...[a] former private investigator... wants to turn the world on to worms as a cheap source of protein-rich food, potent fertiliser and efficient waste disposal. The... survivor of heart surgery has used a seven-year spell on the invalids' benefit to research possible uses for worms... While not great-tasting... “Worms contain all the minerals and vitamins. They're higher in nutrients than fish. They are two-thirds protein,”... [The former PI] has developed a feed pellet for fish, poultry, and livestock which is made principally from minced worms and oat flakes... Worm-based biscuits, high in protein, minerals and vitamins, could one day replace the milk biscuits donated to [Last W]orld countries... Export and local market opportunities could develop for products like worm burger patties, a feature of some Philippine menus. Worm slime could even prove a medical boon for humans if an antibiotic agent within it, which is presumed to keep the invertebrates disease-free, could be harnessed... [The former PI also] hopes other... innovations like worm composting toilets and rubbish bins will eventually catch on with householders... [b]ut his immediate goal is to use billions of red and tiger worms to halve the nation's organic waste output and reduce its need for landfills. Worms turned mountains of organic waste... into piles of vermicast... A trial negotiated with the Stratford District Council would see green waste diverted from the tip face to an on-site worm farm managed by his company, Vermicast N[Z]. The resulting... nutrient-rich... vermicast would be sold as fertiliser to farmers, orchardists, market gardeners, and nurseries... [While on the topic of fertiliser, I hope] Channel One attracts a good audience for its 46-minute Tuesday night documentary *Rubber Gloves or Green Fingers*, not least because of the bizarre way Television N[Z] tried to get out of screening it after contributing \$25,000 to the cost plus \$102,000 from N[Z] On Air. It makes a case for “natural” rather than synthetic chemical fertilisers and insecticides, following in the footsteps of *The Silent Spring* and other polemic pieces warning of the risks of using pesticides that interfere with the ecological predator-prey chain. It includes a segment on a fruit grower who tells of losing his rating as a certified organic producer after insecticide spray drifted across his property from a neighbouring farm. In a Gilbertian farce of accusations and counter-accusations, [the [film-maker... and[the] writer... fought TVNZ month after month to get the documentary shown. TVNZ said it was defamatory. I've seen it, and it is clear that no defamation claim would succeed. I'm satisfied that feeding plants with so-called organic materials is no better than going straight to their roots with the minerals they extract themselves from compost, but contrived synthetic insecticides are another matter. Pesticides that have killed off half the small birds in England, and abolished the ladybirds in my garden, deserve the critical attention films such as *Rubber Gloves*... focus on them.

...Why a programme about pesticides has TVNZ green around the gills... N[Z]'s heavy pesticide use weighs most heavily on Northland. Farmers, orchardists, organic growers and urban refugees jostle for space there and argue over traditional farming practices versus a chemical-free environment. Complaints hang as thickly in the air as spraydrift above the lush countryside... One Northland... organic avocado... farmer's problem goes back some years... A neighbouring orchard was sprayed with organophosphate insecticide. Spraydrift floated across the avocado grower's boundary in such quantities that his Biogrow label was revoked. Adding injury to injury, [the avocado farmer] became ill for several weeks. The spraydrift incidents involving this farmer and some of his neighbours have been well documented. A Northland Regional Council report said, yes, no doubt spray drifted across their property, but there was no proof of organophosphates poisoning people, and not enough evidence for the council to step in and stop the spraying. Attitudes have hardened since. For example, the medical officer of health for Northland has changed. The new incumbent... concluded after another spraydrift incident in Northland that it was “plausible” that some of the ensuing

illnesses were caused by the pesticide used. Against a background of growing international unease about agri-chemicals, farmers reply that sprays are a commercial necessity, part of modern productive life. The... avocado grower... features in a documentary called *Rubber Gloves or Green Fingers*[, which TVNZ]... commissioned... approved its final content... and agreed to screen... on primetime television. After nearly \$130,000 was spent, TVNZ then refused to show the documentary. It says that the section concerning the avocado grower is potentially defamatory. The producer... is willing to remove identifying places and faces... TVNZ, though, says the whole section must be cut... [The producer], whose company, Small World Productions, made the film, says his documentary would lose its edge if the whole section were cut: "The issue of spraydrift goes to the nub of the film... We have to show it, otherwise it's just glossing over, playing some kind of superficial game." According to [the producer] and the programme's writer... *Rubber Gloves or Green Fingers* is about the contradiction between N[Z]'s high use of agricultural chemicals and our green identity and what they see as our opportunity to produce organic food for world markets. It's a piece of advocacy journalism; that is, it takes a particular line, and tells the viewer clearly what that line is. Evidently TVNZ had no problem with that. When the production team delivered the finished product, TVNZ first accepted it, then alleged the six-minute section was defamatory. While [the producer] and TVNZ have argued the point, seven regional stations have aired the programme uncut – without being sued. Why can they do it and TVNZ not? ...In a letter to... [the producer, TVNZ's chairperson] said that TVNZ makes a much choicer target for litigation than regionals. Is this part of the programme defamatory? [The producer and writer] insist that it is not, that the section concerning the avocado farmer is absolutely true (truth is a defence in defamation actions), and that they can produce comprehensive supporting evidence, if TVNZ would look at it. But... they will change their programme to make the section acceptable to TVNZ's lawyers, if they would only tell them what is wrong with it. Says [the producer]: "...I've made a film that's important and I work professionally through the process to make sure the film is safe for the broadcaster as well as for the public issue it's about... I don't think it's right for TVNZ to behave like some sort of rogue." ...Meanwhile, [the leader of NZ's Green Party] has suggested to the Ombuds[person] that the public could see TVNZ's stance as being influenced by the large amount of pesticide advertising appearing on screen. Says... [TVNZ's] company secretary and general counsel...: "I've no idea that the pesticides people even advertise." Surely [the general counsel] has watched a rugby game on [TV? The counsel decries the Green Party leader]'s point: "It has no relevance. And it is a defamatory comment..."

...SAY "NO" TO EMBARRASSING GAS! ...A healthier diet means cutting down on fat and increasing fruits and vegetables. Benefits of these changes may include decreased risk of heart disease, colon, breast and other cancers, a[nd]... other diseases. You will also feel better and have more energy! It is especially important to cut down on saturated fat, which is mainly found in animal products. It is also important to eat more legumes and vegetables which are excellent sources of fibre, minerals, and assorted vitamins. Unfortunately eating more of these, often results in the unwanted side effect of flatulence for many people. BeSure... [- which] comes in convenient, discreet, take-anywhere capsules... you can use any time[-] ...was designed to help you to enjoy a variety of nutritional foods without the embarrassing side effects. BeSure helps to break down the sugars found in... fruits and vegetables so they can easily be absorbed and do not stay in the lower intestine where gas is produced by bacterial fermentation.

...GUYS, here's the diet advice you've been waiting for: Pizza can save your life. So can spaghetti sauce... [D]etailed studies of the diets of 52,000 [guys]... found that five servings a week of some form of tomato sauce lowered the prostate cancer risk by 40%. And the pizza-eaters in the study were among the lowest-risk group... The secret ingredient is a chemical called lycopene which gives the tomato its red colour. It's in the family of carotenoids, which give carrots their orange colour and are thought to prevent cancer, heart disease and [strokes]. Carotenoids are powerful antioxidants, substances in the body that fight cell damage, and lycopene is one of the most potent. It's also found in watermelon and grapefruit, but is not nearly as plentiful there. Here's the kicker: [a doctor] – who just happens to be Italian-American – found that lycopene is more available to the body when a little olive oil is thrown into the processed tomatoes. And it goes without saying that garlic is also a great source of antioxidants.

...THE publicity surrounding antioxidant nutrients has encouraged many people to take... vitamin... supplements... However the... antioxidant nutrients consumed in our normal diets have a protective effect against degenerative diseases including cancer and coronary artery disease. Vegetables and fruit are abundant in antioxidants and the protective nature of eating five or more servings a day... [- which matches the WHO] recommendation of 500g of fruit and vegetables a day... [-] can not be too strongly stressed. Wholegrain products, ...[olive] oil, especially extra virgin... (...oil made usually from green, unripe olives which have been pressed once and to which no heat or chemicals have been applied... [thereby retaining] all its natural flavours and [a] oleic acid level... below 1[%; further]... down the scale is "virgin olive oil," which has an acidity level of between 1 and 3[%; while the]... real cheapos are... refined oil that is extracted with additives from the pulp, or residue, of the pressing[- but] even with such intriguing labels, olive oil[, the local prices of which]... range from \$15.95 for 500ml of Romulo to \$37.40 for 500ml of Colonna... is not always as it seems[because the] words "extra virgin"... are not necessarily an indicator of quality...)... soy beans and other legumes are also rich in antioxidants. Antioxidant nutrients play an important part in the body's defence system against free radicals of oxygen and reactive-oxygen species. While the body needs oxygen to drive essential metabolic processes, it also continually produces free radicals and reactive oxygen species that can cause damage. Under normal circumstances, free-radical activity is well balanced by the body's complex antioxidant defence system. However, as we age, oxidative damage becomes more apparent[(in addition, elderly)]... people often lose so much of their ability to taste and smell that they are in danger of malnutrition, immune problems or food poisoning[- using]... flavour enhancers such as fruit juices and... stocks [is] likely to encourage the elderly to consume a nutritious diet... according to... a psychologist who reviewed research on the problem[])... Stresses such as severe and prolonged infections, ultra-violet radiation and smoking increase this damage. Antioxidants occurring in food join antioxidants manufactured by the body to fight against free radicals... The antioxidant minerals, iron, zinc, copper and manganese, [further] assist the body's enzymes to fight free radicals... The antioxidant vitamins are A, E, C and beta carotene. These scavenge for free radicals and reactive oxygen species, mopping them up and neutralising them. However they are not solely antioxidants but can also be pro-oxidant in certain circumstances, producing billions of harmful free radicals. This is more likely to be so in the pharmacologic quantities found in supplements. Vitamin C, for example, is dangerous in the presence of high iron stores in the body... The main message is to eat a wide variety of food in order to obtain a nutritional advantage and not to limit yourself to [hu]man-made chemicals... The greatest benefit seems to be associated with eating a variety of plant foods which provide a complex mixture of antioxidants. This also avoids the danger of unbalanced combinations causing an environment which promotes oxidation reactions, as can happen with supplements... There are about 600 anti-oxidants in fruit and vegetables which may be more effective than vitamins in preventing undesirable oxidation reactions[, but there]... is a good possibility that the most potentially-beneficial substances have not been isolated yet and so are not available as supplements.

...Every day thousands of people walk into retail health food stores and spend 20 [to] 40% too much for their vitamins. Why do they do this? Very simply because they aren't aware of the fact that buying through mail order can save themselves the added costs of the middle[people], and the usual retail overheads. There is a company set up to provide this service... – *Golden Glow Natural Health Products* and [it is] very enthusiastic about the savings you can make.

...[a] British heart specialist... [says eating] fruit and vegetables is far better than taking vitamin... pills... if you want to prevent a heart attack... [The heart specialist, from] Addenbrookes Hospital in Cambridge... drew his conclusions after reviewing international studies in which people suffering from heart disease were given supplements of Vitamin C, or Vitamin E or betacarotene... "There is no conclusive evidence that taking... vitamin supplements reduces the risk of cardiovascular disease. We should... be recommending that people eat a diet rich in fruit and vegetables... or... exercise... My concern is that in taking single vitamin supplements, people may be wasting money and be given a false sense of security,"...

