowment culture in N[Z], a country where the largest university... Auckland, remains unsure whether it can reach the relative modest endowment goal of \$20 million [for this year]. By comparison, in the U[S], last year's market value of Harvard University's endowment trust totalled nearly \$NZ12 billion, while the per student endowment at Princeton University came to more than \$1 million, according to the... *Chronicle of Higher Education*. [In 1990, higher education institutions in the US received \$US7.781 billion in gifts and grants. This was in addition to endowment earnings of \$3.144 billion.] Despite such sizeable gifts, grants and endowments, 'the average annual cost of attending a four-year private university in the US ate up 29.6% of median family income in 1970; by 1987, it took 40.4%'.]

...Competition for public funds does not produce better universities... [F]ar from improving university quality in N[Z], it will more likely create a situation where institutions in danger start chasing students by any means and so degrade quality. While competition can produce such high-powered, prestigious institutions as Harvard and Yale it can also make for the likes of California Union University, a diploma mill that grants its students a PhD for "life experience." In the middle to lower range of tertiary education in the U[S] and Britain, the need for student numbers has meant a steady erosion of academic standards over the past generation... Even more disturbing has been the proliferation of soft-option courses... The... Ministry of Education green paper... hopes students will make the right choices for quality by themselves, particularly if they are saddled with paying for a substantial proportion of their education. No doubt over the long run most students will choose the institutions with the best reputations. But in the short term of a university career, and given pressures of time and money, many will prefer easy courses in faddish subjects, trying to conclude their degree in the shortest time, thus accruing a lower student loan. In the free marketplace of fast-food outlets, the consumer is justifiably king. But outside the assessment of lecturing ability, the average 18-year-old is not qualified to judge the classics or mathematics department of a university... Who will accredit degrees, so that the education marketplace isn't flooded with expensive, worthless certifications? ...should the arbiter of university quality be the N[Z] Qualifications Authority? This would be a disaster. Despite its heavy cost to the taxpayer, the authority continues to experience difficulties in producing competent exams at the high school level... The authority took nearly three years, and thousands of education dollars, to decide that Aoraki Polytech cannot teach a degree course in naturopathy. For anyone who cares about the quality of higher education, it was a decision which should not have required even three seconds.

...[while a] group of 17 naturopathy students are planning legal action against Aoraki Polytechnic, Timaru, because the Qualifications Authority refused to grant degree status to their course[, an]... Auckland polytechnic has been forced to give back about \$139,000 to a class of students after they complained... [about] the quality of the equipment they were expected to use... and... that[the] course did not provide what was promised... 14 students doing a certificate in television and video operations each received a refund of their \$5000 course fee plus compensation of \$1000... 22 other members of the class were refunded half their course fee. The students also discovered that the year-long course – said to have been endorsed by TVNZ, TV3 and Sky Television – was not formally endorsed by any of the television channels. The deputy chief executive of... Unitec Institute of Technology... was reluctant to discuss the refunds because of [a] confidentiality agreement. He denied that students had complained about the endorsements and added that it was difficult for educational institutions to have state-of-the-art television and video equipment... Such deals could become more common as fee-paying students start to hold their educators to account over the quality of courses; several other tertiary institutions are involved in similar negotiations... News of the refund and compensation... comes just two weeks before a potentially ground-breaking legal hearing between Victoria University and four former students who filed a claim for \$345,000 against the Wellington university last November... [Elsewhere, 30] interior design students are in mediation with the Central Institute of Technology, Lower Hutt, over a diploma course that became a degree this year[, and a]... Lincoln University student has demanded a fees refund and compensation over delays in the marking of a degree.

...[Waikato University students may sue the university for \$20,000 if a planned academic staff strike goes ahead this morning. The president of the student union said yesterday that if students missed vital last-week lectures today it would constitute a breach of contract between the students and university under the Consumer Guarantees Act. The strike could affect up to 1000 students and the student union president said he had estimated the cost of a lecture at \$20 a student. The staff are striking over a 6% pay claim, and the university's non-negotiable 2% offer. General staff at the university are also holding a stopwork meeting at 8.30 am today, and may go on strike in support.]

...[Striking tutors have given Auckland Institute of Technology students a second chance at passing their exams. Students who failed mid-year assessments could now pass if they can prove they missed important lessons during their tutors' four days of industrial action in May. Dozens of students have applied for reassessment and the institute is writing to inform all students who have left since the exams. The student association president said one

business computing student got 77% in a paper with an 80% pass mark. The student claimed he had missed the last 3% because the strike meant he received only 28 hours of teaching instead of 32. The president did not know of any other polytechnic allowing course reassessment based on the strikes. The Qualifications Authority was unable to say last night whether secondary school students – who have lost several days of school during their teachers' strikes – would be able to use the same argument if they failed school certificate or bursary. The polytechnic staff dispute is still unresolved at AIT, where staff rejected an offer accepted by staff at 10 other polytechnics.' In international news, 'Mexico's President says he ordered a bloodless dawn raid which yesterday ended a nine-month strike at the National Autonomous University of Mexico campus in Mexico City, Latin America's biggest university. The speed of the raid, which met no resistance, stunned commentators who feared police intervention could lead to violence and loss of life.'

...An autopsy on a South Korean policeman killed during campus violence on Monday cast doubt on reports he was clubbed to death by students and supported student claims he was killed by a police vehicle... But... [the senior] prosecutor... said... "His death was still caused by the students."

...students ignite storm with 'water bomb' attack... Students holed up in a Melbourne building protesting against up-front tertiary fees are under investigation after they allegedly threw a bucket of urine over police... "At this stage... if we can establish which students... did it... they will be charged with assault,"... [a] police spokeswoman said... 80 students have been staging a sit-in for two weeks. But the National Union of Students denied that urine had been thrown on to police... [The union's] national education officer... said the students had released three water bottles as a "sign of their frustration" with the protest and restrictions placed by police on the goods and materials the student union support teams could send up to them. Police were trying to "censor" the protesters... despite the fact they had not been charged with trespass over the occupation... The incident came after... students earlier marched to Parliament House after a rally that drew strong support from unions... University staff in Melbourne also said they would stop work next week to support the protest. [Incidentally, 'a Melbourne University student who had his grades raised offered the university \$A2 million to set up a research centre, along with consultancies worth up to \$A250,000 for some of its professors, says the *Sydney Morning Herald*. The report said the issue was investigated by university authorities, who found there had been no improper conduct even though money for the research centre was accepted'...

'The AUSn PM said yesterday the coalition Government's intention to enable AUSn students to "buy" a place at university would create a more equitable education system. He told the NSW Liberal Party state convention that a free or heavily subsidised education system was unfair because it placed a greater burden on low income people than those on middle to high incomes. "What is the social justice of saying to a person on \$A30,000 a year whose children don't want to go to university that we are going to use your taxes to ensure people on \$A150,000 a year don't have to make any contribution to their children's university education?"'

'Thousands of angry tertiary students, staff and academics protested across AUS yesterday against an expected overhaul of higher education, including savage funding cuts. Police scuffled with students outside the NSW Liberal Party headquarters in Sydney, where up to 10,000 people rallied, before students burned an effigy of the Minister of Education. The president of the national student union said the Government had misjudged the mood of the AUSn community towards tertiary education and the expected cuts would spark larger and more frequent protests around the country. "I think there are two aspects that are very serious in higher education, the cutting back of funding despite the election promise and the imposition of higher fees for students which will deny equity and access in higher education. That is a very retrograde step for a nation as rich as ours."

...students are marching in the streets to protest against the decline of their universities... [and to request] a thorough overhaul of Germany's crumbling higher education... [system.] but the suggestion that they should pay for their education stops them in their tracks... "Germany has enough money for free education. It is outrageous that the state is failing to properly fund the universities." ...In Berlin, a city with three universities and 119,000 students, the nearly bankrupt local government has cut 300 million marks... from its higher education budget over the next five years... Humboldt University plans to cut 85 of its 450 professors by 2000... Impoverished by decades of spending cuts and a doubling of students since 1977, universities that served as turn-of-the-century models for many American colleges have become so desperate for cash that they have even encouraged their students to strike... "The students have legitimate reasons to protest," said the Education Minister... "They are lacking books, the lecture halls are overcrowded and there are too many students waiting in long lines to talk to their professors..." ...While many say German students enter universities with superior secondary-school educations, that advantage is quickly lost at the universities... "Anyone who can afford it now sends their children to universities abroad... The rest of us are stuck with... lower quality and far longer terms studying." German students were on average 28 when they completed their studies... compared to about 24 in the U[S], Britain and France... [In local news, t]hose who predict that universities will resist the green paper... because they are opposed to change, are wide of the mark... In the 1990s, N[Z] universities have adapted quickly to a different method of funding, a huge increase in students, a sharp cut in the funding per student, increased demands for accountability from students and taxpayers, changing competitive pressures on an international scale – and we have done it all at two-thirds of what it costs to produce an A[US]n graduate and with only half the general staff per student you would find in a British university.

...THE abysmal performance of Canterbury University students in a recent general knowledge test has brought predictable knee-jerk reactions about the deplorable state of our education system... I can appreciate confusion about the sun. I often doubt its existence. However, fallopian tubes are another matter. To regard them as a synonym for London's Underground is excusable with engineering or theological students, but far more serious at the Otago Medical School. And that is the nub of the matter. Higher education today has to be increasingly specialised... [or] compartmentalised... This has eroded the base of general knowledge... Grey-haired critics who write letters to the editor or call up talkback programmes all want our universities to teach better, and students to learn more. What they refuse to accept is that many students – possibly their own children – should not be there. Universities have become an absurd badge of prestige which was denied parents. Until it is realised that the ability to pay bears no relationship to the ability to learn we will continue to pay huge sums – both publicly and privately – turning out graduates who have the dubious distinction of putting a square hat on a square head.

...ABOUT one in 10 of the more than 20,000 university students being capped this month and next are estimated to be still looking for work. That is slightly better than the same time last year, when 12% of graduates were still looking for work. And even though the "still looking" figure has been dropping steadily since 1992, industry heads say too many graduates are destined to find jobs in the traditional professions of law and accountancy, rather than becoming the engineers and technologists needed to drive our export-led economy. It's a problem that will persist until society affords as much prestige to the wealth generators as it does to wealth servicers. NZ is one of the few OECD countries that produces more lawyers than engineers: last year our universities graduated 850 lawyers and 530 engineers. Denmark and Finland, for example, turn out five times as many engineers as lawyers... and Canada and AUS twice as many... If last year's figures are any guide, 20% of NZ's law graduates being capped this month and next are still looking for work. The figures don't mean that those still looking for work hadn't received work offers; just that they haven't yet committed themselves to a job... Of those who found work before capping last year, the biggest median salaries were in medicine and human biology (\$45,000)... Big winners in upper quartile graduate salaries were medicine (\$53,000) and commerce (\$50,000).

...A university degree generally earns a good salary but extra tertiary study can earn even more, according to the findings of a survey... [B]y the third year[of employment] honours graduates are earning a median base income of \$44,500 compared with just \$35,000 for bachelors graduates... Now in its fifth year, the survey produced other interesting data: ...Social science graduates did the best financially in this year's survey while law graduates earned the least... Fringe benefits have declined over the years because of the accent on simpler salary packages... [In related news,] Otago University... stopped some courses this year when staff were laid off... [Now h]undreds of jobs are set to go at the University of Auckland in a multi-million-dollar budget cut that could lead to courses being stopped and the student:staff ratio increased. About 2000 letters were sent to

academic and general staff yesterday asking them to consider voluntary redundancy... but... staff representatives said experienced and high-salaried employees could be made redundant if they chose not to take the offer. The president of the university's staff association... estimated that the university wanted to shed \$10 million in salary costs, meaning about 200 staff layoffs... [Last year, 'a \$7 million budget blowout (instead of an originally budgeted \$7m surplus) forced the university to freeze all new staff appointments and launch a cost-cutting drive in every department.'] Like all universities, it has been drawing cash reserves, turning a \$19 million surplus in 1992 into an expected \$3 million deficit for 1997. It is struggling to maintain or replace existing assets... In 1997 the University of Auckland's roll totalled 26,128, almost double the number enrolled 10 years ago... The Ministry of Education has written to the Vice-Chancellor expressing concern about the university's financial indicators... [and] asked whether the university is run as efficiently as it could be. [The Vice-Chancellor] says it is unfair to accuse the university of slackness, that budgets have been paid close attention to for some time. Nevertheless, the budget committee... wants the university to hire a project manager on assignment from "a major accounting or consulting firm" to drive the cuts through.

...Auckland University has billed students \$31,000 for costs run up during last year's registry occupation – including... \$24,572 for security guards hired by the university after the students stormed the registry building last September, protesting over fees[(the 'week-long occupation of the registry resulted in students having \$50 knocked off their fee increases')]. It also includes \$2627 for "spring cleaning," which the university says was needed after up to 150 students slept in the buildings' hallways for a week[and]... several hundreds of dollars for "laundry." Sheets were allegedly stolen from the sick bay and students were charged for a new set purchased at[an] upmarket department store... The student association president... said the university also alleged that \$50 was stolen from a locked office, watched over round-the-clock by the security guards. He said the bill was "over the top." Security guards were not necessary and a quick vacuum was all that was needed to clean up the building. A university spokesman... admitted that the registry was not left messy... after the occupation.

...Student[s] bunked down for a second night at the Auckland University registry last night after talks failed to resolve the row over fee increases. On Monday about 300 students stormed the locked registry building, smashing windows to gain access, in protest against a planned 18[%] fee rise...

University of Auckland students will have to wait until next month to find out whether... fees will rocket... Several tertiary institutions around the country charge different fees for courses that cost more, such as medicine, but Auckland University has until now chosen to stay with the flat fee system... The postponement has frustrated the Auckland University Students' Association, which claims students already have enough problems paying fees without the university giving only a couple of months' notice of fees for next year. The association vice-president... said it would not be fair for the university to introduce a differentiated fee system at such a late stage... He also accused the university of deferring the meeting until after the academic year ended so that students would not be around to protest against any increase. During a fees protest last week, 13 students... were arrested for trespassing when they invaded the university's registry building. But... the university's vice-chancellor... denied that the change was because of concern about protests. He said the extra time was needed for budgeting and to allow the Government to announce its funding allocation for next year.

...the Auckland University finance registry was [re]occupied yesterday during angry demonstrations. And student protesters are promising more fireworks as they fight Government plans to overhaul tertiary education. What started as a "loud but peaceful" march up Queen St departed from plan when student leaders speaking to the crowd from a truck were literally driven away by the police. The students' education vice-president... was spilled into the street when a sergeant took control of the truck and drove off with five students bouncing round on the back. One of them was [a]disabled student... who said he was on the truck fixing a flat tyre on his wheelchair. "I was scared, I really was... holding on for my life." The officer in charge... said the seizure was not part of the plan – "just good initiative on the part of the sergeant." "Inciting" students were disrupting traffic, he said. "People have a right to protest but we have a duty to make sure the rights of everyone else are looked after, too." At the university registry building, some of the 500 students tried to push the police line, chanting for[the] Vice-Chancellor... to front up on the issue of fee increases. The collective face of the police hardened when a woman officer fell from a retaining wall, injuring her knee and back... The march turned into an occupation when a breakaway group headed for the Old Arts Building. More than 50 protesters barricaded themselves inside on upper floors... [Reinforcements swelled police] numbers... and officers began forcing doors to reach the protesters. The Deputy Vice-Chancellor... said the damage to offices and the staff common room was shocking. Because of the mess made on records he could not guarantee staff or bills would be paid on time. Students would be sent a bill for the damage, he said... Police say the students caused 99[%] of the mess which was worsened slightly when police broke in[. By the way, 'a nationwide survey of 2300 tertiary students showed that 31% of university students and 30% of polytech students are not continuing next year because of education costs (in addition, 23% of university students and 29% of polytech students said fees had influenced their choice of course). Yesterday student groups said the results prove tuition fees are acting as a barrier to further study']...

Images of students having their knuckles hit with batons as they put their hands on a barrier while protesting in Parliament grounds... have done little to deter protesters... Student protests around the country have become increasingly angry and greater numbers are turning out... But visions of students challenging police barriers are doing little for their image or their cause, according to talkback listeners who flooded phone lines after Wednesday's Auckland protest. The protesters are routinely referred to as "radicals" and "rent-a-mob" but students say... those protesting were just "your average students" who "cared deeply" about what happened to tertiary education, not just for themselves but for future generations.

...Student protests are annual events. Spring arrives and students worry about next year's fees. Why are their minds not on exams which start next Thursday? ...Protesters find more fulfilment from living in tents than studying for exams. They are a minority because... the rest of us... studying law and commerce... can't wait to leave [university]... We are not apathetic because we don't protest; we just have more pressing matters to attend to. For us university is not for life; it is a mere pitstop on the way... Taxpayer funds spent on education amount to \$6.25 billion, according to the Ministry of Education. Common sense suggests that resources should be directed at those who are failing to improve... [A] mere \$300 million goes to early childhood education... Primary education gets \$1.35 billion and secondary receives \$1 billion. Tertiary students receive a total of \$1.78 billion and \$530 million in student loans. That means... students who get through the primary and secondary system unscathed receive over one-third of education spending. Why are we spending so much money on the most successful? Their rewards will naturally come. Society benefits more from a child reading who once could not. Society does not benefit from a student already able to read studying, for example, Russian history. If tertiary education was deemed that necessary it would be compulsory. Students should get their own house in order first. Student unions are the first to complain to ministers of education about accountability and honesty. Yet, where is their own? Unions are propped up by compulsory fees from every student... [– even though t]he Auckland University Students Association... is unable to attract quorums at general meetings; [and]protest marches draw 200 students from a university rol[l] of 25,000. The *N[Z] Herald* recently published school pass rates in the bursary examination. A staggering correlation between passing and wealth was evident. University students come from "rich" families[('new figures from 1994 to this year show that the number of students from poor schools going on to university has dropped by 23% – and just 8% of students enrolled in university this year were from schools ranked decile 1 to 3, the bottom level of the scale – while the number from wealthy areas has increased almost 25%; the trend also applied to polytechnics')]. Student allowances, which are means tested on parents' incomes, cost a mere \$300 million. Few students are entitled to them because their parents [have a combined income of] over \$50,000 a year. Census statistics show that... only 6897 people... earn over \$100,000 a year... a mere 34,479 people earn over \$50,000... 216,453 people earn between \$20,000 and \$50,000... [and] tertiary students are over-

represented in the upper income bracket... All the system achieves is the “rich” getting a golden pen in their hand [while middle] and lower income N[Z] struggles to pay tax from jobs not requiring a tertiary education, to pay for students in the higher rewarded jobs.

...A convicted fraudster tells students how to rip off allowances in the latest issue of the Auckland University student magazine *Craccum*... “Student Allowance Fraud (And How to Get Away With It),” suggests students falsify birth certificates, forge signatures and lie when filling in forms. The step-by-step guide, by “Ace Fraudster Mr S,” tells students how to claim a \$240-a-week living allowance by marrying a fictitious person... The... article recommends that students ask a colleague or pay someone to assume a false name and pretend to be their bride or groom... and, once the allowance is in the bank, head to the divorce courts. The university’s loans and allowances manager... admitted that students who followed the guide would succeed... The editor of *Craccum*... said students who took the advice were not criminals, because they needed the money to pay for food and rent. “Certainly I’ve got a conscience about it... I’m very saddened that we’ve got to go to these lengths. We’ve got to use illegal means, to survive.” Police have called the article “reckless” and warned that criminal charges could follow if readers acted on the advice.

...*Craccum* is unlikely to be charged... [A police] legal adviser... said it[']d be difficult to prove the article had encouraged students to act illegally. [In related news, ‘students at “rich” universities face fee rises as the Government moves to cut funding through a new charge on assets. The plan aims to cut state tuition subsidies at well-off facilities to boost the coffers of poorer institutions, including many polytechnics. The announcement is part of a shake-up of the tertiary education sector that student groups have labelled a full move towards privatisation. Universities last night said the new “capital charge” on assets was a serious threat in the face of already dwindling Government funding. Students would be forced to cop any loss in income through higher fees.’

...‘We already have “Bairds Mainfreight Primary School.” Will the University of Auckland become the “Lion Red University”? It could happen much sooner than many of us think if the executive director of the Business Roundtable has his way. In a lecture at the university he openly espoused the view that “NZ universities need to rid themselves of their dependence on Government funding.” Quite clearly the complete privatisation of universities in this country is firmly part of his thinking. Linking the idea of privatisation – although the word never passes his lips – with academic freedom, he argued that universities’ dependence on Government funding is always likely to make them run the risk of being forced to “bend to the Government will.” This seems to me to be a specious argument for the promotion of privatisation and the protection of academic freedom. Of course, it is not unknown for governments to put political pressure on institutions within their jurisdiction, but he needs to be reminded that governments are elected by us, the people, and if we don’t like what they are doing we kick them out. If we have to bend to anyone’s will, surely it is better that it be to a representative, elected Government than a non-elected, non-representative board of directors which might run a privatised university. But, in any case, university academics are not so easily cowed, as opposition to the Government’s green paper bears out. Companies that might run universities would merely be answerable to their shareholders. They might ignore the needs of the community – just as some privatised “public utilities” have. If universities have to genuflect to commerce, or if they have to modify their opinions to suit special interest groups, then academic freedom is doomed. But there is something more sinister than the loss of academic freedom that is under threat by the privatisation proponents, and that is the egalitarian nature of the university. Already there is a sense that things have altered significantly as a result of the high fees that students are now asked to pay. Let us have some private universities. After all, people should have options. But let them compete in the same way that private secondary and primary schools do, and leave our state-funded universities as they are.’ Incidentally, NZ] would be wise to heed Malaysian warnings about excessive costs faced by overseas postgraduate students to educate their children, education marketing officials say... [The] chief executive of N[Z] Education International, which markets education on a generic basis overseas, said international education was N[Z]’s most rapidly expanding export industry. Education industry earnings had risen from \$50 million in 1992 to \$300 million last year, [but – unlike]... many other countries[– NZ] was handicapping its drive for overseas postgraduates... Only 14[%] of overseas tertiary students in N[Z] were doing postgraduate studies, compared with 21[% in AUS] and about 50[%] in Britain and the US (where, ‘in 1991, 408,000 foreign students were enrolled in institutions of higher education, compared to 179,000 in 1976; the largest contingent, by region, was from Asia which accounted for 263,000’). An overseas student taking an Otago University science PhD pays \$16,000 a year in tuition fees and faces fees ranging from \$8000 to \$10,000 a child at Dunedin secondary schools, according to Ministry of Education officials. Many city primary schools charge about \$4500.

...5000... foreign fee-paying students... pumped \$30 million into secondary schools this year[, but the]... number of fee-paying overseas students to N[Z] may dwindle next year as the effects of the Asian stock market dive bite deep. The president of the Post Primary Teachers’ Association... said many schools relied on fee-paying overseas students to bring in money to meet running costs... [T]here were dangers in this reliance, but it was understandable when state funding was lacking... The principal of Lynfield College... said his 100 overseas students were paid up for the year and none had left... [but] some Asian students[at other schools are] already returning home... [However, the] head of Long Bay College... said many factors could combine next year to turn overseas pupils off N[Z] schools. AUS] and Canada were becoming competitors for overseas students and their governments were actively helping schools recruit with advertising campaigns... “I have often said the days of the golden egg with foreign students is over. Many countries... are doing what we are and we cannot assume [overseas students] will turn up on our doorstep.” ...The N[Z] Government, on the other hand, was next year doubling the tax of schools taking overseas students. Long Bay would pass that cost – a rise from \$450 to \$900 – on to the students.

...The decision by the immigration service to close its office in Seoul could cost NZ and the education industry in excess of \$70 million annually. In a market which was demonstrating accelerated growth... the immigration service appears to have made a decision without reference or consultation with those who would be affected, an industry spokesperson advised the... Chamber of Commerce... English language schools have also expressed concern that the immigration service appears to have acted unilaterally and made a decision based on incorrect information. The immigration service stated that one of the reasons for the closure was the drop in permanent migrant and student visa applications. Given that in 1994 the total number of students was 2047, in 1995 equalled 2702 and in 1996 was 3859, it would seem they have got it wrong.

...Economic turmoil in Asian countries is slashing intakes of students to Christchurch English language schools. The Southern English Schools director... urged the Government to allow study visas for students from China.

...English-language schools are[being] advised not to give up on South-east Asia in the face of a downturn in numbers of foreign fee-paying students from the area next year... [This year the region] accounted for just under half of the total \$300 million earnings for the English-language market here... [However, the] chief-executive officer... [of NZ] Education International... said... some schools would have to look to North and East Asia, where growth was most likely... The Minister of Immigration... said more than 100 schools and tertiary institutions would benefit from a more liberal Chinese student policy, which was restricted in 1992 to stop overstayers fleeing political instability in China. He said China’s subsequent economic growth and stable political climate had led to[a] trial policy change... [which meant 400] Chinese students will be allowed in...

[‘The teaching of foreign students is on track to becoming a billion-dollar industry. Already, fees from foreign students add up to NZ’s 8th-largest export earner, bringing in \$500 million a year. This year the private and public education sectors set up the NZ Education Trust to promote education as an export industry. Its chief executive said things were looking up, particularly in the Chinese market. Earnings for English-language schools and secondary and tertiary institutions are expected to double in the next 5 to 6 years. He said education could be in the top 2 to 3 industries within 10 years. Tomorrow’s Schools legislation in 1989 allowed foreign fee-paying students in schools (it also allowed the Ministry of Education to charge \$900 a student because the schools are running a business from Government buildings – in addition, the Government collects GST), bringing NZ into line with trends in AUS and the

US. Most secondary schools have at least a handful of fee-paying students, but some, like Piopio College in the King Country, often hosted Asian school groups for weeks at a time and billeted them out with local families.'

...Asian students are spending millions of dollars in NZ to end up lonely, depressed and in some cases dead, disturbing research shows. A Taiwanese migrant interviewed 144 foreign students and found dissolute lifestyles, neglect from homestay supervisors (interaction between students and their hosts was limited), gambling, fat bank accounts, fast cars and alleged extortion. She cited the case of 18-year-old Chinese student Zhao Yun-fei, who spent \$75,000 during his first 14 months in NZ before dying in a car crash, as a tragic example of the NZ experience gone wrong. "Many Asian students are irresponsible and do not use freedom wisely." The students, with no parental control and big spending power, developed bad habits in a short time and became an extravagant sub-culture, she said. "The behaviour of these adolescents then becomes quite unacceptable to the community, schools and their host families."

...A big increase in the number of fee-paying international students at NZ institutions in the past two years has brought with it more complaints. Key issues prompting complaints were: ■ Poor quality of or lack of orientation programmes; ■ Misleading representation by agents; ■ Inadequate internal dispute resolution processes; ■ Inadequate contract documentation; ■ Inappropriate class level placement of students; ■ Failure to follow the Education (Stand-down, Suspension, Exclusion and Expulsion) Rules regarding international students.' In related news,] **Auckland University students face a \$420 fee rise next year after a retracting to set tuition costs last night which degenerated into high farce. A student representative... even mistakenly voted for the 17[%] rise, then retracted his vote, saying he did not know what he was voting for. Meanwhile, the university council rejected every fee proposal put before it, while an official miscounted the show of hands, prompting accusations of procedural misconduct and manipulation.**

...University of Auckland students opening their cheque-books next February to pay for another year of study will be meeting the largest overall percentage increase in university fees in the country. At close to 17[%], the rise outstrips the next-closest increase – 13.3[%], to \$2200 for an arts or commerce degree at Otago University... The latest Auckland rise makes a mockery of... [the finance committee chairman's] assurance in 1996 that the 15.8[%] increase for 1997 would mean little or no increase in 1998. In absolute dollar terms, Auckland's fees will increase... to \$2884 a year. By contrast students at Victoria University will pay only \$2586 for the year – a 3.9[%] rise... Why is Auckland... more expensive than Wellington and increasing at a greater rate? [The]Deputy Vice-Chancellor... says salary margins paid to staff to cover the extra expense of living in Auckland and the extent of research done at Auckland, particularly in the medical school, contribute to... higher costs... Since 1992 the University of Auckland's costs have risen by 54[%]... The Government can rightly say it has increased the University of Auckland's funding by 34[%] since 1992... to \$155 million annually. [However, the] university argues that the amount for each student has decreased in that time. In 1997 it received \$7783 a head, next year that drops to \$7560. What is more, Government funding does not make provision for inflation... [By the way, after leaving university s]ome graduates leave the country to avoid... student loan... repayments because... Inland Revenue... has no means of enforcing collection overseas.

...Some N[Z] graduates living overseas are terrified of returning home because of outstanding debts from their student loans, according to a straw poll by a Christchurch company... "I don't even know if I want to come home to visit," said one honours graduate. "Will I be held at the airport?"

...Dodging the debt: why students flee... [S]he is too scared to come back to N[Z] to visit her parents because she fears being detained at the airport for overdue student loan repayments. She is one of 29,083 debtors who have defaulted on their repayments to the Student Loan Scheme, contributing to an overdue amount of more than \$16 million... [A]n additional \$2.5 million has been written off for students who have died or are bankrupt... At April 30, 227,000 debtors owed \$2.02 billion... Of those, 2452 owed more than \$35,000 each... In... courses, such as dentistry and medicine, loans are peaking at more than \$70,000... [S]tudent loans have become millstones around the necks of many young university graduates... Student loan debtors who stay and work in N[Z] are required to give the tax code G-Ed to any employer, which allows the Inland Revenue to take 10c in every dollar earned over \$14,300 as repayments... Debtors... who travel or move away from N[Z] for more than 325 days in a 12-month period are deemed to be non-residents [but are still] required to make repayments... Overdue payments both at home and abroad have penalty interest of 2[%] added, with 2[%] being added for every month past the due date. If the debtor dodges repayments for two years he or she may have to pay off his or her whole balance immediately. Interest begins accruing on accounts from the first drawdown of money, which is done through an 0800 phone line and direct credited into the borrower's bank account... However, for young Kiwis on their Big OE[(overseas experience)] in London, student loans waiting back home have become a bit of a resident joke. Graduates living and working in London say that while loans are a topic of conversation among expats, the majority just try to forget they exist. Others say that they know their debts are waiting for them when they return and it makes the option of coming home less appealing... People are generally overseas with the sole purpose of travelling... Work as nannies and in pubs does not pay enough to send money home for loans... The president of the N[Z] Students' Association... said it was sad that graduates were "hiding out" overseas to get away from their debt. He said the association maintained that students should not have to mortgage their futures for tertiary education which would benefit the whole of society. N[Z] needed to produce its own doctors, dentists... and accountants because otherwise those jobs would have to be filled by immigrants. Detractors of the scheme have voiced concerns about the ease with which students can access large amounts of money, the repayment days seeming a long way off. Students can draw down funds to cover fees – \$1000 in course related costs and \$150 in living costs for every week the course runs. After three years the average bachelor of arts degree student could expect an end debt of \$26,739 if the full... entitlement was drawn down each year... Since the scheme started more than six years ago it has cost the Government more than \$72 million in administration costs... Students also pay a \$50 fee each year towards the scheme's administration costs. [Editor's note: 'There is no limit to the size of student loans that retired people can obtain. Most are unable to repay their loans, so their student debts will be wiped when they die.']

...Dear Privacy Commissioner, your department owes us \$3.016 trillion in overdue student loan payments. Yours sincerely, the taxman. PS: Please note the late payment penalty of \$143 million and the interest of \$1.44 million accruing daily. That was the Inland Revenue [Department]bill sent to[the] commissioner... for student loan payments owed by commission staff. [The commissioner] said that "using my lightning reflexes and my quick calculating powers, I soon worked it out. There was a mistake." The... [IRD] said it could not comment on specific cases but occasionally "keying errors" occurred. [● Last year, 'an IRD computer glitch left 15,000 present and former students unable to get loan statements. The borrowers were affected by problems in a May changeover to a new format for statements. The department had stopped sending out old-style statements the previous September and some students went without a proper account of their current debt for almost a year.']

...I'd forgotten about my student loan. Pretended it didn't exist. For the two years I've been working, I've shielded myself from the true cost of the three years at AIT that got me a job. My wage slip shows how much a week I'm paying back – money I've never seen, so don't miss. A sort of education tax, I told myself, denying the horror that I'm not even keeping pace with the interest. But my head's been jerked from the sand by the news that [the IRD] is now in on what students have known for years – that loan statements don't actually reveal what you owe. The taxman has listened to a student who couldn't decipher her loan bill, and from now on a new widened format (for all the zeros) will show how much of the GDP I am responsible for. This is a good thing. It's about time I acknowledged I'm part of Generation Debt, and also accepted that the monster hiding in my finances is going to affect what jobs I take, when and who I marry, my chances of ever owning property, or travelling. And about time, too, that the country's biggest loan shark, the Government, reversed its position on charging students a killer 7 to 9[%] from the time they borrow, thus destroying any desire, or chance, they have to chip away at the debt mountain... The biggest scam is not people fraudulently obtaining student loans, but that young people are forced to shackle themselves to debts the size of their parents' mortgages with nothing to show for it but a job if they're lucky. No longer middle class, I'm part of the diddled class. I took on a huge debt to land myself a job in an industry you don't go into

for the money[– journalism]. The money lenders need a kick in the butt to force them from the Beehive and into schools to explain a loan scheme that will leave us in debt till we're grandmothers and grandfathers... [Incidentally, an economist] argued in a recent column that childcare should be fully tax-deductible and couples should be able to split the principal (male) wage between earner and non-earner – allowing each to benefit from lower marginal tax rates, and permitting some recognition of women's unpaid work. While such suggestions have some superficial appeal[, they] would benefit high earners more than low earners... [With childcare, the] higher your marginal tax rate, the greater the tax deductibility. So the median woman income earner – at \$369 a week – who spends say \$120 a week on childcare will pay \$29.64 less a week in tax while a woman graduate earning \$806 (still \$122 less a week than her male counterpart) will be able to deduct \$40.44 a week from her tax... The same goes for splitting the family wage... Split... the median male wage of \$423 a week... between the man and the non-earning woman and the total tax benefit to the family is \$16.69. Yet the man earning \$60,000 a year who splits his pay packet with his wife will save the family \$61.28 a week in tax. The more you earn, the more you benefit. What these figures reveal is the gross discrepancy between working women's wages and those of working men. Tax fiddles only serve to accentuate wealth disparity... I doubt many would agree that a system that systematically undervalues women's paid work is a fair one. With average earnings 27[%] less than men, women's wages have declined by 5[%] relative to men's since free wage bargaining was given cult status under the Employment Contracts Act... The productivity of women is not matched by the wages women earn. The reason? Gender-blind wage bargaining laws do not acknowledge the different working patterns of women and the way the differences affect wage bargaining itself. An exception to gender-blind employment laws is the 1972 Equal Pay Act. Looking back, it seems extraordinary that until 1972 employers were able to pay women less than men for the same work. - 1997

An Auckland headmaster drove 10 miles to his burning school last year, but when he claimed tax deductions for it he was turned down by the I[RD]. This week the Minister of Finance... said teachers who went back to school after hours could not claim their expenses as tax deductible, unless they were going to inter-school activities, seminars or courses. - 1972

...revenues for public finance in the earliest days of NZ settlement by Europeans came mainly from customs duties and property levies. In the mid-1870s about 70% of public revenue came through customs duties, and the percentage only declined in the following decade when revenues from public railways... the Post Office and stamp duties... became as important. Property tax was replaced by land and income taxes in 1891, to boost revenue for financing the... social welfare programme. By the turn of the century land and income taxes comprised only 7% of total public revenue, and by the beginning of W[W1], only 11%... Taxation sources expanded from the 1930s to keep public revenues high enough to match the demands placed on funds for social welfare services. There has been a long period, too, during which the graduated income tax system, and such devices as the gift and estate duty, have been used to gain a redistribution of income among N[Z]ers. From the mid-1970s through to the early 1980s, about 75% of public revenue came from income tax alone. In the early 1980s the government began to shift from direct to indirect taxation... [T]he breadth of taxation has increased markedly with public revenue now coming from a wide variety of sources such as beer duty, petrol duty, road taxes, fees from licensed industries, and sales taxes on many goods and services at the retail level.

The total tax we collected in the year ended 30 June 1995 was approximately \$24.3 billion; of which \$19.8 billion was income tax.

Last year 1.2 million N[Z] taxpayers, on salaries and wages, did not file income tax returns by the required June 7. In that year just 906 taxpayers were prosecuted... [Y]esterday, a senior I[RD] official... said: "I don't want to give the taxpayers of N[Z] cause to celebrate..." ...failure to file a tax return would not automatically result in a prosecution; only if it ran into multiple years. Consideration was also given to the background facts and reasons the return might not have been filed... [T]he department had to be selective about the cases it prosecuted. "Basically we do not wish to incur the cost and the effort of taking taxpayers to court to have them... [receive] a nominal fine." So the procedure for late filing, according to [the official], is: "There are a series of letters sent out, ranging from gentle reminders through to prosecution action." [The official] was asked, if it turned out that a company with significant income tax payable did not file a return, was that not a deliberate act of evading the department. He replied: "How do you mean evading?..." But [he] finished by saying that if "we have absolute knowledge of the process of what was going on with a single company" and tax returns were not filed, then he would accept that that was a deliberate act of evading the department.

...Now taxpayers may be fined if errors occur in their tax returns through lack of responsible care. For example, a fast-growing small business could see its inadequate or poorly supervised accounting systems lead to omissions of income or overstated deductions. Because even arithmetic errors come under I[RD] scrutiny, employers will have to ensure staff are competent and skill levels adequate. Failure to take reasonable care could result in penalties of 20% of the resulting tax error. There is also the concept of "gross carelessness" in new legislation, and will attract penalties of 40%... [A]n example of gross carelessness could be where an employee responsible for administering expenditure items had no training or written guidelines on how to treat them for tax purposes. Other areas of penalties under the new law are: • *Unacceptable interpretations*: This occurs where taxpayers make arguments to which no court would give serious consideration. This means that taxpayers must ensure they have reasonable arguments when making a claim. Failure to do so could mean a penalty of 20% of the tax error imposed. • *Abusive tax positions*: This applies where a taxpayer has already applied an "unacceptable interpretation" to a tax law, and then compounds the situation by making specific arrangements where their dominant purpose is tax avoidance. The penalty for this behaviour [is] 100% of the tax shortfall. • *Evasion*: The definition of tax evasion has not changed under the new law, and it remains the most serious offence. But the penalties have been increased to 150% of the amount involved. The person convicted of evading or attempting to evade tax is liable to a fine of up to \$50,000, or five years imprisonment, or both. • *Obstruction*: Taxpayers who deliberately obstruct IRD inquiries can have any of the above penalties increased by 25%. • *Disputes procedures*: These will include opportunities for taxpayers in dispute with [the IRD] to opt for a less expensive procedure, but which has no right of appeal. Although the act will first apply to the 1997/98 income year, the long lead time is designed to allow taxpayers to get up to speed on the new laws. Failure to act now could mean bigger tax bills down the track, particularly for businesspeople... - 1996

New tax laws imposing heavy penalties for mistakes in tax returns could force some small firms out of business, [an]... accountancy firm... says... [The IRD] was taking a "hard-nosed" approach, but the department claimed it was acting fairly and reasonably.

...The [IRD] is imposing huge penalties on people who have made simple mistakes in their tax returns, says[a] Lower Hutt accountant... He knew of a company being fined about \$10,000 for a GST claim on the purchase of a property worth about \$450,000 because the transaction took place a few days later than scheduled. The company was given no opportunity to correct its mistake... He also said the IRD was applying the rules differently for large companies than for smaller taxpayers... An IRD officer had said that if, for example, they found a company such as [BIL] had incorrectly claimed the construction of a new carport down to repairs and maintenance, they might decide that was not... [worth worrying about]. "...This is because if they pinprick a big company all hell would break loose," [suggested the accountant]...

The IRD] argues that the compliance and penalty provisions now coming into effect... haven't significantly impacted on wage and salary earners... But step out of line with the new rules, and IRD is promising a tough time. [The IRD] general manager of operations... said: "If you cheat, the likelihood now is that you will be caught, and if you are you will be penalised... There are no 'ifs or buts' – the new rules make that very clear."

Even first time tax evaders can now be jailed for up to five years. For wage and salary earners, tax-speak has often been pretty difficult to follow. The bad news is that the new laws introduce some new words and phrases to that exotic language – but hopefully they are not as foreign to the lay person's ear as some of a tax experts' vocabulary. The new tax laws, for example, are said to be about "voluntary compliance". By that they mean it's up to taxpayers to find out what's what under [the] new regime, and to make sure they comply with it. Ignorance of the law has never been a legitimate excuse for breaking the law, but one gets the impression that now, more than ever before, taxpayers will not so easily get away with the cry, "but I didn't know that". Another new catch cry is that of "reasonable care". The new laws set out penalties for underpaid and unpaid tax, and the premise is that all taxpayers are expected to take reasonable care in attending to their tax affairs. Gone are the days of filing in your return and hoping for the best. If you don't take reasonable care, then you may get the book thrown at you... This harder stance has been prompted by the large amounts of tax arrears owing in the Auckland region, with some \$230 million overdue in taxes at December 31, 1996.

...The national manager of the IRD's BusinessDirect division... said that by the end of [last month] exactly 100 shortfall penalties (78 of them for lack of reasonable care) had been issued, worth a total of \$107,000. About as many again are in the dispute resolution pipeline. "But in the same period over 1000 other adjustments had been made where we didn't apply shortfall penalties. So we aren't applying penalties willy-nilly," [he said in response to claims made by] two tax consultants... [in] last week's *Sunday Star-Times*... [that] the IRD had hard-nosed attitudes when dealing with taxpayers with whom they were in dispute. They said new departmental attitudes were in danger of resulting in a taxpayer and tax adviser backlash. But [the IRD manager said that]... taxpayers... who were careful and complied with the law had nothing to fear.

...[during question time in Parliament yesterday, an Act MP asked the Minister of Revenue whether he would be concerned about a claim that one IRD officer was responsible for five taxpayers killing themselves, and had bragged about it. "I would be concerned at any such assertion," the minister replied, "but I suggest the fact that such an allegation is made in no way makes it credible." The suicide allegations against the IRD were the latest in a catalogue of accounts which damn the department for the way it recovers tax debt.' They include the account of an Auckland couple who claim that 'when the IRD prosecutes, you are guilty until proven innocent.'

...a \$550,000 payout to an Auckland couple has ended a 14-year dispute with the IRD but critics say the officials responsible have escaped blame too easily. The Revenue Minister yesterday labelled the payout a full and final settlement of the concerns raised by the couple over a battle with the IRD that cost them their business. The compensation deal covers just over half the amount the couple estimated they lost as a result of the dispute, which started in the mid-1980s. They ran an engineering business employing up to 400 people when their dispute started with the IRD over the ACC categorisation of their workers. They borrowed and sold assets to pay \$100,000 to the IRD. In 1993, the IRD sent a letter threatening to wind up the company, based on the couple's failure to appeal against a letter sent to them in 1990. However, the 1990 letter gave no indication of any right of appeal. The IRD official involved in the case has since died. The minister said the compensation deal did not set a precedent and other cases between taxpayers and the IRD would be considered on their merits.'

...the 'Acting Inland Revenue Commissioner can be forgiven for feeling under duress before Parliament's finance and expenditure committee on Wednesday, when he unreservedly apologised for the tax department's hounding of an Auckland couple. The apology and promise of compensation came after 14 years of wrangling over a wrongly based tax bill, which cost the couple their engineering business, their home and hundreds of thousands of dollars. As the Great Barrier Island couple struggled to keep their composure, the acting commissioner displayed a humility rarely showed by post-Rogernomics public servants. For others who have fallen foul of the IRD, and for thousands who have been frustrated dealing with it, the admission of error was something of a watershed. Until the acting commissioner's star turn, the most visible effort to sway the public's opinion that the IRD's "never apologise" approach towards taxpayers is heavy-handed and dictatorial had been a soapy television ad, featuring downtrodden Bob from the IRD. The campaign, putting a human face on an increasingly invisible species, is credited with a slight shift in people's attitudes. However, the IRD's increased reliance on call centres has not helped perceptions that tax officers are faceless machines with whom arguing is pointless, and publicity that the shedding of 1000 jobs during a \$46 million restructuring had failed to produce any savings exposed the department to further contempt. The *Weekend Herald* fielded a steady stream of taxpayers' complaints yesterday after publicity over the apology. Cases ranged from 10-year-old disputes to two-year wrangles over ACC levies. Many said they had spent thousands battling the department in court. Officers were described as rude, threatening, dismissive, corrupt and uncaring. Some complainants said they hated the IRD so much they could not bear to watch the advertisements on the television. "I hate the IRD and if I met Bob in the street I would give him a good swift kick where it hurts," said one woman caught up in a five-year-old tax dispute with the IRD.'

...the gas] retailer Enerco has won a... \$4.4 million... five year old battle with the I[RD] over the tax treatment of its rehabilitation of gas lines...

The [IRD] has decided to go ahead with an appeal to the Privy Council in a test case over whether inducements to enter into leases were taxable. The law lords are expected to hear the case next May... [T]he Court of Appeal ruled that a \$5 million inducement paid to accounting firm Coopers and Lybrand in 1991 when it moved into... [a new office] tower in Albert St was not taxable income... Coopers and Lybrand argued the sum was a capital item, a negative premium paid in return for their acceptance of the burden of a non-assignable 12-year lease. It could be seen as compensation for leaving their previous premises under a penalty and making a loss on assets associated with those premises... The Court of Appeal overturned the decision of... the High Court, [which] had concluded the \$5 million payment... was essentially a form of rent subsidy and, as such, was assessable income... Such inducements were for a time commonplace in a depressed commercial property market and the IRD has more than 100 similar cases pending.

...[yesterday in the Auckland District Court a former IRD official faced 102 charges of corruptly selling information she gathered while working for the department. The 29-year-old is one of two former employees of the IRD's Manukau office to appear on corruption charges this year. Also in court yesterday were two repossessing agents, a finance company employee and an unemployed man who face a total of 121 counts of corruptly disclosing official information for advantage or pecuniary gain.' By the way, the IRD] is prosecuting at least nine of its own staff for not filing tax returns. An audit found that they, and other staff, had failed to file their annual returns by June 7 last year. A spokesman said the staff had been warned. The public had to know the same rules applied to I[RD] staff.

...The Department of Labour has been ordered to satisfy its tax obligations "to the letter" after paying more than \$2300 in penalties for late tax returns. Answering a written parliamentary question, the Minister of Labour... said monitoring procedures to ensure[future] compliance were under review.

...Businesses will be saved more than \$20 million a year in compliance costs by moving the due date for terminal tax back two months, says the Minister of Revenue. At present a taxpayer with a March 31, 1997, balance date has to make the terminal tax payment by February 7 next year, but does not have to file a return until March 31 next year. "So some taxpayers have to estimate what their terminal tax liability will be... because they haven't completed their return yet, then calculate it exactly for the return due on March 31,"... By moving the due date to April 7, the costs of that double handling would be eliminated. The use-of-money rules still apply, however. The taxpayer may not have to part with the final payment until two months later, but would have to pay the I[RD] two extra months' interest for the privilege. The change applies only to the 270,000 or so taxpayers who use the services of a tax agent... For other taxpayers, returns are still due on July 7 and final tax payments the following February 7.

...[IRD] policy is making tax dodgers out of parents and businesses who download computer games and other software from the Internet. A recent *Consumer* magazine article on shopping on the Internet included the question: "I bought computer games off the Net for my kids and downloaded them on to my PC. Do I have to pay tax?" The magazine said that if software was bought from an overseas trader, 10 to 15[%] of its

value was due as non-residents withholding tax. [A] tax director... in Auckland, said buying software off the Internet could technically be a very expensive purchase because, since April 1 this year, if taxpayers knowingly failed to send the required withholding tax to the IRD, they could be held to be guilty of tax evasion and subject to a shortfall penalty of 150[%] of the tax that should have been withheld. The problem arises because the IRD continues to maintain that all payments for the use of software under licence are to be taxed as a royalty and are subject to non-resident withholding tax when payment is to a company or individual based outside N[Z]. Most software purchased through the Internet is from companies based in the U[S]. While effectively making tax cheats out of families and businessmen who download software from the Internet, the regulation is virtually unworkable, [the tax director said. The]... IRD requirement on withholding tax for software was virtually impossible to police, and N[Z] should bring its policy into line with international practice... [M]ost OECD countries regarded the purchase of software as a payment for the purchase of a product and not as a royalty payment, as N[Z] did. Normally, royalties were paid for the right to commercially use or reproduce a creative work like a photograph, a book, a magazine article, an artwork, a piece of music, or a sports logo. However... an item of software was essentially a copy-righted product like a book or a compact disc. In most OECD countries – including N[Z] – anybody purchasing a book or CD on the Internet was not required to pay a royalty. Only when the right was granted to actually reproduce a computer game or make the software under licence in N[Z] should a company or an individual be required to treat its payment as royalty... [T]o help buyers work out what is and is not taxable... the I[RD] was developing guidelines that would assist taxpayers to “properly characterise the true nature of their software purchase.”

...BUCKETS of tax dollars destined for A[US]n state and federal coffers were likely to be lost to cyberspace unless action was taken to stop the Internet becoming a refuge for tax dodgers, [the]Tax Commissioner... warned... when launching an A[US]n Tax Office (ATO) draft report on tax and the Internet... [The commissioner] said major revenue losses linked to the Internet were not expected for the next two years... [but] there was plenty of scope for horror stories... He said state gambling revenue, worth \$[A]3.3 billion in 1995-96, was at risk by competition from Internet-based gambling sites. And most existing tax bases were also vulnerable... However[, he]... refused to buy into the goods and services tax... debate, insisting the report did not analyse the impact of the Internet on individual taxes. But he said some countries, which unlike A[US] (with the exception of the bed tax), taxed services, were concerned about the impact on this revenue. [He] stressed it was important for the nation's tax base for local firms to embrace the Web. “If they don't, what we'll find is as commerce increases, people will be acquiring their goods and services from overseas,”... But he confirmed the ATO would examine scrapping the tax exemption on tax advantaged computer programs... saying such software was increasingly becoming an integral component of many goods. The tax office would also speak to software suppliers about the merits of building in ways to check electronic paper trails... [T]he ATO was reluctant to impose a “bit tax” on data flows... [Incidentally, c]iting the... Commonwealth Bank of A[US]’s \$A650 million share buyback plan... that provides both a capital loss and a tax-paid dividend to shareholders[, yesterday the ATO]... Assistant Commissioner... said: “To the extent they are getting two tax benefits out of one arrangement, the outcome is an inappropriate one.” ...the tax authority would “closely scrutinize” the transaction and may counter the buyback if it is found to be against tax law.

...[the] shifting sands of tax legislation have had the unforeseen effect six years later of depriving 10,000... N[Z]... superannuation-scheme members of becoming shareholders in AMP's forthcoming demutualisation... [They] will miss out on shares worth more than \$1000 each. This is because their funds were moved out of the society in 1991 to take advantage of more favourable tax treatment for non-life-company superannuation schemes. The move was made under a change to the tax law in 1990, specifically so that superannuation savings could be shifted from direct life-office control. A spokesman for AMP... said... “The unfortunate thing[for our customers] is that at the time nobody saw demutualisation happening down the line.” [The spokesman] said making a special case for the[affected] members would open the way for people in non-qualifying global operations to argue for entitlements... [In related news, f]illing out governmental demands for statistical, tax and ACC information involves a real cost to the economy. Doctors complain of hours of patient time wasted filling out ACC forms and responding to crown health enterprise demands for details, while businesses and other non-government organisations say they are getting buried in a swathe of compliance costs. One estimate puts the cost to business of tax compliance at double the I[RD]’s expenditure. The Retail and Wholesale Merchants Association says a survey two years ago found that respondents made up to 52 PAYE[(employee income tax)] returns each year, spending up to three hours on each one. GST returns took between 30 minutes and one and a half hours, with similar times for ACC returns.

...Over the past few months I have been following an interesting series of articles on the costs that the tax system imposes on the nation as a whole. The... main stimulus for these articles has come from a paper... [called] Taxation and Economic Growth in N[Z], that was commissioned by [the IRD]. It examines the extent to which the tax system has reduced N[Z]’s growth prospects. That is, it seeks to estimate the “deadweight costs” – the extra cost to the economy of raising tax revenue. Its conclusions were startling: the cost of every extra dollar in tax, or alternately every dollar of public spending in 1994, was really \$2.70... According to [the professor who wrote the paper], high tax rates lead to increasing deadweight costs and our country's tax rates have cost every N[Z]er almost \$6700 a year since the end of... W[W2]. Not surprisingly, the paper has intrigued politicians as well as journalists. As a minister responsible for both taxation and controlling Government spending, I have particular interest. The question is: are the professor's conclusions correct? Other researchers have reached far different conclusions. It is worth, therefore, understanding the nature of the problem. The key purpose of the tax system is to raise the revenue required by the Government for its economic and social objectives... Unfortunately, any tax system also has costs. The actual cost of raising one dollar of Government revenue exceeds one dollar by an amount referred to as the “excess burden” ...of taxation. Some of the sources of deadweight costs are well-known to both taxpayers and the Government. For example, the disincentive effects on work, savings and investment. There are also what are known as the compliance costs of people spending their personal or business time filling in such things as GST or income tax returns. Other sources of deadweight costs, however, are much more difficult to observe. For example, the income tax system has the unintended effect of altering the relative rates of return from different productive activities. These unintended effects encourage less efficient use of resources, thereby reducing our prospects for increased economic growth and employment. This in turn can compromise the Government's ability to raise the revenue it needs... This is why... [NZ's] Government has been trying to foster increased empirical research into the magnitude of deadweight costs... Although the existence of deadweight costs has been recognised for many years, the first major attempt to estimate their magnitude empirically did not appear until March 1994. That study... estimated that the deadweight costs associated with raising the last dollar of revenue from the taxation of labour income have increased from 5[%] (or 5c) to over 18[%]... in the past 20 years... The... [1994] study also estimated that the deadweight costs associated with the last dollar of revenue from the taxation of consumption (all indirect taxes other than property tax and import duties) has increased from 5... to around 14[%] over the past 20 years. Most of this increase occurred after the introduction of GST in 1986... In view of the difficulties associated with this work, and the variety of approaches that can be used to estimate those costs, it is important not to seize on the results of one piece of analysis for the purposes of a few sensational headlines. Even in the U[S], where considerable resources have been devoted to estimating deadweight costs of taxation empirically, estimates still range from 17... to 56[%]. It is better to make a long-term commitment to fostering continual research... It is even more important for the Government to make a commitment to a low-rate and broad-based tax system. The coalition has been developing a revenue strategy and a series of detailed three-year tax policy objectives that will have the least cost to the nation as a whole... Unlike Act, we do not believe that the deadweight cost of taxation is a reason to blindly pursue a zero-tax, zero-Government objective.

...More than... 27[% of]... publicly listed and foreign-owned companies in N[Z] pay no tax... The overall level of corporate tax payments, at about 4.7[% of GDP], is high by international standards... But the... long-run average... [for the] proportion of zero taxpayers... was about 35[%], more than twice the OECD average. At the peak in 1991, 43[%] of... firms paid no tax... There is a distinction between abusive tax avoidance, which

attracts a sanction under the new penalties regime, and normal commercial tax-paying behaviour of arranging your affairs in such a way as to minimise tax within the law... Tax minimisation increased in the 1970s and early 1980s... Favourite mechanisms were the use of tax havens, redeemable preference shares, transfer pricing, thin capitalisation and loss trading.

...Companies are avoiding large amounts of tax by using loopholes that could be closed, says an I[RD] working paper. As much as \$1.3 billion in company tax may have been avoided in 1994... compared with the \$3.1 billion actually collected... "Past experience in N[Z] and overseas indicates that evasion is more the province of small firms and the self-employed." ...The paper does not consider evasion by people or companies not declaring income.

...N[Z]'s "black" or "hidden" economy – in which no one pays taxes... [because jobs are] done for cash and never declared... – could be worth as much as \$10 billion a year. That means the Crown is missing out on around \$3 billion a year in tax... Tax-paying households probably have to pay an extra \$50 a week to make up for revenue forgone.

...Is stealing \$500 from the Crown through not paying tax or GST on the proceeds of a cash job any more defensible than stealing a child's bike? Both carry severe sanctions, including fines and imprisonment. Both could lead to loss of employment following prosecution. Why then is the "cash jobs are okay" culture so prevalent in N[Z]? ...One of Wellington's radio presenters [said] last week that it was puritanical and naive to suggest full tax compliance was possible. Before you can say under the counter jobs are tantamount to stealing, "you really are going to have to make sure that the Government is worthy of respect... because at the moment when people feel they are being ripped off by Government then they will try to dodge their taxes... I am not condoning it because I know it's illegal... but I certainly don't see it as akin to stealing a kid's bike." An interesting line of argument. If the Government is not performing according to your expectations, withhold your taxes... [T]he black economy in N[Z] is of broadly similar size to that in other countries.

...the black economy [in NZ is about 10%] of GDP. What a bother for the taxman. The ability of income tax policy to clip the ticket on all contracts to hire labour will never be 100[%] because some people will simply break the law if they can... Income tax evasion can be addressed in two ways. We could employ heaps more tax enforcers to collect tax on the... transactions missed out. The costs of doing that could well exceed the tax dollars collected. Or we could continue to lower the average rate of income tax, switching more of the collect to GST (which is less fallible) or, best of all, decrease the overall drag on the economy posed by the need to collect tax by reducing Government spending... [By the way, a]bout 100,000 people earning less than the \$34,200 threshold have opted not to file an income tax return[this year (the option was introduced last year). The IRD – which has just]... published a list of 4376 people owed... \$3.3 million in... unclaimed money... [-] says those who sign a form indicating they are not bound to file a return may still claim a tax refund if they later find they are entitled to it.

...When is a tax return officially returned? When it hits the [IRD's] post box, according to a ruling by the Taxation Review Authority. The case concerned a refusal by [the IRD] to pay a taxpayer a GST refund because the return did not arrive at the department's office in time, despite landing in its post box four days earlier... The department had an arrangement that any mail which arrived at its post boxes around the South Island was forwarded to the Southern Processing Centre in Christchurch. By the time the return arrived at the centre via the departments' Nelson postal box, it was three days late for the cutoff date, and the return was refused... However, [the]Judge... said that under the Postal Services Act 1987 an article was considered delivered when it arrived at the recipient's house, office, letterbox or private post box, or was delivered in any other usual way... [The] Judge... ruled that the I[RD] Commissioner had acted incorrectly in disallowing the claim for \$7777.77... An I[RD] spokesman said yesterday that managers were not available to respond to criticism of the department in the ruling.

...[t]he IRD is sorry its computer has been miscalculating penalty payments and use-of-money interest charges. It is sorry it has been telling employers and banks that people owe it money when they don't. It is sorry it has been sending out letters which aren't very nice. And it is really going to try to fix its problems just as quickly as it can. The apologies are made in a letter to tax accountants, after complaints that the department has been sending out inaccurate and heavy-handed debt-collection demands. Its standard debt collection letter says that if the IRD does not hear back within 14 days, it will start taking action. This could involve compulsory deductions from the taxpayer's pay or bank accounts, legal action possibly including bankruptcy, a downgraded credit rating and publication of the taxpayer's name in the *Mercantile Gazette*. Paying off debts by instalments might be possible, the letter said – but only once the taxpayer had first tried to get a loan, considered selling assets, surrendered superannuation and insurance policies, or traded down to a cheaper house. Some people who got these letters were in debt to the taxman for the first time, or owed only small amounts of money. Now the IRD says it is rewording the letter "based on feedback received from our customers, who felt the letter was inappropriate" for such minor malefactions. It has also stopped issuing notices requiring employers or banks to make compulsory deductions to recover tax debt.' ● 'The IRD is trying to give away millions of dollars which has been sitting abandoned in bank vaults. One couple are owed nearly \$60,000, which they have not claimed despite efforts to find them. The \$2.6 million the IRD wants to hand back belongs to over 4000 people who have forgotten they have money sitting in bank accounts or with other financial institutions. Under the Unclaimed Money Act 1971, holders of unclaimed funds such as banks and insurance companies are obliged to make a register and try to trace the owners after six years. If they can't be found, the money has to be paid to the IRD, which puts it into the Consolidated Fund for the public good.'

...A parliamentary committee yesterday threatened [the IRD] with an inquiry into its poor customer service record. The [IRD]Commissioner... was publicly chided for mounting frustration with the speed and quality of the [IRD]'s dealings with the public, especially its "infamous" telephone system... [I]n many centres a... third of customers abandoned their calls; the national average was 25[%]... IRD information and forms... [were] also criticised... as being incomprehensible and too complicated... [The commissioner] said the IRD was... looking at... a revamp of the IR5 form...

The annual chore of filling out a tax return may soon be a thing of the past for many[NZers]... Each year, about a million taxpayers fill out IR5s and calculate whether they have paid too much tax, or not enough, during the past financial year... If the IR5 was abolished, [the IRD] and employers would work together to make sure the correct amount of tax was deducted from pay packets. It would not affect the self-employed... those who... have a student loan, paid or received family or child support, or earned interest on investments... [In addition, taxpayers no longer] have to file a tax return... [if they] earn less than \$38,000...

[H]undreds of thousands of taxpayers could receive inaccurate tax statements next year, says the IRD. It blames the faulty statements on teething problems with the introduction of the tax simplification system. However, a leading tax accountant said it was too soon to panic. "I don't think there is a major problem at this stage. This is a major new tax initiative that wipes 1.2 million people from the drudgery of filing tax returns and we've got some teething problems, but the great Kiwi clobbering machine seems to be at it already." Under the changes, three-quarters of wage and salary earners do not have to fill out an IR5 tax return next year and will not receive a tax statement from the department unless they ask for one.' Incidentally, [t]axation as a share of [NZ's gdp] is not shrinking despite last year's tax cuts... Taxation as a percentage of gdp was between 38... and 40[% said a]... University of Texas economics professor... An optimal tax take was about 20[%]...

The Business Roundtable is calling for a flattening of the tax scales to reduce the top personal tax rate to 20[%] or below over the next few years... Lower marginal taxes reduced the incentive to avoid and evade taxes... [the] Roundtable executive director... said... [He] does not quarrel with the idea that those on higher incomes should pay more tax. They would, even with a flat tax system... The Government expects to derive just over half its personal income tax take this year from the 15[%] of taxpayers whose taxable incomes exceed \$40,000...

High earners and companies are in for tax cuts to the top rate of 33c, the Treasurer... signalled yesterday... [However,] the Minister of Finance... stressed that no decisions had been made[although he admitted that]... the Treasury had started very preliminary work on further reductions...

[Last year, NZers were taxed at '24 cents in the dollar for income of \$30,875 or less and 33 cents for each dollar over \$30,875'; this year, income of '\$30,875 or less was taxed at 22.125 cents in the dollar, 24.375 cents for each dollar from \$30,876 to \$34,200 and 33 cents for each dollar over \$34,200'; and f]rom July next year the 24c tax rate on personal income between \$9500 and \$34,200 will change to 21c on income between \$9500 and \$38,000... A decision to proceed with further tax cuts beyond July 1... would be "weighed up in the context of which reductions are the best in terms of economic growth." ...The... Opposition finance spokesman... said there was no economic justification for reducing the top tax rate...

"Tax cuts as the pump primer to boost N[Z]'s economic growth," was the mantra on... [the Finance Minister's lips yesterday as he] outlined plans to cut the top tax rate and corporate tax rate to 25c and to remove the middle tax band altogether. "...Ideally you might have two steps, a 15% low rate, and a 25% top rate." ...At the moment there is a 15c rate for income below \$9500... [He] said the top rate needed to be brought down so that there was not too much incentive for people to manipulate their income to avoid the top rate of tax. The gap between the top and middle rate at the moment created such incentives... However... the Treasurer... emphatically ruled out a cut to 25c... [In related news, c]redit card transaction duty will disappear from April 1[next year] as a result of legislation introduced to Parliament yesterday. The 5c levy on purchases contributes \$3 million to the total tax take... but has become an anomaly with the widespread use of eftpos and electronic banking.

...The Bank of N[Z] says it is concerned falling government surpluses and the possibility of a deficit in 1998 could mean... the... promised tax cuts will be axed... [However, citizens] questioned for an opinion poll preferred by a margin of almost two to one that the Government cancel the tax cut next July and put the money into social spending.

...Employers stand to benefit from... a radical overhaul of the PAYE system outlined by the Government yesterday. All the information most employers have to provide on multiple forms would now be required on a single form only, to be filed monthly, electronically if possible... The... IR12 or IR13 tax-deduction certificates distributed to employees each year would become a thing of the past, as would the... annual PAYE reconciliations which many firms regard without joy. The... tax partner for Coopers and Lybrand, said the proposals were soundly based and wider in scope than most tax professionals had dared hope for... [especially since c]ompliance costs would[also] be slashed. To relieve 1.2 million wage and salary earners from the annual chore of filing income-tax returns, the... IRD... needs to ensure the PAYE information it receives from employers is accurate and timely. But its aim is to cut the overall cost of the tax system...

IT'S NOT the sort of... holiday reading most people would choose... but... Act's finance spokesman is turning his attention to the country's... tax legislation... [It means] wading through thousands of pages of tax law... and while MPs tired of his perkubusting might be happy, the IRD will probably be less than impressed... He... makes no apologies[, saying that]... if anyone needs proof the country's tax laws are unwieldy, they should check out his Bowen House office. It's there he's stored the... five volumes of tax codes... five volumes of income tax law commentaries, one volume of GST law commentary, one... of cases and 17 case books (law court cases), information bulletins and tax education office newsletters... which make up our tax legislation, and piled high measure more than 2.5m... And if that's not enough, there's a 12,000-page technical ruling manual containing 1.6 million words, the equivalent of 350 copies of the Bible. "This is out of control, it needs to be simplified – there can be no person in N[Z] who understands all this. There are 293 words in the Ten Commandments – and most of us struggle to keep them. How are we supposed to comply with [tax legislation]?" ...MPs were getting more complaints from people who had been "monstered by the IRD" than ever before. "I had a call from a company secretary who couldn't follow his daughter's student loan form – and when people try to get help they get these incredibly complex documents thrown at them. Either that, or their telephone calls to the IRD go unanswered... [Yet.] to run this outfit we have, per capita, three times the number of staff... than there is in America. For every five police officers... in N[Z], we have four people working at the IRD,"... [By the way, AUS's] Government is attempting tax reform... [f]or the third time in 20 years... Tax reforms are too important to leave to the next government or the next millennium, A[US's Liberal P]M... said last week... Tax reform was the Liberal's nemesis in 1993[, and a report released last year said '5000 AUSn families, each with assets of about \$A1.5 million, had used complex avoidance schemes to lower their taxable incomes during 1995 – some were even exempted from the Medicare universal health care levy "due to low taxable income" and also qualified for Austudy and family benefits, subsidised prescription drugs, free dental care and a wide range of discounts and concessions provided to welfare beneficiaries by state and local governments. The Government was still pursuing 100 individuals with a net worth of more than \$30m each who had declared annual incomes of \$20,000. Officials estimated they could raise \$2.4 billion over four years by pulling such people into the tax net by using new sophisticated computer analysis'...

'Billionaire wins dream tax bill: zero If tax policy were a soccer game the score in AUS today would be a media mogul 40 million, the taxman zero. The ATO assessed AUS's richest man as being personally liable to pay \$A40 million on income in the years 1990, 1991 and 1993. But the mogul took the tax collectors to court and after a legal tussle they offered a settlement that would have cut his bill to just \$30.55! Under the deal he would have paid \$2.87 for 1990, \$6.56 for 1991, and \$21.12 for 1993. But even this was too much for the mogul, whose fortune leaped by more than \$1 billion last year to \$5.2 billion. He refused to deal, and now the Federal Court has ruled that he need not pay anything at all. His company, AUSn Consolidated Press, had similar success in battling the tax man. The tax collectors wanted to take \$218 million but in court the mogul beat them down to a mere \$25,000. As outrage filled radio talkback shows yesterday, the Democrats, who will play a pivotal role in the final shape of the PM's planned tax reforms, joined the chorus of calls for an overhaul to close tax loopholes for the wealthy. The Democrats had identified loopholes costing the Government \$3 billion a year in lost revenue'...

Tax – 'the other three letter word ending in "X" that gets people hot under the collar' –] is one area where A[US]ns admire N[Z]'s reforms and which they hope to start emulating this year. "If the N[Z] system was applied to A[US], we would have huge federal budget surpluses because so much tax is not collected under the present system. There has to be restructuring of indirect taxation to some form of goods and services tax."

...The A[US]n Government should follow the lead of N[Z] and introduce a goods and services tax without fanfare[, former NZ Labour PM David Lange]... said in Adelaide yesterday. "With taxation like that you've got to get your finger into their wallets without disturbing their trousers... you don't sort of wave a flag and blow a bugle and say, 'I'm now going to put this on'."

...the Business Council of A[US] complains that A[US] is burdened with high reliance on income taxes, high corporate and business input taxes, and a narrow indirect tax base... The A[US]n Chamber of Commerce and Industry, which last year joined with key Welfare lobbyist A[US]n Council of Social Services to promote reform through a taxation summit... said the present system was holding back A[US]n industry's ability to compete... As confusion and stalemate continued to dog companies caught in the revenue mess between A[US]'s federal and state governments, business has heaved a sigh of collective relief at the first signs that the nation's unwieldy taxation system may at last be overhauled. Spurred by the High Court decision that states are not entitled to collect taxes on petrol, liquor and tobacco and the resulting bunfight with Canberra, [the P]M... has announced a high-powered task force to prepare options for reform... "We need a taxation system that gives incentives to ordinary A[US]ns to save, to invest, to take risks," [the PM] said. "We need a taxation system that helps, rather than hinders, exports and we need a taxation system that provides a more beckoning and more encouraging investment climate." ...If tax reform has been a personal crusade for [the PM] since his days as Treasurer in[a] previous administration, it has equally been a consistent objective of business enmeshed in a web of complex and expensive imposts. The High Court ruling was merely the final straw in a process of moving reluctant governments toward tackling a task that is both a technical nightmare and a political tinderbox, requiring a fine balance between the demands of business, unions and community and welfare lobbies. The political dimension became immediately clear when [the PM] unveiled his plans, focussing heavily on the prospect of a goods and services tax (GST) – which cost the Coalition victory in 1993 – and the level at which it might be pitched. [The PM suggested that GST would enable the 'middle income tax level of 43% to become 30%.' In fact, the PM's] agenda is far broader. The task force of officials set up to consider options will be required to consult a wide range of interest groups and will need to deal not only with a possible GST but with a raft of direct and indirect

taxes, tradeoffs, exemptions, and budgetary impacts. [The PM] will also try to rewrite the revenue-sharing arrangements with the states, spurred by the need for Canberra to collect excise on their behalf in the wake of the High Court decision and the more fundamental long-term requirements for a new system. For business this holds the potential for less complicated, and more certain, taxation – for example, uniform federal levies replacing state excises, once the impasse over tax refunds generated by the High Court ruling is sorted out.

...[‘It began at midnight, gripping first the nation’s buses, trains and toll booths. At 3 am, it spread to the first changes of shifts in taxi fleets in Sydney and Melbourne. And as the rest of AUS awoke, the nightmare became real: GST is here. The Liberal PM has fulfilled his election promise and introduced, against enormous odds, the biggest and most complete overhaul of taxation since the original colonies became a federation a century ago. This morning, like the rest of AUS, the PM will be biting his nails. No one knows yet the full impact of the new GST, despite the tsunami of projections, estimations, guides, promises and warnings. AUS’s GST is a horribly complicated creature and the popularity of both the tax and the PM slumped in direct relationship to the proximity of its introduction. It brought the Coalition Government close to implosion and has set even the PM’s natural allies – business and farmers – at his throat. Suburban AUS has been simply swamped by the mass of conflicting and often downright scary information, at the same time frantically analysing the merits of joining a health fund before close of business yesterday, or face a 2% a year lifetime penalty on health insurance fees for every uninsured year over the age of 30. The PM spent an incredible \$A424 million promoting the new tax, in addition to \$A500 million allocated to business costs involved in the transition. And what does Joe and Joeline Average get for all this? Confused, mainly. Wage and salary earners will get tax cuts and pensions and other benefits will rise – but not enough for many. About 80,000 of AUS’s lowest-paid workers will be worse off, tens of thousands more will receive just a few dollars extra, and almost one million students will be charged more for their university loans despite education’s GST exemption. The extra cash in pocket will also be deeply eroded by higher interest rates, inflation and, despite the PM’s fervent promises, petrol prices. If AUSns are renting their homes, their rents will be GST-free – even if they live in multi-million dollar apartments. But if they are down on their luck, living in boarding houses or caravan parks, their rents rose 5.5% today. If they are women, they can get GST-exempt food for their infants, but now pay 10% extra for their tampons. And with the mish-mash of exemptions and changes forced upon the Government by the Democrats in the Senate, shopping today becomes a truly new experience. Basic and fresh foods are GST exempt. Prepared foods attract GST. But not so fast. If bread is glazed, it is GST-exempt; if it has icing, it goes up 10%. Yoghurt for eating is GST-free, frozen yoghurt is not. Bones for dogs are charged GST, bones for soup are not. Carbonated mineral water attracts GST, uncarbonated mineral water does not. Soya sausages are GST-free, soya chips are not.’

...‘For those thinking of a quick shopping trip to the other side of the Tasman, airfares will not increase today – for now. AUSn domestic airfares bought with an international ticket here will also be exempt from the 10% tax increase which hits domestic flight routes. If, however, you reach AUS and are struck by a sudden urge to fly, bus, or train into the continent’s vast hinterlands then expect to pay for playing it by ear. The exemptions granted to a vast array of AUSn goods and services means a shopping list will need to be audited by trained tax specialists before you know if it is value for money. AUSn clothes, books and shoes are expected to jump in price, whereas TVs, videos, and stereos are expected to become cheaper. A purchased meal itself will become dearer, unless you decide to buy the tax-exempt ingredients separately. And there are reported to be five possible variations of applying the tax to AUS’s favourite food, prawns – depending if raw, hot, cold, in a can or mixed in sushi. As for alcohol and cigarettes – as always, best to pick them up at the duty-free shop on the way home.’

...[NZ] parents who take off to A[US] leaving their spouses holding the baby could find an A[US]n tax collector knocking on their door. The [IRD] is negotiating a deal with the A[TO] which could see the A[US]ns chasing N[Zers to]... bring in an extra \$10-\$11 million each year. Under the present system a N[Z]er who lives in A[US] and fails to pay child support is chased through the courts – a long and costly process. The system in negotiation would bypass the courts... The... agreement... would... [be reciprocal because] it was a “common problem.” [‘■ Targeting property tax cheats – if you invest to sell for a profit, any money you make is taxable – resulted in the IRD getting an extra \$106.6m nationally (\$52.9m from Auckland’).

...[NZ] companies are being given the first bite of a \$4 billion cherry in China’s economic redevelopment programme. Officials from China’s Bureau of Resettlement and Development are touring local businesses this week to attract investment and expertise... The visit is a coup for N[Z] because China has been extremely selective about western investment. The officials picked N[Z] as their first port of call because they want to tap specialist knowledge in areas like agriculture, food processing, hydro-electric power generation and environmental protection... The Chinese Government is offering incentives... including local income tax preferences, enterprise tax breaks and refunds on export taxes.

...[‘89 people including senior officials have been arrested in Zhejiang Province, in China’s largest tax fraud case, involving 6.31 billion yuan (\$NZ1.4b).’ In further news from Asia,] Japanese domestic shipments of colour televisions and videocassette recorders, indicators of consumer demand, fell[last month] as higher taxes continued to cut into spending... [T]he Government raised the sales tax 2 percentage points to 5[%] on April 1...

Japan’s [Government]... is expected to propose tax cuts totalling 950 billion yen... in a broad economic package aimed at stimulating the economy... [Meanwhile, Germany’s] budget plans have been thrown into question by major shortfalls in estimated tax revenue, heralding emergency moves to keep public deficits in line with the requirements of a single European currency. Revised official estimates predicted nearly 18 billion marks... less income for the federal, regional and local authorities this year than they were counting on under previous estimates[made last] November... An aide... suggested last week that... the Chancellor... wants to increase Germany’s version of GST from 15... to 16[%].

...Now the German Parliament is in the middle of a tax reform debate... “The state today is suffering in particular from the myth that its resources are inexhaustible. In other words, citizens ask too much of the state, while for its part the state asks too much of its citizens. The heavier the tax burden, the more is expected of the state – which then has no choice but to borrow more or else raise taxes even higher. When borrowing is too high, all that is left is a kill-or-cure treatment to balance the budget, involving painful economic consequences. It is a vicious circle.”

...[the tax system can be called cyclical because its rates are raised, then lowered, raised, lowered, etc. – although the recent trend is to keep on lowering taxes. ‘Germany’s company tax rate will drop from 40 to 25% and its top personal tax rate from above 50 to 42% over the next five years. France’s company tax rate will drop to 33.3% and its top personal tax rate to 52.5% by 2003. Ireland’s company tax rate – currently the second-lowest in the OECD at 20% – will drop to 12.5% by 2003.’ (‘Ireland has chosen to make itself more attractive than its potential rivals to transnational corporations. It is paying them huge subsidies – in the form of tax concessions – to set up in Ireland instead of somewhere else. Ireland’s success has depended on it pursuing tax policies that differ from other nations. If the majority of nations choose to emulate Ireland’s strategy, then Ireland’s miracle economy will disappear. It will not reappear elsewhere. Rather, the shareholders of the companies that get worldwide tax breaks will be the winners, and everyone else will pay through the loss of their tax-enabled social wage.’)

...In 1978 NZ had a ‘top marginal tax bracket of 60% and 19 rate brackets. In 1979 the number of brackets was reduced to 5; then to 3 in 1986, when the top bracket was reduced to 48%.’ The current top rate of 33% was introduced in 1988. During the same period, Britain’s top rate of ‘83% and 10 brackets (of which the basic rate was 33%) was reduced to 40% and 4 (25%); Canada went from a top rate of 43% and 13 brackets to 29% (plus 8% surtax) and 3; while the US went from ‘70% (although the maximum rate on wages, salaries and other earned income was limited to 50%) and 25 brackets to 2 brackets and 28% (although a tax-back device adds 5 percentage points for a range of income yielding four distinct positive marginal rate brackets with a maximum marginal rate of 33%).’ The US tax system is further complicated by having different rates in different states: ‘Alaska, Florida, Nevada, South Dakota, Texas, Washington, and Wyoming are the seven states that still do not have personal income taxes. Illinois, Indiana, Massachusetts, Michigan, and

Pennsylvania have flat rates while Colorado, Rhode Island, and Vermont have taxes calculated as a percentage of Federal tax liability.' Although NZ, the US, Canada and Britain now have similar top tax rates, 'we rate well against our developed peers because we have no capital gains tax and no estate duty.'

...NZers and British expatriates with property and businesses in the United Kingdom are being warned that they are likely to face tighter tax rules in future, according to... a company in the business of minimising tax through measures such as using overseas companies and trusts. The firm says Britain's Chancellor of the Exchequer... recently signalled plans to increase the number of people liable for inheritance tax on property in the UK, and to tighten the legal definitions which govern who is classified as domiciled in the UK for tax purposes...

A British taxman faces jail after he was convicted of taking bribes from foreign businessmen to fund a life of luxury, lust and deceit... [in] the biggest single corruption case to affect the British tax department... [Incidentally, t]he law lords in London have cleared the way for [NZ's IRD] to try to recover \$4.4 million in winebox-related tax from a [BNZ] subsidiary, BNZ Finance Ltd... A now defunct subsidiary of BNZ Finance called BNZ Finance Deposits Ltd earned \$26.4 million in dividend income from redeemable preference shares between 1989 and 1992... It was all passed on to the parent company... and no tax has been paid on it. The subsidiary was wound up in 1994, with the department's blessing and without being assessed for tax. Later the department reconsidered and decided, under section 99 of the Income Tax Act, that it was a tax-avoidance scheme. By then the \$13 million of income from 1989 to 1990 was out of reach because of a four-year time limit on the amending of tax assessments... The appeal to the Privy Council related to whether the parent company was liable for tax on income of its subsidiary, even though no assessment had been made before the subsidiary was wound up. The issue had split the Court of Appeal three to two. The Privy Council has... endorsed[a] conclusion in the High Court that the commissioner could absolve BNZ Finance of its subsidiaries' liability, because of a section of the act which has since been repealed and replaced. The old provision transferred any liability to shareholders of the defunct company, but its replacement transfers responsibility to its shareholders and anyone else responsible for leaving it in such a state. But the old version still applies to winebox-era transactions, and at least one other case is understood to hang on it[(the MP who later became the leader of NZ First – and is now the Deputy PM – had accused a number of major NZ companies of operating an illegal tax-loop through the Cook Islands during the 1980s; when asked to produce evidence of his allegations, he carried the relevant documents into Parliament in a cardboard box that had originally been used to transport wine bottles)].

...The winebox inquiry head... yesterday signalled that the finish line was in sight – two years late. The Cook Islands tax commission of inquiry was originally to report its findings to the[NZ] Government on March 31, 1995. The report... is now [expected sometime] this year. The inquiry's budget started at \$2 million and trebled to \$6 million after numerous legal challenges. It had reached \$11 million at the end of 1995.

...Taxpayers 'still paying' The Government says [the NZ First leader's] legal costs at the Cook Islands tax commission of inquiry are still being met by taxpayers, amid suggestions [that the Deputy PM – who]... took charge of the country for the first time yesterday when the P[M]... left on a four-day visit to Antarctica... [-] faced a conflict of interest over the inquiry now that he is Treasurer. [Furthermore, the inquiry head 'has been paid about \$840,250 for his work from July 1995 until March this year. The figure was provided in response to an official information request from the Wellington newspaper the *Dominion*. Asked to give the information himself, the commissioner refused. "It's completely private, what I have negotiated with the Government, and what it's got to do with you, I have no idea."

...the] Winebox commissioner... was... considering what action to take over an article in the latest issue of *Metro* magazine, commission staff said yesterday. The executive officer... declined to confirm whether *Metro's* publisher, A[US]n Consolidated Press NZ, would be summoned to the commission of inquiry into Cook Islands tax deals for an explanation... *Metro's* article, entitled "Oops, Wrong Winebox"... alleges that the commission may have based its 2 1/2-year inquiry on the wrong set of documents. The magazine issued a retraction and an apology over the article in advertisements.

...Hearing finally heading for home straight... The winebox hearings yesterday adjourned for at least five weeks as the commission reached the "business end" of its... inquiry... The intervening period will be used to prepare closing submissions [for]which ...a... date has not yet been set. The formal part of giving evidence was completed on Friday when the 73rd witness, [the]Serious Fraud Office director... finished being cross-examined on the 215th sitting day. The hearings began on November 7, 1994, and... produced 12,931 pages of transcripts and 26,138 documents. The cost of operating the commission will be near \$12 million.

...Big business [has]branded the Deputy P[M]... a liar who should be forced to help pay for the multi-million-dollar winebox inquiry. On the last day of the... hearing... some of the country's largest corporations adopted a forthright attitude in their criticism of [the Treasurer. The counsel for FR, a NZ]... merchant banking firm... said the commission was set up after allegations of bribery and corruption – made in 1994 by [the NZ First leader] under the protection of parliamentary privilege – against the then commissioner of the I[RD] and the then director of the S[FO]. Although the conduct of the two Government agencies was meant to be the primary focus of the commission, corporations involved in the transactions under scrutiny were tarred with the same brush and subjected to "unfounded allegations of fraud," [the]... QC... said. "He [[the Deputy PM]] had made the grossest allegations. His allegations were a lie... [He] must now be held accountable for his own corrupt conduct." ...[the NZ First leader] was not prepared to go on oath before the commission to support the claims he had made...

The winebox inquiry commissioner... has been in breach of a High Court order for the past week for not producing documents on the case in which he is accused of bias. His lawyer... then topped that by suggesting the inquiry report, due to go to the Governor-General by August 31, should be kept confidential to the court-case parties... [T]he report would[then] be in the hands of the very people... accused of fraudulent behaviour, while the public would see nothing... This followed the revelation on the last day of the inquiry hearing... that... the commissioner... had interviewed two businessmen and two lawyers two years earlier for "the purposes of ascertaining the history of the winebox documents." ...Meanwhile, the commissioner's opponents have no documents on which they can base an application for "interim relief," a term which seems to apply to suppressing the inquiry report, until the court case is over.

...[the] winebox inquiry report is finished... It has been printed under Government-ordered secrecy and will be tabled in Parliament tomorrow... [S]ecrecy was ordered to avoid tipping off any party thinking of an injunction against its publication... Printing of the findings was completed by Monday – the same day that[the] tax dodge designer European Pacific and[the FR] merchant bank... told a High Court chambers hearing that they would not now proceed with any proposals to stymie the report's publication... For [the IRD] and the S[FO] – the two parties whose competency in dealing with the affair has been under public investigation – a three-year wait is nearly over. The Government spin-doctors are getting their lines ready. And people like [the NZ] First leader... are poised to respond... The commission... finally concluded public sessions last month after a series of legal challenges, deadline extensions and setbacks to the health of key players... [The commissioner] had been charged with inquiring into whether the IRD and SFO acted lawfully, properly, and competently in dealing with a winebox of tax haven company European Pacific's documents. The documents were given to the SFO in October 1992. [The commissioner] will also report on whether there should be any changes to the tax or criminal laws in light of disclosures to his inquiry.

...A brief exchange between two knights in Wellington yesterday ended the longest-running and most expensive commission of inquiry in N[Z]. The commissioner] handed his two-volume report on the... inquiry into Cook Islands tax deals to the Governor General... [T]he commission was born out of allegations of corruption and fraud against... Government agencies and many corporates made under Parliamentary privilege by... [the MP who is now Deputy PM – although] the terms of reference did not permit the commission to investigate[his] allegations of criminal conduct against the corporates... Although the IRD identified 60 deals in the winebox documents, when pressed to outline which transactions evidenced fraud, [the counsel for the Deputy PM] limited his case to four...

It could have been his finest hour. Instead [he] was like a naked man trying to cover his embarrassment with a postage stamp. The Deputy P[M]... had his highlighter pen ready before the special parliamentary debate on the winebox report. But with few, if any, highlights in it for him, not much ink was used. The report abbreviated his name... after the first reference and cut off at the knees his claims of fraud and conspiracy. But on bloodied stumps [he] continued to fight back. He took postage-stamp sized parts of the 770-page report and used them to deliver a trademark counterpunching rebuke of [the commissioner] and anyone else in range. Perhaps that was why the P[M -] ...who had apologised to[both the SFO head and the]... tax chief... for any embarrassment caused by the allegations... [-] shifted from his seat next to his coalition partner to sit [elsewhere]... It also took him out of camera shot as [the Deputy PM] went for a KO... [The Deputy PM's] aim was not helped by... interjections to "just apologise" and that threatened further legal action by [him] should not use taxpayers' money... [A] powerful attack by[the] Labour deputy leader... said the Treasurer had to resign, but predicted he would carry on much like a professional footballer committing a professional foul... [However, the Labour deputy leader] said he held no flag for those in the corporate sector who attempted to delay and undermine the commission, or for those involved in clever tax avoidance schemes... Calls for [the Treasurer] to resign were also made by[the] Alliance leader... and... [an Act MP. The Treasurer] says the report points to the ability of big business under present law to falsify tax documents with impunity; and he is accusing... the winebox commissioner, of breaching his terms of reference in clearing winebox transactions of fraud... [He] also pointed to [the commissioner's] references that it was outside his terms of reference to "make decisions on the truth or otherwise of allegations against corporates and individuals"... [The Treasurer] said that in view of that, [the commissioner] "has made a finding he said he could not make and has made a finding that cannot stand." ...But [he] said yesterday that there was one crucial part of the findings – the part which refers to N[Z] courts giving the effect to the form (the legal form of a transaction) rather than the substance (the real economic content) of a transaction. [The commissioner] said a fundamental defect of form over substance is that the IRD is not a party to the transaction. "The parties may, therefore, document whatever falsities suit their tax avoidance purposes." ...[one] Labour MP... summed up the elusive nature of [the Treasurer's] argument for challenging the winebox findings: "It's like looking for the Loch Ness monster."