Are vitamin[supplement]s vital? SPRING arrived and left you feeling worse. But at least you've [had] your last... snuffle... and can put the vitamin C, the multis and other vitamin supplements back in the bathroom cabinet. Scientists would say don't bother; pour them down the drain. It's almost undisputed that increasing your intake of vitamins by eating more fruit and vegetables reduces the risk of cancer and heart disease. But evidence that swallowing pills has the same effect is thin on the ground – unless you have a deficiency, are elderly and not eating well, or have very specific needs. This message appears not to have got through to the public. Up to one-quarter of N[Z]ers are believed to take vitamin supplements in one form or another and they are taking more of them. Combined sales of vitamin, mineral and herbal supplements have doubled in the past three years and are expected to grow by another 24[%] this year – to reach \$25.6 million. Just why your sore throat disappears after chewing one of those delicious vitamin C pills is beyond science... Otago University's human nutrition department, allows that dosages of between 500mg and 1000mg can possibly reduce the severity of your cold but there's little evidence that the vitamin prevents you catching them. Athletes who take supplements of thiamin and riboflavin for an energy boost are also fooling themselves. There are no tests that show any benefit or improvement in energy from increased supplement levels... [– although] those who indulge in heavy physical activity need to constantly replace riboflavin, which is crucial in the production of body energy, because it is water-soluble and not stored in significant quantities in the body. Those who take B5 or B3 to alleviate stress might as well suck a peppermint. As long as you aren't deficient, the effort is pure placebo... Moreover... deficiencies of B vitamins in N[Z] are rare... However, points out... Red Seal's managing director... most N[Z]ers don't have an adequate intake of fruit and vegetables and that's why they should be buying vitamin supplements. With him on that side of the fence is... [the] technical manager for Healtheries who, with 52[%] of the market, are the largest manufacturers of supplements. [The technical manager] has no quibble with the evidence of clinical trials but... would like the debate to be a bit more open. "There is no doubt that the jury is still out on a lot of these studies... Athletes tell us anecdotally that vitamins work." But when [the technical manager] feels a cold coming, [it] hops back over the fence – leaving his vitamin C behind. "No... I don't believe it works for colds. Lots of people do believe in it but I can't find a shred of evidence." Part of the growth in the market for supplements is because of the rise in popularity of antioxidants... Evidence shows that antioxidants can be effective in slowing the onset of some degenerative diseases and in reducing the likelihood of having a heart attack or getting cancer – but only if you eat more fruit and veges. The point about fruit and vegetables is that they contain many more chemicals than those antioxidants identified as beneficial, and that these benefits may be the result of as-yet unexplained synergistic effects of several substances... But... evidence that folic acid, or folate, reduces the incidence of neural tube defect (spina bifida) is now so convincing that the Ministry of Health recommends that [gals] who want to become pregnant take a supplement to increase their intake by 0.4mg a day. To be effective the supplement must be continued for 12 weeks after conception. A[though 'natural folic acid has been taken out of food by over-processing it', a]chieving that amount by diet alone would be extremely difficult... Folic acid is present in green leafy vegetables, kidney beans, pulses and... some fortified breakfast cereals. There has been a suggestion... that fortifying flour by adding 0.1mg of folate to every 35g would ensure [gals] received an adequate amount... But... ['small tumours have a strong craving for folic acid', and d]espite fortified foods, the rate of [iron deficiency] among Americans has remained the same over two decades[(t)oday, 10% of toddlers, adolescent girls and young [gals] don't get enough iron(), and]... the repercussions for the rest of the population are unknown... THE news for the smoker is even worse than for the general pill-popper. If you smoke, taking a supplement of Beta carotene, because you've read it will protect you against cancer, may hasten the onset of the disease you dread. Two large intervention trials... have indicated adverse effects from Beta carotene supplements for... heavy smokers. If you have to smoke, you could do well to increase your vitamin C intake... "In the U[S] a recommended daily intake [RDI] of vitamin C for smokers has been set at a higher level [100mg a day] than for the general population [60mg a day]. In N[Z] the RDI is 40mg for [guys] and 30mg for [gals]. Some scientists are arguing that the daily intake should be increased to higher levels, perhaps 200mg per day,"... says... the Institute of Environmental Science and Research in Christchurch... One lemon has 120mg, an orange 64mg and a kiwifruit 92mg of vitamin C.

...If you want to keep the doctor away, leave your apples in the fruit bowl and switch to a kiwifruit, new research suggests. The hairy green fruit has been named the "most nutritionally dense"... out of a list of 27 commonly eaten fruits. In particular it scored highly for vitamin C and E, magnesium, potassium and fibre... It also has high levels of the calm-inducing serotonin and the amino acid arginine, which is used to treat impotence... The study, carried out by scientists in the U[S], measured how many essential vitamins and minerals each fruit provided per 100g of weight... Avocados also scored highly in the nutrition stakes, topping the tests for vitamin E, folate, potassium and magnesium... Other exotic fruits – papaya, rock melon and strawberries – outranked the more mundane bananas, oranges and apples... [Strawberries, which are] widely associated with creamy summer desserts and the annual Wimbledon tennis tournament in London, scored best for nutrients yielded per calorie consumed.

...a crop of strawberries [is] destined to give Aucklanders a taste of the traditional summer fruit a bit sooner than usual... [A] Kumeu strawberry grower... planted [a] hectare under plastic [held up by hoops] to create a "mini hot-house." This is designed to bring the fruit on in September, a month earlier... The hoops are exposed when the strawberries are uncovered for weeding.

...[the strawberry is a 'plant of the rose family common throughout Europe. It began to be cultivated in the thirteenth century. Five or six species of strawberries are known. From these a number of varieties have been cultivated. Strawberries are classified into two groups: small strawberries of which the commonest variety is the ever-bearing strawberry, and large strawberries, which comprise a great many varieties. These are constantly being added to by crossings. Large strawberries came from the US and Canada (*Fragaria virginiana*), and from Chile (*Fragaria chiloensis*). They were imported into France by a naval officer. The beautiful Madame Tallien bathed in strawberry water to keep her skin soft and velvety. About 10 kg were crushed for each of her baths. Some people are allergic to strawberries. Cooking them for a few moments in boiling water can counteract this. Strawberries must be eaten freshly gathered because they do not keep. They may also be eaten pureed. Strawberries are used for jam-making, to make a soft drink and for the extraction of spirits. The strawberry tomato is a fruit originating in Mexico where it is called Mexican tomato. The strawberry tomato plant belongs to the same family as the tomato and the potato – a tuber-bearing plant native to South America that was introduced into France, as an ornamental plant, towards 1540, and later from North America into England. Sir John Hawkins is said to have introduced the potato into England in 1563, but its cultivation was neglected there and it was reintroduced in 1586 by Sir Francis Drake. Sir Walter Raleigh grew potatoes in Ireland. In 1619 potatoes figured among the foods to be served at the Royal table in England. In France the potato was still considered suspect in 1771; it was said to be unfit for human consumption and dangerous, because of its weakening properties. It was Parmentier who rehabilitated it. In a thesis, Parmentier listed it among the vegetables which could be used in times of food shortage along with horse chestnuts, acorns, and the roots of bryony, iris, gladioli and couch grass. In 1773 Parmentier began his research into the panification of potato flour. In 1787, during a period of scarcity, Parmentier obtained the concession of 50 arpents (old French measure roughly equivalent to an acre) of poor land in the Sablon plain. The cultivation proved successful, contrary to all expectations, and a short while later Parmentier was able to offer King Louis XVI a bouquet of potato flowers, which set the fashion for this plant. Denigration gave place to a period of enthusiasm and a craze for the potato flower, which was used as a decorative design for plates. After its popularisation, the potato became one of the staple foods at the beginning of the nineteenth century. The potato is an energy food, 100 calories per 100g, rich in carbohydrates (20 to 25%), lacking in albuminoids. It contains a few mineral salts (potassium mostly), Vitamins B and C, and a small amount of iodine. There are only traces of fats and calcium. It constitutes a highly alkaline food. Its starch is one of the most assimilable of all and for this reason it can be included in the diet of diabetics (weight for weight, the potato contains two and a half times less carbohydrates than bread, which makes it a highly desirable food in diets for diabetics, as 40g of bread can be replaced by 100g of potato). Yellow-fleshy potatoes are considered the best, since white-fleshed potatoes are usually demineralized. Some people find potatoes hard to digest, especially mashed potatoes, often due to insufficient mastication and salivary impregnation. To avoid the loss of mineral salts, and in particular of

potassium salts, potato should not be boiled in too much water (or at least the water in which it is boiled should be kept for soup). This loss is decreased by cooking in fat, such as butter, lard or oil. There are lots of nutrients – especially potassium and fibre – in the skin, so the best method of cooking potato to preserve the maximum of its mineral elements and taste is to bake it in the ashes or in the oven. The taste is incomparably better and makes it possible to eat potatoes without salt, should this be necessary. Sweet potato is a hardy plant with edible tubers resembling the potato. A native of India, it has now adapted to grow in all warm countries.’ Editor’s note: ‘*Kumara* is a sweet potato that was brought to NZ by early Polynesian migrants. It almost certainly was a Central American plant originally, and its introduction into the Pacific and its distribution around the islands of Polynesia has been the subject of much speculation over the years. Kumara was the major cultivated food crop of the pre-European Maori, and is the only pre-European cultivated plant to become commercially established in the modern NZ diet – although for a long period following European settlement it lost favour to the potato which can be grown in a shorter period with less care (Kumara is grown successfully here only on sheltered north-facing gardens in the north of the North Island)’.

...though ‘60-80% of cancers are known to be caused by diet’, an] **Auckland cancer researcher has found early signs that some traditional Polynesian vegetables help ward off cancer. The findings...** [- which are part of a] **two-year study being aided by \$93,000 from the Lottery Grants Board...** [-] **could propel Dargaville, the kumara capital, on to the international health map. Results from the humble sweet potato are creating a stir in the laboratory, along with puha and watercress. Taros, coconuts and pineapples have also gone under the microscope, but the findings are yet to come in...** [P]eople living in the Pacific Islands generally had lower rates of most cancers, heart disease and diabetes. However, [if]... you think this means you can now bypass Western vegetables, think again. Much-dreaded brussels sprouts and broccoli have proven to have anti-cancer properties while tomatoes seem... to cut prostate cancer... [The findings come as] Tradenz... published comments on... the opportunities for N[Z] in the expanding world market for healthy food.