...The companies involved in the winebox inquiry spent tens of millions of dollars on legal teams and spoke vociferously to defend their honour at the long and winding hearings. But their reaction was surprisingly muted when the day arrived that absolved them of any fraudulent or illegal activity. No doubt one or two champagne corks popped deep in the boardrooms of [the accused merchant bank FR, the BNZ, BIL] and European Pacific wherever it is now domiciled... [The commissioner] said that although it was not possible for the corporates and individuals to take action to challenge [the NZ First leader's] allegations, as they were made under circumstances of absolute privilege, the findings of the commission might go some way to remedying the injustices done to them... Nor would they be able to claw back the... [million's] the corporates claim they have spent over the past four years contesting winebox allegations... [FR, BIL] and the BNZ were shareholders in the "mysterious" investment and merchant banking group, European Pacific, which operated mainly through tax havens, and in particular the Cook Islands. In the late-1980s European Pacific operated tax-driven transactions for clients and reduced the tax burden on their investments by designing complicated money-go-rounds. The clients received dividends or interest and European Pacific collected "healthy" fees for themselves. The Magnum and Japanese Investment Fund tax-credit deals and the redeemable preference shares transactions – in which the client's investments funds flowed through the BNZ and on to the Cook Islands and other parts such as Japan – were the most famous. [The commissioner], in his report, said Magnum was a "smart" transaction designed to take advantage of loopholes in income tax law. It did not exhibit any elements of illegality or fraud nor could there be any claim of evasion of tax. He said the tax credit certificates (presented to the [IRD] and showing tax was paid in the Cook Islands) must be regarded as valid receipts of tax. The proper returns of income were made and the IRD assessed tax on that income... There was no obligation on the taxpayers when filing their tax returns to report their gains as income. They had within the law been converted into a non-taxable form... The taxpayers, [the commissioner] said, were not making false representations, they were stating the true factual and legal position.

...No, Mr [former PM] – it was not a witch-hunt On Monday this paper published an article by [the last Labour P[M]... which severely criticised the media for its coverage of the winebox saga. The basic tenet of... [his] column was that the Winebox Inquiry was a witch-hunt comparable with Salem in the 1690s and McCarthyism in the 1950s. He went on to imply that the rich did not get a fair trial in N[Z], ordinary citizens had become fascist and paranoid and the media were biased... [His] assessment is a thousand miles wide of the mark. Since the beginning of the decade there have been controversial transactions which have resulted in a massive transfer of wealth from public company shareholders and the taxpayer to a few individuals. The seeds of the Winebox Inquiry were sown by some of these deals, a few of which involved the Crown. The calls for an inquiry were not based on a desire to punish someone for the pains of the 1980s, as claimed by [the last Labour PM], but were a direct response to incidents which took place during the current decade. [The last Labour PM] has called the media lazy and has asked for more scrutiny and analysis. The following brief descriptions of some of the more controversial transactions may go some way towards meeting... [his] request. *Capital Markets/F[R]* On April 23, 1990 Capital Markets, which was controlled by the principals of F[R], made a takeover bid for F[R]. The purchase price of \$225 million consisted of \$42.5 million of assets and \$182.5 million of goodwill. The purchase price was based on profit forecasts supplied by F[R] and was endorsed by an independent report prepared by... the auditor of both Capital Markets and F[R]. Evidence at the Winebox Inquiry indicated that a large proportion of F[R]'s earnings were related to tax deals and these profits could not be sustained following the tax legislation changes at the end of the 1980s. F[R]'s profit forecasts were hopelessly optimistic. In 1993/94 Capital Markets/F[R] group reported an operating profit of only \$4.2 million compared with a forecast of \$49.5 million for F[R] on its own. In 1995... the business, which was bought for \$225 million, [was]... valued... at less than \$50 million. *Telecom* When Capital Markets made an offer for F[R] in April 1990 it issued profit forecasts which led investors to believe the merger would be effective almost immediately. Although Capital Markets shareholders still had to approve the transaction, many mergers are made effective from a date prior to a shareholders' meeting. Following the announcement of the sale of Telecom by the Government on June 14, 1990, Capital Markets share price rose from \$1.01 to \$1.10. This was in anticipation that the merged company would receive a substantial fee – estimated at \$20 million – because F[R] acted for the two U[S] purchasers. The merger was made effective from July 1 – approved at a shareholders' meeting on August 29 – and the fee remained with the previous owners of F[R]. The principals of F[R] also received an option to purchase a 5[%] shareholding in Telecom. This has subsequently generated a profit of nearly \$300 million. If the Telecom shareholding had been placed in Capital Markets and F[R] had not been acquired, the listed company would have been better off to the tune of more than \$400 million. *B[NZ]* In March 1987 the BNZ issued new shares to the public at \$1.75 per share. Following the issue, the BNZ was listed on the stock exchange with the public owning 12.9[%] and the Government 87.1[%]. In June 1989 the B[NZ] announced a massive loss and a 7-for-10 cash issue at 70 cents per share. The Government gave most of its rights in the cash issue to Capital Markets for no cost. The Crown sold the remainder of its rights for between 6 and 10 cents per share and rights traded as high as 30 cents a share. The Government's decision to give free rights to Capital Markets created an uproar at the time. Following the issue, Capital Markets owned 30.5[%] of the BNZ at a total cost of just over \$300 million. The F[R]-controlled company had to borrow most of the money to invest in BNZ and would be in no position to assist the bank if it was hit by another wave of bad debts. Capital Markets' only identified investment at the time was a 30.6[%] shareholding in European Pacific Investments, the winebox company. In November 1990, just after the Capital Markets/F[R] merger, the BNZ announced further massive losses and a restructuring... [which] included, • Ring fencing the bank's bad loans into a separate entity called Adbro; • The Government buying 85.7 million BNZ shares from F[R] (Capital Markets had changed its name) at 70 cents per share. The purchase price compared with an assessed value in the

range of 55 to 60 cents per share... and a market value below 50 cents. • The BNZ issuing 131 million convertible shares to F[R] at 84 cents each. These securities had a pre-tax yield of 16.3[%] which was well above prevailing interest rates at the time. BNZ's minority shareholders were not given the opportunity to sell their shares at 70 cents or to participate in the attractive preference share issue. Finally, on July 21 1992, the National A[US] Bank made a takeover offer for the BNZ at 80 cents per share. The independent evaluation report, which... recommended acceptance of the offer, assessed that the bank had future maintainable earnings of between \$135 million and \$180 million. The BNZ has reported net profits of \$302 million and \$318 million in the past two years, substantially above[the evaluator's] forecasts. If F[R] had not been weakened by the Capital Markets/F[R] merger and the Government had been a more reluctant seller, the BNZ would probably be worth an additional 80 cents per share, or \$1.5 billion, on the stock exchange today. *Tranz Rail* In June 1993, seven months after the completion of the BNZ sale, F[R] told the stock exchange it had acquired a 40[%] interest in Tranz Rail from the Government. Two months later F[R] announced it had a 31.8[%] shareholding. The shareholding was lower than previously announced because... [two companies – one of which was a Mr R] family company – had agreed to subscribe for shares. In February 1995 Sir M[r F, Mr] R... and associated parties made a takeover offer for F[R] at 80 cents per share... [An] independent report valued the Tranz Rail shareholding between \$117[million] and \$130 million. There was no disclosure of a proposed \$100 million repurchase of shares by Tranz Rail which was known to both [Mr R and the person who prepared the valuation report]. This Tranz Rail shareholding has a current market value of more than \$250 million, including the capital repayment. This is double the... valuation. The 80 cents per share takeover offer for F[R] compared with a share price of \$1.06 just before the announcement of the Capital Markets/F[R] merger in April 1990. In the five-year period F[R]'s minority shareholders saw the capital value of their investment drop by 25[%]. During the same period F[R]'s principal shareholders became extremely wealthy individuals. The activities of the F[R]-related companies raise a number of important issues. One of these is why did the Government offer special deals to only one BNZ shareholder in 1989 and 1990, particularly when that shareholder was an active promoter of tax schemes which deprived the Crown of tax revenue? Another is the issue of market regulation and enforcement. The Labour Government, of which [the last Labour PM] was a key member[– but not, at that time, its leader –] initiated a number of inquiries after the 1987 sharemarket crash. Few of their recommendations have been implemented because of fierce lobbying by a sector of the business community, particularly the Business Roundtable. The Roundtable, in which Mr R... has played a major role, has argued that regulation places an unnecessary cost on companies and business operates much more effectively under self-regulation. Evidence at the Winebox Inquiry – where participants argued that business is not a matter of morality but of the letter of the law – indicates there is a massive gap between the theoretical concept of business self-regulation and reality... At the very least the Winebox Inquiry has clarified that certain businessmen operate at the limit of black-letter law and they do not place much importance on ethical considerations... The best one can say about the Winebox Inquiry is that some politicians may have learned a lesson or two. If they have, they will reject the arguments that self-regulation is better than legislation and enforcement agencies are a waste of taxpayers' money. This at least could be a step in the right direction.

...the two [merchant bankers, Mr F and Mr R,] have hardly hit the headlines for some slick corporate manoeuvre since[their] company... was taken private about two and a half years ago. The privatisation left them with a 25[%] holding in the former state-owned national rail company, Tranz Rail. There would be no sad faces atop of the big "pinky" (the [office tower housing FR] on Auckland's Queen St) about the investment. Valued at around 370c a share at the time [their company] was bought out, the Tranz Rail shares are now trading at 870c each. That equates to a \$190 million appreciation in value to \$331 m... So surely it would have been top-quality champagne that was drunk on Thursday night... As a private company they are coy about divulging what they are up to. But the interest in trains has not stopped. Last year a consortium... [the pair is involved with] bought three railway freight companies from British Rail for £225 m... [Furthermore, their company] is... believed to be involved alongside Tranz Rail in the purchase of A[US]n National Railways from the Government. Apart from trains, there was the purchase of a holding in a five-star resort in Fiji... and[they] also own about 23[%] in Cultus Petroleum. Last year the shares traded as low as 56c. Yesterday they were closed at 545c. That values their holding at \$191 m... So if the question was asked, "How are things going...?" the likely reply would be, "Very nicely, thank you."

...Corporate tax dodgers and their lawyers face a harsher future under law changes recommended by the winebox commission of inquiry. Champagne corks may have popped in the mirror glass towers... as corporates were cleared of wrongdoing, but [the commissioner] wants to give more teeth to the tax collector and remove grey areas of revenue law. His recommendations – which the coalition Government is committed to consider in detail – include ending the ability of taxpayers to hide behind the confidentiality of communications with their legal advisers. [He] also wants to wipe out time limits on chasing up tax payments and to stop the practice of companies being set up for one-off deals then liquidated to avoid tax... Tax experts expressed relief yesterday that he... has come out with only a minor list of firm recommendations for further reform of the tax laws... in view of the extensive reforms which had already occurred since the winebox transactions took place... The... commissioner... wrote in his report: "The legislative environment in 1997 is considerably different from that which existed in the mid to late 1980s when many of the transactions evidenced in the wine-box documents were planned and implemented. Since then, many of the real and perceived abuses of the N[Z] tax system have been addressed by specific legislation. The deficiency in... the N[Z] tax base which was facilitated by tax havens (such as the Cook Islands), was that a N[Z] resident was not subject to N[Z] income tax on income earned by a non-resident on its behalf." ...four major tax rules were introduced... to plug this loophole... Incentives for companies to invest a lot of time and resources in tax minimisation have been greatly reduced... And many in the business community have lost interest in aggressive tax avoidance... Corporate tax rates have been cut... and, crucially, the introduction of dividend imputation means companies could pass on credits to their shareholders for the tax they paid.

...The Cook Islands has strongly defended its controversial tax haven operation which has become the second biggest earner after tourism for the small country of 20,000 people... [I]n an official booklet the Cooks Government says... [that under NZ] rule the Cooks had been "a fruit bowl for its colonial parents" but this had changed and now the tax haven earns around \$4.8 million a year in fees and taxes. Salaries and services bring in thousands more. Sixty people are employed locally. "The offshore industry, unlike hotel development or concentrated agricultural practices, does not pollute the environment," the... booklet says... "In Asia, America and Europe, the Cook Islands is respected as a professionally run off-shore financial jurisdiction." ...[By the way, the IRD], which found legal professional privilege frustrating in winebox matters, has successfully invoked it itself in another long-running dispute. The Taxation Review Authority has ruled that eight legal opinions by IRD lawyers relating to tax avoidance schemes devised by[a] tax consultant... are privileged and do not have to be given in evidence by IRD witnesses.

...Moves to abolish privilege for tax matters have drawn criticism from legal authorities, fearful it will endanger lawyers' ability to do their job. In his report into the winebox inquiry, [the commissioner] recommends legal professional privilege for all tax matters be abolished. Claims by corporate taxpayers to professional privilege in respect of alleged confidential communications between them and their legal advisers were a constant source of delays and frustrations for the [IRD]... But the President of the N[Z] Law Society... said that removing legal professional privilege threatened the sanctity of the lawyer-client relationship. "It's something that has come down over the centuries, and it's a very important doctrine that a person should be able to speak to their lawyer fully and frankly, just as they would a priest. If they can't do that, then a lawyer may not get the full story and therefore may not be able to give correct advice." The recommendation needed careful consideration "across the whole spectrum of tax law." The president of the Law Commission... said [the inquiry's] recommendation was timely as the commission was preparing a report looking into the whole issue of privilege. "On one side, N[Z]ers do not like their privacy being interfered with by the state and for many years, in the particular area of taxation, there has been something of a sentiment against intrusion by the [IRD]," he said. "On the other side is that

if one N[Z]er, or group of N[Z]ers, escapes paying a fair proportion of tax, others have to carry it. Increasingly, there is a feeling that maintenance of the tax base is something of importance.” It was ultimately up to Parliament to decide how “that balance is to be struck.”

...Tax law, however, is notoriously complex, and one person’s legitimate tax-break is another’s tax-dodge... TAX, according to [a merchant banker involved in the winebox inquiry], “is not an area where moral issues exist.” Tax questions were decided “on the black and white letter of the law”, he said in November 1995. “There is no grey – it’s either right or it’s wrong and morality does not come into it.” It was the morality of tax avoidance, however, which captured the public imagination at the Winebox inquiry. Few people understood the technicalities of the notorious Cook Islands money-loop – but many had a view about its ethical status. Elaborate tax avoidance schemes of that kind... are immoral... Companies should pay their taxes “because of the sheer complexity of the tax system. There are always going to be clever people who can find loop-holes, because no amount of sophisticated tax drafting can cover every possibility and every contingency. It’s absolutely counterproductive to the country to have some of its best brains trying to sabotage the tax base of the nation.” The country had to have corporate taxes: “It can’t survive on the tax take from private individuals.” If business doesn’t pay its share of tax, “then that effectively transfers the load to other people who can’t minimise their tax burden. Wage earners get clobbered with more tax, and those on benefits also get clobbered.” If the corporates of the 1980s had not tried so hard to avoid tax... the benefit cuts of the early ’90s might not have been so severe.

...[the IRD] will next month issue draft guidelines for assessing corporate tax bills that could garner millions of dollars in taxes that would otherwise be lost overseas. The guidelines cover new rules on transfer pricing introduced at the end of 1995, but only now starting to affect companies. Transfer pricing is a technique multinational companies use to minimise overall tax bills by inflating the profits of subsidiaries in countries with relatively low tax rates and understating them in those where they are relatively high. It is not illegal. The multinational ends up paying all the tax pie it is supposed to – it’s just that the countries where it operates don’t get the appropriate slices... Rules governing transfer pricing have existed for more than 50 years, but matters came to a head in the early ’90s when the legislation was found to be ineffective... The potential tax gain is huge. A[US] lost more than \$2 billion in tax revenue to other countries last year, according to the [ATO]. No one has figures for N[Z] because... unlike its A[US]n counterpart, the IRD here did not undertake specific transfer pricing audits, but instead examined such issues as part of its regular company audits... [The IRD] international tax policy manager [said,] “We’d rather taxpayers voluntarily changed their behaviour rather than have our auditors pull them up on transfer pricing. We’re taking a moderate approach. We don’t want to waste resources and discourage companies from investing in N[Z], but at the same time we don’t want overseas companies ripping off our tax base.” ...[Incidentally, t]he winebox inquiry may have lifted the lid on the workings of some of the country’s biggest businesses but for [one person] it was a long-running saga which seemed to have no end. It was the 43-year-old American-born stenographer’s job to record – verbatim – every word spoken since the inquiry began... Her 13,000 pages of typed transcript... formed the working documents for all parties involved in the inquiry as well as the approved record of events... “There were some witnesses who had pretty colourful vocabularies. Certainly [the NZ First leader] went out of his way every day to use a new word for me... It was unknown throughout what the requirements were going to be and what dates we might sit. So in terms of being able to plan your life it was pretty gruesome... I couldn’t get sick because they wouldn’t be able to sit as I don’t have anyone that can back me up. I couldn’t leave town and it was difficult to plan a holiday.” [She] never imagined the inquiry would drag on for nearly three years.

...IT WAS billed as the clash of the Titans. It came complete with... some of the nation’s richest and most powerful... billion-dollar deals, tax haven bank accounts and crusading politicians... It was a case where truth was often stranger than fiction... It held the country both transfixed and bored simultaneously and when it ended... the Winebox inquiry took its final prisoners – but perhaps not the ones that many people expected... European Pacific’s highly paid legal warrior, rumoured to have received up to \$10,000 a day for his services... managed to snatch victory from the jaws of what his clients believed was going to be certain defeat... NO FRAUD, no conspiracy, no incompetence. That was the verdict... The Winebox saga began with a clandestine meeting in 1991...

[A key] winebox figure... last... night washed his hands of the affair... [T]he Auckland businessman who[in 1991, collected]... a winebox of documents on Cook Islands tax transactions, said he was so busy with a Hong Kong business deal that he had not had time to read... [the inquiry report. In] a private interview in 1995, [the commissioner questioned the businessman] about discrepancies in his evidence about the documents. “...the Commission determined that [the businessman], in light of his varied and confused statements, was totally lacking in credibility and that he could not be relied upon to account for his dealings with the documents,” the report said. [The businessman] was reported to have tried to sell the winebox documents for \$100,000... When asked last night whether he regretted his involvement in the affair, he said: “I don’t know. I haven’t got time to think about that today... I don’t know what the report says about me and I don’t care... I’ve got bigger things going on.” ...[his] lack of interest yesterday was at odds with his frequent appearance in the public gallery during the winebox hearings. Evidence was given during the inquiry that [he] had received death threats against his family for his role in the affair.

...the former head of the [SFO] who was cleared of corruption and incompetence by the winebox inquiry, is considering suing for compensation. [He] came close to blacking out as he gave evidence to the inquiry earlier this year... was unable to continue his evidence for several weeks and, before the inquiry finished, resigned from his post because of his deteriorating health... [Now] on holiday in Britain, [he] said the inquiry had had a “very, very significant impact on his life, his career and his health. Civil appointments have now fallen by the wayside and other doors have been closed on me in terms of opportunities, certainly overseas.” The inquiry had also taken its toll on his family... the stress of[the] campaign played a part in the break-up of his marriage... It’s hard to say exactly how much the inquiry has cost the taxpayer. The official estimate is around fifteen million dollars, but that doesn’t include the ongoing legal costs of the commissioner... The companies that have been named in the Winebox estimate it’s cost them more than eighty million dollars.

...Taxpayers face a bill of more than \$17 million for the commission of inquiry into Cook Islands tax deals – but they will have to fork out \$94.95 each if they want to read their own copy of the inquiry report. [The] 784-page report, in two volumes, is on sale at that price in... Government Bookshops. Last month the P[M]... revealed that the final cost of the winebox inquiry was estimated to be \$12.27 million and that the taxpayer-funded legal costs of the Deputy P[M]... amounted to \$1.38 million at that time. [The Deputy PM’s] costs have been taxpayer-funded since August 1995 at [the commissioner’s] request. Additional inquiry costs to be met by the taxpayer include a \$3.6 million bill from the [IRD] and an estimated \$1.5 million bill from the [SFO].

...The Commissioner has been paid \$1.248 million for his marathon performance. Other commission staff headed by[the] Queen’s Counsel... have been paid a total of \$4.8 million. And... the Counsel for [the NZ] First leader... has so far been paid \$1.472 million... [Furthermore,] a senior parliamentary committee... also noted both [the IRD and the SFO] were likely to have faced “opportunity costs” running into millions of dollars as a result of the inquiry. For example, [the IRD] had been forced to cut the number of tax audits of medium-sized businesses by 25 this year because it had to budget an extra \$640,000 to meet additional costs arising from the winebox inquiry. Each dollar spent on medium business audits is estimated to return \$4.70... [However, the Treasurer] rejected any suggestion that the inquiry represented a “black hole” in terms of cost when he appeared before the committee earlier this month. He estimated there would be a return of \$25 to taxpayers for every dollar spent by the inquiry.

...Tax collectors did not need a commission of inquiry to pounce on \$140 million owed by winebox tax deal companies, the [IRD] said last night... \$140.5 million in taxes was assessed from documents which the [SFO] put in its hands by February 1994. [The IRD spokeswoman] acknowledged that these would not have been assessed without access to the winebox documents but said the task was done regardless of the inquiry. The money related to six tax deals and the department had managed to get hold of only \$38,000 so far as the companies involved were contesting the rest.

...The Treasurer... is seeking to take[a] legal challenge of the winebox findings straight to the Court of Appeal... Normally, the case would be heard in the High Court and, depending on the outcome, then be subject to appeal. The reason cited for going straight to the appeal court is the need to have an issue of national importance “authoritatively determined.”

...In a decision released yesterday... [a High Court] judge has... turned down [the Treasurer’s argument that a]... challenge of the winebox findings should be heard... in the Court of Appeal... [instead of] the High Court.

...[the Winebox appeal has delivered the NZ First leader his best political news since last election night and he is firmly hitching his comeback bid to the case. A full Bench of the Court of Appeal unanimously overturned a High Court decision preventing the Deputy PM from appealing against some of the findings of the Winebox commissioner. The decision also awards the cost of the appeal to the Deputy PM. Now he will go back to the High Court and argue that the commissioner got the law wrong in finding that there had been no tax evasion in the so-called Magnum deal. But anxious to minimise backlash from a Winebox-weary public, he apologised for the time the issue had taken so far and said he would pursue the case “with all speed.” The Treasurer has driven the case largely single-handedly. Now he is intent on extending ownership for the campaign to his party.]

...The NZ] First leader... will have to accede to National [Party]pressure to keep off the ministerial task force on the winebox findings, or face the threat of a head-on conflict with the P[M, who last]... night... distanced National from... his coalition deputy and Treasurer for filing a legal challenge on Friday against the winebox findings... Legal sources say the bill could be several million dollars if proceedings drag on for months. However, if the presiding judge strikes out the action at an early stage it will cost taxpayers only about \$10,000... [The] Treasurer... has said his legal fees will not be at the taxpayers’ expense.

...[the Treasurer] has signalled an acceptance that he will not be appointed to the winebox ministerial review committee while he pursues a legal challenge to the winebox findings... [However, the PM] is now saying he may not establish a ministerial committee... [anyway] – thereby ending the argument over whether [the Treasurer] should sit on it.

...The P[M has given his deputy a] blunt message to put coalition unity first and drop any plans for a legal challenge to overturn the embarrassing findings of the winebox inquiry... But an unrepentant [Deputy PM] – still toughing out Opposition calls for his resignation – gave the impression yesterday that he was in no hurry to make up his mind. He indicated that it might be two weeks before he discussed the damning report in detail with his legal advisers. Such a delay would allow him time to engineer a face-saving backdown. He must also ponder whether he can politically afford another difficult court battle... The longer [he] keeps the winebox report a live issue, the more he risks driving a wedge between himself and [the PM] and damaging a key coalition relationship that has so far survived intact. Parliament has gone into a handily timed, two week recess.

...As happens in the sunset of long and illustrious careers, retirement ultimately beckons... And as so often happens in the dawn of the afterlife, one’s expertise just cannot be replaced... [The Winebox commissioner] put in a lot of hours since getting the call... three years ago asking if he could pop back to work for a couple of months to sort out a few things. Yes, it does seem to have gone on a bit... though... he’s picked up... the million or so dollars... from his little part-time number... [S]ome of the calls have been a bit hard to interpret for the lay people in the terraces. They, after all, will be picking up the tab for the extravaganza... The mean-spirited among them might well question whether, in the history of human diddling, so much has been owed by so many to so few... [However,] if you want the big boys you pay the big bikkies. But, comes the rejoinder, was it worth it? Why all the fuss? ...if someone dumped a winebox outside your door and after clawing your way feverishly through it you found it to be full of a load of old papers, wouldn’t you be jumping up and down? - 1997

For a comfortable retirement you need to do more than rely on... superannuation.

You’ve heard it before and you’re going to hear it a lot more... If you want a comfortable standard of living... for your retirement... you have to plan for your future.

MILLIONS of taxpayers’ dollars have been spent persuading us to think about retirement and most people now accept the need to save for the future. But evidence suggests many of us feel we don’t understand enough about financial issues and are hesitant about seeking advice in case we’re taken for a ride.

...[a] former Treasury official who advised the last Labour government on the issue, said... [retirement schemes] such as those advocated by... N[Z] First, ACT and the Christian Coalition would put a damaging impost on the whole economy but especially on the low-income or jobless... For today’s 35 year-old, a compulsory pension savings scheme would be the equivalent of a 30% tax increase for the next 30 years of working life. The cheapest scheme being mooted would cost 8c in the dollar... People with low or fluctuating incomes... would be subject to a complicated income test all their lives so the government could keep track of how much it would need to top up individual contributions so there would be a pension for them in retirement. Self-employed people would also be vulnerable to income-testing... [A] compulsory savings... scheme would not address N[Z]’s fundamental superannuation problem. - 1996

Over the past 25 years N[Z]ers have struggled to understand that the welfare state was never intended for the middle class. We should not perpetuate the myth that N[Z] has historically been able to afford a universal[tax-based] retirement scheme, nor should we pretend that this is possible in the future.

...N[Z] First has secured a commitment from the coalition to run a referendum on introducing... a... compulsory, contributions-based superannuation scheme... Maintaining the present superannuation system will require substantial tax increases or cuts in social spending, says the Treasurer... [– the NZ First leader who also represents Tauranga (‘Tauranga has more superannuants than any other electorate’ in NZ). He] said the ageing of the “baby boom” generation would mean a doubling of spending on super and health from 10... to 20[% of GDP] towards the middle of next century. Since the present system was introduced, entitlements had been cut from 80[%] of the gross average wage to 66[%] of the net wage.

...The country will vote on compulsory superannuation in September, and a “yes” majority – no matter how slim the margin – will be treated as binding. Through a postal ballot, voters will be offered the opportunity to remain with the status quo or to shift to a system of compulsory retirement savings. If they opt for change, legislation will be introduced into Parliament to have the new scheme up and running by July 1... [1998. L]ocal government experience showed that postal ballots drew more votes than the ballot box. They were also about \$7 million cheaper to run. The exercise is expected to cost about \$10 million: \$900,000 for preparing the electoral rolls, \$4 million for a publicity campaign and \$5 million for the ballot itself, which will be held over three weeks... The Alliance leader... attacked the whole concept yesterday, saying all the experts agreed that the deadline for designing the scheme was too tight. He questioned the fairness of any system which relied on private savings. “What happens to women who take time out of the workforce to raise children, or to people who get sick and spend a substantial number of their years on benefits? ...will... the Government... let them starve, or is it proposing to top up their incomes, which would amount to a massive surtax on everyone else?”

...A “yes” vote in the September referendum on compulsory superannuation seems likely to usher in income-testing for the state pension. The P[M]... indicated this yesterday when he linked the ballot to the long-term affordability of the state super scheme. Quoting Treasury estimates that by the year 2040, the ratio of workers to superannuitants would have dropped from 5:1 to just 2:1, he said: “It must be clear that a shift of that magnitude will result in fiscal pressures... This Government is not prepared to ignore the problem by passing it on to future generations to solve.

That is why we are exploring alternative ways of coping with that pressure now... My position is... I hope we can design a scheme that I can support.” ...The Treasurer... said that if the state scheme was scrapped... existing superannuitants and the soon-to-retire would be protected, as would those unable to save enough to support themselves... Immediately evident from [a speech the Treasurer made] to the Association of Investment Advisers and Financial Planners in Wellington was how far [he] has moved from the NZ First election campaign platform... He said then that people would be able to borrow against their compulsory savings to buy a home or expand their business, but now says the funds will be “locked away” until retirement. Lump-sum payments have also apparently been ruled out. [He] said they were tricky to manage “over an unknown future lifespan.” Instead the system will be annuity-based. Estimations are that an individual would need to have saved in today’s dollars \$160,000 to generate an annuity equivalent to what is now paid out in national superannuation. Under the scenario painted by [the Treasurer], the state would provide a one-off payment into a person’s account to bring it up to \$160,000... Whether people could stop saving once they reached this level or whether they would be forced to continue contributing had yet to be decided. If the [Treasurer’s scenario] is voted in, it will come into force on July 1 next year and, by 2002, contributions will be levied... on assessable income – earnings and dividends. But [the Treasurer] said taxes would be cut to compensate taxpayers for the full... levy. He did not specify where the cuts would be made... He made it clear that the Government was considering a highly deregulated contributory superannuation model in which there will be no Government guarantees. “The market needs to stand on its own performance,” he said. People will be free to choose from competing schemes and to spread their risk between them. No restrictions will be placed on pension funds investing overseas.

...The working group responsible for designing the scheme to be put to the referendum has yet to be announced[, and the Treasurer is]... defensive about the[retirement] policy details so far... “The real question is whether the Government will continue to ensure that[the] elderly will have sufficient income in retirement, and the answer is that we will.” ...So what he’s saying, of course, is... that... the Government’s going to take the whole risk of the failure of these private schemes.

...[a] compulsory superannuation scheme [(CSS) is predicted to be] a “gift for lawyers and accountants,”... [T]ax lawyers and tax planners would have a field day. People were already devising avoidance schemes.

...The... main winners would be bureaucrats. “A lot of rules and regulations will have to be written and policed. It will be good for the Wellington economy,”... [an] economist... said yesterday... [By the way.] Europe has no greater champion of private pension provision than Britain. But efforts to reduce the pension burden on the state have not gone smoothly... [T]he long-running personal pension misselling scandal that arose as a result[of those efforts] has been a highly damaging episode for the reputation of all British private pension providers... [T]he... debacle was dubbed “one of the biggest financial services scandals in the UK this century” by[the] economic secretary at the Treasury... Misselling began in the late 1980s, when the British Government was trying to promote personal pensions as a way to get people out of the state earnings-related pension scheme... Commission-hungry salesmen... persuaded... [thousands] of nurses, teachers and miners... to leave their big public sector pension schemes and take out personal pensions instead. In virtually every case, they should have been advised to stay where they were because employer contributions would result in a much higher pension at retirement. Other victims were simply persuaded not to join their company scheme... As many as 1.5 million people may have been wrongly advised to buy personal pensions over a six year period between April 29, 1988, and June 30, 1994... As one... insurance executive puts it: “There was misselling, there’s no doubt about that... People thought it was all right because everyone was doing it and getting away with it...” In fact, recognition of the problem built up in the early 1990s and regulators finally confronted it directly in 1993 when systematic sampling confirmed misselling was occurring. Initially, regulators published standards for future business – then came the guidelines to pension providers to sort out past transgressions and compensate victims... At the end of March, a mere 12,650 people had accepted compensation out of a staggering 570,000 identified cases. To the industry’s great shame, it emerged that 18,000 victims had died before even being compensated... Latest estimates suggest it will cost British pension providers more than £4 billion... to clear up the misselling scandal. Compensation for those lucky enough to have received it averaged about £9000 a head... Apart from headlines about the “extraordinarily slow” pace of efforts to compensate victims, there have been adverse comments about high charges on personal pension plans, and a tax change in... Labour[’s] recent budget which has made personal savings much less attractive. An estimated 6 million people in Britain have personal pensions.

...A legal tug-of-war has developed between the B[NZ] and its staff superannuation scheme over earnings on the fund’s \$100 million-plus surplus. If the bank wins the argument, the returns credited to members of the scheme are likely to drop by about a third, while the bank’s contribution holiday will be extended for years. In addition, an independent review of the way the scheme has worked since 1991 has discovered up to \$17 million in errors at the members’ expense, the BNZ Officers Provident Association (OPA) says in its most recent newsletter. But the bank disputes the existence of these errors and the OPA board of management’s right to rectify them. Meanwhile, frustration is mounting that the bank and the board have yet to finalise a \$31.8 million top-up payment to be made to some 1100 of the scheme’s 2900 members. That transfer is intended to put right anomalies and what now seem unduly pessimistic actuarial assumptions made back in 1990 when most of the association’s members switched from a defined benefit (pension) to a defined contribution (lump sum) scheme. In each case, a present value of the future pensions they were forgoing had to be calculated. That process left a surplus, which by October 1994 stood at \$144 million, and which is recognised as an asset in the balance sheet of N[BA], which took over the BNZ in 1992. The OPA has operated a policy that allowed the surplus to be shared between members and the bank: the members get the benefits of earnings on the surplus, while the bank pays its contributions to the scheme out of the surplus, whittling it down by about \$6 million a year. Since 1991, about a third of the earnings credited to members reflect earnings on the surplus... In other words, a return of, say, 4[%], after expenses, on the assets of the fund as a whole become an effective 6[%] return to the members. The bank began to challenge the validity of this policy in mid-1995, and High Court proceedings were begun in December 1995. The bank disputes that the board has the power to set the “distribution earnings rate” policy and also contends that the decisions it has made in exercising that power are invalid and unreasonable. [Last] September, a mediation process was started. The results were inconclusive, OPA says, but it may resume this year. Meanwhile, preliminary legal exchanges continue... Lawyers and actuaries representing two groups of members – those with more than 20 years’ service and those with less – have recommended several changes to the... \$31.85 million adjustment... proposals, some of which the OPA board has accepted and which it is now seeking the bank’s agreement to... Under the special legislation that governs the OPA, the proposed changes do not have to be formally approved by members, although they will be informally polled... The OPA has dropped its plans for a series of roadshows to explain the proposal[s], preferring an information pack and written feedback approach. It now also wants to avoid the delay and expense of High Court ratification of the adjustment scheme if it can. That would depend on the degree of dissension among members to the proposals... If there is a high enough degree of acceptance, OPA would seek the bank’s agreement to skip High Court ratification.

...Employer schemes worth signing up with... IF your boss has a company super scheme, then you’re most likely shooting yourself in the foot if you haven’t signed up... Company retirement schemes can be attractive says the retirement commissioner... They were popular in the ’80s when companies didn’t pay tax on money they contributed to the schemes, but many have closed since then as tax laws have changed. From 2242 employer schemes in 1990, the number was down to 392 in 1995. Besides the removal of tax incentives, other reasons for the decline were the costs of running them (especially so for smaller firms), and the move toward total remuneration packages. Of businesses surveyed by the retirement commissioner last year, 16% had retirement planning programmes in place, and it was big companies (with more than 50 employees) who were most likely to have one. While these companies comprise 1% of [NZ’s] businesses, they employ 48% of the workforce. Two thirds of employers surveyed told the... commissioner they intended to maintain their programme. But whether that intention stands the test of possible compulsory

superannuation is another point. Some observers are picking that if employers are forced to become collectors for compulsory super, they may give away running their own schemes in greater numbers.

...The fate of the September[CSS] referendum... will hinge on the attractiveness of the proposal the Government puts to the electorate. It has instructed officials to draw on NZ First's election manifesto and the compulsory scheme mooted by [a] 1992... Task Force in developing the model to be put to the public... Of the two, the NZ First policy is the most superficially appealing, but it is also widely considered to be impractical. It was developed with votes rather than implementation in mind, and avoids all the stiff decisions. The task force faced these issues head-on and came up with a system which includes a heavy clawback regime. This might embarrass the Government, given its commitment to abolish the existing surtax which is extremely modest by comparison. These dilemmas must be making a nightmare of the design team's task, especially as it is already under tight deadline pressure.

...The P[M] yesterday gave his bluntest indication yet that the state pension will become unaffordable with the abolition of the surtax on April 1 next year. He said that once the targeting achieved through the surcharge was removed N[Z] had only three options, given its ageing population: increase taxes, reduce the level of the pension or, at some future date, reintroduce income-testing. The warning... suggests he is trying to soften the public for some form of claw-back to replace the surtax... He acknowledged that the commitment to scrap the surtax represented the single largest item of new expenditure by the Government, but he defended National's adoption of it on the grounds that the majority of N[Z]ers were opposed to [pension] targeting. They had demonstrated this by giving National – the only party that had campaigned on keeping the surtax – only 34[%] of the vote... "Whatever is decided – a savings-based scheme or a tax-based scheme – they are both compulsory and the status quo is not sustainable on present tax levels for very long."

...The superannuation tax surcharge may have become a dirty word for retired people, but its history shows it became that way by political ambushes and public confusion. From its birth in 1984 to its abolition next year it has had blows and curses from halls full of angry elderly, spurred by politicians who knew an easy target... In its first budget the 1984 Labour administration said it was an "inescapable conclusion... that there were other priorities for welfare expenditure than assisting those superannuitants who already had enough income on which to live comfortably." The surcharge meant that once pensioners had a certain level of income (\$6240 for single people and \$10,400 for a couple in 1985) their state superannuation started reducing at 25c in the dollar.

...A National cabinet minister... has come out loudly against compulsory superannuation, saying there is simply no evidence in its favour except that it will benefit the rich... [He] told a meeting of his Clutha-Southland electorate committee that "around 90[%] of the people I represent may be worse off, one way or another... There is no evidence that [it] solves the problems that people say it solves. No one has proved... it actually works... there is no evidence that compulsory super increases savings." ...He also doubted the coalition Government's ability to compensate compulsory savings with tax cuts, saying "trends in Government spending show that the next round of tax cuts will be the last for a while." ...yesterday... the P[M] hinted that the... age of eligibility for national superannuation may have to be raised to contain the costs of the scheme... He did not put a time-frame on when this might occur but observed that modern health care meant people were able to work longer and that some Nordic countries already had a retirement age of 70... [In NZ, t]he age of entitlement for the pension was 60 but is now around 63 and will reach 65 by the year 2001. The policy change was set in train in the 1991 "Mother of All Budgets" and was designed to ensure the scheme's economic sustainability.

...White paper – or white elephant? For an idea whose time has come – as [the Treasurer] declared yesterday – the launch of the Treasurer's [CSS] was a surprisingly muted occasion. Absent was any sense of excitement from a man who has less than 12 weeks to shift public opinion around. Some of that public sentiment, which runs roughly two-to-one against compulsion, could shift on the back of one of the scheme's crucial characteristics – neutrality towards women. But [the Treasurer] pulled out few other rabbits yesterday. What he desperately needs are allies – non-political ones – willing to back compulsion and prevent the debate being fouled by people's dislike of him. He must weather an Opposition hunt for loopholes and anomalies. Those parties will try to kill compulsion by using the white paper's fine print to inflict death by a thousand cuts; [the Treasurer] must keep painting the big picture. But the fine print matters. [The Treasurer's] big problem is that the bulk of taxpayers – more than 80[%] – earn less than \$40,000. Those people will take at least 27 years to save the required \$120,000 just to get a pension similar to what they would get now... The highest paid executive in N[Z] – the man who helped to create Telecom when he was the State Services Commission chairperson ('and was deputy governor of the Reserve Bank when the dollar was floated in 1985') and now... aged 56... earns \$1.5 million... [or] \$28,846 a week before tax... for running Telecom... [-] will take just six months to save for his annuity... [target of] \$24,000... In stark contrast, a young worker on the average weekly income of \$589.54 will take 35 years to save for a \$120,000 annuity. Furthermore, someone the same age as [the chief executive of Telecom] on the average wage will spend the rest of his or her working life saving towards \$24,000 but fall just short of that goal – at which point some of [the chief executive of Telecom's] taxes could provide a top-up... The other Achilles' heel is the degree to which those people will view the scheme as a redistribution of income to the already well-off. Those able to save \$120,000 in a hurry get real tax cuts; those who cannot will see their supposed tax cuts diverted into the scheme for years. Little surprise, then, that [the Treasurer's] sales pitch is cast in gloomy terms of "look what will happen to your pension" should the existing scheme be retained. He warns pension levels will inevitably drop or the age of entitlement rise. But he has one hand tied behind his back. The current scheme's long-term affordability cannot be debated in detail until later this month when [the] task force on private provision reports on the sustainability of tax-funded super. To counter that in advance, [the Treasurer] insists his scheme offers "certainty" and "durability." [The PM] argues the "moral force" of a positive referendum vote will entrench a savings-based scheme, making it free from tampering by politicians. That will not stop future governments fiddling with top-ups and other details. The scheme's success is also contingent on the economy still delivering surpluses to allow tax cuts to compensate for escalating contributions into pension funds. It is also contingent on future (Labour-Alliance) politicians forgoing tax rises. [The Treasurer's] real agenda, however, is getting N[Z]ers to be more self-reliant, "to get non-savers off the back of savers." He is really punting that sufficient people will vote his way to force others to save. But the polls indicate there are few such people and that the majority are more worried about what will happen to themselves – and their money.

...The Treasurer... faces the challenge of selling a superannuation scheme full of loopholes for the wealthy but offering the rest of N[Z] no more – and often less – than they get now... "I take my boat on water – but if I pull this off, I'll be able to walk on water." ...A key problem in the white paper... is that people would have the opportunity to minimise what they contribute to their compulsory savings account and to maximise the amount paid by the state in the form of a top-up... Meanwhile, hidden in the white paper is the fact that the minimum guaranteed retirement income will reduce. The guarantee of an income equivalent to 33[% less than] the net average wage remains but the base will be pulled back because the superannuation levies – to begin at 3[%] and move to 8[%] within five years – will be deducted before that calculation is made. Not only that, but the 33[%] floor will apply only at the point of retirement. After that the relativity will be lost because the annuity payment will be adjusted only for inflation... A woman will have to live past at least 81 years to get a full face-value from her nest egg, which will be inflated by around \$14,000 to recognise the fact that females live longer... A N[Z] man will have to live until he is at least 80 years to get back the \$120,000 he invests... Because there will be a 40-year transition period, only those born on or after April 1, 1973, will be cast entirely into the new regime... The target sum has yet to be finalised but [the Treasurer] says it will be less than \$120,000... Money saved beyond [the target] threshold would be subject to risk... And, although the white paper states that "retirees' incomes will be unaffected" should a pension fund go belly-up, it is vague on how this will be delivered, saying only that the Government will "consult with the industry to explore mechanisms for recovering investor losses."

...The Government is proposing to... add... a surcharge on to the minimum amount people[']d be required to save, and using it to insure annuity funds against collapse. Figures... indicate this could be as high as 8.1% of contributions... [S]uperannuation industry leaders said yesterday... [that they couldn't] recall a retirement savings fund going under in N[Z], but... entry requirements and other measures would provide safeguards.

...AT least half of the \$5 billion-plus compulsory super would rake in each year would probably have to be invested overseas... [because the local] market is... too small to cope with such a huge demand for investments. Treasury forecasts estimate... by... 2011 more than \$51.8b would have been invested in such schemes and this would rise to nearly \$250b by 2050...

Foreign workers who stay in N[Z] for more than two years will not be able to take their superannuation contributions home with them... "Those who stay longer than two years will be treated exactly like N[Z] workers," says the [Treasurer's]... white paper. "Their savings will stay in the scheme until they turn 65 and will then be available only to purchase a retirement annuity, unless savings are not sufficient to purchase a viable annuity. Rules governing access in such cases are still being developed."

...[the 11-year-old boy] can't imagine being 65. But from next year, if [the Treasurer] has his way, the budding actor will watch hundreds of hard-earned dollars disappear into a retirement fund he won't be able to touch until 2051. "Being old is kinda scary. I don't really want to think about that now, I'm young," [he] says. Few children working on paper rounds or in supermarkets would earn the \$5000 a year at which superannuation payments kick in. But showbiz kids... and some teenagers with part-time jobs will be caught in the net... His mother... says that is ludicrous. "It's enough that he pays tax, otherwise it's not worth him going out there. Photographic jobs only pay about \$60, less tax – that's \$40 and me taking time off work to drive him there,"... [Roles in] *Shortland Street*... a short film... and a pile of television commercials have given the youngster significant earning power. In one year alone he earned \$10,500, with which he bought a computer hooked into the Internet and a new mountain bike and had enough left over for a reasonable stash in the bank. "I just save it until I see something I really, really want, like a... Playstation,"...

OF ALL [the details released] last week on the proposed [CSS], the item that exposed the raw Kiwi nerve was the insistence that payments would be by way of annuity, with no lump sum withdrawal. The traditional Kiwi preference has been to take a lump sum on retirement, often for spending promptly on travel or home improvement... [Another contentious detail was that if] a person [who] has bought an annuity... dies within 10 years of retiring, the estate will get a proportion of that annuity... [and if] part of [the] savings target was made up of a Government top-up, then the Government will take its proportion back... But if they die after 10 years in retirement, the surviving spouse or family will get nothing.

...About six out of 10 N[Z]ers could lose out by dying early under the proposed [CSS]... Their loss will be others' gain. By dying early and not getting the full value of their nest-eggs, they will effectively subsidise fellow N[Z]ers who live to a ripe age.

...Tis said that persons living on annuities Are longer lived than others, God knows why, Unless to plague the granters, yet so true it is, That some I really think do never die... ANNUITIES have been around... since the days of Lord Byron... [Yet when the] Treasurer... indicated last week that we may all become the holders of annuities under compulsory super, many people were asking, just what are annuities? Annuities are income streams provided in return for an upfront payment. An investor typically hands over a lump sum to a life office, and they then receive a regular payment (usually monthly) for a certain period, or more commonly, for the rest of their life.

...Normally a person buying annuity is betting that they will live longer than average and get more money from the insurance company than it bargained for. But some people get killed in crashes at the age of 66 and the insurance company, in the case of a standard annuity, respectably pockets the lump sum. There are arguments for and against annuities but they are a zero-sum system (with winners and losers). Moreover, an annuity-based system looks more expensive than the present system, will create gender and ethnic injustices and will not suit people... with an unhealthy lifestyle... Annuities have been used for centuries in Britain. Their chief merit was that a person could have a secure income for life. The person bought the annuity or the donor (often the Government) made one payment that guaranteed the recipient a dependable income stream for life... Payments cease at death. The insurance company decides the amount it can offer by combining interest earned with capital repayments to calculate what it can pay out over, say, 20 years. In 20 years the lump sum will have run out (the opposite to a mortgage). If the annuitant is still alive, the company begins to make a loss. If the annuitant is dead, the company profits. The company, therefore, has to estimate, even guess, the size of two variable factors: interest rates and life expectancy. Historical experience is a useful guide. In the 1820s a British inquiry established that annuitants were very long-lived. They were people who expected extra life, so from the 1880s the companies cunningly added four years to their life-tables. Moreover, the 1820 inquiry found that females lived longer and the industry would have to use different tables for men and women. Since the 1820s it has been normal practice to offer women a smaller annual income than men would receive from the same investment... At present, a 65-year-old female can buy a standard annuity that yields \$13,820 a year... [or] \$531 a fortnight... tax-free, for \$160,000... Men will get \$16,090 or \$618 a fortnight tax-free... This is neither fair nor unfair – it reflects the facts. To ignore them would destroy the insurance companies. And if the Government intervened to lessen the difference it would either rob men of the fruits of their investment or reward women at a further cost to the taxpayer... And when everyone has their annuity, will they be happy? Not if there is inflation. Usually annuities are not inflation-proofed, so income is stagnant. Someone on an annuity for 20 years is likely to need a top-up pension too.

...at a large London-based insurance company... workers joke that as punters walk down steep stairs outside... [-] the "annuity steps" [-] ...they might trip and fall to their deaths. Annuities are paid out until people die, so from the insurer's view, the sooner the client passes off this mortal coil the better... Annuities work by paying a combination of interest and principal on your investment – the exact proportion of which are worked out by whizz-kid maths geniuses employed by insurance companies. Arguably Maori, who statistically do not live as long as pakeha, get a bad deal from annuities. So might smokers or other folk with a relatively high chance of dying of cancer, those who have filled their arteries with plaque or the small number of retired folk who indulge in high-risk sports. Insurance companies are likely to steer clear of race differentials, but already take account of smoking and non-smoking... Smokers should... be able to demand cheaper annuities... It is possible that Maori may decide to opt out and have their own annuities... [because] there was nothing under the Human Rights Act to prevent a Maori organisation from setting up to offer annuities at a higher rate. Cost is the only thing in the way for such an organisation, but the flipside is that existing legislation provides considerable protection for the individual. The Insurance Act (1908) requires that such an organisation would need to pay a \$500,000 bond, a provision to protect people against cowboys. But, \$500,000 is worth only four annuities, so the effect of this bond is disputable... [Incidentally, t]he brief period of compulsory superannuation [NZ experienced] in 1975 has left the National Provident Fund with tens of thousands of "missing persons" on its books. In legislation now before Parliament's finance and expenditure select committee, NPF is seeking permission to extinguish its liability to some 48,000 people who have "gone, no address." The great majority are people who were working in local government or the meat industry in 1975. They joined the NPF... and stopped contributing when the compulsory scheme was terminated... NPF had undertaken extensive searches for these missing members, hunting in telephone books, advertising in newspapers and using Baycorp. The legislation scraps the obligation for the NPF to credit members' accounts with a minimum earnings rate of 4[%] (after tax and expenses) each year. The fund was closed to new members in 1991 because the Government, which guarantees it, wanted to limit its commercial risk. It still has \$2.9 billion under management, 62,500 current members and 26,500 pensioners. But that includes more than 15,000 members in defined contribution (pension) schemes with balances of less than \$1000. There are also more than 10,000 pensioners receiving less than \$25 a week. So another provision of the legislation will enable NPF to pay out lump sums instead of small pensions, while existing pensioners... will have the choice of taking a lump sum.

...[the Government-controlled NPF has told thousands of people with a small superannuation nest egg that their accounts must have a minimum balance of \$5000 or they will be closed. The policy change has outraged one Auckland woman who would like to kickstart her modest account of \$700 after raising

a family and returning to the workforce. The woman said: "The Government was saying save, and yet they are trying to kick out the small people like me who haven't managed to save because of raising children." She felt as though the rug was being pulled out from under her because there was no way she could bring her account up to \$5000 within the six-month deadline. The fund chief executive said 4573 of the 9500 members in the lump-sum cash accumulation scheme had savings of less than \$5000 and 3200 of these had less than \$1000. The Labour finance spokesman said the fund could not afford to run low level accounts, but he thought it had set the limit rather high at \$5000 and was not being reasonable about giving people on modest incomes enough time to come up with the balance.' In related news,] **the criterion for getting...** [the] **Government top up...** [from the proposed CSS] **is failure to have saved to an adequate level. Meanwhile, the state guarantee... would encourage people into risky investments by effectively removing the risk...** "You can take all the risks you like. If you pass [the target level], you are in clover. If you don't, the Government will ensure you still get [the target]... As the only result of saving[for the target] is to forgo any state contribution toward your savings, people will try to... [hide] as much of their income as possible..." ...the arrangement will... also... mean that the taxpayer pays the administrative costs of the scheme as these will be charged to the individual saver in smaller balances which will in turn require bigger top-ups... [To administer] today's superannuation scheme... is estimated to cost about 0.31[%] of taxpayers' money spent. Most fund managers in N[Z] charge between 0.5 and 5[%] on investors' personal funds... According to[a] research house... the average annual return provided by diversified balanced superannuation schemes in this country over the last five years was 6.37% after tax and fees.

...Fierce competition for only small amounts of savings in the early years of compulsory superannuation will make the scheme less of a bonanza for fund managers than it might seem at first sight... [C]ompetitive pressures would prevent institutions from passing on administrative costs and that would chew up much of the management profit... Fund managers often set their fees on a percentage of the amount under management, but it would be several years before savings had grown to profitable levels... [I]nvestment advisers could be cut out as institutions sought to cut costs by marketing directly to the public.

...it is not clever for the Government to steer... money to... the... "approved" fund-management industry. It is overwhelmingly evident that when the participants in this industry try to be active managers they do not proximate the average investment returns from a passive direct investment in cash, bonds and shares. It is equally wrong to conclude, as is the fashion in this industry, that the market average can be approximated by forcing large sums into index funds. Such reasoning ignores how the market average comes about – through myriad competing investments, some winning some losing. If a substantial proportion of household savings are forced to be average through indexing, then the average resulting from the diversity of investment flows is undermined... The Government will make a huge error if it rides roughshod over the diversity of investment flows, of which a free market is composed, by steering large volumes of investment money away from the owners of those funds to the "approved" manager industry. It will create a financial concentration and fund herd-like investment managers to an extent that their behaviour undermines market stability... [By the way, it was announced yesterday that t]he Employers Federation would seek to recover the extra costs of making pay packet deductions under the [CSS]... Unlike income tax, which can be paid on the totalled earnings of a company's employees, the compulsory retirement contributions would require individual deductions and statements each pay period... [A] rough estimate of the extra costs facing employers under the scheme was between 50c and \$2 each transaction... [E]mployers already footed the compliance bill for student loan, child support, court fines and other deductions. The chief executive of the Auckland Chamber of Commerce... said he did not believe compulsory super alone presented a big compliance issue. But he agreed employers should be compensated for the range of deductions they were required to make. One way would be for the Government to reduce business taxes by 1[%].

...Employers have shown the door to compulsory superannuation in a survey published yesterday, citing distrust of the Government... high compliance costs... and... [concern that] a yes vote... [puts at] risk... growth in 1998-99... Almost 76[%] of the 760 companies which returned questionnaires to the Employers Federation journal... favoured voluntary retirement savings. Only 22[%] supported a compulsory scheme and 3[%] were undecided... [Meanwhile, National's 5th-ranked MP] and... the Treasurer... appear to have ignored a cabinet understanding that ministers stop indulging in point-scoring arguments about compulsory superannuation which only confuse the coalition's stance on tax cuts. The coalition's position on tax cuts has become muddled by tit-for-tat arguments prompted by [the Treasurer's] blunt statement last week that a "no" vote in the September referendum would kill tax reductions scheduled beyond those coming into force next year. The Treasurer's remarks annoyed National MPs who see future tax cuts as giving their party substantial "brand differentiation" in the minds of voters.

...The super heavyweights... last night argued about guarantees under the proposed [CSS, with National's 5th-ranked MP] saying there is no Government guarantee and [the Treasurer] saying there is... [Incidentally, i]t's appropriate the superannuation surcharge will be dropped next year, as confirmed in the Budget, because 1998 will mark the centenary of NZ's Old Age Pensions Act. It made this country the first in the Commonwealth to introduce such pensions – 10 years ahead of Britain. The initial scheme was non-contributory and provided £18 a year... about 40[%] of the average wage... for those with an income of £34 or less. Men had to be 65 and women 60.

...More than 100 years ago compulsory superannuation was an issue. Now it is back on the agenda... EVEN before pensions were introduced into N[Z], the country's] Premier... suggested a [CSS] in the 1880s. The scheme was rejected by N[Z]ers, "who did not show much interest then in a compulsory savings scheme"... The public unease then... was much the same as[the unease] raised by today's N[Z] First scheme... People in the 1880s were concerned about the practical difficulties of getting everyone to contribute, the security of the investment fund, and the problems of people moving around the country and changing jobs. "What is being considered today is incredibly similar to ideas discussed 100 years ago... its amazing how circular it has become,"... The second time N[Z] rejected a CSS] was more controversial and illustrated how sensitive an issue retirement income is in politics. In 1974 the Labour Government pushed through the N[Z] Superannuation Act, which had been engineered by [the man] who led sweeping financial reforms as Minister of Finance in the Labour Governments of the 1980s. When the scheme was announced in 1972 it was initially well received... But as the features of the scheme began to emerge it was attacked. Criticisms included: The scheme would take 40 years to come fully into operation, and therefore most of the workforce would never receive its benefits; and that a large number of the population... whose working life was broken or halted were not adequately protected... Labour's superannuation policy was... one of the reasons Labour lost the election. Ironically, the closest relation to NZ First's superannuation policy... is Labour's 1974 Superannuation Act. NZ First has proposed a two-tier system, under which the state-funded pension continues but is topped up by a compulsory scheme. Under the system the minimum level of state super of a married couple would be raised from 65% of the average wage to 67.5%; contributions from wage and salary earners and beneficiaries and the self employed would be placed in each contributor's personal fund; and people could choose who to invest with, or have the Government choose a scheme of private sector fund managers... Whether N[Z]... accepts or rejects compulsory superannuation, debate and [controversy] over payment to the elderly is sure to endure if history is any guide. It took years of argument in the 1890s before The Old Age Pensions Act became law. The Act was generated by the 1880 depression, which saw unemployment and bankruptcy destroy people's ability to provide for themselves in old age... Cost, which has since hung over the superannuation/pension debate like the grim reaper, played a decisive role in the final form of the 1898 act which granted a benefit for those aged over 65 who had lived in N[Z] for 25 years, and were of modest means and a requirement to be of "good moral character and sober habits". Over time, the pension was gradually increased [and]the qualifying conditions relaxed. In 1925 a pensioner's house became fully exempt from a means test so that home ownership was encouraged relative to other types of investment. By 1937, the residency qualification had been reduced to 10 years. The 1930s depression again sparked reform and the N[Z] Social Security Act 1938, was seen by the world as pioneering social legislation with the provision of universal superannuation to all people over 65

regardless of means. It was a token amount but there was also a means-tested age benefit for people in need. The act saw heated debate in Parliament over the amount of payment. In recent years N[Z]'s ageing population rather than hardship has had the biggest impact on the superannuation debate... The National Superannuation introduced by the [National] government in 1977 was linked to average wage, not means tested, and was, in essence, what the 1930s Labour government wanted. However it was hugely expensive and national super began to "blow out", by the end of the 1980s... In 1975 N[Z] spent \$365 million on national superannuation. This had risen to \$1.3 billion in 1980. Measures (such as raising the age of eligibility [from 60] to 61 in 1992, with the age rising progressively to 65[depending on the worker's age in 1992]) saw superannuation payments peak at \$5.5 billion in 1992. In 1996 \$5.1 billion was paid out, against the \$3.5 billion total... paid out in unemployment, sickness, invalids and domestic purposes benefits... A full circle return to a pension along the lines of 1898, which was largely a safety net for the poor, would not surprise some historians.

...Today N[Z] superannuation amounts to \$241.49 for a single person, subject to a surcharge on earnings over \$80 a week. If... one of the country's original pensioners... had been a superannuitant now, he would have got a lot more for his money than he did in 1899, but the payout would still be equivalent to 40[%] of the average gross wage... If... one of the... 7500 recipients... back in 1899, had saved all his pennies from the state he could have bought a horse within two years... [The] seven shillings a week would have bought him little more than a loaf of bread, a pound of beef, a quart of milk and a bottle of whisky. The first universal payment was introduced in 1940... At £78 a year, it was still around 40[%] of the average wage... [F]or those 65 and over it would have barely bought a loaf of bread and a dozen oranges each week... By 1960 the Government had gradually increased superannuation to match the age pension, but at £274 a year for a single person it was barely 30[%] of the average wage. It would have kept the cupboards stocked with groceries for the week, but would not have covered the rent... In 1980... National Superannuation for people aged 60 and over... paid \$80 a week – about 35[%] of the average wage.

...Could you live with a figure like... \$10,344... at sixty? ...It's what fifty-five percent off [NZ] women over 60 live on.

...WOMEN advising other women on money matters are keeping an anxious eye on September's [CSS] poll. Some believe compulsory super will helpfully force the issue for many women – others are not so sure. [One f]inancial adviser... said attitudes among 25 to 35-year-old women towards saving had changed significantly since she began targeting the women's market in Auckland 2 1/2 years ago. "They are realising the impact that compounding interest can have on savings gathered over the long term, and are really getting their act together,"... However, women in the 35-55 age group were slower to respond. "Many are still relying on what their husbands or partners are doing, and they don't realise the seriousness of their position should circumstances change..."... A financial adviser with "Big Six" accounting and advisory firm Coopers and Lybrand... is worried about any scheme that is related to income-earning capacity. "Women earn less, they tend to leave and re-enter the workforce with family commitments... Compulsion is so opposed to the flexibility women need when handling their finances." [A] Hamilton-based financial adviser... said compulsion could be a double-edged sword for women. "For women who have jobs and keep them, it could be good,"... But low-income earners, many of whom are women, could find themselves in even greater difficulty if up to 8% of their income was siphoned off into compulsory super. "Yes, it may be the right thing to force these people into some form of compulsory scheme, but it could also make life even more of a purgatory, and I am opposed to that. Life is for living, and for living today."

...The Government has developed one of the best [CSSs] in the world for next month's referendum... [says the] Minister of Finance... but all the surveys of public opinion suggest... it will be rejected by a decisive margin... Barely one person in 10... supports the scheme... Interestingly, younger voters, aged 18 to 29, were more heavily opposed... than older groups... Significantly more women (83[%]) than men (74[%]) were opposed...

It seems certain already that we are going to turn down an opportunity that has been offered only once before in my lifetime, to put superannuation on a sound financial footing. Those of us well into our working span, who will comprise most of the voters at the referendum, will do exactly what our elders did in 1975: tote up the time left to make compulsory contributions and decide to keep the money, especially when we learn that our voluntary savings for a windfall at retirement will not give the Government sufficient security. This referendum is about social security but most of us will vote on calculations of self-interest.

...Scrooge McDuck certainly had it. The Alliance doesn't want a bar of it. But it could be deep inside a psyche near you, possibly in your grandparents. What we are talking about here is "capitalist spirit," a concept plucked from obscurity yesterday into the blinding light of the superannuation debate... [I]t means the desire to accumulate wealth for its own sake, without any thought of ever spending it... The capitalist spirit factor in the complicated mathematical formula can range from zero to infinity, but if it is greater than one it implies the spirit is a greater motive for saving than future consumption. [The Alliance leader] said he hated to think about money spent on such research. He believed the last thing the... debate needed was "mystical calculations of the degree of capitalist spirit at large in the community." In any case it is an extremely academic way of saying what comic readers knew all along: Scrooge McDuck loves having money for its own sake.

...On Sunday the Alliance leader... issued 10 ways to avoid payments into the retirement savings scheme... "Avoidance measures are irresponsible... but a Government that encourages avoidance with an ill-thought-out scheme is just as bad," he said.

...N[Z]ers are being sent mixed signals. Why save more if the Government is going to pick up more of the bill for health, education, and welfare, as it has announced over the past few months? ...WHETHER we stick with the present voluntary super scheme, or opt for a compulsory one... we will still have to pay more taxes if the elderly are to have adequate superannuation... Compulsory super is being proposed on the basis that N[Z]'s level of saving is inadequate and that the present scheme is unsustainable. Both claims are misleading... It is not obvious N[Z] has a saving problem. Historically, it has not been the level of saving but the poor quality of investment arising from distortionary government policy. It is also not clear a [CSS] would increase national saving. Compulsion will influence the form rather than the overall level of saving... The evidence is overwhelming that high savings lead to high growth. But it is not so clear high growth is always a good thing. Savings rates in many Asian countries are extremely high, and they have grown quickly as a result. However, they do this through sacrifice. They give up the joys of consumption today in order to be able to consume more in the future. In many cases the extra future utility may not be enough to compensate for the lost utility today. Either way, the trade-off between consuming now or in the future is a personal choice and it is presumptive of a government to claim it knows better than the individual.

...Business Systems and Forms Ltd has won the tender for processing the personalised voting forms... The massive mailout... [contains] a post-paid envelope, fact sheet and multi-language directions... The towering stacks of 2.5 million superannuation referendum packs in a Mt Wellington warehouse would fill seven N[Z] homes... Posties can expect to clock up overtime as they deliver... [the] packs to households... N[Z] Post's general manager of letters for the Auckland region... said the referendum packs would almost double the usual volume of mail... Voters have until September 26 to return their completed forms... The task... [of] collating the returned votes... has been made easier with the first-time use of an electronic scanner to count the votes and read the bar codes for individual voters.

...On Friday the debate ends and voting begins. Papers for the referendum on [CSS] will arrive in letter boxes throughout the country over next weekend and into Monday. But the question may fairly be asked: Did we ever really have a debate? Or has it been a case of interest groups with a financial stake or political point in either the [CSS] or NZ Super camps arguing their respective cases while ordinary citizens got on with watching the All Blacks win, or enjoying some fine weekends in a largely mild winter. Unlike MMP, for example, there was no real grassroots push for this referendum. It's been seen as the baby of one political party... and one politician in particular... Because there was no groundswell of public opinion wanting compulsory super put to the vote... there has been no genuine public debating of the issues by ordinary people. Experts have

disagreed over many issues, leaving ordinary people unsure and almost certainly determined not to vote for change. Not the kind of issue, it has been argued, that is the proper subject of a referendum anyway.

...Observers of voting habits in N[Z] might think we are addicted to referendums. No other country consulted its citizens... once every three years [on average] for almost a century... In 1993 the... Government passed legislation allowing citizens initiated referendums. A poll must be held on an issue for which a petition has gained the signatures of 10[%] of registered electors – about 235,000. One petition since, by firefighters, had enough valid signatures. A mere 27[%] of voters turned up at the polls. Referendums are uncommon overseas, except in Switzerland where just 1.1[%] of voters can request one, Italy, where it takes 1.5[%] of voters, and in some states of the U[S]. This may be because they are expensive to run, require careful reduction of what might be a complex issue to be a yes/no question, and appear to some as an abdication of parliamentary authority.

...Some voters in the superannuation referendum are still without their ballot forms... However... [the] referendum returning officer... was confident that all eligible voters would receive the forms in time to have their say.

...After the “no” vote has been counted in the referendum on retirement savings, the nation’s leading executives expect a loud cry for another solution. Three-quarters of those responding to the latest... University of Auckland survey expect political pressure for another answer to the perceived superannuation problem... Two-thirds expect economic pressure to find a solution.

...SUPERANNUATION looks likely to be put into the too-hard basket by the Government for some time if the [CSS] referendum delivers a “no” vote. [The PM] said yesterday: “I would think that there will be a pause for a while.”

...One day... you... may be scrolling through an archive for the authentic voices of the past... trying to understand how N[Z] missed a golden opportunity to install a system of properly invested superannuation funds... You will be agonising over the cost of pensions just as we were all throughout the entire last quarter of the previous century, though our retired population was literally not half the burden we will be to you. Yes, we saw it coming... Those of us born in the 20 years between the war and the pill knew the dependency ratio we would present to you when we began retiring. But look, honestly, it still seemed a long way off in 1997... Looking back, there never was a better time to set up a [CSS] than the mid-1990s. The country was coming out of a long, painful reconstruction of its economy, dismantling a protective system with its high taxation to redistribute the easy profits from restricted competition. Once the opened economy began to grow vigorously from about 1993 the Government suddenly found itself with surplus taxation. What better, you wonder, than to invest the surplus in retirement funds... Most of us would never have missed the money except for one thing. We knew – and this I think is what really killed the scheme – that if we voted against compulsory saving we would get a tax cut. Yes, it was short-sighted; all right, selfish if you must... but it’s the old story, bird-in-the-hand... None of our reasons will sound very rational even to us in time. And I have not even mentioned that many will vote down the proposal just to spite [the Treasurer]. You don’t believe a referendum so important could be stampeded so easily? You had to be there.

...N[Z]ers should be wary of predictions that there will be fewer workers to support each pensioner in 30 years’ time, says the Government statistician. [He] told an Auckland population conference yesterday that the figures often used in the superannuation debate could be misleading... Countries such as Sweden already had the high level of pensioners to workers predicted in N[Z] by 2031... the ratio was “a crude and brutal instrument,” which did not allow for a gradual increase in the retiring age that had already started... The concept of retirement is in the... throes of being radically altered. It is increasingly likely that the first wave of baby boomers to reach retirement will have to keep earning a wage, albeit in a reduced capacity... The proportion of 60 to 64-year-olds still working had jumped from 36... to 50[%] for men and from 17 to 28[%] for women since 1991... [Furthermore,] there was no guarantee that a [CSS] would increase the combined level of private and public savings. [The statistician] said if the country had stuck with an earlier Labour scheme begun in 1974 “we would probably still be discussing the issue now because we would have lost the money either in Think Big or in the stock market crash of October 1987.”

...ARE we about to sail off the edge of the world if we don’t have compulsory superannuation? Truth is, says the *National Bank*, we have already circumnavigated the globe. In its latest bulletin, it says there were more dependents (those aged under 15 or over 64) in 1965 than there will be in 2050 when the supposed... “crisis” hits. “If we managed then, why can’t we manage in the future?” asks the bank... “Kids are just as expensive to keep as the elderly,” said the bank’s chief economist... [Even the Treasurer has confirmed that the 1992] review had found that the current pension could be maintained without alteration until at least 2015... “...N[Z] Super is okay until the year 2015 but there is a question mark from then on.”

...N[Z] has no ageing crisis and there is no need to panic... says... an expert on demographic history... The proportion of those older than 60 will increase by 24% by the year 2020... but in much of the OECD the increase will be 30%-50%. In Japan, it would be 67%. Many European countries already had a considerably older population than N[Z] and spent much more on state pensions. While N[Z] superannuation cost 5% of [GDP], in many European countries it was 10%-15%. “N[Z] should keep the ageing problem in perspective, and not adopt the anxieties of those with much more pressing problems,” he said... In fact... countries like Germany and Japan, with a long history of compulsory super, were even more concerned than N[Z] about the growing burden of supporting the elderly... Western countries had worried for more than a century about the ageing of their populations. The crisis had failed to arrive, and had even produced notable benefits. People had better health, lived longer, had more freedom from child rearing, more money and fewer dependants. The notion that an older workforce would be feebler, less innovative or less productive was not borne out by the evidence... It was absurd to believe that a country could, by a [CSS], determine “who got what share of the cake in 50 years.” It was better to continue with the present scheme, which was simple, easy to administer, and comparatively easy to change when change was needed.

...The reason for the likely failure of the... referendum lies buried in hundreds of pages of official advice to the Government on the [CSS]. The documentation, released under the Official Information Act, shows that the main aim was to save the Government money rather than develop a proposal which would be attractive to the voting public.

...“Stop being self-indulgent. Start listening to the people.” Last night’s stunning referendum result is the rudest possible message to head-in-the-sand politicians in Wellington sent at the best possible time... So overwhelming was the defeat... [–] “no” from... 91.8[%] of the 80.3% turnout [–] ...that the N[Z] First leader... and the coalition Government have to take it personally... [Indeed, 10.9%] voted no because of... the Treasurer[, who suggested yesterday that superannuation]... is set to become a political football again next election... The superannuation referendum cost \$6 million – not including the cost of the Independent Referendum Panel.

...Almost before it got under way, the debate over reforming America’s social security pension system has run into a wall. A commission appointed to examine the scheme’s future has split publicly over whether, and how, to move from a tax-financed, pay-as-you-go system run by the Government to one in which individuals would have more control over their pensions. Many of the commission’s members think that privatisation would expose people to greater risk and bring lower-income workers an impoverished retirement... For... [others,] moving America from a pay-as-you-go pension scheme to a properly funded one... would help eventually to speed economic growth. That benefit would be large, but it is uncertain... To many[, the existing system]... has... proved an exceptional deal... [T]he Urban Institute, a think-tank in Washington, DC, reckon that a typical one-earner, low-income couple retiring in 1980 had paid a total of \$26,511 (in 1993 dollars) into social security over the years. They could expect, before their deaths, to receive benefits (also in 1993 dollars) of \$149,945. No wonder there is no rush to change the system. But change it must. Popular fictions hold that every worker pays taxes into a personal account in a social security “trust fund,” which later pays his pension. In fact yesterday’s workers are supported by today’s. A tax of 12.4[%] of the first \$65,400 of each worker’s earnings covers today’s benefits and, for

now, generates a surplus. But in about 15 years' time, the baby-boom generation will begin moving into retirement. By 2030 about 50 people will collect social security for every 100 active workers. Finding a way to finance the ageing of America was the task of the ill-fated commission.

...I'VE been thinking about how to fix Social Security. Ordinarily, I don't. Ordinarily, I focus on issues such as how to remove little pieces of pepperoni from between my teeth, and I leave government problems to the trained professionals in Washington, D.C... But, frankly, they are not getting the job done. [The]President... hasn't had time, what with all these pesky scandals, which have forced him to scale down his vision for his second term from "build a bridge to the 21st century" to "settle out of court." Congress has also been busy, focusing its brainpower on the scandal swirling around[the] House Speaker... who was... violating the tax laws. Now you may say, in [the House Speaker's] defence: "But everybody violates the tax laws. The whole point of the tax system is to be so complicated that no normal human can conform to it, or even think about it for more than 10 seconds... This system enables the Inland Revenue Service to select random taxpayers for audit with 100[%] confidence that they will be guilty of something, even if they live in isolated wilderness areas and measure their annual income in squirrel meat." Yes, but [the Speaker] is not a "normal human." [He] is a member of Congress, the very organisation, if you want to call it that, that passes the tax laws, and he is therefore theoretically supposed to have some idea what they say. Of course, the truth is that the congresspersons are too busy raising campaign money to read the laws they pass. The laws are written by staff tax nerds who can put pretty much any wording they want in there... My point is that our leaders, what with one thing and another, do not have time for leading, which leaves the Social Security problem up to me... What can we do? ...Unfortunately, there is no one easy answer. There are, in fact, four... 1. Go ahead and force Generation X workers to pay ridiculously high taxes. They deserve it, for starting this stupid cigar craze. 2. Set a mandatory five-year-minimum prison sentence for any person convicted of using social security benefits to make a purchase from the home shopping network... increased to 10 years if the purchase was of a ceramic cat. 3. Do not give social security benefits to people who spend the equivalent of the gross national product of Chile trying to look as though they're too young to qualify for social security... 4. Reduce... Social Security benefits. But this is out of the question, because of the powerful senior-citizen lobby. If any politician dares to even talk about cutbacks, the American Association of Retired Persons notifies the politician's mother, and she immediately flies to Washington, marches into his or her office and twists his or her ear until he or she promises never to do it again. [● 'In 1930 only 4% of America's population were over 65'. The 'proportion of the population aged 65 and over in the US during 2020 is estimated to be 16% (up from 13% in 1995). AUS's figure is also expected to be 16% (up from 12%) while NZ's is 15% (12%). The predicted figures for 2050 are 21% in the US, 22% in AUS, 20% in NZ, and 30% or more in Italy, Greece plus Japan. Other 2050 predictions are 22% in Sweden, 23% in Britain and 25% in France' ...

'Tens of thousands of French workers and retirees took to the streets across France yesterday, paralysing the centre of major cities in a protest aimed at protecting pensions.' A]t present, superannuation, is similarly vexing Japan where the age of entitlement is being extended to 70 and population bulges are pushing pension schemes into the red.

...Compulsory superannuation is not a policy employed in Korea. Indeed, the whole concept of retirement there is slightly different to put it mildly... Most striking is the full inclusion of its elderly in productive endeavour and the anathema of putting them out to pasture thereby condemning them to be a burden to taxpayers... Older people... still have leisure time, of course, but it is not a permanent or enforced state as it is prone to be in N[Z] or AUS – where, 'six years into a compulsory scheme, they've already made hundreds of amendments.' AUS's]... retirement savings pool is far outstripping predictions, but below the surface there are many concerns...

There's a different kind of compulsory superannuation across the Tasman... paid for not by the beneficiaries, but by their bosses. In essence, corporate A[US] is buying the future security of the nation's aged. Although the coalition Government elected last year has created new incentives for wealthier A[US]ns to pump money into private retirement schemes... compulsory super has survived political criticisms and misfortunes and the howls of businesses which must either pay their employees' superannuation or have it removed by federal levy. [The previous PM] did intend to transfer promised tax cuts to super funds as a 3[%] top-up on workers' behalf, but that was axed in this year's coalition budget in favour of tax rebates for payments into private superannuation and new retirement accounts at banks. Even so, the savings pool has now swollen to a massive \$A279.5 billion, a figure which is expected to soar to about \$A1500 billion by 2020... The annual average investment return for super funds for the five years to June 30 was about 11[%], and the average annual for fund managers in 1996-1997 was 18.6[%]. The]... proportion of A[US]ns covered by superannuation has risen from 51[%] of the workforce in 1988 to almost 90[%] of full-time workers, and two-thirds of part-timers... At present employees can top up their superannuation accounts with their own payments, and withdraw these personal deposits when they change jobs or leave the workforce. From July 1999 any private top-ups will be locked into the fund until retirement.

...Expect plenty of hand wringing in corporate head [offices around NZ] as the era of the retirement gold watch draws to a close. From February 1, 1999, organisations cannot force an employee to retire because of their age. Many employers are worried, said... [the] associate professor of industrial relations at Victoria University, Wellington. "The law will have huge ramifications in the workplace, especially those that have career structures." ...[the] deputy chief executive of the N[Z] Employers' Federation, said voluntary retirement would focus employers' minds on performance... "Sixty-year-olds will be compared against employees half their age." Many organisations today might chose to ignore the fact that an older, long-service, employee nearing retirement was no longer up to scratch. But they could no longer afford to take this attitude... No one wants to go on record, but the nagging question for employers as the compulsory retirement deadline looms is: How do we legally replace dead wood with a fresh crop of eager ambition?

...The P[M] has signalled to tens of thousands of Pacific Islanders living in N[Z] that they may soon be able to take national super and retire to their home islands. At present, only people from the N[Z] dependencies of the Cook Islands, Niue and Tokelau can take super home beyond six months, but they must have lived in N[Z] for 40 years to get the full amount. These countries want the restrictions dropped altogether, while other Pacific countries such as Samoa want to join a scheme that could pour millions of dollars into their struggling economies... [L]eaders of Tonga, Niue and Samoa... would dearly love more of their 135,000 nationals living in N[Z] to retire back home... Niue... has a population of barely 2000, and its economy would be greatly boosted if any of its 14,500 N[Z] residents returned... In Samoa, where the weekly wage is about \$50, an elderly married couple returning on the weekly national super rate of \$397 gross would be rated as wealthy and provide an alternative to N[Z] aid, which is routinely siphoned off into unauthorised hands... Pacific Islands pensions represented less than 2[%] of superannuitants here so the cost to the Government of sending pensions overseas would be minimal. - 1997

If the NZ Government succeeds at setting up a pension agreement with neighbouring Pacific Islands it might be encouraged to try forming one with the US. '100 NZers are being denied their US pension funds because the two countries don't have a pension agreement.' One NZer, who is owed 'over \$200,000 by the US Government pension system, was told to return to NZ to make a claim then, when he got back to NZ, was told the process could only be completed in the US – but he was initially refused re-entry to the US for being "loathsome and contagious" (i.e., HIV positive) according to a law confined to the US.'

N[Z] is closely monitoring a British parliamentary inquiry into Britain's refusal to update pensions it pays to its expatriates living in N[Z] and other Commonwealth countries. The manager for international policy and agreements at the Social Welfare Department... confirmed N[Z] paid about \$160 million a year to top up expatriates' pensions to the level of N[Z] superannuation. This was because Britain would pay only the value of the pension at the time the expatriate left Britain or at the time they became eligible for a pension. About 31,000 expatriate pensioners lived here,

and N[Z] “simply couldn’t refuse” to top up their income, he said. “It would just be grossly inadequate and unfair.” Commonwealth counties have been battling successive British governments for more than 20 years to unfreeze the pensions... Britain paid pensions to expatriate N[Z]ers, but this would amount to probably fewer than 1000 people. - 1996

There are over 10 million people of pensionable age in Britain today. By the end of the century there will be 4.1 million people aged over 75. Some will be lucky enough to have good occupational pensions, and their retirement will be joyful; many will feel that they are a burden to the younger generation. British pensioners are among the worst-treated in Europe – the standard pension is a disgrace, and it is likely to get worse for millions of our elderly. Private pensions mirror the inequities in the labour market, leaving in poverty those who worked intermittently or had low-paid jobs. More than 2 million elderly people live on income support, unable to afford proper heating or food. Nearly half of our most deficient housing is inhabited by old people. Over 30[%] of all pensioners live alone, receiving no regular visitors, in the certain knowledge that they will end their days in the geriatric ward of a large hospital. Being old and poor in Britain today means being thrown on the scrapheap...

Of the British pensioners who are poor and alone, many have been abandoned by their family. Such pensioners might think that their lack of wealth is a contributing factor and, therefore, may wish they had been rich instead. Ironically, due to clashes over their money and property – such as how it will be divided after they die – some of Britain’s rich pensioners (and their peers in other countries) may wish they had been poor and abandoned by their family!

THE story has all the makings of a fictional family saga. An old woman dies and leaves several hundred thousand dollars to her grandson and great-grandchildren. Two years later, two other family members, who received \$10,000 each, contest the will. A further two years on – just before the case goes to court – the family settles. The plaintiffs receive \$40,000 each and the original beneficiaries receive less than was left to them in the will. The ruling was made in 1994 and the Auckland family... is disillusioned with the legal system... They are also annoyed that two cousins, who had little contact with their grandmother, could receive such a large inheritance. Last week the Law Commission announced that it was proposing a new law that would make it more difficult for children to contest their elders’ wills... [The commission] criticised present law which can allow grown-up children to change wills against their parents’ wishes... Half of the 27,000 people who died each year left significant property for distribution... [and] around 1400... have wills that end up in dispute. Most are settled out of court. A University of Otago study of family protection claims against wills between 1984 and 1995 shows that 90[%] are successful... “That’s a whole lot of unhappiness.” The amount claimed is usually between \$20,000 and \$100,000... Current law gives judges the right to alter the provisions of a will under various circumstances. Judges must take into account the degree of need of the person making the claim, how much they did for the parents[or family member], the needs of the widow[or the original benefactors] and the equality of the will’s provisions. The latter aspect angers some lawyers, who claim some judges end up giving money to claimants because they feel sorry for them. One Auckland lawyer described it as a Santa Claus attitude... [I]ncreasingly complex claims are coming from families of first marriages or a partner who was in a de facto relationship... Under the Law Commission’s proposed changes, de facto partners[‘who can prove when the relationship began’] would receive half the estate. The law would also apply to couples of the same sex.

...Call me naive but I always imagined a person’s last will and testament was literally the final word in the private property rights sanctioned by the law of a free country... The Law Commission, inviting discussion on some legislative proposals recently, reported that almost every adult child who challenges a will succeeds. And life expectancy nowadays means that children are usually well established and far from needy by the time they can lay claim to their parent’s estate... The whole notion that private property may confer rights to decide its inheritance has somehow come to rank rather low in the principles of present law and not much higher in the commission’s suggestions for updating the code... [C]ourts should be always reluctant to interfere with the clear intentions of a person who is no longer able to argue the case. Who knows why someone has directed assets in any way whatsoever? Unless there is evidence that the will was made under mental incapacity or duress, the wish of the dead ought to be sacred... Who are judges to impose their definition of equity – a witless numerical equality in most cases – over a clearly stated will of the only person who could really know the relationship between the deceased and all claimants? ...And, anyway, does it matter if a will-maker could not justify the decision to the satisfaction of most others, even if he or she could speak? In life, property owners have a right to be unjust. They are free to make substantial gifts to anyone they fancy. A liberal society respects their rights even when most might not agree with their decisions. In death they are being deprived of the right. In death, of course, they do not know it. But we live by principles that do not let agents of the state presume superior wisdom in the disposition of private property[(unless ‘a person dies leaving no will, in which case the property is disposed of according to the law of intestate succession that prescribes to which family members and in what shares the property is to be given’; ‘Howard Hughes’s estate at the time of his suspicious death – he was too weak to give himself an overdose of codeine, but nobody was charged – was estimated to be worth between \$1b-\$4b, but he died without a legal will in place’)]. It is a principle not always respected in too many quarters of the law... [Incidentally, 11] elderly Singaporeans have filed claims against their children. A new tribunal gives them legal aid to seek support under the Maintenance of Parents Act. - 1996

Many regard it as an article of faith that they should leave their children as much as possible... [– even though, ‘not infrequently, the children will vie with each other to be the nicest or the closest to the parents so they will be favoured in the will (greed and deception to gain parental inheritance is a time-honoured reality and was a central theme in Shakespeare’s tragic play *King Lear*)’ – but] there is a direct trade-off between your standard of living and the amount by which your children will benefit from your estate... In many cases our children are now front-end loaded – they are given the best health care and education at the beginning of their lives far beyond previous generations. Their parents (us) pay very high taxes to manage this. We are paying for our children’s development willingly, but in doing so we are diminishing our own wealth, our own estates, which would in former times have been left to our children... Having fulfilled our responsibilities, should we not then be free to enjoy what is left of our wealth? Do we really have an obligation to leave valuable estates? More and more of my generation (and a few of my parents’) are answering this with a “no”... YOUR financial strategy... should be based on your own security and living to your full capacity... The problem with this – going out on the last dollar – is that most of us do not know when we are going to die.

...Families are denying their elderly parents hospital care because they do not want to lose their inheritance, the social services select committee on asset-testing heard yesterday. In one case, a severely disabled Wellington man was living under threat of removal from hospital while his bedridden wife was kept at home because their son believed hospital care was using up all his money, according to the Hospitals Association... While both parents were in hospital temporarily for “respite” care, the father had pleaded to be allowed to stay, but his son refused. The father, who is 89, insisted he had enough money to pay for their care but that their son had taken over control of his finances. Eventually, the son agreed to his father’s returning to hospital but the mother was still being cared for by her son, who was often abusive, according to the association in its submission to the committee. The example was representative of a growing number of cases... the select committee was told.

...[‘a High Court judge is allowing new evidence on the shooting of farmer Patrick McCarthy by his son to be called in a civil action over the dead man’s \$2 million estate. The decision opens the way for an outcome similar to that in the US regarding a former sports star accused of murdering his wife and her lover – acquittal of murder in a criminal trial, but a possible finding of intentional killing in a civil trial where the standard of proof is lower. The son was 15 when he killed his 57-year-old father with a rifle at their farm at Parakai, north of Auckland. The son, now 17, was found not guilty of his father’s murder but guilty of manslaughter by a jury in the High Court at Auckland. He is now claiming a share of the estate but the dead man’s brother and sister

are implacably opposed to his getting a cent. They want to call new evidence, including testimony from an expert about the discharge of the gun. They also want the court to hear about the boy's relationship with his father and his behavioural history at one of the country's top schools. They claim that the allegations of violence levelled against the dead man were not sufficiently investigated. In a reserved decision after a preliminary hearing last month, a judge said it would be necessary for the son to show that the public policy preventing a person from benefiting from crime was not a barrier to his claim. If that threshold were crossed, it was then open for the dead man's brother and sister to contend that their nephew's actions disentitled him from sharing the estate. The nephew's lawyer had argued that his client's killing of a violent and abusive father involved such a low degree of culpability and such a high degree of mitigation that it would be contrary to public policy for him to forfeit his inheritance. The lawyer relied on the jury's verdict of manslaughter and the trial judge's comments at sentencing that the killing was the "unintended result of reckless use of the rifle."

...**'A SCHOOLBOY who killed his millionaire dad and tried to claim his inheritance has told why he did it. "He made me eat sheep poo and rubbed it in my face and hair." He has now dropped his inheritance claim. ■'] The Court of Appeal has finally sorted out which of Cambridge farmer Aubrey Hooker's 14 wills should apply to the disposal of his \$2.25 million estate. Mr Hooker died on May 30, 1992, and had no children. After a 19-day hearing at Hamilton, [the judge]... granted probate on the 12th will, deciding that Mr Hooker did not fully appreciate what he was doing when he made the final two.**

...[**'One summer night, a butcher, a baker, a jeweller and a housekeeper gathered in a Glendowie bakery to discuss the death of an elderly friend. They had two things in common – they had all worked with or for German-born optician Robert Leidl, and they all wanted more from his \$5.5 million estate. They allegedly planned to corroborate one another's claims and went so far as to try to make another man lie for them – something they were all to deny later in court. Mr Leidl, who was 65 when he died, was described by associates as astute, loyal and trustworthy. He was also generous and over the years had given his housekeeper \$100,000 to help her buy a house, a car and to travel overseas. Before he died, he gave the jeweller a bag of rubies, worth \$20,000. But in the months before his death, Mr Leidl appeared to have become wary of some who called themselves his friends, including those who had benefited from his generosity. The multimillionaire was concerned enough to confide in his cousin, "Die Geier umkreisen mich" – the vultures are circling around me. Mr Leidl shifted here with his wife, Traudi, in the 1960s. He owned two optical companies until the 1980s and later had business interests in a bakery, a specialist Swiss butchery and a company called A Taste of Europe. Mrs Leidl died in the US in 1992 from lung cancer. Her husband died a few years later in Auckland after his diabetic condition worsened. Over 50% of the estate was left to the Royal NZ Foundation for the Blind, the Salvation Army and Auckland University. As the couple were childless, the remainder of their wealth was distributed between Mrs Leidl's goddaughter and extended family. But Mr Leidl's four associates lodged claims on the estate. The butcher claimed entitlement to Mr Leidl's shares in Haro Foods, the company Mr Leidl incorporated to run the butcher's Swiss Butchery and Delicatessen. The baker claimed he was promised the bakery business owned by A Taste of Europe. He said that it would be handed over debt-free. The jeweller said he had been gifted Mrs Leidl's jewellery, gold and diamonds. The housekeeper wanted \$450,000 so she would not have to work anymore – a promise she said Mr Leidl had made her. Their case was heard in the High Court at Auckland. The judge rejected all but the baker's claim – because the promise to him was "more probable than not." The lawyer acting for Mr Leidl's estate said she was pleased with the decision, and Mr Leidl's cousin – who lives in Germany – felt vindicated.'**]

...**Five people were arraigned[in San Francisco] yesterday on charges that they were part of a ring which romanced wealthy elderly bachelors to secure places in their wills, and then slowly killed them, using a poison derived from the foxglove plant. The so-called "Foxglove" case, a bizarre tale involving members of a famous gypsy clan... had stumped investigators for four years. The five suspects... did not enter pleas. [The] defence lawyer for one of the suspects... said the police case was full of holes... At one point during the investigation, law enforcement officials dug up... graves... in an effort to pin down the group... In one case stretching back to 1984, [an] 87-year-old... married [one of the suspects, who was] then 24. Within a couple of months, [the groom] was dead and [the widow] had inherited his entire estate, including savings of \$US125,000... Later the group, which includes [the 24-year-old's]... boyfriend... and... mother... got hold of an apartment house, numerous bank accounts and even a Mercedes belonging to four other alleged victims, who are all in their 80s and 90s, according to police. [Incidentally, 'hundreds of thousands of hopeful heirs have bombarded Chicago website www.cookcountytreasurer.com to comb lists of people who died without wills and left assets of \$30 million.'**]

...**A Napier man... aged 52... who believed he was heir to... [an] oil fortune in the U[S]... died last Friday of an asbestos-related lung disease from which he had suffered for several years... but his family intend continuing the fight for a portion of the money... He said he had documents to prove he was descended from a Texas rancher... on whose property oil was discovered in 1901. Royalties paid by oil companies on the property now total \$US465 million... and the money awaits a claim by those who can prove they are the original owner's heir.**

...[a 'former Playboy model has gone to court in a bid to get her paws on her deceased husband's millions. J Howard Marshall II was 89 when he wed the bunny, then 26, in 1994. He died a year later bequeathing everything to his younger son. That outraged the bunny and his eldest son, who said they deserved a share. The battle over the fortune – estimated at anywhere from \$US48 million to \$US1.6 billion – began in court on Friday with the start of jury selection.'

...[it's been a few years since her 89-year-old billionaire husband went to his grave smiling, but only now has she got her hands on his loot. The former Playboy bunny, stripper and Jim's Krispy Fried Chicken worker, is now one of the world's richest women after a judge ordered her stepson to hand over a billion dollars of his dad's legacy. The bunny plans to use the money to make "Marilyn Monroe-style movies". Nice to see she doesn't plan to waste it!]

...**'Frog-gone it!** Master Four was begging his grandpa to croak, so grandpa did his best frog sounds. Master Four was overjoyed: his mother had told him they would go to Disneyland when grandpa croaked!' Speaking of inheritance money, 'former topless model Anna Nicole Smith may not get the \$1 billion from her late husband's estate after a Texas jury ruled oil Tycoon Howard Marshall II's son was the sole heir to his fortune.'

...**'A federal judge has thrown out a US bankruptcy court ruling that gave a former Playboy Playmate \$US475 million from the estate of her late husband'.**

...a 'former model was awarded US\$88.5m from her billionaire husband's estate in the latest twist of a long-running legal battle with her former stepson.'

...**Battle of wills may be over for children... Adult children may soon be blocked from contesting a parent's will to get a bigger share of the inheritance. The Law Commission wants Parliament to curb the power of the courts to interfere with the provisions in a dead person's will... The commission president... said children were contesting wills on the grounds of the dead parent's alleged breach of moral duty to provide for them and it is... sad that a claim may succeed although there is no financial need whatsoever... [But adult] children will still contest their parent's wills... say lawyers[(who are less outspoken about 'attorneys who have become wealthy through having themselves made beneficiaries in the wills of aged clients')]]... A bizarre legal anomaly which left some surviving spouses worse off than a spouse involved in a divorce settlement would also be removed.**

...[**'thousands of out-of-court divorce agreements that awarded half shares in a business asset, such as a farm, but made no provision for future income, could be overturned if the Court of Appeal upholds a landmark ruling on the Matrimonial Property Act, says the Law Society. The Minister of Justice yesterday played down the national impact of a Family Court decision awarding part of a man's future earnings to his former wife. The issue was limited to rare cases where a husband who earned a very large salary separated from a wife who had given up a career "to enable her husband to earn that sort of money," he said. Speaking on National Radio, the minister said he agreed with the judge's decision in principle but it was difficult to legislate for the change. He did not think judges would make awards based on one partner's future earnings if the income gap between husband and wife was only about**

\$20,000. It would be pointless, however, for Parliament to set a minimum income gap – perhaps \$200,000 – as this would give judges no discretion in \$190,000 cases. The minister then said any law change could also upset the “clean-break principle” of the act, which was intended to do away with long-term maintenance obligations. A family law specialist welcomed the judgment as recognition of the sacrifice made by a non-earning spouse, but the lobby group Families Apart Require Equity – which has campaigned against the maintenance payments required under the Child Support Act – said the decision was grossly unfair.’]

...The Government will introduce a long-awaited legal regime for dividing property from broken de facto relationships this year, and will also bring in amendments to the Matrimonial Property Act. The Minister of Women’s Affairs... said last night that the National and N[Z] First caucuses had agreed to give the legislation priority and include it in this year’s crowded law-making programme. There will be separate bills to deal with the de facto regime and matrimonial property reforms. Policy details have yet to be finalised in both areas. The Minister of Justice... foreshadowed the introduction of property rights for de facto partners early last year, but indicated the regime would not be the same as for married couples. There would be the same presumption of a 50-50 split of the home and chattels, but for de facto couples the courts would have greater discretion to decide on a different division if justice required it. Other property from the de facto relationship would be split according to contributions, both financial and non-financial such as child caring. Another proposal would be for the regime to apply only to relationships of more than three years. It is understood that an unresolved point over the de facto regime is whether it should apply to same-sex couples. [The Minister of Justice] said last year that it should, even though he did not condone same-sex relationships. On the matrimonial property reform the Government has been considering changing the act to better reflect the role of divorced partners, usually women, who have care and custody of children. Women’s lobby groups have strongly argued that the “clean break” principle in the existing legislation is unfair because the wife is usually left to look after young children while often having to try to restart a stalled career.

...[‘the end of a relationship often leads to problems, ranging from arguments concerning the care of children, the division of property and issues of financial support. These problems are often ongoing, in some cases continuing to cause problems between couple’s years after they have ceased to live together. “Each situation is unique, and it is important for a family solicitor to be able to identify all of the issues facing a client. We always take the time to fully understand the background and the needs of the people we are dealing with,” says a partner in Smith & Partners. “Our team are qualified family lawyers, who are all members of the Family Law Section of the NZ Law Society, are experienced in dealing with the full range of family disputes – whether between married or defacto couples. If you find yourself in a situation which may end up in Court, early skilled advice frequently results in the problem being resolved quickly and efficiently,” advises another partner.’]

...Lawyers’ adversarial attitudes may not necessarily be the best for couples going through divorce, say two Californian judges... “For the most part lawyers in family law are not very happy people. It’s amazing. They get quite wealthy in the practice but they’re out to get what they can [for their client]... and that inevitably affects them... Some of the nicest letters I’ve had are from lawyers... relieved when mediation has succeeded and taken the acrimony out of proceedings.” ...[such letters support the judges’ opinion that mediation] is... the best way of settling marital disputes... [One, who] is a senior (federal) circuit judge of the U[S] Court of Appeals... said some couples have to be led into the process but the earlier they can be got into mediation the better. The success rate of mediation is about 80[%] if it is entered into before divorce proceedings are filed. That drops off by more than 20[%] once the matter is before the courts. While regrettable, in some cases divorce is necessary and in her opinion nothing should be done to exacerbate the process. However, that can occur because divorce is such big business with many lawyers advising a client to hang on, often adding to the conflict of an already emotional situation... [In related news, a] German court has halved a vengeful wife’s... monthly maintenance... [of] 1874 marks (\$1830)... because... she reported her ex-husband to his boss as a pilferer. A Karlsruhe court said she had damaged his wealth because he was sacked after the tip-off. Judges said they would have cancelled all her alimony as a penalty, but... she had been distraught at the time... The divorce court said the ex-husband was not entirely free of suspicion, but the key point was that he had been unemployed ever since.

...A lawyer for the estranged wife of... the... brother of... [the] Princess of Wales, has accused him in a divorce hearing of “serial adultery.” ...[the wife], aged 32, is seeking a settlement of £3.75 million (\$[NZ]6.3 million) and annual maintenance of £5000 for each of their four children, according to papers filed in the Cape Town High Court... The earl (33) is offering a lump sum of... 2.4 million rand (\$823,800), monthly payments of 20,000 rand... a Cape Town house and contents, including a car, worth two million rand... and full medical insurance... The case, which began yesterday, is to settle where the divorce itself will be heard – in Britain, as... the countess... wants, or in South Africa, as her husband would prefer... [A] British family law expert... said that if the divorce were heard in Britain, the overall value of the award to [the countess]... would probably be at least £3 million... [The court heard that] the earl’s personal fortune was estimated at £6 million and his family fortune at £100 million. His annual net income was around £580,000... The [couple] moved to Cape Town in 1995 but separated soon afterwards.

...[a] businessman... is making a stand for “the benefit of future unfortunate divorces” after a judge granted [his ex-wife] a... £10.5 million... divorce settlement. The award [is] believed to be the largest in a contested divorce in Britain... [The businessman], aged 68, whose fortune is estimated at £80 million, said he had always wanted to see that his ex-wife was financially “well looked after.” But “the judge seemed to view this case as a cause celebre... The fact that this case will now influence family law and become a precedent for generous settlements to husbands and wives who have taken a marginal interest in their spouses’ businesses [is something] I find very disturbing.”

...[the] ennobled restaurateur, bon viveur, gastro-tycoon, friend of [the British PM, feeder of the US President]... and breeder to style gurus – is the man who gave Britain the chicken brick in the 60s. He did not invent it, of course; simply appropriated it and sold it through his new Habitat stores. The nation could not get enough of them, and soon Brit-chicks were being cooked in red clay bricks with the addition of weird foreign things such as garlic... A call to the King’s Rd branch of Habitat, [his] first, reveals that... chicken bricks now cost \$50... So... [the] record-breaking divorce settlement... has cost h[im]... 525,000 chicken bricks. That’s a lot of roast, but I think [his ex-wife] is probably worth it. [The restaurateur], despite claiming his divorce has been amicable, doesn’t: “The settlement figure is unbelievable – just because she cooked a few meals now and again... I taught her how to cook. She left me on the thirtieth anniversary of our marriage... [and, anyway, I] made the bulk of [my fortune after she] left... in 1993...” ...If he was as graceless as this throughout their 30 years together, she deserves a million chicken bricks. [She] is, however, happy with the settlement: “I think it’s very fair indeed. I’m very pleased.” ...[she] is one of those superwives and mothers that men like [the restaurateur] attract. Indeed, he’s got through a few. Number one... whom he married in 1952, left him for a civil engineer and never featured in his *Who’s Who* entry. None the less, [wife number one]... haunted wife number two... who remembers [the restaurateur] keeping an unlocked box of [his first wife’s] love letters on the living-room table, which he banned her from reading. After giving birth to... [two sons, the second wife] divorced him, citing adultery in 1962 (and went on, much later, to write *Superwoman*...)]. The restaurateur married his third wife a year later and opened the first Habitat in 1964. By the end of that year [the third wife] could be found charting her New Year’s resolutions in the *Observer* magazine: “...I will continue to cultivate the cult of housewifery as little as possible.” Before being consumed by actual house-wifery, [she] made it her business... [by writing] a few books... [– including] *Delicious Home Cooking*, which is... both the best and bestselling book on English cookery... [–] and was very much involved in the planning stages of her husband’s new enterprise as a founding director... In fact, as the store’s kitchenware buyer it is a safe bet that it was [she] who gave Britain the chicken brick... It is [also] highly improbable that he taught her how to cook.

...The former wife of a General Electric executive has been awarded \$US20 million... in cash, investments and real estate in a high-stakes divorce case that sought to put a price tag on the value of a corporate wife... [The wife] insisted she deserved exactly half of their estate as compensation for

31 years as a corporate wife. Her lawyers estimated their estate to be worth up to \$US100 million, but [the husband] insisted it was worth about \$US21 million when they separated two years ago... [He] called the decision fair. [In related news, 'the President of the United Arab Emirates issued a decree yesterday approving a law which sets a ceiling of 20,000 dirhams (NZ\$9440) of mahr – the money paid by a bridegroom to his future wife. The law also sets a limit of 30,000 dirhams on compensation paid by men to their former wives upon divorce, and says wedding celebrations should not be more than a day long with no more than nine camels sacrificed. The law is aimed at encouraging weddings between UAE nationals by reducing costs. In a region where men may have four wives at once, high marriage costs are driving up to 40% of them to seek a foreign wife, a trend officials blame for rising divorce rates.'

... 'In other times and in other cultures, marriage was primarily a business agreement. Either the bridegroom bought the bride or the father of the bride bribed the bridegroom by means of a dowry. In either case, a monetary value was put on the bride in much the same way that a price was established for a cow or a piece of furniture. That kind of dehumanization has not been tolerated in this country for a good many years. Long before the advent of Women's Liberation, such blatant male chauvinism became totally unacceptable. Some spokespersons for the Women's Liberation movement advocate that since money is the universal measure of value in our society, wives should be paid for their services. Others maintain that women should bargain for better terms and should enter marriage with some kind of business contract. For these and other reasons, the idea of a financial agreement signed before marriage is slowly gaining acceptance. Surely, too many people, both male and female, have been financially ruined by divorce. When the former Jackie Kennedy married the late Aristotle Onassis, many romantics became disillusioned. To them her marriage was more a business arrangement than an affair of the heart. Whatever her motivation, there was more than a little comment when it was learned that a formal marriage contract was a precondition of the marriage. In this agreement, she allegedly would receive \$US10 million for each year of marriage if he should leave her, a flat sum of approximately \$18m if she should leave him, and about \$25,000 a month for expenses and spending money while married.'

... John F Kennedy junior and Carolyn Bessette are about to divorce after only four months of marriage, the *Express on Sunday* said yesterday. The tabloid said Carolyn was asking for \$US10 million... in compensation, or half of her husband's fortune, but Kennedy lawyers argue she is entitled to only \$US650,000 according to their pre-marital contract.

... A FLORIDA couple who won \$8.75 million in the state lottery agreed on how to divide their jackpot last week and were promptly granted a divorce... As she signed, [the wife] said winning the lottery had been bad luck for the couple. They bought a new house, but within a month were arguing over who owned it... [The couple] had been scheduled to begin a divorce trial on Thursday, ending an acrimonious five months since they claimed their fortune. Instead, [the wife] agreed to take 38% of the winnings and leave her husband 62%... - 1997

Would you survive in a world without men? Fact: [1-in-3 NZ] marriages end in divorce. And it's generally women who are left with little to live on.

[NZ] law now encourages you to become financially independent as soon as possible after your marriage breaks up. It is only in special circumstances that one partner must pay maintenance to the other... As a general rule you and your partner are each entitled to half of all the matrimonial property, that is all assets which you have acquired during your marriage. The matrimonial home is matrimonial property whenever acquired. There are, however, many special rules, for instance about: • marriages of less than 3 years duration • what is and isn't matrimonial property • contributions made (eg household duties, childcare) • debts and creditors... ['The Government is currently considering how to clear up loopholes, such as treating heirlooms as separate property, allowing gifts to be treated as matrimonial property, and providing greater powers for compensation to a spouse disadvantaged by matrimonial property being hidden in trusts.' 'NZ currently has 1.3 million married and 247,000 de facto couples.'] Unmarried couples face many of the same difficulties as married couples... Traditionally the law... offered little to unmarried partners. This has begun to change... For example, the Family Court can now make orders to protect an unmarried person from a former partner who becomes violent. In other ways, however, (and particularly with inheritance rights and disputes over property) an unmarried person can be in a weak position and faced with uncertainty if the relationship breaks down. - NZ Law Society

you need a family trust now (even if you don't have a family) If you're thirty or older, earning good money, have your own business, a house and a few more assets or a family on the way, then you should be looking at a Family Trust right this minute. You could save thousands of dollars in tax a year, protect everything you have from lawsuits, a bitter divorce, or the expensive mistakes of your staff – and have something to pass on to your family (if and when you have one.) If you're between 55 and 65 years of age, are about to retire or have done so, a Family Trust is the best way you can protect your assets from surtax, and avoid losing the whole lot in rest home fees later. [One financial guru... specialises in people who want no nonsense answers to the big financial questions... Walk away from ...his seminar with the power to protect your future assets... **Tuesday 26 August 1997 7.30-9.30pm, Auckland Conference Centre 27-33 Ohineru Street Remuera** ... Only 90 seats are available, and they sell out quickly, so phone us now... or fill in the coupon and post it with your cheque (\$25 per person, \$40 per couple, tax deductible)... [If you] can't attend but want ...his audio tape... [send] \$29.95 include GST... - independent financial advisers

ON A balmy spring evening in Remuera, about 50 well-heeled urbanites file into the Auckland Conference Centre to hear why "there are no downsides and many upsides with a family trust." Their host... advises them on ways to divest themselves of their assets so that if there is a lifestyle mishap – and, say, long-term care becomes necessary – the state pays the bill... Although individual trusts can be complex, the basic structure is this: you systematically gift – at a maximum value rate of \$27,000 a year per person (\$54,000 for a married couple) – as many assets as you wish into the trust, naming other people, generally children, as the beneficiaries. You retain control either as a trustee with power of veto, or by nominating trustees who will protect your interests. The family home and perhaps the beach house can be gifted over years to the trust, but they remain your castles in every way except title. Trusts are perfectly legal devices to protect assets and avoid the tentacles of the state, or civil litigants. People may open your wallet only to find you are, on paper, a pauper. As ancient as the Roman Empire, trusts are the tools of smart legal and financial minds and, for some law firms, have become as valuable as conveyancing fees to build business. [One TV commentator] calls family trusts insurance policies and, in his view, lawyers who tell their clients they have no need of such a strategy are "unpaid agents of the Government." Others would argue that governments are agents of the taxpayer, and the push towards trusts runs counter to a fair and just society. No statistics are available on the background of the 98,789 N[Z]ers who, up until last year, had drawn up discretionary trusts, most of them family trusts. But the trend is growing, up 16[%] from 1995, and may accelerate if a bill giving greater property rights to de facto couples is passed. The faces behind these figures will almost certainly be dominated by the well-off – business tycoons, lawyers, dentists, accountants, architects, sharebrokers and doctors. Farmers will be well represented too. There won't be many factory workers and shop assistants on the list. If everyone had a trust, the Government would have to find another way of financing services that are reliant on asset-testing. The present policy relies on sufficient people being ignorant of trusts or too disorganised or without the means to get one... But... [s]hould the beneficiaries of a family trust inherit riches when the taxpayer is picking up the bill for rest-home care, while the elderly without trusts are forced to sell the family home to pay their way? ...The more N[Z]ers turn to family trusts, the more obvious the inequities will become – and, perhaps, the greater the pressure on the Government to intervene. The taxpayer is presently billed \$450 million a year for the long-stay care of the elderly in hospitals or rest homes. And as the baby boomers go grey, our ageing population is pushing costs higher.

...Tens of thousands of N[Z]ers who use trusts to protect assets for their families may face huge retrospective tax bills from next year. The I[RD] wants tighter rules on gift duty, which will mean trusts will either have to have their deeds redrafted or pay up. Under the proposed change, the department will waive duty only if close friends and near relatives are listed as beneficiaries but not if beneficiaries are charities or even distant relatives... Lawyers believe that... [because the] department has reinterpreted the Income Tax Act's accruals rules... to... say that... to qualify for a tax-free \$27,000-a-year forgiveness of debt, people with family trusts must have natural love and affection for those who are named as beneficiaries[, this means]... any trust that lists... distant relatives, charities and even descendants... as beneficiaries will be liable for income tax of 33[%] on every amount gifted. The department wants submissions on the ruling, but if it proceeds as planned next October it may be made retrospective to include the tax year ending March 30, 1996.

TRUSTS – sometimes called family trusts – were first used in England when noblemen set out against their two biggest enemies, the Infidel and the French. Even if these brave warriors weren't killed in battle, being away from the family estate for many a year meant taking long-term measures against a business failure, say a plague of insects or an unexpected tax-hike. These days the *raison d'être* for trusts, protecting family interests, is pretty much the same as in the Middle Ages. It's just society, business and the economy that have become more complex. The main reasons for setting up a trust are: protecting wealth or family security if you're sued, avoiding death duties (if they are re-introduced) and protection from the ravages of an asset-hungry ex-spouse. A trust is a private agreement – unlike a company. It has no publicly detailed records. So although it's likely N[Z]'s wealthiest families have much of their riches tied up in trusts, it's hard to tell how much unless they say... [Nowadays, an increasing number of people] in the middle [income range] are keen to pass something on to their children and feeling that they have spent their lives paying taxes, are divesting themselves of their personal wealth. Realistically, we have to have – or expect to accumulate – more than the average level of assets to make the costs of setting up trusts worthwhile... Establishment costs are around \$1000, but once you start putting assets into them – there is no point having an empty trust – conveyancing costs and other documentation (say mortgages) may bring the total bill to around \$3000, plus running costs of a few 100 dollars a year... But you don't have to be super-rich... [P]lenty of people with assets of around \$600,000 (\$400,000 in an Auckland home, \$200,000 in the bank), set up trusts. Often such people have both the rest home clawback and superannuation surcharge in mind... Until the National Government axed death duties, prudent couples protected their heirs with mirror trusts. These segregate each spouse's interests into a separate trust – essentially husband and wife are the principal beneficiary of the other's trust, and assets are divided 50/50. Now, without death duties, it's possible to achieve everything in one trust, although... this is a controversial area and quite a few lawyers – with re-introduced death duties in mind – are still setting up mirror trusts. Some lawyers question whether mirror trusts will be an effective barrier against any new set of death duty rules. Anyone starting a business should seriously think of setting up a trust to act as a bullet-proof vest when times get tough or to protect a spouse or children when you're dead. Such trusts may not be watertight when the proverbial hits the fan, though... We tend to associate trusts with grey-haired people sitting in financial planners offices. But a \$27,000 annual gifting limit (per individual) makes for every reason to set up a trust before being old and grey... And for people thinking about the rest home clawback, there's no time like the present. A Social Welfare Department five-year rule means that trusts must be set up at least five years before a rest home subsidy is requested. A trust can also minimise individual income tax by spreading income about, to a partner, several children, even a charity or two... and if the trust is set up for a variety of reasons, the IRD is unlikely to see it as a means of avoiding the surcharge... A trust does alienate you from your assets, making for some increased hassle when you want to sell things... Unless there is some wonder drug or hormone, a newly set up trust will probably outlast the person who set it up... Most trusts have a wind-up date of 80 years after the trust was set up – the maximum under N[Z] law – although it's normal to stipulate in the trust deed that you can wind one up before this... No matter what Governments do to make it harder for individuals to retain their wealth, trusts will always be a useful part of a lawyer's toolkit... - 1996

A court battle is being waged to try to prevent a man convicted of murder getting a half share of his victim's substantial property... [The man] was sentenced... in 1992... to mandatory life imprisonment for the December 1991 slaying of... his former de facto wife... [The] 39-year-old nurse... was stabbed seven times and her throat was slashed. By law, those convicted of murder cannot benefit from their crimes but [the man] is in the unique position of being the beneficiary of a trust set up by [the nurse]. In July 1987, two years after they met, [the nurse] drew up a trust declaration in which she undertook to transfer to [the man] upon demand half of her interest in a property... in Titirangi, valued at well over \$100,000. Since 1994 the Public Trustee... has been trying to have the declaration of trust set aside. But [the man], who will not be eligible for parole until June 2002, has tried to have the Public Trustee's High Court action dismissed, claiming that the proceedings were frivolous and vexatious and that the Public Trustee had no reasonable grounds for the action... The half-share of the property was never in fact transferred, but by fighting the Public Trustee's legal action, [the man] is effectively claiming his right to half the proceeds of the property which has since been sold. Much of the argument in front of [the High Court] involved complex questions of trust law... [The man] also was named in [the nurse's will with her] daughter as equal benefactor... [His] conviction disqualifies him from benefiting from the will.

...The High Court is going to be asked to determine who the owners of the Public Trust Office are. The move is a precursor to the Public Trust being corporatised which could lead to its sale... The trust, founded in 1872, provides independent trustee services, mainly in the administration of wills and deceased estates... [Incidentally, t]he Government is calling for submissions on the future of the... Auckland Regional Services Trust [(ARST) which, going by the size of its] net assets... is... the fifth largest... business... in the country... This year the A[RST] made a cash surplus of over \$30 million on behalf of the people of Auckland.

...The Government is reviewing the future of... A[RST] – to the puzzlement no doubt of many ratepayers who are not... aware of what the trust is.

...The A[RST], owner of Ports of Auckland shares... the Yellow Bus Co, waste services and forests, is responding to a debate about its future by suggesting that it is no longer needed in the region's government structure. The trust may well prove to be a victim of its own success. Set up in 1992 with the primary task of repaying \$224 million of regional debt, it[s]... six elected members... achieved that remarkable goal within only 31 months – this despite Government predictions that in order to achieve its goal the trust would have to sell all its major trading assets, take more than \$180 million from Auckland ratepayers and take 20 years to do it. The fact is... the... elected trustees... sold no major trading assets... other than property... took not one cent from ratepayers... paid [its] last instalment on the debt in less than three years[, built]... a business empire with a market value of about \$2 billion and... [has] \$100 million in the bank... Auckland is rapidly getting too big for its support services – what the bureaucrats call infrastructure... things like roads, water systems, sewerage systems and public transport services – the unglamorous things which we take for granted but without which we cannot survive. An awful lot of money has to be spent on upgrading these services in the next few years and... the fruits of the trust's outstanding financial management should be used to help... [However, the] trust is prohibited by law from providing that help... Without a law change the trust will simply continue to own its assets and accumulate very large amounts of money... Some Wellington bureaucrats have an... extraordinary proposal. They think [the ARST] should sell everything, collect a huge pile of cash, then send a cheque to every ratepayer in the region... [– whereas the ARST proposes that it] should effectively turn itself into a regional bank which would lend money to projects which meet certain standards. Qualifying projects would have to fit the regional plan (when we get one), would need to have a measure of public support and would need to be capable of earning an appropriate financial return... [I]t all comes down to settling on the best way of using the money for the overall good of the Auckland region... [The ARST chairman] said: "...The more... money... we've got, the more people want it."

...Two A[RST] chiefs are on a publicly funded American fact-finding trip, despite the uncertainty over the trust's future... They will visit infrastructure funding banks in five states and a range of public utility owners or managers such as the California Department of Water Resources... The trust was unable to give the cost of the trip but a spokeswoman said its policy was to fly business class on international flights of more than eight hours, economy class within the destination country and stay in reasonably priced accommodation.

...Auckland's infrastructure bills are mounting but new research reveals the region's spending... at \$120 million... remains... \$40 million a year... short of the total needed to pay the costs of... an extraordinary growth surge which began in 1991 and shows no signs of abating... An outlook prepared by a senior regional council officer... said Auckland's growth... would swallow up 25,000ha over the next 30 years... [The outlook pointed out that a]lgeing drainage systems and water supply networks were[already] stretched to capacity[. Consequently, water]... quality, though good by international standards, was slowly deteriorating.

...The Minister of Local Government... last night dangled a \$500 million carrot in front of Aucklanders as a partial solution to the region's development woes. At a city conference on local government research and development, she linked the future of the cash-rich A[RST] with the huge costs the region faced replacing inadequate infrastructure. Investment of about \$1.33 billion is needed by 1999 and some \$4.5 billion over the next 30 years. The trust is expected to amass \$500 million without asset sales by 2001... If the trust's assets were put to work on improving Auckland's public transport, roads and bridges, the Government would have gained a convenient fiscal fix as it would not need to dip as deeply into its own resources to satisfy Auckland.

...The A[RST] fears it will be forced to waste public cash because a decision on its future has been delayed by the Government. The P[M]... said yesterday that the decision would not be announced until late February[next year. By the way, last year 'the chairman of the ARST was granted a 46% pay rise, which meant his maximum salary jumped to \$50,000. The other trust members got a 16% increase, which took their salaries to \$15,000 (although the person who holds the new job of deputy chairwoman, gets \$20,000). The maximum meeting allowance for members increased from \$65 to \$150. At the time of the increase the chairman, who said the trust had a policy of always paying the maximum and estimated that he works about 30 hours a week, said the salaries of the "grossly underpaid" members were "way out of kilter" compared with those for other similar bodies such as the Auckland Regional Council (ARC) and Auckland City Council.' • 'Hamilton City councillors have voted to give their chief executive a \$16,000 pay rise to \$176,000, in a year when more than 120 council jobs were axed.' Furthermore, the council is currently saying it]... may lay off[more] workers if they do not accept new employment conditions. About 400 of the council's 650 staff are threatening industrial action after rejecting the latest contract offers... The... chief executive... said he would continue to negotiate with salaried staff but waged workers[who] refused to negotiate... could be in line for redundancies.

...The chief executive of the A[RST]... is in line for a pay rise. Trust members discussed his bonus yesterday... In the 1996 annual report [his] pay package totalled \$180,000, up \$17,000 from the previous year... However... the chief executive of the Auckland City Council... [is paid \$219,468, and the] chief executive of the A[RST] owned Watercare Services... is paid up to \$290,000... In the private sector he could command a salary of \$300,000 to \$400,000... [because] Watercare... has... 386 staff, an... annual turnover of \$112.5 million... [and] assets of \$1.03 billion...

The privatisation of... local government assets, is being pushed by the Associate Minister of Agriculture... [When t]he privatisation of Government Property Services and some small power stations was announced... the Treasurer... also signalled that other assets could be privatised on a case-by-case basis. "I believe other activities need to continue being looked at, including local government assets such as power companies, airports and Local Authority Trading Enterprises [LATEs]," [the minister] said yesterday. He also said central and local government should continue to contract out services that private enterprise could do better.

...The Government appears to be working on plans to water down a key clause in the coalition agreement giving ordinary N[Z]ers a veto on the privatisation of local assets. A confidential cabinet paper leaked to the Alliance requires local authorities to consult ratepayers about any plans to sell certain assets but it does not say councils have to be bound by the wishes of the community... "As far as the privatisation industry is concerned, local authority assets are one of the ripest fruits remaining in the garden,"... the Alliance leader... said... [when r]eleasing the document from the cabinet strategy and priorities committee... The document raises questions about... the future of assets held by the A[RST. Ironically, the]... Minister of Local Government... said yesterday that she had heard rumblings about the existence of the paper... but... had not seen it.

...The Government yesterday failed to dispel fears it plans to break the coalition agreement giving ordinary N[Z]ers the power to block certain assets sales. No one from the offices of the Treasurer... and the Minister of Finance... would give an absolute undertaking that local authorities and consumer trusts would be bound by the wishes of their communities when putting assets on the block. Instead, a spokesman for [the Treasurer], who is overseas, sought to play down a confidential committee paper... leaked to the Alliance, by saying it had never been discussed by the committee.

...The Manukau City Council is considering selling Excell Corporation... to help stem... the... council[']s... projected... debt of \$119 million for the present financial year... The c[orporation is]... one of three LATEs in Manukau... [It] carries out contracting work such as stormwater and drainage works, roading maintenance and pumping stations. It has nearly 600 staff spread over Auckland, Masterton, Rotorua, Melbourne and Brisbane... Earlier this month, Excell Corporation bought the Tasman District Council's contracting Roads and Parks Services for more than \$3.1 million. The other two Manukau LATEs are Waste Disposal Services and the engineering company Manukau Consultants Ltd.

...Local authorities are forced to consult enough already, and should not have to hold polls before selling assets, says an organisation representing them. Such sales were complex, and councils looked at the interests of future residents, not just those who voted in a poll... "It should be the quality of the argument, not the quantity of the numbers,"... said... the president of Local Government New Zealand[(LGNZ).

...the North Shore City Council plans a telephone poll to test citizen approval to borrow \$3 million to spend on parks. A random survey of 500 ratepayers has been planned after a questionnaire mailed to 63,000 households failed to generate an emphatic response. Only 1229 residents returned the questionnaire on the council's annual plan, which included a question on the loan to buy more green space. The chairman of the council community facilities and parks committee said that the parks spending issue was lost among other questions in the survey. "There was not enough information. We felt it was better to focus on that issue alone." The loan was needed for speedy purchases to meet the needs of growth.'

...Planners are embarking on an extensive opinion poll this week to decide how to handle an Auckland population explosion. The Greater Auckland population is expected to reach two million within 50 years and... 420,000 homes will receive a discussion paper from the... regional growth... forum, a group made up of the A[RC plus Auckland's] four city councils and three district councils... Capacity for growth inside Auckland metropolitan limits is enough to last for about 15 years... About 330,000 more homes will be needed... [by] the time the population reaches two million... and the region could need... an area... of rural land for urban development... three times the size of the Auckland isthmus.

...in 1951 the Auckland Metropolitan Planning Organisation produced its "master plan" for Auckland's growth and advocated an optimum city size of 600,000. This figure was surpassed in 1968...

Manage? We can handle millions says the mayor THIS WEEK IN... 1972 [t]he Mayor of Auckland... sa[id] the present metropolitan area could support as many as four million people. He was commenting on a report... [that] said Auckland was fast approaching the limit of manageable size.

...Auckland's population grew by 12.5[%] between 1991 and 1996 – about 120,000 more people... Growth, to most people, is a good word. So shouldn't we sit back and let Auckland go on growing for ever? Sydney and Melbourne each have more than three million, and we have only 1.1 million, [so] why be concerned? Horror stories like Mexico City and Bangkok exist, but there's no way we could get like that, is there? And, anyway, how can you stop a city from growing even if you want to? Aucklanders should be vitally concerned about the city's future directions. If it

is to keep on growing it should be planned. You can't turn the clock back on growth. Once it has happened you are stuck with it. At present the only planning that takes place, as far as I can determine, goes like this: estimate what the population will be in 10 or 20 years' time on present trends; work out what services will be needed; and set about supplying them. When the 10 or 20 years are up, start again.

...Auckland's four cities and three rural districts must pull together if the regional growth strategy is to work, warns[the] Auckland Central MP. She says the local authorities will need to commit to the guidelines established, otherwise it could be another expensive waste of time and money... The Auckland Regional Growth Forum is to produce a 30-year plan by October 1998...

The... Local Government Amendment Act... requires long-term financial planning by local authorities. The principles in the new legislation focus on matching funding sources to functions carried out and on intergenerational equity in terms of funding costs in the years in which the benefits accrue. The idea is intended to be a further iteration of transparency and accountability in local government. However, the varied interpretation by councils of whether a particular service is a public good or a private benefit is confusing and a long shakedown period looks likely... [An] idiosyncrasy of the local government structure in N[Z] is the community... boards[, which] are elected as a substructure of territorial councils. They were intended, post restructuring, to provide a consultation and participation mechanism to compensate for the loss of smaller communities after amalgamation into larger cities and districts... The reforms have not addressed the need for integrated planning across territorial council borders... Restructuring... in... 1989... left... 159 community boards, 29 of them in Auckland. Auckland City alone has 91 elected politicians for a population of 350,000... – 24 city councillors in 10 wards, a mayor, and 66 members in 11 community boards... No wonder business interests are apt to say that the region is over-governed. The truth is that many community boards behave in a far more political role than originally intended, often being dominated by pressure groups. Many have a tense relationship with their parent body. Some are openly rebellious and see their role as making their parent councils as uncomfortable as possible... Common sense tells us that good local governance is about fostering durable, cooperative communities. The respective roles of local and central government in pursuit of this ideal are still not clear in N[Z] after nearly a decade of reform... Who should be doing what is still a bit woolly and the new MMP parliamentary system doesn't help the prospects of clarification.

...[I] – the author of *The End Of The Golden Weather* – do think that people thought after the last [parliamentary] election that they would get something better than what they've been getting [in the past. They didn't, and it seems like bad politics has]... been spreading down to local government as well...

In what we like to think were simpler times, much brain power was exhausted on matters religious. Calculating the number of angels that could dance on the head of a pin; using the *Bible* to fix the actual hour of Creation – that sort of thing. We like to think such sillinesses belong to more primitive, less rational times. But I reckon the old church theologians would find themselves right at home in the present... Since the Local Government Amendment Act (No 3) came into force in July last year, teams of bureaucrats and elected officials in every local body in the land have... [by] order of Parliament... been waving wet fingers in the air, counting tea leaves and tossing coins trying to decide what percentage of a dog licence is a public as opposed to a private good. They have judged whether burying Uncle Fred in the council cemetery is of greater benefit to Uncle Fred than it is to the community at large – or less. This huge time and money-wasting exercise is all part of Treasury's effort to force political activity into a straightjacket of "economic principles." The bottom line, of course, is to define which activities can be classified as "user-pays." ...To complicate things further there is provision for goods and services which are a mixture of public and private good. Inherently... all this is subjective and political. Is a child's visit to the zoo purely a private benefit? Or is the fact that the kid learns about protecting endangered species while there a benefit to society as a whole? A case can be made either way... but only according to political principles surely, not economic. How subjective this all is can be seen by comparing the preliminary theological discussion in North Shore City and Auckland City. With libraries, for instance, North Shore has decided on a public-private benefit split of 2:1. Auckland, on the other hand, comes up with a 9:1 split. North Shore sees dog control as a 50:50 split, Auckland seems to see it entirely as a private benefit. With pensioner housing, North Shore sees no public benefit, while Auckland lists it at 69[%] public and 31[%] private. Can both council's be right? Sorry, I can't help. I'm still working on the angels on the pinhead puzzle. It seems more worthwhile.

...Local politicians on the North Shore may pull their support today for public consultation on the future growth of Auckland. A number of city councillors are outraged at how the A[RC]'s growth forum has pushed forward... to May... [from] October next year... the process aimed at dealing with growth over the next 50 years... But the regional council... chairman... said... "so what?" ...six other territorial authorities supported the... \$50,000... forum's plans, and North Shore would simply be left behind if it chose not to participate... North Shore's planning committee meets today, and its chairman... predicts it will recommend asking the [ARC] to go back to its original consultation timetable. [In related news, 'four city councils paid a total of \$72 million for consultants' services last year – more than 40% of their staff payroll bill. The councils – all in Greater Auckland – are increasingly turning to outside consultants as they tackle multimillion-dollar infrastructure projects beyond the expertise or capacity of their own staff.']

...Sleep and democracy are on the line as accusations of gerrymaking fill the corridors of Auckland City Council. A meeting to consider the shape and political representation of the city's wards will be held at the "indecent" hour of 7.30am... and some councillors are outraged.

...[his] peers were outraged last year when[an] Auckland city councillor said the city had too many local representatives and their numbers should be cut by a third... [H]e would like to see the city with 19 councillors, not 24, and 48 board members instead of 66... [An] Invercargill businessman... agrees... [He] founded the lobby group One Southland in April to try to create a 16-member Southland council by merging the Southland and Gore district councils with the Invercargill City Council. He believes this could save the region \$9m a year... Generally, councillors earn around \$25,000 a year, with board members earning up to \$10,000 depending on their position... Last Wednesday, the Waitakere City Council voted to cut the number of councillors in the city from 16 to 13... Hutt City Council has gone against the wishes of its three community boards and the Hutt Valley Chamber of Commerce by calling for the boards to disband and be replaced by six smaller boards. The council has also decided to cut the number of councillors from 13 to 12... The Local Government Commission has the authority to step in if, following a council's ruling, a community board refuses to disband voluntarily. Two weeks ago, the commission introduced a scheme to be enforced in Auckland's North Shore in time for next year's election. Under the scheme, the number of councillors has been cut from 19 to 15 and the number of wards halved to three. Community boards have been retained.

...Pressure is mounting for a new court battle over the Local Government Commission's reshaping of the North Shore City Council. Councillors will meet behind closed doors today to decide whether to appeal to the High Court against the commission's ruling last month. Another option is to ask the Minister of Local Government... to appeal. The council has already won a High Court battle, when the scheme was in draft form... The final scheme... most controversially, stops the council delegating resource consent powers to the boards.

...Plans to reorganise local government on the North Shore are heading back to court... The appeal... will cost \$5000 to \$10,000... The council will ask for financial support from L[GNZ]... although it declined to help on the first appeal... However, the appeal could cause headaches at election time in October 1998 if the matter has not been resolved. [Incidentally, unlike parliamentary elections, there is 'no limit for local bodies' on the amount that candidates can spend during their campaigns. Last time, the mayor of Auckland City – who next year will be 'seeking his fourth and last term as mayor – reportedly spent about \$300,000 on his campaign (\$250,000 of which came from his son, who owns a group of gyms, and the remainder came from other supporters; of the total, about \$70,000 was spent on TV advertisements, about \$40,000 for advertisements in the *Herald*, \$32,000 for a glossy mailer, and a combined \$100,000 was paid to an advertising company and a public relations firm), or about \$8 for every one of his 42,542 votes. The third-placed candidate also spent about \$8 for each of his 12,268 votes. The mayor strongly defended the cost of his election campaign, but the Green Party candidate

called for a spending limit. "Mayoral races are in danger of becoming the preserve of rich people or those with major corporate backing." The Minister of Local Government – who has indicated that she intends to leave parliament and become an Auckland mayoralty candidate next year – believed a campaign cap of \$50,000 should apply to stop the "Americanisation of local body politics." Unfortunately, spending on TV and newspaper advertising will rise if other wards follow the lead of 'Avondale and Blockhouse Bay – which have declared themselves election hoarding-free zones.'

...local politicians... have... their... exam... in [October 1998] when voters – at least those who bother[('voter turnout for the last local body elections ranged from 35.5% in Manukau City to 50% in the Franklin district')] – decide whom they want back at the town hall. But life for some could become a little uncertain as moves to cut local government gather strength... At last count the region had a staggering 370 elected politicians – just 65 fewer than the U[S] Congress. Some community board members did not even face the voter last time – they took their seats unopposed. But who can say whether Auckland has too many politicians? Or too few? The big Auckland City exercise may succeed in... moving a ward boundary and delivering 16 fewer politicians[, but there] is no guarantee it will make for better decisions... [However, members] of the A[RC] have voted themselves \$26,000 to improve their skills in areas where they feel shaky. The Citizens and Ratepayers-initiated move will allocate each of 13 councillors a \$2000 grant for training... A proponent of the idea... said... [regional] council staff members had about \$1000 a year spent on their training needs, so it was reasonable that councillors should have training as well. "Why not pay for the people who make the decisions?" ...The motion... was passed at a recent meeting by seven votes to three... [One councillor] who voted against the decision, said if councillors needed training, they should pay for it themselves.

...Aucklanders may be asked to pay for some of the region's local body councillors to learn how to do their job. Courses for "experienced" councillors are being offered at \$495 a head by the Auckland University local and regional government politics unit... The course, beginning next month, offers between 20 and 40 places... The university is contemplating running similar courses next year.

...Examinations in Manukau City schools may soon include questions for young pupils on the identity of their local councillor... The proposal is the brainchild of [a local councillor who is] an advocate of civics teaching... [Meanwhile, t]he dominant local body group in Auckland[, the]... Citizens and Ratepayers Association... is aiming to sharpen discipline and centralise its selection process... The association has a majority on the Auckland City Council, the A[RST] and the Auckland Energy Consumers Trust, and a strong power base on the A[RC]. However, a C&RA... city councillor who sometimes takes an independent stand, yesterday interpreted the performance reviews as a disciplinary measure that would make the group more like a national political party. Parties had no place in local government, she said. One of the association's strengths was that its members expressed varied opinions as councillors. Another member... predicted that centralised selection would split the organisation as ward-based groups clung to power. But the[C&RA] chairman of the services trust... said performance reviews were a common business practice. Voters were entitled to know that the people they put into power were subject to some kind of review.

...The Mayor of Waitakere... wants his sometimes belligerent council to consider a code of conduct... He... has cited the Rangitikei District Council's eight-point code, which reminds its elected members and senior management to act with integrity and honesty... "One or two... around this council table... have demonstrated that they... would fail this "Rangitikei test" on a number of counts." [The mayor], who is travelling to Sweden to speak at a conference on planning... did not name the councillors he had in mind. [However], an independent councillor who has frequently clashed with the mayor, disputed the need for a code. "I can't think of anyone who would fail the test. And if they did, it would be sorted out at the next election." ...[Speaking of which, o]ne simple law change would save Auckland City ratepayers \$120,000 and all of N[Z] \$2 million, says the city council returning officer... [He] said the 1976 Local Elections and Polls Act predated the technology now available... Because the ballots were not allowed to be opened before the final Saturday of polling, 650 people had to be hired and the Town Hall used to count them all manually... If the postal voting papers were allowed to be opened as they arrived at the council, an electronic scanner could be used to put the results into a computer.

...The influential Deputy Mayor of Auckland... has infuriated Alliance supporters with a restructuring plan they say amounts to a "gerrymander" of their inner-city power base. [The deputy mayor], the leading C[&RA] councillor, is pushing for a boundary carve-up which would split the Alliance-dominated Western Bays ward between Hobson and Avondale-Mt Albert. An Alliance Western Bays councillor... was alarmed by an option that would move one councillor from Western Bays to Hobson. The... council must choose an option before... [they] vote on Thursday.

...In national politics we ensure that all votes have equal value by creating electorates of identical size, give or take 5[%]. We guarantee there will be no political jiggery-pokery with the boundaries by employing an independent commission. Unfortunately in local politics it can still be very much the political wild west... when it comes to such matters. Take last Thursday's resolution of the Auckland City Council... to reduce the number of councillors representing the Western Bays ward (population 35,991) from three to two, and to increase representation in the... Hobson ward (population 35,804) from two to three... Of course if I was of a paranoid nature I would suspect that it is really a blatantly political move to punish a ward which regularly returns Labour, or more recently Alliance councillors... who have constantly sniped away at the... [C&RA juggernaut. ■] Almost half the... people who responded to the clip-and-return survey in... [the c]ouncil's... *City Scene* newsletter favoured reducing the council... About 130,000 households received *City Scene*, but only 1.8[%] had responded.

...Consultation: just what does it mean? ...My interpretation is that one or more propositions are placed before people and comment sought. These proposals are impartial with balanced argument for and against and with no attempt to influence the consultation. The results are considered when a decision is being made. Not all see it this way. Inserts in... *City Scene* [invited] comment on a very important topic – the political structure of the city, the number, size and boundaries of wards, the number of councillors and also community boards. This is legally required of the council... People[were] asked for comments on several options... [However, the council had] already voted on which option it prefers. This is just a process under the guise of consultation but is really looking for approval of a decision already made... [A] constant remark made to me is that *City Scene* is purely a organ for council propaganda.

...Auckland City's community boards are campaigning against their membership being slashed by almost a third as part of a move to cut the number of city politicians... Four options for change have emerged, all involving a cut to 19 councillors plus the mayor and 48 elected community board positions. Two options change some boundaries but keep all wards and boards. Two others forge five new super-wards but retain the 11 boards. The... chairwoman of the Auckland Regional Community Boards Association and a Waiheke Island board member, said yesterday that boards performed vital work in community consultation. "We can't keep up our level of service if they reduce our numbers," she said... Community boards were "cheap labour," she [added]... However... a councillor prominent in the push for a single "super city" for the region, claimed slashing representation from 91 to 68 would carve \$1.8 million from the city's annual democracy budget of about \$7 million.

...Take note those who say Auckland is too big for its boots: some politicians want to trade the boots in for an even bigger pair. High-powered councillors in Auckland are pushing for the creation of a super-city. The group, which lists [Auckland City's] mayor among its supporters, wants to see one big body swallow the existing four city and three district councils that now control Greater Auckland. Supporters say it would cut the number of elected politicians in Auckland from 371 to 36.

...The drive to mould an Auckland super-city struck opposition yesterday from politicians worried that the proposed regime would be an impracticable giant. "Everything can be improved but I don't think putting everything together in one big grab-bag is the right answer," said the Mayor of North Shore... "We should work to make what we have got work properly first..." The Deputy Mayor of Rodney... said Auckland was

too broad a place to throw everything into one council. "We are a very different animal to Auckland City. The Hibiscus Coast has always been looked upon as a separate entity." She[also] disagreed with another proposal by a North Shore City councillor... to merge the North Shore and Rodney... [He] said the merger would protect lifestyles north of the harbour bridge. "The lifestyle of North Harbour will change forever if the urban intensifiers of the metropolis-minded Auckland City Council get their way." ...Members of the Auckland City Council have written to the Government urging it to create a single authority to control Greater Auckland... They argue that the super-city would cut ratepayer costs... [and t]he Mayor of Auckland... said a super-city was something Auckland would need in the future. "I believe in the long term it is going to be in Auckland's best interests."

...*Bigger cities do not cost any less to run...* A university lecturer in town planning once defined a region as "an area somewhat larger than the one whose problems we could not solve last time." This great truth probably explains why some politicians and members of the public have called for the cities of the Auckland region to be combined into one single "supercity." This idea maintains the N[Z] belief in "amalgamation" – based on a conviction that big organisations are more efficient than small ones. Business has long abandoned this simple-minded faith. Our politicians continue to find it endearing. We have always been promised that urban amalgamations would lead to more efficient cities because of "the economies of scale." For example... the Mayor of Auckland, has argued that[the] proposed super-city would be more cost-effective because we would not need as many mayors and councillors. Not surprisingly, this idea has been poorly received by other mayors and councillors – which makes it only more attractive to the many citizens who hate their politicians... There are areas where the economies of scale do apply, but access to our elected officials political accountability is almost certainly not one of them... [The] proposal presupposes that Aucklanders would benefit from having fewer councillors and more bureaucrats... [because] statistics indicate that the bigger the city the more numerous the bureaucrats. This is best illustrated by comparing Christchurch with Papakura, a small district sitting on the edge of the Auckland region. Christchurch is a single super-city occupying the heart of the Canterbury region and is presumably a role model for[Auckland City's] Mayor... Papakura has about 40,000 people, Christchurch about 320,000, a ratio of eight to one. Papakura has three people administering the Resource Management Act within a total of 22 in its development and environment division. We would expect Christchurch to have about 24 in its team of a total of about 176 in its development and environment division. If there are economies of scale there might be even fewer. In reality, the equivalent figures[are] 170 and 277. There may be some good reasons for this huge discrepancy[(e.g., Christchurch may place greater emphasis on its development and environment than Papakura)] but Parkinson's Law probably accounts for most of it... Statistics also indicate that the bigger the city the higher the rates paid a head. The... bureaucracies[of supercities] boom and find more and more things to do with their ratepayers' funds – many of which have little merit in the eyes of the public... Anyone for a supercity?

...[Should we merge into a supercity? An Auckland supercity is being bandied around by the region's councils. The idea coincides with calls by Waitakere City's mayor to take over parts of Rodney and Avondale in Auckland City. On the street, the *Western Leader* asks readers if the west needs the rest. Mr Electrician: "I don't think we should merge. Waitakere's got its own identity and we don't need to be burdened with other people's hassles." Mr Stonemason: "I'm quite happy with the way we are. I don't think we have to answer to anyone – the more we have the more involved and complicated it is." Mrs Office Manager: "To be honest I haven't actually given it much thought so I'm not sure what the benefits or disadvantages would be. The only thing I know about Rodney is it's lost most of its staff." Mr Retired: "No I don't think we should have a supercity because they are uncontrollable. Rodney certainly seems to be in a mess." Mrs Travel Agent: "Yes, I think everyone would benefit from it." Incidentally, 'Waitakere City is rated seventh best city in NZ in a *North and South* survey, beating the likes of Auckland, Dunedin, Hamilton, Invercargill and Napier. But we didn't do as well as North Shore which comes in as runner-up behind Wellington. In the next edition of the *Western Leader* we'll find out why readers like it here – and if the North Shore really is better.']

...*Jury's out on big is best...* My impression is that any such proposal would also get rid of the region's environmental guardian – the A[RC, of which I am]... the chairman... The timing of the super-city protagonists is stunning and, by my reckoning, about as intuitive as E. J. Smith, captain of the Titanic, who said before his last voyage: "I never saw a wreck and have never been wrecked, nor was I ever in any predicament that threatened to end in disaster of any sort." Only a matter of a month ago I attended the Auckland Mayoral Forum along with the region's mayors. The sentiments expressed in that forum were that real leadership for the Auckland region can be provided by putting aside any parochial interests and working together. We know from experience that this is achievable... Having observed local government amalgamation and restructuring over the past decade, it is quite clear in my mind that it would be totally unacceptable and abhorrent to Aucklanders to have a single authority which is both gamekeeper and poacher when it comes to environmental issues. The suggestion is, at the very least, naive. There is a growing... understanding that our place in the world – our future – is tied in with our relatively unspoiled environment. To whom do we trust this future? ...But... [s]ome people commend the single-city proposal as having fewer politicians[, and on this point I concur. The]... region's councils together have more than 370 elected members – clearly ridiculous. We are not running the United States of America... The regional council has only 13 elected politicians representing one million people. [By the way, I'm 'delighted with a recent Privy Council ruling which forces the IRD to refund more than \$2 million to the ARC. The case goes back to 1989 when the Auckland Harbour Board was abolished and its assets and liabilities (including tax obligations) were transferred to the ARC.'

...The ARC] is convinced it does not need additional councillors, despite the population boom in its area. While it is busy developing strategies to deal with the growth and accompanying infrastructure and environmental problems it does not want to increase spending ratepayers' money... If the policy, established in 1994, was to be followed in the local body elections next year and if each councillor was to represent the same population as in 1994, the membership would rise to 14... By resolving to stick with 13 members the ratio will be one councillor to more than 88,000 residents.

...The Auckland City Council spent three hours debating its size last night but finally spared itself the knife. Only the mayor... and four councillors voted for... the cut... One... later said it was a disgrace his colleagues had voted against the cost-cutting proposal. He claimed they were afraid of losing their seats... [However, i]t should be pointed out that bigger wards and fewer councillors... result[s] in the concentration of power in fewer hands... If community boards were reduced in numbers but given more work to do, would they be able to cope? Would they be effective as far as ability to do what was required and... would... the cost... be less than it is at present, or more to service fewer councillors needing more backup support or delegating to more staff? ...It is fallacious to quote the number of elected representatives (as against full-time members of Parliament) without acknowledging that councillors are regarded as part-time and they do much more work than what they are paid for.

...Local politicians' meetings are full of "waffle and claptrap" and achieve little, says a rebel Waitakere City councillor... The... self-employed businessman, said yesterday that councillors should give up inflated allowances and do the job for free. [● 'Last year, the 24 Auckland City councillors' salaries cost \$444,551; when combined with the \$415,106 paid for attending meetings (the councillor who received the largest share attended 216 meetings) their combined pay cheque was \$859,657. The \$87,442 salary of the mayor brought the total to \$947,099. This financial year the budget for councillors' salaries is \$575,000 and for meeting allowances \$390,000. The mayor's salary is \$88,900, making the combined total \$1,053,000.']

...Local politicians are "grossly overpaid" and their pay system needs a shake-up, says the Mayor of Papakura... Councillors in the big cities can earn \$15,450, but make a lot of their money from meeting allowances... He said... many councillors were being paid more than \$40,000 a year: "That's far too much for a part-time job. Some of them are making a career out of it." ...[his] comments last night came in the wake of a report by Local Government N[Z] that suggests the way councillors are paid does not give value for ratepayers' dollars. The report says decisions take too long, with redundant subcommittees meeting to claim daily allowances which, in the Auckland region, range from Franklin's \$110 to the \$175 on

offer in Auckland, Waitakere and Manukau and with the regional council... [According to one councillor, these "meetings" average under two hours.] ...Two senior Auckland City councillors... disagreed with [the Papakura mayor's] view, saying the present system should remain... [One] said: "In all my nine years in council I have not known councillors to drag on making a decision just to make a few more allowance claims." [However, a lecturer from] Auckland University, who specialises in local government, said the system of paying councillors per meeting had been abused in the past, with committees adjourning, then reconvening straight away under a different guise. This had been curtailed by the introduction of the rule allowing only one meeting allowance to be claimed a day... The rates are set by the Minister of Local Government... who does not know whether councils abuse meeting allowances. She favours capped spending... [Unlike councillors, mayors are] not entitled to the [daily] meeting allowance... Mayors of cities with populations above 150,000... are entitled to a... maximum annual salary of \$91,570 plus a car... Mayors of cities with populations between 75,000 and 150,000... can get \$79,420... An independent pay-setting body would be a useful way of distancing local politicians from being seen to be rewarding themselves pay increases.

...It's not easy being a mayor in N[Z]'s biggest cities – but an extra \$20,000 a year could ease the burden. That's the thinking of local government lobbyists, who want a 21[%] pay rise for the top mayors. The proposal would mean salary increases... to \$108,000 for the mayors of Auckland, Manukau, North Shore, Waitakere, Wellington and Christchurch. The Government has been asked to approve the pay rise by L[GNZ, whose]... acting chief executive... said the proposed increase would restore a lost pay balance between top mayors and junior Government ministers.

...Rural mayors want to be paid more... They said working in a rural environment involved a lot of travelling and councillors and board members were disadvantaged by the meeting allowances. The mayors of Southland, Waimate... and Taranua... [to name a few, also said that] because of distance, several meetings were often held on one day but councillors could claim only one meeting allowance... ranging from \$100 for small councils... on top of a "pittance salary." ...at \$36,000[... the]... Waimate Mayor... is one of the lowest-paid mayors in the country... [However, the] Southland Mayor... who is paid an annual salary of \$53,550... [to cover] the largest area of any of N[Z]'s councils... said she did the job because she loved it, not for the money... [The maximum mayoral salary for towns 'up to 19,999 in population, such as Taranua, is \$44,130.'] In Taranua, board members and councillors are paid \$3000. Chairpeople get a salary of \$4000... [Meanwhile,] Auckland City... councillors... [have] voted a 3[%] pay rise to themselves, the mayor... and... community board members. The rise, which took two minutes to rubber stamp, was permitted for all councils two months ago by the... Minister of Local Government... and is backdated to July 1 last year.

...All local authorities in the Auckland region, except Waitakere[(where 'Go Waitakere party members – who campaigned on reducing the running costs of the council – voted themselves a 6% pay hike')], have accepted a... 3[%] pay rise, their third in eight years... But... the Mayor of... North Shore... has opted to take home about \$1700 less than the maximum... The Mayor of... Papakura... has always opted to take home about \$1000 less...

A Papakura political group is... [opposed to] the planned franchising of the district's water services. The plan effectively to lease the water and wastewater assets... is being promoted by the dominant Papakura Action group on the district council. The minority Papakura Residents and Ratepayers Association on Monday began a petition to delay picking the franchisee until people are given more information.

...Complaints to the Ombudsman mount as more people lodge objections to the Papakura District Council's "inadequate" public consultation process over the sale of control of its water and sewage services. The council used the dead days period of Christmas, New Year and the summer holidays to publicly advertise the franchising of local water services... which is nothing but a backdoor method of privatising... Despite complaints from the public, the council voted last Monday night to call for tenders from the private sector to buy control of water and sewage supply for 30 to 50 years... Councillors [expect to receive]... between \$7 million and \$13.1 million for the franchise... At last count, 19 companies were interested, including several from Britain and France. If the experience of other countries is an example of the control of water by private companies, whether local or foreign, it will mean higher prices, poorer quality service, reduced investment in infrastructure and lower environmental performance... [A study of records obtained from British companies during the] six years... since the involvement of private [enterprise] in water and waste-water services... [showed] that on average prices have increased by 159[%], profits have trebled, executive pay has increased by 339[%], and pollution incidents have gone up by 53[%]. Yet investment in water supply fell by 20[%] in the past year, and the companies paid virtually no tax.

...*Water, water, everywhere, but not a drop to drink... unless you're prepared to pay the private contractors...* The idea of franchising water supplies has angered those who insist that water is public property and should not be used for private profit. The debate has been revived by the plan to franchise Papakura's water services. That district council's decision on Monday... coincides with the fifth annual water conference in Auckland... Last year the Alliance staged a protest outside the venue. This year, as has become fashionable for some major conferences, an alternative is being organised. The Alliance's Keep Water in Public Hands conference in a suburban Auckland hall tomorrow costs \$15 a head. In contrast, the two-day water management conference... beginning the next day at the Centra Hotel, costs \$1500... Supplying water and disposing of sewage have been defining features of local government in New Zealand. Municipal water and wastewater assets, owned mainly by councils, are valued at \$6 billion. This is comparable to the investment in the electricity transmission and distribution system... Supporters of reform say that as politicians and bureaucrats are replaced by investors and managers with strong incentives to perform, the better the industry will be. They predict gains in efficiency and an end to what they consider the inequity that results from charging, through local body rates, for sewage disposal... Opponents of privatising water services... argue... [that it] will inevitably mean price rises as consumers start paying a percentage into investors' pockets as well as for the services.

...Auckland bulk and retail water prices are likely to double... from [the] present level of 39c a cu m... in the next few years, according to the Waitakere City Council. This would cut the region's water demand by an estimated 20[%], the council... said yesterday... The council... favours fostering the use of efficient home appliances which it believes are likely to cut domestic water use by 40[%] over the next 10 years... [W]ith additional savings, the need for a new source can be delayed for many years. Watercare[Services Ltd], however, maintains the need for a new source is more pressing than ever with Auckland population growth of about 25,000 a year... Watercare[... which]... yesterday announced a surplus of \$19,547,000 for the year... [– after recording 'a profit of \$293,000 last year and a \$15.4 million net loss before tax during the 1994-95 year' –] is prevented by statute from paying a dividend to the... A[RST, a law that] has got the company looking at phasing in a rate of return on investment over the next 10 years to make it a more commercially run business... It can return surpluses to its customers, the city and district councils, but never has. They have been reinvested or used to cover the losses of the 1994 water shortage. A company spokesman... said outside the hearing that its water price would not double. It would, however, rise by 5[%], to 40.95c, from July 1 – the first rise since 1989... This would add about 30c a month to average domestic water bills if passed on by the councils. And it would rise in line with inflation in coming years... He said it was ironic for Waitakere to raise the question of pricing since its retail price was Auckland's highest, at \$1.22 a cu m, and was aimed to rise to \$1.34 on July 1.

...Auckland City residents will buy their water from Metro Water, a new council-owned company, from July 1... [after] councillors voted 13-11 to commercialise the council's water services... And three months later they will also start paying a user-charge to the company for wastewater disposal, a service now paid for from rates... Council critics of the move said it was anti-democratic, hard on the poor, lacked public support and would lead to privatisation. Supporters said the company structure would be more efficient and lead to more investment in the decaying wastewater network... [An] associated... council-owned holding company, [to be] set up to own Metro Water at arm's length from the council, will have seven council-appointed directors... [This means that the] council will have no direct control over Metro Water and its prices although it will be

able to set the rate of return annually and could sack directors... The cap for the holding company's directors' fees is \$120,000, and the ceiling for [Metro Water directors] is \$140,000.

...On July 1... Metrowater, took control of water supply to Auckland city residents. On the same day United Water, of which British Company Thames Water and French water services giant Compagnie Generale des Eaux are major shareholders, took over Papakura city's water supply franchise for 50 years... [after t]he Papakura District Council... voted 11-2 to accept[its] \$13.1 million bid... United Water, the world's biggest water supplier, operates in A[US], Britain and the USA... [(t]he group, with about 2500 subsidiaries and 204,000 employees, has an annual turnover of \$45.6 billion[)] ...It will bill Papakura customers, set charges and be responsible for systems upgrades. Water prices are frozen for two years and then capped at the Auckland city rate thereafter... Papakura[']s... decision to put its water services in the hands of private managers has led to the slashing of its annual budget by 28[%]... Water rates in Papakura will initially fall by 18[%] but residents will then pay a sum, which may be more or less than 18% depending on consumption... Metrowater will[eventually] work in a similar manner... [Previously, people were charged] for water and wastewater based on the value of their land. "Some people are charged \$500 to \$600 a year through rates for water when they only use \$100 worth." ...[the] Papakura Mayor... said a big factor behind the switch to United Water was a \$310[million] upgrade to the Mangere oxidation ponds which he predicted would have seen a 50% Papakura rate rise over the next decade... [- although a] build/own/operate/transfer (BOOT) scheme might cut the facility's costs by 10[%], and some]... critics have said the upgrade could have been \$160 million cheaper if an option with less stringent effluent-discharge rules was adopted. The... new plant will use electricity to treat effluent rather than breaking it down with sunshine... It is possible some of the electricity will be generated by a cogeneration plant, perhaps using methane gas from the waste... [T]he treated sludge might [also] be a good nutrient for forests and it is even being looked at as a fuel for the old Meremere power station... [In related news, resource] consents have been obtained for the construction of[a] \$16.4 million Wellington composting plant between the... [refuge] collector and recycler Waste Management NZ... and the Living Earth Company... [The announcement came as] Waste Management... reported... all divisions contributed to... [a] \$3.92 million... six month... profit... compared with \$3.27 million for the same period last year and was after tax of \$2.13 million (\$1.81 million in the 1996 period)... During the period, Waste Management successfully re-bid for the... five-year... Hastings District Council residential refuse collection contract... The company also bought Bin Hire Services (Whakatane) but was unsuccessful in bidding for the Gisborne District Council residential refuse collection contract... Sales revenue was 13.3[%] higher at \$34.05 million... [L]eading the way... [was] the landfill at Redvale on the North Shore. The site had increased its share of the... Auckland... region's waste volume and continued to meet expectations. The landfill had the capacity to receive significantly larger proportions of the... region's waste[, which is fortunate because the 'half filled tip at Rosedale Rd has recently been closed because of its smell. The North Shore council had wanted a cricket ground and four rugby fields on the fully filled site but slopes on the unfinished part are suitable only for open parkland.'

...[the] North Shore City Council-owned company NSM Contracting... which manages parks, gardens, sewerage and cleaning on the Shore... has reported a before-tax surplus of \$1.37 million for 1996-97. The company... returned a dividend of \$460,000 to the council – more than double that of 1995-96... [Incidentally, a]nother publicly owned Auckland asset is being lined up for a possible sale. The A[RST] is looking at privatising its 100[%]-owned waste-management company, Northern Disposal Systems Ltd, which has a book value of \$18.6 million... The trust is required by law to sell Northern Disposal "as soon as is practicable and prudent." ...Northern Disposal, which paid the trust an \$875,000 dividend in the past financial year, owns half of Enviro Waste Services, the country's third-largest waste-management operation.

...The leasing of Papakura's water services to the private sector has sparked strong interest from[other] councils... No law bans local authorities from selling their water operations, except Watercare Services Ltd, owned by the A[RST].

...Auckland City's 25 councillors are there to make far-reaching decisions as a result of the popular vote. The status quo must be paramount when consideration is given to a sudden and large alteration in the way we manage any of our core functions. The closeness of the decision when we first voted on setting up a... LATE... to manage our water resulted in an 11-all split. The casting vote of the mayor... meant the company did not proceed. [Yet, a month later], when the matter was revisited, the decision was reversed 12 to 11... This huge decision [aw] the transfer of \$100 million of capital assets to this council-owned company and a loan of \$75 million which has to be serviced. This, long before [Metrowater started] invoicing us for fresh water supplied and foul water removed... Watercare... has to find \$340 million to upgrade the Mangere sewage works and \$150 million of that is to be levied on Auckland City (or rather [Metrowater]) as the largest user... [Metrowater] will have to service a \$75 million debt and the other charges. It will have to borrow more and/or levy us with additional charges... Auckland's water business... operat[ed] very successfully as a stand-alone business unit... As N[Z]'s 14-th largest business we ha[d] the income and asset backing to repay our water loans and defuse the fiscal effect of Watercare's upgradings and expansions. The setting up of [Metrowater], as a profit-making corporate, places[Auckland City's] water supply and removal function a step away from full privatisation. Some[councillors] may bleat: "I... definitely [didn't vote] for privatisation but for a sharper operation" ...increased loan servicing? ...regional levies? Who said we are going to privatise our water? No one. However, there will not be any one of us now governing... Auckland City... around in 20 years when future councillors will find it easier to privatise because of what we are doing now.

...The Metrowater company model is being officially promoted for a second Auckland City Council department. The works committee yesterday narrowly supported investigating the conversion of... City Design... into a... LATE... City Design is N[Z]'s eighth-largest engineering consultancy, with 130 staff, mainly engineers and a few architects. In the June year it produced annual earnings for the council of about \$1.2 million from total turnover of about \$12.6 million. All but 10[%] of its work is for the council but outside work is expected to increase to 30[%]... The Deputy Mayor... said... that while not pushing the issue, he was interested in creating trading enterprises from the[rest of the] council's... profit-making business units: ...City Parks Services, Fleet Services, City Contract Services, and the parking buildings... [●] Manukau plans to establish a ...Late[for its water services by January next year], while Waitakere is still consulting residents.

...Activists had the sting pulled from their protest against water commercialisation yesterday when Waitakere City politicians welcomed them into the debate. Twenty Alliance and Citizens Against Privatisation members mounted the protest outside the council offices and waved placards with slogans such as "hands off our water." But the mayor... and his deputy... swept down from the chamber to usher them inside and invited two of their number to address the council meeting. The meeting later adjourned to next Wednesday without making a decision on the proposal to set up a company, tentatively referred to as Eco Water, in line with the council's image. The company would own and run the council's \$230 million water supply and sewage disposal assets. An Alliance protester... said... "...the issue of privatisation is more about who will own the system in 20 years, than who will own it tomorrow."

...The... Alliance co-leader and energy spokeswoman... said other councils should wait to see what happened in Papakura and Auckland before making a decision. "It is a dangerous agreement between Papakura and United Water because the council loses all control... and United Water has the power to disconnect services at any time. It has no obligation to upgrade pipes or improve quality..." ...She said there... were 21,592 disconnections... [in] Britain... in 1992... Despite the criticism, [the Papakura mayor] said he had community support and believed it[was] a step in the right direction... [His comments were supported by] the Business Round Table[, which says the rest of NZ]... could be forgoing huge savings by not reforming its water industry...

[The] executive director of the N[Z] Business Roundtable... argues for privatising water supplies and selling water at market rates like any other commodity... British water industry privatisation is often criticised. Indeed it seems to be the only example of water privatisation known to Alliance

politicians and many journalists, and they seem to think it demonstrates the failure of privatisation. The heavily regulated approach adopted by the British Government is certainly not a model that commends itself. In many ways the industry swapped a Government owner for a Government controller and regulator. However, it is important not to overlook that in Britain substantial investment was required for maintenance, which was neglected when the water companies were under political control, to meet E[U] environmental standards (whether justified or not), and to improve the quality of drinking water. This investment meant that regardless of privatisation prices would rise and consumers who did not value such improvements would be dissatisfied. In fact, charges have risen in all E[U] countries, in part as a result of the need to finance higher standards. A rise in prices following corporatisation or privatisation is not necessarily an indicator of policy failure. If prices were previously held down artificially – for example through failure to undertake adequate maintenance of assets, or for political reasons – over-consumption and other distortions would occur causing resource misallocation and environmental damage. Artificially low prices are as harmful to society as artificially high prices – the goal should be to promote efficient pricing. Despite these significant weaknesses in the implementation of water industry privatisation in Britain, the balance sheet is clearly positive. Real improvements in drinking and bathing water quality and efficiency gains have been made. Compared with the momentum of reform of water utilities around the world, progress in N[Z] has on the whole been extremely slow.

...There is nothing new under the sun; old ideas come round again. [The Business Roundtable's executive director] would take us back to 19th-century Britain with private companies selling water for profit. Perhaps history will serve as a better guide than untested economic theory. For centuries in Britain water was supplied by private companies with many public attempts to control pollution and profiteering. The issues were the same as now – water quality, reliability of supply, pricing, access for low-income people. Competition was well-established, too, with eight private companies competing to supply London. Some streets had three sets of pipes with three sets of labourers – selected for their belligerence – making fortunes persuading customers to change supplier while the streets were constantly torn open to allow connections to be switched. The stink of the Thames and high death rates from cholera, while poor families had no water connections and at best shared standpipes in the streets, led to efforts to bring water under public control. But the struggle took decades as water companies strenuously resisted demands for clean water sources, filtration, continuous supply and access for the poor. While Manchester took water into public control in 1847 and Liverpool soon after, in London the private water companies succeeded in holding up progress until 1902. Britain has recently reversed this decision and sold its water companies. [The executive director] argues that all that is wrong with water privatisation in Britain is that it is “heavily regulated.” That may be a problem for the companies, but N[Z] water users should envy them. We have no mandatory standards for drinking water quality. There are voluntary guidelines, but some water authorities fail to meet them. At least when the authorities are publicly elected voters can force a change, as they did recently in Dunedin when [a new]Mayor... was elected on a platform of cleaning up water quality and investing in the crumbling pipework. The guidelines are derived from World Health Organisation standards designed to be achievable by Third World countries. They allow much higher levels of nitrates than exist in water from the Auckland dams at present, and other trace minerals as well. We do not need to lower our standards that far but private suppliers will lower them for us if we let them. [The executive director] would allow people to decide how much they value water quality and be prepared to pay accordingly. That imposes huge and inefficient costs as each consumer has to find out what the various contaminants are and the likely effects on their health. That is what we elect public bodies to do; we expect to hold them accountable if water quality is seen to be inadequate and we don't expect them to downgrade the quality of our present supply. [The executive director] argues the British experience is clearly positive... There is evidence to the contrary. Just this month Three Valleys Water in north London concealed for some weeks that its water was contaminated with cryptosporidium. Thirty-two people became ill and three were put in hospital, including two infants. This company is owned by Compagnie Generale des Eaux – the major partner in... the successful tenderer for the Papakura water franchise. Drought management has been poor – much worse than in Auckland in 1994 – and communities have run out of water. Disconnections have grown... That has not been normal practice in N[Z] where councils would have to face the wrath of electors, but disconnection for those who cannot pay their bills is expressly provided for in the Papakura franchise agreement.

...[AN Avondale petrol station owner vows he will fight Metrowater over wastewater charges even if that means being cut off. The owner of the Caltex service station in Great North Rd doesn't agree with paying 100% for his wastewater charges. He says about 200 to 400 gallons of water a week are used to top up radiators and wash windscreens. He also refuses to pay for an audit which could reduce the wastewater charge by up to 25%. “I am a businessman being sent an invoice for the wrong amount. If I did that to a customer I would be expected to put it right at my expense.” He expressed his concerns to the Avondale Community Board which has asked Metrowater to explain its audit charge. Metrowater's communications manager says initially each of the city's businesses is charged a flat 100% waste water charge. “The reasoning behind that is in the normal course of everyday residential life, gardens get watered and cars get cleaned which means water doesn't go into the wastewater system. Those aspects of life don't happen in the business world.” She says the \$100-plus fee for an audit is for the time and staffing it costs to access premises. “I don't think it's fair for our 122,000 residential customers to pay for an audit which could save a business money.” She said some businesses, especially those where water is used in the manufacturing process, have saved thousands of dollars by spending the money on an audit. But she says, in her experience, only a negligible amount of water doesn't enter the wastewater system from petrol stations.]

...[Water Pressure Group campaigners dug up an Onehunga street yesterday to restore water supply to a house cut off by Metrowater. The water company disconnected the Grey St house more than a month ago because its owner refused to pay the wastewater component of his bill. The group said the occupiers, three generations of one family, had survived by filling pots and pans from a neighbour's garden hose. A “turn-on” squad of 100 supporters took about three hours to reconnect the pipe to the water main. A pickaxe was used to dig through the asphalt and expose the water main and feeder pipe. Road cones warned passing motorists of the work. A previous attempt to restore the supply brought a public safety warning from the company. Its spokesperson said last night that the water main was under enormous pressure and if proper procedures were not followed a fitting could blow off and kill or injure bystanders. Metrowater's spokesperson was not sure whether the company would again cut off the supply. “We have a responsibility to our other customers if they are paying to make sure everybody pays. But there doesn't seem to be anything to gain from inflaming the pressure group – it just seems to make them more dangerous, which is not in the public interest.” Metrowater was relying on a High Court ruling to clarify the issue of wastewater payments once and for all.]

...[a lobby group boycotting wastewater user charges said its “turn-on squad” plans to reconnect a Blockhouse Bay family whose supply has been shut off. It intends digging up the water mains in Chaucer Place and installing new pipes, before concreting over the hole so Metrowater could not remove the pipes. A barbecue and street party are also planned. The action comes a day after a group member was arrested during a protest involving 10 people outside the company's Three Kings headquarters. The man, who allegedly spray-painted “Dump Metrowater” in big yellow letters on the headquarters' steps yesterday afternoon, faces wilful damage charges next week. The increasingly strained relationship between Metrowater and the group was underlined when Metrowater asked police to investigate another reconnection attempt. Metrowater said its contractors had seen two men tampering with the water supply in Grey St, Onehunga, last Saturday, putting nearby householders at risk. Metrowater's communications manager said the men had dug up the road without using safety barriers or warning cones. She said the group's plans were both illegal and dangerous. Metrowater's chief executive said it had a responsibility to ensure a reliable supply and to keep residents safe, “and we will take whatever steps are necessary to do that.” The group claims it has more than 700 members. But Metrowater says that so far only 36 customers have had their water cut off because of non-payment. Chaucer School, which is in the same street as today's protest, is also in dispute with Metrowater and has refused to pay the wastewater component of its water bill.]

...the corporatisation of Auckland's] water system will add more than \$40 million to consumers' bills over 20 years, according to a new study. The main extra cost is almost \$100 million for corporate overheads, including directors' fees... but this is offset by a \$55 million saving on maintenance.

...A community backlash against plans for a water services company in Manukau may force a council rethink. More than 95[%] of a record 3700 submissions... opposed the idea on the ground of cost... The council usually receives only a few hundred submissions... each year... Manukau City ratepayers are[already] being asked whether they want their council to sell its contracting company, Excell Corporation. The [LATE] has interests as far away as Brisbane, where it manages a civic works project. The council says the company... needs more capital to fund growth and wants to hear from ratepayers whether they should be exposed to the business risks of expansion.

...Manukau City's transtasman lawnmowing business is again under fire in Queensland after the renewal of its \$A2.3 million contract by the Brisbane City Council... [C]ritics say the company won the work by undercutting its closest local rivals by 50[%], and has since provided an "atrocious performance record." The business, described as "wholly subsidised by Manukau City Council," was first blasted when it won the grass-cutting contract last year. Critics said it was sending A[US]n ratepayers' money to N[Z]. This time the]... council opposition leader... said a report by [BCC] staff on Manukau has shown unsatisfactory work, 20 problems having been identified in the past year in his ward alone... However, the Lord Mayor of Brisbane... has defended the business, telling the *Courier-Mail* newspaper the latest allegations were utter nonsense. "We've had only one complaint in the past year," he said.

...Congratulations to Manukau City for backing off plans to corporatise its water and wastewater systems... Too many councils around the country have been bullied by the Government and business interests into setting up their service units as "businesses." ...Formerly free or subsidised services are being charged for at full market rates. The public sector seems to have forgotten why it exists. In fact, the public sector exists because our objectives as a society are different from the objectives of any private business. Business has to make money. We bring in government when businesses are not providing needed services. This is not to say that people in business don't have non-monetary goals too. They do... But at the end of the day the quality of service that anyone in the private sector can provide is limited by what the customers are prepared to pay for it. A business will prosper to the extent that its good service attracts more paying customers. But if its service merely attracts people who can't pay it will fail. You only have to go to almost any developing country to see the result of a pure market system where you only earn money if you can sell something that the wealthy will pay for. The able-bodied and the educated tend to do alright. Anyone with less than the full quota, physically or mentally, is liable to end up begging in the streets. Disease is rife because many people can't afford adequate water, shelter or health care. Our forbears created a strong public sector because they were not prepared to tolerate this situation. They introduced welfare so that no one had to beg. And they provided basic services such as water free to everyone, so that all citizens had access to it even if they squandered their welfare cheques on beer and cigarettes. They provided these services directly, rather than contracting them out to corporates, for good reason. Because of the cost of the pipeline network, it made sense to have only one water supplier, for example, rather than several competing networks. And it was important not to limit how much of the service was provided because the service had to be available on the basis of need. In any situation where there is only one... private... supplier... [the] monopolist can hold a gun to the council's head, saying it will not supply services unless it gets a good price... [By the way, l]awyers worked through the small hours of yesterday to iron out objections to the \$360 million upgrade of the Mangere sewage treatment plant... [- a project that will] result in a cost-effective means to deal with wastewater needs... [and its effect on] the Manukau Harbour... into the next century...

Metro Water... will use its income to pay for the upgrading of the city's aged and overloaded drains, a job it inherits from the council. The biggest task is the 30-year separation of the harbour-polluting combined stormwater-foulwater network, at a cost of \$360 million... The company... has[also used its income to] start... posting out to its 120,000 residential and business customers what it calls a "welcome pack" - information on the company, its service aims and promises, and customers' obligations.

...Metrowater is keeping secret the costs of its huge advertising campaign to [explain its customer charges from]... October 1, when the user charge, based on 75[%] of metered water, kick[ed] in... Customers, who... pay[ed] for the advertising... will not be told the costs because of commercial sensitivity... [However,] a city councillor who opposes the water company [said the cost was \$500,000-plus]... FOR years N[Z]ers have taken for granted the amount of water they use, but... [an Auckland] family of four using the average 165 litres of water each day... [is now] paying \$611 a year for water and wastewater... Service charges for residential customers [have dropped] by 50c to a flat fee of \$63 and households... pay 87c per cubic metre of water... ['Unmetered customers pay \$330. There is also a new connection charge of \$495 and a reconnection charge of \$100.' Some companies received] bills for the first three months... which were almost 50[%] of last year's total bill... Businesses are charged \$172 per pipe unit... Most homes have the minimum 20mm diameter pipe (one pipe unit)... A 40mm-diameter pipe... cost[s] businesses \$687, 80mm[pipes] cost \$2749 and a 200mm-diameter... attract[s] a \$17,182 charge... [About 20%] of businesses have... pipes of up to 200mm, which are often not used to full capacity... Customers are able to have a pipe made smaller if it is bigger than necessary. Reducing a 150mm pipe to 50mm... cost[s] \$800 and cut a business charge from \$9664 to \$1074... An Onehunga industrial landlord... [who] owns five factories on a 5ha site... is facing a \$17,640 base charge for water and waste water in 1997-1998, which will increase to \$29,440 the following year... [T]he new costs... were "outlandish" when compared with the tenants' actual water consumption, worth about \$5500 a year... The wastewater user charge for all customers is 95c a cu m... [It has also been announced that] big water users, such as breweries, would soon be able to choose between competing water suppliers, a choice likely to be extended to residential consumers within five years.

...Metrowater... got a roasting last night from councillors outraged at... the expense of the advertising campaign and brochures and the secrecy surrounding the spending... [E]stimates of the cost of the campaign ranged from \$100,000... [However,] Metrowater says its customers will be the winners from a precedent-setting ruling that lets it off the tax hook. [The IRD] has spared... Metrowater... from liability for the 33[%] company tax, because it was set up as a charitable... enterprise.

...A Government decision to abolish tax-free charity status for Metrowater... came under fire from Auckland's deputy mayor... last night. The Treasurer... and the Finance Minister... announced yesterday that from April next year all... LATEs... will have to pay 33[%] tax on money they hand over to their parent councils... Aucklanders will pay more for water if the Government revokes the tax-free status of Metrowater, a city councillor... claimed yesterday... [In related news,] Metrowater... has finally revealed it spent \$269,000 on its heavily criticised... advertising campaign[which] was undertaken after legal advice indicated that "it was important that all ratepayers were introduced to Metrowater and the c[ompany's] charges]." ...The spend-up - which its directors admit was "greater than necessary" - was accompanied by a further bill for \$83,000 for the yellow-covered service standards booklet sent to its 130,000 customers... The contract booklet, which Metrowater accepts is flawed and has agreed to amend, was printed before the company started operating on July 1... Last night... the company's interim chairman... promised an improved customer contract would emerge from discussions with consumer groups... [He] said that the company had been launched under enormous pressure and amid considerable uncertainty, with the council vote unclear until the last minute... [Councillors only] voted... on June 24 to proceed[with the corporatisation of its water services]...

The Consumers' Institute has attacked Metrowater's customer contracts as a one-sided abuse of its monopoly power... Metrowater... denies abusing its position and has defended... its "terms of contract"... The terms, which spell out the company's view of its own and its customers' rights and obligations, have worried some customers. One... in a letter to the N[Z] *Herald* tags the terms "all care, no responsibility." ...The sales and marketing manager for Metrowater... said the contracts were needed since Metrowater operated under the Companies Act, unlike the council

water division it replaced which came under the Local Government Act... Contracts were standard practice for commercial utilities... [M]eters will continue to be read six-monthly, but customers will now be billed quarterly instead of six-monthly with the non-metered bills based on estimates.

...The controversial Metrowater customer contract has come under fire from the Ministry of Consumer Affairs[, whose]... officials are understood to have challenged... the... 21-point contract... in the areas of disputes procedures, including its measures for resolving disputed accounts, its lack of specific details on supply disconnections and its assessment of the extent of its liability... The... company's "cut-off first" option for late-paying... puts the health of its customers at risk, warns the Minister of Consumer Affairs...

Auckland City councillors may pull the plug on... Metrowater... A leading councillor... said... the public outcry... [means] the time was ripe to change the minds of the councillors who had supported water corporatisation... [H]e believes he has the support of the required nine councillors to force a special meeting to dump Metrowater... [Incidentally, r]ed-faced Auckland City officials plan a new public notice to correct a public notice published last Sunday to correct an earlier flawed public notice. A computer has been blamed...

Red-faced Metrowater officials have backed down and apologised to Auckland City water users over the lack of detail in their customer contract... There was more flak... after more than 500 properties found their water costs had tripled because of a computer glitch... Metrowater initially offered credits to fix the problem but has since offered refunds, one of which was nearly \$200.

...A Red Beach resident... [is] unhappy that Rodney District has won renewed permission to dump treated waste in the sea 750m from the main beach at Orewa... The council should have a land disposal system instead of "chucking sewage" into the sea... [The resident, who has lived on the] Hibiscus Coast... for 25 years... said the sea frequently had a bad odour and scum was regularly seen. She had stopped swimming at Red Beach after seeing water discolouration... A council environmental consultant's report says there is no threat to humans from eating shellfish from the area. Contact between swimmers and discharge effluent is effectively prevented by limiting the discharge to night. The council blames water discolouration on the plankton from the oxidation ponds... But the district council[also] says it has been shortchanged by the A[RC] commissioners who made the decision.

...[Hibiscus Coast residents are being asked to sign a petition calling for a byelection to fill the vacancies on the Rodney District Council. But a muted response of about 200 signatures so far was reported yesterday by the petition's organiser, a Whangaparaoa solicitor. He said some people had refused to sign because they wanted an election for all 12 seats on the council. Five councillors and the mayor resigned earlier this year on the assumption that other councillors would follow suit. They intended to clear the way for the Local Government Minister to call prompt elections for all seats. But the seven remaining councillors decided to appoint five people to fill the vacancies. The minister is expected to announce after a cabinet meeting today whether she supports the findings of a ministerial inquiry into the council. The inquiry recommended that the minister appoint a commission of one or more people to run the council until local body elections in October next year.]

...Auckland's "Mr Fixit" has been called in to run the dysfunctional Rodney District Council, which was sacked yesterday by the Minister of Local Government. The management consultant, aged 54, has in his 30 years in local government been Auckland City Council's troubleshooter, but from today he takes the place of Rodney's mayor and 12 councillors. Asked last night how he proposed to take the place of 13 councillors, the commissioner said: "You have to have a good ear for what the community is saying. Councillors are no longer active but the community's voice needs to be heard." He said he aimed to let people have their say by getting a good communications network going. A forum would allow the public to know what was happening in place of the present council meetings. In appointing him as the Rodney commissioner, the minister said she was accepting the "compelling" recommendations of a ministerial inquiry into the council. The cabinet had endorsed the appointment at yesterday's meeting. The commissioner was not a replacement for local democracy, she said. "It is a holding measure until fresh elections can be held by March next year." However, the minister said she would have to introduce legislation next month to stop the process of a planned byelection for the mayoralty and to appoint five council vacancies. The legislation would also enable the council elected next March to have an extended term, instead of needing to be re-elected during the next scheduled triennial body elections in October next year. Rodney's MP, who attended the minister's press conference, said it would support the necessary law change.]

...the appointment of a commissioner in Rodney is a major development for NZ politics, but most of our politicians could be excused if they were more interested in the news that] Wellington has canned the idea of asking people to spend a penny. A city council review of its very private public service, which costs \$660,000 annually, decided user charges would be feasible only in the inner city, but a "major culture change" would be necessary to counter public resistance... [Returning to Auckland,] Manukau residents face a 6.3[%] rates jump following their city council's decision not to set up an Auckland-style water company.

...Residents of the sleepy town of Clevedon want to escape the big city lights of Manukau City for greener pastures... The residents have made a submission to the Papakura District Council requesting a boundary reshuffle. The chairman of the Clevedon East Combined Residents group... said there was no problem with the Manukau City Council management of Clevedon but many... in the town of 3000... found the lower rates of Papakura enticing. "We are the only rural district represented by Manukau. Rural communities tend to be more basic. Such things as roads and drainage are more important to us than things cities focus on,"... The Mayor of Papakura... said [his council] would investigate the possibility of taking in Clevedon... The Mayor of Manukau... said he had heard nothing of the proposal.