...[‘*health foods* If it’s true that you are what you eat, then here is a list of nutritious “musts”: CARROTS Super-rich in beta carotene – one carrot gives you all you need for a day. They are good against cancer, especially of the bowel. Use pureed for infant diarrhoea and juiced for liver problems. Carrots can help with chest infections, skin and eye problems. CELERY Very rich in calcium, it is diuretic – so it helps pre-menstrual water retention. It is also a traditional herbal cure for rheumatism, and is reputed to be an aphrodisiac. CRANBERRIES The iron in cranberries would be a valuable contribution to a vegetarian diet. The juice kills bacteria and is effective against urinary infections and cystitis. GRAPES A form of instant energy and easily digested, so they are good for you as well as delicious. They are vital, too, for relieving chronic fatigue. OLIVE OIL It stimulates production of bile, and so improves fat digestion. OATS Contain lots of protein, polyunsaturated fats, B vitamins, calcium, potassium, magnesium, silicon, vitamin E and a valuable growth-promoting hormone called *auxin*. They help reduce cholesterol (a bowl of porridge a day can bring the level down by 20%). Oats also control sugar metabolism, so they are good for diabetics, and they keep the bowels regular. ONIONS Powerfully antibiotic, they are excellent for chest, stomach and urinary infections. They also protect the circulatory system and help increase the good fats in the blood. ALMONDS These delicious nuts are a highly concentrated form of protein – and, unlike some other nuts, easily digested. They are perfect for convalescents and especially good for chest complaints. More than half their weight is oil. APPLES High in the gumlike substance called pectin, which reduces cholesterol, apples are also a good source of malic and tartaric acids, which relieve indigestion and break down fats. Eat two apples a day if you suffer from arthritis, rheumatism or gout. APRICOTS Rich in beta carotene, which helps protect against cancer, helps fight infection and keeps your skin clear. The dried versions have more iron and fibre than fresh apricots. AVOCADOS These contain potassium – to beat fatigue, depression and poor digestion – the anti-cancer vitamins, and healthy mono-unsaturated oil. Avocados stimulate production of collagen, so they help to keep your skin looking young and fresh. They are also good for circulation problems and fertility. However, the avocado is the only fruit that contains fat. BANANAS One of the first fruits gathered and cultivated by humans, bananas are a perfect fast food.’]

...*Bottom of the junk food chain...* What do teenagers and kitchen garbage grinders have in common? Quite a lot... MOST parents of teens will recognise the whine “there’s no food in the house.” Never mind that the pantry is groaning with staples, the fridge loaded with eggs, milk, cheese and yoghurt, and the crisper a cornucopia of fruit and veg. It’s the freezer that counts, and in households with teenagers it cries out for pies (microwave heatable), mini-pizzas, crispy-coated potato wedges, potato medallions, sausage rolls, ice cream and ice-blocks. Fast, fatty, salty and hot – or frozen and sweet. That’s what teenagers crave. An instant hot meal with frozen afters. A big bowl of ice cream is necessary to round off each and every meal – and in our house that can include breakfast. For snacks, the teens can devour fruit at a cracking pace. But they also desire cheese balls, salt-and-vinegar crisps, barbecue snacks, chocolate biscuits and chocolate milk, canned soup or instant noodles – though apparently the last lose their appeal after a few months of daily consumption. Distinctions between meals and snacks are meaningless to grazing teenagers. Most adolescents eat at least six times a day, say four Auckland public health researchers... [who] have just completed a study on the eating habits of 13- to 16-years-olds... As one mother reports of her 15-year-old son: “[My son is]... like a permanent hole. I’ve watched him eat for three hours at a stretch, just one thing after another.” While there’s no doubting teenage appetites, the researchers were more interested in just which foods these kids were choosing to eat – and what influenced those choices... While parents provide most of the food that gets eaten, the adolescents do influence what is purchased... As principal shopper mum takes charge of the trolley, loading it with staples and unprocessed food. The teens cruise the aisles, amassing pricey toiletries and value-added foodstuffs. Some get dumped straight into the trolley while others are recognised as negotiable items. In our house it goes like this: “Yes you can have the potato wedges but only one bag. No, I’m not buying the crisps but you can deduct them off your pocket money. Yes, you can have the yoghurts but I am definitely not buying that disgusting cheesecake... oh alright then.” As one surveyed mum puts it: “I guess I influence those things by telling her that we can or cannot afford them... [while my daughter] influences me by telling me [it] doesn’t like them.” ...The researchers also discovered parents negotiate with their kids which veg to include in the evening meal. Otherwise, say the parents, disliked veges are resisted at dinner (and who wants hassles then?)[...] Disliked fruit too is left to rot in the bowl. VEGETABLES, even preferred ones, don’t get eaten as snacks. That, say the researchers, is because they are not instantly available. Teenagers report occasionally eating a carrot or tomato as a snack, but they avoid any vegetable that requires preparation... Fruit is different. That’s seen as an acceptable snack food. Peeling a banana is just about on. Not that teens purchase fruit. It is something parents are expected to supply. Most of the surveyed teens say they wouldn’t think of spending their own money on fruit. Parents do provide fruit – but they have a few problems about it. Some avoid higher-priced fruits, while others ration fruit for reasons of cost – summer stone fruit in particular. “I actually restrict it,” says one mother. “...[my daughter] can eat six nectarines at a sitting... I spend \$50-60 in my major shop of fruit and vegetables and then sometimes I have to go back again.” Some parents resort to putting the bananas and oranges in the fruit bowl, while doling out the passionfruit and peaches from a hidden supply. That avoids squabbling along the lines of “[my brother] ate seven apricots and I haven’t had any.” From a public health point of view, encouraging emerging adults to eat more fruit and vegetables and less fatty, sugary food so heavily promoted on TV is a good idea. After all, fruit and veg are proven to help prevent heart disease and cancer – although not one of the surveyed teens volunteered that information when quizzed about it.

...IT used to be rubbished as “pure, white, and deadly” but sugar is no longer considered such a poison on the palate. It may provide only “empty calories” but you have to bolt down half a kilo of the stuff before it starts to make you fat. That is because very little of the carbohydrate we consume is converted to body fat under normal circumstances and sugar is just another carbohydrate... Eating fat is what makes you fat. Eating a little sugar may even help keep you lean. Reports from the U[S] indicate that people who restrict their sugar intake eat more fat in compensation and conversely, when fats are restricted in the diet there is a natural tendency for sugar consumption to rise. It is called the “fat-sugar see-saw” and the dietary experts all agree that the low-fat option is the way to go for unclogged arteries and a daintier derriere. There are no proven links

between sugar and heart disease – or cancer. On the minus side, sugar can rot your teeth, but only if you suck on sugary substances for hours a day. A sweet dessert alone will not result in caries... Even diabetics are now allowed to consume moderate amounts of sugar. At the centre of this sugar revolution is the “glycaemic index factor.” The Glycaemic Index is not new but it is only beginning to be understood by ordinary people designing ordinary breakfasts for ordinary lifestyles. The GI measures the rate at which carbohydrate foods are digested and absorbed into the bloodstream. Pure glucose is absorbed the fastest and has the reference score of 100. All other carbohydrate foods are compared to that... It is the surprising GI factors of some common carbohydrates that have forced dietitians to reconsider the role of sugar... A baked potato scores 85 on the GI compared to 68 for a Mars Bar. Sugar is “moderate” at 65... So have that ice cream, muesli bar or fruit juice – if you are active enough to “deserve” it. But look out for the fat, which is present in a lot of “sweet” foods... “It is often a spoonful of sugar that makes the fat go down,” says... a... sports nutritionist.

...A US government advisory panel says saccharin[(the ‘commercial name for a crystalline chemical substance, soluble in water, with a very sweet taste; the sensation of sweetness provided is 250 times stronger than that of sugar, 5 centigrams being equivalent to a normal-sized sugar cube – but it has no chemical analogy with sugar and none of its nutritional value; it is chiefly used to give an illusion of sweetness’), **ja key ingredient in some sugar substitutes, should stay on the list of likely cancer-causing agents.** [● ‘Carrots have a notable amount of sugar, which adds to their nutritive properties.’

...‘Any substance which upon entering the body is capable of supplying it with materials for growth or repair and with fuel for its energy requirements is an aliment. *Simple aliments* are those that the organism consumes and absorbs without first submitting them to modification; water, which is of considerable alimentary importance, and sea salt are about the only substances in this category. Foods that contain an excess of basic elements (lime, soda, potassium, magnesium) are called *alkalescents*. Milk and blood are the only alkalescents of animal origin. On the other hand, most foods of vegetable origin are alkalescents with the exception of cereals, cereal products and a number of vegetables of which we consume the flowers (artichoke) or buds (asparagus, Brussels sprouts). All acid-tasting fruit are alkalescents. *Alimentation* must provide (with a small excess) the wherewithal for growth (in the young), for the repair and upkeep of the tissues and organs, and for the expenditure of energy. To determine the energy value of an aliment or diet, we employ as a measure the calorie, going on the principle that all forms of energy can be transformed into heat. Modern dietitians agree that the normal alimentation for an adult of average weight (65kg) in repose or engaged in only light duties must correspond to 2350 calories, that is approximately 36 calories for every kg. Fats have the highest calorific value of all foods, but they produce a feeling of satiety more rapidly than other foods and the system can only tolerate a limited amount of fat (there are three principal constituents in fat: *stearin*, *olein* and *margarine* – stearin is solid at normal temperature, olen is liquid and margarine has intermediate consistency). The normal diet for an adult must contain an average of 75g of natural fats daily (in very cold countries far more is needed’)]...

DO YOU FEEL worn out halfway through the day? Try changing your diet. “Eating wisely can increase your energy,” says... a nutritionist... Food, after all, is the body’s fuel, and adding high-energy choices to your diet will keep your engine running at peak performance. That means having breakfast each morning, refuelling your body with a meal or snack every four to five hours, and choosing the right foods – [‘all organic foods can supply energy to the body, but the most readily usable form of energy is provided by carbohydrate foods. However, one tablespoon of fat provides two and one-quarter times as much energy as a tablespoon of carbohydrates, which are the only food which can be almost totally eliminated from the diet.’]