...A group of East Auckland home owners, angered by rates rises of up to 48[%], have lashed out at the Manukau City Council and are demanding a better deal. The Cockle Bay and Howick Residents and Ratepayers Association alleges inefficiency in the council and wants a move away from land value-based rates to greater use of flat rates – which hit each property equally – user charges, and rating differentials.

...the residential portion... of the rate levy... is... a selective wealth tax which, of course, raises the issues of equity. It is selective in that two homeowners with the same wealth, but with differently valued properties, will pay different taxes to the local authority.

...Last night the... Manukau City Council... introduced rates differentials for residential properties of less than 1500 sq m. For the portion of a property's land value between \$85,000 and \$300,000, the rates drop to 75[%] of the base value; and above \$300,000, to 60[%]. This will carve hundreds of dollars off the rates of higher valued properties. The majority in the middle and lower range will pay more.

...Owners of plush West Auckland homes have come up trumps with a rates cut of about \$1000... Waitakere City Council cut the rates for exclusive properties by 25[%] to about \$3000 when the rating differentials were changed in favour of expensive properties. The changes follow the High Court's ruling last June that the council was hitting high-value home owners too hard... However, the losers in the deal would be owners of properties of low and mid-value. Rates on homes with the average land value of \$54,000 would rise 7[%]. The... figures might change yet as an increase in one of the items in the rating mix, the \$305 uniform annual general charge, would not be settled until this week. It was expected to rise by \$15. All this while the Waitakere City Council claims a "nil" rates rise... th[is] year... The nil refers only to the council's activities and excludes the effects of rising payments to Watercare Services Ltd, the A[RC] and Auckland Museum. Collectively, these produce a 4.26[%] rates rise.

...Some Auckland City homeowners could find themselves paying an extra \$1100 a year under a phased rates policy to go before a council committee today. An increase in rates – some by as much as 69[%] – for many residential ratepayers seems inevitable after the recent city-wide revaluation showed big increases in property valuations... A smaller number would fall by 20[%]... The rates setting process is also likely to mark the end of a differential enjoyed by inner-city residents. Struck to encourage settlement of the central business district, the rates advantage was designed as a short-term device.

...[a homeowner] says that when his father built the wooden house 75 years ago on the edge of the Waitemata Harbour, people were surprised he wanted to live so far from the city centre. But now the three-bedroom home, with a flat underneath, is in a sought-after area. [The homeowner] and

his wife are upset that as a result of the new annual values[proposed] by the Auckland City Council, the annual rates for their West End Rd home may leap by 49[%], from \$2158 to a possible \$3221... The couple has appealed. "I think the values around here are artificial. The only thing is it's on the seafloor," [he] says... The extra rates will be "quite a lot to find" on the couple's annual income of about \$30,000.

...The [Auckland City C]ouncil's finance committee yesterday approved, narrowly, a rating policy that would burden homeowners with a 5.8[%] average rates rise which, with the general 5.3[%] rise, comes to 11.1[%]... The highest differential, on inner-city businesses, is aimed to rise from its present 118[%] of the benchmark residential rate, to 140[%]... Officers' reports about costly infrastructure investments... led to the move... A final decision on the rating policy will not be made until the outcome of objections to the new valuations is known... There are worries that if this level of [rate] contribution to capital is not achieved, debt will hover too close to \$425 million, the level considered the maximum, in three years. "Ruthless project prioritisation will be necessary," one report says of capital expenditure and major maintenance... The finance committee also supported putting \$15 million a year in the council's bank account from operating income.

...Divided Auckland City councillors will[continue to] grapple with controversial rating issues tonight as the business community gears up to attack central city levies... Ask anyone in business and they will tell you local government expenditure is high and out of control.

...the... Waitakere City... council's \$97 million debt could jump 400[%]... in the next 20 years... if it continues to fund services as it does now.

...Ratepayers across the upper North Island are being left to foot large debt servicing bills as city and district councils go on a borrowing binge. A *NZ Herald* survey found that the indebtedness of the 29 councils in its circulation area is on track to leap by more than 20[%] this financial year – from \$906.1 million... to \$1091.5 million... taking the debt for every man, woman and child in their districts to \$498... The biggest borrower per head of population in the... survey... is the Tauranga District Council at \$1684. A spokesman said a \$14.6 million debt raised on behalf of council-owned company Tauranga Electricity, and a \$20.8 million debt for the toll-generating Tauranga Harbour Bridge and associated roading were two factors pushing up the debt... [Another] reason cited for the borrowing boost is the fundamental change to local body financial management wrought by the Government last year. Councils are now obliged to... spread... the cost of long-life infrastructure across the generations which benefit from them... A spokesman for L[GNZ] predicts that the increasing indebtedness of upper North Island councils will be reflected elsewhere as other councils "realise that they are funding assets that have very, very long lives." [However, the] local government sector's indebtedness is low... at \$11 of assets for every \$1 of debt, compared with a ratio of about 2.5:1 in the private sector and an even lower ratio in central Government.

...North Shore City Council won a legal battle against the upper echelons of central Government yesterday when the High Court ruled that an order-in-council signed by the Governor-General... which would have forced it to reorganise its ward structure and stop community boards hearing resource consents... was invalid... because it should not have been issued until an appeal against the reorganisation was heard before the High Court... next month... The council[had] argued that the reorganisation scheme should not have gone to the Minister of Local Government... who sent it to the Governor-General... [A] North Shore City councillor... said the council was sick of being told what to do by the Local Government Commission, a non-elected body made up of three former local body politicians. "The argument is about whether a democratically elected council that pays its own way can have its powers interfered with by the non-elected Local Government Commission." ...[Meanwhile, b]uilders dodging resource consent payments have created a \$244,000 bad-debt headache for the North Shore City Council. About 20 builders and developers a month skip on payments, forcing council staff to spend 30 hours a week on debt recovery... Half of the bad debts are \$300 or less and another 30[%] owe between \$300 and \$1200... There are about seven court actions in progress, at a cost of up to \$10,000 a case. Applicants give incorrect contact details, on-sell properties and disclaim responsibility for payment or refuse to pay because they object to the decision, charges or processing time. Building consultants sometimes claim to be the applicant but when an invoice is sent the consultant denies any responsibility for payment. Consents are required for developments that are not permitted as of right in the district plan... Non-notified consents cost between \$350 and \$1500 and notified consents range between \$3000 and \$7000, but can be higher depending on complexity... North Shore staff... suggest non-notified consent application deposits increase from \$500 to \$850 and notified applications double to \$4000. This would reduce bad debts and provide refunds in some cases... Deposit charges in Auckland City are \$600 for non-notified and \$4000 for notified consents... Auckland City Council is dealing with consents debts of \$408,000 by withholding the approval until it is paid.

...North Shore City Council is looking to increase its rates take by \$5.1 million, or 6.6[%], for the year... taking the average rates bill... to \$1057... The mayor... said the rise was needed to finance upgrades to core services... But ratepayers could yet be called on to bail out the... North Harbour Stadium. A report was given to councillors yesterday about the new venue... The council... has already contributed \$6.37 million towards the \$41 million stadium and is guarantor for \$12 million of... a \$20 million loan.

...The Government would make a contribution to economic growth if it removed... the monopoly privilege which enables councils to spawn expansive "visionary" projects (such as sports stadiums or land development...) with apparent minimal accountability... There is a place... for local leaders to champion municipal projects but they should be subject directly to the citizenry for the funding consequences... [because there] remains a costly dislocation between the outputs local authorities produce and the means of funding which makes production of those outputs possible.

...Statistics N[Z] yesterday published figures for the first time showing local authorities have increased their revenue from rates, petrol tax, licence fees and fines by more than 19[%] in the past five years... [while an] operating deficit of \$31.5 million in 1993 has been turned into an estimated \$75.7 million surplus... The survey covers all... city, district and regional councils... The total revenue of local government is around 3[%] of... GDP... and last year increased by more than 4[%] – well above the rate of inflation... A policy analyst at L[GNZ]... said... the... present surpluses were no more than was prudent to provide for unforeseen events... [but some local] governments... had, in fact, dropped rates...

With \$64 million in the bank, earning an average interest of \$6 million a year, the Taupo District Council has more money than it knows what to do with. In the past 10 years, the council has built a \$9.6 million cultural centre, a \$5.4 million state-of-the-art sewerage system, its famous Superloo and a \$1 million water reservoir, and developed its sports fields. Work is also under way on a \$9.5 million sports centre and a \$4 million swimming pool redevelopment – all despite a rates discount of \$1 million annually in the past two years.

...Councils around the country might have to make multimillion-dollar refunds to ratepayers if they have interpreted their valuation roll as the Far North District Council has... It had treated each roll entry as a separate rateable property, which resulted in one Kerikeri orchardist paying two annual charges because he sold fruit from a 6 sq m garage and car park at the front of his property... The Valuer-General has told the council it wrongly applied its \$355 uniform annual charge. If that opinion is upheld, the... total... to refund... could be \$1.2 million for the past five years... A council critic... said 338 properties... were affected... [Incidentally, a man who has lived] for five years in Kaipara District Council territory... pays rates on his farm to two district councils and two regional councils... [because last year he] bought an 11ha piece of land from... a... neighbouring farm... that was in Rodney District Council territory... In July when the 1997-1998 rates demand was due, [he] received one for \$1976 from Kaipara... [for the original] 77.5ha... including a levy of \$196.60 from the Northland Regional Council, and one from Rodney for his new piece of land. This demand was for \$698.20, including a levy of \$43.29 from the A[RC].

...a Waikato couple] and 394 other rural landowners have been included within the expanded city boundary of Hamilton... [They] have been told that this will double their rates over the next two years. If the Hamilton City Council adopts proposals in its draft plan, the [couple] will in 1998-99 pay rates of more than \$9000 for the 31ha of their farm now within the city. Nobody lives there and it has no buildings. Across the road, the [couple] live on 54ha in the Waikato District, to whom they pay \$6500 in rates, including charges for three houses.

...Rural residents have failed to convince the Hamilton City Council to rethink a new rating scheme... Councillors yesterday voted 8-4 to approve new rating differentials which will have most of the 400 rural property owners on the city's fringes paying at least 25[%] more this financial year... [S]ome farmers' rates bills[will go] up by 40[%].

...a Hamilton City Council report... says... [refuse] charges for Hamilton ratepayers will go up because of a \$5 million loan to expand and improve the Horotiu landfill...

A Hamilton ratepayers' lobby group has asked the Audit Office to investigate the city council's controversial shift... from the ground floor... to the top floor of its office block... a shift which will cost ratepayers \$325,000... [By the way, t]he controversy over councillors having financial conflicts of interest has spread to include the Mayor of Franklin... He sparked the inquiry that led to the Audit Office's ticking off a Franklin District councillor... for voting on a Pukekohe scheme that may affect the value of her nearby home. But now it appears that [the mayor], too, may have run foul of the rules about councillors voting on issues in which they have a financial interest. Following the Audit Office finding against [the councillor], the mayor sought a ruling on his debating and voting on the council's involvement in upgrading the Pukekohe, Tuakau and Waiuku central business areas... as he owns shops and commercial properties... in... the Pukekohe business district...

Human error put last year's Franklin District Council budget blowout at only a quarter of the \$2.3 million total found by auditors. Before the audit the mayor... said the figures showed the overspending was \$510,000, but... the... audit found some figures had been put in the wrong column...

The Auckland City Council admits that it gave deficient information to community boards during the present budget round. At least three of the city's 11 community boards have criticised the way they were asked to comment on service levels in the city because they were not given any costings for what the council planned to provide in the next financial year. In a report to the council released yesterday, the democracy services manager... says the document... had been prepared during restructuring and was released in draft form. Improved budget documents would be distributed to the boards... [In related news, d]irect marketing gurus, the bane of posties the world over, can now get their hands on more information about you and where you live – thanks to an ombudsman's decision that local councils cannot legally refuse bulk-buying of their rates rolls. The Waitakere City Council last year told[a] real estate agent... that he could not buy their entire rates roll which says who owns what property, its value and what improvements have been made. He appealed to the Ombudsmen's Office... But it may be a hollow victory for... the real estate industry, because the ombudsman and[the] Privacy Commissioner... have joined forces to restrict access to rating rolls. An ombudsman spokesman... said the Rating Powers Act made it clear that rate records must be available to the public... [but the] Act could be changed to include provisions similar to the Dog Control Act, which lays down strict criteria for who can obtain details of dog owners.

...[a ratepayer] wanted to know the cost of developing the... Waitakere City Council... district plan and details of payments to consultants. But the council's manager of social and environmental policy... told... him... that getting the information would cost between \$7144 and \$10,344. The figures were based on an estimated two days of staff time at \$48 an hour, plus two to three weeks' work by a temporary accountant at \$80 an hour. The first half-hour of work would be free of charge, and the research would begin when [he] had sent a \$7000 deposit... [The ratepayer], who battled the council for a year over subdivision of 49ha of land near Bethells Beach... said the cost of the plan so far should have been readily available, and the council was apparently spending ratepayers' money with total disregard to costs. "Bureaucrats are running berserk. Surely they have a ballpark figure...." [In reply, the manager] said the district-plan development began in 1991, so an extensive search of archival records would be needed. Dozens of staff had worked on the plan, hundreds of formal committee meetings had dealt with it and there had been more than 200 different consultant contracts. Further complicating the matter was that studies and systems improvements associated with the plan had also benefited other council services. This made it unfair to attribute all costs to the plan... [However, the] Waitakere chief executive... said[that although] the detailed nature of the request made it time-consuming... a general assessment of the cost would take only a couple of days. "Depending on the level of accuracy of the assessment, we probably wouldn't charge." ...A spokesperson for L[GNZ]... said the costs did not sound unreasonable... "I suppose in a user-pays world they are quite within their rights..." ...but she thought it unusual that... the information... was not readily available... [Incidentally, t]he... Auckland City... council this week finally settled on its complex rates structure for [next year], with an average 4.4[%] rise. But... the... Auckland Regional Chamber of Commerce is threatening legal action after the city council radically raised commercial rating differentials... The inner-city business differential has increased... to 245[%]... above the benchmark residential rate in the dollar of property value... The chief executive of the chamber... said the move was "fatally flawed" and predicted that all but big business would be priced out of the central city... Auckland could ultimately end up a "soulless city" dominated by the banking industry, like Frankfurt in Germany... [and the] council had wrongly assumed that property values meant that the commercial sector could afford to pay higher rates compared with residential sectors... The council also voted to slow its move to near-market rentals for the tenants of its remaining non-pensioner houses and flats.

...A spokesman for rest-homes says old people could be out on the street if rates rises being considered for Auckland rest-homes and geriatric hospitals go ahead. The city council is looking at reclassifying the 85 private-sector rest-homes and geriatric hospitals in the city from residential to commercial. This would more than double their rates in the suburbs and triple them in the inner-city... A finance committee member... said some rest-homes were making "huge profits" and ought to be rated as businesses. Another member... said that because people lived there, rest-homes were residential. The Northern Regional Health Authority says the rate increases could lead to higher fees, waiting lists and declining standards. There would be no more Government money, only a reshuffle of where it went. An authority spokeswoman... said half the 4000 people in Auckland rest-homes and geriatric hospitals received a Government subsidy. She disagreed that people would be out on the street because "something would be done." ...The 34 [rest-homes and geriatric hospitals] run by charitable groups are not affected because they are non-rateable.

...Auckland City Council boosted its average rates rise... yesterday. The council meeting was meant to confirm the 4.4[%] rise, but after rejecting amendments proposing rises of 6.1... and 5.25... councillors approved 5[%]. The actual rate rises for individual properties will vary... However, it was revealed at yesterday's meeting that [the rise] was significantly lower than intended, because of greater-than-expected development in the city. Council accountants were banking on growth producing an extra \$3.8 million in rates. But when calculating the level of rates in the dollar of property value late last month, it was found to have more than doubled to \$7.9 million... The 5[%] rise will reap \$285.2 million in rates, restoring the budget to the \$1.2 million surplus flagged in the annual plan.

...[universities, schools and hospitals will no longer get rates relief under a proposed Auckland City Council policy. Ports of Auckland and Tranz Rail will also have to pay rates to the council. The city's finance and property committee yesterday endorsed the plan to seek a law change enabling the council to collect a net \$10 million in rates from groups which have been exempt or have had a rates remission. Some of the money would be channelled into providing financial support for organisations, but the council would decide whom it helped and in what form – for instance a loan, grant, or special rates differential. The committee voted to exempt religious organisations and charitable groups, which already get rates breaks. The council's strategic aim is for central government services and SOEs not to be "subsidised by ratepayers." "These organisations are supposed to pay their true operating costs," says the report.

...the attempt by the Auckland City Council to charge schools full rates was a blatant attempt to "milk easy money" from the state system, the School Trustees Association said yesterday. The association's president said schools had spent the past five years fighting such moves, which contravened the principle of free education. "People who sent their children to school are already taxpayers and ratepayers and they already pay plenty for education. The Auckland City Council obviously look upon parents and schools as a soft touch and expect them to pay up without a whimper." She said schools were

being used by both local and central Government to try to “score” against each other. “The Government expects schools to lobby against increased rating while local authorities expect schools to lobby for more money from the Government.”]

...For the second time in almost two years, the High Court has ruled that the Auckland City Council can charge business rates for Telecom's 1400km of telephone lines and 700 phone booths. The council has hailed the ruling... which Telecom said yesterday it was considering appealing. It will not say if it will increase the cost of phone calls if it loses. If other councils follow suit, Telecom could be levied for 4000 phone booths, and many thousands more kilometres of phone lines, throughout the country. The council finance director... said Telecom owed about \$3 million in rates on utilities which it had refused to pay since 1991. Telecom was charged a rental rate based on the commercial return of each phone box and phone line. In 1993-1994, it was charged \$412,048. As a result of the ruling... the council planned to levy rates on all other utilities not at present charged for – such as postboxes, communications cables, gas lines and stormwater drains. “This opens the way for us to charge everyone. We need to be consistent and treat other utilities the same,”... NZ Post's letters manager for Auckland, said NZ Post had been watching the case with “interest.” It feared rates might be charged against the city's 1000 mail boxes and might have to review some if that happened... The L[GNZ] policy analyst... said the ruling was “a rating victory” for local government.

...LOCAL authorities say they are losing millions of dollars a year because central government has exempted itself from paying rates on much of its land and property. The councils are calling for an urgent law change to force the Government to pay its way... Key Crown-owned land exempt from general rating under the Rating Powers Act includes central government buildings... Crown Health Enterprises and Department of Conservation[(DoC)] land. Trans Rail is exempt from paying rates on its 3913km of track and its loading and unloading platforms. Some parts of ports and airports are also exempt... Local Government N[Z]... said non-rateability of government land and property was one of the most important issues facing local bodies. It was a matter of equity and transparency... Tens of millions of dollars a year was at stake... [The] LGNZ chief executive [said,] “[Central government's philosophy is that the costs should fall where they lie, that people should not be cross-subsidising other people's costs... but they are not applying it [to central government]... They have to admit they are not paying their way.” [However, if central government was to pay its own way, that way would come through higher taxation or lower central government spending across the entire country – and taxpayers living in districts where the central government rate levy is low would be subsidising ratepayers in districts where it is high]... Wellington City Council... said there were around 500 properties in Wellington that were non-rateable, including Parliament buildings and the Governor-General's residence. The properties had a combined capital value of \$1298 million and the council is collecting just \$900,000 in sewerage charges from them... If full residential rates were charged, the council would gain \$4.4 million and if commercial rates were charged that would rise to \$12 million... Tertiary institutions now occupied prime commercial land in the central city, but weren't paying any general rates, while other commercial ratepayers were coughing up large amounts... [The] Chairman of WCC finance and corporate services... said: “It's no good trying to obscure the issue by pretending there's not a major cost to running the Government, when in fact it's local government that is paying the costs.” ...South Island councils with large areas of DoC land have been calling for the changes for years. DoC land makes up nearly 90% of land in Westland and Buller districts. The mayors of these councils... say when DoC took over the land, the milling industry in the area was severely affected and because the land has been made reserve there's little scope for new industrial development. [The] Westland Mayor... says the land was reserved for the benefit of the nation, but the locals, not the nation, were paying... [In international news,] [the Microsoft Corp co-founder... and [his wife] have decided not to contest an assessment that will see them paying more than \$US600,000... in annual rates on their lakefront mansion. [The couple], who spent the past seven years building[the] 3600 sq m house... questioned the county tax appraisal which valued the home at \$US53.4 million[(although, if they were concerned about rates, they could've built elsewhere in the country – ‘in 1990, property tax rates varied from the highest level of \$4.40 per \$100 in Detroit, Michigan, to the lowest rate of \$0.48/\$100 in Honolulu, Hawaii’)]. The county had determined the value based on construction costs for the home[, which]... features an 18m pool, a sauna, a 150 sq m guest house, a trampoline room, a 20-seat theatre, a dock for water skiing, two spas, and a reception hall for 100... The county's highest assessment was on his Microsoft... [partner,] whose property was valued at \$US60.2 million. - 1997

It is approaching midnight in the suburban heart of Silicon Valley, and all is quiet aboard the number 22 bus. This is the service that never stops, plying the length of the valley from Menlo Park to San Jose all night long. For a hard core of its passengers, it is also the closest thing they have to home. Some are the traditional sorts of homeless: the drug addicts, the mentally ill, the social dropouts. One woman dresses as a nun but spews an endless stream of obscenities... But some are just ordinary folks with jobs – cleaners, restaurant bus boys or shop assistants – who have no idea how to put a roof over their heads in the monstrously affluent epicentre of the U[S] high-tech revolution. With house prices raging out of control, they have little choice but to haul their most immediate belongings aboard the number 22, enjoy the relief from the wet and the cold, and try to get a little shut-eye before embarking on working days that can last up to 16 hours. “These are people earning anywhere from \$US15,000 to \$US50,000 a year, and it still isn't enough to make ends meet,” says the bus driver... who himself endures a daily 80km commute because he can't afford to live closer to his work. He calls his bus the “rolling hotel.” This is not the Silicon Valley politicians like to boast about... They would prefer simply to see an unalloyed success story of tech companies and dot-com Internet enterprises popping up in thick clusters and driving the economic boom that has sustained the [42nd President's] era and will, they hope, last several years longer. But if Silicon Valley is a symbol of American economic dynamism on the threshold of the digital age, with its rivers of stock options and venture capital funds and its estimated 63 new millionaires created each day, it is also a graphic illustration of the price such success forces a community to pay. For the 70[%] or so of Valley residents who are not lucky enough to be in high-paying technology or professional jobs, life is turning into a nightmare. Salaries that would make them middle-class in any ordinary setting put them on the verge of poverty. Jobs are often temporary or part-time, stripped of benefits, and prone to being terminated at any time... According to Working Partnerships, a community group dedicated to improving the lot of ordinary workers in Silicon Valley, up to 40[%] of the workforce is employed on a temporary or contract basis – more than double the national average. Around 20[%] of jobs do not pay enough to allow a single person to be self-sufficient. Around 40[%] of the jobs do not cover the needs of an adult with one child, and around 55[%] are too low-paid to keep a family of four out of poverty... Cold economic logic – more ruthless here than in any other part of the country – has pushed living costs into the stratosphere, triggered suburban sprawl without adequate planning or infrastructure and created vast social and economic disparities between the elite and the rest. There are neighbourhoods in the ritzier parts of Palo Alto and Mountain View where it is impossible to find family practitioners because doctors can't maintain a decent lifestyle there. On Sand Hill Rd in Menlo Park, once a stretch of pleasant suburban housing and now the venture capitalists' Main St, there are no restaurants or shops or cafes because no trader could afford the rent. Even Stanford University, one of the most prominent institutions in the area, is having trouble attracting staff in non-technological faculties because there is nowhere decent to live on an English or history professor's salary. The housing market has become so heated that a modest three-bedroom home in Menlo Park recently went for more than \$US1 million over the asking price. One venture capitalist offered almost \$US4 million in cash for a Palo Alto house, sight unseen, handing over the money before the house hit the market... [A] small home costs \$US1 million... “It's beyond crazy. It's madness,” said[a] local real estate agent... [The people who are] just short of the desperation of the night riders on the 22 bus... are... sleeping in their cars all over the valley, or[in] single housing units in San Jose shared between five or six families.

Before NZ changed its currency to dollars in 1967, an average family home in Auckland sold for about ‘£5000 (\$10,000), a stately home only 50 yards from the Takapuna water's edge sold for £17,000 and an executive home on the city side sold for £21,000.’

Auckland residential property was an outstanding investment in the June half-year, with the average sale price jumping 14[%]... to \$262,000. In contrast, the average price for Wellington rose by 4.8[%]... to \$179,500... according to Valuation New Zealand. Its figures show that N[Z]ers spent \$7.72 billion to buy 43,655 residences in the first half of the year. That was up 26.7[%] from the preceding six months. By local authority, the best performer... was Waitakere City. The average sale price there increased by 14.8[%] to \$200,500. This was followed by Auckland City, where a 14.5[%] surge lifted the average price to \$320,000... Within Auckland City, the best median price[gain was] in St John's South – up 42[%]... The most active [suburbs were] Forrest Hill-Sunnynook[on the North Shore] – 366 sales – followed by... Avondale-Waterview[in Auckland City], where there were 323 sales... The most expensive suburbs were Herne Bay[in Auckland City] at \$550,000 and... Takapuna-Milford coastal... [on] the North Shore... at \$529,500... The... cheapest... suburb[in Auckland] was... Otara-East Tamaki (\$103,000).

...Blocks of 4ha... on the 146ha Hauraki Gulf island... Rakino... which sold five years ago for about \$150,000 are now selling for nearly \$300,000... which, while cheap by Auckland standards, are records on Rakino... [A r]eal estate agent... said many of the sales were to people from... nearby... Waiheke who thought th[at] island had been spoiled by an influx of Aucklanders... Rakino is not serviced by high-speed ferry and the journey by[a standard-speed ferry or] boat to downtown Auckland takes nearly two hours... [In related news, t]he Rodney District Council is planning hefty increases in the charges developers pay to subdivide land. The cost of a change to the district plan for an average residential site on the Hibiscus Coast, valued at just over \$100,000, would rise from around \$8000 to \$16,000. A \$60,000 site in the Kaipara Harbour town of Helensville, which is on the verge of a development boom, would incur a charge of around \$15,000. The charges, called financial contributions, are levied to cover the capital cost of community assets that have to be provided, upgraded or extended as a result of new developments. These include roads, sewerage, water supplies, stormwater systems and reserve purchases. The Mayor of Rodney... said the increases “weren’t a matter of getting tough [with developers] but of being realistic.” The area was no longer a holiday resort but is one of the fastest-growing regions in the country. “The community costs don’t finish at the edge of the street.” ...He did not think that the move would put a brake on development... But one developer... said the additional costs could have a dramatic effect on the profitability of subdivisions with section values at the lower end of the market. The people affected would be either the original landowners, who would be forced to accept lower prices, or the section buyer, who would pay more... [However, the developer] was still planning to continue with a 250-lot development in Helensville despite the increases.

...Some Tauranga property developers are upset that local Maori are demanding fees for subdivision consents and keeping them waiting weeks for consultation. Frustrated at long delays for approvals, the developers have taken their concerns to the Mayor of Tauranga... and want the district council to take responsibility for consultation with iwi under the Resource Management Act.

...A report prepared for the Reserve Bank has blamed Auckland councils for driving up housing costs through heavy-handed use of the Resource Management Act. But the bank has been accused of trying to deflect the blame for high interest rates on to the councils.

...immigration has generated 49[%] of the increase in Auckland house prices since 1993... says an Auckland University study... Job growth – including N[Z]ers moving to jobs in Auckland – is responsible for 40[%], and higher wages for 11[%]. The study also warns that the Auckland housing boom has been exaggerated. It claims true house prices for the whole region – rather than the “fast movers” in central and eastern suburbs – have risen by only 27[%] since 1993. The... study tracked 45,000 “repeat sales” – more than one sale of the same house – to see the real change in house prices over time. Houses with renovations were excluded from the study... The figures support a popular theory that Auckland house prices have eased this year because Asian immigration has been cut to a trickle by tighter entry criteria. An Auckland City Council study estimated that Asian immigrants spent \$2 billion on Auckland houses during 1995... Auckland house prices affect the national economy because they are regarded as the leading cause of inflation, which is prompting the Reserve Bank to keep interest rates high... Last week the Governor of the Reserve Bank... said any fall in interest rates would depend on a 4... to 5[%] drop in house prices by the end of the year, leading to lower inflation in 1997. “If this assumption proves incorrect, monetary conditions might have to be firmer than otherwise. We will be keen to resist any movements in mortgage rates that might reignite house price inflation.” Housing made up 1.3[%] of the 2.3[%] rise in underlying inflation in the latest June year... [By the way, a] new house weighing 14 tonnes was lifted from Aotea Square early yesterday in preparation for its move this morning to Otara to become a home for [a low-income] family... The house will cost them \$70,000, interest free, over 20 years... The wooden house was built in less than a week in a partnership between Habitat for Humanity, a non-profit organisation providing housing to the needy, and 120 University of Auckland planning students... [The family], who... were picked from 80 applicants to be the owners... as part of a campaign highlighting housing needs... are required to put in 500 hours of “sweat equity” building other houses but... “They have already completed their 500 hours and are still helping.” ...The N[Z] Housing Network calls today “national housing day” and says that Auckland is not far from having a permanent homeless community.

...[50%] of Auckland City Council tenants live near the poverty line, according to a report by University of Auckland planning department lecturers... [T]he report painted a distressing picture of tenants trying to pay market rents. The report comes on the eve of the council's expected confirmation tonight of the sale of 604 rental homes... The... report says the sale has the potential to destroy stable communities such as Freemans Bay, where hundreds of tenants face the task of finding a new home... [T]he inner-city location of most flats helped tenants financially by being close to work, education and health services... [L]ocation was important when people were trying to break out of poverty. If tenants had to move, transport costs would cancel out cheaper rents... The report measured poverty using methods developed by the N[Z] Poverty project team in a 1995 study funded by the Foundation for Research, Science and Technology. These analyse a household's income after housing costs have been met... It found that... [t]he elderly were the worst affected by housing pressures... About [8] out of 10 households with two or more children were below the poverty threshold... 65[%] of households had... income of \$300 a week... 35[%] had an income of below \$178.11 (an invalid's benefit)... 5[%]... had an income greater than \$750 a week... The... [c]ouncil yesterday declined to comment on the report... Following is a sample of tenants' responses to the proposed sale of their inner-city... houses: “...In September my rent went up to \$165. My weekly 55+ benefit is \$218 including the accommodation allowance.” ...“We are in a no-win situation – not enough money coming in for a mortgage and can't save anything because of the rent increases.” ...“Having to move would affect me very little. I own my own home in Freemans Bay and will return to it. I'm lucky!” ...“To move from the area would cause havoc for my parents for they don't speak English. The familiarity of Freemans Bay helps them to survive and be happy...”

...The letter was intended to touch the heart. And it did. [The 9]-year-old Israeli-born... son of a soldier, wrote to Auckland City councillors: “I go to Freemans Bay School and I love Freemans Bay. I got so upset when Mum came home saying that they MIGHT sell the flats... I want to stay there and get taught by my teacher. I love my school and house & my park [Western Park]... PLEASE DON'T SELL THE FLATS.” A tender plea, as notes from children can be. But as US President Woodrow Wilson once observed: “We are all caught in a general economic system which is heartless.” That observation seems truer now than ever. The universal movement from regulated national economics to a deregulated global one, backed by governments run on the premise that less is more, has created a world that is increasingly individualised and selfish. [The boy]'s letter was moving, but it was futile. Since June this year, when Auckland City voted 13-9, with one abstention and two absentees, to sell 604 of its 679 non-pensioner houses and flats, an outraged and anxious ad hoc Tenants Action Group based in Freemans Bay, where most people affected by the decision live, has fought the council in vain. Indignation over the decision to sell was made greater by the fact that the council simply ignored overwhelming public opposition. Of 104 submissions examined by *Metro*, 99 opposed the sale. That did not include 5000 signatures on a petition beseeching the council not to sell... The selling of the council's houses and flats has been called “immoral”, as if morality is a factor in the politics of

the bottom line. It is not. Money is not a morality play, and no matter how loud people scream, nothing will change the fact that decisions today are made on the basis that if the numbers don't stack up, nothing else does. In the case of the council's non-pensioner houses and flats the numbers don't stack up. They don't stack up with pensioner housing either, but, says one source, the council is leaving the sale of pensioner housing for another time... In a fax to *Metro*, [the mayor] wrote: "Under present rentals, the return on the very considerable investment is only 3.38[%]. Even with rental increases to be phased in over the next 12 months, the rate of return would still not be satisfactory." ...[the mayor] told the *Herald* that, given the council's investment in its houses and flats ought to represent a return of [9%] on the... asset, the council is arguably *losing* money... These are notably pecuniary times. Business is booming and economics, not sociology, guides both public and private decision making. People generally, not just Auckland City or central government, are less inclined to be loose with money. Money is more important than social responsibility. Greed is cool, productive efficiency and competitiveness is more valued than social stability, and history – where we've come from as it relates to where we're going – is worth little... [MPs] from the Alliance... and... Labour, the Tenants Action Group, church groups, trade unions and others, the amorphous left, have been fighting the politics of the bottom line for a long time. In the case of the sale of the council's houses and flats, they remind us that this issue is not just a passing altercation in Freemans Bay, not just a spat between some people and the council. It's a battle which epitomises the issue that has divided this country ever since it divided [the 1984 Labour P]M... David Lange from his finance minister...

60 Auckland City Council tenants and supporters braved the rain yesterday... to protest against the sale of 40 council-owned units. A... Whitson Tce block... tenant... said a rent rise last month... from \$260 to \$312 [per week]... and news that the flats would be sold had brought uncertainty for his family... of six... [T]he family's resolve to stay in the inner city to be close to their church and friends will be tested by the shortage of affordable housing... The Whitson Tce flats are the first properties of a \$25 million package due to be sold this year... The council decided to sell almost all of its non-pensioner housing, valued at about \$60 m... because it was not a "core business" and was the responsibility of the central Government.

...One in three N[Z]ers eligible for the accommodation supplement is not receiving it, according to a research report released by the Government yesterday. The Labour social welfare spokeswoman... said the figures in the report, requested by Labour months ago, showed the Government had willfully neglected its responsibility to inform low-income people of benefits they were entitled to... A total of 31[%] of non-beneficiary renters used the supplement, while the take-up rate for superannuitant home-owners was 15[%], and non-beneficiary home-owners just 4[%]. "The survey's findings are an absolute disgrace," [the spokeswoman said. "81%] of non-beneficiaries who are on such low incomes that they qualify do not get it. [45%] of superannuitants who are eligible – or around 18,000 older N[Z]ers – do not get it." ...She said questions had to be asked of the Income Support Service which was obviously not informing people of their entitlements. "Even a fifth of non-superannuitant beneficiaries who would regularly report to Income Support are not aware of their entitlement,"... The ministers... of Housing... and... Social Welfare... said that the small take-up could be explained by several reasons, including faulty data which overstated the number of eligible people. In addition, some eligible people might have discovered the amount they were entitled to was so small it was not worth applying.

...The Minister of Housing... is under attack for appearing to condone overcrowding in state houses as a way of paying the rent... In answer to a parliamentary question, [he] said rents were recorded against properties rather than tenants, "therefore do not take into account the number of occupants in a property able to contribute towards the rent..." Nor did... figures take into account financial help paid by the Government... The Leader of the Opposition... said doubling up was becoming more common... "The accommodation supplement never makes up the difference," she said... "The minister's statement concedes that the market-rent policies of this Government are so onerous that people are having to accept overcrowding and multiple stack-ups in individual tenancies as a means of putting a roof over their heads," [the] ...Alliance housing spokeswoman... said... But... [the] minister strongly denied[their] claims... "The statement was referring to boarders. In many cases sons and daughters may be eligible for the accommodation benefit in their own right." Of the 270,000 people receiving the accommodation supplement, just over 67,500 were boarders... [However,] a Housing Lobby spokeswoman... said tenants received an extra \$15 a week from the supplement, but faced rent increases of up to \$70 a week. She said she had written to the minister demanding that he put a freeze on the round of rent rises. "The supplement goes up and so do the rents. It's a vicious circle,"... The explanation means little to one family who have been doubling up with relatives in a Mt Roskill state house since last year... [A]t one point 12 people from two families were living in the house, with two teenage boys sleeping in the cellar. The... [boys] now boarded with another family... [T]hree teenage daughter's have also moved... To give the family space [the daughters] now live in a damp, rented caravan outside the house... Their mother said the girls' health had suffered in the cold conditions and they found it impossible to study for school. [She] is also worried about their safety... The family could not afford exorbitant rents charged by private landlords and were still waiting for a state house [of their own – something the mother] cannot understand. "I know there are houses around because there are three empty in this street." ...A spokesman for Housing New Zealand[(HNZ)] said there were many reasons for state houses standing empty. "Just because a house is empty doesn't mean it matches these people's requirements." ...[However, the mother said: "HNZ]... is selling all the houses..."

...A Mt Roskill family of six living in a two-bedroom [HNZ] unit have been told they will have to wait a year for a bigger house... [The mother] said, she would need that long to save for the higher rent. The family face a rent rise of between \$80 and \$100 a week for the extra bedroom... Housing lobbyists say the family are the victims of a company push to sell sought-after state houses despite growing waiting lists... The family are among 10,115 Aucklanders on state-house waiting lists, 86[%] of whom have requested two- or three-bedroom houses... The average wait for two-bedroom houses was 164 days... Those who needed three bedrooms faced a 170-day wait. [In comparison, there is a '34-day wait for a bedsit or one-bedroom flat, and a 26-day wait for a four-bedroom house.' A]... spokeswoman for the Housing Lobby, said... would-be tenants on the waiting list had resorted to living in garages. A tidy three-bedroom state house in Pakuranga, which had been empty since February, was on the market for \$210,000... "Why didn't they put someone in there?" A spokesman for [HNZ]... said the house was being sold because it was worth too much... [HNZ] is only selling houses that are old or uneconomic to maintain and, therefore, not wanted by tenants... The company could build or buy more than one house in a cheaper area, and charge more affordable rents for them... [HNZ] earned \$73 million in the last financial year from the sale of 515 state houses in Auckland... Figures... show that 87[%] of the... houses sold... had two or three bedrooms... It bought or built just 87 new properties in Auckland in the year to May, but leased another 597 houses from private landlords.

...An Auckland state house[was] sold to a... [former] *Shortland Street*... star for \$398,000 – \$100,000 more than the tenant paid six days earlier. Sale documents... show [HNZ] sold the house at 127 Kohimarama Rd to the tenant for \$297,500... In another case made public yesterday, a retired tenant... paid [HNZ] \$154,000 for the house he was renting... The tenant next door... bought her house from the company a week later... and sold it to [her retired neighbour's] son... for \$193,000[making]... \$17,000 profit, minus legal fees... The two houses fetched a total of \$435,000 when they were sold to a builder... and shifted to Whakatane... later that month... Three new houses being built on the site are on the market for a total of \$1.2 million... The Minister of Housing... has acknowledged that the Home Buy scheme for sales to tenants was being exploited for profit... [He] said steps had already been initiated to tighten up the scheme, including a review of the panel of valuers[, and]... was also considering a buy-back clause, or some alternative, in agreements for sale and purchase, where it was believed there was a prospect of later on-sale. He called for a report last week after it was revealed that a tenant in Hillsborough made \$56,000 from the quick sale of the state house she had bought through the home-buy scheme. He found there had been 15 cases of on-sales so far out of a total of 1004 sales.

...HOMES and... mortgage subsidiary Residential Mortgages Ltd... [has] consistently denied allegations of improper conduct with regard to the value of... [its homes since the] Labour housing spokesman... first raised allegations of misconduct in Parliament on May 29... [RML] responded... on June 17: "We totally refute the general and wide-sweeping allegations... The issue of new house prices and subsequent values is very complex.

Any proper debate can only occur with a full understanding of the circumstances of each property.” ...In response to... questions, [RML’s] corporate affairs manager... said a study commissioned by the Real Estate Research Unit at Auckland University[showed] property values are cyclical and volatile. “...It is worth noting that in the late 1980s RML was leading the way in terms of providing finance to people with low deposits. This brought home ownership within the reach of many people who were traditionally excluded... While it is true some people have experienced a loss in the value of their properties... no claims of over-valuation had ever been proved against [RML.” He also said RML]... could not accept responsibility for mistakes made by independent valuers... Two weeks later [RML issued] its first press release announcing it was setting up an in-house mediation process to deal with customer complaints... [RML’s managing director said:] “If there has been any transgression at a local level of the company, or by any independent valuers engaged by the company, then we would be as concerned as you... If customers have been disadvantaged by improper conduct by any of the 37 valuation firms engaged to value properties... we... will... seek the co-operation of those firms to join the [mediation] process.”

...They’re hard-working, honest, decent N[Zers who]... may never write a cheque again... but they’re not unique, just another struggling young couple who lost everything in a house that [Challenge] Homes built... Like other owners they’re bitter, confused and angry. What was to have been their life’s foundation has crumbled... They bought one of two... show homes under construction in the Auckland suburb of Howick in 1989... attracted by the promise of little or no deposit, interest-only loans and a company with a blue-chip reputation for building quality budget homes. [The couple] secured their home with a \$1000 holding deposit while their house was completed. The asking price was... \$38,000 for the section and \$127,000 for the house. A further \$7000 in loan-establishment fees, insurances, valuation and a Housing Corporation building guarantee gave a total contract price of \$172,143. [Challenge] Homes, through its subsidiary mortgage company... RML... offered to lend them \$155,883 subject to a valuation for mortgage purposes[, which the couple]... were never given a copy of... even though they paid for it... and their mortgage had been approved... The valuation... said the property was adequate security for a mortgage not exceeding \$112,000. Despite the valuer’s advice, RML loaned... [the couple] a first mortgage of \$147,900 and a second mortgage of \$7983. [The couple] also paid a \$16,000 cash deposit. As advertised, RML agreed to charge interest-only of 12.5[%] for 12 months on their first mortgage and 17.5[%] on the second. Monthly repayments on both mortgages worked out at \$1741.16... They had no difficulty meeting payments in their first year and even managed to carpet and curtain their new home. A year later RML increased their first mortgage interest to 16.25[%], increasing monthly payments to \$2233.56. [The couple] struggled, falling into arrears after several months... [The husband] visited RML... seeking relief from penalty charges while he looked for a second job. RML refused, charging \$600 for every missed mortgage payment on its due date. The situation was getting out of hand. RML then wrote giving two months’ notice of a mortgagee sale. [The couple] immediately put their home on the market but were told by estate agents it was only worth \$125,000. They were horrified. They had spent thousands on improvements and expected some capital gain in the previous two years. The house eventually sold for \$127,000... [The couple] paid the entire proceeds of the sale, less the agent’s commission, to RML and moved into a flat. They had lost everything – their initial \$16,000 deposit, the \$37,599 they had paid off in mortgage principal, and the thousands poured into improvements. They were destitute. [They] never heard another word from RML or [Challenge] Homes but on October 19, 1992, received a demand from [a debt collection agency] on behalf of the Housing Corporation claiming \$52,096[, which was]... what RML had claimed under... [the] mortgage guarantee scheme as the amount outstanding on [their] mortgage. How RML arrived at the figure bewilders [the couple but]... there was no way they could meet the corporation’s demands and [the husband] was advised by his solicitor to file for bankruptcy. [The debt collectors then pursued the wife] and she, too, filed for bankruptcy four months later... Wellington solicitors representing [Challenge] Homes owners say they have 280 cases from around the country alleging over-valuations. [Challenge] has agreed, as part of an out-of-court settlement with the Commerce Commission, to review more than 560 individual cases... The commission had filed a High Court action in Christchurch alleging [Challenge Homes, RML], and Christchurch valuers... had breached the Fair Trading Act.

...As bargains go it is hard to beat the \$US22.50... a year rent which the U[S] Department pays for its ambassador’s residence in Russia... Not surprisingly, Russian authorities want more money, and have opened negotiations with embassy officials. The... Russian Government suggested a more realistic rental of \$US60,000 a year... [In local news, t]he number of disputes before the Tenancy Tribunal has jumped from 9455 in 1990 to 17,304 last year, and is expected to rise 147[%] by the year 2005, says a report ...[from the NZ] Judiciary. The national manager of Tenancy Services... says that the best explanation for the increase was better education and an awareness of the service. People were more aware of their rights and obligations, she said. About 72[%] of applications made to the service initially went to mediation. Many were resolved without needing to go to the tribunal. Last year the service received more than 400,000 calls for advice nationally... According to Tenancy Services, in the year ended June 1995, about 87[%] of applications to the tribunal were by landlords. Of those, about 59[%] were for recovery of rent arrears or termination of tenancy for rent arrears... A member of the Housing Network secretariat... said that more people were buying rental property as investments, while others were unable to afford their own houses and were forced to rent... “I think the trend in housing policy has had a real influence... People moving from state houses to private rental...” The widening gap between rich and poor would see more cases of people struggling to meet rent payments. [She] said there needed to be an education package offered by the Property Investors Association on the responsibilities of being a landlord... She said that many did not understand the Residency Tenancy Act... She wanted to see landlords foot part of the bill for running the Tenancy Tribunal. “It’s the tenants who pay for the service but the landlords who benefit from it... I think they use it more frequently because they don’t have to pay for it,” she said.

...A High Court ruling in favour of H[NZ] is a bitter blow for an elderly Onehunga woman. She now faces a \$4000 rent-arrears bill... [The] 75-year-old holder of the Queen’s Service Medal, took [HNZ] and the Government to court to seek a judicial review of the market rent policy... [She] claimed to the court that the rent rises breached N[Z] law and international conventions. But the judgement... this week found for the defendants – [HNZ] and the shareholding ministers. [However,] it also said there was little doubt she and others had been... adversely affected by the move to market rents. [The pensioner] says she cannot understand how hardship can be acknowledged but the claim dismissed. “I never thought a government would be so bloody-minded to make old people suffer as they are making them.” ...The decision rejecting her claims affects 140 other current and former state house tenants who... went on[a] rent strike three years ago, refusing to pay the increases which would bring them in line with market rent. [‘State house rents used to be set at 25% of the tenant’s income.’ The 75-year-old] and her 83-year-old husband... have lived in their now shabby two-bedroom state home for 49 years. She said yesterday that she could not afford to pay the arrears or the market rate and the couple would stay until evicted... A [HNZ] spokesman said the company was pleased with the result. “When you are under attack from a lot of sources from time to time, it’s nice to know the court has supported the company’s actions.” The Minister of Housing... said: “I am naturally pleased to have the court confirm the Government’s position.” - 1996

[The 75-year-old rent strike pensioner] is ready to barricade herself... and her 83-year-old husband... in her house whenever H[NZ comes knocking for]... about \$4000... She has the hammer, nails and wood on standby. “I’m not going to move out,” she says. “Everyone thinks I’m a stupid old woman but I honestly feel someone has to take a stand, somehow.” She and about 20 others have been paying only 25 per cent of their income since the move towards market rents, but in November [last year] she lost a claim in the High Court at Auckland for a judicial review of the... policy. H[NZ] can now move to retrieve the money but confusion appears to reign over what will happen... [HNZ] says that they have not evicted anyone in Auckland in a year... The State Housing Coalition is preparing to occupy the houses of anyone evicted. “There is going to be a very heavy

political stand-off over this... We are going to use everything we can to mobilise mass public support for these families... If it means we've got to occupy houses and be arrested for defending little old ladies and... children, that's what we will do." ...[Incidentally, t]he Children, Young Persons and Their Families Service expects to raise about \$9 million from selling 55 surplus family homes, the Minister of Social Welfare... confirmed yesterday... [T]he homes were not at present being used by the service... The service would put the funds raised towards the cost of setting up secure residential units for young people in Auckland and Christchurch.

...A woman who has cared for neglected and abused young people for decades says a crippling Auckland City Council rent rise could force them under bridges and into despair... Four other Auckland community houses are also facing huge rises as the council moves towards market rents and sale of housing stock. It is also reducing subsidies to community houses... The Ponsonby council house... has been a haven for thousands of young people over the past 20 years. Its future now hangs in the balance... With the subsidy... the rent on the... property was \$186. In May it spirals to \$618... [A] former deputy mayor and now chairman of the[council's] promotions committee, said that although charitable groups had received letters notifying them of rent rises, they should write seeking a special arrangement. Applications would be carefully considered.

...A Ponsonby woman's rent rise from her landlord, the Auckland City Council, will use up her entire pension and then some... She has lived in the three-bedroom house for nine years but faces moving because her hardship subsidy from the council will be scrapped[meaning a weekly rent]... rise from \$198 to \$380... The size of the rent increases has shocked tenants already waiting for their homes to be sold by the council. It... delayed putting the rents up until... this month to take account of the recent city property valuations... [W]ithin the past month the council had told many tenants they could buy their homes [while knowing] they could not afford them, and then the offer had been followed by rent increases... The rent increase represented more than \$1 million in revenue and the council had made a financial decision. Properties, especially those near the inner city, were worth a lot of money; sometimes single people were living in houses worth \$400 to \$500 a week in rental... [A dissenting] councillor... said the increases made a "complete mockery" out of the tenure protection offered to pensioners, tenants of more than seven years and those whose Freemans Bay homes were demolished for a council urban renewal project. They would be priced out of their homes...

Some Auckland City Council tenants may receive a windfall of up to \$1500 if a Tenancy Tribunal ruling is upheld. The tribunal has ordered the council to refund money to 47 tenants after finding they were given inadequate notice of rent rises introduced in September[last year]. However, the council's property department is considering appealing against the decision[although it]... has only 10 working days to [do so]... The property manager... said the council had been "clobbered" on a technical foul, saying the ruling went in favour of the tenants because the council had been nice to them. Tenants were given the required six weeks' notice for the rent rise, but some appealed against the increase on hardship grounds. The council agreed to reduce their increases, but kept the same date for the rent rise. "If we had persevered with the increase for all tenants, it would have been in order..." ...He said the council could feel "quite aggrieved" by the decision because it had bent over backwards to help its tenants... However, [a dissenting]... Councillor... said the matter was not simply a technical issue. "I would expect officers in the largest local authority in the country to act within the law, but they haven't paid attention to the law. The council slipped up badly." Even though what the tenants had to pay was less than what they originally thought, it was their right to have greater assurance on the amount of rent they had to pay, he said. The tribunal ruled that the council look into previous rent rises which may also have fallen foul of the law.

...While Auckland City is getting out of unprofitable pensioner housing and charging market rents on most properties or selling them, 30km south at Papakura the council is making "a small profit" on 72 units it provides for the elderly. It charges a single pensioner \$40 a week and a couple \$65. They pay their own power and phone bills but get water free. Ask Papakura's mayor... how his district council serving 40,000 people can do what Auckland can't, and he says it's an example of "small is beautiful and efficient... We're interested in the welfare of people, who must always come first, and not piles of bricks and mortar or empires... We aren't top heavy with bureaucrats..."

...The Ministry of Housing has criticised the state landlord... for heavy-handed tactics with tenants. In a report to its minister... the ministry said Housing NZ was too quick to take people to court and used eviction threats more often than private sector landlords... [HNZ] was also the biggest user of the ministry's tenancy services in actions against tenants... Despite having less than a third of the country's rental homes on its books, [HNZ lodged 56%] of all applications for breach of tenancy in the three months to September 30[1996. 29%]... were under section 56... [of] the Residential Tenancies Act... which provides for eviction, whereas only 8[%] of applications made by private sector landlords were under that section... The... report was released... under the Official Information Act. In it the ministry said its staff believed the eviction threats were to get rent paid rather than to enforce evictions. [■ West Auckland realtors and landlords are applauding a ruling allowing the addresses of beneficiaries who are bad tenants to be passed on to the courts on a case by case basis. Up until now courts have battled to track down bad tenants to serve them order papers. Many leave with no forwarding address. Realtors spoken to are delighted – but wish this was a blanket ruling applying to all beneficiaries who are bad tenants. One Harcourts property manager is thrilled: "People vacate a house with rent owing, things may be damaged, you need to change the locks – it can be very expensive."

...[In *Renters* (screened on TV2 last month), a property manager insisted an owner look at the damage to his family home. While the owner was looking like he was close to tears (and I do not blame him) the property manager stood there passing whimsical comments about "how could a tenant do this?" and "the laws protect the tenants, not the landlords." The property manager made it known she was not accountable and that her hands were tied when it came to the law. Why did she not notice that the house was in a terrible state? Surely rent payments were overdue and a drive-by would indicate that the house was in disarray? To wait 90 days was totally incorrect and to allow the family to see this mess was inexcusable. *Renters* reflects that bad tenants can get away with it. Not so. I do not think it is a good idea that the tools we can use to evict a tenant be made obvious, so those wanting to exploit the situation can.]

...[A tenants group is fuming at tactics used by some Auckland landlords to generate more rental income. One St Mary's Bay landlord recently tried to increase a long-term tenant's rent by \$50 a week, giving only seven days notice. The group says this is illegal, because a landlord must give 60 days written notice of any rent change, or 90 days for tenancy terminations. The Residential Tenancies Act allows landlords to evict tenants using a 42-day period of notice if a family member needs accommodation quickly.] By the way, 'a government mansion has been empty for seven months as nearly 13,000 wait for a state house. The \$530,000 four bedroom Wellington house in a posh Wellington suburb is owned by Internal Affairs and is loaned to government ministers. But it appears no one wants it. While the home is empty, the taxpayer is forking out \$500 a week to cover a minister's rent elsewhere.')

...The taxpayer is paying \$5960 a week in rent to house 12 ministers in top Wellington suburbs... [and i]nformation provided by the Minister of Internal Affairs... also shows that the Government spent \$94,000 maintaining ministerial houses in the three months to December 31 last year... The highest rent is paid for the Karori property of the Minister of Foreign Affairs... – \$700 a week. At the other end of the scale, the city pad of the Minister for the Environment... costs \$250. The 26 ministers inside and outside the cabinet are each entitled to a ministerial home or a taxpayer-funded rental property[because they 'live in their constituency but spend most of their time working at parliament'. The P]M... lives in the \$2 million Premier House, while the Minister of Justice... lives in the historic Vogel House, valued at \$2.2 million... The youngest cabinet minister[who is] a Wellington resident... has moved out of a previous flat and into a house in Karori, valued at \$326,000... By comparison, the N[Z] First leader and Deputy P[M]... bunks down with relatives, although he is considering some kind of taxpayer-funded accommodation.

...[a nun from] the Wiri Sisters of Compassion, wants to spend a night with a politician. Preferably, she says, with [the]Housing Minister... in an over-crowded three-bedroom state house in South Auckland. Then... she would like to invite the minister to cast aside state house statistics and discuss the real housing crisis in N[Z –] ...the desperate struggle hundreds of low-income families have each week paying market rate rentals...

"Most people seeking help are working but... are only earning \$7 or \$8 an hour. They work all hours as it is. They can't do anything more. It comes down to cold hard cash and they just don't have it." ...a H[NZ] report showed... waiting lists... had increased from 2.5 months to 4.5 months for emergency cases...

An Alliance deputy leader... said the Government was ignoring its social responsibility for housing the most needy N[Z]ers by allowing emergency housing waiting times to nearly double... [in] the year to last September... Emergency applicants are people living in overcrowded, substandard, refuge or emergency housing. They are also people who have become homeless by virtue of a fire or other circumstances beyond their control...

Wanted: people who are living in an overcrowded house owned by H[NZ]. But the chances are that [HNZ], which is keen to talk to people living in such conditions[– where]... when one child gets ill they all get ill... and... when one family member wakes they all wake... [–] will not get a rush of replies. Occupants are scared the Crown-owned company will evict them for breaching conditions of leases that limit the number of tenants.

...[a bill that would let a US county prohibit its residents from sleeping in rooms other than a bedroom has won approval in Virginia's Senate. Jamming 15 to 20 people into a tiny two-bedroom house diminishes property values, takes up parking spaces and robs neighbours of peace and quiet, said the bill's sponsor. "About 80,000 Fairfax County households would be in violation of this bill." The legislation passed by a 20-19 vote, but opponents demanded that it be reconsidered today. A county Board of Supervisors member said the legislation made him uncomfortable. "I have a lot of problems with the Government telling people where they can or cannot sleep." Other civic leaders criticised the bill as a misplaced, hostile response to those struggling to pay for accommodation.' In local news, 'more than 40% of Pacific Island families are sharing their homes and living in overcrowded conditions, compared with 17% of families in the general population. Worst off were Tongans – 50% of them earned less than \$9900 a year, \$6000 less than the national median. The official records, from the latest census, contradicts the claims HNZ chiefs made last month that many Island families shared accommodation by choice. The claims were withdrawn after an outcry.'

...Feeling crowded? Census proves it... Final results released yesterday from the five-yearly population count last March show the country's resident population on census night was 3,618,302 people – a 7.2[%] jump on 1991. The total population, which includes overseas visitors but not N[Z]ers who were out of the country on March 5, also jumped 7.2[%] to 3,681,546... Statistics N[Z] staff had to work out the addresses of more than 34,000 people who did not provide enough information. More than 106,000 people had forms completed on their behalf because of reasons including illegibility, their missing out questions, or only partly completing them... The figures will be used by Government departments and local authorities to plan for future growth. N[Z]'s 30th census... shows Auckland was the fastest growing centre. Auckland grew by 124,871 people, or 13.2[%], passing the one million mark for the first time... Auckland [now houses 29.5%] of the country's population... After Auckland, the most populated areas were Canterbury [468,040] and Wellington (414,048)... 13,000 New Zealanders now lived in mobile or temporary accommodation.

...Home, sweet crowded home GREENACRES caravan park is no holiday home. The police have condemned the living standards and one of the residents describes it as a "rat hole." But... the row upon row of caravans[are] home to 150 children... There is no privacy... Ask the children how they cope with homework and the answer is simple. According to... on[e]: "I don't do homework." ...Across town in Mt Roskill, [a bright, confident girl]... aged 11, is tired of living with her sisters and parents in one room of an emergency house. Still, compared to Greenacres, it is luxury accommodation... She... is one of the 24 children living in the Monte Cecilia emergency house and the overcrowding has begun to take its toll... She has been at the house for two months and has been sick twice... It will almost certainly be many, many more months before her family can afford to move out... "We move a lot because every time we get to a house there's too many kids."

...During the 10 years [that she] has worked in emergency housing in Auckland, she has never seen so many empty beds. The manager of the Monte Cecilia House Trust in Mt Roskill believes the Government's... rent rises ha[ve] pushed the dream of a state home further from the homeless and stopped them seeking temporary accommodation. Housing workers throughout Auckland ha[ve] reported unprecedented falls in the numbers of people seeking emergency accommodation... They... were living in... caravan parks, garages, or with relatives.

...Tenants seeking emergency housing have to wait longer than non-urgent clients, Ministry of Housing figures show. The 91-day average waiting time for emergency houses... compares with... 85 days for non-priority clients, 115 for all new tenancies... 187 for tenancy transfers and 132 for tenancies relating to health. The ministry yesterday described as a "statistical quirk" the longer waiting time for emergency clients... [because] two-thirds of emergency applicants were housed or offered housing in the circumstances they sought within one month of their application... A Labour MP... earlier released figures showing [HNZ] had 1821 empty properties... Of those... 405 were for sale and 279 were under repair... The number of empty state houses in Auckland has more than doubled in nine months... [from] 252... to... 538[, yet for]... every empty state house in Auckland, 10 people stand in the queue for a tenancy... The figures do not include people already in a state house who want to be transferred to another... The national waiting list at March 31 was 12,896, compared with 14,155 at the same time last year... [However, according to] a spokeswoman for the Housing Lobby... the lists were a farce because many people on them could not afford the rents anyway... "There are[also] hundreds of people that don't even bother putting their names on a waiting list in the first place because they know they can't afford it," she said... Labour is promising the Government "a battle" if it proceeds with[further] plans to sell state houses to private landlords on a lease-back basis... Labour's housing spokesman... said the move would force up rents as investors buying the properties sought a high return from their investment.

...[the sell-off of HNZ stock is gathering pace. In the six months ending December, the Crown-owned company sold 1841 homes, up 60%. Labour's housing spokesman said a \$7.7 million drop in maintenance spending indicated HNZ's tactic of letting homes run down then claiming it was forced to sell. HNZ owned more than 70,000 homes nationwide five years ago.' HNZ also revealed in its] half-yearly report that it made a \$70.8 million profit between July and December last year. ['Almost 60% of the profit came from house sales.'

...STATE houses are being sold off at the rate of one every three hours... [The Housing Minister] said... "It is the Government's desire for tenants of [HNZ] to have the opportunity to become home owners." ...but... Labour's housing spokesman... claimed the sale programme was doing more to make quick profits for property speculators than to enable low-earning people to buy homes... "...So far this financial year, there is only one home-buy for every five houses sold." ...Houses were instead being bought by people who could afford to do them up and sell them at sizeable profits. "Groups of real estate agents, lawyers and builders are making a killing." ...this was occurring because they were being sold "dirt cheap", and [HNZ] was "too lazy" to do the houses up themselves. The public's money was being lost... "The massive state house sell-offs are exacerbating the pressure on rents throughout the country. While the Government and [HNZ] chase profits, thousands of families are doubling up, with other families in cramped accommodation, or living in converted garages or caravan parks." ...[he] said many of the sales were occurring in areas where there were sizeable waiting lists, such as Wellington and Christchurch... But[the] Housing Minister... said [the Labour MP] was misrepresenting the situation... [T]he Government had a reconfiguration policy, which aimed to sell off houses people didn't want and to buy them in areas of high demand. But he conceded that acquisitions of property for state rentals in Auckland – where the average waiting list for a three-bedroom house in the central city is 771 days – were slower than they should be and [HNZ] was being advised to speed up its purchasing programme... Figures released... by [HNZ] show that 4122 homes have been sold since 1992, while only 655 have been added to the state housing stock... The sale figures include 928 properties owned by Community Housing Ltd, which was sold to the Housing Corporation... 866 properties[are also leased] from private landlords... The total number of state homes at the end of December was 66,634... About 37,000 of the houses were more than 30 years old. "They have specifications for the 1960s not the 1990s."

...A block of flats in Otara that [HNZ] sold less than two years ago for \$240,000 is back on the market, with renovations... The block of four three-bedroom flats... was sold in December 1995... [at] \$9000 less than the Government valuation. Two months later it was sold again for \$251,000, though the new owner said it had been attacked by vandals in the meantime. He said he spent up to \$100,000 on renovations, and sold it in March 1996 for \$400,000. Now the flats, looking like new, are on the market again with a price tag of \$495,000... [T]he initial deal was an example of the Government's fire-sale approach to state house sales. "State houses are being sold at bargain-bin prices so [HNZ] and the Government can make a quick buck. Property developers are making an even quicker buck."

...[house-proud HNZ tenants are being urged to demand compensation for any improvements they make to their state homes. In last week's *Sunday News*, a housing expert said good tenants in state houses should be rewarded for looking after their houses. Earlier this year the housing minister said he would look into rewarding model tenants. One reward suggestion was a gift of household items, such as a backyard barbecue. However, last week's article fired up a 64-year-old who took HNZ to the tenancy tribunal seeking compensation for the work he'd put into a state home he rented for 30 years. When he moved out of the home and into a smaller state house, he asked HNZ to cough up for the landscaping, gardens and other improvements he made to his former property. The tenancy tribunal ordered HNZ to pay him almost \$10,000, but the decision was overturned in an appeal at the Lower Hutt District Court last year. He has now decided to take the case to the Court of Appeal.]

...[she] has no pets but her baby... is covered in flea bites. [The woman], her husband and the little girl pay \$140 a week for their flat on the third floor of a large [HNZ] apartment complex called Greenstone Gardens in Otahuhu... Six months ago, [the] eight-month-old... had pneumonia. [Her mother] says she believes it was caused by the damp from the leaking, mouldy ceiling... The roof is so rusty workmen fear they will fall through if they stand on it... There are no lifts in the apartment block so when [the mother] goes shopping she must drag her pram down three flights of concrete steps. "It's very horrible to live here,"... Children play in long, gloomy corridors and concrete stairways which smell of urine... Down on the ground floor... [another] family say they have been waiting years to be transferred out. They also are overrun by fleas... The fleas are part of a plague of problems that... [HNZ] is unwilling to fix: "They never worry about the people living here." The family sleeps in the lounge because water from the bath leaks into the bedroom. Part of the carpet was cut up because it was always wet. The kitchen sink leaks. The toilet has no seat. Wires are exposed through the broken cover of a bedroom light switch. At \$115 a week for the one-bedroom apartment, [the mother] says it is not good enough. "It's cheap here – but we need to move... my baby [aged one year] is always sick. He's coughing and wheezing all the time. He cries all the time..." Evidence of overcrowding is obvious in another flat – two double beds and a single bed crowd the lounge... [Many of the] mainly Pacific Island tenants... [speak] poor English and, therefore, [have] limited lobbying powers [and even less chance of gaining well-paid employment]... The 89 units have been condemned by Labour politicians as... not fit for human habitation but [HNZ] says they represent value for money... A [HNZ] spokesman... said... \$1,130,735 had been spent on maintenance since July 1993... [A] Labour MP... says the flats should never have been built. They were privately constructed in the 1970s but the owner went broke... The Government then bought them because of the housing shortage. "There's no way they would comply with any modern building standards and they probably didn't comply back then." He believes they are part of a bigger picture of squalid housing conditions in Auckland... [HNZ] rejects allegations of squalor but a local doctor... said health problems of the type described by the tenants were common in South Auckland... "It's quite shocking and also for the families, because they're doing the very best that they can in my experience to protect their children. They often feel overwhelmed by the conditions they are in." ...she had written to [HNZ] on a number of occasions to ask them to look at the conditions of some of their South Auckland properties. "One that springs to mind is a patient who had an infestation of cockroaches and also was trying to fight off rodents, mainly mice, which were coming through the walls from the flat next door." ...In Otara... was another patch of "disgraceful" state house units and in Lappington St... children played in rubbish, she said.

...A parliamentary committee has criticised [HNZ] for the way it looks after some of its properties and is going to call its chief executive back every three months to report progress... "We are not satisfied with the level of service delivered by [HNZ] in some parts of the country and, in the case of the Greenstone Gardens apartments, it did not act as a responsible landlord..." the committee said... "We are far from satisfied that adequate maintenance systems are in place and we conclude that there is an urgent need for a significant improvement in, and more expansive, systematic processes of monitoring individual stock." ...The Labour Party housing spokesman[... who was]... a member of the committee, said the report was "further proof that the Government's profit-making market rents policy precludes [HNZ] from meeting social objectives."

...Families with children may be moved out of the three-storey [HNZ] apartments in Otahuhu known as Greenstone Gardens. The company expected to decide in the next few weeks whether the 89 units, originally built as a motorway motel, were suitable for families... So far the rusty roof and downpipes have been replaced, many units have been painted and new carpet laid. Carpet in the ground-floor corridors, which stank of urine, has been replaced by easily cleaned rubber material. The rubbish skip has been moved, the ventilation system is to be replaced and a fumigation programme has started. Units on the southern bottom level, which never see the sun, may be taken out and [turned into] car parks...

H[ZN] apartments condemned as squalid continued to be used as a political football yesterday... Housing workers yesterday told... there were "streets of shame" dotted throughout the city where people on low incomes struggled to survive amid mould, damp, pests and illness. [HNZ] owned some of the properties but private tenancies were often worse... Health inspectors [agreed that] there are dozens of properties in Auckland City in worse condition than the Greenstone Gardens apartments... "In Kingsland there is a place... like a mini-ghetto area." ...the Federation of Ethnic Councils, said immigrants and refugees often ended up in inadequate housing but because of poor English were unable to complain. "The migrants definitely have setbacks in getting good housing conditions."

...A South Auckland refugee resettlement centre has been forced to close its doors to local people needing cheap board... Boarders at the Mangere centre – who included a teacher from a nearby private school, a senior public servant and unemployed men – were paying just \$112.50 a week for accommodation, power and three meals a day... The Labour MP for Mangere... said it was ludicrous that the Immigration Service was tossing them out when the centre was under-used... [However, the] manager of the centre, said... "We were actually running at a loss and it was just not appropriate. The money we get from the Government for refugees is... not for subsidising people in the community who might like to board here." About 120 refugees stay at the hostel for six-week periods to help them adjust to conditions in N[Z].

...Soaring city rents are forcing low-income families to move to cheaper housing in small centres, according to a survey. Beneficiaries and people who live in rental homes have been migrating to satellite towns such as... Masterton in ever greater numbers since 1991... This was particularly noticeable in the trio of towns near Auckland... [-] Huntly... Te Kauwhata... and Coromandel... [-] where the number of migrating beneficiaries in rental homes jumped by 209[%].

...state house residents face rent increases from July 1... Auckland will be hit hardest, with rents rising by up to \$181 a week for a [5]-bedroom house in Mt Albert... [T]he average rent rise for a [3]-bedroom... house will be at least \$34 a week... Rents on all properties will rise by at least \$5...

The Mt Albert woman who faces the biggest... rent rise is being pressured to move out of her home into a cheaper house... [HNZ has offered her] a four-bedroom house in Avondale for \$300 a week, but she said it was filthy, there were holes in the walls and the stove did not work. She said [HNZ] told her about the house on Monday and wanted her to sign the lease today and be out of the Mt Albert house this weekend... [She] does not want to move from her five-bedroom house but is worried about how she will feed her five children... "I don't want to go, but I want food for my kids on the table. It's a lot of pressure. This is not fair." ...Her rent nearly doubled, from \$194 to \$375 a week. The most she would earn in a week from her night job at a fast-food restaurant is \$280. Her accommodation supplement has also risen by \$70 to \$135 a week, but she says that does

not leave her with enough money after rent to cover food and bills... [T]he most she could afford to pay in rent was about \$250 per week. "I begged them [H[NZ]] yesterday, they were just laughing at me. They said it's all the same for other people." She has calculated she would be better off giving up her job and going on the domestic purposes benefit, but she enjoys working. "I don't want to stay at home feeling depressed about it. When I go to work I think I am somebody. I don't want to live on a benefit the rest of my life. It's really tough."

...Two key pieces of received wisdom commonly reiterated by supporters of the new economic order of the 1990s are, first, that private enterprise should not be protected by state subsidies, and secondly that the state should avoid "distortion" of the market's price system by any direct or indirect intervention. One would have thought that these principles had achieved a status equal to the Ten Commandments for today's policy-makers, but one only has to look at Government housing policy to find that this is not so. There are aspects of this policy that are not as ideologically pure as they might seem. I refer to the divestment of the state's housing stock in favour of a greater reliance on the private market. Those on low incomes who cannot afford the market rentals are increasingly being supported by an accommodation supplement as a cash transfer, rather than being moved into rent-controlled state houses as in the past. In 1995, about 78[%] of those receiving the accommodation supplement were either renters, boarders or mortgagors in housing other than that provided by the state. That year, about \$491 million was spent on the supplement, more than double the old accommodation benefit only two years earlier in 1993... Taxpayers' money, rather than being used to maintain a housing asset, is thus increasingly channelled, through beneficiaries, into the hands of bankers and landlords... The effect of these handouts to landlords would appear to have a number of adverse effects. Landlords will, over time, gradually increase rents to extract the maximum possible gain from the accommodation supplement, up to the limit set, leading to the inefficient use of taxpayers' money. The increasingly unaffordable rents for those on lower incomes will inevitably lead to demand for increases in the maximum level of the accommodation supplement (which is what the coalition Government is due to consider this year). This will, in turn, lead to landlords extracting higher rents from the larger subsidy available and rents will once again become less affordable. This rent-subsidy spiral seems inevitable as long as policy-makers rely too heavily on the private market. The market is naturally geared towards increasing the returns on property investments. The higher the rents that landlords can extract from their properties, the higher the values of those properties on the open market. Hence it gets harder for people on low incomes to afford a first home, and the upward stimulus to property values only contributes to inflation.

...Housing lobbyists plan protests across Auckland to mark the end of the... coalition's rent freeze tomorrow... and what they believe is the beginning of increased hardship for state house tenants... [However, the] Housing Minister... says this is nonsense... [H]e was adamant that... the country's 281,000 accommodation supplement recipients would be better off... [because t]he Government was dishing out much more in extra help... Rent rises would equate to \$22 million a year, [while] the Government's housing assistance package would deliver \$58 million extra... But [he]... conceded that 10,000... tenants... would be "slightly worse off" even after taking into account the increased supplement... State house rents have doubled in some parts of N[Z] and trebled in parts of Auckland since market rents were introduced in 1991.

...a retiring state housing chief... told Parliament's social services select committee yesterday that studies revealed flaws in Income Support's accommodation supplement system... [HNZ] research showed Aucklanders were 8 to 10[%] worse off than those in... provincial areas... [because of] Auckland's higher cost of living...

Almost two-thirds of weekly state house rentals in Auckland now fall between \$200 and \$299... and 1.8[%], more than 400 state houses, had rents over \$300... Two years ago 75[%] of them were less than \$200... Now only... 8500 of Auckland's 25,300 state houses[a]re rented for less than \$200... [A]ffordable rental accommodation was "swiftly becoming a distant memory for most low-income families." Pointing to [HNZ]'s latest annual profit of \$111 million... Labour's housing spokesman... said state housing had become a "cash cow" producing profit and dividends for the Government from the poorest... Private landlords are[in turn] reaping the benefits of the accommodation supplement to the tune of \$6 million a week...

A version of musical chairs in the state housing sector may help the merger plans outlined in the coalition agreement... [The person who] is already chairman of the two entities due to merge with H[NZ]: the Housing Corporation, the state's house lending arm, and Community Housing, which manages about 900 properties for groups such as the intellectually and psychiatrically disabled and those needing emergency housing... was yesterday named the chairman of H[NZ]... The Minister of Housing... said [the new chairman] would head a small team to work out the details of the merger. For Community Housing, it will be a yo-yo exercise. Until last August, it was part of... H[NZ]... But running a charity conflicted with H[NZ]'s profit focus, so Community Housing was sliced off and made a subsidiary of the Housing Corporation... Now under the coalition agreement, the profit focus of H[NZ] has been toned down and replaced with a brief "to meet the Crown's social objectives in a business-like manner." And Community Housing is going back to H[NZ]. While the Housing Corporation is part of the merger, the business of the former lending giant is being wound down; only \$78 million will be lent this year.

...THE Coalition Government is due to announce radical changes to housing next month as it admits National's five-year-old housing reforms have failed to provide affordable housing for many low-income tenants... That ill-fated attempt to marry business with social imperatives has formed the battleground ever since for clashes between[the Housing] Minister... and a hapless parade of short-lived chief executives and... chairmen[of HNZ]... Government sources said... state houses are[now] to be rented out purely for profit, with no restraining social objectives. The housing stock may remain with one Crown-owned company or be split among three or four competing state companies. The aim of a split would be to create competition among several state landlords, thereby keeping rents down... The accommodation supplement, which is expected to subsidise the rents of 310,000 N[Z]ers this year, will continue as it is. The supplement is forecast to cost \$774 million this financial year... The changes will be a fresh attempt to harness market forces to address housing problems, instead of a return to the low-rent, state-owned housing of the past.

...['getting the private sector to provide low cost housing will be hard, says a west Auckland social agency. The idea has come from the latest Auckland Regional Growth Forum. The forum's social infrastructure team is planning a seminar on how to provide affordable housing in the region. A team member says they are unsure if the private sector will be willing to help but the seminar is a good way to find out and make a start. However, the Auckland District Council of Social Services liaison officer says the private sector hasn't shown itself to be a good provider of low cost housing. "People want to make a profit. What's the incentive to take on cheaper housing and keep it in good condition? It's not a good return. I'd be asking how it's going to be different from what it's been in the last five years." In related news, a] landlord who refused to rent a house to a solo mother - then refused to say sorry - has been hit in the pocket for breaching the Human Rights Act... [He was] ordered to pay the woman \$1000 for humiliation, loss of dignity and injury to feelings and \$2000 in costs following a Complaints Review Tribunal hearing... It turned out she was the third single parent who had wanted to rent the Auckland property... Contacted last night... the owner... said the suggestion that he was prejudiced was ludicrous. Of the 10 properties owned by the trust he represented, six were rented by solo parents. But he would not appeal the decision because he could not afford legal representation.

...A Far North solo mother sick of living in a garage with her three young daughters and a bucket for a toilet is one of many low-income rural dwellers hoping a trial Housing Corporation scheme will open the door to a new home... Targeted are those not able to get private sector finance but who might otherwise meet the costs of home ownership with careful planning, providing they meet "affordability criteria." They must attend a series of home-ownership workshops to gain an eligibility certificate to apply for the loans requiring a 5[%] deposit, where usually 15 to 20[%] would be necessary... Partly because of such affordability constraints, the low deposit scheme has barely scratched the paintwork in addressing the desperate housing needs in the trial areas caught up in complex, multi-factorial related social problems... Ministry of Housing briefing papers

prepared shortly before the October 1996 election said by then 1000 people had completed the workshops, with 88 loans issued valued at \$5 million... Since its inception there were no significant arrears, illustrating that the programme was “sound and sustainable” for both the borrower and lender. However[, relative]... to the number of loans advanced under the programme its price tag appeared high – costs of \$413,000 in 1995/96 when 53 loans were issued a total of \$2.9 million... In the Far North authorities report people living in caravans, shacks with dirt floors, and tents. With overcrowding and no running water or power the “living” conditions are ripe for disease or disaster... [Fortunately for the solo mother, she] completed the workshops and thanks to a “crucial” family donation raised the \$2900 deposit... The application is still being processed but the woman says without financial assistance from her family she would not have passed “Go.”

...Three young children... died on Saturday when fire... sparked by a candle... engulfed their makeshift Northland home... In a statement... yesterday... [the] Housing Minister... said the family was trying to build a home through the Government’s Low Deposit Rural Lending Scheme, but had faced delays. He said the deaths of the three children should not be used “as the focal point of a cheap political debate.”

...Horror stories about poor housing in rural Northland have attracted a great deal of recent publicity. Unfortunately, this experience is not limited to families in the North; poor housing standards blight life in both rural and urban N[Z]. In all the debate and discussion that has surrounded this issue there has been a failure to come to grips with the essence of the problem – profit-oriented market forces. The Housing Corporation’s rural loans scheme illustrates the Government’s market approach. It seeks to bring some people on the lowest of all incomes in N[Z] into the housing marketplace by lowering deposit requirements but at the same time charging above market interest rates for finance. Yet how can families living from day to day on a benefit save one dollar towards a deposit, let alone several thousand dollars. A recent report in the *Listener* highlights the... many families walking away from Housing N[Z]’s housing seminars knowing that the offer is unrealistic for them. The Cooperative Housing Association of Aotearoa-N[Z] proposes patenting... technology which uses conventional materials and meets all N[Z] building codes but is... only... available... to the third economic sector and is designed specifically for community housing schemes.

...BUILDING a house for less than \$60,000 may sound too good to be true, but a contest organised by the Housing Corporation has proved it can be done. The competition was organised to encourage housing designers to think of innovative ways of providing low-cost housing, particularly in rural areas... The designs needed to comply with the Building Code, were allowed to include an element of owner’s self-help labour if properly supervised, and could use second-hand materials worth up to 25% of the building’s total cost. The corporation received 98 designs, which have been included in a handbook that is available through its head office. The entries ranged from conventional kit-set homes submitted by mainstream building companies [– such as Versatile Buildings’ ‘2 bedroom cottage (which costs \$49,950, including a 5-year guarantee, G.S.T, a stove, verandah and delivered to your site, but excluding services like power, water, stormwater, sewerage, plans and permits – or \$24,990 for a lock up shell only’), and IDEAL Homes’ ‘2 bedroom, 60 sq m SUNSEEKER (which is built on site for a cost of \$51,600 – complete with a Quality Kitchen and stove, bathroom and laundry, a large feature bay window, a timber deck and verandah roof, plus a 5-year peace of mind’ guarantee) –]to innovative... homes submitted by individual designers. One of the entries attracting a lot of attention was[a] straw-bale house... Putting his design to the test [the designer] built a 99sq m studio, with no interior partitions, plumbing or fittings, for \$27,000 including materials, GST and labour... And the thick walls make it very energy efficient and sound proof... Building with straw bales is relatively common in the prairie land of the U[S], where they obviously have a lot of straw.

...The cost of house building has risen to almost \$900 a sq m, says the N[Z] Institute of Valuers... The typical form of modest-cost housing being built, according to the institute’s modal house specification, is a 100sq m building constructed on a timber foundation using[a] prefinished corrugated steel roof and wood-cellulose-fibre-cement wall claddings. The specification provides for three bedrooms with separate service rooms and open plan lounge-dining and kitchen areas. Construction of the modal house was most expensive in Auckland at \$942.53 a sq m...

Delays in getting resource consents adds 4.4[%] to building costs, a survey by the Building Owners and Managers Association estimates. Direct and indirect costs of actually gaining the consent added another 2.6[%]... Those were the averages from a pilot study carried out in the Auckland region[, which saw]... \$1 billion of residential construction last year...

Builders are concerned that the cost of new North Shore housing may rise if the North Shore City Council forces them to pay towards new infrastructure and community facilities. The council is looking at levying builders and developers around \$10,000 a section... The North Shore formula will be similar... [to the one which] is close to [being finalised in the] Rodney District... “It’s fair enough to work on a user-pays basis, but how do you establish a fair and reasonable charge? Creating subdivisions increases the rating base. To add another rate seems a bit unfair,”... said [the]... president of the Auckland Master Builders’ Association... [Incidentally,] Manukau is the fastest growing city in N[Z], and its... 1996 census... population of 254,278 makes it N[Z]’s third largest city, behind Auckland (345,768) and Christchurch (309,028). The Mayor of Manukau... has predicted the city will... soon overtake Christchurch... The Manukau City Council believes the intense building activity on vacant Howick sites partly drove the strong growth. In the Howick South area, the population has tripled since 1991 as scarce land became available for subdivision.

...Earthmovers have uncovered several tonnes of potentially lethal asbestos on the site of a housing subdivision... Labour Department officials stopped construction on the 40-section Hilltop Park in Manukau City after workers began digging up asbestos pipes, fittings and fibrolite sheets containing the fibre... An Occupational Safety and Health inspector... said the asbestos appeared to have been used to fill in a deep gully several years ago... A spokesman for the Manukau City Council said the site boundaries would be monitored for airborne asbestos fibres until the cleanup was completed... Health problems... [associated with asbestos such as] cancer and other diseases... can develop years after exposure.

...Labour Department officials expect to find more asbestos dumps on former farmland in South Auckland, but say residents have no cause for alarm. The discovery of tonnes of potentially lethal asbestos pipes and sheeting on a 40-section housing subdivision... sparked dozens of calls from neighbours concerned about the health threat... [but an OSH inspector said m]onitoring had found no airborne fibres from the material, which is to be buried 4m under a road to be built on the subdivision.

...[‘HNZ has offered to move any of its 1000 tenants who live in East Tamaki properties where asbestos was dumped between the 1930s and 1970s, if they fear for their health. HNZ officials have met the Mayor of Manukau, who is complaining that the Minister of Health has not responded to requests from his council for professional support and funds to help it determine the actual health threat from the asbestos so it can work out what action to take.’ By the way, HNZ plans to add] 2000... homes... to the[Auckland] region in the next 12 months. [Some ‘homes are to be physically relocated from Wanganui to Auckland’ – although HNZ is also ‘advertising Wanganui homes to Aucklanders’ (because their rents will be cheaper and HNZ will save the expense of moving a house 450km!).

...HNZ] yesterday revealed plans to... spend millions of dollars on a Glen Innes development... [A] block of 44 houses... will be renovated and shifted back on their sections so the company can fit an extra 42 homes on the sites... [A] Housing Lobby spokeswoman... said the development would force people to live like sardines. Similar developments... [such as the] \$12.7 million... Maybury St revamp, in which 68 houses were relocated to make way for 65 new homes... had left tenants with inches between the house and the edge of the section... But [HNZ’s]... Auckland regional manager... said the new development was well within density limits permitted by the city council.

...A property in a leafy Westmere street has become a suburban battleground in a test case for the Auckland City Council district plan [after dozens] of local residents... joined forces to oppose a... couple cross-leasing their 943 sq m property... [The couple’s] proposal is seen by its detractors as opening the door to in-fill housing in a... suburb where the district plan restricts cross-leasing. [However, council] planners approved the subdivision... They concluded that although the proposal for a second house on the property did not comply with density, tree-protection,

earthwork and excavation controls, development conditions would limit any environmental damage... [Council planners were] also criticised... for striking an agreement with the applicant before... a resource consent hearing.

...Residents in upmarket parts of Henderson say they will fight a low-cost subdivision planned near their neighbourhood... A resident... [from one of the] exclusive homes in adjacent Braeburn Estate, Burgundy Park and Palm Heights... said the \$180,000 two-storey houses would lower the value of surrounding homes and[will] soon look like a ghetto... The sections are understood to be about 127 sq m each, compared to the... North Shore City minimum size of 150 sq m. The Waitakere City Council does not have a minimum section size, but its planning manager... said the sections... [satisfied] height and other restrictions.

...The North Shore City Council is looking at a zoning u-turn because[of] intensive housing in some subdivisions... [Terraced] houses completed or under construction... [at] the Ponderosa housing subdivision... have a section size of between 167 sq m and 350 sq m. The standard size is 550 sq m to 650 sq m... Council engineers were worried about pressures on stormwater, fresh-water and wastewater systems and felt roads were too narrow for emergency vehicles...

Gas contractors cutting corners in an Auckland house building boom have prompted emergency repairs to stop dangerous leaks... after the discovery that kilometres of pipe were laid above the ground, increasing the risk of corrosion and breakage. The gas supply company Enerco disclosed yesterday that... [the problem affected] about 800 of 1100 connections to new customers in the past year... and Enerco has given former contractors a one-month amnesty to own up to any more or face repair costs if their work has to be redone... Enerco acknowledged last night that there was a delay before it realised contractors were milking the system... They profited by using stainless steel pipes from Enerco's supply depot to get the job done much faster than with polyethylene, which can be laid only underground... Up to 100 contractors had been replaced by three main operators, who were now responsible for keeping subcontractors in line... [In related news, t]he Auckland Regional Growth Strategy Forum heard... yesterday... that [there is]... enough vacant land to build an additional 70,000 households, room for 36,000 "infill" homes on existing sections, and enough room for 24,500 redeveloped homes. This included renovating buildings in the current business district for apartments... There are at present 366,000 households in the region...

Home-buyers and property developers will foot a multi-million-dollar bill to computerise N[Z]'s land information records... The only Government funding... will... be about \$1 million. A spokesman for... [the] Minister of Lands... said that despite the funding concerns, the cost would be widely spread as N[Z]ers changed homes every seven years on average... About... 70[% of NZers]... own the homes they live in... An "automation levy" will add \$30 to \$40 to the cost of transferring a property title for the average home-buyer, a spokeswoman for Land Information said. The levy will disappear when the project is completed in 2001, and the Government promises that a more efficient automated system will take fees to below today's level... Land Information processes 900,000 land transactions and approves 18,000 survey plans a year. It holds 30 million records.

...A total of 77,687 house sales were recorded in 1996... for an average price of \$177,000... Southland has the cheapest housing with a median price of \$91,750, although that was up by more than 13[%] in the past year... Nationally, nearly 81[%] of houses were sold for \$250,000 or less[while]... less than 2[%] of the houses cost more than \$500,000, but in Auckland City more than 11[%] did. In fact, more Auckland houses were sold in this price range than any other ('431 compared with 391 in the \$400,000-\$500,000 range; 394 in the \$225,000-\$250,000 range; 93 for \$125,000-\$150,000 and 40 below \$125,000')... The Treasury expects house prices to increase above inflation for just two more years... After that alarm bells may ring for property owners looking for capital gains... House prices have not dropped since 1991-92... Land has become more expensive in the outer areas of metropolitan Auckland, with the median price of sections sold in Manukau reaching three figures for the first time at \$124,000, and Waitakere pushing its median to a record \$125,000. Both were higher than Auckland (\$120,000) and North Shore (\$123,000) for the first time.

...Residential construction continues to race ahead, defying the soggy state of the market for existing houses. Councils last month authorised the building of 2691 houses and flats, a 48[%] increase on... last year... Economists... doubt if it can continue... but... are at a loss to explain the strength of the residential construction market... [The] sharp increase partly reflects a cluster of large apartment developments... [Speaking of which, it has been announced that a] second mortgage... of... \$8.95 million [in bonds will be issued]... on the Tower Hill apartment project... The second mortgage comes in behind a \$23 m... ANZ Bank facility financing the 19-storey, 161-apartment building under construction... The building, costing \$35.4 m... has been given a completion value of \$44.6 m... Questions were raised... recently when similar bonds, known as mezzanine finance, were offered on another inner-city apartment block, Parklands[which]... has since begun construction after getting the sales to make the project viable.