...ARE you in the Zone? This is the question on everyone’s lips in Los Angeles. And if you’re a supermodel... a megastar... or a top athlete... in fact if you’re an anybody who is anybody, then the answer must be yes. In a city where flab-fighting is a full-time job and bandwagon-jumping is everybody’s favourite past-time, the Zone diet is the hottest thing since sliced bread. Actually, according to the Zone, sliced bread isn’t hot at all. Neither is pasta or potatoes or any of those other starchy old carbohydrates. Welcome to a bizarre world where carbo-loading is bad for you and eating a high protein, high fat diet is good. The secret, says [the Zone’s] inventor... is all in the proportions. Eat a mix of 40% carbs, 30% protein and 30% fat at every meal and you’re at the optimum zone to lose weight. Of course this prescription means sitting down to a Zone meal is a scientific equation. Skipping the number crunching, most Hollywood celebrities choose to dine out at Zone restaurants instead. Or if they’re on the run they could grab a Zone Bar to see them through. When[the] biochemist... wrote *Enter The Zone*, as a “guide for medical purposes”[the biochemist claims it] had no idea the text would sell over 1.5 million copies and expand into an entire lifestyle. Perhaps [the biochemist] didn’t anticipate the ’90s craving for fad diets. Just when it seemed that nutritionists had finally convinced us that living off nothing but whole grain bread, starving ourselves on cabbage soup, or surviving on only green apples just didn’t work, it seems the fad diet is regaining popularity. Let’s face it, eating sensibly is boring, whereas surviving on the Hollywood Diet of fresh pineapple, strawberries and champagne is more of a challenge... [A]n Auckland nutritional consultant[’s]... problem with the Zone diet is simple. “The ideas in this book are so outdated it isn’t even funny. They go against all the state-of-the-art research on nutrition.” [Another] Aucklander... – a freelance television director who was so convinced about the Zone, [the director] began to import the second book *Master The Zone* himself because it wasn’t available here – anticipated such scepticism. His response? “I’ve followed all the fads and tried them for years... what convinced me about this one is that it really works. I went from 24% body fat to 14%.” ...[the director is] obviously sincere in his enthusiasm, although his arguments for the diet seem specious at best. “10,000 years ago we ate like this,” [it] says of the Zone, “then the ancient Egyptians invented bread and that was when we started getting fat.” Apparently, there are some pudgy mummies lying about in their tombs. Then there is the “fat cow” argument, “What do they use to fatten cattle? Grain! So obviously bread and grains are fattening.” Ermm... Not a likely comparison since cows have three stomachs which would tend to point to differences in our digestive systems... Forget keeping your diet low fat says [the Zone’s] inventor... “it’s excess insulin that makes you fat and keeps you fat. And your body produces excessive amounts of insulin when you eat (1) too many fat free carbohydrates, or (2) too many calories at a meal...”... “People lose weight on this diet because it is so energy restricted,” says [the nutritional consultant]. The Zone diet adds up to under 1700 calories a day – low enough to lead to weight loss in almost any adult. The recipe for weight loss is simple, “At the end of the day... [it’s] down to energy input verses energy output... [M]ovie stars spend hours on exercise and personal trainers. It’s not all based on diet.” ...A recent study at Stanford University... compared low calorie diets where fat, protein and carbohydrate intake varied. All participants lost the same weight no matter what combination they ate... Sorry fad dieters, back to the drawing board.

...HERE’S the dilemma. For several days you’ve been courageously adhering to The Diet, but sitting inconsiderately in front of you is a dark, heavy fantastic chocolate thing. Your body has already made the decision and begun watering the mouth. All that stands between you and gastronomic infidelity is willpower. To eat or not to eat? Of course, your conscience says stick with the diet... But how wise is this advice really? Consider the story of two [US gals]. For most of her life [one] exercised no self-control when eating, wolfing down whatever took her fancy. By the age of 49 [this gal] clocked the scales at more than 200kg... Tragically, it wasn’t that [this gal] accepted obesity – a car accident earlier in life had left her mentally retarded. [This gal] was completely unaware of her weight problem. [The other gal], on the other hand, paid close attention to her appearance and had gone on diets throughout life. But her battles with the demands of the stomach were in vain. At 49 [the other gal] too tipped the scales at more than 200kg. How could these [gals], with their very different attitudes to food, end up with almost the same figures? [A couple of] US obesity researchers... believe the explanation lies with [the two gals’] relationship. They were identical twin sisters and therefore had identical genes. Pitted against a genetic programme hell-bent on fattening [her up, the other gal]’s self-control was just too feeble a force. So are the waistline impaired not gluttons after all? Just a little remiss when choosing their parents? Interestingly, many studies over the years have shown that obese people do not eat more than average, indeed some seem to eat less. But [a] Chicago nutritionist... found such results hard to swallow. A more likely

explanation, [the nutritionist] figured, was that heavier people consistently underestimate their food consumption. For in most of these studies they were the ones trusted to note down what went into their mouths. [The nutritionist] devised a more objective method. By dosing up the subjects on radioactively labelled water [the nutritionist] measured how much energy their bodies burned over a two-week period. [The nutritionist] weighed them before and after to work out the bulk they put on and then a simple calculation revealed how much food must have been consumed over the fortnight. Sure enough, bigger people ate more. Then there's the old I-don't-pig-out-I-just-have-a-slower-metabolism line. Wouldn't you like an after-dinner mint for every time you'd heard that one. It's true that more leisurely engines chew through less fuel but... most of the evidence indicates that both the skinny and the elephantine run on similar-sized engines. In fact, the metabolisms of fatter people are actually a little faster than normal but this is due to their greater size. Once adjustments are made for body weight there are no significant differences... It's long been thought diet is something learned from the environment you grow up in. Feed a child apples instead of lollies and they'll become a thin apple-munching adult. But it now seems genes exert a stronger influence. An excess of cakes and chocolates may create fat children but the effects will be only transitory if they have thin genes. Still the environment obviously plays some role. How else do you explain the results of one survey which found that fat people tend to own fat dogs? And, of course, not all identical twins are equally rounded. Studies of migrants also indicate that a country can cause a person to put on weight. On average the Japanese living in America... are heavier than those who stay back in the homeland.

...Nearly 70% of our flower exports go to Japan, and that's meant mixed blessings for the industry... Flower exports fell in the year to June from \$61 million to \$53m, [primarily because] while... the yen has strengthened... the Kiwi dollar... [has weakened. B]etween \$10m and \$20m... [of sales are attributed to] FlowerZone International... SUCCESS in Japan has earned [the company] a finalist berth in the Tradenz Exporter of the Year awards... FlowerZone [also] exports cut flowers to... the rest of South East Asia, North America and Europe. It buys cut flowers year-round from 300 to 400 growers at either a fixed price if they are sent direct to customers or at a price determined later if sold at auction overseas. Speed is the essence. A typical scenario: A grower cuts and packs flowers on Thursday, and sends them – usually by road – to FlowerZone's headquarters near Auckland Airport. They arrive early Friday... and are maintained by FlowerZone at controlled temperatures then readied for loading on to a Tokyo-bound plane. The aircraft takes off on Friday afternoon. The flowers arrive in Japan early on Saturday... NZT and are cleared in time for Sunday afternoon wholesale auctions. By Monday they are for sale in florist shops. Different varieties require different handling and packing into high-grade cardboard boxes. Some travel with water vials, cushioning material is used liberally and if the export markets are suffering a cold snap they may be wrapped in several layers of newspaper to keep them warm... [One of FlowerZone's partners] said the most popular flower was the cymbidium orchid, grown in four colours and which retailed in Japan for \$25 to \$40 a stem. In Italy, our No 2 flower market, it was the "Queen of Flowers" and in great demand. They were grown in winter and supplied to markets at a time they were unavailable from Northern Hemisphere growers, particularly Holland. That also applied to No 2 and No 3 in the export popularity stakes – calla lilies and sandersonias, the major (Kiwi) summer sellers. Few roses were exported. Once big sellers in Norway and Sweden, the market collapsed overnight about three years ago when those countries joined the European Community. Before that N[Z] had competed several months of the year with Dutch exporters, overcoming the problems of distance by supplying bigger and better flowers... [NZ's biggest flower-exporting competition currently comes] from Kenya, Zimbabwe and South Africa... "We can't stop competition from countries with cheaper production bases. The only way we're going to stay ahead... is to... develop new and better varieties..." said... [FlowerZone. By the way,] 36,000 long-stemmed blooms [have been] wrapped for Red Cross Red Rose Day today. They are available for a \$1 or \$2 donation that will go towards emergency preparation courses for children and to build up equipment supplies. A local shortage of red roses meant organisers had to import some... at the last minute... from... [AUS and Holland – where t]ulip growers... a[re getting] ready for the annual bulb harvest. The tulip generates big foreign currency earnings for the Netherlands from the export of bulbs.

...ALL that glitters is not gold – as [an] Invercargill tulip growing family... know all too well. Over the next few weekends thousands of Southland flower lovers will make their annual pilgrimage to tiptoe through 11ha of tulips in full bloom at the[ir]... flower farm... "Half don't buy anything. They just come for a look. Some have been coming for years and years," said... [the son of a couple] who emigrated from Holland 38 years ago. But lack of flower sales doesn't faze the [tulip growers]. In fact, the cherished blooms have a tragically short lifespan. At the end of showtime they are cut and dumped – so many millions of flowers would have little commercial value anyway. The real gold for these growers is what lies under the ground... Small bulbs are planted out, not for the flowers but to increase the size of the bulb, making them more saleable to other growers, who will replant them to reap better quality flowers for on-selling... The family not only supplied a local market with 2-2.5 million bulbs each year, but have now exported to Holland the first trial shipment of half a million bulbs. Tulips are always planted in spring... It was possible for growers in Holland to cold store bulbs during the northern summer for replanting in September, but quality suffered, and bulbs from N[Z] were finding a ready market... [Another plant being 'cultivated for its bulb' in Southland is the giant garlic – which has cloves the size of a normal garlic compound bulb, but a milder smell. However, for those of you who prefer a] truly odourless garlic... Kyolic – The Aged Garlic [–] ...supplement with scientifically proven immune boosting effects... [is now on special: pay just \$12.95 for] 30 CAPSULES... \$24.40[for 60.

...the 'LEEK is a hardy biennial, the origins of which go back a long way, which has never been found in its wild state and is believed to be a cultivated variety of oriental garlic.' Speaking of 'garlic, Aristophanes wrote that athletes used to eat it before their exercises at the stadium. In the 16th century, certain doctors, says the *Dictionnaire de la table*, "condemned themselves to constant carrying of several cloves of garlic in their pockets to protect them, and their patients, from the bad air and epidemic diseases." "The king of healing plants, modern science has now proved garlic reduces cholesterol, blood pressure and clotting tendencies, improves circulation, fights attacks by bacteria, fungi and viruses. Garlic also helps protect against cancer and is good for infections and stomach bugs. I tell everyone that garlic is an indispensable ingredient in many types of cooking. Include it in all types of savoury food.'

...The American who taught the English how to cook French food and 16 years ago accurately predicted the rise of Pacific rim cuisine and the popular fusion of eastern and western cuisines is making a flying first visit to N[Z] this week... to promote his updated book *Great Dishes of the World*... [H]is rise to stardom is as colourful as his food. When the New York[er]... arrived in Britain in 1953, the country was getting over food rationing, and cooking was seen as a tedious chore. After editing a paper in Paris and also running a theatre in Montmartre and touring Italy as a singing cowboy, [the New Yorker] took on the task of teaching the English how to... have fun with [cooking]. In 1963... *Great Dishes of the World* was first published. The book was subsequently translated into 12 languages and enjoyed sales of over four million copies. Restaurants followed, in Islington (London) and Hintlesham Hall in Suffolk and both received Michelin star status. His *Food, Wine and Friends* television series was a huge success... Despite an impressive publishing record... [(the New Yorker] has published a total of 11 books[) his]... food today can be summed up in one word – simplicity. ["Simple need not be boring. Simple can be exotic and full of flavour, yet be prepared in minutes." There is, however, nothing new about his theories – the *New Larousse Gastronomique* states that 'the true gastronome, while esteeming the most refined products of the culinary arts, enjoys them in moderation, and for his normal fare, seeks out the simplest dishes.']

...IT'S enough to make Thomas J Edmonds turn in his grave. The N[Z]er who invented baking powder as we know it and who was responsible for the first – and now ubiquitous – *Edmond's Cookbook* would surely be upset to discover a lost generation in the kitchens of N[Z]. Apparently young NZ[er]s can no longer cook. Right now a large proportion of under-35-year-olds are staring blankly at the food processor and wondering exactly what it was they were meant to do with flour, eggs and milk. They can't understand a cookbook, they eat a lot of toast and tonight they'll probably end up down at the supermarket buying a packet of Edmond's pancake mix. The kids-can't-cook controversy is being fuelled by the N[Z] Beef and Lamb Marketing Bureau... The bureau's market research has shown a large portion of the population – mainly [gals] and younger than 35 – thinks beef and lamb is old fashioned, confusing, difficult and time consuming to prepare[. so]... its Quality Mark campaign... aims to educate

those who don't know their spatula from their fish slice, or a lamb shank from a chop, with some simple meaty recipes. There's no doubt the eating patterns of our once three-veg-and-meat-proud nation have altered. In general, N[Z] consumers... spend less time on preparation, an average of half an hour on dinner, and the most common ways to make a meal are opening a can, box, bag or the phone book. They also spend more money on eating out... Grocery stores and supermarkets are experiencing minimal growth, whereas the cafe, restaurant and takeaway bar sector is expanding by around 10%. [Gals] used to be the ones to take charge of preparing the evening meal (and apparently in 60% of households they still are; in 71% they do the food shopping)[but now] that almost 60% of [gal] householders work, they are just too busy or tired to prepare meals from scratch. Today you'll "make someone a good wife" if you can open a jar of pasta sauce. This may account for the inordinate pride with which some under-30s proclaim their lack of culinary skills: It's a political statement. Parents are not teaching their offspring to boil an egg or knit a scarf the way they used to. And in schools domestic science is slowly being replaced by computer science. A 1994 study in Britain found that most children aged from seven to 15 could play a computer game and programme a video recorder but less than half knew how to cook a jacket potato. But isn't this just a sign of the times? After all, even the Queen of England gets her weekly curry delivered to Buckingham Palace. Would it really kill us if we ate fish and chips every night for a year? Unfortunately, it just might, says... [the] National Heart Foundation['s]... director... "Your fat and salt intake would be higher than normal, which could very likely lead to cardiovascular disease, obesity and high blood pressure,"... Traditional takeaways, including hamburgers, fish, chips, pizza and chicken, all contain higher-than-average fat and salt. Increasingly, there's a growing demand for what sounds like a contradiction in terms: Healthy fastfood. "In 20 years' time relying on convenience foods for nutrition may not be an issue... But at this stage it remains a problem." Happily, over the past decade our palate has had a cosmopolitan education. Kebabs, sushi, green curry and black bean sauce feature on fastfood shopfronts all around the country. Our restaurants, producing imaginative and delicious hybrids of classic Asian, European and Pacific cooking, are considered world class. Which make you wonder if those so-called good ol' days of meat and two veg were really as good for you as is made out. We may not cook from scratch every evening but what we do cook is probably better for us. We're unlikely to boil all the nutrients out of the broccoli or roast everything in dripping. Olive oil is the choice of a new generation, as are vegetarian meals, spices and white meats. "There's no doubt about it," says... [the] senior lecturer in epidemiology at the Auckland Medical School. "The sort of diet we eat now is healthier, though certainly there's still room for improvement." Although we are getting more obese... mortality rates from cardiovascular disease have decreased by around a quarter in the last few decades. This... can be partially attributed to dietary change: We eat less meat, butter and saturated fats. Fast-thinking marketers say the key to encouraging home cooking is to take away the drudgery but not the excitement. A good example is fresh pasta. Consumers cook it and add sauce from a jar. When they add meat or vegetables and seasoning of their own choice it becomes their own creation. Mainstream manufacturers, such as Heinz-Wattie's which now makes fresh pasta, are expanding into this area, known as the "home meal replacement market". Foodtown Kitchen – a flashy, new section that opened last week in the [supermarket] chain's Meadowbank, Auckland, branch – will include things such as stir-fries, salads, burgers and pasta meals made to order, a cafe, a juice bar and a range of packaged meals with everything from pate to paella. It optimistically promises "the speed of takeaways, the freshness of home cooking and the quality of a restaurant at reasonable prices". But, says... [the] senior lecturer in the department of human nutrition at Otago University, cooking like this is a little like doing your taxes without learning how to add. With help you can manage, but you don't really know what you're doing. [The lecturer] believes cooking should be recognised as an essential life skill. [It is] particularly worried about the rising cost of heat-and-eat or value-added meals to lower income families. "These meals do tend to be more expensive than raw ingredients... So those who can least afford it, who also lack basic cooking skills, will be spending a greater proportion of their discriminatory dollar... Most of us have never had more choice... But for those on low incomes there is actually less choice." N[Z] is following trends in Britain, A[US]... and North America... However... in some countries – Finland, Belgium, the Netherlands among them – governments have begun to recognise cooking as an essential skill, instituting programmes in schools to teach children culinary craft and nutrition... [I]n France children are also taught cooking, but this is more in an attempt to preserve the French culture and stop dishes like frog's legs being usurped by a Big Mac. So should we do the same: Place... the pavlova and pikelets on a gastronomic pedestal and harass anyone who can't prepare them? [The lecturer] thinks not. "I'm not sure that those dishes are worthy of preservation... What I love at the moment is the input of other cultures into our food. So it's not so much what we put on our plates that worries me, it's that we may forget how it got there."

...[If you have never cooked before, the efficiency displayed by experienced cooks in their spotless well-organised kitchens, and the luscious mouth-watering delicacies they produce, may seem completely beyond your capabilities. No doubt visits to restaurants with their expensive meals will have given you the impression that anything worth eating is outside the range of the normal budget. Take comfort, the prospects are not so grim – cooks are not born but made, while many recipes are cheap and easy to prepare. If you are uncertain of your cooking ability it is tempting to take the line of least resistance and buy pre-cooked dishes in cans, or from the grocer's deep-freeze locker or as "takeaways". However this soon proves to be a very dull and expensive way out. These pre-cooked meals are reasonably nutritious but tend to lack flavour, and their range is strictly limited; above all, they'll cost you double or treble the price of a home-cooked meal – or even more than that. One question that arises continually: is it better to shop in a supermarket or in specialist stores? Like all complicated questions the answer to this one is – it depends. The advantage of using a good supermarket is that it is convenient and often very cheap. However, it is important to remember that supermarkets generally are able to reduce prices because they buy from suppliers in bulk – which also means that the products they are selling are often not as fresh as they might be in stores which order smaller quantities more frequently. For the purpose of bulk buying and storage, foods can be divided into three main categories: (i) highly perishable, e.g., milk, meat, fruit, vegetables, bread. *Do not buy in bulk.* (ii) perishable, e.g., butter, cheese, bacon, prepared cereals. These may be stored rather longer than those mentioned in the first category, but only under special conditions (such as refrigerating or storing in air-tight containers). (iii) non-perishable, e.g., salt, sugar, spices, flour, bottled, dried and canned foods' ('canned food keeps almost indefinitely – but canned goods have serious defects: they take up far more space than dried foods, and the high heats used in canning damage the vitamin C, the B Complex, and enzymes, to say nothing of protein; they lose nutritional value rapidly, and after six months to a year, their value is dubious at best; plus canners just can't resist the temptation to add sugar to everything – it has a mild preservative effect but adds nothing but empty calories'). 'If you buy in bulk you will save money. When buying foods ensure that adequate storage is available. Above all, the space available should be dry. Store potatoes and other root vegetables in dark dry places or they will begin to sprout. Onions should be hung in a mesh bag. Try not to keep vegetables in the fridge for more than three days. Do not store strong-smelling foods in the fridge unless they are securely sealed, since they will taint other foods.'

...One of the most important ways to prevent contamination of food is correct storage. Foodstuffs of all kinds should be kept covered as much as possible. In the air there are certain micro-organisms called moulds, yeasts and bacteria which cause foods to go bad. Food spoilage can occur from other causes, such as by chemical substances called enzymes, which are produced by living cells. Fruits are ripened by the action of enzymes; they do not remain edible indefinitely because other enzymes cause the fruit to become over-ripe and spoil. Acid retards the enzyme action; e.g., lemon juice prevents the browning of bananas or apples when they are cut into slices. Pasteurisation – heating a liquid up to a temperature between 70° and 80°C, then cooling quickly – arrests development of certain bacteria and increases the duration for which the product can be kept, without assuring complete sterilisation (unfortunately, pasteurisation often removes valuable nutrients). Boiling will kill bacteria in a few minutes, but to destroy toxins boiling for a half-hour is necessary. To kill heat-resistant spores, 4-5 hours boiling is required. Bacteria are not killed by cold, though they don't multiply at very low temperatures – e.g., in a deep freeze they lie dormant for long periods. Bacteria require moisture for growth, they cannot multiply on dry food. *House flies* are the foremost of the insects which spread infection. Flies alight on filth and contaminate their legs, wings and bodies with harmful bacteria, and deposit these on the next

object on which they settle; this may well be food. This is what happens when a fly lands on your food. Flies can't eat solid food, so to soften it up they vomit on it. Then they stamp the vomit until it's liquid, usually stamping in a few germs for good measure. Then when it's good and runny they suck it all back again, probably dropping some excrement at the same time. And then, when they've finished eating, it's your turn. Domestic pets should not be permitted in kitchens or on food premises as they carry harmful bacteria on their coats and are not always clean in their habits. Dust contains bacteria, therefore it should not be allowed to settle on food or surfaces used for food. Kitchen premises should be kept clean, then no dust will accumulate. Hands should be cleaned after handling dirty vegetables. For the body to obtain the maximum benefit from food it is essential that everyone concerned with the buying, storage, cooking and serving of food should have some knowledge of nutrition. For the body to obtain the full benefit from food it must be absorbed into the blood-stream; this absorption occurs after the food has been broken down. It should be remembered that to stimulate the flow of saliva and gastric juices food must smell, look and taste attractive. Protein is an essential part of all living matter. Protein is composed of amino-acids, and the number and arrangement of these acids are not the same in every food. A certain number of these amino-acids are essential to the body and have to be provided by food. It is preferable that the body has both animal and vegetable protein, so that a complete variety of the necessary amino-acids is available. Proteins containing all the essential amino-acids in the correct proportion are said to be of high biological value. The human body is capable of changing the other kinds of amino-acids to suit its needs. On being heated, the different proteins in foods set or coagulate at different temperatures; above these temperatures shrinkage occurs. Moderately cooked protein is the most easy to digest. There are two main groups of fats, animal and vegetable. The function of fat is to protect vital organs of the body. To be useful to the body, fats have to be broken down into glycerol and fatty acids so they can be absorbed; they can then provide heat and energy. Cooking has little effect on fat except to make it more digestible. Fats should be eaten with other foods such as bread, potatoes, etc, as they can then be more easily digested and utilised in the body. There are three main groups of carbohydrates: sugar, starch (uncooked starch is not digestible; when cooked, the starch granules swell, burst and then the starch can be digested – this is called gelatinisation of starch) and cellulose (the coarser structure of vegetables and cereals which is not digested but is used as roughage in the intestine). Sugars are the simplest form of carbohydrate and the end-products of the digestion of carbohydrates (sugars, which leave no residue, are completely digestible; with most other foods there is a proportion of waste). The function of carbohydrates is to provide the body with most of its energy. Vitamins are chemical substances (hence they can be produced synthetically – it generally takes five years from the time of discovery of a nutrient for it to be synthesised) which are vital for life, and if the diet is deficient in any vitamin, ill-health results. Dark green vegetables are a good source of vitamin A, the green colour masking the yellow of the carotene. Carotene is gradually destroyed by light (hence the fading of orange coloured spices and vegetables on prolonged storage). Like Vitamin A, Vitamin D is fat soluble. Vitamin B is water soluble and can be lost in cooking water. Vitamin C is also water soluble and can be lost during cooking or soaking in water. It is also lost by bad storage (keeping foods for too long, bruising, or storing in a badly ventilated place) and by cutting vegetables into small pieces. There are nineteen mineral elements, most of which are required by the body in very small quantities. The body has at certain times a greater demand for certain mineral elements and there is a danger then of a deficiency in the diet. There is a possibility of some minerals being lost in the cooking liquor, so diminishing the amount available in the food. This applies to soluble minerals such as salt, but not to calcium or iron compounds which do not dissolve in the cooking liquor. Food additives can be divided into 12 categories – preservatives; colouring agents; flavouring agents; sweeteners; emulsifying agents (to stop separation); antioxidants; flour improvers (to strengthen the gluten in flour); thickeners; humectants (to prevent food drying out); polyphosphates; nutrients; miscellaneous (e.g., anti-caking agents added to icing sugar and salt; firming agents added to tinned fruit and vegetables to prevent too much softening in the process; mineral oils added to dried fruit to prevent stickiness) – and except for purely “natural” substances, their use is subject to certain legislation.’ During the ‘19th century lots of untested products – that today are known to be unsafe – were added to foods. It is estimated that the average NZ child now consumes 158 food additives/day – many of which are used by the producers simply to increase profits’. Incidentally, with full support from the World Dental Federation, the NZ Dental Association is encouraging children to chew gum (*Extra* sugar-free gum – the ‘first sugar-free gum recognised by the world dental industry’ – as opposed to bubble gum, which has been known to stick to faces, human and animal hair, not to mention the undersides of desks and shoes) as a way to ‘help strengthen teeth against decay...