...Against suggestions that time is up for the inner-city apartment market in Auckland, [a] property agency supremo... produced figures this week showing capital and rent returns for investors were still good... "This was the year of the 1100 settlements, as opposed to the 500 or 600 last year, and I've been amazed at how the market's stood up..." Among apartment completions requiring settlements in the past two months were Quay West on Albert St, containing 166 apartments, CityLife with 253 and Park Central with 117, both on Queen St. Among developments approaching completion is the first part of the Symphony-Dynasty Pacific combination of the Heritage in the old Farmers' building and Heritage Grand behind it, which will add 450 serviced apartments between them. Quay West, which has about half its apartments leased back to[the] developer... for managing, is running around 50[%] occupancy... One of the two two-level apartments at the top of Quay West has been let, unfurnished, for six months at \$2200 a week, giving an initial gross yield of 8.6[%] on the 269 sq m apartment and its two parking spaces. Among other Bayleys leases in Quay West signed in August were \$1200 a week for a furnished three-bedroom unit on level 27, and \$800 a week for an unfurnished unit on the same floor. [A spokesperson for] Bayleys Real Estate, said good rents were being achieved for cheaper inner-city units, starting at \$225-\$250 for unfurnished and \$300-\$375 for furnished studios, [rising to]... \$475-\$550 (unfurnished) and \$550-\$650 (furnished) for three bedrooms... The next city apartment market will be on the waterfront, where four projects are planned... [including] three apartment projects... [a]round the Viaduct Basin... [One] Viaduct Basin project... [has] 100 New York-style loft apartments above commercial space... on the old Turners & Growers[markets] site... More than \$100 million of sales have been achieved in... [the] Metropolis apartment tower, to be built on Auckland's old magistrates' court site... and it remain[s] on course for completion in October 1999.

...[t]he Metropolis tower opens a window on the whole inner-city accommodation market in Auckland. Ever since the conversion of the first weary office blocks to apartment use in the early 1990s, Auckland's apartment boom has, in the view of many observers, been about to end. What it has done, instead, is change direction. And it has kept growing as developers turn to purpose-built structures, offering high-priced units'...

'METROPOLIS HAS TRULY INTERNATIONAL APARTMENT RESIDENCES FROM \$280,000 TO \$4,000,000. *Services and facilities* include: Butler, Concierge, Valet Parking, Room Service, Maid & Laundry Service, Swimming Pools and Saunas, 24-Hour on-site Security.'

...*'Its Grandeur Will Have No Equal'* 'The design was inspired by New York, the marble is coming from Italy, the natural timbers are growing in AUS, the carpet is starting life eating grass in Southland - it's taking the world to create METROPOLIS'...

'There's a magic, a mastery, a perfection to a Metropolis penthouse home that cannot be surpassed. No address will enjoy such continuous acclaim. No address offers such distinction or importance. A few residential penthouse homes are available offering incomparable views, ambience and services. Each an integral part of the "Metropolis" way of life. View a display suite at Level 2, 48 High Street between Midday and 2pm, Today and Sunday.'

...Aucklanders have watched with interest as the Metropolis has shot upwards from within the character-filled buildings on High St, backed by the green of Albert Park. Its art deco-inspired exterior is the result of its developer's passion for early American office buildings, and will be a testament to his dedication for detail. The 40-storey building will eventually house 345 apartments, 21 penthouses and be topped by a private suite of rooms and offices for

the developer's use. Sales of the one and two-bedroom apartments (which can be purchased for one of three uses: for owner occupation; to rent; or as a serviced apartment to be leased back to the managers) have been sure and steady. There are just 32 left. 11 penthouses (which can't be used as serviced apartments) also remain.' 'The developer is intensely proud of what he is creating. "What this building has that others don't is a public scale. Everything has a size and scale and grandeur that will stand the test of time.'" Incidentally, 'a legal black hole that leaves subcontractors at the mercy of developers has claimed a west Auckland building firm. Henderson steel fabrication company Power House Ltd has been forced to close, laying off eight people. It's one of several west Auckland building-related firms forced to the wall by the lack of laws protecting subcontractors. An arbitrator says because builders and developers don't pay for work already done, some subcontractors haven't been paid for two or three years. The payment loophole has plagued the building industry since the Wages Protection and Contractors Liens Act was repealed in 1987, leaving subcontractors without any protection. That act allowed subcontractors to put a lien or charge on a property if they weren't being paid. Now, pay-when-paid or pay-if-paid clauses are a standard feature of building contracts, meaning subcontractors don't have to be paid until the builder gets paid by the developer. The owner of Power House said: "The law means we are left carrying the can. The whole thing has just got out of hand and I can't handle it any more."

... 'the collapse of Auckland builder Goodall ABL – which was managing projects like the Quays apartments in the Viaduct Basin and Shed 24, the apartment block at the end of Princes Wharf – has spurred a push for legislation to protect construction industry subcontractors. The builder's voluntary liquidation, with 400 creditors – mainly subbies and suppliers – owed an estimated \$20 million, couldn't have come at a better time for those pushing for a law change. The question is how to stop the subbies getting hurt in such cases. "Such an act would have major implications for contractors and subcontractors," says the Institute of Building, which is promoting debate on the topic, beginning with security of payment for building subcontractors. Also behind the push is the Building Subcontractors' Federation, which sent questionnaires to Goodall ABL's creditors asking them what they wanted done to protect others who might find themselves in a similar situation. The Law Commission has already rubber-stamped proposals for a change. Proponents were given further impetus when a similar law was passed last year in NSW. Goodall ABL is not the only collapse used to further the industry's cause. Christchurch developer Tuscany Enterprises went into voluntary liquidation in January last year, owing 70 creditors \$1.3 million after not being paid itself. Tuscany was building three blocks of flats. A year earlier, Auckland apartment developer First Investments collapsed.'

... 'a slowdown in sales of Auckland inner-city apartments has spelt disaster for a high-profile block in the central city, with the company which owns it put into receivership 10 days ago. Metro City Apartments in Wakefield St, a towering 16 storeys with 109 units, has been dogged with ongoing problems since it was finished recently. The latest came when the first debenture holder the BNZ, instructed accountants to place the owners in receivership over a \$5 million debt. One of the central reasons for the block's problems has been the softening in Auckland's apartment market, according to the director and majority owner of Metro City Apartments. The receiver for the accountancy firm agrees. But the bank still wants its money back and the lack of sales has resulted in a failure to service the debt. The director acknowledges a high amount of debt involved in the project. As well as the \$5 million owed to BNZ, \$3.5 million is owed to Canterbury Asset Management Ltd of Christchurch, while a further \$2.5 million is owed to Hartford Group of Auckland, the second debenture holder. But this \$10.5 million does not include money owed to 17 investors who have bought the apartments, guaranteed a 10% net return for two years.'

... 'hundreds of subcontractors face lean times after the collapse of NZ's fourth-largest building firm, Hartner Construction. One predicted that, while not unexpected, the collapse would send a "cascade" of small firms to the wall.' One subcontractor, who 'employs 40 people – and lost \$45,000 on Shed 24 on Princes Wharf when the ill-fated Goodall ABL went under – is now owed at least \$25,000 for electrical work on Sheds 19 and 20. "This is just sucking the construction industry to death," says the subcontractor, who was last year forced to write off \$100,000 in bad debts.' 'Hartner Construction's founder and managing director points the finger of blame well away from himself and his managing director. He blames the way the construction industry works for his company going into receivership. It is an industry which, he says, operates in an "insane" manner. He wants developers to be bonded in a system not unlike in America, where, before a developer lets a contract to a builder, the developer has to prove the money is there.'

... 'an insolvent Auckland apartment developer is trying to stave off bankruptcy proceedings after running up debts of \$44 million. The debt is a result of the collapse of a string of companies. It is owed to 75 creditors, including banks, suppliers and family trusts, although documents lodged by his lawyer in the High Court note that their "total estimated net exposure" is only \$16 million. This is because various property assets are being used as security to help reduce the debt and because the developer had loan facilities and guarantees, listed as debts, which he did not use. The developer, who was to turn the MLC Building in Queen St into apartments, has proposed a debt compromise with creditors which could see them get as little as 0.3c for every dollar owed. They will decide whether to support the plan at a meeting in two weeks. However, many have already filed individual bankruptcy petitions.'

... 'at least 10 people died when a 12-storey building collapsed in the southern Russian city of Zernograd yesterday. Russia's NTV channel said 6 people were injured in the collapse of the apartment block, which was home to about 44 people. A local official said the structure of the building and the foundations had given way. Police have ruled out a bomb blast.'

... 'screams of relatives punctuated the recovery of bodies at a flattened apartment house in the southern city of Foggia, the scene of Italy's deadliest building collapse in decades. The death toll rose to 34 yesterday, with almost as many still missing. Many people were caught by a slow-burning fire seeping through the underground garage where many of the victims were believed to be trapped. The fire lessened hope of finding any more survivors. After the six-floor building collapsed on Thursday, a number of theories were offered – none conclusive: construction used substandard steel bars or concrete; a sudden settling of the sandy soil; renovation work on the underground garage; water eroding the foundation. Whatever the cause, Italy's national statistics institute said 3.5 million houses nationwide were at risk of similar collapse. Age had weakened some, while cut-rate building during the south's construction boom meant some were weak to begin with. Lawmakers want legislation which would mandate inspections of buildings. Backers of the legislation have argued that too little was done after Italy's last fatal building collapse, when a Rome apartment house fell down in December, killing 27 people.' In local news, the AUS]n contractor... build[ing] the \$200 million serviced apartment project Metropolis... [aims to keep the project] on target for a late-1999 completion... despite rumours its staff have gone home.

...N[Z]-like housing policies [a]re creeping across the Tasman and w[il]l... wreak increased havoc among beneficiaries and low income workers. The recent A[US]n budget had cut \$200,000 million in public housing, so the public housing stock would reduce... [At the time, a]bout 230,000 people were waiting for public housing and the intention was to move to a system... where rent subsidies [a]re paid to individuals... Private rentals took up about 50[%] of a family's income. Public housing rent took up only 26[%], but that was also likely to change with the introduction of market rents... [Meanwhile, a] survey showed that... Sydney's residential property prices had grown by 30[%] since June 1996 and Melbourne by 14.9[%], but other A[US]n cities had only grown by around 9[%].

...THE British] housing market continues to rise... according to a new survey... Prices went up by... 7.2[%] over the past year... Nationally, the average price of a semi-detached house is £65,875. The highest prices are in London, where a semi sells for £132,148; the lowest is Dyfed in Wales, where a typical semi fetches £40,561.

...A central London flat the size of a store cupboard has been sold for £42,500... The studio... in Orme Court, Bayswater, measures 4m by 2m.

...A resurgent British property market began to stretch credulity yesterday after... [an] unnamed London businessman paid £495,000 for a vacant 1920s shoreline boathouse in Poole in the west of England, to have as an unusual holiday home... and... the owner of a four-metre-by-one-metre lock-up newspaper kiosk in Piccadilly Circus in the heart of central London... [announced he i]s asking £500,000 for his stall. Reckoning the street shop had the most valuable location in Britain, [the owner], the third generation of his family to man the kiosk, has already turned down an offer of £200,000. "I have the best pitch in London and I know what it's worth. I want half a million or nothing."

...[‘runaway property prices in London have made reading the property pages almost a disturbing experience. The average price for a one-bedroom apartment in central London is around the \$NZ600,000-\$720,000 mark. Rent in a similar flat – say near the British Museum in Bloomsbury – would set you back around \$4800 a month. In prestige locations, prices go up each year as regular as clockwork by about 10% or more. In up-and-coming quarters, price increases can exceed 20% annually. This situation is unique to the capital. A two-bedroom flat in Edinburgh costs around \$144,000. In London, you can quadruple that price and still not get a good view. The 1980s housing policies of the Conservative Iron Lady are partly to blame. Wanting all people to benefit from the middle-class dream of owning a home, she made it possible for people who rented subsidised properties from local authorities to buy them at knockdown prices, usually yielding an immediate re-sale profit of more than 100%. In the long term, it is hard to imagine things carrying on. How long will the market be able to bear the rise in accommodation costs? And there are casualties – the tens of thousands of street-dwelling homeless, and the commuters who spend millions of hours commuting to and from work.’

...‘For those looking for a new house in England, the bad news is that, with 30 bedrooms and as many toilets, five swimming pools, tennis courts with underground heating, a marble-lined shooting gallery, two bowling alleys, squash courts, a cinema, an ornamental lake and tropical gardens set in 45ha, the country’s most expensive new property has been sold. The good news is that, at £70m it would probably have been affordable only to a few of the world’s super-rich. According to British newspaper reports, the owner of the house being finished in Windlesham, in a tranquil corner of Surrey, is from the UAE.’

...No 68... Paritai Drive... might... fetch... a record, per square metre, for metropolitan Auckland... Real estate agents believe the 1699 sq m section... [and] the much modified... house, which is in disrepair... w[i]l... fetch... close to \$4 million... • A 1168 sq m, vacant section at 58 Paritai Drive sold last month for, it is believed, close to \$2.3 million.

...A Paritai Drive property donated to the... Auckland City Council... by a pensioner... was bulldozed yesterday after a neighbour purchased it for \$3.6 million... The demolition means that the purchase price is one of the highest for residential land in metropolitan Auckland – \$2117 per square metre... [The donor], now in his mid-90s and living in a pensioner flat, gave the property to the council in 1974 as a museum to house his collection of clocks and objets d’art. The council is putting \$500,000 of the sale proceeds towards maintaining his collection...

[‘Million-dollar homes common as brass The NZer who paid \$8.3 million for a beachfront Takapuna house is not an isolated figure in the market for top-dollar homes. The 32-year-old who grew up on the North Shore and went to Westlake Boys’ High School, and has just left his position as a senior director with Cisco Systems – the internet networking giant which has 38,000 workers throughout the world and in the past year had sales of close to \$50 billion (at one stage last year it was named the world’s most valuable company) – paid what is believed to be the highest price for a house in NZ. Real estate agents say the top end of the property market is booming and the 32-year-old’s record could soon be overtaken with the sale of the Victoria Ave, Remuera, mansion of NZ’s richest man. The house, which has a Government valuation of \$7 million, is tipped to be the first property in NZ to sell for \$10 million. One of Auckland’s top residential agents said he sold his first \$1 million house in Paritai Drive 14 years ago. Last year, 115 homes in the eastern suburbs sold for more than \$1 million. His personal tally of 25 million-plus sales include 11 at more than \$2 million and one for \$6.75 million. A rival agent sold \$50 million worth of properties over nine months last year. The agent who sold the \$8.3 million home sold eight \$2 million-plus North Shore coastal properties last year. He said homes on Takapuna and Milford beaches started at \$2 million’.]

...IT IS now relatively more affordable to rent or buy an apartment in New York than Auckland, according to a survey... [of] 18 cities around the globe... [P]roperty prices were higher in Hong Kong than any other city in the survey – \$US1.9 million for an apartment 30 minutes from the city centre, which meant it would cost 7.92 times the annual salary... [of] \$US240,000 a year... for middle ranked executives... [New York salaries were highest in the survey at \$US300,000, while] Auckland was second from bottom on the salary index, with an indicative salary of \$US90,000... [By the way, ‘six million people are crammed into Hong Kong, a city not much bigger than Wellington’...]

‘The housing chief in Hong Kong has resigned over the worst construction and public housing scandal in the territory. Two unfinished 34-storey government housing blocks are set to be torn down at a cost of HK\$250 million because of faulty foundations. The scandal, which touches a sensitive nerve in Hong Kong, has met intense public anger. Last month a Government-appointed commission blamed a subcontractor who had run into money problems for the fact that only three of 36 piles holding up the two blocks reached the standard depth of 40m. But the commission said the Housing Department was also at fault for failing to supervise the project closely enough’...]

Economic woes have rapidly changed the outlook of most South-east Asian property markets and developers and investors are in for a tough time... Some Singapore-based analysts say Hong Kong property prices might fall by as much as 30[%] at the top-end of the market... The Hong Kong property market’s plunge will also have significant impact on Singapore’s outlook as the latter had been a beneficiary of Hong Kong buyers seeking second homes... In fact, developers are already running to the Singapore Government asking for slower land sales on concerns of major price corrections... Already, stocks in Singapore’s property development companies have been dumped by international investors on that basis... Demand, estimated at around 7000 new condominium units this and next year, is unlikely to match supply, forecast at around 11,000 units a year. In Indonesia, new completions are expected to triple the existing stock of condominiums and apartments. Occupancy rates in Jakarta, for instance, were 62[%] at the end of 1996 but were expected to dip to an alarmingly low... 43[%] by the end of this year. Malaysia’s capital city... is also... heading for a glut... the new supply of condominiums is projected to more than double the existing stock with excess units likely to take more than three years to clear. Thailand is no different... with a five-year period needed to clear the backlog flooding the marketplace...

[NZers] who have bought homes as investments are biting the bullet as a glut of rental properties forces rents down... [The] Real Estate Institute vice-president... estimated that around 51,000 new landlords have entered the market over the last few years... [M]any... borrowed against their existing home to buy an investment property, hoping the rent would cover the mortgage... The overheated Auckland residential property market has been particularly hard hit, with inner-city apartments suffering most. “The inner-city market is just a shambles... It’s just a matter of supply exceeding demand, with more bedrooms than there are tenants to fill them, and there’s a lot more coming on the market. You’d have to have rocks in your head to be buying in the inner city at the moment,” said... [someone who] manages a large number of rental properties in Auckland... Competition for tenants was so intense that local landlords would often poach tenants away from houses owned by out-of-town landlords by offering a sweeter deal... And the worst could be yet to come as the country’s biggest residential landlord – H[NZ] – prepares to drop its rents as a result... But... rents had “plenty of room to fall.” They were now at an all-time high of 24[%] of the average wage. In 1970 they were about 12[%].

...‘in 1973, a 30-year-old USer earning the medium income for his age paid 21% of his monthly earnings for a medium mortgage on a medium-priced home. In 1984, he had to pay 44% of his income for such a mortgage. In 1973, 23.4% of USers under the age of 25 owned homes. By 1988, just 15.5% did. Among those in the 26-to-29 age group, the rate dropped from 43.6 to 36.2% according to a study by the Joint Economic Committee of Congress.’ • ‘Mortgage interest rates in NZ hit 23% in the late ‘80s’ (‘in 1986 NZ topped the international table of the percentage of people who owned their own homes; NZ is now 8th at 67% – Singapore, at 90%, is the new leader’)].

...Home mortgage rates jumped dramatically last night, with Countrywide Bank pushing its floating rate to 10.5[%] – and other major banks likely to follow suit. Precise figures were not available on exactly what the big rise – from 8.95[%] – would mean to most mortgage holders. But it will certainly be a jolt... The increases are effective immediately for new customers... Countrywide defended the 1.55[%] jump to the new industry high. The managing director... said it was disappointing but “we have been left with no alternative, in view of the unexpected rise in wholesale [interest] rates.” ...the Treasury predicts... floating mortgages... could rise... to 11[%] or more before falling below 6% in about 12 months.

...A widow is being] forced to sell her house because she can't afford... the cost of the mortgage, rates and maintenance... [Her] partner died four years ago. The marriage was a second one for both of them and... they didn't have a lot of money. The couple had been on national super but... [because of her age, then 54, she] was put on the widow's benefit which is worth less... She said there had been times she hadn't had the money to buy food for herself and so had no option but to put her house on the market.

...HOME buyers looking for a mortgage will soon have to go no further than the real estate agent who sold them their house... From next year Frontline Finance, an offshoot of Motor Trade Finances, will provide real estate agents throughout the country with competitive, point-of-sale mortgage finance... Home buyers would... benefit from low home loan rates through money provided by a method of financing called securitisation. Instead of borrowing money on the wholesale bill market to relend, or relending deposits like banks, Frontline Finance would tap into overseas lines of credit to onlend. These loans would then be bundled into debt securities and sold to institutions on the wholesale markets, with the international creditors being repaid. [In related news, 'a couple were checking out the housing market when an advertisement caught their eye – particularly the phrase “\$280,000 plus.” But when they saw the house, it was obvious that \$280,000 was hardly a fair offer. The real estate agent later agreed with them that around \$400,000 was more realistic, before trying to interest them in a \$350,000 property around the corner. Practices such as this have spurred the Commerce Commission to launch a crackdown on deceptive advertising. The real estate industry says it is like any other, with a small minority using dubious methods, but the acting manager of the commission's fair trading division said there were “major, systematic problems” in real estate that showed no sign of abating. In one of the first prosecutions of a real estate agent under the Fair Trading Act, the Orewa Property Shop, trading as “The Professionals,” was this week fined \$3600 for using photos of sweeping beach vistas to advertise homes not on the beach. The Orewa prosecution comes after more than a year of escalating action from the commission, which says that its attempts at educating the industry into compliance have failed. That campaign involved the Real Estate Institute organising seminars up and down the country to help agents recognise the limits on advertising.’

...‘Phantom bidders at auctions will be exposed under new ethical standards proposed for real estate agents. New, agent-initiated rules will ensure dummy or vendor bidders declare themselves, making the sale business more transparent. Dummy or vendor bidding is not illegal in NZ. It happens when a representative of the vendor or real estate agent bids for a property at an auction to drive up the price. The Real Estate Institute's moves are in line with the Victorian Government's ban on dummy bidding, introduced two months ago to overhaul the Melbourne house-selling system and impose fines of up to \$65,000 on real estate companies which break the law. In this country, a Christchurch case is being carefully observed by the industry for the impact it could have on the auction process. The case concerns the auction of a historic Lyttelton house advertised for \$110,000 when the vendors had set a \$235,000 reserve. The vendors said the only bidder at the auction last month – attended by 35 people – was the auctioneer, so none of the bids was genuine.’

...‘A security guard will be stationed outside an East Auckland open home today in a bid to deter thieves. The Real Estate Institute has warned agents to be on the lookout after 29 thefts at open homes across Auckland since June. A Century 21 agent admits that in his 16 years in real estate there has never been a theft from any of the hundreds of open homes he has overseen, but wants to send a message that agents are determined to protect vendors' valuables.’]

...With all the debate about whether there is any real value doing business over the Internet, one group that does seem to have taken to cyberspace, and shown positive results, is the real estate industry. There are several N[Z]-based real estate sites on the Net. In the U[S], there are over 8000 such sites. Local realtors report that the Internet is particularly useful in generating “out of area” leads – involving potential buyers, whether overseas or locally, wanting to know what's available in areas they are unfamiliar with or far removed from. Yes, the real estate industry is starting to smell an opportunity. A recent Main Realty newsletter noted that, “The Internet is definitely the future way of buying and selling real estate. That was the message emphasised by virtually all of the thousands of exhibitors and presenters at last year's annual convention of the American National Association of Realtors.” What's extraordinary about all this is that realtors could get so excited over a new communications tool that could well bring about their demise... Some say, that... [i]f buyers and sellers can sit at their PCs and... gather enough information about each other's offerings – and make an offer – why should they pay agents? In a paper delivered in N[Z] earlier this year, [a couple of lecturers from]... the University of North Texas College of Business Administration, noted that... “In any real estate market, information is power... This power has in the past been controlled largely by real estate agents...” At the same time, the inherent inefficiency with which information is handled in the industry “has been capitalised into the real estate agent's fees,” they said. In other words, when you pay an agent \$11,000 to dispose of your \$250,000 house in Glen Innes, you are also subsidising an inefficient system. What you are paying for are not only the costs associated with selling your house, but some of the costs involved in the agent having had to take four other people from house to house without concluding a sale. You are paying for their time wasted, and the overheads accumulated, on sales that never happened, or happened very slowly. One might ask, why are we prepared to pay all this money? The fact is there has been no efficient means of bringing buyers and sellers together, other than doing it through the official network of estate agents. Many have tried to bypass the system, and create their own market of buyers and sellers, with limited success... Recently, more concerted efforts have been made by new businesses specialising in private sales, and these have had some success. However, the Internet dwarfs all these efforts. Here is a cheap, efficient medium where anyone can set up a private real estate site with a modest capital outlay. More importantly, the Internet is capable of providing a level of information unmatched by other mediums...

[The ‘Real Estate Institute national president believes that most Auckland agents pay their top performing salespeople too much. South of the Bombay Hills, agents pay their salespeople about half of the commission gained from a house sale, he says. In Auckland, some get 80% of it. When he started in 1963, agents charged \$110 a sale. “We got 40% of that, and everyone was happy.”]

...Lawyers have blamed real estate agents for the rising cost of buying and selling houses and suggest they could do the job cheaper... The Law Society president... urged the Government to deregulate the real estate industry to allow consumers the choice of who to use when selling property. At present only registered real estate agents can legally do the work... [He] said estate agents benefited most from having a protected position. Ninety-one per cent of the cost of selling an average home in the Auckland region was agent's commission, with the lawyer's fee 9[%]. Since the real estate agents' scale of commissions was abolished 12 years ago, commissions charged had risen from 2.9[%] of the average sale price (\$137,000) to 4.2[%] of the present average (\$235,000). But since the lawyers' conveyancing fee scale was abolished in 1984, fees had gone from about \$460 (0.34[%] of the average sale price) to about \$500 (0.21[%]). This implies that... if lawyers were allowed to do both jobs, the public would get better value for money – although [the Law Society president] urged caution before taking away the monopoly lawyers have on property conveyancing work[, as was recently suggested by]... the Attorney-General... The[Law Society] call infuriated the president of the Real Estate Institute... who asked why lawyers would want to get into the business of selling property. [However, his question seems hypocritical considering how some real estate agents want to get into the business of selling mortgages! Many are already in the related business of managing rental properties on behalf of owners, who tend to be encouraged to increase their rents as often as possible – especially whenever the agent's fee is calculated as a percentage of the rent collected.]

...When it comes to maximising rent, landlords know all the tricks. However... lease... discrepancies are coming under closer scrutiny in N[Z], says the... managing director of a... firm which holds the A[US]n and N[Z] rights of American tenant representative Leasehold Analysis International. "Eighty or 90[%] is human error made by the property manager or landlord. The other 10[%] is landlords deliberately, dishonestly overcharging their tenant and waiting to see if they get found out... Accountants sometimes audit accounts, but in the U[S], even after a member of the Big Six accountancy firms has done it, they've found errors because they match invoice and payment. They don't go into the detail of whether the invoice was correct." ...[he] used an example from Sydney of how wrong measurements could make a huge difference. Westpac had contracted to buy a North Sydney building for \$70 million but checked the floor measurements made by the seller's surveyor and found a 20sq m error on every level. The result was a \$2.5 million cut in the price... The next category of overcharging was management and administration fees... [Most NZ] leases said these fees should be... fair and reasonable. A[US]n companies coming into N[Z] now are saying that means there should be a 100[%] increase. Incidentally, a)... Te Atatu North couple were able to sleep more easily last night after [HNZ] withdrew moves to evict them for not paying a rent rise... [following intervention from the] Minister of Housing... The couple... were relieved at the reprieve but say they will continue to refuse to pay the increase until their house, which has damp carpet and walls, is fixed... [HNZ], which manages the tenancy but does not own the house, is fighting with the owner... over who is responsible for repairs.

...Thousands of H[NZ] tenants in Auckland are set for rent falls as [a result of the coalition Government's demands for] a stronger social mandate from the company... However, the lower rents could be matched by a similar drop in the accommodation supplement... Meanwhile... Te Atatu residents are crying foul over a... bid to split up the last green space on the edge of Waitemata Harbour. The Waitakere City Council's city development committee will discuss a proposal today to divide 40ha of the council-owned... Te Atatu Peninsula into reserve and sites for "employment-focused development." ...But [the] mayor... said last night that any decision by the committee would have to be ratified by the full council – and that was not going to happen. "We, the elected members of the council, run the show and it would be a brave council that would go... and put in light industrial development." ...The... space... is adjacent to 30ha on which the council has initiated a seaside housing development.

...Standards are slipping out west, according to results of a... Waitakere City Council... questionnaire designed to gauge the performance of councillors and officers, and the effectiveness of council services... The annual survey, called Resident Link, provoked a mixed reaction from residents about the council's image. More than half failed to answer... [If the council is seeking inspiration, perhaps it should look to the east – where, for example, a] gorse-ridden Manukau stream in danger of being covered over to make way for housing has won a new lease of life. The watercourse, known only as stream 320, runs through former farmland in Flat Bush... The Richmond Park development... could have led to the stream being piped underground – a common practice in subdivisions. But with Manukau City Council approval and work by a youth training programme, it has instead been cleared and the banks planted with 12,000 natives. The ongoing \$200,000 project will bring walking tracks and a playground nestled among more than 3ha of landscaped reserve... In another break from housing development tradition, the stream will be flanked by a road and a single row of houses. That reduced the cost-effectiveness of the 300-site project, said the land development manager for Universal Homes... But the design made the area... safer for children... discouraged rubbish dumping... and added amenity value. "If you have houses backing up on either side no one ever uses it except burglars. We hope to eventually attract pukeko and other birdlife back into the area."

...[a doctor] is turning to the Court of Appeal in his fight over Rodney District... building consents. The council has received the news with alarm because of the prospect of adding to the \$51,000 legal bill it has run up defending itself against the Manly doctor's many actions... [S]o far... the council... had been awarded costs of only \$2500... [The doctor] believes the council should insist that his neighbour obtain a resource management consent to build a home because of potential danger to an oak tree's roots. The council granted a building consent a year ago, with a special condition that the owner... retain an arboriculture firm to supervise the tree as construction progressed on the Whangaparaoa Peninsula site. But [the doctor] objected, saying the council was palming off its monitoring responsibility... Since then he has pursued the matter several times in both the Environmental Court and the High Court.

...A... doctor's obsession with ensuring the safety of a 20m oak tree has been a farce and a financial burden for all parties involved, the Environment Court has been told. The comment was made by the lawyer representing a Manly couple whose bid to build a house next to the 37-year-old tree has brought them into conflict with their neighbour... "He [the doctor] has gone from court case to court case... this court, the High Court and anywhere he could fight this case. Every case he has lost, he has appealed... It has cost my clients, so far, more than \$20,000 and the... council about \$60,000... He doesn't know when to stop and it's been... difficult for my clients... to build their house on their chosen piece of land."

...Residents living on the hillside of Mt Eden are considering legal action against a neighbour who has bulldozed trees on the slopes of the volcanic cone to make way for a private sports complex. [The doctor] won an Auckland City Council resource consent in May to build a full-sized squash court, swimming pool and spa pool with a recreation hall on top... Neighbours said the consents were issued without consultation. They did not know about the plans until the bulldozers started... One neighbour... said many of the trees were natives. "He has totally remoulded the shape of the mountain. His house is so far up the mountain that it... does not look like Mt Eden any more because his buildings have almost completely covered the views[.]" The doctor, who is the... owner of Anaesthesia Auckland, refused to comment last night... But the council said submissions were called for in newspaper advertisements leading up to a resource consent hearing... Council files show he won approval from seven Maori iwi and several archaeologists before being granted consent to build the extension to his home, a few doorsteps from Government House. In his application, [he] said two trees would be cut down and that the mountain's appearance would not be affected.

...[a woman] could not stop the tears yesterday as she relived the horror of a lucky escape from a landslide that destroyed her... home... She had just gone to bed on Saturday night when her neighbour... rang to say he was worried about the earth moving under his house, farther up a hill from hers... [She] barely had time to run down the stairs... and ring 111 when, with a loud groan, [his] entire house came crashing down on to hers, trapping him inside his destroyed kitchen... [She] escaped unscathed, but [he] remained trapped for nearly two hours before the Fire Service cut him out with a chainsaw... "The Fire Service did a wonderful job... They risked life and limb to save him because while they were cutting him out of the house, the earth and the whole house were still moving..." ...He was taken to Auckland Hospital and last night was in a satisfactory condition... The Earthquake Commission will pay [both owners]... its limit of... \$112,500, and insurers will compensate them for the rest of their loss... Remedial work was done on the site yesterday to prevent any further land movement... She spent the day moving her belongings to her father's house on the North Shore – and looking for her charcoal-coloured cat... who has been missing since the landslide hit. [■ 'On December 3, 1981, three houses were destroyed by a landslide in the suburb of Grey Lynn. There were no fatalities.'

...*'On August 8, 1979, half a Dunedin suburb disappeared in a giant landslide. Scars on the land have healed, but for those who were there it still seems a bad dream.* During July, 1979, residents of several streets in the Dunedin suburb of Abbotsford had been woken by strange creaking and groaning noises – their houses were moving. Each day the cracks in the walls and pathways were widening. But when the slip came in the cold dark night it was something no one could have imagined. Seven hectares of hillside slid away gouging a 50-metre wide canyon which split the suburb in two. Parents and children, many in pyjamas, fled leaving behind all their possessions (some families had escaped only minutes before the slip). Many family pets were never seen again. In the darkness the slip site was enveloped by confusion and uncertainty, not helped by officialdom's efforts to keep journalists out of the disaster zone. No one knew if more slips were to come. At dawn a grim picture was revealed. In the canyon lay almost 70 homes, broken and squashed in the mud with furniture, cars and children's toys. More than 170 homes had been evacuated. As the initial shock subsided it was replaced by anger. Residents had been campaigning for weeks to have the suburb declared a disaster area, but in spite of growing gaps in walls and paths nothing had been done.'

...The... landslide that destroyed two houses[in Auckland] on Saturday was an accident waiting to happen... Slips in the area date back at least 50 years, and the residents say they have long been at loggerheads with the Auckland City Council to get stormdrains above the... properties fixed... [One neighbour, who] bought a 150-year-old cottage two doors down from the houses six years ago... was... not surprised at what happened. "I'm angry because two people could have died the other night because of the council's inaction." An engineer's report into a slip on his property on July 1, 1979, said: "The present situation is precarious, with many tons of soil poised to slide down... there is a real probability of disaster to the houses below." [Another neighbour] and her family were evacuated from their... house... when a swimming pool in a neighbouring property started to crack and sent water down the hillside, collapsing the retaining walls... The insurance agencies said they would consider recovering their costs from the council, which has commissioned a report into the cause... But the council's public relations manager... said yesterday that... it was unlikely the council could be held directly responsible.

...The clean-up of a second major landslide in Auckland will fall on the shoulders of the Auckland City Council. A hill... in the central business district slipped after heavy rain on Sunday, sending tonnes of soil and shrubs into... [a] building... carpark... The council public relations manager... said he was sure the council would clean up the mess... because it was council-owned land which had fallen... Engineers assessed the site yesterday, but made no decision on how the hill would be stabilised... Workers in the office received parking tickets because their cars had been [trapped] in restricted time parks... Meanwhile, a slip has closed off a section of Scenic Drive in the Waitakere Ranges[. • 'About 300 slip-related house and land damage claims to the Earthquake Commission have been filed so far this year – some 50% more than usual. Most were from Auckland']...

In a climate like Auckland's there is always an element of risk when houses are built on sloping ground but, engineers say, the trick is to minimise it. That includes adequate stormwater drainage. But what is adequate when a 12-hour downpour dumps more than 40mm on some suburbs...? That is almost impossible to define... The two previous winters had been among the wettest on record and... Earthquake Commission... payouts had jumped sharply to \$5.75 million... the commission's insurance manager... said. "The land hasn't had a chance to dry out before another bad season. It's so sodden that it just can't take any more." Included in those payouts was damage to properties in Glenfield and Torbay caused by landslides on steep subdivisions. A North Shore engineer and city council consultant... said that with recent development there was more building on "marginal land in terms of stability than was the case in the past..." The Earthquake Commission had managed to stabilise both the Glenfield and Torbay slips and the home sites were now all right for building, if precautions were taken to[prevent] any risk of further movement, he said. Pole houses might be the most suited for steep slopes, but there was no guarantee they would hold where others might slide... West Auckland is another area where houses hang... above steep slopes. Waitakere City Council's strict ordinances include the preservation of trees and bush cover on building sites and subdivisions to reduce land movement as well as to retain the city's "greenness," said... [the] manager of the city's regulatory services. "We don't permit any wholesale stripping of land or clearing of trees. Of course, most people who build here are usually tree lovers, but nevertheless our bush clearance controls are so tight that we don't have too many worries,"...

Landslides have swept down on isolated villages in China and a state capital in India during the past few days and killed up to 178 people, many of them in their sleep. In the worst landslide, 150 people are believed dead in a mountainous area of China's south-western Sichuan province... The torrent of mud and rocks in China fell after two days of heavy rain. It turned parts of four villages in the Yangshanzhou region into a lake of mud and destroyed 84 houses and damaged 223... And in the Indian city of Gangtok, capital of Sikkim province... torrential rains triggered a series of powerful landslides that killed at least 28 people... Mountainous Sikkim is hedged in by Tibet in the north, Nepal in the west and Bhutan in the east. Landslides are common in the region during the monsoon... [In local news, t]he Kaipara District Council has been criticised for a slow response to concerns about a landslide near four Dargaville homes. After heavy rain about three weeks ago a slip knocked down about two thirds of a 35m concrete retaining wall behind some units, and on Tuesday the council advised 11 tenants to leave after another section of the wall collapsed. One tenant... said she was upset the council had not acted sooner. The... problem first came to... the... council's... attention earlier this week.

...The Auckland City Council has started a \$60,000 cleanup of an inner-city slip, but the owners of the affected building say work should have started sooner... "People with their offices right below the slip are quite apprehensive about working under it,"... [However, t]he... council's property manager... did not accept the council had been slow to react... "I think we have responded very quickly. We got an engineering assessment immediately..." ...[In related news, the council]'s insurers may be stopping it from admitting liability for the... landslide that claimed two... homes[last month]. The Hobson councillor... said last night that in such a situation, the council's insurers took over and it could not get involved... A group of... residents appealed to the Hobson Community Board on Wednesday night to get the council to stabilise the ground and improve drainage. However, to so do could admit liability and the board felt it was an issue for the works committee... Reports show that... the council was warned in 1947... [about the] imminent danger of[a land] collapse.

...Two... sections have lost their insurance cover for natural disasters after a landslide destroyed two houses last month. The Earthquake Commission's insurance manager... said yesterday that it had accepted claims for both... houses and for damage to a third house... But he said the land titles of the two destroyed houses would be flagged, as required by law, and the commission would not insure the two sections until the owners had completed remedial drainage work at their own expense. If either property was found to be a write-off, the commission would pay the value of the minimum property size allowed by the Auckland City Council in that area – about \$100,000.

...The Fire Service in Auckland fielded about 70 calls on Saturday night and early Sunday morning, mostly reports of flooding and road slips, after rain had fallen steadily all day. More showers are expected today. With ground still saturated, more slips could result... [Incidentally,] Fielding police believe an electric single-bar heater caused a fire that swept through a caravan killing two... children[over the weekend]. The 9-year-old girl and her 5-year-old brother were asleep in the caravan with their mother and two-year-old sister... The mother escaped with the youngest child but her attempts to return to rescue her elder children were thwarted by the intense heat... [According to fire officers, 'the 9-year-old got half-way out of the caravan before being overcome by fumes while the 5-year-old appeared to have tried to hide from the flames under a blanket in the corner.'] A Fire Service safety spokesman... said a \$20 smoke alarm might have saved the children. "The risks of death from fire are even more hazardous in a small, confined space like a caravan." - 1997

The Fire Service and Insurance Council are calling for compulsory sprinkler systems in rest-homes following the deaths of two residents... in Fielding... early yesterday... The Licensed Rest Homes Association [responded by blaming] Government under-funding for the lack of sprinklers[(which, according to 'research, fail where computers or TVs catch fire because plastic doesn't produce enough heat to immediately trigger them')]... The president of the association... said putting sprinklers in an older-style, 18-bed rest-home would cost nearly \$40,000... However, [the]... Auckland fire hazards manager... said he did not generally accept the poverty cry and fire safety had to be given higher priority. "We don't allow people to drive around in unsafe cars because they don't have enough money... we do not allow hospitals to operate that are unsafe," he said. The Fire Service had run an aggressive campaign in past months targeting the 150 rest-homes in the Auckland region... [but] he could not say what proportion had sprinklers. The Insurance Council also has taken a hard line, saying the Fielding fire could easily have been prevented. "The cost of [sprinkler] installation should be seen as the cost of running a commercial enterprise. Those who can not afford this basic safety requirement should not be in the business," said the [ouncil's c]hief executive... All new rest-homes with more than 20 people must have sprinklers. A cigarette is thought to have started the Fielding blaze... The home had smoke detectors, fire walls and an alarm system. Thirteen residents were safely evacuated... Some of them yesterday were at a nearby rest-home; others were being cared for by their families... Rest-home associations told the

N[Z] *Herald* in March that many owners were struggling to stay afloat on inadequate Government money, paid through the regional health authorities[(RHAs)]... North Health, which buys services for the Auckland/Northland region, said it looked favourably on homes equipped with sprinklers when deciding which to fund... [– although it is up to each rest-home to decide on] the best way... to use their money... to meet both patient care and safety.

...The Government has placed caveats on nearly 1500 homes owned by old people in order to secure loans to pay for their long-stay hospital care. The Labour social security spokeswoman... said that although public focus had been on[one particular] Far North pensioner... there were many more who together owed... \$26 million for long-stay geriatric care. “A... further \$12 million has already been recovered.” ...The Government’s approach was shameful, [she] said. Asset-testing... was cruelly unfair. “No other group is required to pay for long-stay hospital bills except older N[Z]ers who have already paid years of taxes and saved a little for their retirement. It seems the Government sees them as a major revenue earner for the state. It looks upon older people as a defenceless cash cow to be exploited because their assets are easily obtainable... [The Far North pensioner], aged 80... has received national publicity over his refusal to pay \$30,000 towards the care of his wife, [aged] 84, who is in Kaitaia’s long-stay unit with Alzheimer’s disease. [He] has already paid \$21,000 towards her care but is refusing to pay the next bill, which is increasing daily... Under the Government’s income and asset-testing policy, [he] must subsidise his wife’s care because the couple have assets, other than a house, worth more than \$40,000... Northland Health has now served papers on him to pursue the debt.

...The last time he was in trouble with the law was as a 16-year-old who gave a smart answer in a Whangarei billiard saloon. For that indiscretion he came close to feeling the summary justice of the day – a kick in the backside by a disgruntled constable. Since then he has never had so much as a traffic ticket. Nor has he borrowed any money. But in the eyes of the restructured health system he is a defaulter who unless he pays up will be charged in the same Kaitaia court where thieves and drug dealers are regularly dealt with... [I]t is as if in his twilight years the stable ground he has walked and worked on all his life has turned to quicksand... At the kitchen table of his neatly presented... home... [he expresses] amazement at the momentum gathered by his stand... “I never dreamed it would end up like this. Refusing to pay those bills is just something I did off the cuff... I’ve had phone calls and messages of support from all over the country, it is all new to me. I had never protested about anything before, never. But I was having a beer with some of the boys at the golf club after paying the first... bill... and then receiving another one for \$8000 when one of them said he would not pay a bill for that sort of thing. That started me thinking... It all seemed so wrong. One of the chaps in the ward... was smashed up in a road accident... and has been there ever since. He has to be fed and toileted just like Alzheimer’s patients but his family don’t get any bills.” ...The couple... who were unable to have children... went to work for the same grocery chain for 28 years... until they quit the company in 1970 to set up house at Ahipara. It was not until... six years ago, when an elderly neighbour... mentioned that she thought [his wife’s] memory was failing, that their long retirement was anything but ordinary... [H]er condition... gradually[deteriorated]. He looked after her at home for as long as possible but one day in 1994 the inevitable happened: [she] was admitted... for long-stay care. Six days a week ever since, apart from when his own health has prevented it, [he] has driven to Kaitaia to visit her. Included in his ritual is a chocolate fish and when he gives it to her he thinks that on most days she recognises him... Elderly patients suffering from Alzheimer’s are required to contribute to their long-stay care because Alzheimer’s is considered to be an “age-related condition” that does not qualify for free hospital care. [However, ‘people can also get it in their 40s and 50s. ● 10% of over-65-year-olds will get Alzheimer’s.’]

...A MAN fighting Northland Health over a hospital bill for the care of his wife said he was humbled by a protest march in Kaitaia yesterday. A crowd estimated by police at more than 500 marched through the town... Many more lined the streets as the march, complete with pipe band, brought the central business district to a standstill... He... was too frail to take an active part... [himself and] his wife would not be aware of the march. She was too ill to comprehend what was going on.

...The fight between a Northland pensioner and the region’s crown health enterprise [(CHE)] appears to be far from over. Confusion arose yesterday when Northland Health said in a statement that it was withdrawing court action against[the] 80-year-old. But that does not mean the [CHE] has decided to drop efforts to recover around \$36,000 which it says... [he] owes for the hospital care of his wife, Ida.

...Public hospitals have been thrown into confusion over whether to charge some older people for on-going care. The High Court has dismissed a case against a 57-year-old Palmerston North Hospital patient with dementia for \$33,000 of care. The case, taken by MidCentral Health was the first to test a 1993 amendment to the Social Security Act which allowed hospitals to charge people under 65 for on-going care if they have no spouse or dependent children and are “close in interest” to people over 65. The High Court at Palmerston North questioned the hazy wording of the amendment. [The judge] said he was unsure what “close in interest” meant. He urged Parliament to consider writing guidelines on the meaning of the phrase and how it was to apply... The chairman of Northland Health... said he doubted whether anyone at his [CHE] had heard of the amendment. He said the interpretation problems were another example of a system over-burdened with legislation that few could understand. A Ministry of Health spokesperson said the ministry would work with [CHEs and RHAs] to clarify the issue... [Meanwhile, a Northland pensioner] is still holding out against a Northland Health bill... which rose this week to nearly \$39,000. - 1996

Northland Health is refusing to... confirm or deny whether... it will pursue an outstanding debt of just over \$58,000 from[an] 81-year-old... Last August... Northland Health summonsed [him] to appear in the Kaitaia District Court to sign a document to make him his wife’s guardian so legal proceedings could start against him to recover the money. But on August 19 the [CHE] decided to cancel the hearing and instead mail... the necessary papers, which he never signed.

...Ten days before his wife died, [the] Northland pensioner... learned health authorities were to renew their efforts to recover money he owed for his wife’s care – with the backing of the Minister of Health... Yesterday the minister refused to say whether his support for Northland Health had changed since [her] death. He considered it inappropriate to comment on the day of her funeral, a spokesman said.

...N[early all NZ]’s elderly will continue to be asset and income tested if they need resthome or hospital care, despite measures announced in the Budget. The Grey Power Federation has only belatedly realised the good news... was far from what it was cracked up to be. The Budget suggested... testing for the elderly was to go from October next year. But the fine print spelt out that... testing would be abolished only for people in long-term public hospital care. Asset testing for... long-term private hospital care was also abolished, but [patients] would still be income tested. And, most critically... testing for those in resthomes was to stay... [M]ost people who needed care first went to a resthome, which provided a lower level of care than a hospital. A couple... need[s] around \$1000... a week to pay for it, and many would be forced to sell their homes to meet the bills.

...A 97-year-old woman had her foot partly eaten by gangrene this year because she was not given adequate rest-home care, the Hospitals’ Association said yesterday. Many more elderly patients were suffering because their needs had been poorly assessed. Medical staff in hospitals continually saw “gross negligence” in elderly residential care, often leading to serious health problems... The... association... blamed funding constraints, family interference, delays in assessments and rest-home operators wanting to keep beds full... forcing the patients to stay in rest-homes when more specialist treatment was needed.

...A funding crisis in the Midland Health Region will see old people shut out of rest-homes unless it is considered “unsafe” for them to live in their own homes... [Its] chief executive... said yesterday that Midland Health would fund 50,000 fewer rest-home beds than last year.

...[James Lynch] is our most patient [in-]patient: he has spent 40 years in a bed in the same ward of Tauranga Hospital... [where the staff have become] his family... It has been a confinement impossible for most people to imagine... but he... has touched the hearts of hundreds with his

indomitable spirit and uncomplaining manner... A heroic act 66 years ago cost [him] a life to savour. As a 14-year-old, orphaned when both his parents died in the 1918-26 influenza epidemic, he was visiting a ship berthed in Tauranga when he saw a sailor holding a live cable. He grabbed the man's hand to pull him free, but could not let go as the current passed through him. [‘Tragically, the sailor had been fatally electrocuted. The 14-year-old was so badly injured’ that o]ver the next 26 years his body’s motor functions slowly deteriorated, until he was admitted... in November 1957... to the ward that is still his home... [He has become] almost completely immobile and[can be] understood only by those he is close to... [H]is eyes are sensitive to light... But... [he] can thank his lucky stars that he slipped through the health-reform net. Under today’s cost-cutting service, he would not get a bed in an acute hospital such as Tauranga, let alone live there for 40 years. Acute hospitals generally deal only with the sickest patients, who need urgent medical care or surgery. Elderly people needing long-term care are usually transferred to cheaper, smaller, often privately run hospitals. Fortunately... the accountants seemed to look the other way – perhaps deliberately – when his case was considered. Even[the] health reforms champion... could not remember last night exactly why he had let [him] stay when he ran Tauranga Hospital in the early 1990s[while the]... Western Bay Health customer services manager... said the 40-year stay was “proof of compassionate service.” She said [James] had “his own special fund” through “a private arrangement” with the [CHE].

...Northland Health... is being praised for its performance after returning a... \$499,000... operating profit for the year. Northland is the only one of the 23 CHEs to have met its budget forecast and return an operating surplus... [O]nly two others have achieved a bottom line profit... The latest indications are that Southland, about the same sized operation as Northland, will report an \$11 million deficit for the year. In total, the country’s CHEs will fall \$200m short for the year, a deficit increase of 28% over the previous year... [when ‘only two CHEs stayed within budget and services provided by the enterprises exceeded Government funding by \$403 million – although income from hospital charges (e.g., \$50 a night for people who earn above a set level), investments and selling or leasing assets cut the 1996 operating loss to \$164.2 million, taking the accumulated operating loss since July 1993 to \$546m.’ Northland Health’s] profit... would be invested in more health services for... [the region. The profit hasn’t, however, softened the CHE’s position regarding a] Kaitiaki pensioner... Northland Health is continuing with legal moves to recover \$58,000 in unpaid fees from [the pensioner]...

Medicine is an industry that defies the normal market-balancing forces of competitive suppliers and consumer price resistance. The retailers of medical knowledge are a tightly unionised profession so anti-competitive that it forbids its members even to advertise. But... I once heard an American medical insurance executive get to the heart of it. Health care, he said, is unlike any other product because there is really no limit to our demand when our bodily well-being or even life might be at stake. The normal cost-benefit equations we all make for every other thing we buy – education, legal services, property security, for instance – do not enter our heads when we have a health tremor. Ask yourself how much you would lay out to save your health. More than... the Government spends on your behalf probably. You would bankrupt yourself if it was a matter of life and death. And such is our ignorance that health can easily seem a matter of life and death... When governments and insurers become more assertive consumers on our behalf – when demand is as well organised as the suppliers – then they will reasonably set limits on the costs we have to accept. Until then services will expand on the pretext that “patients demand them.”

...waiting lists and unending public clamour for better services and the latest high-tech equipment had... long been the source of continuing political embarrassment for whatever minister of whatever party had been unlucky enough to occupy the health minister’s chair... [F]or many decades, the nation’s health system comprised of a Health Department in Wellington, elected hospital boards which managed public hospitals and numerous independent health practitioners, specialists in private practice, private hospitals and agencies like Plunket and IHC[(originally the ‘Intellectually Handicapped Children’s’ service, it now also handles mentally disabled adults)]. There was little co-ordination between any of them and all were paid for in different ways... “What we found was that nobody knew the value of anything... Money was just poured into the system. If a service cost \$20,000, how did you know if that was good or bad unless you knew the value? You can’t compare it with what other people could do with the same resources... You couldn’t find out the value of health services because there were no markets and no prices. We wanted to introduce markets into one of the most heavily socialised areas of our economy.” ...“In the early 1980s, it was thought it would be fairer to base hospital funding on an area’s population and demography. The process was begun, but by the early 1990s we still didn’t have equity. It was hard to shift boards to equity funding if it meant taking money off them.” ...[a report] recommended replacing the bureaucratic Department of Health with a small health ministry charged with giving policy advice to the government. Beneath the ministry it proposed a tier of “regional health authorities” whose job w[as]... to decide what health services were needed and buy those services on behalf of the public from hospitals, doctors and agencies... Instead of public hospitals being funded by block grants each year, they[’]d... be funded according to the services they provided. [RHAs] would not be limited to buying services from public hospitals – private hospitals could also tender. This would provide the health market that... was needed.

...[‘trends in the private health sector since the health reforms do not necessarily provide comfort that, as an alternate provider, it is superior. Early last year I was in need of a hernia operation. Being fully insured I did not even stop to consider whether the public system would be in a position to provide the operation at a time that was convenient to me. Once he determined I was insured, my specialist agreed he would carry out the task at a private sector facility. All went well with the operation and my turnaround at the hospital was about 24 hours. The bill for the operation was \$5500. Now, from friends in the medical supplies and surgical fields I obtained an informed audit of the costs to find: The hospital’s mark-ups on individual elements of the largest single item, surgical sundries, are obscene – up to several hundred per cent in several cases. Hospital sundries also were subjected to similar pricing. The total cost of the operation could have been performed profitably for \$3000. Now, being disposed to market solutions, I have little objection to any individual player pricing his services at whatever he likes and if he can extract a premium all power to him. After all it is the regulations which define the competitive environment that limits the scope for market exploitation. In my case a couple of normal “checks” on the activities of the supplier were absent. First, why did not I find out the cost before I purchased? I didn’t care. I am insured and I have almost without exception been rebated from my health insurer each year more than my premiums. So I figured I wasn’t paying, the rest of the insurer’s clientele were. Secondly, wouldn’t there then be a check on pricing by the insurance company? When it comes to health care, our personal ignorance of the true costs, our general acceptance that the public system cannot deliver when we want treatment, and our preparedness to insure against all health risks the industry will offer to insure, leads us collectively to be quite insensitive to the shared, premium cost. After all, the premium is but a fraction of the direct cost we might face if one of those really serious surgical needs fell upon us personally. This, of course, is the hazard faced by the American health system. The cost of health care just keeps rising inexorably as the insurance industry invokes a cost-plus approach to its suppliers’ market power.’]

...We’re a pretty healthy lot, we N[Z]ers. Our life expectancy is among the best in the world and keeps rising. With a few exceptions, our major illnesses are the diseases of affluence, not poverty. If we get sick or are injured in an accident, highly trained doctors and well-equipped hospitals are waiting to treat us, for little or no personal cost. A visitor from Somalia or even the U[S] might think the state of the nation’s health system would be the least of our worries. On the contrary, it’s the number one political issue... it far outstrips issues like immigration, racial problems, interest rates, housing, unemployment, law and order and virtually everything else that regularly creates headlines, according to a... poll published on July 13... Probably because hardly a day goes by without newspapers, radio and television running prominent stories on the latest problem in the health system. While this article was being prepared... the news was[about] the man who for a time came to epitomise the alleged failings of National’s bean-counting health reforms, [an] Auckland pensioner... denied kidney dialysis until he went on [a current affairs] show. Far from treatment being of little use to him as he was told, it seems he’s now in good health... The[National] Government’s health reforms were meant to

cut costs, reduce hospital waiting lists and make everyone happier. Instead, costs and waiting lists have soared... Every government for more than 20 years has stumbled on health. The time might have come to accept that health is a voracious black hole no amount of money can satisfy... - 1997

There are many problems associated with providing a universal free health care system (e.g., tax-funded health means healthy people subsidise the unhealthy; people may be less inclined to worry about their health if they don't have to pay for it; free health equals a sick health insurance industry). However, the problems associated with a user-pays system are at least as bad, if not worse (e.g., poor people can't afford health care; health insurance means that *healthy people subsidise the unhealthy*; it creates a paradox whereby insurance companies want people to be healthy in order to maximise profit but doctors want them to be unhealthy *in order to maximise profit*! Since 1993, NZ's public hospitals have been expected to compete on the open market and also make a profit (or at least break even), effectively taking the country's health industry down the path that leads to the US version – where patients may be given an expensive treatment when cheaper, more effective treatments are available, and some doctors deliberately prescribe medication to people for illnesses that they haven't got (a consequence, perhaps, of drug companies competing with each other to give doctors perks for supplying their products).

Is this factory making essential medicine or creating a market for it?

Her career was faltering, her weight was ballooning, she was drinking too much, taking too many prescription drugs. The world was stunned when three of her doctors were investigated for prescribing nearly 19 thousand drug doses to [the actress (r:p18, ln20)] over a single five-year period.

Despite a dazzling career, romances with some of the world's most eligible men and a fortune measured in the hundreds of millions, [the actress] lacks the one thing we all need most – good health... [She] has admitted to taking more than 10,000 tablets during her life, which has included more than 40 stays in hospital, 30 major operations and two stays at the Betty Ford Clinic to fight drug and alcohol addictions. A renowned doctor shopper, she has also battled the bulge, at one stage ballooning to 81kg. "People like... [her] go through their lives looking for a magic cure,"[a] psychologist... says. "She's looking for something to fix her pain. When the doctor or husband doesn't work, it allows her to repeat the cycle again." ...The latest instalment in a life-long saga is a tumor – believed to be benign – about to be removed from her brain. - 1997

"Is brain cancer mortality increasing in industrialised countries?" "Without any question it is." "Why?" "We don't know... There are multiple factors we have to look at but one of them may be, for some people, increased consumption of Aspartame." Better known by its brand names, NutraSweet or Equal, Aspartame is the most popular sugar substitute in the world. Since the [US Food & Drug Administration (FDA)] approved it back in 1981 it has become a multi-billion-dollar industry. It's now being used in thousands of products, from table-top sweeteners [and] children's vitamins to diet soft drinks. What most consumers don't know is that... [some people] have reported more than seven thousand adverse reactions, ranging from dizziness... to seizures. But the makers say it [is one] of the most tested food additives ever, and is safe for the tens of millions who use it worldwide... [However, a doctor] who has been studying Aspartame's effect on the brain for more than twenty years disagrees. He is the neuroscientist at Washington University's School of Medicine... "We've found that in the last eight or nine years, which is about three to five years after Aspartame was approved, there has been a striking increase in the incidence of malignant brain tumours." [He] does not say flat out that Aspartame is responsible for the rise... but he does believe that his analysis of the data shows that it's the most likely suspect... and... he says, the same type of aggressive brain tumours found in the Aspartame animal studies over twenty years ago are now increasing in the American human population... "...I'm saying that there is enough basis to suspect Aspartame... FDA needs to reassess it and this time around... do it right." ...Aspartame was discovered in the mid-sixties... The FDA originally approved Aspartame back in 1974 but FDA investigators soon found serious problems in some of the studies... submitted to the FDA and so a task force was formed to investigate... Because the FDA taskforce found so many discrepancies in... late '75 the agency put the approval on hold... The FDA Commissioner back then... said their investigations revealed "...a pattern of conduct which compromises the scientific integrity of the studies." "According to the FDA... [the manufacturers] in making their presentation to the FDA had wilfully misrepresented the facts and had withheld some of the facts that they knew would possibly jeopardise the approval of the product[," said a former senator and chairman of the Consumers' Federation of America. "... FDA officials themselves were so upset that they sent the file to the US Attorney's Office in Chicago for the purpose of presenting it to the Grand Jury as to whether or not there should be indictments. It wasn't presented, it was delayed." ...[Furthermore,] the US Attorney who[eventually] led the Grand Jury probe withdrew from the case while he was in... discussions with[one Aspartame manufacturer's] Chicago law firm... [for a] job that he later accepted. The investigation stalled and the Statute of Limitations on Aspartame charges ran out. As a result the investigation was dropped... [The current FDA Deputy Commissioner said recently:] "The critical question is not whether there were... mistakes made in recording data. That clearly occurred. The scientists looking at that information decided that the basic strength of the conclusion remains intact... We believe that based upon all the information that we've received to date that this is a safe product." ...[but the senator says:] "...I found 164 studies. 74 were funded by the NutraSweet industry. Every single one of them attested to the safety of Aspartame. Of the 90 independently funded studies, 83 identified the problem... I think it's inappropriate for researchers to have a vested interest in the outcome of their research." ...[an epidemiologist agreed with him, and went on to say:] "...when we have evidence that something produces cancer in animals, we'd better pay attention to that evidence. That's a basic tenant of public health..."

The high incidence of disease in rapidly expanding urban areas, in the 2nd quarter of the 19th cent., provided the impetus in the U.S. for research in public health. In 1847, the American Medical Association[(AMA), which was]... founded in... the interest of the medical profession – to improve training facilities, to set up a code of ethics for doctors, and to spread knowledge of medical progress among the general public... [while] opposing the replacement of private medical practice by government agencies and programs... [-] surveyed 12 cities... and documented the relation between illness and urban filth... In 1849, the Massachusetts legislature authorized a survey of state health conditions by the Massachusetts Medical Society in association with the American Statistical Association. The findings led to recommendations... which included all major aspects of modern public health practice: standard census and vital statistics compilations, a centralized board of health and local branches, a health education programme, and specific measures for sanitary control. Little implementation of this program took place until after the Civil War... In 1872, the American Public Health Association was formed and surveyed the extent of organized public health activity. Medical discoveries and new techniques constantly added to the effectiveness of public health practice. Federal activity in this field, as in other fields, has broadened widely in the 20th cent. The *U.S. Public Health Service* is a Federal agency which had its origins, in effect, in 1798, when Congress passed an act providing for hospitals for care of merchant seamen. Since 1953, it has been under the Dept. of Health, Education, and Welfare.

In 1953, [a] US Senator... began a Senate investigation into the cancer industry... [which] concluded that the AMA, in collaboration with the NCI and FDA, entered into a conspiracy to suppress alternative, effective cancer treatments... The A[MA]... has a long history of corruption. Its most infamous leader was Morris Fishbein who reigned from 1924 until 1949. He had failed anatomy in medical school and had never practised medicine a day in his life, but during his years in power he was recognized as the virtual dictator of American medicine... [H]e "managed to hold

back the twentieth century for 50 years for the benefit of organized medicine"... Those who paid large advertising sums to the AMA Journal were given the AMA "seal of approval" for their products, despite the lack of any benefit, while those who wouldn't pay the advertising tax often had their products labelled as worthless. It was essentially a lucrative blackmail scheme. Fishbein supported drugs but adamantly opposed any food or natural remedies. Fishbein's opposition to any therapy or technology unrelated to drugs was based on the simple fact the AMA's power base and economic growth *required* drug sales. Anything which threatened the growing dependency on drugs threatened the AMA's entire empire. Public health was not and could not be the primary concern of the AMA... Evidence... suggests that Fishbein ignored medical documentation to the effect that products promoted by the AMA were dangerous... [O]ne such product caused blindness in a number of people. Another quietly killed people in their sleep. Another was so poisonous that it eventually caused the deaths of many, many people. Another of Fishbein's primary interests was his attempt to corner the rights on promising cancer treatments, or insure that any cancer treatment which threatened AMA financial interests was kept from the public. When the owners of a promising cancer treatment refused to sell it to the AMA, "difficulties" started[(e.g., 'their laboratories were burned down; the inventors were imprisoned or murdered; doctors who used the treatment had their licences revoked')]. In collaboration with the government and private interests within the cancer industry, Fishbein and his successors have left a history of illegal acts, bribery, conspiracy against medical innovation, monopolistic suppression of competitors and contributing to the physical mutilation and death of patients and consumers... There is reason to believe that the AMA has been hasty, capricious, arbitrary, and outright dishonest[said a]... 1953 Congressional Record... In 1971, the AMA's Council on Drugs, an independent group of scientists and doctors, completed a \$3 million evaluation on prescription drugs. Over 300 experts had been involved. Unfortunately[the then] chairman of the board of directors of the AMA, did not like what the independent council concluded in regard to drugs. He asked that the report not be published until "our friends" at the Pharmaceutical Manufacturers Association... looked at it. The P[harmaceutical Manufacturers Association] came back with "three or four crates" of revisions, but the Independent Council refused to make major changes, especially in its criticism of the drug companies' heavily advertised drug combinations. In September 1972, a second edition of the "AMA Drug Evaluation" was ready and the Council gave the AMA Board of Directors another advance look. One month later, the AMA disbanded its independent Council on Drugs. On February 6, 1973, two former chairmen and one vice-chairman of the AMA's Council on Drugs testified before Congress. They accused the AMA of being "a captive of and beholden to the pharmaceutical industry". The ad revenues from the drug companies, which had been the basis for the AMA's power and had distorted medical procedures and policies for decades, was shown to be still the driving force behind the AMA in the 1970's. It hasn't changed in the 1980's and 1990's. Policies and procedures which are in the interest of the public, but not in the financial interest of the drug companies, are suppressed. In 1987, the AMA was found guilty of conspiring for 20 years to destroy the profession of chiropractic.

MAJOR drugs companies are banding together to fight the mounting threat of [unscrupulous companies or individuals]... flooding the world with weak, adulterated and counterfeit medicines. Representatives of the pharmaceuticals giants put competition aside and met in London 10 days ago to discuss how to tackle a problem believed to cause thousands of deaths every year. The... meeting was told that... about 10% of medicines sold outside the Western industrialised countries were believed to be fake. In some countries, especially [in]Africa, the figure might be 60%. Many of the bogus drugs are simply copies of the genuine medicine but sold rather like a fake Rolex watch, as though they were the real thing. Others may be more or less safe but the dosages will be wrong. In the worst cases, they are made up of anything from coffee and sugar to toxic chemicals. Some are manufactured in factories, others brewed in bathtubs... 2500 to 3000 children are believed to have died in the African state of Niger in the past year after being injected with a fake anti-meningitis vaccine. The medicine, hidden among batches of genuine vaccine, bore the labels of highly reputable British and French firms. In a notorious case in Nigeria, 109 children died in 1990 after being given a syrup that turned out to be antifreeze solution. Some 250 children are known to have died in Bangladesh in the past few years in similar cases... [F]raudsters in Europe were making large amounts of money exporting to the former Soviet Union, although... Russia and neighbouring countries would ship counterfeit medicine to the West within a few years... Drug companies, which spend billions on research and development, are understandably keen to stamp out the trade.

...One by one, the multinational drug companies are leaving N[Z], and as each one goes, the last remaining Kiwi [drug manufacturer]... grows bigger... While the company's growth has been fuelled by the success of its own drugs, much has come as a dozen multinationals which once manufactured here have left... The latest departure... saw [the Kiwi company] take over its clients, products and its marketing personnel... [The Kiwi company] also acts as agent and local manufacturer for four other multinationals which have decided to quit the N[Z] market... Turnover for the family-owned company, which started life as a chemist shop in west Auckland 40 years ago, has risen 25% in each of the past few years... To keep up... last week[the company] opened a \$15 million manufacturing facility with the capacity to produce half a billion items a year... It's a long way from 1957... Then, pharmacists weren't allowed to own more than one shop... Despite such rapid growth and big plans to boost exports – 20% of the company's production this year is destined for Asia – the company won't be raising capital by going public... Around 40% of the drugs [it] makes are generics... And sometimes... [the company] has been able to make... drugs because of legal oversights by others. Frucid, a diuretic and one of the company's mainstays since 1974, came about when the German company that developed the original drug forgot to register a patent in N[Z], believing we were part of A[US]. The Kiwi company saw the loophole and went for it. Growth may be rampant, but it's not all beer and skittles in the drug world. One of [the company's] concerns is the lack of [local] incentives for research into new drugs, in contrast to A[US] where government subsidies to manufacturing and research has led to a thriving pharmaceutical industry and a steady stream of patents being filed on new drugs. "With our academic base in N[Z], we could be doing some very good things in original research if there was a return. But as the market sits in N[Z], you're not going to get reimbursed in selling price, because our selling price is around the lowest in the world. And you won't get reimbursed for new products. So what incentive is there...?" [The company], and the rest of the industry isn't happy with the way the government handles pharmaceuticals. The health reforms created Pharmac... which manages a kind of Schindler's List called the pharmaceutical schedule. Chemists who fill out prescriptions for drugs not on the schedule don't get reimbursed... So if a drug isn't on the schedule, chemists won't stock it. Not only does Pharmac decide which drugs get reimbursed, but it also effectively decides the price companies are paid for their drugs. Companies... have to meet the price or miss out on Pharmac's list... "There's no easy solution. We understand the Government's need to control expenditure as well as anyone. Pharmac is saying 'Meet our price or you don't sell.' We're coming back and saying, 'That's fine, but give us more volume.' If we could get our machines working for a week at a time on one drug, as opposed to a day, the costs of our drugs would fall dramatically..."...[the Kiwi company] and its generic drugs can benefit by undercutting the brand-name drugs on price, provided Pharmac will put the drugs on the schedule. Often the brand name drug will attract a premium – the difference between the base price Pharmac will pay and the price the company is asking for. That premium is paid by the patient prescribed the drug. [The latest multinational company's] decision to leave... was in part prompted by its failure to get several of its products on to the Pharmac schedule.

...PHARMACISTS and drug companies believe patients will pay more for the common painkiller paracetamol if the drug funding agency Pharmac goes ahead with a groundbreaking plan to put supply of the medicine up for tender. The tender would apply to prescribed paracetamol and result in only one company winning a subsidy for the product when it is supplied on prescription. About five companies currently receive subsidies for the drug, which is sold under a range of tradenames... [I]ndustry sources believe the loss of the subsidies will cause price hikes on the \$15 million worth of paracetamol supplied over the counter through chemists and supermarkets each year. The country spends about \$2.5 million

annually on prescribed paracetamol... [The] Pharmacy Guild president... said... “The volume produced for over-the-counter sales would go down and the cost of production would rise. We believe it will have an effect on availability and price.” ...Companies say the profits on over-the-counter sales enable them to offer cheaper rates for paracetamol used in hospitals and prescribed by doctors. They say Pharmac has nothing to gain by seeking cheaper rates on tender... One drug company source, who declined to be named, said he thought the Pharmac proposal was a forerunner to plans to put other drugs up for tender to further ratchet down prices. “Paracetamol is a nice easy place to start and if that goes well, it will be a test case, but I doubt there is fat left in its price.” ...One paracetamol supplier... says it receives \$30 for each dispensing pack of 1000 tablets, which cost more than that to produce. “How can you tender when you are already making a loss?” ...But Pharmac... said the agency proposed the tender because it believed it was paying three times the world price for paracetamol. It was “fuzzy logic” to suggest the move would result in higher over-the-counter prices...

More than 100 high-ranking Italian health ministry civil servants, former deputies and business executives are to stand trial on charges of giving and receiving bribes to inflate the price of medicines... [In local news.] Pharmac has decided to pay for treating the rare and debilitating Gaucher’s disease which affects 14 N[Z]ers. Pharmac will fund the drug ceredase, which... is extracted from human placentas, 50,000 of which are needed to produce enough of the medicine to treat an adult patient for a year, at a cost of up to \$75,000. - 1996

A last-minute turnaround by... Pharmac has given [a N[Z]er] the chance of a better life. The 44-year-old sufferer of Gaucher disease – a rare condition which affects the spleen, liver and bone marrow – has been waiting three years for treatment with ceredase, a drug which costs \$85,000 a year for each patient even at low doses. In the last week his spleen has swelled to eight times the normal size and he has developed knee pain, a possible sign that the disease is spreading to his bones. He was due to get a letter this week from a Pharmac-appointed committee of specialists telling him he had missed the cut-off point for treatment. But the letter was headed off by a... phone call yesterday from the Pharmac general manager... assuring him that he would receive ceredase after all. [The manager] also warned that Pharmac might drop its subsidies on products such as pimple creams and decongestant nose sprays to pay for the high-cost treatment. [The 44-year-old] said he was sure the change of heart came because he was prepared to go public on his plight. The North Shore man was rapt to get the treatment but disappointed that he and fellow sufferers had waited three years and that at least three would still miss out. He said low-dose treatment would work for him but worse-off patients needed a high-dose treatment, ruled out because it cost \$500,000 a year... [The manager] said Pharmac had not given in to public pressure or criticism by the Alliance. He... said funding was originally limited to nine of the 14 Gaucher sufferers... based on criteria set last year. Further assessments showed two more people... met the criteria because their conditions had worsened... [Incidentally, Fernz] Corp is preparing to launch a new version of its much-vaunted wonder drug Interferon with applications for treating some forms of cancer. Up until it embarked on its recent headline-grabbing international expansion programme, the drug was the sexiest thing about the blue-chip pharmaceutical and chemicals company. Fernz started developing the drug in what it dubbed a venture capital exercise five years ago, but production delays and marketing problems in its biggest market, China, have dogged progress... The project in China, managed through subsidiary Pharma Pacific, has cost the company a net \$5 million in each of the past two years... and... the loss would be similar for... 1997... Developing the drug had cost Fernz \$30 million and the company had little to show for it. But that may now soon change. [The]Fernz managing director... said the company was trialing high-dose oral treatments of Interferon in France, and so far there had been no sign of the side effects associated with the drug in previous high dose treatments. The company should be ready to apply for worldwide patents by next month... Most analysts placed a value of \$30-\$35 million on the Interferon business... [but the managing director] estimated the worldwide market for Interferon at close to \$4 billion... The drug was also being trialed for hepatitis treatment in N[Z] and AUS], while its use in an HIV trial in the US has another 18 months to run.

...[‘the ad shouts out from the recruitment pages: Earn £100 per day! Reading on, it sounds too good to be true. No mention of 14-hour shifts packing fish in frozen shipping containers, holding “Golf Sale” signs in high streets or “glamour” modelling for unlisted agencies. Just a requirement for healthy males and females aged 18 to 45. So how do you get your hands on this free money? The picture of a pill bottle full of pound signs is the giveaway. Deal is, it’s a pharmaceutical company looking for volunteers to take part in drug trials. Paid to take drugs. Brings a twinkle to your eye, doesn’t it? But in the beady peepers of medical multinationals, a healthy human represents a commodity. A laboratory with legs. A walking, talking guinea pig, if you will. That’s not to say the volunteers are being taken advantage of. They ain’t doing this to further medical science. It’s just a 90s version of the oldest profession: selling your body for cash. With the same possibility of bizarre repercussions. “Phase One” is the medico term for experimentation on humans. They’re usually testing unlicensed drugs that have thus far only been administered to animals. Drug trials can last anywhere from two hours to a month. In theory, the money is paid for “time, inconvenience and discomfort.” If you’re involved in a study where nurses constantly stick a tube in your nose or into your lungs, say, it’ll pay you more than the basic rate of around £100. In practice, though, part of the fee is danger money. The Phase One trial originated as a check on the inadequate research procedures which had allowed the clinical use of Thalidomide in the late 50s. Nearly 40 years on, the system is still bound to an antiquated and embarrassingly inept series of guidelines. Unbeknown to most guinea pigs of the upright-walking kind, there’s no legislation in place to govern human experiments. In theory, any wannabe doctor could set up a clinic and enlist volunteers in the search for that elusive cancer cure. The guinea pig industry has been known to step over to the dark side, where notorious cowboy doctors offer thousands for irregular practices and short cuts, but for travellers wanting to finance that next leg of their journey on the continent, a London-based company called Carra Recruitment offers a directory in international clinics. The Association Of Independent And Clinical Research Contractors also holds lists of drug companies looking for guinea pigs. London itself has eight “official” Phase One clinics. Visit one and you’ll experience something akin to a halfway house for the terminally bored. Once the trial has started, the usually Antipodean male students are banned from leaving the clinic, and forbidden every vice that might affect results. Namely chocolate, fags, caffeine, alcohol and sex. “I suppose it’s a bit like being in jail, except the food’s better, we have cable TV and we get a wad at the end,” says a veteran of 15 trials. His latest job, 28 days using an experimental incontinence drug being developed for the elderly, will net him more than £3,000. Of the estimated 20,000 people a year volunteering for Phase One trials in the UK, by no means all get the opportunity to make any cash. They’re comprehensively screened to ensure they don’t have any surprises in their system which could alter the outcome of the experiment. After years of testing drugs on America’s inmates and liver-corroded homeless, the labs – commissioned by the pharmaceutical firms – need to find the “best of the best” subjects, to get the most accurate results. The screening of subjects came under close scrutiny in the mid-80s however. In 1984, arts student Niall Rush expired almost immediately after taking an experimental heart drug. It was concluded that Niall’s death was due to a reaction with other medication he was taking at the time. He was to be paid £20. The previous summer, 21-year-old Philip Jones suffered a slow death after taking a new variation of a tranquilliser already on the market. When he entered the clinic to earn £70, Philip was a strapping, rugby-playing medical student. In the months afterwards, he developed a number of ailments which led to his death. When Philip eventually died an inquest ruled that the drug may have caused his condition. The pharmaceutical firm concerned paid his family £50,000. Indeed, since 1990, pharmaceutical companies have paid compensation to at least 11 healthy volunteers in Britain. In a recent review of Phase One trials over a single year, the *British Journal Of Clinical Pharmacology* reported 610 cases of adverse side effects and three potentially life-threatening incidents where subjects had to be resuscitated. What these figures don’t tell is the number of ill or drug-taking guinea pigs who blag their way through the screening. Some drink half a gallon of vinegar to flush out their system. Others smuggle in a jar of mate’s urine, heating it up under a hot tap for that “fresh” feel, before handing it over. Here are some more human guinea pig blunders: 1984 New York student nurse Bernadette Gillcrist, 23, died after testing drugs that affected sleep and mood patterns. Officials believe she had concealed a history of heart trouble. 1986 Three Japanese testers died in trials for a shingles treatment. The company continued selling the medicine, which proved fatal when

combined with cancer drugs. A further 15 died. 1990 Three young male volunteers at a Manchester clinic contracted hepatitis B from another trialist. Nobody was screened. The clinic is now closed. 1996 Hoi Yan Wan, a 19-year-old NY student, died after a 10-minute procedure in which a tube was inserted into her lungs and her throat was sprayed, poisoning her.'

... 'revelations that thousands of AUSns are being used as unsuspected guinea pigs by multinational pharmaceutical companies have brought demands for tighter controls on drug testing. Those tested, including children and intellectually disabled people, have been included in trials by doctors who have received up to \$A6000 in a booming trade that has seen the number of such tests rise 20-fold in the past decade. An investigation by the *Sydney Morning Herald* said patients were being bought and sold like commodities by doctors and pharmaceutical companies without being told that money changed hands when they volunteered for new treatments. The investigation came in the wake of resignations from the committee overseeing the inclusion of drugs on subsidised lists. The Health Minister had earlier overridden the committee's recommendations on the subsidy level of the anti-arthritis drug Celebrex, and made it AUS's most heavily subsidised drug. As the reaction from the newspaper's investigation gathered pace, ABC Radio was yesterday contacted by a large number of people claiming they had been persuaded by their GPs to take part in trials of Celebrex, with painful results. An 84-year-old said he had been told Celebrex was harmless when he was asked to trial the drug, but eight weeks later was still suffering agonising skin problems. A Sydney woman told the paper she had been placed on a trial for the anti-epilepsy drug Gabapentin by her neurologist without being told that he was being paid for recruiting patients by its manufacturer. The *Herald* investigation said this trial was, like most others, designed to speed up the registration of the drug in the US and Europe. The report said AUS was being targeted for trials because of the decision in 1991 to end national over-sight of the approval of clinical trials by the Therapeutic Goods Administration and to pass it to ethics committees comprising medical professionals and lay people. The federal watchdog was obliged to directly review only two of the 1712 clinical trials done in AUS last year, almost one in six of which were run by private organisations.'

... 'new drugs are constantly appearing, designed to combat everything from obesity and impotence to battling heart disease or cancer. Although these drugs will have been through years of clinical trials, who ultimately decides they are safe for pharmacists to sell or for doctors to prescribe? Unlike the US, where advisory committees of the FDA discuss new drugs in open forums that are both televised and published on the Internet, NZ makes its decisions on new drugs in comparative secrecy. Drug companies submit a weighty dossier on the drug to Medsafe, the Ministry of Health's unit that deals with drug registration. The dossier describes how the drug was developed, what is in it and the results of clinical trials. It must also comply with standards set by the EU's Committee of Proprietary Medicinal Products. The ministerially appointed Medicines Assessment Advisory Committee, made up of experts in clinical pharmaceutical chemistry, pharmacology, infectious diseases, psychiatry, anaesthetics, general practice, oncology and biostatistics, advises the Minister of Health when it is satisfied a new drug has reached the necessary standards. The Ministry of Health then comments on the recommendation, advising the minister whether to accept or decline the drug. Medsafe will be aware of where else a new drug may or may not have been registered, but it likes to make its own decisions, unlike AUS's Therapeutic Goods Association, which takes a closer interest in the FDA. Medsafe's medical adviser is unimpressed with the FDA. He says the structure is so dense it can be difficult to get a drug through – taking between two and five years compared with NZ's 12 to 15 months. Does the FDA's caution mean Americans are more protected from unsafe drugs than we are? The adviser says there is no proof the FDA's approach is safer. For example, the FDA approved two weight-loss drugs, Redux and Pondimin, which were withdrawn from the market last year when they became linked with heart damage in obese patients. The adviser suggests the FDA may even be unnecessarily denying Americans early access to beneficial drugs. Medsafe doesn't tend to grant registration more quickly than its overseas counterparts because it is lax, but because it doesn't have the workload of overseas authorities because not as many drugs companies come here, he says. Being a small market, and one where the drug-funding agency Pharmac has a tight grip on the chequebook, means we are not considered a worthwhile market, dollarwise. But NZ has another attribute – it is a market to watch. Our small, isolated, easily monitored, largely white, affluent and educated population is representative of the larger, more lucrative markets of Europe and America. Plus, says an Auckland Medical School specialist in clinical trials of drugs, "NZ has a small and relatively tight-knit medical community and a well-established system for detecting and reporting adverse effects of medicines. This makes it a good place from a post-marketing surveillance viewpoint. Rare adverse effects that are essentially impossible to detect during the pre-marketing phases of development are perhaps more likely to be detected in NZ." Local medical school academics regularly undertake drug company-sponsored research. UniServices, the business unit handling these commercial research projects, last year earned Auckland University \$8.7 million from pharmaceutical research.'

... 'Auckland University has established a company, NeuronZ – effectively the country's first research and development-based pharmaceutical company – to take two drugs that its researchers have discovered to clinical trials. Offers of donations and calls from desperate patients have poured in to the Auckland Medical School since the *Sunday Star-Times* revealed last week that the drugs could stop the progression of diseases such as Alzheimer's, Parkinson's and multiple sclerosis. Negotiations are under way with international biotechnology merchant bankers for the \$20 million required for clinical trials of the growth factor IGF1.' In related news, last month a pharmaceutical company's UJ\$... **patent on the herpes drug Zovirax ended. In July, it faces the expiry of UJ\$ and UJ\$K... patents on peptic-ulcer treatment Zantac...** [These are] its two biggest products, which together accounted for almost a third of its revenue last year... As one commentator explains... the best defence strategy against generic competition[is]: don't be reliant on one drug... The effect of losing a patent on a blockbuster drug can be dramatic. Copycat companies soon produce generic versions, which sell for as little as 20[%] of the original's price... Once generics are on the market, the original drug is effectively on Death Row... The pharmaceuticals companies pull out all legal stops to try to hold on to their patents... Intellectual property is the life-blood of a pharmaceuticals company. Filing a patent is one of the first steps when a potential drug is discovered, but although the patent guarantees exclusive rights to that chemical compound for the next 20 years, it takes an average of five to eight years, including three rounds of clinical trials, to get the drug to the market[('99 out of 100 new drugs fail to get onto the market')]. Once a drug is launched, the patent usually runs for 12 to 15 years during which time manufacturing costs are minimal; the main cost is sales and marketing. Margins can be 30[%] or more.

...Pharmac believes it can slash... [NZ's] medicine... bill by breaking the stranglehold on supply by pharmaceutical companies and assisting other companies to import generic drugs... Pharmac believes the existing pharmaceutical companies are charging excessive prices for generic drugs and says the potential savings in the scheme are formidable. It says it has already identified savings of \$47 million – including \$22 million on ulcer drugs... – with more to come if direct imports can be established with the UK... Pharmac[, which has already]... approached 60 generics companies overseas to try to entice them into N[Z, said]... the underwriting offer was open to any company for any drug... The[existing] companies say the policy is anti-competitive, threatens the future of the local pharmaceutical industry and could cost N[Z]ers jobs and export earnings.

...[NZ's] health reforms have produced their share of battles but few as bruising as the present struggle over the cost of the medicines we use... Pharmac, the agency which decides which drugs will be subsidised in this country, is involved in a long-running and costly war with the drug companies themselves... [A] bitter animosity exists between pharmaceutical companies and the state-funded agency... At the heart of the debate [are] questions over who should get drugs, when should they get them and how much should taxpayers pay for them. The scrap is costing millions of dollars in legal bills... The companies say [they've] got to go to court to protect a reasonable right of access for[their] products to the N[Z] market... Both sides claim the real losers are health consumers... Pharmac... acts on behalf of the country's four [RHAs]. The RHAs buy drugs which are then dispensed through doctors and hospitals... Pharmac can only spend what the [RHAs] decide they can afford... "...N[Z]'s health sector... is funded to the tune of \$5 billion... committed to a wide range of services. The fact of it is that when we go to the [RHAs] and say, 'this looks like a good drug, we should have it,' the [RHAs] aren't immediately able to make that money available... We do need to look at the bottom line... [I]f we don't then we have to cut health services somewhere else because the amount of money that we have to work with... as a whole, is fixed." Pharmac deals with a steady stream of applications from drug companies who want to get their new or improved products on to the subsidy

list... [T]he length of time it's taking Pharmac to list new products... is where the conflict arises... The drug companies say Pharmac's deliberately dragging the chain and that's costing them their products and sales. Pharmac... says[the] drug companies deluge them with so much paperwork it takes a lot of time to process... The result: some people are missing out on treatments that are potentially life-saving or could greatly enhance their health... [A] heart specialist... says Pharmac's delays are killing his patients... [while a] doctor... says elderly women are being denied a powerful treatment for brittle bones... [and a] multiple sclerosis sufferer... says Pharmac's cutting off her access to a significant new drug... There's no cure for multiple sclerosis but there are treatments that can improve a sufferer's quality of life to such an extent... that they can continue in work. One such drug is Betaferon. It's very expensive. A year's worth... would be about \$20,000... [In AUS], Britain, even Slovenia or Hungary, it would be on the list and [a] doctor could prescribe it, but not here... "I presume... that... it goes like this[Pharmac says,] '...we could approve Betaferon and give it to [each sufferer but for every] \$20,000... someone else[(i.e., someone with a different health complaint that also costs \$20,000)] would have to miss out.' ...we wouldn't want to see someone with a serious life-threatening illness go without a drug so [someone else with a non-life-threatening illness] can have one... We[already] figure, based on scientific data, that there are probably four N[Z]ers who die per week because of the current policy.'" ...[Betaferon is just on]e of the faces from a debate in which there are few easy answers... Whether it's an expensive drug like Betaferon or a relatively simple antibiotic... Pharmac believes the way forward is to hard-nose the negotiations with the drug companies and take its time putting new drugs on the list. Money is the number one issue. In its 1996 annual report Pharmac claimed that if it registered every new product seeking approval the annual cost would be up to 200 million dollars more a year. By hanging tough, Pharmac says it saved taxpayers nearly 50 million in the last three years and will save nearly a 100 million more in the next two years... Pharmac's strategy is open for all to see. If it can drive down the cost... it can, in theory, free up money... The newly discounted price... then becomes the industry benchmark and everyone else has to discount to compete... Pharmac... is in the business of doing deals which are clearly forcing drug companies to scrap with each other and undercut, sometimes savagely, in order to get new products listed... It's... [undeniably] a real boon for the[NZ] taxpayer. But... is it an appropriate strategy when it comes to something as complex as listing new medicines with considerable patient benefits? ...No matter which side of the debate you favour it's clear that the international pharmaceutical trade is, for many companies, exceedingly profitable. On the basis of a return on capital, American companies have, in recent years, recorded returns as high as 60% per annum... Pharmaceutical companies... [say] this battle... is... more about the nation's health... [and] the agency which decides which drugs you as the consumer can access... [than] about big profits... Their anger towards Pharmac draws on the idea that with so much money invested in product development this country's slash and burn approach to pricing would make it impossible to do business if these policies became more widespread. But how realistic are the drug companies' estimates on what research and development really costs? In Washington [a] consumer watchdog group... has just produced a report seriously challenging what the drug companies say it costs to get a new product onto the market... "The industry has an interest in exaggerating how much it spends on research and development." ...public demands, once the miracle cures are announced, can be awfully loud, as is the cry of foul from the international pharmaceuticals [companies] when they don't get their way... Drug companies argue their profits have to be seen in the light of the expense involved in getting a new product on to the market... "Typically it... costs between 400 [to] 600 million US dollars... [and] takes about 14 years... [including] a very lengthy process of trials... to develop a product from the laboratory to marketing it..." ...Critics of the industry say that many drug companies have... made big profits by making and marketing drugs that were originally developed with taxpayer money... [A] number of American drug companies have done exceedingly well in recent years out of making products where the bulk of the research was done by bodies like the National Cancer Institute... "[One company] was charging 20 times more to the consumer than it was paying its supplier for the drug, and this was for a drug that [the company] didn't even invent... [It] was invented by the U[S] Government..." ...Although drug companies make a lot of noise about the amount of money they spend on research they are still in a profit-driven business. Pharmaceutical companies, by way of promotion to chemists and doctors and... advertising... also... spend a great deal of money... on their pitch. In the early '90s, American studies determined that drug companies were actually spending more on advertising than the billions in research they were so keen to talk about. The wealth of multinational drug companies also makes them very influential... [They] exercise their muscle in Washington through... PhRMA... the US drug companies lobby group. It's this organisation which has been applying none too subtle pressure in the US Congress over the policies of Pharmac... There's even been speculation that the American Government might be asked to take trade sanctions against N[Z] as a consequence... Likely? Not really. Even during the worst days of ANZUS we were still trading. But it's an indication that this subject has a real depth of feeling to it... What's best for the industry, the taxpayer and the patient? ...what you learn when you start delving a bit in this area is that there is a high degree of sensitivity over how much drugs cost and over how much we actually need the new products on offer... There's a greater willingness these days to ask whether every new product that comes onto the market which is supposed to be really good for us actually deserves to have a halo around it.