Do you brush morning and night? Good. And after lunch, snacks, drinks, sweets? The trouble is almost every time you eat or drink you produce plaque acid. You should chew sugar-free gum. Chewing produces more saliva you see, which neutralises the acids’]...

Opponents of gum chewing are wrong, it seems, to blame the habit on America... [T]he latest edition of *British Archeology*... reports... that it was popular – particularly with children aged six to 15 – in 7000 BC. It was made of birch bark tar and had a “smoky, burnt flavour.” Many modern kids tend to discard chewed gum with a dismayed lack of consideration. So, it seems, did young cave-dwellers in the Stone Age. - 1997

THE stickiest problem facing streets worldwide could be on its way out. Wrigley... has filed a worldwide patent for the first non-stick chewing gum. The product, described by Wrigley as “wax-free and non-tacky”, promises to end the problem of gum on shoes, pavements and school desks. It is a revolutionary “plastic” gum made from a polyester, which is biodegradable as well as non-stick. It is expected to reduce significantly the annual bill of at least \$500 million for cleansing the streets of discarded gum from the 13 million sticks chewed daily in Britain alone. The product is understood to have cost millions and taken years to develop as confectionery experts strive to ensure that it has a flavour to match the world’s favourites, such as Juicy Fruit and Spearmint. News of the patent was welcomed by environmentalists, local authorities and anti-litter activists. The Tidy Britain Group, which recently launched a chewing and bubble gum programme with the slogan, “Gum: don’t drop it, bin it”, is watching closely... [The] director-general of the group which has worked on the problem with Wrigley, said: “We are making significant progress in ridding the streets of Britain of badly discarded gum... However, until such time as it becomes available to customers, we believe the best way to keep chewing gum off our streets is for people not to drop it there in the first place.” Chewing gum was first made in America more than a century ago. Today the industry is worth more than \$660m a year in Britain alone. However, gum also accounts for about 6% of all litter, compared with 1% a decade ago. Conventional gums are notoriously difficult to remove... Removal techniques include chemicals, high-pressure ice pellets and long-hand scrapers, but have had limited success. Laser technology tests are under way... Local authorities in Britain have tried measures such as special bins, or boards on to which gum can be stuck, but their efforts are largely ignored... Among the councils facing the worst problems is Westminster in central London, where the average number of “blobs” per square metre on city centre pavements can exceed 20. At any one time there are an estimated 300,000 pieces of gum stuck to Oxford St. The council... [uses] two high-pressure “gum-busting” machines to tackle the hazard every night between 2am and 8.30am... Among the most vociferous campaigners against the menace has been [a]Labour MP... who... was incensed when Bradford council recently had to spend \$2570 scrubbing gum from the city’s new Centenary Square. “...I just hope... this... [new] gum... works... It is high time that the manufacturers, who make so much money from selling gum, took a more responsible attitude.” Wrigley is the world’s largest chewing gum manufacturer, with worldwide annual sales of \$4 billion... AS anyone who steps on to our streets can confirm... unsightly chewing gum problems are in... [NZ too. The] manager of Auckland Street Environments, part of the city council, says in the Auckland... CBD... alone the cost of cleaning gum from streets would be \$2.6 million a year. But that’s not what is spent. The budget for street cleaning, not just the removal of gum, is \$100,000 for the 60 commercial centres in the CBD. That’s enough for just two cleans a year, and the progress is difficult. “The most effective way to remove gum on asphalt is to lift the top 25mm. That’s hugely expensive so it can’t be done. With paving slabs it’s a bit easier: we use high-pressure steam in combination with scrubbing machines.” ...councils all over N[Z] would be delighted to see a non-stick gum. But the manager of Wrigley N[Z]... says availability of a commercially acceptable non-stick product is a long way off. “What has happened is that one of our scientists has developed a proposition. As it’s valuable intellectual property, Wrigley has patented it... it could take years to develop acceptable

flavours and texture qualities. In the meantime, the most important thing for Wrigley is to help educate the people who dispose of their gum incorrectly.” The right thing to do with your gum is wrap it before you toss it. [■ Chewing gum wrappers usually state, in small print: ‘Please dispose of wrapper and gum carefully’ – alongside a sequence of diagrams that suggest chewed gum should be placed inside its wrapper before both are placed in a bin (Wrigley’s wrappers also state: ‘Excessive consumption may produce laxative effects’) – but, though ads for chewing gum feature prominently on TV, they never cover the topic of disposal.]

...Heavy gum chewers risk breaking down the amalgam in their dental fillings, boosting mercury levels in their bodies to dangerously high levels, a Swedish study has found... “In our study, we found out that people who chewed gum for at least five hours a day had significantly higher mercury levels...”... said... the... medical director... [of the] Sahlgrenska university hospital in Gothenburg... The test group included 17 people with at least five amalgam fillings who chewed gum an average of five hours a day, and consumed seven pieces of gum. The group was compared with a control group of equal size made up of people with the same number of fillings, but who chewed gum only 30 minutes a week. A comparison of quicksilver levels between the groups yielded clear differences. The heavy gum chewers had twice the amount of mercury in their blood and three times the level in their urine and breath exhalation as the infrequent chewers. The mercury level rose in proportion to the number of fillings the subjects had...

Singapore’s... famous... ban on chewing gum, is about to come unstuck, but gum will be available strictly for therapeutic reasons and only on prescription. The chewing gum question had been a sticking point during two years of negotiations to seal a free trade agreement with the U[S].

...SWEETS are creating something of a sticky situation for [US] chewing gum makers. Americans chew an estimated 190 sticks of gum per person per year, but the industry is in a slump due partly to sweet success – especially of the mint kind. While sales of all types of sweets rose 2.3% in the year ended March 31, chewing gum sales dropped 4.8% in the year ended June 21. A spokes[person] for famed gum-maker Wrigley, the 105-year-old Chicago firm, admitted high-intensity mints had given them something to chew over... [Their response has been to introduce a mint-coated gum (or ‘Mint Crunch Pearls’)! In related news,] yesterday... 26,000 sweets [were scattered] to throngs of children in the Auckland Domain... as part of an attempt to throw the world’s largest lolly scramble. Some 100kg of lollies rained down from a cherry-picker...

[‘The transformation of sugar into sweets is termed CONFISERIE (confectionery). It tends more and more to be an industry of which the products are sold in special shops. Long ago the Egyptians, the Arabs and the Chinese prepared sweetmeats based on various fruit juices and honey. In Europe the use of sugar was not widespread until after the Crusades, and even then remained for a long time in the hands of apothecaries. In the 15th century the crystallised fruits of Auvergne, the sugared almonds flavoured with amber or musk, and the *gigemrats de Montpellier* enjoyed a well-deserved reputation. In 1660, the regulations promulgated by Colbert underlined the importance of the manufacture of the sugared almonds of Verdun. With the discovery of sugar beet juice and the advance of machinery in the 19th century, sweet-making developed rapidly. One branch of confectionery is the making of chocolates (chocolate was brought to Europe from Mexico by the Spaniards in 1519; the Aztec Emperor Montezuma and his court are reputed to have consumed 50 large jars of cocoa a day – there was no sugar at that time and it was flavoured with vanilla). The dried, roasted and polished “nibs” or almonds of the cacao bean are crushed, and the resulting liquor, if of good quality, is about 50% cocoa fat. When the liquor is partly defatted, it is cooled and solidifies into a hard block, known as *bitter chocolate*. This is used for baking in U.S.A. The cooking chocolate used most in England and France is a mixture of the chocolate liquor with some of the fat removed and sugar added. In England this is known as *pure chocolate* and in the U.S.A. as *bitter-sweet chocolate*. *Milk chocolate* has powdered or condensed milk added to the sweetened chocolate and is flavoured with vanilla, almond, cinnamon, etc. Chocolate used in confectionery to coat sweets has added cocoa fat. Cocoa is made from powdered chocolate which contains only 18% fat. Chocolate is better eaten between meals. It is a concentrated food, but should not be abused. The cocoa from which it is made contains theobromine – a nitrogenous substance similar to caffeine, which has a stimulating effect on the nervous system, and makes chocolate an excellent tonic for intellectual fatigue – but also calcium oxalate, which is harmful to the obese and those with rheumatic or liver complaints. It is not recommended for sufferers from constipation nor for diabetics, who have their own special chocolate.’]

...chocolate is about to change. Food bosses are set to remove minimum standards for making the mouth-watering confection, prompting predictions of doom and gloom... The A[NZFA] plans to rewrite the rules that require a certain amount of cocoa bean solids or cocoa butter in chocolate. At present chocolate-makers must put... in... at least 14[%] non-fat cocoa solids (or a mix of mild solids and cocoa solids)... White chocolate must have at least 20[%] cocoa butter. The proposals would... allow manufacturers to use vegetable oil. Manufacturers say the new rules could harm chocolate quality, threatening exports worth \$300 m... and... alienate a nation of sweet-lovers whose... diet consists of large amounts of confectionery. “There’s an issue of consumer deception here if products are put on the market purporting to be chocolate but no longer contain the right ingredients,” says Cadbury’s scientific adviser... [An ANZFA spokesperson] says manufacturers must still use some cocoa ingredients in order to call their product chocolate... [but existing] rules fail to recognise innovation and are beyond the authority’s role of maintaining safe and healthy food... [By the way,] German experts have discovered why chocolate is the perfect winter comforter and why a craving for sweets is common during winter months. One reason is that the body breaks down the “happiness messenger” substance serotonin more quickly when there is little sunshine. That is why a quick bar of chocolate or a walk in the fresh air can do wonders for a gloomy mood. But that is no excuse for pigging out on chocolate, say the spoilsports at the Hamburg nutrition advice centre. They say the potato is just as good at helping combat winter blues.