...[Pharmac is spending money to wean us off expensive drugs. Pharmac is determined to combat the sometimes subtle and sometimes blatant marketing techniques used by drug companies to persuade doctors and ordinary people like us that we need drugs when probably we do not. Set up to manage the supply of drugs, Pharmac soon realised that if it was to control the budget it would have to control that demand for drugs, a demand it sees as largely manufactured by the drug companies, especially since NZ joined the US as the only two countries in the world to allow drug advertising directly to the public. Pharmac has now even gone as far as asking a select committee considering new legislation to give it the role of promoting the responsible use of pharmaceuticals. This demand-side strategy operates on several fronts, employs two people, and cost a total of \$1,076,000 in the last financial year. Some of that money paid the bills for Cabix, its public relations arm that helps it communicate with doctors, pharmacists and patients. Occasionally it also uses a firm called Viewpoint to help it communicate with its political masters. The bill from both public relations companies last year was \$221,000. Compare that with what Pharmac estimates could be as much as \$350 million spent by the drug companies on marketing here and it looks as if Pharmac is using bows and arrows against the commercial equivalent of a nuclear power. The demand-side budget also finances the Preferred Medicines Centre, which advises doctors on good prescribing habits, and an anti-drug company magazine, *Healthy Scepticism*, that goes to GPs and is run by the Medical Lobby for Appropriate Marketing. Pharmac paid for its AUSn editor to tour here last year, teaching doctors how to read between the lines of drug company advertising. But the idea that Pharmac has to spend more than \$1 million to untangle doctors from the grip of drug companies rankles with many doctors. The Medical Association chairwoman says not only do many doctors refuse to see the sales representatives, but doctors are not gullible and there is no evidence they succumb to undue influence. However, Pharmac's general manager says studies by the US advertising industry show 80% of people who went to the doctor asking for a certain drug got it, even when in 30% of cases the doctor did not think it was the best treatment. The chairwoman agrees that advertising directly to the consumer drives up the drug bill, but often because it is the first time people suffering from a particular condition find out there is a treatment for it, so they see their doctor. But "Pharmac has got to accept that appropriate, effective use of pharmaceuticals sometimes means more." She gives the example of cholesterol-lowering drugs, too few of which were being prescribed in this country. Pharmac's medical director says Pharmac does recognise that more is sometimes better, and that it gave presentations about the best use of cholesterol drugs. Pharmac is also paying to remind doctors that exercise is good for their patients. It is putting \$425,000 annually towards financing the Green Prescription campaign, whereby patients leave the doctor's surgery with a note telling them to walk around the block twice a day after meals rather than a prescription for drugs. Why does Pharmac need to fund a campaign telling doctors something they should already know? "It helps to be reminded," says the general manager. But wouldn't a patient whose preferred drug is not subsidised because there isn't enough money in the kitty be angry that Pharmac is spending \$425,000 a year telling GPs about the importance of exercise? "If you can get behaviour change in people the benefits are large." But if indeed doctors have been busily over-prescribing all these years, isn't there something wrong with their training? Before Pharmac put the screws on them, drug companies assumed much of the responsibility

for educating doctors about drugs, although where the line was drawn between education and marketing was anyone's guess. Pharmac is considering stepping into that education role, particularly once nurses are granted the power to prescribe.¹

...Pharmac... is budgeting... for legal costs... to defend its querying new products and refinements which international drug companies want to market here. It's... [money] which should be going to help the sick but Pharmac's management is convinced that the drug bill would be much higher but for its watchful role. Seven legal actions are underway and... the agency has been threatened with two more... Even with its scrutiny Pharmac is budgeted to pay out \$715 million dollars to subsidised prescriptions and related products this year – up from \$694 million last year... “...that's a hell of a lot of drugs for a country which is slightly smaller[in population] than Sydney.” ...Without its intervention, the agency estimates the drug bill would be more than \$800 million. Two men drive Pharmac... a 35-year-old economist and accountant, and... a[49-year-old] doctor who had more than 20 years' experience in general practice before venturing into administration. They admit to some “fiery times,”... in sifting recommendations on what[to] subsidise and what to delist... [Pharmac] has to do what it can within a given budget and patients' needs come first... Their job is to deliver the best within the country's ability to pay. That on average is nearly [7%] lower in terms of [GDP] than most developed countries[(the 'OECD average for 1995 was 7.9% of GDP – NZ's level was 7.5%, which placed us ahead of Japan, the UK and Greece, whose levels were 7.2, 6.9 and 5.3% respectively; but behind Italy, Finland and AUS, whose levels were 7.6, 8.0 and 8.4% respectively)]... We don't get within cooee of the U[S (14.5%)], Switzerland and Germany. “Then again... we only have an average income of about \$28,000 a year, not the \$40,000 to \$60,000 of the more developed countries... and if we are to have an equivalent health system to that of the Swiss or Americans we're going to have to work much harder in terms of being smarter in what we purchase... However, I don't think anyone would argue the U[S] delivery [of health services], for example is equitable... Sometimes people will get good news but at others the therapy that they want is either not within the finances of the health system to provide or we don't, from a medical perspective, perceive it as being as important as individuals may see it from a survival point of view.” To the suggestion that they may “be playing God” by withholding life-prolonging drugs, he retorts: “Delivering the message can be hard. But by fronting up to the issues and having them debated openly we hope at least to earn respect. It's uncomfortable when some mooted 'wonder drug' is being pushed [by a drug company] with inflated hopes and expectations and we put the damper on... Then again interaction with user groups can often provide useful information. The Aids groups are a good example. They are quite expert... and they can add to the quality of our decisions.” ...Pharmac's creation three years ago was a radical departure from the way N[Z]'s pharmaceutical needs used to be assessed and funded. It is a non-profit-making company owned equally by the four [RHAs] and its lists cover about 3000 prescription drugs and products... A large proportion of pharmaceuticals subsidised through Pharmac were from U[S companies who]... are “very fearful” of what Pharmac is doing... “This is quite a change for the drug industry, which is parochial in its attitudes and seems to believe it has a God-given right of entitlement to public moneys, whereas what the new health sector has done is put drugs basically in competition with all other health sectors. We have to now think about whether it is better to fund a drug for treating a heart condition or alternatively fund a public health programme which looks at smoking rates and attempts to reduce the incidence of cardiovascular disease by cutting smoking. We have to toss up spending money on services in the mental health sector verses drugs. So that's particularly challenging for a drug company and they're fighting back.” Some doctors have challenged the agency's competence to limit the choice of a prescription. Pharmac has bitten back, including citing an Auckland study which showed that medical practices have on average more than a thousand promotional items from drug companies... it's hard to believe these giveaways don't have an influence... “Somebody's got to give advice and somebody's got to make a decision. At least we are explicit about what we are doing and why which may not have been always true in the past when decisions were hidden... But we're not aggressive compared with the stance by the drug companies. We don't want to spend health dollars on court actions... but at the end of the day that's always their right.”

...Pharmac needed to play hard-ball with drug companies, given the number of legal actions it had faced, [its general manager] said. It spent \$1.6 million in legal fees last financial year and \$680,000 the year before, facing about seven cases. One case involved 17 products. Most cases remained unresolved. “We get a [threatening] letter from their lawyers on average about once a week. Each company obviously has a taste for litigation,”... The Government expects to spend up to \$4 million battling drug companies in court this year. Pharmac... said the legal costs were worthwhile given its track record in cutting profits made by manufacturers... One of its best court victories had sliced \$13 million off the drug bill... \$1 million was budgeted for each time a drug company took legal issue with a decision on whether to subsidise a drug or by how much... The rift between health officials and the drug industry will be cemented by the Government's get-tough plan to cut drug spending.

...TOUGH new measures to tighten the supply of medicines are expected to be announced this week, with Pharmac claiming the drugs bill is heading for a \$30-50 million blowout... [T]his year Pharmac expects to spend at least \$747 million... [P]atients are likely to have restricted choices of medicines while doctors face pressure to prescribe cheaper drugs they regard as less effective and with more side effects.

...Health officials have outlined an eight-point strategy... which promises to get tough on prices paid to drug companies. The general manager of Pharmac... warned that other health services would be cut if a forecast... budget blowout became reality... [M]oney would be taken from elsewhere... general surgery was... [among the areas] threatened... Doctors, patients and pharmacists will also come under the spotlight in the drive for savings. [Pharmac] signalled a move towards pharmacists actively questioning what doctors prescribed. Although the pharmacist would have to know the patient's drug history... this would act as a check on inappropriate prescribing. Pharmac's concern was that doctors often opted for expensive drugs, despite little evidence they were better than cheaper alternatives... A key strategy is to cut the price on asthma inhalers, which cost the country \$110 million a year. Pharmac said it would save \$15 million if drug companies charged the same price for inhalers as in A[US]. This included one inhaler which cost \$107 in N[Z] but only \$38 in A[US]. But 3M Pharmaceuticals, one inhaler maker, said the comparison was out of context as the A[US]n Government paid manufacturers for research, development and manufacture of drugs. In return, they got lower prices... A health sector researcher... said Pharmac was working within an unrealistic budget which disadvantaged patients... Before Pharmac was formed in 1993, drug subsidies paid to companies rose about 10[%] each year. That has halved in the past four years... “...It's now about 5[%]. Compare that with A[US] where they're expecting growth of 17[%]. Pharmac]... redescribed the market place...”

...DRUG companies have hit back at claims they are the fat cat villains of the pharmaceutical budget blowout... [F]igures from U[S]-based International Medical Statistics show that, at manufacturer level, N[Z] spends \$197.43 per head each year on medicines, while A[US] spends \$217, the UK \$203, Canada \$211 and the US \$441... [(‘1995 state health spending in price-adjusted US dollars per capita for OECD countries went from \$101 in Turkey, \$256 in Mexico and \$456 in Greece, to \$1703 in Switzerland, \$1833 in Luxembourg and \$1853 in the US – NZ = \$942; UK = \$1077; AUS = \$1175; Canada = \$1475’). P]er capita spending had increased 18%-19% in N[Z] since 1993, compared with 28% in the US, 30% in A[US] and 39% in the UK. Canadian figures were unavailable... [The] Pharmac general manager... said if the figures were true, they showed Pharmac's policies were working and N[Z]ers had access to the drugs they needed, but costs were being kept down. But, he said, the figures should be treated with caution because the mix of drugs used in the different countries was not the same... Previous rows between Pharmac and drug companies over pricing and subsidies have ended in court action.

...Drug companies are to appeal against the High Court ruling last month that... Pharmac was not subject to the Commerce Act... The chief executive of... the Researched Medicines Industry Association (RMI)... said yesterday that the industry had decided there were aspects of the judgment that needed to be further addressed. “[However, the] industry genuinely regrets the level of litigation produced by the current system...”

...PHARMACEUTICAL companies are calling on[the] Health Minister to set up a national advisory group to change the way Pharmac runs the country's budget... In a stinging attack on the current set-up... [the chief executive of the RMI], which represents 35 research-based pharmaceutical

companies in N[Z.] ...said... Pharmac... practiced an “exclusive, divisive and combative approach to pharmaceutical issues”... N[Z]’s drugs bill is steadily rising... and... funding constraints were leading to incredible tension in the health system. “Every group in the health sector is fighting over a smaller share of the cake and it’s something we need to overcome.”

...the drug-funding business came under attack again yesterday as a public health lobby group joined drug companies in pressing for a new independent body to make decisions about drugs.

...N[Z] is paying seven times more than other countries for some common medicines. Figures... showed that drug firms were making big profits on treatments for... illnesses including diabetes, cancer, high blood pressure and depression. Pharmac’s head... said a reason for the high prices was a lack of competition in the N[Z] market. With the country’s relatively small population, some companies found it unattractive to operate here... Pharmac paid up to 10 times the British price for a heart drug, but could not find another competitor to drive that down... N[Z] could save \$38 million annually by buying 27 top-selling drugs at the same price as A[US]... Drug companies had argued that the small market and the country’s isolation were factors in the price differences.

...The small size and isolation of Pacific Island countries makes them a target for the dumping of defective drugs by rogue pharmaceutical companies, a... WHO adviser on pharmaceuticals... has warned... “Some big manufacturers do not take small islands seriously... Once they combine forces they can put down their request for good-quality drugs.” The Governments of... Tuvalu, Kiribati, the Cook Islands, the Marshall Islands and Niue[recently] agreed at a meeting... to set up a joint drug procurement and testing office... [Incidentally,] a long-time critic of excessive drug prices... says... [the NZ] Government’s get-tough stance on pharmaceutical firms is decades overdue... For the past two decades, [he] has milked the huge price gap by importing drugs and on-selling to chemists at discounted rates... [H]e has brought in cancer, ulcer and heart drugs and sold to a ready market. Advertisements were placed in the N[Z] *Herald* to promote his wares. The flipside was a string of court cases challenging his war against drug giants. These include blackmail charges in 1985, when he asked three companies for between \$100,000 and \$150,000 in return for not marketing cheaper imported drugs. He was cleared of demanding money with menaces... “I am detested by drug companies, not for the money I made out of them but for the publicity when I went to court.” ...The courts were not so forgiving in 1992, when he admitted holding up a central Auckland bank... Last year he was taken to court by health authorities, accused of fraud and charged under the Medicines Act. He started a nine-month prison sentence... after losing an appeal. Fresh out of jail after serving four months, the 61-year-old faces more charges next month for importing without the Health Minister’s consent and trading while insolvent... “I’m not angry that they caught me. They had my invoice book, I admitted importing, I admitted the sales. All the chemists I had dealt with all knew I only sold imports.” ...The 25 fraud charges laid against him last year involved his importation of asthma inhalers from A[US], repackaged to look like the N[Z] product. One type of A[US]n inhaler he brought in cost \$37 each. The Government pays \$107 for the same product. He estimated bringing in 800... inhalers between October 1994 and June 1995... “It took a long time for the department to come down on me... I never had a belief it would go on for so long undetected. What I intended to do was... have it publicised so politicians would ask why was this guy able to buy the medicines so damn cheaply... I never disguised that I wanted to make money. But the Ministry of Health has sat on its backside and the public have paid for it.” ...He said he was approached by a Treasury official in the early 1980s for a list of comparative drug prices – proof enough, he said, that N[Z] was being ripped off. “It took them from 1984 to 1994 to establish an independent buyer such as Pharmac, which is only what the A[US]ns have been doing for 20 years – hard-nosed, up-front negotiations.” ...[he] feels his point has finally been made... [T]he Government was[now] aware of how much could be saved if drug companies lowered prices... But he said there is “a hell of a lot more that Pharmac could do.”

...People with heartburn, hayfever, hypertension and heart problems will be the first to bear the brunt of the new wave of Pharmac cost cutting... Pharmac... plans to subsidise only one or two brands of some medicines and drop all subsidies on others...

If you’re sick of the health cuts we’d like you to make one of your own... Pharmaceutical companies launch a million-dollar campaign today calling for public support in their fight against... Pharmac. In a series of “Mayday, mayday” newspaper, radio and television advertisements, the industry will ask doctors and patients to send protest coupons to the Government to counter Pharmac’s cost-cutting measures and seek an independent review of prescription subsidies. [The RMI’s] spokesperson... said Pharmac’s proposals meant many patients would have to change to different medicines because they might... face hefty part-charges to continue on their present drugs... [The spokesperson also] said the industry disputed claims that the medicines bill was blowing out... Prescription medicines, including those used in hospitals, cost only 76c per person per day... (8c of this is GST) – less... than the Government was spending per person in 1987.

...Drug companies have shied away from threats to pull out of N[Z] and take their products with them. In past weeks, industry heads have repeatedly said that they were likely to ditch the country because of the Government’s crackdown on medicines spending. But when pushed to get specific yesterday on those likely to leave, the threat turned into more of a whimper... In other developments... attempts at selling its message to the public has landed... the industry... in hot water.

...The advertising campaign launched this week by the drug companies has drawn strong criticism from MPs on both sides of the House and been condemned by Pharmac as “American multinational gunboat diplomacy.” But a suggestion from the Minister of Health... that he might complain to the Advertising Standards Complaints Board brought an apparent concession from the [RMI that]... it did not want to provoke a fight with [the minister] and would consider pulling the campaign... [However, the offer was] conditional upon the minister and Pharmac agreeing to enter negotiations with the industry based on “certain bottom lines and assurances that we were not just going to be buried in process again.”

...No end is in sight for the bitter row over the country’s drug spending. The Advertising Standards Complaints Board yesterday issued a lacklustre ruling that passed no judgment on the controversial advertising campaign... This prompted both sides... to claim victory.

...The drug industry has abruptly dumped its... advertising campaign after being told by doctors that it was unnecessarily scaring patients.

...On its past record, the result of Pharmac’s renewed “get tough” policy is likely to be a worsening of the nation’s health... Two years ago, in a bid to reduce “unnecessary” use, Pharmac introduced a policy by which patients could get only one month’s supply of asthma-preventer medicine at a time rather than the three months’ supply previously available... but only 70[%]... picked up their second months’ prescription for inhaled steroids and only 11[%] their third. N[Z] asthma hospital admission rates have jumped by a horrifying 30[%]... since this policy has been in place... The average stay in hospital for asthma patients is three days at a cost of about \$1350 to the taxpayer. By comparison, the taxpayer pays about \$88 for a year’s supply of preventer medicine for an average asthma patient... [O]f five western countries – Britain, A[US], the US, Sweden and N[Z] – which have defined the direct costs of asthma management using the same methodology, N[Z] spends the least... \$216 an asthmatic a year compared with \$450 to \$1100 an asthmatic a year for the other countries.

...WASTE and incorrect use of prescription drugs is costing nearly \$1 billion a year, says a pharmacy lecturer... [He] says most of Pharmac’s eight moves... to rein in the drugs budget fail to address the real problems. “The product produced by the pharmaceutical industry is excellent – the delivery of their product by health professionals... is an abysmal failure.” He says pharmacists could help to save \$500 million a year almost immediately... if the Government... wanted to make it happen. Under the present system, after a drug was dispensed there was usually no follow-up and no measures of outcomes, client satisfaction, success or failure. The anecdotal evidence of drug misadventure was rife... In one case, he interviewed a woman who in two years had gone from a healthy working mother to someone who had had numerous hospital admissions, was unable to work and was using vast amounts of medication without improvement. He established she simply did not know how to use her asthma inhaler correctly... [He] said international research shows... [up to] 60% of all prescription medicines are not taken as prescribed... 17% of

prescriptions are never presented to be filled... Medicine non-compliance causes 10% of hospital admissions... For every \$1 spent on pharmaceuticals, there is approximately another \$1 spent by the taxpayer because of drug “misadventure” – over-use, under-use or non-use of prescription medicines and the economic costs of hospitalisation, time off work and welfare payments... [In related news, Pharmac] has offered drug companies a \$37 million a year payout to match the A[US]n Government’s support for pharmaceutical manufacturers. But... in return, the companies would have to match A[US]n prices – and cut the drug bill by \$149 million.

...A drug company has massively undercut its rivals to get exclusive access to Government subsidies for prescription paracetamol, a monopoly which has outraged the competitors... The company which markets Pamol... agreed to supply the pain killer at 44[%] below what the Government pays now for it, saving \$1.19 million on the drug budget. Previously, six brands of paracetamol were available on prescription... The Pharmac general manager... said it was the first time the agency had used tenders for medicine and he was happy with the outcome.

...Pacific Pharmaceuticals has agreed to drop prices by between 25 and 40[%] on heart drugs and nasal sprays, a move... Pharmac says will save \$8 million a year.

...MORE than 100,000 heart patients will get free access to lifesaving medicines previously denied them after a Pharmac decision late last week to ease prescribing restrictions on cholesterol-lowering drugs... The drugs, known as statins – fluvastatin, pravastatin and simvastatin – have been available previously only through specialists, to... [about] 12,500 people... with a cholesterol level above 7... Now GPs will be able to prescribe the drugs[to] patients with... a cholesterol level of 6 or over... Patients who have had a coronary bypass operation will qualify if their cholesterol level is over 5.5... 115,000 patients will qualify under[the] new prescribing rules... The agency spends about \$13 million a year on statins already... But [Pharmac] says taxpayers will not pay for the increased patient numbers because of a deal it has hammered out with... [the] suppliers of fluvastatin. [The supplier] has agreed to supply fluvastatin for just \$1.05 a day, compared with the \$3.60 a day Pharmac now pays. This means that unless the two other statin suppliers... agree to lower their prices, patients will be forced to pay a part-charge on their products to make up the difference.

...A MAJOR heart drug is facing the Pharmac... scalpel. The drug funding agency says the \$35 million spent each year on the drugs known as calcium channel blockers may be a waste of money. The drugs are used mainly to treat mild to moderately raised blood temperature but Pharmac says... there is insufficient evidence of their benefit in hypertension to justify the spending.

...Pacemakers that shock a stuttering heart into beating are more effective than drugs for keeping heart-disease sufferers alive, according to two studies in the *New England Journal of Medicine*... The devices cut the mortality rate by 39[%] the first year, 27[%] the second year and 31[%] the third year... [By the way, our] Government is asking doctors and chemists... to help fix the medicines spending blowout.

...Doctors are saving millions of dollars on drug bills by managing their own budgets through large GP-run organisations... Until recently most doctors claimed a “fee-for-service” Government subsidy each time they saw a patient. But... a former Wellington Medical School researcher, said 65[%] of GPs were now members of independent practitioner associations. These associations ran their own budgets based on numbers of patients, rather than numbers of consultations. A survey of 33 of the 35 associations last year showed annual pharmaceutical and laboratory savings ranging from 8 to 26[%]. The 1[%]... increase in administration costs was easily outweighed by the... savings... Procare... saved \$2.9 million over eight months last year by targeting drugs to patient needs. It had also developed guidelines on the best drugs to prescribe for certain conditions... Labour and the Alliance have condemned the trend, saying it will lead to funding cuts once budgets are capped and eventually a private takeover of the public health system.

...Doctors will keep about 20[%] of the money they save on drugs this year under an “integrated-care” health plan in Auckland. ProCare, the country’s largest group of family doctors, expects to save about \$2.5 million through tighter drug-prescribing guidelines... [H]alf the money saved... [will] go to North Health... for general health needs. The other half[will be] returned to the group... about 60[%] of this money will be spent on various health and training initiatives. The remainder will go towards \$200-a-meeting payments for the 340 doctors, who average 70 to 75[%] attendance at 10 meetings a year... The chairman of ProCare... said... GPs who earned about \$80,000 a year were losing money by attending[the] two-hour daytime meetings... [because] they could make \$150 an hour by staying in their surgeries.

...[“Knowledge is the best medicine, so always see your pharmacist for advice.”] Doctors are keeping a close watch on pharmacists who charge patients up to \$50 for health advice – a move they warn may be over-stepping the mark. Thirty pharmacists nationwide are offering private consultations with customers. But the Medical Association... says pharmacists [– who ‘get a \$2.60 fee plus 22% of the drug cost’ for dispensing prescriptions –]should already provide advice free of charge. The association chairman... said the consultations may lead to pharmacists diagnosing illnesses and taking over the job of doctors... But the president of the Pharmaceutical Society... said pharmacists wanted to work with doctors in giving comprehensive care... [and] the new service was a growing international trend which had started in the U[S]. He expected the service to lead to less wastage of expensive drugs and lower hospital admissions... Pharmacists had no intention to diagnose or to prescribe drugs... Customers would be unable to claim the consultation fee back through health insurance... The consultations concentrated on medication management for people on large or wide-ranging drug doses or with complex diseases. Pharmacists would review the drugs a customer was taking, how they were taken and explain why they were needed. Most sessions would last at least 20 minutes... “We are talking about something completely different from normal dispensing or... sale of medicines. Doctors deal with disease states; pharmacists... with drugs. Doctors do not have the training to deal with things that may happen because of adverse reactions to the same extent. They are also unaware of other things the person may be taking... [T]he pharmacist is the only one who gets the whole picture.” Pharmacists paid \$1800 to take part in a comprehensive pharmaceutical care course which lasted two to three days.

...I was taken aback by the news item that pharmacists want to charge \$50 for a consultation on the drugs they’re selling. The story said they have paid \$1800 for a comprehensive pharmaceutical care course which lasted two or three days. That long, huh? Why would anyone want to know how a prescription works? You get your medicine, take it and wait around for the problem to clear up. Imagine this. You’ve just had a cosmolectomy because of suppuration through the reciprocating torque winding valve. The doctor prescribes some pills to ease the pain and writes – using the word “writes” in the loosest sense in the case of physicians – that you should take one three times a day with meals. You take the prescription around to the shop and this joker in a white coat who’s been suckered into a comprehensive \$900-a-day course wants to tell you how the stuff works and to clip you \$50 for the privilege. Not me, buddy. I might just give him 50 bucks to shut up... Personally, I have steadfastly abided by the principle that the less you know about your body the better.

...These tablets help save a lot of lives but, if a child sees them and thinks they’re lollies, just two could kill. Now I know we’re all careful and we all keep medicines out of harm’s way but every year kids die. That’s why at Unichem we believe it’s better to be extra safe than sorry. So if you’ve got kids around please ask us for... a child safety cap. In fact, please talk to us about any medicine matter because at Unichem it’s our job to give you the right medicine, the best advice, and anything else that can help you and your children’s health. That’s a promise.

...A COUPLE fed their baby a serious overdose of a gastric drug because of a pharmacy’s botched prescription... The correct dosage was in fact 0.8ml, but the pharmacist incorrectly labelled the bottle with instructions to give... [the] ailing three-month-old... 8ml of Ranitidine... [The baby] was taken to Christchurch Hospital that night and treated for an overdose... [plus] very low blood pressure... Weeks earlier [the baby] had been diagnosed as having the rare von Willebrand’s disease, which means her blood is slow to clot. She remained in hospital on a heart monitor for 12 hours... The [family] have been fighting for redress since the 1995 case. The pharmacist, who admitted her mistake, was found guilty of professional misconduct in April, censured and fined \$450 and ordered to pay \$3110 towards the cost of the inquiry. Her name was suppressed. Although the

miscalculation had been made by a pharmacy technician beforehand, the pharmacist failed to notice it... [The pharmacy's] owner... said the incident had been distressing for all staff, as well as the family. "It is a very, very regrettable situation..." ...The ACC found last year that [the baby] suffered as a result of medical error but law changes mean... no... lump sum compensation. [The] single income family with two children... struggled to find the \$50 fee to apply for legal aid towards suing the pharmacy for exemplary damages. In July they were granted \$1500 to obtain an expert's report on the viability of their claim but they had to refuse because they could not afford to pay it back at the requested rate of \$100 a month. Attempts by the [family's] lawyer... to negotiate an out-of-court settlement with the pharmacy's legal representatives have been fruitless. Last week any hope of legal action finally faded when the two-year deadline within which proceedings must be brought under the Limitations Act expired. The [family] has been left facing a yet-to-[be]-determined legal bill, potentially worth thousands of dollars. [●] It is 'estimated that 7000 people die in the US each year because – due to the poor spelling – chemists have misread doctor's prescriptions.'

... 'the NZ Government is planning to deregulate the pharmacy industry by allowing supermarkets and similar outlets to dispense prescriptions and sell discount drugs, aided by removing import restrictions.' However, the risk of stomach irritations caused by aspirin means the pain reliever might soon be available at pharmacies only. The Ministry of Health has prepared a paper for the Medicine Classifications Committee on non-steroidal anti-inflammatory agents, of which aspirin is one.

...An Auckland woman who tried a Chinese "herbal remedy" for her skin disease received a dose of the world's most powerful skin steroid instead... A report in the *N[Z] Medical Journal* says... misuse of the cream could cause stretchmarks on the skin and up to 50g a week could start reducing the protection mechanisms of the body's internal hormone system... [Incidentally, child]-resistant safety caps become mandatory for a new range of medicines from Saturday... But... a consultant pharmacist for the National Poisons Centre... says the Government backtracked on the original agreement, cutting the budget from \$800,000 to \$200,000 and in doing so left some problem drugs out. All medicines in tablet form were dropped from the list of drugs identified as a danger to children. Only liquid medicines will have safety caps funded by the Ministry of Health.

...['Pharmacists in the top half of the North Island have launched a legal fight for about \$2 million they say they are owed by health authorities. The battle is part of court action against the four RHAs to recover about \$4 million in prescription claims owed to pharmacists nationwide, the Pharmacy Guild said. Pharmacists were also seeking big amounts of interest – possibly 11% – following "intolerable delays" by the authorities in processing prescription claims since monthly dispensing was introduced']...

'Vending machines dispensing drugs may soon be seen in AUS, but NZ looks unlikely to follow suit. The AUSn plan to make a range of medicines more freely available would see paracetamol, pain-killers, cough remedies and other medicines dispensed through vending machines in public places. Both the Pharmacy Guild of AUS and NZ's Pharmaceutical Society have voiced concerns. The latter's spokesperson said a similar proposal was raised in NZ last year. He said the society had made its opposition clear then. "We certainly put forward an opposing view, saying it wasn't appropriate to have machines dispensing potentially dangerous medications. We certainly don't believe a vending machine is the appropriate dispensing method for paracetamol, which is very dangerous in overdose. These are not lollies." The Pharmacy Guild of AUS national president said the proposal was a major threat to public health and safety. Children would easily find a way to buy drugs from the machines, no matter what steps were taken to make the dispensers difficult to access.'

...PHARMACIES will increasingly become the first line of defence against ill health for most people, according to... the new president of the Pharmaceutical Society... [The] Manurewa pharmacist... believes this will happen because pharmacies are easily accessible and have more contact with the public than most other health professionals... [She] is the first woman president of the society, which was established in 1981... [Incidentally, osteoporosis researchers say that drugs... such as alendronate (sold as Fosamax) and... calcitonin-salmon [–] a synthetic version of a natural hormone available as a nasal spray... – helped to prevent new fractures in women who had already suffered fractures and also in those at risk because their bones were thin. The U[S]'s National Osteoporosis Foundation... estimated that 10 million Americans have osteoporosis and 18 million more, mostly women, have low bone mass that puts them at risk. Experts said 200 million people worldwide suffered from the disease.

...Success in cervical cancer war... The number of new cases of cervical cancer, and deaths from the disease, are going down. The national cervical screening programme, set up in the wake of the... report of the cervical cancer inquiry seven years ago, appears to be working. [82%] of women aged between 20 and 69 are now having regular smear tests. Between 1990 and 1994 the incidence of new cases of cervical cancer dropped from 249 to 208 and deaths from 101 to 77. Although figures for 1995 and 1996 will not be available until the end of the year, they are expected to show a continuation of the downward trend. However, [the]... coordinator for the... screening programme... [was concerned that 18%] of women are still not on the national register... [A gynaecologist... of the Columba Clinic in Auckland, said there was no doubt that early treatment of any cervical abnormalities picked up through a smear prevented cancer in most cases. "...one laser treatment has a 97[%] success rate at six months. The chance of getting a cancer after that is one-fifth of 1[%]..." On Friday the National Cervical Screening Programme promotional week begins.

...A Mt Maunganui family are praying that research soon to be extended to other parts of N[Z] will help lift a lethal curse that has ravaged their members for generations. The Maori family have lost at least 30 members in 30 years to gastric cancer caused by a mutant gene inherited from a distant ancestor. More cases have been uncovered and earlier generations traced, producing the world's largest genealogical record of a genetic disease. The MP for Tauranga... yesterday announced a \$931,171 Health Research Council grant to finance, over the next three years, a pioneering collaboration between Otago University scientists and the specially established Kimihauora health clinic[... which]... operates out of a simple building on the Tamapahore Marae... on the outskirts of Mt Maunganui...

A Masterton woman says she and her husband may have to find \$700 a week to save the lives of their twin daughters... [They] are angry that the Government will not pay for... a drug used to treat cystic fibrosis, unless they test the drug first – at their expense... [T]heir identical five-year-olds... had to show a significant improvement before the Government would consider financing it. "At a cost of \$100 a day for the two of them, how are we meant to find that sort of money?" she asked. "The drug is funded in A[US], so why not here? ...The Government wants to see a 10[%] improvement but I think even a 1[%] improvement is worth it." ...Cystic fibrosis is a genetic disease and having children with it means both [parents] carry the gene... The girls catch the school bus every day... and then get a taxi to Masterton Hospital for physiotherapy... Every two to three months [the twins] spend about two weeks in hospital for intense physiotherapy... "Basically we just battle on," [the mother] said... Their other daughter, [aged] 12, does not have the disease, "but she will carry the gene too."

...Going to the gym and getting on with normal life are the main ambitions for Canterbury's \$1.3 million teenager... The Ashburton teenager has returned... after a Christchurch Hospital haematologist... made a N[Z] medical breakthrough in haemophilia treatment that stopped [the teenager's] system rejecting medication... The solution came when [the haematologist] decided to use a European drug, Feiba... [which] cost \$900,000, or about 60[%] of the total cost of treatment... The discovery that teenagers can be successfully treated with Feiba has caused great interest in the Australasian medical world as previously it was thought the treatment would work only on infants... [In related news, Pharmac wants] to tighten up use of a hormonal treatment for acne, Diane 35, which acted as an oral contraceptive. [Pharmac's general manager] said some patients were using it solely as a free contraceptive, which was irresponsible since it was double the normal price... Pharmac was... also... considering making savings [by excluding mild pimple creams, which cost \$6 a tube over the counter but \$3 with a doctor's prescription.

...Expect to see more spotty faces on the street once some pimple cream subsidies are wiped to save the country's drug bill more than \$500,000... Pharmac plans to take off its list... about 12 creams used in the treatment of mild cases of acne... [because 'acne treatments rose to \$11.64 million a year' in 1996, and] there were other drugs which had higher priority for public money. Subsidies would remain for treatments of moderate and severe acne, where systemic antibiotics or hormone therapy is used... About 20[%] of the pimple creams were obtained by... people with community

cards[(which identify them as *beneficiaries or low-income earners*)]. Meanwhile, Pharmac has decided another Aids drug, ritonavir, will be added to the two protease inhibitors... already subsidised. They will cost the country \$1 million in the first year... There were 76 cases of Aids last year in N[Z], bringing the total number since 1984 to 598. A further 92 people newly infected with the HIV virus brought the total... to 1168.

...[‘HIV patients have been heading to AUS for new Aids drugs which cost about \$15,000 a year a patient when combined with existing drugs in large “cocktail” doses. One of the drugs, Saquinavir, is subsidised by the AUSn Government, meaning each patient paid \$40 for a month’s supply. The drug was available in NZ but without a subsidy, which meant patients pay more than \$500 a month. A survey of NZ Aids patients taken last year showed many spent up to half their incomes trying to cope with illnesses. They were often beneficiaries or low-income earners – earning less than \$1000 a month – because of their poor health.’]

...The protease inhibitor Saquinavir will be available from[Pharmac] next month... Up to 150 Aids patients are expected to benefit... The drug – taken three times a day – will cost the taxpayer about \$7600 a patient a year. [The 150 people will have satisfied Pharmac’s ‘prescribing restrictions’. In comparison, ‘protease inhibitors are distributed via a lottery’ in parts of the US (e.g., New York).

...A US] Government trial of Aids protease inhibitor drugs has been aborted because it was so successful, say scientists... [T]hey had halted a 1200-patient trial because the new three-drug therapy had cut in half the number of deaths and new Aids-related illnesses compared with a two-drug regimen... A Pharmac spokeswoman said yesterday that this was not the first protease inhibitor trial that had been aborted because[of] good early results... This had made it difficult to get good scientific information from the trials. [The spokeswoman pointed out that other research showed ‘Aids drugs were not as effective as first thought – they don’t eradicate all of the disease; they have side-effects such as diabetes and heart disease.’ Furthermore, an ‘untreatable strain’ of Aids has been identified.]

...Researchers say they have isolated a weak spot in the Aids virus which may allow new drugs to stop the infection from spreading... [A]t the Whitehead Laboratory in Cambridge,[Massachusetts,] scientists have pinpointed an image of the viral protein that allows HIV to attach itself to a healthy human cell and kill it... Part of what has made Aids difficult to combat is that the virus mutates so often. What... [the scientists] discovered was that the protein’s structure remains constant – an unchanging target for scientists developing anti-Aids drugs... To speed the process of drug discovery, the Whitehead scientists will make the precise, three-dimensional information about the protein structure accessible to all scientists through Brookhaven National Laboratory’s protein data bank.

...Evoking the memory of John F. Kennedy’s challenge to Americans to put a man on the moon in the 1960s, [the 42nd]President... has promised that the U[S] – where ‘more than 300,000 people have so far died from Aids’ – will find an Aids vaccine within a decade. Speaking at Morgan State University, Baltimore, [the President] yesterday announced that an HIV vaccine research and development centre would be established at the National Institutes of Health to spur the effort. “With the strides of recent years, it is no longer a question of whether we can develop an Aids vaccine – it is simply a question of when,” he said. “And it cannot come a day too soon.” ...[the] director of the White House Office of Aids Policy, said the special HIV centre would be fully operational within months and involve 40 to 50 scientists. It would add about \$US17 million... to Aids spending, bringing the annual total to \$US150 million... But that’s[still] too little funding to address all facets of the Aids epidemic, say some Aids advocates. “We applaud the President’s commitment but stress that this project will require a large infusion of federal money, which must not be siphoned from other programmes that support people with HIV and Aids,” said... [the] legislative director of the Human Rights Campaign... Aids researchers had been toiling since the mid-1980s but had not found a vaccine[– although last year ‘a vaccine that protected an entire test group of monkeys against the HIV virus was genetically engineered by a team of immunologists at Guy’s Hospital in London’ –] and “one has to be in awe of the problem.” Central to the task was the nature of the disease... The virus mutated so quickly that a vaccine that seemed effective one day might not be the next. In addition, the human immune system’s inability to make any antibodies to fight HIV made the search for vaccines even more difficult... [T]he president of the American Foundation for Aids Research... acknowledged problems, but said the short history of Aids in the U[S] had proved past Cassandras wrong... “People said we’d never find a treatment, and now we have 11 treatments.” Another “impossible goal” – prevention of transmission of HIV... from pregnant women to their babies – was achieved in 1994 with the drug AZT.

...The U[S] and other Western nations funded experiments on Aids in poor African countries that would not be allowed at home, a consumer group claims. Consumers International said the... “unethical” experiments... with unproven AZT-type drugs... could kill hundreds of babies at risk from infection with the Aids virus from their mothers... The drug AZT, a standard treatment for pregnant women infected with the Aids-causing HIV virus in the West, reduced the transmission of the virus from mother to baby by about two-thirds.

...N[Z] children with HIV are being treated with revolutionary drugs designed for adults... This could see a child taking up to 15 tablets a day... [S]pecial doses had to be worked out... [because] treating children with drug cocktails was complex. Children had to stick to the regime or face drug resistance. The long-term effects of inhibitors on children were not well known... “People think development of drugs for HIV is slow but when it comes to children it’s even slower because everything has to be used on adults before they do paediatric studies...” ...A U[S] drug company has now developed a new inhibitor including a child formulation. [One drug] manufacturer... has applied to have the drug... registered here. It goes before a Ministry of Health committee shortly... [C]hildhood HIV was becoming an issue for N[Z] as there was a 20[%] chance of the disease being passed on through pregnancy. Research showed that an HIV drug, AZT, could cut that risk to 5[%] – and ‘one dose of the “cheap” drug Nevirapine administered to a pregnant mother, plus one dose administered to her newborn, cuts the transfer of the virus between them by 50% over AZT’ –] so it was important women knew if they had HIV... Eighteen N[Z] children have been diagnosed with HIV since testing began in 1985. Five have developed Aids.

...Notifications of Aids have halved[in NZ] so far this year compared with the past two years, but medical researchers say it is too soon to draw conclusions... The total number of people... with Aids... is[now] 621, of whom 28 are female.

...bucking national trends... HIV infection is on the rise in Auckland... for the second year in a row... There were 54 new people in Auckland with HIV in the first nine months of 1996, compared with 48 for the whole of 1995... Numbers dropped in Auckland from 1990 to 1994... The figures showed the number diagnosed in Auckland, although many may have come from outside the region... Latest findings continue the trend where infections from homosexual transmission has dropped and heterosexual infection is increasing. Homosexual transmission, however, is still the most common method of reported infections... The Auckland Healthcare public health registrar... said the increase of heterosexual transmission stemmed from people having sexual encounters while overseas. [● ‘Heterosexual intercourse accounted for 70% of infections worldwide during 1996.’]

...‘studies of HIV-infected people in Los Angeles show disturbing behaviour trends that could lead to the rapid spread of the virus that causes Aids, say researchers. One of the most disturbing studies involved 113 HIV-positive bisexual men. It found that 54.4% failed to disclose their infection status to sex partners. 31% reported having unprotected sex. In another study of 53 men in Los Angeles County, 50% reported having had sex with an average of 28 partners in a public place in the previous six months. And 41% said they had had unprotected sex in a public place. A study of 305 black men with HIV or Aids found 31% identified themselves as heterosexual even though they reported previously having sex with men. In another control group of 305 black men who were not HIV-infected, 16% said they were not homosexual but reported having had sex with men. Researchers cautioned against applying the Los Angeles findings to other parts of the US. But one noted that California often provided a look of things to come for the rest of the US.’ Incidentally, a] jury has awarded \$US12 million... to a former... intern who sued the Yale Medical School after she contracted the HIV virus[after] working on an Aids patient nine years ago.

...[NZ's p]risoners believe they are at greater risk of contracting HIV and Aids than the general public because the Department of Corrections continues to refuse to supply condoms and syringes. The department argues that sex and drugs are banned from prisons so it will not do anything that could be seen as promoting or endorsing illegal activity, but health workers and inmate support groups say that position is a denial of reality. The... only report... [the] department... has about HIV/Aids in prison is seven years old. That Health Department report found sexual activity between inmates was rare but did occur. There were reports, but no evidence, of sexual violation in some prisons... Research in Britain indicated as many as one in 10 inmates had engaged in sexual activity with one or more other inmates. Condoms were not used. The same research found a wide variety of drugs available in prisons and that most people who injected drugs used syringes which were also used by others.

...Overcrowding, drug abuse and sexual promiscuity have caused an Aids explosion in Europe's jails. One in five prisoners in Spain and Ireland are infected... says a U[N] agency.

...The number of people testing positive for HIV is growing rapidly in Russia, and may reach one million by the start of next century, said health officials yesterday. Up to 90% of the infections occur among drug users.

...[‘virtually 90% of Aids cases are in the developing world’, and ‘the majority of victims don’t know they are infected’]...

Prostitutes, truckers and... one-night stands have spread Aids along Africa's economic highways... The spread of the Aids epidemic is far worse than anyone feared, say... experts. They say the HIV virus is infecting twice as many people as they previously calculated and is threatening to orphan more than 40 million children... Twenty thousand children in Kenya have[already] lost one or both parents to Aids... “More than 42 million people have been infected, and a staggering 30.6 million are living with HIV... which is one in every 100 adults in the sexually active ages of 15 to 49 worldwide... This year alone, some 5.8 million people globally were newly infected with HIV...,” said... [the] executive director of the... programme UNAids, at a news conference to mark World Aids Day... “The implications of this in terms of human and social costs are rather extraordinary,”... said... [the] director of USAID... “It’s having a devastating impact on development and we cannot ignore it.” Countries would be unable to develop their economies as their productive workers died, and would be subject to social unrest as the orphaned children – poor, malnourished and uneducated – grew up... The... director of Aids Control and Prevention Project... said teenagers and young adults accounted for three out of every five new HIV infections around the world. “Two-thirds of all those who acquire HIV will become infected before they reach 25. The risk is greatest for teenage girls. Worldwide up to 60[%] of all new HIV infections in women occur before the age of 20... [M]ost will not benefit from expensive new antiviral therapies... prevention is the only hope.” ...studies had shown early and comprehensive sex education programmes could influence young people to postpone sexual activity. “At the same time, we must recognise that many young people are already having sex,” he added. An educator from a Kenyan university noted that it was very hard to start telling young people: “No, don’t do it” when they were already doing it.

...IT WAS the summer of 1990... Her husband had just succumbed to Aids. She knew he had infected her. Now her in-laws clamoured for her to allow one of her husband's brothers to make her his responsibility, as tradition has long dictated... [Then 28, she] could scorn tradition, be driven from her community and face starvation with her three children. Or she could marry a brother-in-law, feed her offspring, protect her property – and pass on the virus. She chose the brother-in-law. He died of Aids two years later, but not before infecting two other women. Then they both died. Another man has since inherited [her], and when she was recently interviewed, she was pregnant with his child. She says she knows the child may have the... virus... which causes Aids. And she knows that the disease likely will kill her inheritor. Just as it will soon kill her... “It’s a terrible cycle,”... In Western Kenya, the custom known as wife inheritance once held an honourable promise... If a brother-in-law could not care for her, then a cousin or a respected outsider would. The inheritor... could take on a widow only if he had a family. His first wife would accept the arrangement because tradition frowned on his having sexual relations with his inherited one. The system worked until the inheritors began to shun that taboo. They had sex with the widows and that helped HIV explode throughout central and East Africa. One out of every eight people with Aids lives in sub-Saharan Africa, where in some countries 10% of the population is HIV-positive... the HIV rate in... some... large towns and cities is as high as 25%. - 1997

[A 62-year-old] has photographs of her four eldest daughters on the wall of her tiny shack in Nairobi's Kibera slum. She has buried three of them in the past 12 months. The other died four years ago. All were victims of Aids... And now her fifth daughter – she has six – has been diagnosed HIV-positive... [She] seems overwhelmed by the scale of the epidemic which is wiping out her family... [and had] thought her mothering days were well behind her. But now she cares for 13 of her orphaned grandchildren... “I’m very worried because my grandchildren... could go out and get it[, and]... I don’t know what will happen to my grandchildren[if I die,” she says.] “I have no brothers and sisters...” ...Kibera is one of Africa's largest slums and easily the most crowded on the continent. About a million people – a third of the population of the Kenyan capital – live here, crammed into just 2.5 sq km of land. At least one in five of the people in Kibera aged 15 to 45 are thought to be HIV-positive, well above the national average of 14[%]. But the figure could be much higher. No one really knows... There is no recreation space in Kibera, scarcely a tree, no benches for people to sit and talk and no public squares – just narrow, muddy streets stinking of sewage and rotting garbage. There is little for young people... [-] fewer than half [of whom]... go to school... [-] to do except have sex... “When people are idle they think of sex, because idle minds think of idle things.” [The 62-year-old]'s home is typical of Kibera – only 9 sq m... [- but she] somehow fits 10 of her grandchildren in [t]here at night and the three eldest sleep with a neighbour. Backing on to the house is a crude bar which sells illegal home-brewed spirits. By noon it is already full of drunk middle-aged men. Alcohol and casual sex go hand in hand. “The women who run the bars often sleep with their customers to keep them loyal,” one aid worker says. “Then their customers, these old men, turn their attention to their daughters, often very young girls.” Girls in Kibera often become sexually active from as young as 10, boys from 13. Youngsters here often know what condoms are, although... “...if they are given them, they just throw them away.” Perhaps the greatest challenge, aid workers say, is changing the way a community thinks... “Everybody here does everything because everybody else is doing it,” says... a project officer with Unicef. “Sex is part of leisure here. They have nothing else to do, they have no jobs. They are HIV-infected – so what? What is death, after all, to a poor man?” ...[Kenya's] President... declared Aids a national disaster late last year, but experts say the Government is still not devoting anything like enough effort to curbing the epidemic, which has killed two million Kenyans. As well, little seems to be done towards solving the special problems of Kibera[, where]... there are about 50,000 Aids orphans... alone... To Kibera's north, the greens and fairways of the Royal Nairobi Golf Club look on almost mockingly. It is the closest Government ministers ever get to the slum.

...*African apocalypse looms as Aids toll mounts*... The truly devastating threat that Aids poses to Africa comes into painful focus when the President of Botswana... says his country faces extinction from the disease. [The President], who leads a diamond-rich country of 1.6 million people, is not being alarmist or playing with rhetoric. The U[N] estimates that one in three of the country's adults are living with HIV/Aids, giving Botswana – which is roughly the size of France – the highest percentage infection rate in the world... At Gaborone's main hospital, up to 80[%] of the beds in the male ward are filled with sufferers in the last stages of the disease. More than a third of patients in the children's ward also have Aids... As in virtually every public hospital in sub-Saharan Africa, no anti-retroviral drugs are available because they are too expensive. All the overworked staff can do is treat opportunistic diseases such as meningitis... The alarming statistics and overflowing graveyards still have little impact on the spread of Aids across the continent. [90%] of the sex workers who ply their trade with the long-distance truck drivers at the town of Tlokweng on the Botswana-South Africa border are HIV-positive. Commercial sex is driving the disease throughout the continent. In neighbouring

Zambia, [one prostitute] works the top hotels in the capital, Lusaka, where her clients are mainly Government officials... and... foreign businessmen... “When a man doesn’t want a condom, I ask for more money. They usually pay extra.” ...[the prostitute whose] tale is one of parental abuse and poverty... is hardly unique – a U[N] study in Ndola, Zambia, found that only one in four sex workers had used condoms with their last client and only one in seven used condoms with all clients... 24.5 million of the 34.3 million people with HIV/Aids live... in Africa... Most are without hope of effective drugs, proper supervision, basic health care or counselling. The... [lack of these] basic care provisions have al[so allowed Aids] to go unchecked... There is no sign of a quick cure.

...A newly approved medicine has enabled doctors to develop Aids drug cocktails that are easier to take, cause fewer side-effects and appear to work more effectively in children... [The] class of medicines called protease inhibitors have made Aids a treatable disease. But some patients fail to benefit, largely because they cannot cope with taking 15 or 20 pills a day on a precise schedule. Two studies suggest that Sustiva, one of a new class of Aids medicines, may work better than the standard treatment, perhaps because it requires fewer pills... [T]aken once a day... Sustiva is known as a non-nucleoside analogue. Like older drugs, such as AZT, it blocks a certain enzyme the virus needs to reproduce, but does it in a different way... In the study of 450 HIV-infected adults, blood levels of the virus fell to undetectable levels in 48[%] of those given the standard regimen of a protease inhibitor plus two older drugs, compared with 70[%] of those taking a mix of Sustiva and the same two drugs. Also, 43[%] of the protease inhibitor patients stopped treatment because of side effects. Only 27[%] of the Sustiva group dropped out... Sustiva, generically called efavirenz, goes under the brand name Stocrin in N[Z], where it was approved for use last month. Pharmac has been asked by the manufacturer... to subsidise it. The drug was approved last year in the U[S]...

A small Californian biotechnology company has engineered the first Aids vaccine to win federal approval for a large-scale trial in humans. The study, which will begin sometime in 1998, will involve 7500 healthy volunteers, cost \$US20 million... and take three years to complete. If successful, the vaccine would be made available to the public in the early part of the next century... [By the way, r]esearchers measuring the rate of genetic change in HIV... [believe it] originated from a common ancestor that first evolved from a simian virus in southwest Africa between 1915 and 1941, with 1931 the most likely year[, but Aids]... stayed in remote Africa until jet travel, big cities and the sexual revolution spread it worldwide...

As medical mysteries go, this one is about as big as they come. An unknown virus somehow emerges from the heat of a tropical jungle to cause one of the most frighteningly stealthy pandemics in history. Before doctors are even aware of the Aids virus, it has already infected hundreds of thousands, probably millions of people around the world. Now scientists are on the verge of answering... the [mystery]... The answer might turn into the ultimate medical irony. A modern-day plague is unleashed with the unwitting help of doctors... [- and u]p to 400 wild chimps... many dying in scientific experiments that would constitute dubious practice by today’s animal-welfare standards... [-] trying to fight another, equally appalling disease. If true, it means that Aids was a terrible side-effect of the polio vaccination campaign which took place in the Belgian Congo at the end of the 1950s. If false, the allegations would amount to a damaging slur on a heroic attempt to rid the world of a devastating paralysis.

It was the miracle of the baby boom. Throughout N[Z] in the 1950s tens of thousands of children lined up at schools for their dose of... the medication that would keep them safe from the crippling and potentially fatal plague of the polio virus. Unknown to them, their parents and the officials who ordered the huge programme of mass vaccination... the vaccine carried a rogue hitchhiker: a monkey virus potentially linked to brain tumours and skin cancer in humans... Since crossing the barrier from monkeys to humans... Aids... has taken less than four decades to establish itself as the worst pandemic in human history, and by 2010 will eclipse even the 300-year ravage of the Black Death in Europe... Yet the real message of both polio vaccination and Aids has still to be accepted. There is now powerful evidence that Aids was unleashed on the world by the pioneers of polio vaccination, and that the lessons of this tragedy have yet to be learned by the new pioneers of cross-species medicine. True or false, the scientific establishment has steadfastly attempted to squash debate on the theory, and publicly sees no need to understand fully the origin of Aids... But the appalling fact of Aids remains as a warning beacon. From only a few thousand early infections it has raged to a global toll that is extended by one new case every nine seconds. A medical breakthrough tomorrow would still not prevent the plague causing over the next 25 years more deaths than... W[W2]; even if a vaccine appeared hundreds of millions of people would be economically beyond its protection... “The polio vaccine theory is essential both to medical history and probably to finding a cure for Aids itself... But it is even more important in what it can teach us about how new plagues invade humans and the risk of this occurring in the future. Without objective testing of the theory the perils to humanity are bound to be discounted – as in cases such as thalidomide, breast implants, toxic shock syndrome and many other medical mishaps.”

...Claims of a N[Z]-based Aids breakthrough have failed to excite the American media. An Auckland company... announced this month that it had helped develop the first biological Aids remedy... called HRG-214[– that ‘helps rid a body of the HIV virus by improving the body’s immune system’ –] which it held the exclusive[‘worldwide’] rights to manufacture. The N[Z] announcement was followed by widespread media releases in the U[S], where the therapeutic treatment has been jointly developed. The American lawyer acting for the drug developers... said the treatment was yet to make any headlines or score any air time. He... [added that the US] public had probably grown tired of Aids claims, hence the cold media response.

...The first urine test for HIV... has been approved by the... [FDA]. “The urine test could become a significant weapon in the battle to slow the Aids epidemic because it makes testing safer, easier and more accessible compared to traditional methods,” said [a spokesperson for] the Los Angeles Gay and Lesbian Community Services Centre. HIV is currently diagnosed by testing blood or saliva samples... [However, the FDA] said that if a sample tests positive it would be retested and that even a second positive result would have to be confirmed via a more accurate blood test.

...[‘Philippine health officials have advised patients who have had blood transfusions to take Aids tests after an HIV positive man boasted he’d sold contaminated blood five times in the past year. The Department of Health barely avoided a huge public scare as it flipfopped over whether it had been able to find his blood. The 26-year-old, who has been confined in hospital for drug rehabilitation treatment, said he used false names to sell his type AB blood to two Manila blood centres. The scare highlights the appalling state of the country’s blood donor and transfusion system. A 1994 US-backed study by the department called the system “unsafe, inadequate and wasteful” and revealed that 4% of the country’s blood supply was contaminated. The study found that only one out of every 500 Filipinos donated blood, and for every 10 patients who needed transfusions, three did not get one. Most blood is supplied by commercial banks. The problem here, the study said, is that a paid donor is three times more likely to lie about his or her medical history and have one of the four transmissible diseases – hepatitis (B or C), syphilis, malaria or Aids. Blood from commercial banks has infected at least 11 people with HIV.’

...‘Villagers in China sold blood to a government organisation (that made a profit out of selling it to pharmaceutical companies). The organisation used dirty needles – infecting 500 out of 800 blood-donors in one village, and possibly 600,000 in all.’

...A US] judge gave preliminary approval yesterday to... [the] settlement of claims against four drug companies accused of knowingly selling Aids-tainted clotting products to haemophiliacs. People with haemophilia who used blood-clotting products between 1979 and 1985 and who are HIV-infected would get roughly \$US100,000 each under the settlement... Also eligible for payment are survivors of haemophiliacs who died of Aids as well as family members and others who have contracted HIV from a person with haemophilia. Lawyers... estimate the number of people eligible... at 5000 to 6000... Although some haemophilia activists contend the offer is inadequate, [the]Judge... said it had sufficient earmarks of fairness... Terms of the settlement say \$600 million will be distributed to victims, and \$40 million will pay for expenses and lawyers fees... The main lawyer for the haemophiliacs... said the settlement was probably the only way many of them could get compensation for their suffering. He said most who had sued the drug companies in the past had lost. Those who had won later had their victories overturned on appeal. Individual suits by about 800 people remained. Haemophiliac groups say the companies purposely failed to protect them by refusing to treat the products with heat that would

kill the virus, and by manufacturing the products from blood... taken from people at high risk for Aids. The companies contend that reliable Aids-killing treatments were not available until the mid-1980s.

...[t]he Accident Compensation Corporation must cover a woman and her son who contracted HIV after her husband received an infected blood transfusion, the High Court at Wellington has ruled. The judgment overturns a district court decision upholding the ACC view that they were not entitled to be covered. The mother was diagnosed as HIV-positive in June 1993, a month before she gave birth. In December 1993, her baby was found to be HIV-positive. They now have Aids. Her husband, Shannon Hughes, was given a blood transfusion in 1984 after a motorcycle accident. He did not know he was infected until after he had passed the virus on to his wife. Mr Hughes, who died last year, had been covered by ACC because he had suffered a medical-mishap, but ACC denied cover to his wife and son, arguing that how they contracted the virus could not be termed an accident because the ACC law specifically excludes contracting a virus. The family's lawyer said last night the decision was a victory for common sense. It meant rescuers who caught a disease while giving mouth-to-mouth resuscitation or attempting to stem the flow of blood would be covered by ACC. "So this case is wider than just the medical misadventure case," he said. ● "The "bad blood" scandal, in which a number of people were infected by HIV, is part of a wider international uproar. In the 1980s, in countries as diverse as Canada, Britain, France, Germany and the US, tainted blood and blood products infected tens of thousands with hepatitis C. Official inquiries were held and governments sued. The Canadian government offered a \$1.1 billion payout to some 22,000 people.'

...about 400 Canadians who said they were infected with hepatitis C from blood collected in US prisons have launched a \$C1 billion class-action lawsuit against two companies and the federal Government – and vowed to expand their case into the US. The group's lawyer said 1000 Canadians were exposed to the tainted blood: "In our view it was irresponsible to even consider collecting blood within US prisons. We certainly hope there will be some American investigation to explain why the FDA would allow plasma that wasn't good enough for its own citizens to be exported." The lawsuit is another blow to the Canadian Government, already reeling from a tainted blood scandal that drew thousands of outraged hepatitis C sufferers to the steps of Parliament Hill in Ottawa and ultimately forced Canada's Red Cross to file for bankruptcy protection. In March Canada's federal and provincial Governments agreed to a \$C1.1 billion compensation plan for those who were infected with hepatitis C from tainted Red Cross blood. The package does not cover those afflicted before 1986, however, the year that comprehensive testing of blood samples began in the US.]

...Victims of hepatitis C from contaminated blood say they will not allow a court ruling to stop their claims for lump sum compensation. The [ACC] successfully appealed to the High Court in Auckland against a District Court decision awarding a lump sum payment as compensation to a haemophiliac who had contracted both hepatitis C and HIV from blood products given for accidental injury... [T]he decision would affect more than 100 people... A Hepatitis C Support Group co-ordinator... said... the... group believed that the Government had a "moral and ethical responsibility" to compensate people who received hepatitis C from contaminated blood and blood products... [A]ccess to lump sum payments had been barred since changes were made to the law in 1992... All the claimants were injured before July 1992. But only those who found out by that date, and lodged claims by October 1992 were eligible for the lump sum. Many did not discover until much later that they were infected... [L]awyers originally found loopholes in the legislation which would have allowed more claims, but the Government amended the act in 1993 to exclude the claims. The group could now take the decision to the Court of Appeal.

...A woman who contracted hepatitis C through a blood transfusion is incensed that the hospital where she was infected will not finance her treatment. [The woman], aged 58... has demanded that Waikato Hospital pay for the drugs which are vital to her life. Health Waikato officials... have not disputed that the infection occurred at Waikato Hospital... [She] was given infected blood during a transfusion at the hospital in 1992. Twelve weeks later she developed hepatitis C, which causes liver disease and can be fatal... In a letter to her doctor in January 1993, a Waikato Hospital haematologist... confirmed that her disease had been contracted through the transfusion[, that her]... treatment should be financed if she developed chronic hepatitis, and she could lodge a claim for accident compensation as a result... Between April and October 1994 Waikato Hospital gave her Interferon injections. She relapsed after the treatment stopped... She receives... [the minimum weekly ACC payout. In May she] met a Waikato Health physician... to see if more Interferon treatment was available for her but was told that she would have to pay \$7000... At the time of the transfusion, hospitals were not legally required to screen blood for hepatitis. Although [the woman] told her doctor that she was nervous about the risk, she was reassured that there was only a slim chance that she would be infected.

...Auckland blood experts are working to cut the risk of a potentially deadly bacterium being passed through transfusions... [The] medical director of the Auckland regional blood services, said officials were not ready to divulge details but they thought the risk could be reduced by 50[%]. "It's a problem we will try to reduce as much as we can but no medical procedure has zero risk." He warned that any measures would cost "an awful lot of money." ...A woman died last year after she received blood in a transfusion of stored blood at National Women's Hospital. About eight patients had then been known to have received yersinia-contaminated blood over the previous 10 years, four of whom died... The Ministry of Health says yersinia is one of more than 30 readily identifiable infections which can be transmitted through blood... A ministry spokesman said rigorous procedures were employed by blood banks at the time blood was collected and when it was issued to recipients. Routine screening was carried out for hepatitis B and C, HIV and syphilis. It is also carried out on blood from donors who have recently travelled to certain countries... Donors must be fit and healthy and answer a health survey which included questions about travel, occupation, sexual or "at risk" behaviours. Once donated... blood is kept refrigerated to minimise bacterial growth. Plasma is heat-treated, disinfected and filtered. People who have haemophilia... rely on blood products... [●] People who want to store their own blood for an upcoming operation are going to have to pay for the privilege. The Minister of Health... is putting through law changes which allow [hospitals] to charge for blood checks and storage services... [I]t cost about \$165 per unit plus GST to store the blood... People usually stored between two to three units of blood for an operation... Records show that 71 Auckland patients stored 155 units of their blood for surgery in the last financial year. [An] estimated 1000 units of self-supplied blood was stored nationally a year... The ministry said the charge was coming in to recognise an increased demand for this service which had no proven safety improvement... Most of the patients who requested the use of their own blood were elderly private hospital patients... The medical director of Auckland Regional Blood Services... said most elected to use their own blood for peace of mind and because of an unwarranted distrust of donated blood... [T]here was virtually no medical benefit in using one's own blood, as donated blood was so well screened.

...The country's first blood donor club is being launched in Auckland in a bid to boost desperately low supplies... [T]here had been a huge run on certain types recently – a road crash victim last week needed 250 units of blood. The average patient used just over three. Stocks of type O negative, used extensively in emergencies, were at about half what the blood bank regarded as a safe level... [I]n dire shortages, supplies could be flown to Auckland from down country... The service's donor recruitment supervisor... said it was important to get a steady flow of blood rather than huge waves of enthusiastic people. Each unit had a shelf life of about 35 days. A long-time donor... will be held up as a brave example for would-be club members. The 57-year-old has rolled up his sleeves 148 times since his first donation 38 years ago. Club members will occasionally be able to meet recipients whose lives had been saved by donations... The club is named after an English obstetrician who performed the first human blood transfusion in London in 1818. [*85% of people are Rh-positive. Such people can't be donors for patients without the Rh factor. Second or later pregnancies resulting from the union of an Rh-positive father and an Rh-negative mother may end in miscarriage or produce a child with a blood disorder.] - 1996

Fears that... [diseases] could be spread through the public blood supply are driving the establishment of a national computerised blood supply management system... Health Otago's system, which recently went live, could instantly track donor and/or recipient details while maintaining a high level of confidentiality... The Ministry of Health... is expected to give top priority to developing a... single national blood service.

...Provincial... cities will lose their blood processing and testing centres under a new National Blood Service structure announced yesterday. The number of... [centres] around the country will be cut from 19 to three... The other blood centres... will be reduced to blood collection sites.

...The Auckland Regional Blood Service has issued an urgent appeal for blood. The critical need is for O positive type blood, with type A also required. The service is offering to transport donors to and from their workplace.

...As the holiday season looms pressure on blood stocks is expected to intensify as regular donors take time off. The Auckland-Northland region needs 250 donors a day to maintain stocks. The... [manager of] donor services at the Auckland Regional Blood Centre, says he faces a battle to attract donors outside a core of 32,000 regular providers... [The centre says it needs to increase its stock levels of] A+... A-... B+... AB-... [and AB+ blood types, but u]rgently needs... O+... O-... [and B-. One reason 'blood banks are facing shortages is because body piercing rules out many young donors.'

...Teenage trends for body piercings are preventing one of the most generous group of blood donors from giving. The Blood Service has to decline donations from those who have had a body piercing or tattoo within the past year, because of the potential for serious infection. The national donor manager said donations from 10% of the total Auckland donor base had to be deferred for 12 months. Tests were being developed that might mean donors with piercings or tattoos had to stand down for just six months. "My problem is getting donors in the door. It's a constant challenge to make sure there are enough. We do get stressed." A "red felt-tip" advertising campaign seemed to capture the public's imagination. The national donor manager says one of the toughest things about keeping numbers up was getting first-time donors to return. AUSn and US research suggest 40 to 60% of first-timers do not return.]

...British doctors have begun a legal battle to overturn an American company's patent on the use of blood from the umbilical cord in the treatment of leukaemia and genetic disorders... Newborn babies have spent 9 months being nurtured through the umbilical cord and at delivery it still contains a rich supply of stem cells which can be used to help restore healthy blood... The discovery is being claimed by a firm in Philadelphia... which has been granted patents... [requiring] a royalty to be paid to the... firm... every time cord blood is put to medical use... in the U[S] and Europe... It wants to create a massive bank of cord blood samples which will be sold to hospitals. "We invested in this idea early on, we've spent millions of dollars developing it, we sponsored the very first transplant... in France, we pioneered this technology and we have submitted this before the patent offices and they have agreed that it is a patentable idea." [However, blood]... specialists in Britain... say the patent is immoral... "It's just entrepreneurs who want to make a lot of money [out of] something that could help lots of people [from] something that's freely donated."

...A Wellington mother has won her battle to have blood from her newborn baby's umbilical cord stored for future use by her daughter... aged 4... who... was diagnosed with leukaemia a year ago... [The mother] is expecting... in 10 weeks and would have gone to A[US] to have the blood stored if it could not be done here... [She] has been fighting since early this year to have a cord bank set up... Cord blood transplants give leukaemia sufferers a better chance of survival and are much less painful.

...A public appeal is being launched... to raise \$1 million... for a special blood bank... which will store blood from placentas... to help children with life-threatening diseases, after health officials cried poor... [A] Starship children's hospital specialist, was dismayed by the[officials'] rejection. He said that up to 40 seriously ill N[Z] children needed bone marrow transplants each year. Most had cancer or immunodeficiency disorders and stood a high chance of dying before a suitable bone-marrow donor was found. The discovery of umbilical cord blood as a substitute was regarded as a major breakthrough. The blood is taken from the severed umbilical cord after a child's birth. It can be stored indefinitely... [A] national cord blood bank would save at least two children a year.

...Buying [a] Life Link Cord Blood Development Appeal "Bonus Bag" for \$4.95 will help to keep a child alive... One dollar from the price of your bag will be used to provide the equipment and services needed to provide this Life Link... *Please be generous...* Your \$4.95 will get you over \$20 worth of products and coupons, *plus* the chance to win a 5 door Daihatsu Mira LS or a 7 night holiday for 2 in Tahiti or a matching pair of His & Her Seiko Kenetic watches.

...[an Auckland couple 'are beautiful, young and in love. They dream of a future together and of having a baby. It seems the perfect romance – if only he lives long enough to enjoy it. Despite the love and support of his 18-year-old partner and his beloved family, the brave 19-year-old is starting to lose his battle against leukaemia. After two rounds of chemotherapy and a failed transplant of his own bone marrow, doctors are running out of options. His only hope now lies with donated bone marrow, but the worldwide bone marrow registry has failed to come up with a match. It is far harder for people like the 19-year-old, who is part Tongan, to find a compatible donor as there are only 4500 Pacific Island and Maori people on the registry compared with six million people of European descent. "I try not to think about what might happen if I don't get the transplant, but it is scary," says the talented songwriter, who longs to be a rap star. His family is committed to increasing the number of Pacific Island and Maori people on the bone marrow register. They encourage everyone they meet to become a donor, and with the help of a Pacific Island health service in the Waikato are hoping to take a blood donor van to Auckland to test potential donors at the Otara Flea Market and at churches in South Auckland. "This is our mission now," says his mother. "We realise we may not find a donor for our son, but it might help someone else." Her son has his own message for anyone thinking of becoming a bone marrow donor: "It would only take a bit of your time. Please help me. I'd be your friend for life." ■ The bone marrow is collected in major hospitals under general anaesthetic from cavities in the hip bones, using four to eight needle punctures. ■ You can go home the next day and return to normal life after two to three days. ■ The marrow quickly replaces itself, and the only cost is your time. ■ Your name will stay on the register until you are 56.']

...Lack of money is... preventing bone marrow transplants... in N[Z], according to a] visiting American expert... [An] Auckland Hospital haematologist... [agreed. He said that] tight budget restraints... [meant NZ] could do only six bone marrow transplants per million population each year... compared with 30 per million in A[US] and 60 in America. N[Z] had 800 people on its bone marrow transplant register which was established last year. Since then, two children have been matched with donors for successful transplants... [Incidentally], the Haemophilia Society is lobbying the Government to finance alternatives to treatments which use human plasma... A society vice-president... said the situation was appalling, and that the Government had fobbed sufferers off for long enough... [H]aemophilia was devastating enough for... sufferers without the complications of life-threatening viruses... The campaign, centred around World Haemophilia Awareness Day today... coincides with calls for an urgent meeting of the Creutzfeldt-Jacob Disease working party, which will take place in the next few weeks... [following a WHO... endorsement of a warning by a U[S] scientist that people at risk from the brain-wasting disorder must not donate blood. "N[Z] has got one of the safest blood systems in the world, but having said that, people whose lives depend on the blood products can't help but remember 1983 and HIV... [They also] are still smarting from the hepatitis C scare, and now we are aware of other viruses." ...With the credibility of the blood service "shot to pieces," the society president... said recombinant products should be available to everyone who wanted them... [S]ynthetic products were internationally recognised as the preferred products, and there had been no documented cases of viral transmission through their use... The society has been lobbying for three years to get recombinant factor 8 introduced in N[Z]. The synthetic product would enable 80[%] of sufferers to stop using blood products. The 20[%] of sufferers with factor 9 deficiency would still be reliant on plasma products until a replacement factor 9 product became available... [10%] of severe haemophiliacs in N[Z] have contracted HIV... from their treatment. [● 'American hospitals have been using accident patients to trial synthetic blood (which can be used by any blood type and doesn't clot) without their consent.']

...A visiting Japanese expert... said artificial blood had been studied in Japan for 30 years and had received a government grant of \$5 million... [The grant means that within 2] years... haemoglobin solution... transfusions... would be available in ambulances to be given to accident victims on the spot – with less than a 0.5% chance of infection. [However, the] Auckland Blood Transfusion Service... said... a lack of money means it won't happen here... in the near future... But... N[Z]ers receiving transfusions could feel safe knowing that hepatitis had not been detected in blood since 1992.

...A new hepatitis virus has been found in donated blood but people with the virus do not and will not know they have it because the researchers worked with anonymous samples... The testing method also means it is not possible to trace back from the samples containing hepatitis G and withdraw blood products from those people's donations... The virus was present in 2.3[%] of... more than 1000 samples... The... action of the virus was still unknown, but blood carried a lot of viruses that did not cause disease "and we think this could be one." No country had withdrawn blood because of possible problems... There was no evidence implicating... hepatitis G... in liver damage... The Director of the Auckland Regional Blood Centre... said... it was difficult to know what to tell people shown to have the virus when so little was known... [Meanwhile, h]aemophilia sufferers have labelled new Health Ministry initiatives for improved treatment discriminatory. Proposals announced yesterday... would see increased use of the blood-clotting agent Factor 8... Some haemophiliacs already receive the safer artificial product... and it is expected that plasma-based blood products, derived from humans, will be phased out over the next two to three years... But the... Haemophilia Society said the ministry's access proposals limited the virally-free recombinant to... sufferers aged under-18 who had not contracted hepatitis C.

...The Ministry of Health has made public the results of a \$1 million review of blood products that were donated during the two years that it took health officials to act on a recommendation to introduce... hepatitis C screening... The National Hepatitis C Lookback Programme found that 56 people who received contaminated blood between August 1990 and July 1992 now have chronic hepatitis C infection. Up to 5[%] of those people were likely to develop liver cancer... while 10 to 20[%] would suffer serious liver damage. A further 76 were found to have antibodies to the disease and were at risk of developing a chronic disorder... In one case it was believed that hepatitis C... had contributed to the person's death... The lookback programme identified 669 people who were at risk of contracting the disease from contaminated blood. Of those, 374 were still alive; the rest had died as a result of the illness for which they received the transfusion. The ministry was able to contact 339 people of whom 277 were tested. The others could not be contacted or did not want to be tested.

...The first of 120 High Court claims for people infected with hepatitis C from contaminated blood were filed yesterday... [The] scandal... could cost the Government tens of million of dollars... [because they are claiming] damages of between \$750,000 and \$950,000 each... The Government was told in early 1990 that blood should be screened for the disease, but that was not done until 1992. Screening tests were available from 1987.

...The number of hepatitis C "bad blood" claims filed against the Government has doubled in past weeks... [to more] than 200... Claimants stand to lose more than a third of their payout in legal fees, if victory comes their way.

...[the Government has offered to pay compensation to 77 hepatitis blood transfusion victims, but the rest get nothing because they contracted hepatitis before the date when testing could have begun]...

The 'people who contracted hepatitis C from contaminated blood are disgusted with the Government's latest compensation offer of \$22,000 – just \$2000 more than the amount they turned down in October. After subtracting lawyers' fees they'd receive about \$13,000. "We feel like it's a kick in the teeth."']

...Devastated. That's how [a] lawyer... described the feelings of cancer patients who Good Health Wanganui said were in good health. The patients feel that way because the High Court has told them they can not sue for compensation for misdiagnosis. Another group of patients who did not have cancer but... had unnecessary cancer surgery can sue...

But the eight women... whose cancers were not diagnosed for up to six years... can still sue for \$250,000 of exemplary damages, aimed at punishing those responsible... the former Wanganui Hospital pathologist... his employer, Good Health Wanganui and the Residual Health Management Unit... Ten other patients wrongly subjected to cancer procedures such as mastectomies... are also seeking exemplary damages of \$250,000 each... The case was seen as an important test of N[Z]'s "no-fault" accident compensation laws... The... [pathologist], who is understood to suffer from Parkinson's disease, seriously misdiagnosed 43 patients between 1975 and 1994...

Suing for damages from illness and injury will become commonplace as growing numbers of people become aggrieved at the lack of adequate accident compensation, says an expert on ACC law... The result would be "good for insurance companies, good for lawyers – but bad for the country,"... [the] Victoria University law lecturer... said on radio... [following] a High Court ruling that eight former Wanganui Hospital patients whose cancer biopsies were misdiagnosed can sue for exemplary damages... [He adding that the] surge in litigation probably suited ACC, because it meant the money for compensation was not coming from its budget...

AN INQUIRY into patient safety at Wanganui Hospital is being urged after specialists failed to see a woman with a malignant breast tumour and an elderly man with a newly-amputated leg was sent home in a taxi, bleeding and without a dressing on his wound... "He was writhing in pain from the amputation... and it appeared no decent pain relief was provided... The wound was infected when he got back to the rest home... [The 43-year-old woman] has a five-year-old son to take care of, but things may be too late for her... People are just not getting the treatment they deserve." ...Good Health Wanganui has promised to investigate... A woman was [also] sent home from Timaru Hospital with a broken ankle because there was no one to x-ray her leg. [Her son] is furious that his 72-year-old mother had to spend the night at home in agony.

...A doctor who told a patient that a growth extracted from her breast had proved to be benign, when in fact it was never tested, has been found guilty of professional misconduct... The mother of three... later developed breast cancer and died... aged 41... despite radiation and chemotherapy. The doctor told... the tribunal... that he did not believe the earlier growth had any connection with the cancer that killed the woman. He denied lying to the woman... He could not explain why routine testing of the removed growth had not occurred, but took responsibility. "I can only assume that for some unintended reason the tissue was disposed of,"... The woman's husband told the hearing the doctor had shown genuine remorse and paid \$18,000 towards her cancer treatment... The Medical Practitioners Disciplinary Tribunal is seeking submissions on an appropriate penalty.

...[a patient] spent 10 years waiting for her doctor to realise she still had breast cancer. She repeatedly told him about the sore lumps under her armpit, but he assured her each time there was nothing to worry about – even though he had removed her right breast because of cancer in 1985. Eventually in 1995 she went to another surgeon, who cut out the malignant lymph nodes immediately. Now the 47-year-old Kaikohe beef farmer is waiting to find out if any more cancer has survived inside her... Because of [her original surgeon]'s continuing reassurances, she had her right breast reconstructed in 1991, in a 12-hour operation which cost her \$16,000. She now wonders if the ordeal was worth it... Her original surgeon... was disciplined by the Medical Council... for allowing her cancer to go untreated for a whole decade. He was found guilty of conduct unbecoming of a medical practitioner and fined \$500 – half the maximum fine... The top penalty had since been increased to \$10,000 but this applied only to complaints received after July 1 last year... The medical practitioners' disciplinary committee also said that [the original surgeon] should pay the inquiry costs of \$6693. It said he should take at least two courses or attend two conferences about breast surgery within the next two years if he wanted to continue practising in this area... [He] said this week that he was not trying to hide the truth from [his patient] but admitted he might have been influenced by his hope that she did not have cancer. - 1997

[A] Paihia woman... who is dying of cervical cancer, is trying to sue her former gynaecologist... for \$60,000. The *Herald* understands [the patient]'s lawyers have put forward a claim for exemplary damages against [the gynaecologist], alleging his actions in relation to her care amounted to more

than gross misconduct. Last month, [the gynaecologist] was found guilty of disgraceful conduct over his treatment of [the patient], whom he initially failed to diagnose when she was referred to him with abnormal bleeding in August 1997. The Medical Disciplinary Tribunal's ruling criticised [the gynaecologist] for not examining [the patient]'s cervix at the time, saying it was grossly negligent and reckless. The tribunal is expected to release its decision this week over penalties for the disgraceful conduct finding. [The gynaecologist] could be fined... have supervision conditions imposed or be struck off. Last night, [the patient]'s husband... said he preferred not to comment on the lawsuit... It is the second such claim for exemplary damages in the past two years. The woman *Herald* readers know as Jane lost a lawsuit last year against [a] former Gisborne pathologist... who under-reported her cervical smear slides.

...A woman who developed cervical cancer has lost her lawsuit against the pathologist who repeatedly missed signs of the disease. After the specialist cleared [4] suspect smear slides, the 30-year-old developed invasive cervical cancer, requiring major surgery. She has a near 50:50 chance of the disease returning. Lawyers say the pathologist's win yesterday in the High Court... sets an almost impossibly high threshold for proving negligence and is likely to deter further cases against health professionals. Had the woman's claim been successful, she would have been the first person in N[Z] to win exemplary damages from a health professional... [The judge] had found the case extremely difficult and... [a]lthough he had no doubt the doctor had been guilty of negligence and some of his care had been "sub-optimal," his actions narrowly did not fall into the category that warranted the awarding of exemplary damages. The woman – whose name was suppressed, as was the defendant's – had alleged that the doctor was incompetent... that he had no quality assurance methods in place and failed to keep up with continuing education... The woman said the doctor had been found guilty by the Medical Practitioners Disciplinary Committee and ACC. "I don't know what more it takes." ...In closing submissions, a member of her legal team... said the pathologist had shown no remorse. In defence, [a lawyer] said the doctor had been practising in accordance with the standards of his day... Following yesterday's decision, the doctor expressed remorse for the woman's plight. "Having spent most of my professional life trying to avoid this sort of thing, I was very distressed in 1995 to find out that [the woman] had developed cancer."

...[the Gisborne] doctor accused of misreading cervical cancer smear tests is still listed as a consultant pathologist by the laboratory testing Gisborne women's slides... The revelation by [the] Alliance health spokeswoman... sent health officials darting yesterday for legal guidance. [The pathologist] last held a practising certificate in March... and in 1997 was found guilty of unbecoming conduct in his reading of a woman's cervical smears. Following a High Court case this year, the [health funding] authority urged Gisborne women to have new smear tests and announced it would recheck 30,000 slides read by [the pathologist], who retired in March 1996.

...A new cancer-test botch-up has Gisborne men in a state of fear as [the] Health Minister... moved swiftly yesterday to sack the region's... six-member... health board... [in an attempt] to restore faith in the public health system... Hundreds of men may have been given incorrect results from tests on their prostate glands at Gisborne Hospital... The errors are blamed on a senior laboratory technologist at the hospital repeatedly misusing a testing machine. He left last year and is working at another N[Z] laboratory. The Ministry of Health is checking the other 18 hospital and community laboratories which use the same machine for the prostate specific antigen... test to ensure the same errors are not being made elsewhere. It is expected to know the answer today. About 465 Gisborne men aged 50 to 90 will be sent letters warning that they may have received incorrect test results... It is the third health scare to rock the region in a year. A ministerial inquiry is under way in Gisborne into possible widespread misreading of cervical smear slides, which affected 1500 women. The region was also shocked by revelations that a former anaesthetist reused syringes on patients, rubbed cold ice on their nipples and threw sharp objects around the theatre.

...Inexperienced staff and a shortage of money have been blamed in part for a health scare at Gisborne Hospital... A Canadian anaesthetist who worked at the east coast hospital from October [last year] to last March is being investigated... over reusing syringes on 134 patients. The anaesthetist is understood to have left the country. Gisborne's MP... told the *Herald*... that although it was unacceptable to reuse syringes... she believed a lack of money had led to the loss of many experienced staff who might have picked up the anaesthetist's healthcare breach earlier... Meanwhile, [six of the]... women caught up in the Gisborne cervical cancer scare have lodged ACC claims for medical misadventure.

...A Howick woman, once a... kickbox[ing]... singer and model, is paying with her own money and tears for a medical blunder that has ruined her life. Today she is in so much pain she cannot perform normal household tasks or care for her 10-year-old son. "I have to pay someone else to be his mother," said [the] 34-year-old... Her case has come to light in a *Herald* investigation into the limits of compensation for victims of medical misadventure in this country. [Two years ago, the 34-year-old] was admitted to Green Lane Hospital with a collapsed lung. A week after the successful surgery a nurse tried to remove the drain, but it had been mistakenly stitched to the intercostal nerve between her ribs. The nurse pulled the drain out, wrenching the nerve. [The 34-year-old] writhed in pain, but even with the intervention of pain specialists she cannot get relief. Doctors tell her there is nothing they can do and she should seek medical help overseas, an option she cannot afford... Her wedding has twice been postponed and she fears her partner will no longer want to marry her... [In addition, she] has become addicted to an expensive cocktail of painkillers and anti-depressants. "I'm basically turning into a junkie. I'm so drugged to the eyeballs I can barely stand at the bench to cut my son's lunch." Her claim for medical misadventure was accepted by ACC, which pays her \$184 a week for loss of earnings. She also qualifies for a \$175-a-week invalid benefit. ACC contributes 80[%] of her medical expenses. She pays the remainder of specialist and prescription fees, which she says is unfair. "Why am I paying anything? Some doctor did this to me and ruined my life. Why can't they pay for everything? They tell me I have to reinvent my life and learn how to be an invalid." [The 34-year-old] and her fiancée... wanted to sue the hospital to get enough money to get an operation overseas, but their lawyer said there was nothing they could do... [The] ACC Minister... yesterday rejected the idea of returning medical misadventure cases to the courts. "Suing is a lottery and the first prize always goes to the lawyers and the victims end up with very little," he said. Instead, the Government is planning to restore lump-sum compensation on top of other ACC allowances... He could not specify the amount the Government would offer in lump sums but said it would cover both loss of function and pain and suffering.

...An Auckland couple whose son was born severely brain damaged... at National Women's Hospital on April 14, 1993... are suing doctors and hospital authorities for more than \$1 million... However, [lawyers representing]... the doctor who induced labour, as well as [a] special obstetrician... and... the Residual Health Management Unit, the successor to the Auckland Hospital Board... [a]re seeking to have... claim struck out for being brought out of time... [Furthermore, t]heir clients "rigorously denied" negligence. The... [lawyers] told the court that two independent reports by an internal hospital inquiry and by the ACC misadventure unit in Wellington had concluded that the adverse outcome was not the result of medical error, but rather of treatment properly given... [– even though the couple] say that a vital pelvic x-ray and an accompanying report... were sent by Green Lane Hospital's radiology department to the wrong hospital. The report noted: "Successful vaginal delivery of a normal-sized foetus through this pelvis seems unlikely." A letter from [the obstetrician] signalling possible difficulties with pelvic restriction was also not placed on [the mother-to-be]'s file at National Women's... In their statement of claim the [parents] say that as a result of the omissions from... [the] medical file, none of this information was available to the specialist on-duty team that ultimately stepped in to deliver the baby. They say [the doctor] induced labour without making sure he had seen the pelvic x-ray report. When the baby became severely distressed an urgent caesarean section was performed. The child was stillborn but was resuscitated by paediatric staff and admitted to the neonatal intensive care unit. As a result, [the baby] suffered cerebral palsy with significant physical and psychological impairment which required constant care and assistance.

A jury in New York has awarded \$US23 million... to an 8-year-old boy for the botched birth that left him severely brain-damaged, with cerebral palsy and unable to speak. The jury decided that [he] was the victim of negligent treatment his mother... received when he was born prematurely.

...Two doctors have been found guilty of... the death from meningitis of an 11-year-old boy who was misdiagnosed with a tension headache and sent home from a hospital emergency department... The Medical Practitioner's Disciplinary Committee found... a former Middlemore Hospital house surgeon and his registrar... guilty of unbecoming conduct... [The house surgeon] was fined \$400 and ordered to pay \$10,877 costs... [The registrar] was fined \$600 and ordered to pay \$18,128 costs... The... [registrar] bore the major responsibility as... supervisor. He failed to examine [the boy] himself and approved giving the narcotic painkiller pethidine which might have masked the rapidly developing meningitis. Use of the drug was "grossly unwise". [The house surgeon], who graduated in 1992, had been on the emergency department roster for only three weeks and had never diagnosed a case of meningitis when he saw [the boy] on March 21, 1994. The head of Middlemore's emergency department... told the committee that where a large casualty department was understaffed and staffed with comparatively inexperienced people, such incidents were inevitable... But the boy's mother says the... fines handed out... are a joke and she is lobbying MPs for a change in the law to allow relatives to sue... She said the opportunity to sue would help to relieve her suffering because she would feel justice had been served... [A] medical law expert... said Appeal Court judges in 1989, when considering the police shooting of [a suspect], said estates could not sue because of a 1936 law which ruled out claims for exemplary damages when a person had died. "While N[Z] society doesn't want to go the same way as the U[S] where you can sue for anything, it does create an injustice for families," ... - 1996

Consider the following scenario... As he left hospital Bill was approached by a smartly dressed young man with a pad in his hand. "We're just doing a survey of patient satisfaction with their treatment in hospital. Could you spare a moment to answer a few questions?" Bill said yes and was asked, "Did you have any complaints about the way you were treated in hospital?" "Not really," replied Bill. "But I think they might have made the diagnosis a bit faster. I was uncomfortable and very anxious, but things are better now. I really can't complain." "That doesn't sound very good," said the young man. "Perhaps you should get some compensation for that delay in diagnosis and consequent suffering. You might help other people in a similar situation and make yourself a nice little nest egg at the same time if you took the hospital to court. I can give you the name of a lawyer who will not charge if he doesn't win a settlement. I think he will probably ask the courts for something like \$200,000 in compensation... If he succeeds he gets half and you get \$100,000. It's a win-win situation for you. How about it?" This may sound a little fanciful... but I understand that it is not very far from what happens frequently in the U[S] – the spectacle of lawyers or their agents actively seeking to create discontent in the minds of patients in the hope of generating work and, of course, big money. As a result the American public and the American medical profession are very litigation-conscious... It is widely recognised in medical circles that many patients in the U[S] are over-investigated and over-treated. American doctors are the first to admit this, but they say that for fear of litigation they are obliged to practice what has become known as "defensive medicine". The extra tests designed to cover almost every diagnostic possibility also add greatly to the cost of medical care... Medical care is an imperfect science and much depends on judgment and experience.