...Brought to Europe from South America 200 years ago, potatoes have been a N[Z] staple for the past century. Although rice and pasta have made big inroads in the past 30 years... 85[%] of us still eat potatoes at least five times a week... We boil them, bake them and fry them, stuff them, mash them and turn them into soups and salads, eat them as hash-browns... The... *all year...* Desiree [variety is]... okay for anything[, as are the]... Karaka *Feb-Sep...* and... Rocket *Oct-Jan...* [varieties, whereas the] Nadine *Feb-Sep...* Draga *Oct-Jan...* and... Jersey Bennie *Oct-Jan...* are... low... in starch... [and, therefore, are less] perfect for roasting or chips... [but] make a great potato salad... [We don’t know yet what style of preparation suits it best, but a variety] spliced with toad genes[could one day be on the market]... Last month the... Environmental Risk Management Authority held hearings in Wellington on a proposal from the Institute for Crop and Food Research to grow potatoes containing a synthetic gene that encodes an antibiotic toxin from the African clawed toad. The experimental programme is designed to discover whether production of the toad antibiotic in potatoes protects them against the troublesome soft rot that plagues growers and distributors... The E[рма] has to decide whether Crop and Food should be allowed to grow plots containing 150 different lines of genetically modified potatoes during each of the next five years. Some of the spuds produce a toxin found in the giant silk moth rather than the toad, others an enzyme from a “phage,” a sort of virus that attacks bacteria, and still others Bt insecticide toxins derived from the bacterium which was used to great effect in Auckland against the white spotted tussock moth. The application from Crop and Food stated that all the transgenic potato lines were produced essentially following their standard transformation protocols. But it turns out that most of the potatoes, perhaps three or four hundred varieties, have not yet been produced at all. Crop and Food’s counsel argued that an application under the new Hazardous Substances and New Organisms Act was like a request for a discharge under the Resource Management Act. You shouldn’t have to specify every occasion on which you are going to discharge waste, or the exact composition of the waste, provided the levels of chemicals are within certain limits. So, they argue, you shouldn’t be required to have already created all the modified potatoes you want to grow. One of the problems with available techniques for genetic engineering is that when you introduce a new gene into an organism, the DNA can become inserted at essentially any point in the organism’s chromosomes. The genetic engineer lets this happen more or less at random then looks for transformed organisms that seem to behave normally, those whose genetic structure has probably not been seriously disrupted by introduction of the new foreign gene. The Crop and Food application is designed to cover billions of such possibilities. It is

not possible to test many important characteristics of transformed potatoes before they are field-tested in open experimental plots. For one thing, potato plants don't usually flower when grown in a containment glasshouse. This means there is considerable uncertainty concerning the possible characteristics of [GE] potatoes, even after they have been produced and grown in containment. However, blanket approval is being sought to grow open plots of potato lines that have not yet been created, let alone met the limited tests of normality that can be conducted in a glasshouse. No one denies that the proposed experiments run a risk of "genetic escape" but the probability of the toxic genes being transferred into other organisms in the wild is claimed to be minuscule. It is up to the authority to decide whether the benefits of the experiments outweigh the risks... What approach would N[Z]ers like to see the authority adopt in reaching its decision? A special advisory group, Nga Kaihautu Tikanga Taiao, has been set up to look after Maori interests and comment on treaty issues. The group noted in its report that some of the general concerns about genetic engineering raised in public submissions to the authority were similar to those likely to be raised by Maori, but tangata whenua cannot be lumbered with the task of acting as a conscience for the whole of society. The Maori attitude to indigenous flora and fauna differs from the attitude of scientists to "biodiversity," as the living world is now called in official circles. If I sequenced the gene encoding the katipo toxin, inserted a modified version into kumara which I then wanted to grow in experimental plots with a view to testing the vegetables as possum bait, great weight would be given to the statutory role of Nga Kaihautu in protecting the status of katipo and kumara as taonga. However, genetic engineers do not regard the providence of evolutions as a treasure, the integrity of which they have a responsibility to preserve. In N[Z] we allow the transfer of genetic information from the African clawed toad into potatoes to be done in an ethical void. We are all complicit. While tangata whenua act to protect and preserve the whakapapa of their valued taonga, we allow genetic engineers to reduce the evolutionary tree of life to a jumbled heap of broken twigs. In fact, the Government is right behind such activity and foreign corporations are given liberal access to N[Z] as a testing ground for their [GE] products.

...The E[rma] has approved an application by... Crop and Food... to grow potatoes genetically engineered to resist soft rot and tuber moths. The authority said the risks of adverse effects were negligible. Crop and Food[']s chief executive... said the trials would be conducted on a research farm and appropriate steps would be taken to minimise risks of any loss of genetically modified material from the site... The application was approved subject to 20 controls, including that the area of the trial be left fallow for three years after the trial finished. The controls did not state whether the potatoes could be eaten. At last month's application, critics questioned whether Crop and Food would abide by the trial conditions after it offered [GE] potatoes for human consumption earlier this year. At a July conference in Nelson on food and nutrition, 300 guests were reportedly offered potatoes genetically altered... for higher levels of anti-oxidants and resistance to aphids. They contained a specially inserted gene from the human gut bacteria *E. coli*. But a Crop and Food scientist... said that incident had nothing to do with the latest application. Last month the authority approved an application for field trials of [GE] sugar beet, the first new organism taken to a full hearing by the authority... *News in Brief*... – raids on G[E] crops in UK inspire similar direct action in USA and France; 45 people charged over bungled attack on farm in Lincolnshire; protesters also]... arrested after mistakenly tearing up crop of maize believed to be genetically modified...

An act of eco-sabotage and growing public unrest has brought calls from scientists and politicians for a high-level inquiry into [GE] organisms. The calls follow the destruction by political activists of an experimental... potato crop at Crop and Food Research, Lincoln. There are five other experiments under way, including tests on radiata pine and sheep. The Wild Greens, an activist group affiliated to the Green Party, claimed responsibility for the sabotage, saying it had a moral responsibility to break the law in order to protect people. Police are investigating but so far there have been no arrests. The Parliamentary Commissioner for the Environment... said there was a desperate need for some kind of public forum. A public referendum was also an option, but there was no stopping genetic science. "This is not going to go away. This will be the revolutionary branch of science in the next century." The chief executive of AgResearch... said the international competitiveness of N[Z] agriculture could be seriously undermined if the value of [GE] organisms was not assessed.

...[NZ's Green Party has] been delivered a reprieve from political death row. Since signing their own warrants when they quit the Alliance in 1997, the Greens have not found anything likely to save their parliamentary hides[– until g]enetic engineering... To... [be anti-GE] is thoroughly Green... But until the Greens uncovered the lumpy-headed salmon experiment this week, and the existence of 200 other [local GE] experiments, the biggest impact had been from the party's aptly named youth activists, the Wild Greens... [I]t is difficult to see that the Wild Greens did the adult Greens too much harm... [by demolishing a GE] potato patch in Christchurch... The Wild Greens are not rivals and could even help the Greens... The Government's slow response also plays into the Green's advantage... If the Greens are smart, they will continue to exploit that lack of focus from the Government... [□ S]ecurity fears... in the light of the vandalism of... [the Christchurch] potato trial... have led HortResearch to postpone the public hearing on its application to conduct field trials with transgenic apple trees in Auckland... "In the emotion of the moment, we are concerned for the security of this valuable research material. If it was tampered with, it could destroy the results of several years' work." ...In the meantime, HortResearch can continue experimenting with [GE] apples in containment, under an old approval given by Erma's predecessor.

...A nationwide petition calling for public scrutiny of genetic engineering kicks off... today, following claims that genetic engineering of kiwifruit is... well advanced. The Greens... said nearly every quality of kiwifruit was being targeted by... genetic engineers... at HortResearch[in] Te Puke...

N[Z]ers are feeling "left in the dark" about [GE] organisms and the products to which they can lead, says the Parliamentary Commissioner for the Environment... "N[Z] consumers, retailers, farmers and food manufacturers – and our overseas buyers – all need more information about [the organisms] to be able to make informed choices,"... Calling for wider debate on the issues involved in developing [GE] plants and animals, [the commissioner said it] was concerned the technology was advancing so fast that public understanding was being left behind. "Last week's destruction of a research crop of [GE] potatoes was a wake-up call for everyone interested in the place of genetic science in N[Z]." The issue had been highlighted again on Tuesday in Parliament by the third knockback of a private member's bill for labelling of [GE] foods. "Public anxiety is justifiably bound to rise," [the commissioner] said... yesterday... "People don't have enough information..."

...Don't know your [GE] apples from your oranges? Here... are all the answers you need about Frankenstein foods... *Which crops have been modified so far?* The first plants were modified in 1983. All major crops have been modified and are now being grown commercially... but only on an experimental basis... in N[Z]... *Is it unnatural?* On the face of it, yes. Plucking the gene that makes a jelly fish glow and inserting it into an experimental crop, which has been done, seems very unnatural. But experts point out that in the natural world, foreign genes do move between species. When one scientist began to introduce genes that resist virus infection into the tobacco plant, [it] was surprised to find that hundreds of similar foreign genes already existed within the plant's genetic makeup... *Are they really putting human genes into animals?* Yes... *How does this fit in with cannibalism?* Only those with a very stupid understanding of what it is to be human would classify this as cannibalism... There is nothing particularly "human" about any particular gene... Genes are just stretches of code that instruct the body to produce one substance or another... [and we] share virtually all our genes with other creatures... *Is [GE] food dangerous?* Many theoretical risks exist... [but as] for the foreign gene itself, we eat DNA all the time so there is no general reason why an introduced gene should cause harm. DNA is rapidly broken down in the stomach and by cooking. That is why there is little concern that sugar refine[d] from sugar beet modified to resist insects will cause problems... *What is the worst-case scenario?* Pressure groups predict an environment of "green concrete" in which the herbicides have wiped out all weeds, leaving only the [GE] crops growing. Alternatively, rampant superweeds might engulf the countryside... The groups [also] predict a population with damaged immune systems as a result of eating harmful proteins... *How likely is this?* Environmental pressure groups say it is highly likely. Scientists in the field say it is extremely unlikely... *What's wrong with banning [GE] food or crops from N[Z]?* It could put us way behind in exploiting what promises to be one of the biggest industries of the next century.