...A jury in Portland, Oregon, decided a cancer survivor's sperm was irreplaceable and ordered a hospital to pay him \$US1.25 million... [The cancer survivor] was a 25-year-old medical student when he was diagnosed in 1985 with Hodgkin's disease. His doctor suggested he should deposit his sperm because chemotherapy could leave him sterile. But when [he] returned to the lab in 1994... ready to start a family, the hospital's sperm bank told him they did not have his sperm... [The] jury found the hospital at fault. A hospital spokeswoman would not comment... [Incidentally, t]he parents of a British boy who suffered brain damage during a heart transplant operation have lost their claim for damages. [He] was 16 months old when he had the operation. His parents claim the medical team at the renowned Harefield Hospital hadn't warned them of the risks associated with the operation but the High Court has disagreed.

...A mother who left her only child at Tauranga Hospital for minor surgery returned two hours later to find him brain dead and on a ventilator. [The mother] told a depositions hearing in the Tauranga District Court she had asked medical staff more than once about the risks of her 13-year-old son... going under a general anaesthetic for an exploratory operation on his knee, which had been pierced by a [plant] spike. She had been assured that he was a "big, fit, strong boy and it would be okay." ...The boy was allegedly deprived of oxygen... He was not able to be revived... Interim name suppression has been extended for a 63-year-old Tauranga woman charged with manslaughter... The woman was not on trial and there was a presumption of innocence "at this point." ...the crown is alleging that the defendant omitted to use reasonable knowledge and care, and failed to follow recommended protocol, resulting in [the boy's] death.

...a 9-year-old] was told at 11 am last Saturday she had appendicitis. By 3 am on Sunday it was clear her appendix had ruptured, flooding her system with toxins... Because it was the weekend, only one operating theatre was available [at the local hospital]. Because of minimal night-shift staff, there could be no surgery until 8 am. And even then, because of pressure on the theatre, hours of pain lay ahead. Her mother... is livid about the hours of agony her daughter endured... She wants to know why Tauranga Hospital is being forced to cut services to save money... "My blood boils when I learn that the hospital has been told to cut back by another \$4 million, and I want to know why the public health system is being so drastically cut." Tauranga Hospital said yesterday that [the girl's] safety was not compromised at any stage. The delay was not related to service cuts, but was caused by other emergency admissions... [By the way, the] retired Tauranga hospital anaesthetist charged with the manslaughter of a 13-year-old boy... has been committed for trial in the High Court at Rotorua.

...A woman bled to death after an anaesthetist's needle missed its target... the jugular vein and punctured a major artery and also the membrane of the chest cavity, allowing blood to flow into the chest cavity... a pathologist told an inquest yesterday. [The woman], aged 44... died in Rotorua Hospital... after an overnight operation for serious but not life-threatening fractures from a car crash... [A] bid to attach an intravenous line to [the woman's] neck about two hours into the operation had gone wrong... The eventual loss of blood, on top of that lost because of the car-crash injuries, killed her, he said. [The woman's] son-in-law... said the family felt someone should be held accountable for the death and steps should be taken to prevent such a mistake happening again. The family were very distressed and had been unable to settle back into their lives. A police investigation found no one criminally liable after a Melbourne specialist... said sufficient care had been taken during treatment... [However, t]he inquest was told the doctors... were called in to do the emergency surgery after a full day's work... [and, therefore,] had worked a total of 20 hours each by the time they... finished the eight-hour operation... to mend severe fractures to both legs, an arm, hand and foot.

...Anaesthetists' mistakes and the reasons behind them will be investigated in a wide-ranging project aimed at reducing drug errors. Researchers in Auckland and Wellington are to scrutinise the part fatigue plays in mistakes and pitfalls in systems used for giving drugs. The new project follows a N[Z] study published in 1995 which found that most of the 66 anaesthetists surveyed admitted at least one drug mistake in their working lives and 12.5[%] had harmed patients as a result... [The] chairman of the N[Z] committee of the A[US and NZ] College of Anaesthetists, said mistakes included giving the wrong drug, the incorrect dose or failing to give the drug at all. However, the track record of anaesthetists... [- who, i]t has been estimated... can give 250,000 drugs in their working lives... [-] was very good compared to other specialities.

...A trainee specialist... [who failed] to diagnose meningitis in a toddler... has been... censured, fined \$800 and ordered to pay \$25,142 towards the cost of the inquiry... His competence must also be reviewed by the Medical Council each year for up to three years... The... 18-month-old... girl was twice seen by her [GP] on June 23 last year. She was referred to the... Palmerston North Hospital... emergency department after the [GP] suspected a viral illness or bacterial infection... [T]he hospital duty paediatric registrar, examined the girl after speaking to the [GP] by phone... The parents mentioned meningitis and pneumonia, but [the trainee paediatrician] diagnosed flu and sent the child home. Paracetamol was prescribed every four

hours to lower her temperature. The family left the hospital at about 5pm and within three hours the mother noticed about 12 red marks on her daughter's legs and groin. The parents checked the girl four times during the night, but the next morning her father found her dead.

...AN ACCIDENT victim whose spinal injury went undetected for three weeks, despite checks by two hospitals, urges patients to complain about doctors' mistakes... [The woman] spent two days at Wairau Hospital in Blenheim after crashing her bike while holidaying... On her return home she visited Christchurch Hospital twice in one day for relief. She got morphine, but the hospital did not notice... on her X-ray... that a shattered vertebra was... pressing on her spinal chord... She still has problems with her back... "It is incredible that my back fracture was picked up only because I insisted on another X-ray... For three weeks I was trying to be mobile... I was trying to take a walk every evening... What if I had become paralysed in this time? Doctors need to be more accountable for their mistakes." ...She still has problems with her back... 18 months on and wonders if this could have been avoided... if she was correctly diagnosed... [The] Health and Disability Commissioner... said she could not find a breach of standards because the incident pre-dated the introduction of a code of rights in July, 1996.

...A Hong Kong doctor removed a young girl's Fallopian tube, thinking it was her appendix, in the latest in a spate of alarming blunders in the territory's hospitals. "We all make mistakes," [the] head of surgery... at Queen Mary Hospital... was quoted as saying... Earlier this month a car-crash victim died at Queen Mary... after he was given a transfusion of the wrong blood type... [and] a woman had her right Fallopian tube cut at the hospital during an appendectomy... Local newspapers yesterday took aim at the medical industry. "Potential patients, who may already be nervous about having the wrong type of blood, now have a fresh source of concern at the possibility of having the wrong organs removed... At this rate, fewer and fewer patients will be willing to be admitted to Queen Mary Hospital – where a disproportionately large number of the recent mistakes have occurred – and many will think twice about seeking treatment at any other government hospital,"... the *Sunday Morning Post*... said... The young girl... has not had her appendix removed since the botched operation... Officials at Queen Mary... could not immediately be contacted for comment. It was not known whether the girl's family planned to take legal action against the hospital.

...[the operating theatre at a hospital in Auckland was originally set up for surgery on the correct hip of a patient given the wrong hip replacement. The surgeon marked the patient's correct thigh, but only after the patient had been checked into theatre. The anaesthetist and a technician then injected an epidural anaesthetic into the patient's spine – and he was asked to lie down on his left side, the side to be operated on. But the patient was not turned on to the correct side for his surgery. When the surgeon returned to the theatre he assisted nurses with preparing the incorrect leg. Before surgery both the anaesthetist and the scrub nurse recalled having to change their plan to operate on the right side. An independent review of procedures leading to the botched operation was released yesterday. It outlined human error, but found procedures at the hospital were consistent with guidelines for hip-replacement operations. The case has led to a call by the Health and Disability Commissioner for junior medical practitioners and nurses to challenge the actions of senior staff.' In international news, 'a terrified South Korean woman was left trapped in a hospital scanning machine when a medical technician forgot about her at the start of a four-day public holiday. The 38-year-old housewife, who was receiving treatment for injuries sustained in a traffic accident, was strapped into the barrel-like magnetic resonance imaging machine for a neck scan. The routine scan should have lasted no more than a few minutes. Frightened and exhausted, she shouted in vain for help through the night. She finally managed to free herself from the pitch-black scanner about 29 hours later.'

...an Egyptian doctor got the shock of his life when he opened a refrigerated compartment in an Alexandria morgue and had his hand grabbed by the occupant. The occupant had been taken to the morgue five hours earlier, after holidaymakers saw him collapse while swimming and thought he had drowned. Instead of being examined in hospital he was taken straight to the morgue. When a doctor carrying out an autopsy happened to pull open the draw where the 29-year-old was lying, he was too frozen to talk, but made his situation clear. He has laid a complaint with the hospital.' In local news, a 'morgue worker is seeking compensation for the distress he claims to have suffered when blood spurted from the body of a Maori woman he was starting to perform an autopsy on. Health officials are confident that the woman was already dead.'

...Rheumatic fever is killing about 120 N[Z]ers prematurely each year – second only to Aids among communicable diseases... [– while] an average 134 people a year [are] admitted to hospital with the disease, and one in five was probably a repeat admission... One in five victims is Maori... Rheumatic fever can develop from a simple throat infection, often in childhood... A study in some Auckland schools is looking at the effectiveness of having nurses on site to pick up students with a sore throat and test for the bacteria that causes rheumatic fever... Overseas studies have pinpointed poverty and overcrowding as factors... A report from the Ministry of Health, Progress on Health Outcome Targets[– which had studied rheumatic fever cases]... between 1990 and 1994[– said some]... food and waterborne diseases, such as campylobacteriosis, might also be considered "emerging," [and]... noted the... re-emergence in the 1990s of... tuberculosis... and... meningococcal disease...

Modern technology could help stem the spread of... meningococcal disease. Deaths and hospital admissions are expected to hit record numbers this year, but Auckland public health officials [will use] computers to track each case and identify geographical hot spots... [In international news, an African] meningitis epidemic... has now claimed 1506 victims, says the W[HO]. The epidemic has struck 11,175 people... [across] seven countries...

Wellington health authorities have treated residents at a Victoria University hostel to try to contain a serious meningitis outbreak linking the North and South Islands. Drinking games at a function in Christchurch may have enabled the spread of the highly contagious disease... which has killed one athlete and left another seriously ill... [A 19-year-old] Christchurch athlete... was admitted to Wellington Hospital on Sunday morning... but is now out of danger, according to his family... Top Otago multi-events athlete Vance Latta, aged 25, died of meningococcal disease on Monday within hours of being taken to Dunedin Hospital. Latta's flatmate, [NZ's] top sprinter... is in A[US] and visited a doctor yesterday to check that he was not carrying the disease. A[US]n authorities called for athletes who had contact with [the NZ sprinter] when he competed at Brisbane on Saturday to be checked... The chief executive of Athletics N[Z]... issued an urgent plea to all athletes... [who] competed in the national championships in Christchurch this month and... especially the 120 to 130 people who attended the... function at the Pegasus Arms Restaurant and Bar... to contact their local doctor or the medical officer of health in their region. He had been advised that the 500 athletes who competed could be at risk. Immediate action had been taken to inform them... So far about 30 people... who attended the function... had been traced... Six other athletes from the Western Samoa Athletics team were also at the Pegasus Arms party, but according to their Christchurch contact... none was reported sick... The owner of the Pegasus Arms... said he did not know of the problem until yesterday.

...The impact of the deadly meningococcal disease has been declared a public health emergency as hospital admissions and death rates soar... Thirteen people have died this year, compared with six at this time last year. Middlemore Hospital is seeing about one child a day with the illness... N[Z] has the worst rate of the disease among developed countries... [–] 14.6 per 100,000 people... [–] with no sign of improvement... South Auckland has a disease rate of 43 for every 100,000 people and central Auckland a rate of 27 per 100,000... Most developed countries had two per 100,000... "The epidemic can last for 15 years and we have no evidence our epidemic has peaked..." [There is]... no proven vaccine for the type B-strain prevalent here... Auckland health officials hope to test a Dutch-manufactured vaccine... But a limited trial of 100 children will cost several million dollars and getting participants could be tough... "It's fraught with difficulty telling people we are doing a vaccine trial but their child may just get a jab of water. It's likely one of those in the trial will get the disease and die so it's a public relations job from hell to sell the idea."

...[a new vaccine against the deadly brain disease meningitis is to be given to thousands of babies, children and teenagers in a mass immunisation programme in Britain over the next few months. The vaccine, which protects against group C meningococcal infection, the type most commonly associated with mass outbreaks of the disease, is said to be the first to offer real protection against meningitis and could save hundreds of people. Last year in Britain 1530 people were infected with the group C strain and 150 died, mainly children and teenagers. The only other vaccine available lasts for just three years

and is not considered very effective. The latest vaccine, developed by British scientists, is being made available on the National Health Service a year earlier than expected after successful trials on more than 25,000 children. There is still no vaccine for group B meningococcal infection, which tends to occur in more isolated cases'. By the way, a 'mother has caught polio after taking her child to be vaccinated – the 6th case in NZ in the past 40 years (compared with 8-10 per year in the US). Officials say parents catch polio by failing to take adequate precautions when handling their child's saliva or faeces.'

...NZ] should consider switching from oral polio immunisations because the risk of disease from the vaccine is greater than the chance of catching polio naturally, says a new medical paper.

...The Ministry of Health has no immediate plans to change the type of polio vaccine being used to immunise children, despite the availability of a newer, safer version. The oral vaccine... used in N[Z] is made from live polio virus and can cause "vaccine-associated paralytic polio" in a very small number of cases... – ...one case in 750,000 doses... A newer... injectable... version, made from inactivated... [or] killed... virus, has been recommended for use in the U[S. NZ has]... seen no cases of locally originated wild polio since 1977. Polio had been eradicated from the entire Western Hemisphere and western Pacific...

['More than 112 million children under the age of five were yesterday vaccinated against polio in India. It was the world's largest public health drive which sought to banish the disease from the face of the Earth. Pakistan and Bangladesh conducted simultaneous campaigns. Indian health officials said 90% of 125 million children were vaccinated by tens of thousands of doctors and paramedics across the country's 25 states. A second dose of the vaccine will be administered on January 18 next year. The Indian PM flagged the drive by giving two drops of oral polio vaccine each to five children invited to his office with their mothers, signalling the start of the campaign. Schools, colleges, banks and Government offices shut down as the Government declared a public holiday to help parents to bring their children under the age of five to free vaccine centres. India, polio's last real bastion, vaccinated 93 million children in the first phase of the anti-polio programme a year ago. There were 2993 reported cases in India last year compared with 2836 cases in the rest of the world.'

...the mass vaccination campaigns of the 1950s and '60s may be causing hundreds of deaths a year because of a cancer-causing virus which contaminated the first polio vaccine, says London's *Daily Telegraph*. Known as SV40, the virus came from dead monkeys whose kidney cells were used to culture the first Salk vaccines. Doctors estimate the virus was injected into tens of millions of children before being detected and screened out in 1963. Those born between 1941 and 1961 are thought to be most at risk of having been infected. Until now, SV40 was regarded as harmless, with no evidence of long-term health effects emerging in follow-up studies of those vaccinated. Now it appears these studies may not have been conducted over a long enough period. New highly sensitive laboratory tests have disclosed the presence of SV40 in many different types of human tumour. The most startling results centre on mesothelioma, a once-rare type of lung cancer whose prevalence is rapidly increasing – over the past 30 years, the number of cases has risen 10-fold to about 1000 a year – and until recently was linked primarily to exposure to asbestos. Studies have found that around 70% of mesothelioma cases test positive for the SV40 virus. Some scientists remain sceptical of the link, however. A professor of viral oncology at University College, London, said SV40 is widely used in laboratories and could easily contaminate tumour samples, fooling the ultra-sensitive tests used to detect the virus.'

...A test case legal action for damages is to be launched in Britain following new A[US]n research backing claims that thalidomide deformities can be inherited... [A child of] one of the first generation of thalidomide victims... was born with badly deformed hands and legs and undeveloped tear ducts... But... [s]ceptics maintain that those cases where children have been born with deformities are not necessarily linked with thalidomide.

...[a drug company] said yesterday that it had received an "approvable letter" from the US F[DA] for thalidomide, which was once withdrawn from the market for causing severe birth defects. The letter did not mean the drug had been approved for sale, but was a big step towards that approval... It covered using the... drug for a side-effect of leprosy known as erythema nodosum leprosum... Thalidomide... was introduced in Europe in the 1950s as a sedative... The problems associated with the drug led to stricter drug approval regulations... [The manufacturer] has said it would use careful procedures to make sure any women given the drug did not become pregnant while using it. But experts, as well as thalidomide victims, said they were certain someone would get pregnant and birth defects would result if the drug was prescribed.

...The 30-year-old Wyoming woman suffers from Behcet's disease, an auto-immune condition that inflames the joints and ulcerates the skin, eyes and genitals. Her teeth were falling out, but the sores in her mouth kept her from wearing dentures. She often suffered fevers that led to convulsions, and joint pain confined her to a wheelchair. Today, she walks, drives and works with ease. Her skin is clear and her joints feel fine... The secret to her success? Thalidomide. Thalidomide has been synonymous with horror since the late 1950s, when 10,000 deformed babies were born worldwide to mothers who had used the drug to alleviate morning sickness. The sight of those children – some lacking eyes or ears, many born with tiny flippers for limbs – still haunts drug regulators. Yet the [FDA] is poised to let thalidomide [go back] on to the U[S] market – and thousands of sick people are looking to it for relief. Thalidomide's rehabilitation started almost as soon as it was shelved in the early 1960s. Studying the drug, researchers discovered it blocks the formation of new blood vessels, while slowing the immune system's production of a troop-rallying chemical called tumour necrosis factor alpha (TNF- α). The first effect had disastrous consequences for the developing foetus – limbs can't grow without blood vessels – but it had potential benefits for people with cancer and other conditions in which vessel growth causes trouble... By the 1970s, researchers had found that thalidomide could forestall the fever, joint pain and skin nodules associated with leprosy – presumably, by modulating TNF- α . Further study has shown that it can ease the symptoms of lupus, multiple sclerosis and rheumatoid arthritis, and can combat Aids-related wasting. Researchers are also studying it as a possible treatment for brain and prostate tumours and macular degeneration and diabetic retinopathy, the two leading causes of blindness in adults. The drug administration is approving thalidomide only as a treatment for leprosy conditions. But once it reaches the market, probably early next year, doctors in America will be free to prescribe it at will. And, as the drug comes into wider use, the odds increase that unborn babies will be exposed. Other drugs can damage foetuses, but thalidomide poses extreme risks... Researchers are now working to develop thalidomide-like drugs that yield the same benefits without the same hazards. Until then, we can only hope that [the] triumphs... don't come at too high a cost... [In related news, a]n outbreak of leprosy... is threatening the... Kiribati Islands... Leprosy specialists from N[Z, AUS] and Fiji... have flown to the republic in a bid to contain the disease, which spreads through close contact with a carrier over a long time. Last year, 78 new cases... were diagnosed... So far this year, the number has stretched to 115 new cases – a high prevalence rate of 14.93 cases for every 10,000 people. The normal prevalence rate is one case every 10,000 people... The real worry is [that] more than 30 cases involved children under the age of 15.

...Honduran health officials [have] announced that 65,000 people in the country are in the late stages of Chagas disease and will die from the parasitic illness during the next few years... [They] estimate... 300,000 of the country's 5.8 million people are infected with Chagas, which weakens the heart and eventually causes it to fail. There is no known cure for the illness, which is spread by insects carrying the parasite *Trypanosoma cruzi*. The Pan American Health Organisation believes between 16 and 18 million people are infected throughout Central and South America.

...the world could eliminate four tropical diseases by 2007... New therapies... and creative disease-fighting strategies in developing countries provide... an unprecedented window to curb the illnesses. "If we don't do it, we may see drug resistance and [elimination] will be more difficult in the future;"... [the] WHO tropical disease chief... said. The diseases are: Chagas... which has infected about 18 million people in Latin America; river blindness, a parasite that has infected about 18 million people, mostly in Africa and Latin America; leprosy... the age-old scourge... which strikes one million people every year; and lymphatic filariasis, spread by mosquitoes to about 120 million people between India and islands in the Pacific... Eradication is expected to cost more than \$US160 million... a year. "If you add the cases... that's less than \$US1 a patient a year."

...[‘an immunization campaign instituted by WHO saw the last death from smallpox in 1976. In 1974, WHO launched a second campaign to secure the immunization of all the children in the world against polio, diphtheria, whooping cough, and tetanus. Less than 5% were then being immunized. Now more than 60% are. The cost is estimated at \$1.20 a child.’]

...When the W[HO] launched its Health for All strategy 20 years ago, with a mission to expunge preventable disease by the year 2000, Fortune took an easy hostage. As its deadline approaches, the always ambitious strategy is looking sickly: a situation blamed on too few government resources and a lack of willpower on the part of vested interests... World Health Report 1997... shows that the human race is far from outsmarting disease... The encouraging news is that deaths among children under five declined from 19 million in 1960 to 11 million in 1996[while the number of births increased]. The number of leprosy cases has fallen by 82[%] in the past 11 years... Further improvements “demand integrated, comprehensive action against all the determinants of ill-health.” It seems that inaction can seriously damage the health of millions... The report estimates that the number of cancer cases is expected to at least double in most countries in the next 25 years... Other non-infectious diseases are also on the increase. Dementia, particularly Alzheimers disease, is likely to affect three times as many people in 30 years time... Diabetes is affecting more people... Infectious diseases are still a huge problem, killing about 17 million people a year and afflicting hundreds of millions of others, particularly in developing countries... “As long as developing countries have to spend so much of their national incomes servicing their debts, then ill-health is likely to continue.” ...Tuberculosis killed 3 million people in 1996... and diarrhoeal disease claimed 2.5 million lives... Malaria accounted for between 1.5 million to 2.7 million deaths.

...[‘South Africa faces another major malaria epidemic as wet, warm weather creates ideal breeding conditions for the malarial mosquito. The Health Minister said the previous year’s malaria season had been the worst in 30 years, with 42,000 cases of malaria and 310 deaths. The worst-hit areas were Northern Province and Mpumalanga, which are suffering some of the worst flooding in half a century as abnormally wet weather batters the region. Malaria is the biggest single killer in neighbouring Mozambique, the continent’s poorest country, where about 60% of child and 40% of adult hospital admissions are malaria cases, while the disease causes 20% of hospital deaths.’]

...One hundred years after the discovery that mosquitoes spread malaria... [made doctors] hope this disease could soon be eliminated... organisers of a conference on parasitic illnesses said the disease has made a comeback... About 40[%] of the world’s population, or about 2.5 billion people, are at risk in more than 90 countries. More than 1 million children die of malaria each year... In India, malaria was almost wiped out... Between 1950 and 1970, an eradication programme reduced annual infections from 75 million to 100,000, and deaths from 800,000 to almost none. But over the past two decades the trend has reversed, with four epidemics since 1994. In 1996, 2.85 million cases were reported, and the official death toll – believed to be far below actual numbers – was about 3000... About 20 million Western tourists travel in regions prone to malaria every year.

...Doctors are still prescribing the malaria prevention medicine maloprim to N[Z]ers going overseas, despite the drug’s links to adverse effects, says a report... The report looked at the adequacy of advice about malaria given by [GPs to N[Z]ers about to go overseas. It said 340 cases of imported malaria were notified in N[Z] between 1983 and 1992... Chloroquine, alone or with a standby drug such as quinine or mefloquine, was the most commonly prescribed anti-malarial. The side-effects of mefloquine had also been a source of controversy, particularly in regard to reported neuro-psychiatric effects... [M]aloprim had not been recommended for use in N[Z and AUS] since 1992... The first neurological side-effects... from... Mefloquine, otherwise known as Lariam... were reported in 1987 and in 1989 doctors were encouraged to notify the [WHO] of such problems. They did and the result was a one in 10,000 statistic of people suffering serious neurological side-effects. A British study carried out between 1993 and 1995 showed more than 9[%]... of users reported neurological side-effects... [– such as] fatigue, insomnia and phobias... [– that were] bad enough to interfere with daily activities... [80%] of the travellers who had disabling neuropsychiatric effects were women...

[‘That buzzing, biting nuisance in the middle of hot summer nights could be put to good use if a molecular biologist’s research is taken up. The biologist who works at Sydney’s University of Technology is investigating whether mosquito saliva can be used to replace aspirin as an anti-clotting agent. About a dozen molecules in the saliva secreted by mosquitoes when they bite have functions that maximise the success of feeding. “They stop coagulation, dilate the blood vessels and suppress the immune system locally, all things which have evolved to allow the mosquito to get its blood meal.” These are the exact properties to combat cardiovascular problems, for which many take aspirin. “What is wanted in anti-clotting agents is something which can be absorbed through the stomach pretty easily, doesn’t cause bleeding, and has a long half-life in blood.” His work may also be useful to researchers developing vaccines. “If you cocktail these molecules with a vaccine, you may be able to turn up the amount of protection against mosquito-borne viruses.”’]

Incidentally, a) genetically engineered vaccine against the deadly Ebola virus has been developed... The University of Michigan medical centre... had created an immune response... by injecting... plasmid DNA encoding Ebola proteins... into the muscles of animals... [G]uinea pigs showed strong immunity two months later... “Researchers examined the organs of the animals and found no traces of the Ebola virus, meaning that immunisation completely neutralised the infection.” ...After four months they showed good immunity from one version of the vaccine but not from another... [T]he next step would be to study the DNA vaccine in primates and then hold controlled toxicity tests in humans. All four strains of Ebola would need testing. Ebola[, which]... kills between 50 and 90[%] of its victims... is spread by direct contact with body fluids such as blood, vomit and diarrhoea... [T]he virus was first identified in 1976... in Zaire...

Thirteen people have died from an unidentified disease in the north-east of Kenya. A doctor rejected rumours of an Ebola outbreak, and said the disease, which leaves victims bleeding uncontrollably from body cavities, could be haemorrhagic fever passed on by a species of the malaria-carrying mosquito.

...Close to 1000 people have contracted dengue fever... which causes internal bleeding... in Rarotonga, despite efforts by the Cook Islands Ministry of Health to get the epidemic under control. Spraying the homes and surrounding grounds of infected people has not eradicated the type of mosquito which carries the disease – *Aedes aegypti*... “It is threatening our health and in its worst form our life and... our tourist industry,”... says... [a local] expert in public health... [who] was intensely annoyed by the... outbreak as the disease and its carrier were eliminated... in the Cook Islands during the 1940s... The Rarotonga Hospital laboratory has been stretched to the limit carrying out blood tests on suspected dengue cases, with up to 70 people needing tests a day. A laboratory source said they were running desperately short of blood-testing apparatus and N[Z] suppliers are demanding payment of overdue bills before supplying further essential equipment. The Ministry of Health is reported to be trying to source funding to pay[the] outstanding bills... The disease... has hit New Caledonia heaviest, with 7000 reported cases already this year... Outbreaks... have [also occurred in] Fiji and Samoa...

A DENGUE FEVER epidemic has hit Western Samoa, killing two children and sparking concerns that tourists may carry it home to... [NZ. M]osquitoes... carrying the... no[n]-contagious... fever have been known to travel on planes and on board ships. [There were ‘12 cases of dengue fever reported in NZ during the past 12 months (including one death’). But when it comes to people travelling on planes and ships, NZ health authorities are more concerned about tuberculosis. ‘NZ and Canadian health officers had to try and track down 220 people in order to screen them for tuberculosis after they had shared planes with a woman who was suspected of being infected with the disease when she flew from Auckland to Canada and back again during 1996.’ ‘Approximately one person a day dies of tuberculosis in NZ’ (worldwide, ‘more people have died from TB since the 16th century than from anything else’).]

...World health officials have warned of a new plague of incurable drug-resistant tuberculosis threatening to sweep across Asia and the Pacific to A[US and NZ. The director of the Who’s]... global tuberculosis programme, said the region already accounted for two-thirds of the world’s TB cases... About one-third of the world’s population is infected... According to Who estimates, worldwide deaths from the disease soared from

900,000 in 1993 to 3.1 million in 1995. By the end of the decade, it estimates more than 6 million cases will be reported annually in the Asia-Pacific region. "Unless national TB control programmes utilise the treatment strategy which has proven to be effective, it is likely that the emergence of multidrug-resistant strains of the disease would worsen the situation dramatically," [the director] said at a Who TB training workshop in Sydney... About 14% of current cases are believed to be resistant to at least one antibiotic, but researchers are most concerned about those strains – about 2% of new diagnoses – able to withstand the two most widely used antibiotics. This multiple-drug resistant form of TB is extremely expensive to treat – up to \$270,000 per patient... The new antibiotic-resistant TB bacteria develop by mutation when patients discontinue treatment early, either because they begin to feel better or they cannot afford to take the drugs[. so]... Who is urging... health workers... to ensure patients took the complete course of medication. "When patients do not take their full course of anti-TB treatment not only are they not cured – they continue to infect others... For every person who is provided incorrect TB treatment, at least 10 additional people annually can be infected... With world travel increasing and HIV infection further accelerating the speed at which TB infection spreads, everyone – from Kathmandu to Tasmania – is vulnerable to this threat." ...[he likened] the potentially fatal disease to... a forest fire – it was no good ignoring a fire raging in a different part of the forest because everyone was likely to be eventually engulfed by the flames. "It is in A[US]'s interest to fight TB on all fronts if TB is to be defeated at home and abroad."

...A[US] is being tragically reminded that old killers never die. In hospitals around the country children are fighting the return of whooping cough in a... battle not all win: last month a six-year-old boy died in Sydney, the third death in N[SW] in three months. Another 42, according to federal health officials, have been killed by measles in the past two years. Immunisation rates that have plunged below some Third World countries raise further fears of new epidemics of diseases such as polio and diphtheria. Said the Federal Health Minister... "In A[US] we are now starting to see again babies who are born deformed because of German measles, one in every 4000 unimmunised kids dying from whooping cough, and young men becoming sterile because of the complications of measles." ...children who had not been immunised risked the health of other children as well as their own... Finding an answer is not easy... [A] range of proposals to lift the rate of immunisation is now being prepared, including the possibility of paying parents for each injection administered to their child... Others are more drastic... [– such as] banning children who have not been immunised from enrolling in schools, an option which, while winning support from the A[US]n Medical Association, has met with resistance from the state Education Ministers who will meet later this month to discuss the move... Opponents of immunisation are also rallying... claiming... more than 200 serious reactions and deaths from child immunisation. "It's time the Government acknowledged that the freedom to determine whether vaccines are administered rests with the parents, not with the medical lobby,"... Reluctance to immunise is significantly entrenched. According to a survey last year by the Bureau of Statistics, a third of the parents who had not immunised their children against diphtheria, tetanus and whooping cough, and a quarter of those failing to immunise against polio, were opposed to immunisation, were worried about side-effects, or were advised against it... At present A[US]n children need six sets of injections by the age of four to be fully immunised... But the Statistics Bureau's survey shows that even among parents who start off well, immunisation rates fall noticeably by the time children reach the age of two... The overall rate for immunisation against all diseases on the recommended schedule is now just 53[%] – well below developing countries such as China and Vietnam... [T]he outlook is grim unless the trend can be reversed, possibly by a combination of policy and technology... In the meantime, A[US] faces serious difficulties. Up to 150 children could die this year from whooping cough because they were not immunised against it...

[An Auckland doctor and his 8-month-old son are experiencing first hand the early arrival of a whooping cough epidemic. The Middlemore Hospital emergency department registrar caught whooping cough after treating three babies with the disease. He passed it on to his son, who was immunised but appears to be among the 10% of the population for whom vaccination does not work. New figures show 558 NZers have been diagnosed with the infectious bacterial disease in the past two months, compared with 1042 in the whole of last year, and 153 the year before that. Most people with whooping cough carry the infection for a week without realising they have it. Sufferers later experience symptoms, including a runny nose and cough which becomes progressively worse. The most severe coughing attacks can cause vomiting and bleeding into the eyes and brain. Babies may stop breathing in their sleep, suffer pneumonia and brain damage or even die. Doctors say the early arrival of the epidemic can be attributed to NZ's poor immunisation rate.]

...Fewer children would end up in hospital with gastroenteritis if babies were immunised against a virus which causes the disease, say health researchers. A report in the *N[Z] Medical Journal* suggests all children could be vaccinated against rotavirus, which causes about seven out of 10 cases of gastroenteritis. The disease, which mainly affects children under five, causes severe diarrhoea and loss of body fluids and can lead to brain damage or even death. The authors of the report... say gastroenteritis was the fifth highest cause of admissions to the Starship children's hospital in... 1995-96. They suggest an oral dose of a vaccine called RRV-TV should be given to babies with the present oral dose of polio vaccine at the age of six weeks, three months and five months. The report... argues that overseas research shows the benefits of reduced hospitalisations would outweigh the costs of giving the vaccine to all babies... [T]he latest U[S] trial showed protection for 49[%] of children against all rotavirus illness[es] (which, worldwide, 'kill over 5 million children each year'), for 80[%] against severe episodes and for all against dehydrating illnesses. However, four of the 1278 babies were hospitalised within a week of the first dose with fever, vomiting and diarrhoea. Other side effects were less severe diarrhoea and increased temperature... [N]one of the 2748 children who received RRV-TV in previous trials had to be taken to hospital... N[Z]... has low immunisation rates by world standards for the nine diseases covered by voluntary immunisation.

...Hepatitis B is a killer... So why do some countries still not immunise their children against it? ...Peter... was aged 17 when tests showed he had contracted hepatitis B. The... student had been infected in infancy – by his mother... The effect on the [their] lives was cataclysmic. [The mother] discovered she had been a hepatitis carrier for years and had been responsible for giving her son a disease 100 times more infectious than HIV and a frequent trigger of fatal liver illness. Peter (not his real name) was shunned by fellow pupils; the family were treated like lepers. Peter's mother found she could no longer afford to buy him life insurance; his chances of getting a mortgage in later life were badly dented; and Peter's prospects of becoming a dentist – his career choice – were destroyed. "Hepatitis will almost certainly affect his chances of settling down and marrying as well... Who would want to put themselves at risk of contracting a fatal disease every time they had sex or shared a toothbrush?" Peter has a one in 10 chance of becoming a carrier of the disease... It is a grim story, one that is likely to be repeated many more times in coming years as... infection rates stubbornly refuse to drop. Yet, while dozens of countries including the U[S], Germany, France and Italy say they now immunise all infants and adolescents, a handful of Western countries revealed they still do not: Scandinavia, the Netherlands, Ireland – and Britain – where Peter lives. Health chiefs in Britain pledged several years ago to implement a countrywide immunisation programme to eradicate the disease... [Instead, Britain continues] targeting only high-risk individuals – needle users, gays and promiscuous heterosexuals – for screening and vaccinations. The policy has allowed thousands to become infected by a virus that is spread through contact with any body fluid, including saliva. There are about 50,000 carriers in Britain. Because many do not show symptoms, they are often unaware of the deadly cargo they carry in their blood... It is estimated that more than one-third of the world's population has been infected with hepatitis B. Most have recovered, but there are still 350 million carriers. Every year a million of them die, usually from liver cancer. Researchers... said they were progressing towards the creation of a cheap combined diphtheria, typhoid and hepatitis vaccine.

...as renewed fears are raised in Britain about links between vaccines and serious illnesses in children, N[Z] authorities release a five-year study reassuring us all is well. What's going on? ...IF THE report of the Adverse Reactions Monitoring Centre is any guide, not a single N[Z] child has been permanently damaged by a vaccine in the... years the study covered. We can trust the findings, it says, because our reporting rate, though voluntary, is the best of all the [WHO] nations collaborating in side-effect monitoring, including those who have mandatory reports. But hang on,

what about the 44 children the [ACC's] medical misadventure unit have accepted since 1992 as being injured by vaccines and entitled to Government help? [The centre's] medical assessor... was unaware of those cases, saying the Privacy Act prevented the ACC passing on the data. The problem had now been rectified, he said. But that does not explain why doctors seem to report apparently minor vaccine reactions – including rashes and injection site inflammation – while overlooking brain damage. The centre's report... appeared in the *N[Z] Medical Journal* on the same day as a British doctor's journal reported links between the Measles Mumps and Rubella vaccination and two other conditions, the incurable bowel disease Crohn's and autism, a mental illness which makes children withdraw from their surroundings[('the condition is also incurable – although studies suggest that half of the people with autism gain some benefit from high doses of vitamin B6 and magnesium, and autistic people can be taught to socialise if other people understand how to respond to them; about one in 10 have special skills in a single area, such as a memory for numbers or drawing')]. In the last few days, three[NZ] parents have reported suspected MMR-related autism to the anti-vaccine Immunisation Awareness Society... Evidence linking MMR to autism has emerged at Utah State University, where researchers discovered the genetic structure of the measles virus was similar to myelin, which insulates the central nervous system. Delayed or incomplete myelination in the brain has been suggested as the cause of autism. The Utah doctors believe the immune systems of children react inappropriately to vaccination, harming the host instead of battling the “invader” vaccine... The doctors at London's Royal Free Hospital medical school say they didn't set out to prove a link between MMR and Crohn's, but believe Crohn's is caused by the failed response of the immune system to the measles virus... The team... believes exposure to the virus through vaccination at... around 15 months, when the immune system is still developing – carries greater risk than natural exposure to the wild virus later... [However,] British and American health authorities have pronounced the study seriously flawed... [and the company] which produces the MMR vaccine, says rates of Crohn's disease are rising in some countries but falling in others, regardless of immunisation rates. [Furthermore, the] managing director... says autism is expected to strike one in 10,000 children, but statistics his company has indicate rates among vaccinated children are lower... British statistics put the accepted risks of measles vaccine at one in 10 of mild rash/fever, one in 100 of mild measles reaction, one in 1000 of convulsions and one in 12,000 of fits. Anaphylaxis, an allergic reaction that can lead to breathing difficulties and – rarely – death, occurs in about one case in 200,000. About 1% of children who get measles will get pneumonia. One in 5000 suffer brain inflammation – and one in 5000 of those may develop a hardening of the brain which can kill. Anti-vaccine campaigners argue death rates from measles have been slashed by better living standards and nutrition. They say the risks of vaccines are unacceptable and ineffective – [one mother] says her children caught measles from vaccinated kids who got the disease anyway. The Health Ministry says... the benefits of vaccination far outweigh the risks.

...[a new question is being asked of parents enrolling 5-year-olds for school this year – has your child been vaccinated? The Ministry of Health has asked schools to obtain immunisation certificates from parents. The aim is to raise NZ's immunisation rates, which are low by the standards of the developed world. Only about 70% of NZ children are immunised']

...[a] survey, conducted last year, found 63[%] of children in the northern region had received all recommended immunisations by age two. In 1992 the number was 55.4[%]. The] North Health communications manager, said the increase was in part due to a national Immunisation 2000 Strategy programme, started in 1995, and regional awareness programmes. Despite the improvement... [there] is... concern that one child in every five is not immunised against measles by age two... [T]here was potential for a measles epidemic unless 95[%] of children were immunised.

...Health officials are on the alert as a measles epidemic takes hold in Auckland and Waikato. Twenty-three cases have been confirmed in Auckland this month. The country recorded no cases last year... [The] last epidemic: 1991[, left s]ix dead, 570 hospitalised. This year's predictions: six to 10 deaths, 900 hospitalised, 40,000-50,000 infected... Children aged between one and 10 should be vaccinated to guard against the highly infectious virus... However, the public health physician for North Health... conceded last night that only 50,000 vaccine doses were available nationwide – well short of what would be needed for all the unvaccinated children. A further 180,000 doses are expected from A[US] next month. “The Ministry of Health predicted there would be an epidemic and that it would be most likely to start next year but events indicate it is starting now. We have two weeks to get as many children immunised as possible.”

...Fifty-seven cases have been confirmed in the past month in the measles epidemic in Auckland and Waikato... A shipment of 72,000 doses of vaccine would arrive in N[Z] by next Thursday, and further shipments of 514,000 doses were expected later this month... Only two or three cases have been confirmed in other districts.

...A national measles immunisation campaign covering more than 500,000 children is about to begin to stop the spread of the epidemic... Parents are being urged to vaccinate babies as young as six months old... as infant cases start to pour in[, even though]... the Immunisation Awareness Society said vaccinating at such an age could seriously damage a baby's long-term health... Public health figures show that a quarter of 63 confirmed cases in Auckland in recent weeks have involved toddlers from six to 11 months. This has brought a revision of the earlier recommendation by health officials that children aged from one should be vaccinated... But health officials are racing against time. The disease is already well established in Auckland and is expected to spread rapidly... Most cases have been in West Auckland, where there have been outbreaks in three schools and four pre-school centres... The Ministry of Health... was “as in control of the situation as we can be,” considering that the epidemic had happened faster than expected.

...THE measles epidemic could have been contained earlier if doctors had acted on Ministry of Health advice... says[the] public health director... Doctors were advised in December to start ensuring all children were up to date with immunisations. But... “Health professionals did not take a lot of notice of that warning.” ...Of the 1543 confirmed measles cases this year, 118 have been hospital cases but there have been no deaths. - 1997

A British nurse has been suspended from her job amid a police probe into the allegedly suspicious deaths of 18 children, health officials confirmed yesterday. The police are investigating claims that the youngsters, all aged between eight weeks and 17 years and all suffering from terminal illnesses, were given lethal doses of painkillers between 1996 and last year. The nurse has yet to be charged or questioned. If the allegations hold water, Britain would be faced with a second case of dark medical practices at the heart of its much-maligned and chronically underfunded National Health Service. Last year, [a] doctor... was jailed for life for the murder of 15 elderly patients in his charge.

...the bearded, bespectacled doctor who became Britain's – and perhaps the world's – most prolific serial killer, was undone by a simple signature. [The doctor], who... killed at least 15 of his patients... forged the will of Kathleen Grundy, his final victim... in order to obtain cash and property worth £300,000... Her lawyer daughter... became suspicious of the document which bequeathed her mother's estate to the GP. She analysed specimens of her mother's signature and questioned the so-called witnesses only to find out their signatures were forged. When his trial ended[, the] 54-year-old [GP] was convicted of murdering 15 of his devoted and trusting patients with lethal injections of medicinal heroin, in Hyde, a town near Manchester. Most of the victims were murdered after they let him into their homes, usually by appointment. One was killed in a consulting room at his one-man surgery in Market St. As he was jailed for life, it emerged that [the GP will] be charged with the deaths of 23 more patients... Greater Manchester Police believe he has killed 95 times.

...If anyone can come close to unlocking [the doctor]'s mind, it is probably... the only psychiatrist to interview him since his arrest. Because [the doctor] denied the... murders, he has given no explanation of what motivated him, or what pleasure he derived from the killings. However, [the psychiatrist] sees him as the “classic” necrophiliac; a man obsessed not with having sex with the dead, but with the act of inducing death, and controlling and observing the moment when life leaves the body. [The doctor] appears to have been meticulous about details, such as the positioning of his victims before he injected them... and was excited at being present when his handiwork was discovered by others... He no doubt relished the

fact that he had evaded capture for so long, and he perhaps gained particular pleasure from those he murdered in his surgery. He also enjoyed breaking the news to some of his victims' relatives. Whether he achieved some sexual release after a murder is unknown. [The psychiatrist believes the doctor's] choice of career could have been influenced by his developing tendencies towards necrophilia, perhaps originally triggered by the death of his mother from cancer when he was 17... Prosecutors at... the... trial... of Dr Death say... his drive to kill was fed by a desire for God-like power over life and death... "There are enough recorded instances of multiple murders by doctors to make at least a prima facie case that the profession attracts some people with a pathological interest in the power over life and death,"... says... a retired psychiatrist in Berkshire...

At first glance, [the suspect] was everything a patient could want in a physician: confident and competent, with a good bedside manner. Prosecutors took a longer glance and saw something else – someone they believe fatally poisoned three patients at a Long Island veterans' hospital and left a trail of dead bodies stretching from Ohio to Zimbabwe. Now the man dubbed "Dr Death" by the tabloids faces the death penalty himself. [The physician] returns today to Long Island for his arraignment on [three] murder charges... but the best selling book *Blind Eye: The Story of a Doctor Who Got Away With Murder* suggests he may have killed as many as 35 patients... [The physician] graduated from Southern Illinois University Medical School in 1983. There... classmates... joked that he had a licence to kill after several of his cases ended in death. While an intern at Ohio State University in 1984, [he] allegedly killed a 19-year-old gymnast with a dose of potassium. [He] was never prosecuted for that death, or for another alleged poisoning of a patient who survived. When denied permission to return for the second year of his residency, he... took a job as an emergency medical technician. His stint ended with his conviction for lacing co-workers' coffee and doughnuts with ant poison. Five of them became ill. [He] served two years of a five-year prison sentence and lost his medical licence. He made several attempts to revive his career, eventually landing a 1993 residency at the State University of New York by lying on his job application... [He] was dismissed after his past record became public knowledge, and he soon moved to Zimbabwe. Within a year of his arrival, patients in a hospital there were showing signs of poisoning. In July 1995, a Zimbabwe hospital suspended [him]. He was finally arrested two years later at O'Hare Airport in Chicago, boarding a flight to Saudi Arabia... [In related news, the] British doctor... who is serving life imprisonment for killing 15 patients, may have killed up to 265 people, says a Government dossier... Immediately after the conviction, [the British] Health Secretary... ordered a statistical audit of [the doctor's] clinical practice [since] 1974 and... found at least 250 more deaths during his career than in the practices of other doctors in the same area at the same time... The findings of that study have now been passed to the police... Soon after [his] conviction, police opened inquiries into the deaths of a further 39 of his patients and were investigating as many as 175 cases... However, a new trial was ruled out.

...It's a funny thing, the politics of grief. The little town of Hyde ought to have been in a state of shock after discovering that an official Government report suggests as many as 300 of its residents may have been murdered by a local GP... And yet, while there is shock in the town at the new numbers, there are also some very different responses. Some people are still in a state of denial. A baker, whose shop is just up the road from the surgery where [the GP] practised for more than two decades, said: "After all that has come out, I still get customers saying that [the GP] was such a nice man." Other townsfolk demonstrate a sense of weariness – mixed with anger – that the dreadful saga is continuing. One resident... screamed at reporters... outside [the GP's] former surgery... "Why don't you lot bugger off and leave us in peace!" The surgery is still open... An angry man, whose wife works in the surgery, tried to chase away the press. "There has been enough trauma and illness through stress here without you adding to it," he said. "Go away. This is over." Only it isn't. Some of the relatives of [the] victims were angry too. But their ire was directed at the Ministry of Health for not having given them advance warning of the report's contents. Their solicitor... was demanding that the coroner open inquests into many of the 300 deaths. Some local people support her in this... But many others feel that nothing would be served by it... There is a close-knit sense about Hyde. It is there in the fact that almost everyone you meet... appears to know someone who was killed by [the GP]. Everyone seems to have a story about him. And almost everyone, at some point in the conversation, mentions the Moors Murderers. Almost half a century has elapsed since those child murderers shocked British society with their gruesome crimes. But few of us could remember where they were from. In Hyde, they have not forgotten, because... [the Moors Murderers] perpetrated their killings less than a mile from [the GP's] surgery. Behind the surprise, the anger and the weariness in Hyde lurks another unspoken emotion. It is shame.

...Deaths of at least 466 people in the two areas where... the former GP from Hyde... practised will be investigated... [Staying in Britain, a surgeon has defended his] decision to amputate healthy limbs of two patients suffering from rare mental disorder as [his] hospital bans further operations.

...Dozens of babies died unnecessarily at Bristol Royal Infirmary because of a "club culture" among surgeons, who adopted a paternalistic attitude to patients and wielded too much power, a damning report says. The long-awaited report of the... inquiry, the biggest conducted into the National Health Service, said that one-third of young children who had open-heart surgery at the hospital received less than adequate care because of the arrogance of doctors and fundamental failures of management. Those who raised concerns over the number of babies dying were ignored or threatened because of a "poisoned" atmosphere that existed between management, surgeons and other staff... This led to a "Greek tragedy"...

The British pathologist at the centre of a scandal over stockpiled human organs kept a child's head stored in a jar, a damning report is expected to reveal. The findings make such distressing reading that the British Government is braced for violent scenes at Alder Hay Hospital in Liverpool when grieving parents see them. The report comes after a one-year inquiry into how hundreds of children's organs, many taken at post-mortem examinations without parents' knowledge, were stored... apparently without the knowledge of senior hospital officials. The findings are expected to conclude that the collection of organs went far beyond what would have been necessary for [the pathologist's] work. Some children lost almost all of their internal organs... after unwitting parents signed consent forms asking merely for samples of "tissue." The report will only severely criticise [the pathologist], who has insisted the backlog of body parts built up because of lack of funding to complete his cot death research, but also the hospital's management for its complete failure to monitor him, and its treatment of parents when news of the scandal first emerged. Families were repeatedly given false information and some were offered body parts of their children to take home in cardboard boxes. Others had to reopen their children's graves three or four times to ensure they had buried the entire bodies... Last week it emerged that the hospital had passed discarded thymus glands from living children during heart operations to a drug company for research in exchange for financial donations. Such is the level of suspicion between the parents and the hospital that many suspect the trade in organs could have been more extensive... The report will be published tomorrow, alongside a second survey by [the] chief medical officer for England and Wales... revealing that up to 40,000 body parts are stored for teaching and research at hospitals throughout Britain, many without relatives' knowledge... The Government is not expected to offer a central compensation fund... The report was passed to the Department of Health [two months ago]. Its publication has [been] delayed by the need to ensure that new guidelines hampered neither research nor organ donation for transplants... The... [pathologist] moved to Canada in 1995, where he was subsequently sacked and disciplined for "incompetent acts." He then moved to Holland.

...[a couple of Aucklanders] say their lives were shattered last night when Green Lane Hospital revealed to them that it has held their dead baby's heart and lungs for the past 17 years... The Henderson couple's second child, Lance William James, died in Green Lane's intensive care unit... aged 8 months. He had undergone open-heart surgery to correct a valve defect and his survival chances had been put at 50[%. They]... are one of the 18 families the hospital has matched up with hearts stored without specific consent... Green Lane revealed last week that it was holding more than 1300 abnormal hearts, mainly from children, babies and aborted fetuses. The collection dates from 1950... Six families wanted the organs back and six had opted to leave them with the hospital... [F]amilies who wanted to retrieve a heart would be given financial help to cover agreed travel costs of two people and burial of the organ... Hospital staff were about to start calling back families for whom there was no organ match.

...My first-born Travers, was 25 – old enough to make up his own mind. That’s why I didn’t object when he renewed his licence and opted against organ donation. ‘I’d like to leave this world in the same way I entered it,’ he said... A week or so later, I was tidying the house when... his younger brother phoned... A wall had collapsed at a demolition site and Travers had been crushed by falling debris... Somehow, amidst[my] sadness... I organised Travers’ burial... [F]or some inexplicable reason, 18 months after Travers’ death I decided to obtain a copy of his post-mortem results. It indicated certain parts of his body had been removed. ‘But we didn’t give consent,’... I was horrified... – Travers’ brain had been removed and destroyed, while his spine and spinal cord were in storage. ‘We have to get them back,’ I said... The very next day, the coroner organised for their release... [from Western AUS’s] Royal Perth Hospital... and I went to Travers’ graveside, where they were buried in a child’s casket.

...[‘AUSn research shows that up to 30% of cot deaths may be caused by babies sliding down under bed covers. “Especially the thicker, softer combinations. In particular, duvets allowed carbon dioxide levels around the baby’s face to go up to about 4%, when normally there’s very little,” says one of the researchers. He points out that in Holland young babies often go to bed in small sleeping bags, which avoids this risk, but he stresses the main rule is still to make sure babies sleep on their backs with their face clear of the covers. • NZ’s rate of cot deaths has fallen from 400 a year in the 1980s to 130.’ ‘Each year 10,000 infants in the US die in their sleep from unknown causes which are classified as “crib death,” or sudden infant death syndrome (SIDS).’]

...Parents must not give up sleeping their babies on their backs despite fears about them developing flat heads[, because it]... is the single most effective way of reducing... SIDS... “The development of babies is not harmed in any way if they do get a flat spot... on the back of their heads from lying in the same position all the time... and in most cases no-one except the parents would ever notice it,” says... Plunket’s national pediatrician...

Background noise may help to keep babies at risk of cot death alive, says an Auckland clinical psychologist... [The] senior lecturer at the Auckland School of Medicine, has completed a review of cot-death literature with[a] Scottish acoustics specialist... and two Italian researchers. Their theory suggests that from about 3 months old, babies’ breathing during sleep is improved by exposure to a level of background noise. A lack of noise over a period could trigger breathing problems among vulnerable babies... The theory[, which]... was partly developed from research [the lecturer] did 10 years ago at Otago University on infant pigs and dogs... has been greeted with reservation by[a local] cot-death researcher... who said she would be surprised if sound was a big factor.

...Wrapping baby up warm – it is a natural maternal instinct, but experts say it is something we need to reverse, as thermal stress is putting babies’ lives at risk... A baby could not... easily... kick off blankets or cool itself if hot... An Otago Paediatric Physiology Group spokesman... said it had long been recognised that temperature played a part in ...SIDS... A recent survey of parent knowledge in Britain showed that parents tend to overheat their children. Almost two-thirds... did not know what temperature was needed to keep their babies comfortable and 64[%] of the rooms checked in the survey were too hot. Doctors suggested keeping a room at a temperature of between 16 and 20 degrees C... A 1997 study of more than 500,000 babies in northern England and... western England, of which 325 had died of SIDS, revealed the link between overheating and cot deaths. Mothers of those babies had been much more concerned about their babies being too cold than too hot... [By the way, a]n ACC finding of health workers’ negligence sparked the inquiry announced this week into baby deaths and brain damage at National Women’s Hospital. ACC said yesterday that it had paid compensation for 10 medical misadventure claims for physiotherapy given to premature babies... who had been on respiratory ventilators... at the hospital between April 1993 and December 1994... The treatment[, which] involved tapping babies’ chest with a soft latex cup to clear secretions[, was]... stopped... when it was linked to death and brain damage... When asked why it had taken so long to address the issue, [the]... chief medical adviser at the Ministry of Health, which set up the inquiry, said... ACC had reviewed its original findings... The Director-General of Health... said the main issue appeared to be an increase in the intensity of the chest-tapping method, used to a lesser degree by other hospitals... Management at Wellington, Waikato and Dunedin Hospitals... [– where n]o deaths or injuries were linked to the treatment... [–] said they used the treatment in the same era but less vigorously and less often than at National Women’s[, where it]... went from being applied only during an eight-hour period to round-the clock... The[inquiry] panel head... said two babies suffered rib fractures[, which]... indicated the therapy was too vigorous... The hospital’s general manager... yesterday declined to expand on an earlier written statement, which welcomed the inquiry and said staff followed international standards of the time... The Nurses Society national director... said it would be unfortunate if the inquiry became a witch-hunt. He predicted the inquiry would find National Women’s and its staff were blameless. While it was tragic that babies had died, there had been a good rationale for the treatment.

...A physiotherapist at the centre of the... inquiry says that ideally nurses should not have given the treatment. Nurses trained in the therapy... started giving it to premature babies at National Women’s Hospital in 1993. That was owing to funding cuts and because it was considered an improvement to make the therapy available around the clock. The physiotherapist told the... inquiry yesterday that if she had “all the resources in the world” she would prefer the therapy to be given by physiotherapists rather than nurses. “A physiotherapist has a repertoire of skills that are over and above nursing skills [so] that she can always individualise her treatment to the baby.” ...A National Women’s paediatrician told the inquiry yesterday that the chest tapping was difficult to watch as it conflicted with the policy of handling premature babies as little as possible.

...In 1995, a paediatrician from the country’s largest maternity hospital... issued national and international warnings that a form of physiotherapy could be the cause of death and disability in premature babies aged 13 to 16 weeks with low blood pressure. The treatment... could have been behind 13 cases of brain damage. Five of the babies died... The Ministry of Health’s chief medical adviser... said that in the majority of cases ACC had found that a medical mishap had occurred. But two cases came under the more serious medical error or negligence category, which meant that, effectively, the ministry had to step in... To his knowledge, the... increase in the frequency of the physiotherapy to meet international standards... occurred in only two places in the world: Birmingham in England and National Women’s. The investigation had been driven by... some parents[who were] anxious to pursue the matter.

...A parent whose child died after receiving controversial chest-tapping physiotherapy at National Women’s Hospital believes he is close to a breakthrough in getting compensation... [His] persistence forced an inquiry into the physiotherapy after his son, Alistair, died and Alistair’s twin sister... was brain-damaged. He is threatening legal action against the public hospital company if it does not come up with a “satisfactory settlement.” ...He had not put a total figure on what he was seeking but said the costs before the inquiry were more than \$100,000. His driving motivation was to provide a secure future for... [his daughter, who] cannot run, has a speech impediment and has difficulty eating and drinking...

Chest-tapping physiotherapy on premature babies has been held up to international ridicule, according to an A[US]n expert opposed to the practice... [The] neonatal specialist at Royal Children’s Hospital in Melbourne, said yesterday that during a “joke session” at a U[S] conference last year participants discussed the “10 most useless treatments” for babies in intensive care. “Number one on the list, at last, was chest physiotherapy. For 20 years we have been telling everyone it’s a waste of time and potentially harmful.” ...[he] said it destabilised babies, potentially triggering a sequence that could occasionally lead to brain damage, although not to the rare type of injury discovered at National Women’s... Only one other hospital in the world – in Birmingham... – has reported cases of the rare brain damage in live-born babies. Fifteen babies suffered from it from 1988 to 1990 and all but one died.

...Many cases of the unusual baby brain damage... may have gone undetected elsewhere, an A[US]n medical expert says. The... leading neonatal specialist from Sydney, told the Government-appointed inquiry yesterday that only one case... had been reported in A[US] and NZ], outside National Women’s. It was from a Western A[US] hospital... and was not well documented... The brain lesions [in 13 babies]... at... National Women’s... were detected on ultra-sound scans, but the witness said that at some newborn units other than at National Women’s, there was often

“missing data for a lot of ultra-sounds at four to six weeks.” ...These “late” scans were missed in up to 25[%] of babies born eight or more weeks prematurely in N[Z and AUS] in 1994, the first year from which the data was collated... The missed scans might be because of health workers not getting around to doing them or because of infants being transferred out of newborn intensive care units in big cities “back to lower levels of care in peripheral hospitals.” He said health workers looking at scan results also might not have recognised the lesions because of their rarity... He... [added] that “percussion” therapy... was still practised elsewhere...

The Cartwright inquiry into what was widely known as “the unfortunate experiment” at National Women’s Hospital upended... the relationship between doctors and patients. The landscape would never look the same again. Slowly, new services came into being to mediate the relationship between a medical profession seen as aloof and arrogant and its patients, who felt that for too long they had not been listened to. Few would dispute that the change has been for the better. But in the wake of the report into “baby-tapping” at National Women’s, questions are being asked about how responsive the medical profession is to the concerns of patients. The inquiry found that parents’ concerns about the “tapping” were ignored, even when they were expressed with some vigour, and that parental consent was not obtained for the treatment. Inquiry members said in their report that the issue of informed consent – even though it lay outside their terms of reference – “needs to be properly addressed for the future.” ...So does this new report suggest we are back where we started? ...[the] co-writer of the *Metro* article that indirectly launched the Cartwright inquiry, says at least some of the gains made since then have been lost. The latest inquiry is a “snapshot of the system which shows informed consent is not being observed in an adequate fashion at all... The doctors were saying you don’t need to get informed consent for a procedure if there isn’t a risk involved, which is a bit bizarre when in this instance they ended up killing people.” ...Before the reorganisation that changed hospitals into [CHE]s, some area health boards employed their own advocates... [A nationwide patient advocate service... w[as] established under the office of the Health and Disability Commissioner in June 1996... Today, the equivalent of just over 25 fulltime workers are employed by the commissioner’s office, which will spend a shade under \$2 million this year on the service. Few of the advocates are on site at hospitals. They can be contacted through toll-free numbers – although a patient facing a tricky decision in the small hours of the morning won’t get any help...

It was close to 2am on a Monday in late August when the police cars cruised quietly through the deserted North Shore streets and down the long driveway, stopping below the concrete steps leading to the 50s-style bungalow. The family were woken by the pounding on the door. Something like a dozen people, police and social workers, pushed into the hall. Believing the mother was drugging one of the two children in the house, the social workers – having just learned the results of a urine test taken 26 days earlier – scooped them up and took them to the Starship children’s hospital for further tests. Their mother has not been allowed to see them again. This same mother was separated from her first four children in Britain four years earlier after a court found she suffered from a rare and controversial disorder known as Munchausen Syndrome by Proxy (MSBP), believed to cause sufferers to induce or fabricate illnesses in their children to get attention. She has since married a N[Z]er, but the allegation that she suffers from MSBP has followed her from Britain, to A[US], where the younger child was born, and now here... In the time she has been under suspicion here, the mother has laid complaints against no fewer than 39 people in the case. This, too, was considered a symptom of her personality disorder... By the time the case hit court last October, the... Family Court... judge was asked to decide whether the allegation of MSBP upheld by the British courts was indeed correct, whether the mother had given an adult hypno-sedative drug, Zopiclone, to her 18-month-old son whose development is considered severely delayed, and whether leaving the children in the care of their parents was an unacceptable risk... The judge not only accepted that the mother had indeed given the child Zopiclone – a sedative she had been prescribed a month earlier – but also reached the view that the mother, and “to a lesser extent the father,” were not available to meet the children’s daily demands. He accused the mother particularly of focusing all her energies on challenging the earlier removal of her four children... Her history of having children removed in Britain and the subsequent improvement in their health, plus his belief that she drugged the boy, were enough to convince [the] Judge... that the children “will be subjected to an unacceptably high level of risk should they be returned into the care of their mother.” They now live with extended family members outside Auckland. However, the [mother is appealing against the judge]’s decision... Her chief accuser in Britain... [- who] was... seen in this country on the controversial documentary screened by *Assignment* two years ago showing secretly filmed footage of alleged MSBP sufferers suffocating, poisoning or assaulting their defenceless babies... [-] is now himself the centre of controversy and is under investigation for the conduct of ventilator trials where he is alleged to have either not obtained or falsified parental consent. Some of the babies on the trial died or are brain damaged.

...The last time... [two young children] saw their mother, she had just given birth to their baby brother... in Rotorua Hospital. Two days later, Jeanette Van Leeuwen died in the hospital from a severe infection that caused a fever and vomiting, but was not diagnosed by doctors or midwives. Yesterday, Rotorua[’s] coroner... gave his report on Mrs Van Leeuwen’s... death, and expressed concern at the lack of communication between hospital staff and independent midwives about her condition. Two days before she went into labour, Mrs Van Leeuwen, aged 36, scratched her leg on a picnic table. She was vomiting and had a fever before she gave birth... on December 19... [A] Rotorua Hospital obstetrician... examined Mrs Van Leeuwen and suspected she had either a viral infection or a stomach upset from something she had eaten. But[a] Rotorua pathologist... later found that Mrs Van Leeuwen’s symptoms were most likely caused by a rare streptococcus, probably from the scratch on her leg. Mrs Van Leeuwen... told doctors after the birth that she was feeling better. But her condition fluctuated and two days later, a senior medical officer called to examine her prescribed antibiotics. But it was too late, and she died four hours later from severe blood poisoning... Yesterday, [her husband – who had]... arrived at the hospital on December 21... to find staff trying to resuscitate his dead wife... [-] said the report made no difference to his family’s grief. “Ultimately, no one will be found responsible for Jenny’s death – I can’t be expected to tell my kids when they grow up that their mummy died because of a lack of communication,” he said.

Midwives are threatening legal action if the four [RHA]s accept changes proposed by doctors to new maternity services arrangements... Doctors have been boycotting the funding system that came into force on July 1, saying it would compromise the care received by mothers and babies. Midwives are angered by the doctors’ alternative proposals, which they say would reduce the maternity care options available to women under the new system... The... [new system] gave women the option of choosing either a midwife, a doctor or a specialist as their lead maternity carer. - 1996

The maternity system... introduced last year... puts mothers and babies at risk because of confusion over when specialists should be consulted, according to an expert...

A North Shore man whose 38-year-old wife bled to death... last November... after giving birth to their stillborn baby... is suing his doctor and Waitemata Health for more than \$1 million... [T]he man claims compensation for his nervous shock as a result of his wife’s death, which he alleges was caused by doctors’ negligence and breach of duty of care... The inquest heard that [his wife] was given the drug oxytocin to make her uterus contract, despite a specialist’s recommendation that a different method of induction be used... The drug is known to carry some risk of over-stimulating the uterus and causing rupture... At the hearing... the... family doctor... admitted she had not used the method recommended by a consultant gynaecologist-obstetrician. The specialist had written in... clinical notes to use prostaglandins... [but] the notes were not properly read until after the induction had begun... The family doctor – a veteran of more than 1000 births – said she knew [the wife] was a high risk patient for the use of oxytocin because of her age and because she had had several children. However, it was chosen because [the wife] wanted a painless and quick delivery... [To further complicate the situation, the wife’s] ruptured uterus was misdiagnosed by a specialist who believed she was suffering

from toxic shock... A... report identified... [a] failure to recognise that seven topups to [the wife's] epidural, administered by [an] anaesthetist... were needed because of the overstimulated uterus. There was also a failure to communicate how often they occurred and that they were accompanied by drops in... blood pressure... [O]ne mother dies in every 10,000 births], and 'around 50,000 babies are born in NZ each year'...

A REVIEW of maternity care at south Auckland's Middlemore Hospital has recommended improved safety monitoring systems, coinciding with claims from family members that their stillborn baby girl should have been saved... A... midwife... detected... the baby's heartbeat [before] an emergency caesarean section was arranged...

A Lower Hutt midwife criticised for her role in the death of a baby boy has complained to the Privacy Commissioner about her name being made public... [after] the Health and Disability Commissioner... found she had breached the code of rights by ignoring danger signs and failing to call in a doctor for almost four hours. She will appear before the Nursing Council next month. The baby boy was born brain damaged and died five weeks later. [The commissioner] said that being able to make public comment was an important part of her job... [Incidentally, following an] amendment to the Nurses Act in 1990, midwives were able to claim the same delivery fees and hourly rates as doctors. However, because they tended to spend longer at births, midwives collected relatively more money. This infuriated some doctors. One Remuera midwife mimicked the doctors by purring around in a gold BMW (number plate STORK) and a small group was rumoured to earn around \$200,000 a year. Certainly, between 1990 and 1993, payments to doctors and midwives rose from \$50[million] to \$90 million.

...[it won't yet affect the length of time that is required to deliver babies – and, therefore, the pay of midwives and doctors – but 'AUSn scientists have discovered the hormone that induces labour. The discovery could lead to a test that identifies mothers at risk' of having premature births and, perhaps, will also lead to the development of safer inducement drugs? 'All drugs are passed onto babies who do behave differently.'

...a comatose woman who authorities believe was raped gave birth to a premature baby girl at the weekend while investigators tried to solve the case. No employees have been fired or suspended at the Town Manor Nursing Home in Lawrence, Massachusetts, where the woman was cared for. Nursing home officials discovered that the 24-year-old was pregnant only last Monday, when she appeared uncomfortable and a doctor examined her. She was five months pregnant. The *Eagle-Tribune* of Lawrence reported that the woman had been comatose for four to five years since a drug overdose. The girl, who has not been named, was yesterday in a critical condition.'

...doctors in Rochester, New York... delivered... [a] baby girl... by caesarean section... at the weekend... [after keeping] alive... her... mother... Lisa Nottingham, aged 20, [who] was about four months pregnant when she suffered a brain haemorrhage and was declared brain dead... Shortly after the delivery of the 1.4kg baby, doctors removed Lisa from the machines that had kept her alive for 14 weeks and 20 minutes later she was dead. [In local news, 'Whangarei Hospital has successfully delivered the baby of a woman who was seriously injured in a car crash. The woman's family had wanted her life-support equipment to be turned off, but her husband wanted it to be left on until the foetus was old enough to be born.'

...A CONTROVERSIAL new funding scheme that limits care for premature babies funded by the Southern [RHA] is "market madness", says Labour[']s health spokeswoman... The new approach to funding neo-natal care was "attaching financial risk to the most critical of services in our hospital"... It has also caused a stand-off between the Dunedin-based health purchaser and... Healthlink South. [The spokeswoman]... said it was unethical and immoral for the RHA to make Healthlink South adhere to a system it did not want. "It's like holding a gun to their head." ...The proposed "capacity contract" means that instead of funding Christchurch Women's Hospital to care for all premature babies who need it, the RHA has set a cut-off point of... around 600 a year. Healthlink South must take financial responsibility for babies born after that limit is reached. Should the hospital not reach the limit it keeps the spare change... [The hospital's] general manager... said the neo-natal unit tended to be used as a last resort. "Babies go in there if they need to. We pick up babies from other areas like the West Coast and South Canterbury and we don't want to have to refuse those." The babies were very expensive to care for, he said... Another CHE, Healthcare Otago, has a limit of around 300 babies. The estimates are based on the hospital's previous records of premature births... [T]he RHA's general manager of primary care, said capped funding was one way for the authority to manage its \$1.1 billion budget. Neo-natal services were in high demand because of improved technology and higher expectations of saving babies. "People are pushing technology boundaries so now it's possible to have babies less than a kilogram survive and that comes at a cost." [He] said... the... RHA was prepared to listen and discuss alternative ways of funding services.

...CHRISTCHURCH Women's Hospital is expected to lose one-third of its... 28... obstetric nurses... The N[Z] Nurses Organisation... blamed the cuts not on the [CHE] Healthlink South, but on a lack of funding... from the Southern R[HA]... In the long term, the number of midwives may also drop as some will not be replaced when they leave. The NZNO is upset about the cuts, [and]... is also concerned that the quality of care... will suffer from a move to replace nurses with unqualified caregivers. [Meanwhile, a baby 'born 13 weeks (91 days) premature and weighing just 570g – 54g lighter than the baby listed as the world's tiniest – went home yesterday. The little girl, who now weighs 3.49kg, spent the first 105 days of her life in the Christchurch Women's Hospital neo-natal unit. She was born by emergency caesarean section after a routine scan intended to determine her sex found complications with her mother's placenta. Her parent's finally felt confident enough to issue a birth notice this weekend. ■ The *Guinness Book of Records* lists the world's most premature surviving baby as a boy of Ontario, Canada, who was 624g when born 128 days (more than 18 weeks) premature in 1987.'

...A healthy 3 1/2-month-old girl who came into the world weighing just 285g spent her first full day home from the hospital yesterday, and her doctors say they believe she is the tiniest human on record to live so long. The "miracle" baby now weighs 2kg and doctors say she has a nearly 100% chance of enjoying a normal life. She was delivered by caesarean section in Rome during the 27th week of pregnancy. At that stage of prematurity, some babies do survive, but they have weighed much more at birth.' ● 'NZ's smallest surviving baby – who weighed just 385g when he was born 16 weeks early, and had another close call when his heart faltered during surgery to mend two hernias – has been allowed to go home from the hospital's neo-natal unit with his proud parents 10 days before his official due date. When born, he was no bigger than a ballpoint pen from head to rump. Now he weighs 2 kilos, small by newborn standards, but huge to his parents. "He isn't so keen on sleeping but loves feeding."

...pressure on women – including their breasts being seen as sex symbols – is leading to a worrying decline in breastfeeding, academics warn. More women returning to the workforce after giving birth and the misconception that formulas are as good for babies as breast milk are other reasons. Breastfeeding rates have been declining for years and now fall well short of an aim by the former Public Health Commission to have 75% of three-month-old children fully breastfed by the year 2000. The latest Ministry of Health statistics show that last year just 48% of three-month-old children were breast fed. Even very young babies are coming off the breast early. Back in 1993, 83% of two-week-old babies were breastfed; by last year this figure had dropped to 72%. For six-week-old babies the drop-off was from 75 to 64%. A Massey University medical anthropologist says NZ culture fails to encourage breastfeeding and men can feel threatened. "In my own research I've come across mothers who admit they are happy to swim nude with friends but they wouldn't breastfeed their baby in front of them." People also found wet T-shirt competitions or topless sunbathing more acceptable than breastfeeding.'

...*'Research favours breastfeeding over bottle, but that leaves many women feeling guilty about letting their babies down.* IT was 5 am. Tears streamed down my cheeks as I cradled my sobbing baby. I could count on one hand the number of hours sleep I'd had since giving birth four days earlier. We paced the living room, as we had done most of the night. The baby's screams echoed and I tried to feed him once again. He nuzzled me, fed for a while and started beating his fists in rage. Years of exposure to the idea that "breast is best" had made me determined to breastfeed. But the images of a happy mother and sweetly contented baby were a world away from what we were going through. Hospital staff, aware that they had only 48 hours to get the baby feeding before we went home, spent hours with us. A succession of midwives and nurses pinched my breasts, heaved me into uncomfortable sitting positions and pushed my nipples into the baby's mouth. By 11 pm – 18 hours after his forceps birth and with me falling asleep sitting up – I was hooked up to an electric pump and my baby was fed 20ml of creamy colostrum from a medicine cup. The next day – a Friday – a midwife decided that I needed to see the hospital's

lactation consultant. Unfortunately, she works Monday to Thursday. We persevered, and by the end of the day my baby was feeding every two or three hours. As we left the hospital the next day I felt happy and confident. The feeling lasted until that night when the baby refused to settle. The next 39 hours passed in a blur. Relief came when my partner took matters into his own hands and bought formula. Our baby guzzled it hungrily, was overtaken by a fat and happy look we hadn't seen before, and fell asleep. We were told we had done the right thing. The fact that the baby was wetting only two nappies a day and his urine contained pink urates indicated he was dehydrated, a potentially fatal condition. He was also losing too much weight and we were advised to give him a bottle every night. The mixed feeling continued for six weeks, through the baby's oral thrush, which he passed to me, and the first aching stages of mastitis. Now, with my milk dried up, I am plagued by guilt. I am not alone. The dearth of information and the constant messages of guilt prompted an American mother to write *Bottlefeeding Without Guilt*. As well as giving practical advice on bottlefeeding, the book criticises a "cult" within the breastfeeding movement for promoting the idea that all women can and should breastfeed, regardless of the difficulties.']

...THE AGE of the breastfeeding househusband may one day dawn, according to... an award-winning scientist and author who is one of the world's leading experts on human evolution. In a new book, he says the physical and physiological barriers which have prevented men from breastfeeding their children are breaking down while they face increasing social pressures to help bring up their offspring... All men have a latent potential to lactate and there have been rare cases of this happening naturally. At first, however, it would have to be induced artificially, says... [the] professor of physiology at the University of California in Los Angeles. H[e]... says the incentives for men to consider the possibility of lactating have never been greater. "Today, many or most mothers in first-world societies have already become unavailable for breastfeeding, whether because of jobs, illness, or lactational failure... The first men to breastfeed will undoubtedly be ridiculed by many other men. Nevertheless, human reproduction already involves increasing use of other procedures that would have seemed ridiculous a few decades ago." ...[an] author of best-selling childbirth books, said the ultimate challenge to gender roles may prove too much for many men... [A] professor of genetics at University College, London, agrees with [the UCLA professor]'s biological arguments but is also sceptical: "In principle it's feasible but I doubt it will happen in practice." ...a 64-year-old man... produced milk for seven years after hormone treatment for cancer. There are... thousands of incidents of lactation in male prisoners of war where starvation led to diseased livers, which failed to break down the natural hormones in the body that can induce breast development. Lactation can also be induced by manual stimulation of the nipples, which is known to trigger the production of prolactin, the female hormone essential for breastfeeding... [● The UCLA professor's] theories will be detailed in *Why is Sex Fun?*, to be published in July. His bestselling first book, *The Rise and Fall of the Third Chimpanzee*, earned him the Rhone-Poulenc science book prize.

...It's a great endorsement of the value of breast milk – even if some mothers would balk at the idea. New mums at Waikato Hospital recently saved the life of an abandoned newborn spider monkey at Hamilton Zoo by donating their expressed milk... Of course, it's always been possible to express and freeze your own breast milk for your baby. But access to banked milk is important for premature or sick babies and for mothers who can't breastfeed, says[a spokesperson for] the NZ Lactation Consultants Association... With this in mind, National Women's Hospital may re-establish its breast milk bank, says[its] newborn services manager... A decision should be made later this year. The bank would work by collecting, screening and storing donated milk, which has a shelf-life of only three months. The hospital's original bank was opened in 1969 but like many others, closed in 1986 after fears that HIV... could be passed on through human milk. Researchers are still divided on the role of breast-feeding in transmitting HIV. It's believed several American babies could have contracted HIV this way... However, nothing adverse has happened in N[Z], and a handful of banks in the U[S] and Europe operated throughout the crisis period without problems. New screening and sterilising techniques mean we know for sure the risk of disease transmission through banked breast milk is now practically zero... Once cleared of HIV by a blood test, healthy lactating women can donate any extra milk they have. Smokers and big drinkers can't... Mothers on medication – even the contraceptive pill – or at risk of HIV infection from their own drug use or that of their partners, are also unable to donate. However, you can't be paid for giving milk. N[Z] law prevents the sale of human material, though in parts of Europe, such as Sweden, a litre of breast milk earns about \$27. Australasia's about to see its first private breast milk bank but it's a non-profit foundation and donating mums won't be paid.

...Would you let another woman breast-feed your baby? A storm in a C-cup erupted after [a] Porirua mum... discovered another woman had breast-fed her infant daughter... while the child was under a babysitter's care. [The mum] says her consent was not sought and demanded blood tests to prove the unauthorised wet-nurse didn't carry hepatitis or HIV. Experts agree consent is a crucial issue but, within certain conditions, they can't see anything wrong with cross-nursing... However, [breast]... milk composition changes with the age of the baby, so the best wet-nurse is one with a child of her own about the same age as the child she's feeding... [In related news, n]ewborn babies could be getting sicker because their mothers are being sent home from hospital earlier. Health authorities are investigating whether shorter stays for new mothers are connected with a recent drop in breastfeeding and a suspected rise in the readmission rates of sick babies. Mothers are now generally sent home from hospital within two days... Hospitals maintain that the practice is safe but the Maternity Services Consumer Council claims that women are "hobbling out of maternity hospitals in Auckland barely able to walk." ...Underfunded hospitals were cutting back on midwives' visits... to help[mothers] to learn to breastfeed and care for their babies... [the] council coordinator... said. Sick babies less than two weeks old now made up 15[%] of visits to Plunket family care centres, even though Plunket was not funded to care for them... [The coordinator] said a constant downgrading of postnatal services had grown worse since spending on maternity services was capped last year... [The] new lead maternity carer system... introduced in July last year to stop rising costs... gives each woman a limited budget for the... [lead maternity carer] of her choice.

...Being pregnant for the first time is scary enough, says [an expectant mother]. The last thing she needs right now is a constant battle to make sure she will be looked after... Based on mainly anecdotal evidence... thousands of N[Z] women are feeling the same way. Many have had a struggle to find someone to deliver their baby, because of a drawn-out battle between doctors and midwives over limited maternity funding... Some say they have been charged by their GPs... up to \$500 if they want independent midwives rather than hospital midwives... Those who can afford it are reluctantly paying up to \$2000 for a specialist to gain extra security... The controversy came to a head on the North Shore... when a group of doctors called Shore Birth began charging women \$880 for maternity care. Shore Birth claimed it offered a superior service for the money but admitted the charges were driven by frustration with the new system... North Health says these fees are illegal because the Government insists that midwifery care must be free... Until the new system began, pregnant women could get care from both doctors and midwives... Now... [in] theory, if they choose a midwife they can still see a doctor and vice versa. In practice, many find this difficult because the lead maternity carer has to pay the other health professional out of his or her budget. The scramble for limited money is made worse by a frequent lack of trust and mutual respect between doctors and midwives, based on strongly held philosophical differences about how to handle childbirth... In the process doctors have accused midwives of not intervening quickly enough to protect mothers and babies from medical complications. Midwives have strongly defended their safety record and accused doctors of being more concerned about their falling incomes than the women in their care. Caught in the middle are pregnant women and new mothers, trying to make sense of a confusing system. The first problem, says[the] founder of Action to Improve Maternity Services... is finding someone to deliver your baby... [She] has no doubt that family doctors are abandoning obstetrics because of the new system and midwives are struggling to cope with the increased workload. The doctors agree. A telephone survey in February claimed 70[%] of GPs who had offered maternity care in most parts of the country two years ago had quit. The startling figures included... North Shore[going] from 60 to six in five years... [and] South Auckland from 30 to three in one year... [The] Medical Association's maternity services committee chairman... said GP deliveries had fallen from more than half the births in N[Z] a few years ago to about 20[%]. He predicted virtually all family doctors would stop delivering babies within another two years... Officially there is no shortage of midwives yet.

...Some Lower Hutt doctors have run foul of the Commerce Commission... The commission said the doctors' attempted collective agreement to pay midwives specified rates was a form of price fixing and risked breaches of the Commerce Act, which prohibited people getting together to agree on prices... "We have advised the doctors that under the act it is up to the doctor and midwife involved to agree on the fees... For groups of doctors and midwives to get together and agree on standard prices is... price fixing." ...The doctors had changed from setting fees to now negotiating individually with midwives, and the commission was not taking further action... The commission... was focusing on the \$7 billion health industry this year – "and our involvement with it shows that its awareness of the Commerce Act is poor." ...The General Practitioners' Association said yesterday that the price-fixing problems showed that the new maternity scheme arrangements had become an administrative nightmare.

...Twelve South Waikato [GPs] have quit offering obstetric services, fed up with the new maternity system. The decision by the 10 Tokoroa and two Mangakino GPs means expectant mothers in an area with a population of 23,000 will have to travel to Rotorua or [Hamilton] to give birth... Plunket condemned the Tokoroa situation, saying it was dangerous for women in labour to travel so far for help... [A] Tokoroa GP... said that 10 years ago Tokoroa Hospital had four full-time specialists and an anaesthetist. Now GPs had no immediate backup in the event of an emergency during a birth. GPs had spent many anxious moments waiting for rescue helicopters, which took an emotional toll... They feared a baby or mother would die because of a complication and that they would be held responsible. He doubted the [CHE or the RHA], or specialists, "would stand by us in a messy court case. That could be the end of our careers." [He] said the maternity system introduced last year was bureaucratic, restricting, unrewarding for GPs, and pitted them against midwives.

...The Kaitia Maternity Service is patting itself on the tummy over its complication-free partnership between doctors and midwives. The... business cooperative of six midwives and five [GPs], which first contracted Far North maternity services in April, was unique as they "get on really well." ...[while all is well in Kaitia, a] mutiny by Tokoroa family doctors has forced the [ir] local health authority to back down on the Government's much-trumpeted "lead-carer" maternity scheme – the first crack in the plan's unified front... Since [the]... GPs had refused to provide free care to pregnant women and to deliver their babies... Tokoroa women have been forced to rely on independent midwives in Rotorua and Hamilton, as there are none in the South Waikato timber town... But now Midland Health has agreed to pay for Tokoroa's expectant mothers to visit doctors in the first three months of their pregnancies – putting pressure on the scheme in other parts of the country... The patients will still be entitled to care under the lead-carer scheme... Although only the lead carers can claim subsidies for delivering babies, Tokoroa GPs will be paid to help in "unexpected, life-threatening emergencies." ...The women will also get two free routine checks after six months, and Midland will pay for any urgent consultations at night and on weekends... The traditional free six-week check-up has also been reinstated... A spokesman for [the] Tokoroa GPs... said... "Common sense has prevailed at last."

...New mothers are being offered \$120... plus 50 free nappies... to leave... Waikato Hospital within 24 hours of a normal delivery or within four days of a caesarean section... The communications manager for Waikato Health... said the \$120 was to be spent on home help, such as housework or minding other children... [A] new women's group fighting for increased maternity services... has... condemned... [t]he offer... as a bribe... [because mothers] who left hospital early saved the health system money... Meanwhile, hospitals are also gaining \$100 for each woman who leaves within 12 hours, if the hospital is [the mother's] "lead maternity carer"... The extra money is supposed to be used for postnatal care but is not specifically tagged to any service.

...A new private birthing clinic set up to compete with the Waikato Hospital public maternity service was kick-started with Government funding worth \$350,000. River Ridge Birth Centre... has been contracted by Midland Health to provide primary birthing care, in direct competition with Waikato Hospital. A public health lobby group is furious that the private midwifery operator... was given... Government funding towards "development." ...the Waikato Coalition for Public Health says the private clinic duplicates services and undermines the public health system... [The funding also] gave the clinic a competitive advantage. "Why do that when Health Waikato operates a delivery suite and wards, and is in desperate need of capital investment?"

...Government funding for a free nappy service in Waikato has been cut, two months after it was called a bribe to get women out of hospital more quickly. Midland Health says it could not afford to extend the service throughout the region... "Access to primary maternity services, particularly in rural areas, is costing more than anticipated, and the dollars saved from cancelling help at home will be used to enhance access."

...[early discharging became] routine amid a belief that neither maternal nor infant health was compromised... However, [sending]... mothers home early from hospital is "an uncontrolled human experiment" designed by governments to save money, say two A[US]n birth specialists... [Their] editorial... in the *Medical Journal of A[US]*... said casemix funding had led to a situation where choice was losing out to cost effectiveness... Women discharged early from hospital after childbirth have an increased risk of developing postnatal depression... [14% of them developed postnatal depression] compared with 7[%] of those who had a standard stay of more than three days... "While health services are having to cut costs, early discharge may result in short-term savings[, but]... the consequences of postnatal depression could lead to escalating costs in the long-term... Struggling depressed mothers are often undiagnosed and unsupported, which leaves their children at long-term risk."

...A teenage mother, distressed at having no milk for her two-week-old baby, was turned away from a Palmerston North medical centre because she had not paid a previous bill of \$60. [The mother], aged 17, was eventually admitted to Palmerston North hospital with a fever caused by an infection in the wound from her caesarean section. The general manager of the practice has apologised to her[, saying]... its policy was to see anyone who was seriously ill, regardless of their financial status... [Incidentally,] Middlemore Hospital has posted a 24-hour guard in a paediatric ward to stop a child's parents from removing him... Police are on standby in case the [parents] arrive to forcibly take the child home. A direct line has been set up between the hospital and Otahuhu police. The head of South Auckland Health... said the child had been at risk because of the parents' lack of care and reluctance to follow hospital instructions. The child was legally taken from his home and admitted to hospital yesterday morning. He was operated on last week to prepare his legs for artificial limbs. The boy's legs were amputated below the knee when he was a young baby because they became infected after he developed complications from meningococcal meningitis. Since then, the family have been reluctant to bring the child to hospital. Six surgery appointments were missed before the parents finally brought the boy in for last week's operation. They returned home after the surgery but the parents then removed a plaster cast which was to straighten his legs. Infections were also found on his leg stumps. Hospital lawyers urgently contacted Children, Young Persons and Their Families Service, which was granted guardianship of the child for six weeks by the High Court. On top of that... the hospital had an array of legal means to hang on to the boy and continue treatment... The security guard will cost the hospital about \$3000 a week to monitor the ward.

...Middlemore Hospital has spent \$27,000 posting a 24-hour guard... to stop a child's parent[s] removing him... The Middlemore chief executive... said the case put immense pressure on staff and the need for security had added to the strains of a cash-strapped budget... "We have an obligation to the child but we will get no compensation for this." ...The child... had had ongoing surgery so he could wear artificial legs. [By the way, 'researchers have found toys kept in surgery waiting rooms are crawling with disease-causing bacteria. They may be responsible for cross-infection after being handled by youngsters with different illnesses. There are strict rules on toy hygiene in pre-schools but not GP clinics. "There may be a case for GP surgeries to follow the same rules," said a spokesperson for Auckland Healthcare's public health protection department.']

...Auckland Healthcare officials are investigating reports that a cocktail of chemicals dumped in a West Auckland park may be linked to health problems in children... [A] 12.9ha former landfill in Kelston, was closed after 11 complaints from children about skin problems, including rashes, boils, infections and dermatitis... Residents believe that uncontrolled dumping up to 15 years ago of timber treated with arsenic, zinc and copper

may be contributing... The park was a landfill between 1965 and 1970 and from about 1982 to 1992, before being developed into a... widely used... park... A truck driver and local resident, who did not wish to be named, said last night that he had told the Waitakere City Council his former employer was among companies which dumped treated timber at the site. "We had five trucks on the road dumping stuff... [K]nowing what's gone into the park I would never let my kids play down there," he said... The council manager of city infrastructure... said there was no clear link between the park and alleged health problems but the council was taking residents' concerns seriously... Signs have been erected warning the public... [and the] council has begun soil tests...

[Four children have been tested for HIV and hepatitis after hundreds of dirty hypodermic needles were dumped in an Auckland playground. The children – aged 3 to 7 – now face an agonising wait to see if they test positive after playing with the bloody needles. Other children may also have come into contact with the needles, and health officials say any worried parents should seek urgent medical advice. The *Herald* has been told that the children found a shopping bag filled with up to 300 syringes in a rubbish bin at Miranda Reserve, Avondale, on Sunday morning. Other syringes had been scattered around the bark-strewn play area of the reserve. A bloody-looking syringe with needle intact that the *Herald* found buried in the bark under the children's swings was confirmed as having been supplied by the Auckland needle exchange programme (nearly half of those on the programme have hepatitis C). On two occasions, reporters saw children playing in the bark in bare feet. A health inspector was due to inspect the playground early today before children arrived. It is the second recent find of dumped syringes – about 30 were found at a Mairangi Bay bus shelter two weeks ago. It is understood that a child was pricked after handling those needles. The national co-ordinator of the needle exchange programme said needles were found in public eight to nine times a year. While more than a million needles were distributed every year, only 25 to 30% were returned. The problem was that while the needle exchange programme was legal, drug users could still be arrested for possession of injection equipment and so tended to hoard syringes and secretly dump them. The law surrounding the disposal of needles for diabetics also needed changing because they were entitled to get rid of them in the domestic rubbish, "which is not a very safe thing to do." In related news, c]hildren's health in Auckland has been under renewed scrutiny after parents told a confidential research project of serious problems with suburban services. Difficulties with after-hours medical care, costs of repeated visits to doctors and weak relationships between doctors and families were cited in the study... The information was obtained by the... *Herald* under the Official Information Act and after intervention by the Office of the Ombudsman... The report was commissioned by the Starship children's hospital to find out why so many parents bypassed other health professionals and took their sick youngsters to the emergency department... Auckland [GP]s and the Starship have been working on projects to improve the situation... [The GP]s did not agree with all of the report's findings but decided to make improvements in service rather than expend energy disputing parts of the document.

...The *Herald's* recent [article] on the plight of children in our society was... illuminating. But there was a dimension missing from the discussion: the rural story. South of the Bombay Hills and rather more than a comfortable car journey from the Starship hospital, the difficulties faced by children... go largely unreported. So do the efforts of the health professionals in our rural communities. Many urban children undoubtedly fall short of having an acceptable level of health. But their problems tend to arise more for economic reasons than through a lack of health facilities. Generally, the health infrastructure is in place to help. Children outside our cities and towns face a dual obstacle: both cost barriers and a shortage of appropriate medical facilities and people... A key plank in the health... [strategy of the coalition] Government... was the concept of equity: fair access to health services. The goal was for every N[Z]er to achieve health gain through having the same rights to their share of the health dollar as the next person with a similar level of need. That is a huge challenge. How do you ensure equity when an Auckland child can be a short taxi ride away from cancer treatment while his Gisborne cousin faces a taxing and costly series of connections to get to the same facility because there is nothing in between? ...To achieve equity, ironically, requires an inequitable commitment of resources... There are unquestionably a host of serious issues around children's well-being in the cities on which we must focus and shed light. Our plea from this large central North Island slice of your circulation area is not to leave us in the dark.

...Leading the world in ills that ravage the young... As we head towards the year 2000, we are set to remain world leaders in lots of areas... Figures from Auckland-based North Health reveal the state of play: • child hospitalisation rates of 65 per 1000 (the U[S] rate is one third of that)... [include] 30,000 children entering hospital each year with injuries that are preventable... • world leaders in rheumatic fever, Maori and Pacific Island cot death, motor vehicle injury, suicide, meningococcal disease, hearing loss and teenage pregnancy... More depressing still is the fact that health officials do not expect the figures to fall for perhaps another decade. That old, feel-good jingle trumpeting energetic, carefree Kiwi kids as Weetbix kids has become a fading fantasy: Kiwi kids being sickly kids is closer to the mark... Appalling child-health statistics have been reported for years – and we have screeds of... *Herald* clippings to prove it. So what has been done to ease the situation? Many argue very little. The biggest complaint is that no one has taken charge of children's health. Within the Ministry of Health the issue has been handled by staff across different departments rather than by one specifically focused team. The more cynical say that children do not vote... and therefore... are not a powerful lobby group... - 1997

Those in the front line of care say our society does not treasure its young and are calling for leadership and direction from the top... N[Z] has some of the worst child health statistics in the developed world... Of 145 countries in a 1995 Unicef report, 74 had higher immunisation rates for diphtheria, tetanus and whooping cough for 1 year olds. Those bettering N[Z]'s position included Malawi, Rwanda, Tanzania and India... Whooping cough hospitalisation figures in the period 1980 to 1989 were up to 10 times higher than those of the U[S] and about six times those of the U[K]... Rates of respiratory disease among Maori infants are three times higher than their non-Maori counterparts... Glue ear rates are also high and about 14[%] of Maori and Pacific Island children fail the hearing test given to five-year-olds compared with 7[%] of other youngsters... Rates of rheumatic fever... which can cause life-long heart problems... are said to be "Third World." ...[a GP] working... in West Auckland... is convinced that poverty is a major cause and the children worst affected come from families with little power to fight the system... [M]oney is a factor in some parents not seeking early medical help for their children but there is also a financial problem on a grander scale... "The philosophy in the health sector is around competition which isn't terribly conducive to members of society who are vulnerable." ...Issues like waiting lists, maternity and mental health services appeared to carry much more political clout than children's health issues... "The people who have the greatest ability to push for change are the people whose children are least affected, [so] they don't see the need." ...to win new money for child health... [is] extremely difficult... but if N[Z] could bring down Maori and Pacific Island children health statistics to a developed world level, huge amounts of money would be saved.

...Enveloped in beds... in the Middlemore paediatric ward... are children suffering from diseases that N[Z] health professionals thought were on the way out... Not all are suffering from what have been tagged "Third World diseases." but for the staff on the ward it is obvious that they are dealing with the results of poverty... [They] once told a young rheumatic fever patient she could go home for the weekend on the condition that she sat on the couch and relaxed. The girl looked worried. Her family had no couch, and no house. Her parents, siblings and grandmother lived in a garage with mattresses on the floor. There was no other furniture... [One staff member noted that] parents of sick children often ask which of two prescription items they should get because they could not afford both... While it was inappropriate to transport sick children to hospital on buses and trains many low-income parents have no choice... There are calls of desperation... "In the last two days I've had two phone calls from mothers saying baby is sick, they have no money to get baby to the GP and no money to get a taxi to the hospital."

...DOCTORS told a desperate mother the only way to guarantee the care her severely epileptic and intellectually handicapped daughter needed was to abandon her in a hospital emergency department... Where once [the 12-year-old girl] may have been admitted to the now-defunct Mangere Hospital for the vital respite care her mother needs, she is now unsuitable for the alternatives – too mobile for... [a specialised hospital on the] North Shore... and too medically sick for the IHC... She has hundreds of fits a day... has behavioural problems exacerbated by medication and is aggressive and hyperactive, sometimes sleeping for just three hours a day. Until last year, when respite care was administered by Income Support, [the mother] was entitled to 28 days' fulltime help... but now health authorities assess the needs in each case and contract the job to caregivers... Because few caregivers are adequately trained to care for children such as [her daughter, the mother] has had little respite in the last 10 years... In July, when [the mother] became severely ill with flu and was admitted to hospital, six days of 24-hour home care was arranged... "Then the agency supplying the caregivers said they had blown their budget and no more care would be available. If I wanted caregivers, I had to find them and pay for them out of my 28 days' carer support." When [the girl's condition worsened, the mother] tried to have her admitted to the Starship but the hospital could not guarantee 24-hour supervision because of a "nursing crisis". "I knew [my daughter] wouldn't remain in hospital unsupervised for more than five minutes." A week later, a psychiatrist and social worker told an exhausted [mother] the only way to force the system to look after [the girl] was to take her to the hospital and leave her there... Now [the girl] has spent the past six weeks in a \$500-a-day bed in [the] Starship Hospital while health authorities try to organise help so her mother... can bring her home... [The mother] wants to look after [the girl] at home but only with a specialist package of help, including respite care. North Health last week hired Spectrum Care, an agency for people with intellectual disability, in a \$55,000 annual contract. But [the mother] said the RHA was still unable to say where respite care could be provided away from the family home. [Another mother said she and other friends with severely disabled children had discussed abandoning them at the Starship just to get some breathing space. Her daughter has cerebral palsy and other medical problems and can go without sleep for days on end. She gets 28 days respite care a year but says carers are paid just \$71 for 24 hours of intensive work so it is hard to find anyone prepared to take on her daughter.]

...Midland Health has introduced new guidelines that cut the number of days off it gives people who care for disabled people at home. The new scheme removes a standard 28-day annual entitlement for respite care, and replaces it with priority levels ranging from 10 days to a flexible number.]

...In 1975 a significant piece of legislation was passed in N[Z] – the Disabled Person's Community Welfare Act[– which]... gave families an entitlement to 28 days' respite care... Under this act the Government acknowledged that families of people with disabilities lived lives that were often stressful and outside the normal sphere of parent commitment. Family members who are disabled take more time, more family resources, more energy and more family commitment than a typical family member... To families, this piece of legislation was a way of valuing what we did for our family members. We did not have to ask for handouts, we did not have to justify why we needed respite care; it was there for us when we needed it. As a parent of a 16-year-old with Downs syndrome I valued that right to plan where our son could go for a few days so the family could have a break. It was important that we as a family could pay the caregiver a realistic amount of money to cover that cost... The state had created a right, an entitlement, for families. It seemed inviolable. Families asked themselves: "Surely no government will take this right away from us?" Enter the 1990s – the time of accountability, the time of the individual, the era of so-called choice and competition. Early on in the decade the Minister of Health... had endeavoured to make respite care means tested. Families wrote letters, marched, [and] collared members of Parliament... The minister publicly backed down on this issue. We thought we had won. But the Government regrouped and led another charge – this one is not upfront. It is a wily, mean-spirited move to make an entitlement into a subsidy... North Health has decided on a method of delivery after what it calls a round of "consultation" with the public. The rate for caring for a family member with a disability has been adjusted so that a close family member can now be paid \$60 a day, and institutional carers such as IHC and CCS are paid \$71.84... Auckland families can now go to one of 13 needs assessment agencies, have their needs assessed and then a request for days of respite care will be sought from North Health by the provider on behalf of the family. It all sounds so straightforward – until the sums are done. North Health has a budget of \$6.1 million a year. It has 7200 people with disabilities for whom to provide service. At \$60 a day this means that those people can only get 14 days' respite care. The message to families is very clear: the state – and by definition the people of N[Z] – no longer value what we are doing.

...You don't have to be brilliant, beautiful, or very bad to make a major impact in many peoples' lives... Born with Down syndrome... Nigel Simmons... struggled with severe mental and physical limitations until his death 12 days ago... aged 39... following complications... [after having] corrective surgery... for... a defective heart... But his simple courage, his determination and his joy in living have been a great inspiration and his mourners are many... When Nigel was a child [his parents] were told their son would never learn to read or write; they did not believe it. "My wife and I had both been teachers in England of what they call the 'educationally subnormal.' We knew what could be achieved." Attending a special school in Dunedin, Nigel was the first child in N[Z] with Down syndrome to be taught to read and write... Until just before his death, Nigel worked one morning a week each in the Remuera and Panmure libraries. He was also employed three-and-a-half days a week at Taniwha Enterprises, a company employing disabled people to do production work... "He was a delight, and one of the very few people in the workshop who lived a 'normal' life. Nigel was right out there in the community, challenging the prejudices so many people have against those with mental disabilities." He was a familiar figure around the streets of Remuera through his many years delivering community newspapers and pamphlets. This kept him fit and financed trips to England with his mother, and to Rarotonga and A[US] as part of an organised group. It also helped to finance the purchase of a small block of land in the Kaipara where he had plans to build a small cottage for his nephews.

...A REVAMPED home care scheme for the disabled, which clocks jobs... down to the minute, is being described as "market-driven madness". The doctrine was introduced by the Southern R[HA] on September 1 after a "phenomenal growth" in the demand for help for the disabled... – up... 200% for domestic care... and... 1000% for personal care... Personal care – bathing, toileting, grooming, feeding – has been "averaged" at four hours a week for each client. Domestic assistance – cleaning, laundry, maintenance – is 2.5 hours a week. Precise times have been allocated for tasks, such as 20 minutes for toileting, 15 minutes for dressing, 30 minutes to assist with meals and 10 minutes to transfer a patient from a bed to a chair... It takes five minutes each week to change a light bulb... The SRHA has warned that because of budget constraints, clients may get only half – or even less – of the hours they are assessed as needing. They could, however, pay for extra hours themselves... Families are able to offer the carer the maximum sum of \$2.50 an hour before tax... [The] SRHA communications co-ordinator... said... \$5 million has gone into the... scheme[s]... budget this year, boosting it to \$17.6 million... [T]he Central R[HA]... said \$16 million was to be spent on home care this year, up from \$4.7 million in 1993. North Health is spending \$26.4 million on personal, home and respite care, up \$3 million on last year.

...[Daffodil Day raised \$530,000 in Auckland and Northland for the Cancer Society. Last Friday's street appeal brought in \$10,000 more than last year. The national total will be released today.] Last year, 'Daffodil Day raised more than \$2 million, the society says.')

...Saturday night's fashion show to raise money for the Starship hospital's bone marrow transplant unit is expected to have raised \$25,000... [The show was] one of several moves by the Child Cancer Foundation's northern division to fulfill its pledge to raise half of the \$400,000 [needed. By the way, a recent article said that 'more children and adults overdose on paracetamol than any other drug.' A paracetamol manufacturer has responded by 'saying the extent of paracetamol overdosing has been exaggerated. Pharmacists are calling for tougher controls on the sale of the over-the-counter painkiller, following recent moves by the British Government to lower the numbers of accidental and deliberate overdoses. In Britain there is a limit now on how many packets may be sold at one time to one customer, and labels must have health warnings. But paracetamol was safe when taken in the recommended dose, SmithKline Beecham, which makes the paracetamol Panadol, said yesterday. Overdosing on the painkiller was extremely rare, and accidental poisoning of children happened almost solely with liquid preparations, which were sold only by pharmacies, the company's medical director

said. Liquid paracetamol sold over the counter had safety caps, but that was not always the case when dispensed by chemists, said the director of the Starship hospital's child safety service Safekids'...]

According to the latest N[Z] *Medical Journal*, more than a third of surveyed medical staff at Auckland[']s Starship] Children's Hospital either did not know safe doses for the drug... paracetamol... or over-estimated the safety limits... A two-month survey at the hospital found 140 out of 823 prescriptions for children older than four months were for toxic doses of the drug. Only 3% of the drugs were administered because most prescriptions specified the drug was to be given as required... But four times newborns were prescribed doses at the limit of safety for older children... Paracetamol[, which] is widely available... is in the top 10 medicines most commonly associated with accidental poisoning in children. Pharmacists have recently failed in a bid to ban it from supermarket sale...

Auckland's Starship... hospital has rejected claims that its doctors are prescribing toxic levels of paracetamol to children... "The... Starship compares favourably with international practice." Referring to the... claim that more than one-third of medical staff at the hospital did not know safe dosages for the drug or overestimated the safety limits[, the]... hospital's clinical director of the paediatric pain management unit... said the study referred to findings on newborns, for which there were no international guidelines... "In fact, there is very little data about safe doses of paracetamol for children, particularly those under the age of three months..." ...The... report... [stated] that "53 out of 80 medical staff thought toxic levels of the drug were safe in children aged four months and older." Levels occurred over time, whereas doses were measured at a given point in time, [the clinical director] said. "It takes a week for paracetamol to accumulate to cause liver and kidney damage and the daily checks by pharmacists on prescriptions at Starship are carried out to prevent any such occurrences."

...N[Z] children have the highest rate of asthma in the world... A study... which measured asthma in 500,000 children in nearly 50 countries... [-] the largest international collaborative study on childhood asthma... [-] found the... rates... in places like... North America, A[US] and Britain were... [also] well ahead of other countries... While a number of different questions were used to measure the incidence, the study found one in every three Kiwi kids under seven had had an episode of wheezing... [and, although NZ]'s asthma death rate was now down to 0.5 for every 100,000 from a peak of four in 1980, the incidence of the condition was rising... A sixth of the country's drug bill was now spent on asthma medication... [T]he study was important because it used the same criteria worldwide and should trigger further research into the cause... Other countries' figures indicated increasing asthma rates with increasing affluence... [The] study... said a range of factors... [-] cigarette smoking, diet, air pollution involving farm fertilisers and pesticides, housing materials, fungi and possibly changing climate... [-] could be responsible for levels of the disease in the West. [● Another NZ study found 'babies born with a larger head are three times more likely to get asthma. Researchers intend to see if mothers' diets affect baby head sizes.' 'Overseas research suggests the practice of giving antibiotics to babies is a cause as it prevents their immune system from developing naturally.']

...A battle over asthma fundraising has left research the poorer and confused many would-be donors. Jeans Day yesterday was run by the Child Health Research Foundation... But it came under attack last week from the Asthma Foundation which was unhappy with how funds raised from the inaugural Jeans Day last year were spent... [A] spokesman for the Asthma Foundation... said it was unacceptable that only 25[%] of the funds raised last year were actually spent on asthma research... Hundreds of people had called the foundation yesterday asking whether they should give money... Many people chose to make donations directly to the foundation... [The] project manager for Jeans Day, said that although it would be three weeks before yesterday's total was known, he felt the campaign had suffered as a result... [He] said that high start-up costs accounted for the poor profit margin last year but it would improve this year. For example, Jeans Day organisers were able to re-use last year's television commercial and leftover stocks of badges which would lower the cost of the campaign[. ● Asthma is 'estimated to affect 20% of NZ's population (in comparison, the rates for the US and AUS are 6 and 11%' respectively)]...

Deafness is becoming a bigger problem... [A]bout three N[Z] children in every 1000 needed hearing aids, similar to rates in A[US] and the U[S]. The worry was that children... are suffering problems for longer before being noticed... and given help. [Although 'it is possible to check for deafness soon after birth', t]he average age at which hearing loss is identified has climbed to two and a half years... Nationally, the goal is to identify children with hearing problems by the age of six months... [T]he squeeze on health dollars was likely to be a major cause of worsening problems. "The policy is that there should be at-risk screening of all babies but... it's not happening... ['Only infants considered a risk are currently given hearing tests.'] Plunket is not continuing to see children for as long as they used to[, so]... maybe the continuity of care and general surveillance is not being done as well as it was,"... the National Audiology Centre... said.

...[in 1907 the Plunket Society was established following the foundation of the Royal NZ Society for the Health of Women and Children. Hospitals were subsequently established throughout the country to help mothers and their babies, and nurses were trained for work in these hospitals and within most NZ communities', usually via family centres. Today these] centres are under threat... Management proposals to rein-in spending... [to overcome] a \$90,000 cash shortfall... [in the] northern region... include closing one or two of the region's eight... centres, cutting staff or reducing their hours... The proposals... come hard on the heels of... closures further south. Hamilton, Gisborne, New Plymouth and Tauranga centres shut their doors in April to cope with a \$250,000 deficit. The... centre in Hamilton has since reopened after a private laboratory, Medlab, donated \$35,000. - 1996

Women and children have come a poor second to the economy, business and the market over the past decade, the Plunket Society conference in Auckland was told last night. Many supports and benefits that N[Z] women had used to enable them to raise healthy children had been unravelled... "The state is only interested in families when they fail. It does little to ensure that families succeed. In fact, many policies have had the effect of dooming a greater number of parents to failure by eroding their security and incomes." Advocates of the free market had tried to force families to adopt business values and operate as business units, in competition with other families. Children had been reduced to the personal property of their parents and acquiring them was like acquiring a car. Plunket had suffered through the ideology of the free-market state... The organisation[that has helped raise 'over 93% of NZ babies' i]s needed more than ever, even though surviving under the health reforms might seem one of the toughest calls it had faced.

...The Plunket 24-hour parent helpline is being cut back... to 18 hours a day. Plunket[']s president... said the society regretted the decision, but it could not secure committed funding for a full day. "Plunket requires \$850,000 per year to provide a 24-hour service. We have relied on bequests and donations for the service and these have been insufficient to meet the full cost." ...Plunket has already had to cut back on the number of home visits it can provide new mothers.

...Only 8% of... Plunket Line... callers [have managed to get] through on their first attempt... [since the] free advice line... was cut from 24 hours to 16 hours a day and... staff were reduced from five to... two or three nurses on duty at any one time... Most[callers] try five or six times before they get through and about 40% of callers... never get through.

...Plunket Line, which has given free advice... [that] helped thousands of parents of young children in the middle of nowhere has been axed... The chief executive of Plunket... said the helpline had been a success and the decision to close it was a sad one to have to make, but the society had exhausted all financial avenues... [He] said the loss of the line would affect the future health of many N[Z]ers. "It shows once again the lack of willingness by the Government to fund preventive services which can and do make such a difference to child health." ...In the year to June 30, the 0800 number received about 83,000 calls from parents worried about illness or problems with feeding, sleeping or behaviour; parents seeking nutritional advice; and parents reporting cases of suspected child abuse... "The line was set up with the expectation that we might get 50 calls a

day... Instead we got upwards of 250 calls a day..." ...the society considered replacing the line with an 0900 number, but that did not meet Plunket's philosophy... [A]bout 17,000 callers a year are referred to their GPs, preventing problems from reaching the stage of needing more expensive care...

The Commissioner for Children has described the looming end of the Plunket Line as tragic... especially as infant mortality and child abuse levels in N[Z] were unacceptably high. A rally for people to show their support for the service will be held in the grounds of Parliament today... [In related news, t]he Cot Death Association has blamed a rival researcher for a 25[%] dive in takings from its Red Nose Day... [The researcher,] who before last year's Red Nose Day put a large advertisement in the N[Z] *Herald* questioning the work of the association... has long been at loggerheads with... [it. The researcher, who] believes cot death is caused by toxic fumes from fungi reacting with chemicals in mattresses... acknowledged that he had probably caused the Red Nose Day takings to fall. "I told... [the association's chairman that] I will do whatever I can to destroy Red Nose Day... The price of peace and co-operation is that I expect the association to endorse my work or maintain a benign attitude." ...Last year, the association commissioned an Auckland University lecturer to begin studying... [the researcher's] findings. The association chairman... said yesterday that the investigations were continuing... "However... [m]illions of pounds have been spent trying to substantiate these claims in the U[K], but they have been unable to..."... The association said yesterday that[of the] \$750,000... collected last year, down from just under \$1 million in 1995... almost 60[%] will go to education and research. About \$255,000 will be spent on costs such as distribution of the funds and Red Nose Day merchandise.

...The Red Cross[– 'an international organisation set up, at the instigation of the Swiss philanthropist Henri Dunant, according to the Geneva Convention of 1864 for the treatment of the sick and wounded in war and those suffering by large-scale natural disasters (nowadays it also undertakes first-aid and welfare work as well as participating in relief work abroad') – has announced that it] raised \$40,000 from the sale of 46,500 roses at shopping centres and hospitals in the northern region... [The announcement coincided with the launch of the NZ] Crippled Children's Society [annual appeal. The society, which began]... life over 60 years ago... primarily to help young people with polio[, now]... helps over 6,000 children and adults with a wide range of physical disabilities... [Its] core services include early childhood programmes, education, information, accommodation, job training, lobbying, disability awareness, recreation and disability parking [schemes]... To continue its work, NZ CCS needs to raise more than \$8 million every year from the public... [Incidentally, a]bout 200 parents and children marched on Parliament yesterday... [to put] pressure on the Government to save the Plunket helpline[– a protest which] is doomed to fail. Health officials last night ruled out funding the service, due to close next month, because of tight budgets. A... Health... spokeswoman... said money had to go on services that led to most gain – and that did not include the helpline. [She] said that instead... parents could ring a 24-hour medical clinic, go to their local doctor or take their child to a hospital... [Furthermore, the Coalition Government's *pledge of free*] doctor visits for under 6-year-olds[would mean] that cost should no longer be a barrier.

...The Minister of Health... plans to... [introduce] free doctor visits and prescriptions for children aged five and under... [He is] confident of receiving the backing of most [GPs] for the new child health policy... But he acknowledged pockets of resistance, and that family doctors would want to maintain some control of their fee structures... [S]ome GPs could... have a problem with the final fee agreed with the Government. In Auckland... fees for children ranged from \$25 to \$45 but could go higher for longer consultations... with discounts for lower income families with a community services card... With a card the[pre-schooler's] fee could vary from no charge to \$9... [F]or over-5s... the fees... [for] cardholders... ranged from about \$9 to \$15... [However, under] the new system, N[Z] families will still pay more for their medical care than Britons and A[US]ns. Both countries pay a specific health tax – Medicare in A[US], national insurance in Britain – which funds a free, or largely free, service for both adults and children. A[US]ns can be liable for doctors' bills in some expensive cases but can claim back 85[%] of the costs. In the U[S], families rely on private insurance, which covers only about two-thirds of Americans, to pay their hefty doctors' bills. [• '12.9% of USers weren't covered by health insurance in 1987; by 1994 – when the uncovered figure for people 65 years and over was 0.9% compared with 33.7% for Hispanics – the average figure had risen to 15.2%.' In the same year, there was 'no charge for a visit to a doctor in Britain; it cost \$33.00 in NZ; \$NZ4.38 in AUS; and \$NZ97.17 in the US.'

...a healthcare plan in Poland has found 11,000 dead people on its patient register, costing it \$NZ269,438 since the beginning of the year. An official said the number of people on the register for the Podlase region had grown by 5000 since January, with several of them even managing to change their primary care doctor.'

...America's Medicare system, which subsidises health care for the elderly, has been much in the news for waste and fraud. Now it appears that the system also has a less obvious fault: it redistributes money from the poor to the rich. At first glance, Medicare seems quite progressive. Every American is entitled to [t]he same health benefits on reaching the age of 65, yet the system is financed with taxes that fall disproportionately on the wealthy. It would appear that the rich bring more to the table, and then everyone shares equally. Not exactly, says a recent study by... Stanford University, and... Dartmouth College. Using a sample of 1.5 million Americans eligible for Medicare in 1990, [the study's authors compared]... lifetime Medicare taxes paid by different income groups with their projected lifetime benefits. True, the wealthy bring more to the table; but then they gobble up more than they brought. For example, the authors reckon that, among Americans born in 1925, the richest 10[%] will collect \$1000 more in Medicare benefits than the poorest 10[%]. How can this be? First, wealthy Americans live longer. For men aged between 65 and 69, the mortality risk for the wealthiest decile of the population is 40[%] lower than the risk for the poorest decile. So, by cheating death, the rich collect benefits longer. At the same time, the wealthy use the system more intensively. Among individuals over 85, the wealthiest 10[%] of the population claim nearly 40[%] more in Medicare expenditures than the poorest 10[%]. When the analysis is extended to younger workers, who will be more affected by recent changes in Medicare financing, the system becomes only slightly more progressive... Medicare still has much to offer the elderly poor. Many would have no health insurance without it. Before the creation of Medicare, over 60[%] of elderly households in the bottom third of the income distribution were uninsured. Yet it looks as if Medicare is not welfare, at least not for the poor. [Speaking of health insurance, 'when a 22-year-old Aucklander left for an extended overseas holiday, he decided that travel insurance was an expense he didn't need. But six months later, while hitch-hiking in Corfu, he broke his neck and injured his spine in a car accident. Had the partially paralysed Aucklander taken out holiday cover, the insurance company's international assistance network would have assessed his medical needs quickly and ensured the most appropriate treatment. This would have included transfer to a major or specialist hospital. Then, when doctors felt he was ready, he would have been flown home, all at no personal cost. Instead, his father, a sickness beneficiary, and mother had to pay \$46,000 – the amount lent to them by the NZ Ministry of External Relations and Trade to cover his medical and repatriation costs. Thanks to donations from sympathizers and parishioners at their church in Massey, they've paid back \$34,000, but are struggling to find the rest. "Our son's story should be a warning to all Kiwis going overseas," says his mother. Some 760,000 NZers made overseas journeys last year, but at least 150,000 of them did so without travel cover, suggesting that many people take a risk that they won't need insurance while abroad. Statistically, chance may favour them: just one person in nine makes a holiday-insurance claim. Half the number of claims arise from stolen, lost or damaged baggage, 30% are for medical expenses, and the rest are for holiday cancellations, personal liability, death and disability payments, and the financial failure of travel companies. Costs of holiday insurance vary widely. For three weeks in AUS, premiums range from \$60 to \$80 per person, and for worldwide cover from \$170 to \$200. These rates exclude the riskier activities, such as mountaineering, scuba-diving and parachuting. As a minimum, your policy should provide medical expenses of \$200,000 in AUS and the South Pacific, or \$1 million for the rest of the world; personal liability cover of \$2 million; up to \$40,000 for the loss of personal belongings; \$750 for immediate needs if baggage is delayed; and at least \$200 for out-of-pocket expenses in cases of aircraft delay of more than six hours. While on holiday with his wife and four children in California during 1991, a 36-year-old Hamilton real-

estate agent collapsed and was rushed to a Los Angeles hospital. A team of neurosurgeons performed five operations over the next 48 days, saving his life. The hospital bill came to \$500,000, including a \$35,000 fee for x-rays. Luckily the family had taken out a comprehensive travel policy at the last minute because of the children. The insurers promptly paid the hospital and bills for the wife and children's hotel accommodation, phone calls and food. Also, the company's international assistance network regularly rang the wife to ask if she needed further help.'

...one of the hottest ideas on the US business scene, "customer care outsourcing" – handling customer inquiries in everyday parlance – is spreading to NZ. In April, a US leader in the industry, TeleTech, bought Access 24, a Sydney-based customer care group begun by a NZer. While travelling, the Aucklander saw a need for travellers dealing with health emergencies to be able to get expert advice through a 24-hour telephone support system. This led him to form a telephone call centre manned by qualified nurses and doctors, in AUS, NZ and London. People buying medical insurance before going overseas were given the centre's telephone number. The network arranged to fly about 500 people who became sick overseas home to AUS and NZ each year. TeleTech handles about 300,000 calls a day in the US and expected to double its number of employees to about 6000 this year to maintain its growth.' ■ 'The chief executive of Southern Cross has unexpectedly resigned. His sudden departure follows weeks of damaging publicity over delays in processing medical insurance claims and comes after a series of *Herald* articles about the firm's problems. The country's largest health insurer has been beset by disgruntled clients who have waited weeks, and sometimes months, for their claims to be settled. Private hospital operators and medical specialists have also complained of being out of pocket. The problems arose after Southern Cross' controversial purchase of a multimillion-dollar computer system last year. The chief executive took responsibility for the delays and admitted that the company had failed to hire and train enough staff to handle the switch to the new system. Yesterday, the chairman of the Southern Cross board denied that the chief executive was pushed or that there was any serious falling out between the parties.'

...From where the] former chairman of the Business Roundtable... who [recently] stepped up to chairman of Lion Nathan... sits, N[Z]ers are unrealistic in their demands. He describes how, when... [his] charming Tahitian/French... [wife] was rushed into hospital in Los Angeles to investigate a possible heart attack, it cost \$20,000 for two nights. "And the doctor's bills haven't even arrived yet." His point is not that the American health system is better, but rather that by charging upfront people get a realistic idea of what these procedures cost, whether they're paid privately or out of public money. "N[Z]ers want the world's best health service but refuse to recognise that the funds needed to provide it can only come from a competitive, world-class, business sector..."

...Too many N[Z]ers are in danger of being brainwashed into accepting a misdiagnosis of, and treatment for, troubles in their health system. Good health is not the automatic outcome of dollar injections. A recent American study compared the financial inputs and outcomes of the Canadian, Cuban and U[S] systems. Hardly unexpectedly, the U[S] easily came top for spending and Cuba bottom. The big shock for Americans on the health delivery side, though, was that the Cubans beat them. Let's take a personal example... of a well-insured couple... [from] Washington DC... The woman had an operation and was soon discharged from the topline hospital. But not for long. She became a one-woman epidemic of emergency dashes to hospital, in great agony and violent sickness. And regular swift discharges back home. Clearly she was considered the problem; it could not be anything the highly paid "experts" – for all their elaborate equipment – had or had not done. Despair and chance eventually conspired to take the couple to the door of another doctor, who quickly... discovered... that the other surgeon experts had left things so twisted that the woman was vomiting her own faeces. He treated her – on the next floor up in the same hospital. The dollar cost of all the coming-and-going blew out to the best part of \$100,000. It was kept as low as that because the couple resisted some charges, even though they were not paying the bill. For instance, two in the initial medical team each claimed \$700 or so for the same service – simply admitting the woman to hospital. It was not dollars that brought her return to health. It was brains. The couple did consider litigation, but didn't pursue it: they reckon life had so many more better things for them to do. Their next-door neighbour is another story. We missed saying goodbye to her because the dear little 84-year-old had flown off to care for her son who was being discharged from hospital because his cocktail of sicknesses, headed by cancer, were either beyond treatment or not yet bad enough to warrant attention. He was clearly going home to die. His insurance, for all that he had paid, didn't run to hospice care. Whose health system isn't sick? Friends at home here chuckle about the tale of a funeral director driving past a bowling green crowded with busy players and commenting... "I see our holding pen is still full." One could ask as a footnote: How many of those people were enjoying themselves thanks to happy hip or knee replacements, successful heart, stroke and kidney treatments..."

...Children have long missed out on health spending because politicians have pandered to powerful lobby groups... says the Associate Minister of Health... He said the elderly, in the form of Grey Power, had ensured... that money went to cutting waiting lists. "That may be justified because we have a ballooning older age group, but it shouldn't be at the expense of children's health." Claims that children had missed out on money because they did not vote had "an element of truth." Politicians had been too easily swayed, he said... The result was children filling hospital beds and high child death rates... [T]he case of a Christchurch toddler waiting eight months to see a specialist for glue ear was further proof child health needed more resources... The 85-and-over age group has more than 10 times as much spent on it (per person) than the... five to 14 age group. ['Children make up 24% of the NZ population but receive only 7% of the health budget.']

...An unrelenting tide of sick children going to hospital is seriously threatening strained budgets... Middlemore Hospital has... admitted... [almost] 500 children... compared with about 290 in the same month last year... [M]any in the health sector argue that poor families are... missing out on health care because of wider financial difficulties.

...Financial barriers to health care for people in lower socio-economic groups have not been taken seriously in N[Z]. An Auckland Medical School senior lecturer... said yesterday that the country was not looking at social policies like housing and benefits and how they affected health care. [The lecturer] was speaking to delegates of the Cardiac Society of A[US and NZ] in Rotorua.

...Economic change has hit the health of N[Z]'s poor hard, says... Green Lane Hospital's... coronary care director, w[ho w]as speaking at the annual meeting of the Cardiac Society of A[US and NZ]. He said the... main causes of disease were social and political and it followed that the solutions should also be social and political... Politics and medicine could not be separated... Time would tell, he said, if... [NZ's] lower socio-economic... communities reaped the benefits of programmes [such as the proposed 'entitlement to eight free checkups from 6 weeks to starting school.']

...Free doctors visits for children under six are still not guaranteed, despite the fanfare...

The coalition pledge of free doctors' visits for children aged five and under still relies on GPs agreeing to waive their fees for these children. This in turn depends on GPs accepting a higher Government subsidy in compensation and any attached conditions, which are both still under negotiation. Last night both sides appeared to be close on the level of subsidy... and on guarantees of good service... Doctors will have to meet new national standards – such as guaranteeing an after-hours service – to get the full child subsidy... [V]irtually all GPs already provided an after-hours' service to their patients... North Health's contracts negotiations manager... said increasing the subsidy to \$30 a child would cost \$10 million in the... region, plus about \$5 million for free prescriptions. It was therefore important for North Health to make sure patients were receiving a good service for the extra money... Experience testifies that services invariably expand in response to a higher subsidy and doctors soon reinstate a charge if they can... [so be prepared] for another round of medical inflation.

...DOCTORS have warned free health care for children under six may not happen if the Government fails to fund the consultations properly... [A]t stake is whether after-hours care consultations will be free... [The] GP Association chairman... said a study carried out by the group revealed GPs believed a reasonable minimum fee would be \$35 a head, and this would not include late-night call-outs. "We would be most uncomfortable with anything less than that... We hope to offer a situation where over 90% of care (to children under six) is free. What the Government said was it

wanted a simple arrangement. We can't necessarily cater for every situation." ...The association fears the RHA team could offer as little as \$27 a consultation... [The] RHA free child health negotiations spokesman... said the Government wanted to pay a reasonable rate for consultations. However, the \$35 suggested by the association was "substantially above the average fee listed by most GPs." ...The RHA figure was likely to be related to a study that showed the average cost of a consultation for children was \$29.50... The association's own survey had shown 30% of doctors didn't charge above the current subsidies... for children under five... [and] for community service cardholders.

...Parents may need to change their children's doctors if they want to qualify for the free visits... Doctors and the [RHAs] are at odds over the maximum cost of each consultation... and it appears unlikely all doctors will sign up for the deal. But the chairman of the Medical Association... believed all children would be able to find a doctor prepared to treat them for \$32.50 or less during normal business hours. That is the amount being offered by the authorities... However, the GPs say it is not enough to cover the fees of doctors with high overheads in central city locations, or after hours consultations and house calls... "It's a tricky exercise to pick a figure which is going to cover 100[% of cases] and still have a certain amount of equity about the whole thing." ...[the chairman] said the Government caused the problem by promising free doctor visits and it was now worried about its credibility. A sensible option would be to set the Government payment at a reasonable level and let those who wanted to go to expensive doctors pay the difference... A spokesman for the Minister of Health... said the Government remained committed to the free-visit policy. "My personal view is that the GPs are just trying a bit of posturing," she said. The Asthma Foundation issued a statement calling for the Government and GPs to "get off their high horses" and fulfill the promise. The foundation believed \$32.50 was sufficient for normal hours... and \$40 should be offered for after-hours consultations, based on a survey of Doctors' charges by the Consumers Institute.

...On school holidays as a child, I was sometimes allowed to get in the way at my father's busy general practice in Hamilton... Patients might pause at the desk on their way out with purse held inquiringly open but they would seldom be asked to supplement the seven shillings and sixpence of the... General Medical Services (GMS) benefit – the Government's payment in respect of each consultation... Dad's commitment to free health care was a grumbling one: when he got a plumber's bill he always announced that his fees were going up... For all his spluttering, those fees hardly ever went up... It's these memories that I'm keen to put in front of... [the] chairman of the General Practitioners' Association... [He] has the same memories. "My father was a GP, too," he says, between mouthfuls of a five-minute lunch. "It was in Manurewa and most people didn't pay anything then either." Free health care is a misty memory now, [he] says... because the technology and pharmaceuticals available to doctors are so much more sophisticated. But, he adds, primary care is better as a result... Barely 10 minutes before afternoon surgery is due to start, the waiting room is finally clear of the morning appointments and the doctor sits down to field the suggestion that the public might see him and his colleagues as rich and greedy. After all, I suggest, the possibility of free care for the littlies is foundering on \$2.50 – the difference between the \$32.50 offered and the \$35 he says most of his members would settle for. But [he] says the fee should be "about \$60." His group practice cost \$1 million to set up... "Doctors don't pluck that sort of money out of the air. They're small businessmen and they have to beg and borrow and service loans like any other small business." He begins a 12-hour day at 7.30 most mornings and while he does have the famous half-day Wednesday, "I haven't played golf for years. The afternoon disappears in paperwork." [He] rarely does housecalls these days; most patients prefer to come to the surgery where staff and technical resources mean they get better treatment. When he does, the fee is meant to be around \$70 but, he explains, those who need a home visit almost invariably can't get to surgery so it's rarely charged in full. By contrast, the glazier who came late on a weekday afternoon to repair a window broken by his son's cricket ball charged a \$110 callout fee. "Doctors have lost plenty of income," he says. "Some of the specialists earn a fortune but plenty of GPs struggle."

...The Government seems to have little chance of delivering its key promise of free healthcare for children under six. In a compromise solution announced yesterday, [GPs] will be paid \$32.50 for each child they see in normal hours... But the General Practitioners Association predicted that only two-thirds of GPs would provide free visits for this subsidy... A... survey this week showed it usually cost between \$20 and \$30 to take a child to the doctor in Epsom, St Heliers and Queen St in Auckland... [T]he top fees... would probably drop... to \$12 because of the new... subsidy... But the survey also showed that in Otara and Panmure most children could already see a doctor for no charge. The new subsidy meant these doctors would receive up to \$17.50 extra for each child.

...Free doctors' visits for children under six could force cuts... to other health services in Auckland and Northland. The free visits... would cost about \$6.6 million more than the Government is providing... [according to] North Health figures...

Health officials are clamping down on doctors overclaiming for expenses, estimated at about \$30 million a year for Auckland and Northland alone. Some [GPs] in the upper North Island are claiming... \$700,000 a year each in Government subsidies for seeing low-income adult patients and children... The average paid to a doctor in subsidy claims was \$60,000 a year. Over-claiming extended to laboratory tests, or doctors asking patients back for minor complaints... The North Health general manager of primary care... said it amounted to fraud, ethically... But the chairman of the General Practitioners Association... described North Health's figures as exaggerated and pointed to a flawed claiming system... [In reply, the general manager] said North Health had already recovered more than \$600,000 after investigating a number of suspicious cases. It began focusing on inappropriate claiming about two years ago... Health Benefits Ltd, which pays subsidies to doctors in the rest of the country, estimates the overclaiming "risk" at more than \$50 million a year... [Its] general manager... said only a small percentage of that would be outright criminal fraud. Many cases would stem from doctors being lenient to those whose community services cards had expired.

...Low-income patients may have to prove their cash-strapped status before receiving Government-subsidised medical care. The Auditor-General... has suggested that doctors "be required to sight and record" patients' community services cards so others do not get subsidised drugs that only cardholders are entitled to... [Health Benefits] estimates that 20[%] of claims... are invalid. This translates to about \$21 million a year... But... [the] Auditor-General... said making patients show their... cards to doctors was unlikely to save the Government money. Only 75[%] of those eligible for cards had one, and the suggested crackdown would probably result in more people formally obtaining one.

...The National Community Services Card Centre believes some employees are unaware they are entitled to the community services card... The qualifying income limits... are: Single person sharing accommodation, \$17,769; Single person living alone, \$18,846; Family of two (either a couple or a sole parent with a child), \$28,000; three (couple with one child or a sole parent with two children), \$32,846... six, \$47,385. Income limits are before tax and, where there is more than one earner, mean a family's combined income... Those eligible to hold the card pay, for each visit to a doctor, \$15 less an adult and \$20 a dependent child over the age of 6... and are charged a maximum of \$3 for each government prescription charge.

...The very poor are still not going to the doctor... [according to a] survey... It was "extraordinary" but many... families had been unaware that [GP] charges for under sixes had been scrapped and did not know they were entitled to a community services card... the Auckland City Mission... missionary... said... "I can't stand there and say it's disgusting that there's not medical care there for these people, but they have been put in a position where they have lost the will to get there and to find out what is there for them..." ...In a "significant" number of cases children's symptoms had been ignored in the hope they would go away but instead the children turned out to be seriously ill with meningitis. The problem crossed ethnic boundaries and was a symptom of exhausted, distraught families who were never able to make ends meet... [E]ven the... prescription... charge of \$3 was unaffordable.

...A surge in spending at chemists in July may have been caused in part by the introduction of free prescriptions for children under six, say pharmacists... Retail spending figures released this week show that pharmacy sales were up 23[%]... from the same month last year.

...Coalition ministers yesterday affirmed that free medical care for children under six will remain, despite public questioning of the scheme by... [the PM. But the PM] told the *N[Z] Herald* that he was not seeking to relitigate it but had raised it to “highlight” some of the unintended side-effects created by universal access... He gave as examples the “tiny tot” who was prescribed a quart bottle of cough mixture and the wealthy couple who took their three children for a free health check before taking them on holiday overseas... He has given a series of speeches over recent weeks advocating more targeting and more private provision in both health and education. [Meanwhile, ‘hundreds of college students have been forced to travel long distances for free dental care because local dentists have turned their backs on “inadequate” Government subsidies. Teenagers in two towns in the Rodney district have been unable to get free dental treatment locally for over a year. Young people in Warkworth and Wellsford must travel to Orewa or Whangarei for the free service, pay for local treatment or go with their teeth unchecked. About 1700 teenagers in the towns were affected. The gap in services also affects primary school children needing emergency care out of school dental clinic hours. A dentist in Warkworth for 15 years said he and his surgery partner resigned from the scheme a year ago because they could not afford to treat the 1000 children on their books on the subsidies without increasing fees for adult patients. While they could run at a loss for routine examinations they could not sustain the losses for higher levels of treatment which could climb to \$100 a patient. North Health pays dentists about \$37 for check-ups, with payments for additional work such as fillings and extractions. About 250 dentists were still offering subsidised care in the Auckland and Northland region’.]

...Health officials fear that universal free[dental] treatment for secondary school students will become just a memory unless the Government pays dentists an extra \$6.8 million a year. Briefing papers to the Minister of Health... say the additional money would be the best option for saving the scheme... Many dentists, fed up with fighting the Government year after year to cover costs, have already pulled out... About 100 in Auckland and Northland had quit last year and eight out of nine dentists had walked out in Manurewa... Others threaten to follow suit... Teenagers... get free dental treatment from the time they leave primary school (where a free service should be provided) until the age of 18, as long as they are not working... Figures... suggest that only about half of the eligible teenagers in the wider Auckland and Wellington regions use the service... [T]his was only partly because of the lack of participating dentists. Teenagers with the worst dental problems were usually from poorer families who did not know about the service. Most patients were from better-off families who could afford to pay something.

...The Dental Association supports concerns about the state of *N[Z]* children’s teeth. A new lobby group, the School and Community Dental Services Forum, criticised [RHA]s this week over a deterioration in child dental health for the first time in 20 years. The president of the Dental Association... said dentists in practice who provided 12-year-olds with emergency and special care and also treated first-year secondary students had reported the same thing. “Evidence of untreated cavities and larger-than-expected fillings... point to a disturbing change from the pattern of past years, which had seen a continuously improving situation.” The Otago Dental School has previously said that while some children had shown great improvement more than half still had dental decay and many of these at high levels...

[‘Diet, general health, structural defects of the teeth, and heredity affect one’s chances of developing caries (tooth decay). Treatment includes attention to diet, often entailing the avoidance of sweets, and care of the teeth by cleansing and by restoring teeth that have cavities. The addition of sodium fluoride to municipal water supplies reduce the incidence of caries by as much as 65%. Hypocalcification, in which there is insufficient calcium and a soft enamel is produced, may result from excess fluorine in the diet. Normal enamel may vary in colour from yellow to grey.’]

...‘American dental researchers are closing in on a treatment that eliminates the corrosive action of bacteria in the mouth, and a vaccine that makes tooth decay virtually impossible. To counter the loss of business formerly generated by tooth decay, dentists have already begun to develop new services, such as tooth painting, which makes teeth perfectly, lastingly white.’

...consumers are being ‘warned to stay clear of some teeth whiteners. Prolonged use of hydrogen peroxide-based whiteners could damage the teeth, opening them up to further staining.’ Consumers were previously warned that the ‘mercury-based fillings that have been used for generations in NZ’ are ‘causing problems in people with such fillings and, among dental nurses, an increased incidence of reproductive problems, miscarriages, still births and SIDS.’ There are ‘alternatives to amalgams but they are more expensive.’

...a few years ago a dental technician proposed ‘covering teeth in a kind of plastic to protect them from decay’. Although his proposal seems to have come to nothing, ‘tooth decay deterrents are expected to be developed in two years’ or more, and Swiss scientists have developed a gel that ‘dissolves tooth decay but leaves healthy parts of the tooth alone – dentists only have to drill to tidy up.’]

...The General Dental Council said... [a] dentist... earned more than... \$2.38 million... in four years by unnecessarily drilling, filling and crowning the teeth of hundreds of patients... in his “deliberate pursuit of financial gain.”

...A Pukekohe dentist is on trial in the Auckland District Court for falsely claiming Government dental subsidies... [for children. The dentist], aged 45, faces 20 fraud charges of using a document to gain pecuniary advantage between July 31, 1991, and October 27, 1994... The Crown says that... the... [dentist] lied to get more money back than he was entitled to... [H]e would use a variety of ways to submit false claims. His most common method was to “hold over” fillings so that he could claim for them later. Dentists can only claim one fee for fillings on the same surface during one treatment period... [He also] claimed for fillings and wisdom teeth extractions that were not done. A favourite ploy was to extract all wisdom teeth on the same day but falsely claim for separate extractions and emergency consultations for toothache... [The dentist] had been a contractor since the 1980s and in that time his surgery had had problems with the subsidies, in particular with late claims. In 1989, 1991 and 1993 audits of his practice detected discrepancies. The trial is due to continue for four or five weeks.

...A woman who says she suffered for nine months because her dentist failed to remove packing after an extraction has been told she cannot sue him... for \$250,000. The High Court at Auckland ruled that she was too late to bring the 1992 claim and the Court of Appeal in Wellington has agreed... [By the way, s]ince buying... the Geddes dental practice... in 1988, which was then a business only making dentures, [the new owner] has lifted the turnover... from \$120,000 a year to \$6.5 million last year. It now has seven branches, employing 25 dentists and technicians to service 40,000 patients – the largest in *N[Z]*. He was among the first to see the potential for business that was ushered in with the new Dental Act in January 1989. The new act enabled dental technicians to make and fit dentures directly to the public, where previously these had to be supplied through a dentist. It created a new class of worker, the dental hygienist. And it revoked all restrictions on who could and who could not own a dental practice... Suffice to say, an element of protectionism and elitism[still] exists in dentistry, as it does in all professions. The pecking order is very clear, with dentists at the top, and dental technicians... some distance below. Overlaying all this is a deeply rooted conservatism... The conservative, restrained dignity of dentistry took a bit of a shaking when [the owner] started appearing in his own, high-profile television advertisements offering his service... Ironically, [he] could not have taken on the dental profession with his aggressive marketing had he been a dentist himself. “For one thing, peer pressure would probably have prevented me from advertising.”... Eighteen months ago, Geddes won the North Health contract to treat community service card holders. This division was sub-branded as “Dentcare” four months ago. A second contract, and potentially a more interesting one, will enable Geddes to treat 14,000 secondary school children at school. Geddes has built a mobile dental unit, which examines the kids and, thanks to computer technology, enables it to produce a “report card” on the spot, complete with X-ray pictures of the... mouth. If treatment is required, the kids are referred to a Geddes surgery. [The owner] says one of the most valuable elements of this contract is the data can be stored, providing details of all the kids’ dental make-up. “I can tell you how many... schoolchildren living in Hurstmere Rd have cavities in their left molar,” he says. And if this sounds like the type of information that only a nut would collect, it must be remembered that this data base is valuable for the group’s overall marketing strategy of providing dental care through a patient’s entire life. The key is to get them young and make them comfortable with the Geddes brand... he believes.

...Most teenagers in Auckland schools need dental treatment, especially in poorer areas, say the organisers of a mobile service. Geddes Dental Group... says only 8[%] of the students it sees have been to a dentist during the past year. The managing director... [also] said tooth decay was coming back in schoolchildren after 30 years of improving dental health because of fluoridation. N[Z]ers had treated fluoridated water as “a false security blanket” but it could not protect children against the effects of a regular diet of takeaways, soft drinks and chocolate bars. - 1997

Chocolate may be rehabilitated from its place as an enemy of children’s teeth – the future versions may even make teeth healthier. The reason? Cocoa beans contain antibacterial agents which offset the sugar content and reduce the chance of decay, Japanese researchers report in *New Scientist* magazine. The problem is that the useful chemicals in the cocoa beans are predominantly in the husk, which is normally thrown away. But... husk extracts could be used in mouthwash or toothpaste to fight tooth decay... It could also be added to chocolate confectionery... Teeth begin to rot when the common bacteria *Streptococcus mutans* secrete a sticky molecule called glucan, which helps them anchor themselves to teeth, and so form a layer of plaque. In that plaque, the bacteria convert sucrose molecules into acid which attacks the enamel.

...Adult humans have 32 teeth in a full set... The enamel they are covered with is the strongest natural material known.

...the A[US]n Dental Association... said tooth wear had become more common in recent years and one of the reasons was clenching and grinding because of stress. It said people were working longer hours and cramming more into their busy lives, adding further to the problem.

...[a] Muscovite... is delighted that at the tender age of 104, she will at last be able to munch her favourite ginger cookies – after growing three new teeth. [She] has become the oldest person to grow new teeth, baffling doctors in the remote southern region of Tatarstan, where she lives alone in a small village tending a garden and raising poultry... Local dentists are studying the rare event.

...*Hope for those too long in the tooth*... Dental scientists at Guy’s Hospital in London have discovered what type of tooth an embryonic tooth bud will develop into. They have used their knowledge to make a tooth that should have become an incisor become a molar instead. It is a big step towards their long-term target of making it possible for people who have lost teeth through accident or decay to grow new teeth... [(t)he tooth is the only part of the human body that cannot repair itself]... That we grow a second set of teeth in childhood may seem to make it more likely that we could do the same again. But the second set grows from the same bud-like structures as the first set and these disappear after the second set is formed. Other genes that are normally only active in embryos have been switched on in adult animals in experiments. Genetic dentists may be some years away but they are coming.

The dentists who stand in the last line of defence in the dental care war are losing the battle... In Auckland, several patients a week on average are admitted to hospitals after neglected tooth problems have escalated into potentially dangerous conditions... Pain relief and extraction are the only options left... North Health said the number... had doubled since 1993... The northern [RHA has] paid for 15,000 such treatments. Patients still have to pay between \$30 and \$40 at the hospitals... Why adults wait so long before seeking dental help is the subject of debate... [S]tudies showed that less than half of N[Z]’s adult population went for regular dental checks... Some say that people cannot afford to pay for consultations... These days, the charge... ranges from around \$50 to \$100 depending on what is done, according to figures supplied by the Dental Association... According to the most recent national statistics... 36[%] of 20- to [34]-year-olds said they could not afford dental care... 17[%] of 35- to 44-year-olds avoided care because of the expense... Among the economically depressed, dental care was pretty low on the priority list... The president of the Dental Association... said that in countries where dentistry was more or less free, half of the population [still] did not seek care... The dean of the Otago University Dental School... this week said... [fewer] students are enrolling... and those who do are paying higher fees which seems likely to push charges up even further as graduates seek to recoup education expenses by charging more.

...The cost of dental care was blamed this week for some people failing to seek help and becoming sick when infections spread through their bodies, but a study by an Otago University dentistry student has found that fear may also be a potent factor... [People] were frightened of the sight and feel of needles and of the sight, sound and vibrations of drills... The news... comes as Auckland health officials delve into why many college students are avoiding the dentist... The authority spent about \$12.5 million a year on free dental care for primary and secondary students in the region... Officials fear that the reluctance to turn up for free annual checks will lead to an upsurge in people later needing expensive emergency care... About 20 or 30[%] of the people admitted to hospital with[tooth] infections ended up in intensive care... What started as a toothache put... [a] 50-year-old Otara father... in hospital for several months and left him with scars all over his upper body. The infection in his teeth raced through his system... An Auckland dental specialist who treated the man said he believed one of the operations at Green Lane[Hospital] had been the difference between life and death for his patient. He said some similar cases he had treated had cost hundreds of thousands of dollars.

...As the ache in your jaw eases, another starts in the pit of your stomach. Surely that dentist bill can’t be right? There was a time when car mechanics seemed to eat up our disposable income. These days it feels as if doctors and dentists are taking a disproportionate whack – and Statistics Department figures bear this out. Over the past 15 years, dental charges have increased by three and a half times – almost twice the rate of increase of the consumers price index. Going to the doctor is also costing dramatically more, by about three times. By contrast, your car mechanic is positively restrained – servicing and repairs charges rose only 98[%]. An... overview of the economics of dental practice in N[Z], from 1974 to 1993... pointed out that while N[Z]’s supply of dentists had risen over that period (from 34 to 39 per 100,000) and our dental treatment needs had reduced, the fees charged by dentists for almost everything except dentures had increased considerably... When all the sums are done, real after-tax dentist incomes are higher in the 1990s than they were in the 70s and 80s – despite a reduced workload. More recent... figures show the average self-employed dentist had a net before-tax 1994 income of \$109,740. Dentists in group practice earned 30[%] more, and the average dentist worked 199 days... Auckland-North Auckland dental incomes are about \$20,000 higher than the national average. Surprisingly the highest-earning dentists of all are not in central Auckland but out west, where... figures show the average gross income is \$482,282, which nets \$168,936. Since West Auckland practitioners don’t charge higher fees than other Auckland dentists, that is puzzling. Perhaps they are better at making sure their bills are paid.

...PATIENTS’ access to dental care and the size of their dentist’s bill depends on where they live. Studies have shown that inner-city Auckland is the most expensive place for treatment and Christchurch the cheapest. The price difference is around 40% for no apparent reason... The cost of a single filling starts at around \$80 in central Auckland and can range up to \$200, but shop around in Christchurch and you can find dentists who charge \$45... per filling. The same dentists charge as little as \$40 for an examination without x-rays, compared with some Auckland practices at... \$75... Having a tooth pulled can also leave a hole in the wallet, particularly in Auckland. Straightforward extractions there can cost... \$160. In Christchurch you can easily get rid of a troublesome tooth for \$50... Dentists are at a loss to explain why the regional variations exist, except to say they are historical and accepted by patients and practitioners alike... “Competition may be a factor but it is hard to quantify. [Christchurch] dentists’ incomes are the lowest in the country and dentists accept that,”... said [a Dental Association spokesperson. Incidentally, a]... patient at Christchurch Hospital recovering from an uncomplicated mild heart attack had recurrent chest pain that was not recognised as significant by the casual nurse on duty, according to a report by senior doctors. The woman, in her 60s, died. Her case is labelled a potentially avoidable death by... the executive of the hospital’s Medical Staff Association... [The] report... has details of 40 cases and was leaked anonymously. An accompanying letter to the Minister of Health from the association chairman... says the report outlines four categories of system failure: understaffing, inappropriate staffing, inappropriate patient location, and loss of quality indicators or practice falling below stated standards. On a ward in July

one registered nurse with intravenous certification and one enrolled nurse were required to nurse a ward of 30 cases, including acute surgical, medical and cardiac patients. At 4 am, two patients were bleeding significantly, one becoming severely shocked. The registered nurse twice telephoned the duty manager to ask for extra help, to be told none was available. The duty manager finally sent a nurse from surgical recovery while the ward registered nurse ran to obtain blood for transfusion.

...Lives “were not, and will not be” at risk at Waikato Hospital, despite a management taskforce identifying a chronic staff shortage, a Waikato health chief said yesterday... [He] was responding to a report... which detailed a shift in one of Waikato’s acute medical wards... [that] was staffed by two nurses who had to care for 23 patients – of whom six needed one-on-one care, 12 required intravenous antibiotics and four were incontinent. The report, written by a registered nurse... was entitled “Nightmare on Night Shift.” It outlined how the skeleton staff was forced to leave one man lying in faeces for more than three hours as they struggled to cope with the other patients... A taskforce... recommended more staff be employed immediately... But the Nurses Organisation said that as long as Health Waikato offered low pay rates, the [CHE] would find it difficult to attract staff... “Since the Employment Contracts Act was introduced in 1991, Health Waikato nurses have had a mere 1[%] pay rise...” Health Waikato nurses were paid 8[%] less than their Auckland Healthcare counterparts... An organiser... said the ultimate blame lies with the Government, which has forced Health Waikato to cut its costs by \$30 million over three years. “...you can’t take \$30 million off an organisation without screwing the staff too tightly...”

...Nurses at Waikato Hospital say a staffing emergency has been brewing for two years... “We have been heading towards a staffing crisis across the board – not just nurses, but orderlies and cleaning staff,”... said... one nurse, who would not be named for fear of losing her job... Another nurse, also afraid of dismissal if named, said... “We cannot get experienced nurses. We can get graduates but they take up to six months’ training and that is yet another demand on the senior staff.” ...Hospital management has forbidden nurses to speak out about the problems, highlighted in the article ‘Nightmare on Night Shift’... However... [the NZ] *Herald* has discovered that other nurses have recounted their own nightmares in a journal unofficially dubbed ‘The Grizzle Book.’ A March, 1996, entry reads: “Shift from Hell – 11 admissions and no help available in entire hospital.” Another in March: “Horrible shift – 13 admissions, one patient unable to be taken to high dependency unit because of no beds.” And in April: “Receptionist sick, can’t get relief; 27 patients, no agency nurses, two staff nurses sick; overflow hideous.” ...The charge nurse in the Intensive Care Unit... and the operations manager for the Emergency Department... confirmed that a shortage of experienced staff is at the heart of the problem at Waikato – and numerous other hospitals.

...Women with breast cancer may be forced to have their breasts removed unless up to \$30 million is spent on methods of less drastic cancer treatment, doctors say. The Australasian College of Radiologists believes the extra funding will be needed to cope with a 20[%] rise in cancer cases by the year 2000 expected as a result of... an ageing population... and... a breast screening programme [being introduced next year (the potential rise should be higher than 20%, but NZ’s health funding authorities decided that ‘they can’t afford a thorough breast-screening programme’)]... The college says that unless resources are boosted waiting lists will grow so unmanageable that only the most severe cases will be treated. Women found in the screening programme to have early stages of breast cancer could be low priority. “People would face the risk that their treatment would be less effective because of the delay,”... Already people with all sorts of cancers are waiting nearly three months for... therapy in some parts of the country... N[Z] was short of about two radiation therapy machines to cope with the 15,000 cancers found last year. It was also short of about 30 personnel to run the machines, some of whom took 10 years to train.

...Nine out of 10 women are still alive five years after breast-cancer treatment, according to a new study... conducted in 35 countries,[which] involved more than 5500 women who all received a combination of radiotherapy and conservative surgery for tumours up to 5cm in diameter.

...[a NZ] Cancer Society survey has found most women believe that at least one in four will contract the disease: the truth is it’s only one in 10. Women also tend to suspect a family link, when most women who develop breast cancer have no history of it in the family.

...[research has linked increased rates of breast cancer to prolonged use of ‘sports bras, or similar clothing that hold the body too tight and, as a consequence, restrict the passage of blood through adjacent skin, while also putting extra stress on the lungs, etc.’]

...As Auckland expands, so does the quandary health planners find themselves in. More people means more health care, which also throws into question where those services should be... A key issue for Waitemata Health is distance to health services. People living on the North Shore and in the west must travel outside their Waitemata Health area for some treatments. There is no intensive care unit or 24-hour emergency department at North Shore Hospital, which is also devoid of several other services.

...liver transplants could be performed at Auckland or Wellington hospitals, cutting the need for patients to travel overseas. The country’s four [RHAs] are reviewing tenders from Auckland and Wellington Hospitals along with bids from Sydney, Brisbane and Melbourne... [O]nly a relatively small number of people needed liver transplants each year, which had to be weighed up against the high cost of keeping a liver transplant unit running... A decision is expected by late next month. The [Surgical Services manager] at Auckland Hospital... said staff were very keen to win the contract, which involved only adult patients... Children needing new livers will continue to travel to A[US] for operations. Up to 20 adults a year go to A[US] for liver transplants, receiving up to \$120,000 of Government money for surgery, travel and accommodation. [The manager] said he did not expect Auckland Hospital to be able to do the surgery any cheaper than A[US]n counterparts, but many people would be spared big accommodation and travel costs. The money would also stay within the N[Z] economy rather than go overseas... If Auckland Hospital won the contract... worth up to \$2.5 million a year... it would need to spend \$150,000 training staff and about \$500,000 on equipment. This money would probably be raised through philanthropic trusts... If successful, Auckland could start the work during the second half of next year.

...Auckland Hospital has closed a surgical ward for up to eight months because it has run out of money to take extra patients waiting for operations[, a move which]... has embarrassed the Government... The hospital’s general manager... said the closure was the result of more efficient patient management which cleared beds faster... Last week Auckland Hospital announced a go-slow in four areas – urology, neurology, general and eye surgery – after surgeons worked 40[%] ahead of their financial targets in the first two months of the financial year... The empty 25-bed ward is capable of taking up to 1000 general surgery and urology patients between now and its likely reopening in April or May next year... [T]he ward could stay open only if the... [RHA] decided to buy more surgery from Auckland Hospital... North Health had switched its funding priorities from elective to acute surgery, leaving less money for people on waiting lists. The Government has produced a \$130 million fund aimed at cutting national waiting lists but this was aimed at specific operations.

...Green Lane Hospital says the future of its heart surgery[unit] is threatened by the Government’s refusal to pay the full cost of operations. The hospital claims underfunding means it loses \$8650 for every coronary bypass operation it performs... North Health, disputes the figures but conceded yesterday that the hospital might be underpaid... Heart surgery costs were highlighted by the Government’s announcement on Thursday that 120 fast-track coronary bypass operations for Aucklanders at the top of the waiting list would go ahead... The extra \$3.74 million of work will be split between Green Lane (20 operations), the private Mercy Hospital in [Auckland] (20), Waikato Hospital (20) and the private Wakefield Hospital in Wellington (60)... [T]his time Green Lane was being paid the full \$17,486 cost. Normally it received only \$8836 from North Health. Wakefield... was understood to have tendered \$14,500 an operation...

A... Government blitz on hospital waiting lists has come too late for an Auckland man who finally made it to the head of the queue. After 19 months waiting for heart surgery, [the man] was told yesterday by Green Lane Hospital surgeons that his angioplasty could not be completed. A block in one of the main arteries of his heart means he now faces a heart bypass operation and the likelihood of going to the end of another long

waiting list... The 51-year-old journalist said it took him about four months from last March to get an angiogram before then being put in the queue for surgery... [H]e had spent the last 19 months in a drug-induced haze to help reduce pain. "This has ruined my life. I can't hold down steady work. This is the end of a 35-year-career." ...One Green Lane cardiologist... has labelled the delays in coronary treatment "a national disgrace"... [P]atients could not get angioplasty operations until they deteriorated to the point they needed to be in hospital.

...The new chief executive of the country's biggest [CHE], Auckland Healthcare... steps into one of the thorniest health jobs in the country with a warning: if a service... [at the] Auckland, Green Lane, National Women's and Starship hospitals... is not funded adequately that service will go... The 44-year-old, like his predecessor [– who]... had a salary package of more than \$220,000 a year... [–] is keen to spread the gospel that waiting lists and trade-off decisions are the property of [RHA]s, not hospitals. Authorities... says... the man who, until recently, ran the Hamilton-based Midland authority... must assess the needs of their population and set the priorities. "It's our job to provide good-quality services according to what North Health wishes to buy from us." [By the way, one CHE 'spent \$60,000 advertising a job throughout the country then reemployed the incumbent employee.'

...The northern RHA has spent \$82,551 on advertising itself in newspapers, and is planning to pay out at least the same amount again... The North Health communications manager... said yesterday that money for the advertisements had come from the administration budget and would not affect services being bought. Advertisements were also planned for Maori, Pacific Island and mental health services... The advertisements met requests from the public that North Health tell them what it was doing, he said... "It's a stupid waste of money," said [one person] whose 58-year-old wife... has apparently been on the priority waiting list for knee replacements since February last year.

...Just over 94,000 people are on waiting lists for hospital operations... down slightly from 95,470 in March... [(but higher than the previous year's figure of 85,171),] according to Government figures issued last night. The Minister of Health... said... "I can tell the public that we've been able to hold the trend that's been dogging governments for the last 30 years,"... The figures show that more than 18,000 people have been waiting two years or longer. Of them, 329 have been waiting for cardiology or cardiothoracic operations. Nearly 19,000 people have been waiting between 12 and 23 months.

...Being on the waiting list for ear, nose or throat surgery at Waikato Hospital is not an ideal position... The specialist department is the only one of its kind in the Midland region... Not only does the waiting list for surgery exceed 1000 but the number of people waiting for an initial appointment is around 3000. To make matters worse, the department's five surgeons have resigned and will hang up their scalpels in December. The "potential horror stories"... include the one about the patient recovering from cancer of the larynx being given solid food; the patient who was left for hours with "bloodied crusts all over his face" from a bleeding nose the nurses did not have time to clean up; and the time the surgeon rang to inquire about his patient and discovered the patient's wife answering the phone – the nurses simply did not have time. For... the surgeons... such incidents were too common for comfort and gave them ample motivation for their decision. The ear, nose and throat specialists said over the last year, the problems have compounded and despite continued talks and meetings with Health Waikato management, no "concrete" solutions have been found. The surgeons... did not want to quit but said their resignations and the guaranteed chaos created by their absence, would "hopefully force the issue to a sensible conclusion." In the meantime, patients are suffering...

Bosses of the 23 [CHE]s were paid bonuses of up to \$34,000 last financial year, despite some failing to keep within budget. Chief executive salaries – all over \$100,000 – and top-up bonuses were revealed yesterday by the Labour health spokeswoman... from information gathered under the Official Information Act. She criticised bonus payouts when thousands of patients were stranded on waiting lists... The Association of Salaried Medical Specialists said... that the bonus payments were largely financially driven and paid little attention to quality healthcare.

...The Government has repeated that it has no intention of selling public hospitals, although it continues to be equivocal about whether all 23 [CHE]s would be retained. The Association of Salaried Medical Specialists claimed yesterday that the Government had plans to sell up to seven provincial hospitals. But both the P[M]... and the Minister of C[HE]s... rejected the statements... Speaking on radio, [the PM] said it was true there were some facilities "at minor hospitals" that were no longer needed and that [CHE]s might want to sell them. "But we are not in the business of selling hospitals that we require for a public health system... There are some out there on the Right who say we should [but] we have rejected that emphatically." ...[the minister] had previously stated that he doubted whether there would be 23 [CHE]s in five years.

...Two more heads of [CHE]s resigned yesterday, bringing the total number of resignations of chief executives or chairmen and women to at least 17 in the past three years. The resignations of the heads of Health South Canterbury... and Nelson Marlborough Health... were announced by the Minister for C[HE]s... Their terms were due to expire... he said. Their resignations are effective immediately... [The minister] also announced the roll-over of the appointments of a further 29 [CHE] directors whose terms were due to expire... [In related news, t]he Wellington public hospital system has blown its budget just months into the financial year, raising fears of cuts in services. Capital Coast Health was about \$6 million in the red for July and August – about \$1.7 million more than budgeted.

...Capital Coast Health is reviewing all of its services after forecasting a deficit of between \$31 million and \$44 million at the end of this financial year. Announcing the proposed deficit... the Minister for C[HE]s... said the amount was unacceptable and much worse than the earlier budgeted figure of \$13.3 million. The board had been told to take steps to ensure that the deficit did not occur.

...The chief executive of Capital Coast Health received a bonus of almost \$30,000 last year despite the [CHE] recording a \$19 million loss... in the 1995-96 year and forecast[ing] a deficit of \$44 million this year... says the Labour health spokeswoman... She said yesterday that she was astounded the Minister for C[HE]s... had approved the bonus... [The minister] was not available for comment.

...Labour is taking aim at big bonuses for public servants, attacking in particular a possible \$65,000 top-up for an Auckland health chief already earning more than \$180,000... Labour's state services spokesman... said that it was "appalling" that a public servant could be paid such a bonus... [A]t \$1250 a week [it is] double the average household income. His predecessor had received between \$160,000 and \$170,000 and a bonus of \$47,000. The increased amounts... equated to a 12[%] pay rise and a potential 38[%] increase in bonus payment... Figures released by the Government in response to a Labour question show that Auckland Healthcare has budgeted \$1.623 million of its funds for bonus payments... The chairman of Auckland Healthcare... said in a statement that the pay and bonuses for management reflected the market... [The chief's] salary and bonus had been approved by the State Services Commission. The Minister for C[HE]s... said that the Government supported bonuses that were based on performance and accountability. "It is important that our hospitals are well run."

...The caretaker Minister for C[HE]s... says likely changes to National's profit-driven model for the enterprises will not solve the problems in public health. National has already flagged that it is prepared to drop the profit motive in hospitals and could bring back elected representatives on [CHE] boards as a result of coalition talks. But [the caretaker] said yesterday that whatever model was chosen "doesn't change the nature of the problem." ...He was commenting on a blow-out deficit of Auckland Healthcare to \$34 million, coming on top of the news that Capital Coast Health... was projecting a deficit of between \$31 million and \$44 million.

...a new Treasury report... criticises Auckland Healthcare's ballooning deficit and Waitemata's inability to meet financial targets... Waitemata Health, serving Rodney, North Shore and Waitakere, recorded a \$7 million deficit... well over the predicted \$4.5 million... [The] report said Auckland needed to address "fundamental infrastructure inefficiencies" to be financially viable... But there is recognition of Auckland Healthcare's problems. It is the biggest, most specialised provider of health services, with more than 1.4 million patients treated each year... and is predicting bigger losses this financial year "due to an ethical obligation to treat all acute patients,"... While... South Auckland Health... delivered a

surplus, it ranked the lowest nationally in terms of customer satisfaction... [M]anagement was addressing its poor... rating with suburban Super Clinics[, 'where public and private health providers will work under one roof']... The report noted that South Auckland Health's attempt to address customer dissatisfaction had been at the expense of financial performance. It recorded a \$20.4 million profit in 1993-1994... [down to] nearly \$1 million last year and \$1.3 million forecast this year.

...The Ministry of Health has warned the Government of a growing gap between the cost of health care in N[Z] and the level of public spending... [O]verall health costs over the next decade were projected to increase at about 5[% a year while public] spending would grow by only 1.9[%]. The ministry has recommended to the Government that it drop its funding model based solely on demographic factors and put public health funding on a new, sustainable growth path... The Treasury believes the health reforms have become a kind of "half-way house" with managers overspending their budgets and central Government tampering with decision-making... The Crown Company Monitoring Advisory Unit said the long-term payback for the reforms, "may still be two to five years away. [The] reforms have... not achieved their full potential." The unit said there had been considerable public anxiety about health reforms and whether this was based on perception or reality, it needed to be addressed... [A]reas of public concern[included] a perceived increase in bureaucracy... the number of well-publicised resignations of the chief executives of the enterprises, and the jargon of management and economics rather than health. [However, the]Minister of Health... said... many of the issues raised... [by] the briefing papers... had been superseded by the coalition agreement.

...The coalition Government has outlined priorities which will... be the death of key parts of National's largely unpopular health reforms brought in three years ago... although hospitals will[still] have to behave "in a businesslike fashion." ...Ironically the coalition compromise to cover children aged 5 and under matched Labour's pre-election position... [and] Labour was the first to offer free doctors' visits for pre-schoolers... in 1990, just a few months before it lost the election.

...Crucial details are still missing from the latest restructuring of the health system announced this week. Some observers think the ambiguity is deliberate because National and N[Z] First could not agree... [The result is that] it is hard to tell just how far the... coalition Government has backtracked on National's health reforms... Interpretation of the many grey areas is likely to fall to the next Minister of Health... The most significant change is... the new "benchmark" contracts system. Contracts will no longer be decided by a simple market model in which the purchaser sets an order for health services and providers compete to supply it at the lowest price. Instead contracts will be based on "historical funding information and levels, benchmarking information, changes in technology and comparative data." This is similar to the agreements some [CHEs] were reaching with [RHAs] anyway – after long arguments about the true cost of providing services. But it changes the emphasis from competitive bargaining between buyer and seller to a forced agreement on what needs to be bought and at what price. It also looks as if private patients will be able to use public hospitals.

...Nauruans, once the world's richest but sadly also sickest people, have been told they can no longer be treated in hospitals in Melbourne because they have not paid their bills, according to the *Pacific Report*. In its latest issue, the fortnightly newsletter quoted the Nauru Health Minister... as saying they had clocked up \$A400,000... in unpaid bills in 28 years... [The minister] said it was vital Nauruans be treated in Melbourne because of its diabetes expertise... [(Nauru's) 9000 people have the world's highest rate of diabetes[])... He said former Nauruan Presidents had made large donations to various Melbourne hospitals and "now they are closing the door to us." ...N[Z] taxpayers often foot the medical bills of overseas patients treated here because their own Governments renege on payment deals... The Starship general manager... said the hospital was treating an overseas youngster who had turned up with an acute condition. There was no guarantee the treatment, which could run to tens of thousands of dollars, will be paid. In May, the Starship treated a four-week-old baby who needed \$150,000 of medical care. The overseas Government concerned guaranteed payment, but has paid only \$32,000. [The manager] said there was no time to secure payment guarantees in emergencies, which should not be left for clinical staff to decide... [He believed] any decision to decline medical treatment to countries had to be made by the Government after diplomatic considerations.

...Frustrated health chiefs are calling for urgent Government restrictions to stem the flood of sick foreign patients arriving on hospital doorsteps. They say a clearer policy is needed on treating overseas patients who are draining their shallow coffers... The situation has been highlighted in a... report about a 12-year-old Fiji cancer patient. The girl has received about \$53,000 of treatment but her family cannot afford the bill, leaving the Starship out of pocket... The country's public hospitals run into mammoth debts every year through treating foreign patients who easily take advantage of N[Z]'s goodwill. Auckland hospital services are bearing the brunt of the problem with a large influx of people from the Pacific region. The chief executive of South Auckland Health... said the Government ordered all public hospitals to treat acutely ill people. As a result, many people jumped on a plane to N[Z] when they were seriously ill. But the Government had arrangements with only some countries. Hospitals were left footing much of the cost when treating patients from outside those areas... [He said] "non-eligible" foreign patients clocked up \$1.3 million of care at his [CHE] last year. The Government wrote off about \$500,000, leaving the enterprise about \$800,000 out of pocket. The chief executive of Auckland Healthcare... said... the Government's lax policy meant a lot of taxpayer money was going on foreigners... Newcomers to N[Z], whether tourists, visitors or immigrants, needed to know exactly what they were entitled to, he said... "Realistically, a significant number... can't pay. Some of the treatment is most expensive..." ...most non-eligible patients turning up at Middlemore Hospital needed maternity or kidney dialysis treatment. Kidney treatment could easily cost tens of thousands of dollars a year per patient... "The responsibility is clearly at Government level to get clarification. It is very messy... we are very keen to point out the situation is far from ideal... If the Government feels it is necessary to provide these services it needs to sort out the details... We are left to feel the heat at the coalface." ...An Auckland businessman has offered to pay[the] young Fiji cancer victim's medical bills...

Hospital debts clocked up by overseas patients will be docked from N[Z] foreign aid payouts under... new policies. The move comes out of coalition Government talks on foreign affairs. Auckland health chiefs yesterday welcomed the news, saying it would bring long-awaited relief to stretched budgets... But the get-tough policy is sure to raise the hackles of many Pacific Island neighbours who rely on foreign aid money. This year N[Z] expects to spend \$184 million in foreign aid. The largest chunk – \$70 million – is destined for the South Pacific. The Western Samoa High Commissioner... last night said the policy was unfair and drastic... "I have seen the debts cleared before. Why can't we do the same thing again?" ...N[Z] officials needed a better monitoring system so it was not so easy for "non-eligible" patients to have access to healthcare. It would have been courteous for the coalition Government to alert Samoan officials before the announcement, she said. Last financial year South Auckland Health and Auckland Healthcare were left more than \$4 million out of pocket by non-eligible patients... The general manager of the Starship... said his hospital was on the verge of bringing in protocols to stem growing unpaid debts. The protocols, which were to start early next year, would see Starship doctors stabilising emergency overseas patients and returning them to their home countries... [T]his could mean children going home to die, but his hospital was financed for N[Z] children unless other arrangements were made... - 1996

About two thousand Aucklanders are being denied elective surgery in public hospitals [each] year because of overseas patients' refusals to pay their hospital bills... The main debtors are Samoans, Tongans and Fijians in that order. They have either skipped the country without paying, or remain on visitors permits, and won't or can't pay... But in other parts of the country they are American, Japanese, German and Taiwanese... The Government's reimbursements... [-] 60% in Auckland Healthcare's case... [-] are due to end in the year 1999/2000... The... Auckland Healthcare chief executive... said the system was being abused more often than most people believed. This included women coming to N[Z] specifically to give

birth so their babies become citizens. In another case a mother concealed her child's serious condition on arrival in the country, in order to be treated at the Starship Children's Hospital... The Government reimbursements had to continue while a long-term solution was negotiated, he said... A[US]n and British patients are treated free in N[Z] because of reciprocal arrangements between their governments and ours. People from Niue and the Cook Islands, classed as external N[Z] territories, are also treated as Kiwis. Hospitals pick up the tab for these patients and ACC covers accidents, such as car crashes, for all visitors.

...[an] Auckland businessman and budding political leader... has so far failed to honour his promise to pay a young Fiji cancer patient's medical bills... now \$61,000... The Starship children's hospital confirmed that \$2224 of donations had come in from [Auckland's] Indian community to help to pay the bill... [By the way, i]mmigration officials have warned the coalition Government that implementing its... [health] screening of overseas visitors... policy could harm tourism and international relations. The advice is contained in a paper on the... coalition agreement... The paper, obtained under the Official Information Act... points out the practical difficulties of screening visitors from the 34 countries with which N[Z] has visa-free arrangements. In 1995 visitors from those countries averaged 2000 a day... If the plan went ahead despite the objections, the airports would be in chaos as they coped with thousands of medical checks every day of the year... "Furthermore, other governments may be prompted to introduce similar measures for N[Z] nationals travelling abroad."

...The country faces a public health disaster as asylum-seekers are forced to wait... up to three months... for medical screening... endangering the public with serious diseases such as tuberculosis... says the Auckland Refugee Council... With about 1200 asylum-seekers each year – most of them coming through Auckland – it was vital to contain threatening illnesses... "Every asylum-seeker who comes in must be screened as soon as possible. Some asylum-seekers go into our new hostel but if that's full, they go straight into the community."

...A Somali refugee family looking forward to a new life in N[Z] has been forced to deal with heartbreak and tragedy... [N]ow living in Wellington, [they] have had to cope with the death... [through] malaria... of a 17-year-old son and brother since arriving... The... [family] came to N[Z] after their... refugee camp was burned to the ground. They joined an elder son... who[had] been working in N[Z] for three years raising[the] \$10,000 needed for his family's travel expenses... [T]hree other children [were left in] Kenya. One, a 10-year-old, became separated from his immediate family and is with relatives in a refugee camp in the Dadaab region. The other two are in Nairobi... [One, a] 14-year-old... was left in a Nairobi hospital when the family left for N[Z]. He is now well, but the hospital will not release him until the bill for hospital and air ambulance travel has been paid... [The mother, who is] a widow... does not have the estimated \$10,000. The director of the Refugee and Migrant Service... hopes a public appeal will help to pay the child's hospital bill and air fare to N[Z]... Meanwhile, another child, [a] 15-year-old daughter, is in Wellington Hospital with an unknown illness.

...[a young] Somali refugee... could barely talk when he was finally reunited with his family last night. But his wide smile said it all as he was swamped in hugs and kisses from his mother... at Wellington Airport... [T]ired from his two-day flight, [he] shook his head when asked if he felt the chilly Wellington evening, but nodded that he was happy to be here... [He] is still recovering from a tetanus infection which forced his family to leave him in a coma at a Nairobi hospital... His survival was touch and go. When he did recover, the hospital refused to let him [go]... He was made to sleep on the floor of a ward, risking reinfection... [An] appeal raised \$13,000 to cover his bill and his airfare... [His mother] said through an interpreter that she wanted to thank the N[Z] public for their generosity... [Incidentally, 'the Government is looking at whether babies born in NZ to foreign women should still get citizenship. Last week, the Cabinet closed a loophole that allowed women from other countries to have their babies in NZ free of charge.' But d]ocking foreign aid to Pacific Island countries to recoup unpaid hospitals bills has been thrown in the too-hard basket.

...It is commonplace for political parties at election time to make promises which, although they sound simple enough, often prove more difficult than expected to put into effect. It [was a NZ] First policy that children should have free medical treatment. This has been modified... to free treatment for children... five years of age... [and under. But GPs don't] consider that every service is equivalent... any more than lawyers or plumbers would be happy to charge the same sum for everything they did. Like most other people, doctors take the view that the fee should be adjusted according to the nature of the service and this does not necessarily relate only to the time taken. It can also reflect the skill or training required to perform the task. If we assume that all services a doctor provides are equal value we discourage doctors from training themselves more highly which in turn is likely to put a greater strain on specialist services necessary to fill the gaps and is inevitably more costly for the patient or the state. It was because the courts recognised differences in the value of services that in a very celebrated case some years ago the Labour [Government]... failed to fix a price for the medical care of children. The attempt was halted as a result of a successful court injunction sought by three prominent [GPs]. The truth is that most [GPs] do charge the same fee for most of their services but they also believe that they should have the right to charge more when a special, out-of-the-ordinary service is provided. Such services would include prolonged counselling of parents, minor surgery, extended consultations and certain specialised or semi-specialised procedures. An alternative would be an increased subsidy for such services, but this could be difficult to regulate.[In addition, experience has taught that doctors can be dishonest!] Experience has also taught doctors to be wary of fixed subsidies. Many still recall the institution of a general medical services subsidy at 7s 6d which, despite considerable inflation over the years, remained at that figure – although converted to decimal currency – for well over 30 years. Had there not been a right to charge a fee from the patient in addition to the subsidy, medical practice would have become quite uneconomic for the majority of practitioners... [S]ome would claim that a small fee discourages trivial consultations. However, where the service is free, as in Britain, there is little evidence that it is abused... The system of payment known as capitation has been established for many years in Britain... The doctors get a regular payment for all who are on their register irrespective of whether they are seen in the course of the year. In this way doctors can afford to give extra time to those who need special attention, knowing that many of the people who registered with them will use less time and effort than the payment would allow, and some will not attend at all. Many people would favour such a system in N[Z] since it also enables doctors to assume more responsibility for patients registered with them. In this country a patient may be regularly attending several [GPs] and no one doctor can be said to have ultimate responsibility. In Britain the... doctor as a result has a much more defined responsibility to the patient. In fact these responsibilities are clearly specified in a legal contract... The capitation system theoretically should encourage doctors to do even more to keep people well as they will have fewer people to see and hence less work to do for the money they receive.[But what happens to the principle of getting a *second opinion* – and what happens when, for any one of a variety of reasons, patients are unable to see the doctor they are registered to? Are they told: "Fack off! Can ye no see I'm abo' to go play golf?"] Many doctors believe that the community would be best served by a system which integrates capitation and fee-for-service and some experiments along these lines are in operation already in this country... Such a system would require registration and it would become more difficult, but not impossible, to change from one doctor to another in the event of dissatisfaction. It would, however, encourage continuity of care, which is something which is often lacking in N[Z] medicine... In the end the concern must be for the health of our children, which is not as good as it should be in a highly developed country such as this. To what extent this can be put down to failure to get medical care because of the fee barrier remains unknown. After all, inoculations are free but many children do not get them.

...Most countries that pursued a market model in health were now having second thoughts because of proliferating bureaucracies and other negatives... such as transaction costs... [an] English health... Professor... said yesterday.

...Cold weather and a flu epidemic... [- that caused] 130 deaths... in the first week and 60 in the second... [-] have strained hospitals run by Britain's state-funded National Health Service[(NHS)], with some blaming their problems on staff shortages and lack of cash... "We're facing the biggest crisis in accident and emergency in this hospital that I can remember in 12 years of being a consultant here," said... [the] clinical director of

Royal Liverpool Hospital's [A&E] department. His workload is up 50[%] in five years; funding has not increased. [However, t]he Government... maintains it has increased spending on health every year in real terms, and says its injection of market-style reforms has shortened waiting lists for non-emergency care. This year the service's budget is \$NZ106 billion... A poll conducted by the Gallup Organisation late last year found health was rated the nation's second most urgent issue, behind unemployment. Another Gallup survey found 60[%] believed the service would get worse...

BRITISH doctors, alarmed by a funding crisis in the state health service, are considering options to find more cash, including charging patients to see their family doctor... "The very fact we have to consider any such possible option demonstrates just now desperate doctors are," [the]British Medical Association chairman... told BBC radio... The BMA, a professional body, has no power to set fees for patients... Increasing taxes and making patients pay for hospital rooms and tests are other options being examined... [However,] the new Labour government was against raising taxes... [The NHS] was set up in 1948 to provide fair, free and state-of-the-art medical coverage... [Today] doctors say it does not have the money to provide treatment for everyone when they need it. Hospital closures, a lack of intensive care beds, year-long waiting lists for routine procedures and operations cancelled at the last minute make daily headlines.