...IT will be dubbed the genetic revolution: the time in the late 20th century when “super crops” bloomed and boomed. N[Z] does not lag in the revolution. Overseas corporations have viewed this country’s temperate climate, isolation and well-trained scientists as ideal for a test-bed and 11 major field tests for [GE] crops are under way. But, as with all experiments, the results don’t always turn out as expected. Critics of [GE] crops... will take grim solace in French research that shows that a transgenic crop... [of] canola (*Brassica napus* L. *oleifera*, or oilseed rape)... grown in N[Z] can pass on a herbicide-resistant gene to wild radish, a noxious weed in Canada which is also found in this country. The gene persists through at least four generations... The likelihood of any engineered trait transferring to a related wild species or to another crop was “extremely low,” according to the applicants... [in] 1996... If it did happen, the consequences would be “negligible,” and the risk for harm would be “none.” And since there are no native brassicas in N[Z], they said, the trial posed no threat to native flora. But just to be sure, the site would be located at least 1km from any other canola plant, and the field monitored for the subsequent emergence of stray canola plants. The Minister for the Environment approved the trial application – as well as another from Zeneca Seeds, also for engineered canola. They imposed a swag of extra conditions, including an isolation zone of 2km, reduction of the trial site, isolation tents and netting covers. Of more than 60 applications to field test or release [GE] organisms into NZ, only four have been rejected... The procedures sound reassuring – until you consider the French research, reported in *Nature* magazine... In Europe the French study is seen as both good and bad news. Optimistically, the results suggest the gene might be lost eventually. But for a hybrid like that to survive beyond the first generation is unusual, and that persistence troubles the French team... [A] Crop and Food plant geneticist... is less concerned. Our isolation procedures are adequate and... [the] French had to use sophisticated breeding techniques to force... [the hybridisation of] wild radish... with canola, and the hybrids were not particularly “fit.” “In the improbable event that the hybrid happened in the wild, it would probably revert back to regular radish, with no herbicide resistance.” The French experiment is not the first such study – engineered canola has been found to interbreed with related weeds in Scotland, Canada and Denmark. There has been another unforeseen genetic-engineering spin-off. British scientists fed ladybirds on aphids which had been fed sap from potatoes engineered to resist aphid attacks. The life span of the... ladybirds was halved, and they laid 30[%] fewer viable eggs. Such an effect on a beneficial predator species has not been seen before, reported the *New Scientist* magazine. It is bad news for the biotechnology industry, already dealing with the European public’s suspicion of transgenic crops – including American soy beans and maize engineered to produce a bacterial insecticide (a crop approved for trial near Pukekohe this season.) Nor is it good news for [a] Greenpeace campaigner... who has helped monitor transgenic crop trials in N[Z] for several years. A year ago... the Zeneca Roundup Ready canola... seed was sown without any confinement of the area involved, and... [the] Greenpeace observer noticed considerable bird activity in the field. In any event that seed failed to germinate, since it was eaten by springtail insects... “We are concerned at the casual way in which Zeneca appears to be undertaking this field trial,” [the observer] wrote to the... Interim Assessment Group... Zeneca’s N[Z] consultant... rejects that charge, saying it was not in the company’s interest to allow outside contamination. A very high standard of site security and isolation from related crops and weeds is essential for the production of pure seeds, [the consultant] says... But one complaint by Greenpeace was upheld... by IAG...: non-modified canola was planted alongside the transgenic crop, a deviation from the original proposal... The IAG lacks the resources to check that its own conditions have been met, and would be unaware of some breaches unless Greenpeace alerted them... says... [the observer. A] molecular geneticist at Massey University[, who is the IAG chairperson]... concurs. “We can’t go and look at a crop every week. In some ways Greenpeace did a good job for us.” A more regular monitoring programme has [since] been introduced... with infringements punishable by a maximum fine of \$500,000 and up to three months in jail... But [IAG’s chairperson] also defends Zeneca, saying it was their first test here. “They wanted to come and do things on a big scale. We scaled them right down. They just didn’t appreciate that this isn’t the Canadian prairies. We’ve been pretty tough with them and they are much more aware now.” ...[the IAG chairperson] expects several 100ha to 200ha applications early this year, probably for canola and maize. If approved these crops will be grown here on a commercial basis in order to build up seed supplied for other countries – making N[Z] one of the few regions other than North America where this can be done. Asked how N[Z] benefits from transgenic plantings, [the chairperson] responds, “Good question. We’ve always worked on the basis that there has to be something in it for N[Z]. We’re not just a testing ground for multinationals.” ...[Zeneca’s NZ consultant] says the benefits for N[Z] include access to transgenic technology and, for farmers, diversification – adding a new, perhaps more profitable crop... THE scale and speed of the switch to [GE] food production in the U[S] is stunning even those in the industry. With six giant agrochemical corporations poised to dominate world food production, more than 12 million hectares of [GE] crops were planted last year, reports the *Guardian* newspaper. The market is expected to double this year if, as expected, the European Union approves commercial releases of engineered seeds. This food revolution raises questions of corporate influence on governments, says the *Guardian*... The newspaper reports: • A revolving door between the U[S] Government and the biotech industry. • Heavy lobbying to rewrite world food safety standards to favour biotechnology... • Legal contracts locking farmers into corporate control of production. • Public relations firms massaging of the debate in favour of [GE]... • New laws protecting the U[S] food industry from criticism... Critics say this food revolution will mean more U[S] domination of food markets. They fear unemployment for millions of small farmers without access to technologies or global markets... Consumer resistance to engineered foods is growing in Europe, and some trial crops are being sabotaged.

...G[E] potatoes can damage the immune system of rats, according to British research that calls into question the safety of the new food technology... Aberdeen’s Rowett Institute... fed five rats on... potatoes that carried genes from the snowdrop and jackbean for 110 days – equivalent to 10 years in human terms... [T]he rats suffered from slightly stunted growth and were more likely to be vulnerable to disease... The findings have alarmed consumer groups... The A[US]n Consumers’ Association said... “We’ve really argued all along for the precautionary principle – that is that these products are presumed guilty before they are ruled innocent. That may take 20 years.” Environmental groups say that it took decades before the full dangers of pesticides such as DDT were known, or the ability of BSE... to also affect humans. However... Monsanto Co... said that all [GE] food was safe and had undergone rigorous trials. “There have been more than 25,000 field trials conducted on 60 crops in 45 countries around the world... and not one of the regulatory agencies in those countries has said that there is a safety issue,” a Monsanto spokes[person] said. But many Britons are anxious about meddling with nature to produce food. More than 40 of the 300 experimental sites growing [GE] trial crops... in Britain... have been damaged in the past six months by environmental campaigners. [The Prince of Wales], himself an organic farmer, fuelled the debate in June with a warning that genetic engineering of food “takes [hu]mankind into realms that belong to God and God alone.” ...“We are assured that this is absolutely safe and that no harm can come to us from eating it. But if you gave me the choice now, I wouldn’t eat it,” [the professor who headed the institute’s rat study]... said. Britain’s agriculture ministry said [GE] potatoes had not been approved for human consumption in Britain, although soya and some other [GE] products have been on sale for about two years. The particular strain of modified potato used in the professor’s experiments are not thought to be sold commercially anywhere in the world... [ANZFA said no GE] foods would be allowed in A[US] and NZ until they had passed rigorous safety standards. “We’ll take a cautionary approach... If there’s any doubt it won’t be on the shelves.”

...G[E] food is probably already in your shopping trolley... Officials believe 56 genetically altered crops are permitted worldwide, and that up to 500 products on N[Z] shelves contain one or more of these ingredients... As part of... temporary safety measures, the Ministry of Health would carry out random checks... But... the Safe Food Campaign[group is] not happy with the temporary regime, which allows food to be sold if it has been approved overseas. Some products have been approved by the U[S], but rejected elsewhere... Meantime, [the]... Royal Agricultural Society[of NZ] said the reaction to genetic engineering had been extreme.

...N[Z]'s academy of sciences, the Royal Society – which says it represents most of the country's scientists – has backed the use of [GE] foods for humans. [Its] president... said the society wanted to see constructive debate on the issues involved, but believed “the debate surrounding [GE] organisms in NZ” is beginning to stray from the informative. The risks are being overplayed.”

...GOVERNMENT agencies are helping to promote the controversial [GE] food industry, providing funding and experts for seminars that opponents yesterday dubbed taxpayer-funded propaganda... Entitled “Concepts, Myths and Realities of Gene Technology and Food”, the seminars have been underwritten by a \$60,000 grant from Technology N[Z], an arm of the government-funded Foundation for Research Science and Technology. A further \$10,000 has been made available to prepare educational material for schools, aimed at children around 12 years old. Both the seminars and educational resources are being prepared by Genepool, a trust established to “provide authoritative gene technology information so N[Z]ers can make informed choices on the use of these technologies”... The first of 11 national seminars, costing \$50 to \$100 per head, is in Hastings tomorrow. It will present scientific and industry viewpoints, but has no speakers scheduled to give opposing views in the polarised debate. Substantial protests are being promised at each venue by Revolt Against Genetic Engineering[(Rage)], an environmental lobby group with links to the Alliance MP... whose attempt last month to introduce legislation requiring labelling of all [GE] food failed... Genepool is managed from the offices of a Wellington public relations consultancy, Communications Trumps, but its purpose was educational, not public relations, said the N[Z] manager for Monsanto[– one of the trust's private]... sector members... the trust[also includes] government-funded scientific research institutes, and representatives of official health, agricultural, and food regulation bodies... The... Science Research and Technology Minister... defended Genepool's funding... and personally supported “any initiative that develops reasoned scientific debate”... However, [a spokesperson for] Rage... said the group was “horrified that an organisation that purports to be neutral would organise seminars that are completely one-sided and don't represent the consumer viewpoint at all”... Last night... Rage... said it was taking legal action against the [Erma] over its decision to approve the latest [GE] application, by Kimihere Research Centre in Canterbury, for a second trial of sugar beet that is resistant to a type of herbicide... “We are concerned that even if it doesn't spread to other crops, you still have pollution of the soil. Insects will eat the genetically altered sugar beet, birds will eat the insects... We don't know what the result of that will be. We want these experiments done in contained laboratory conditions, not in fields, and that is why we are taking legal action to ensure this happens.” ...[● C]ontroversial biotechnology forays include Syngenta's “golden rice”, normal rice that has been genetically engineered to make vitamin A. This, it is claimed, could save thousands of [Last] World lives. Some scientists even claim that a month's delay in marketing golden rice could cause more than 50,000 children to go blind through vitamin A deficiency. But Greenpeace research suggests a person would have to eat 10kg of... the... rice a day to receive a sight-saving dose of... vitamin[A].

...When the gene genies start tampering with our food, where will it end? And should we be worried?... [A NZer] is the Devil Incarnate. Or so [it] must seem to the small, but potentially fast-growing lobby which sees the technology juggernaut of [GE] food as a combination of unknown health risks and global corporatist plot. Look at these diabolical credentials[the NZer is the local manager] for the multi-national food and chemical giant, Monsanto, the company which made Agent Orange... On his card is the slightly cultish Monsanto credo: “Food, Health, Hope.” His recommended reading is a book called *Saving the Planet with Pesticides and Plastic*. The company [the NZer] represents sees a future, and not a terribly distant one, where corn stems will be pulped for plastic, and where instead of taking pills, antibiotics will be available in the flesh of specially coloured bananas. It markets this vision under the banner “Let the Harvest Begin”, and accuses its critics of a First World arrogance that ignores what more reliable, higher yield crops could do for the [Last] World. Those critics, however, see an international web of relationships between the bio-tech companies and those who will regulate them in future, and attempts to make American food standards for genetic modification the world's standards. Already, “Roundup Ready Soy”... accounts for around 40% (and growing) of the American annual harvest of soybeans, a staple ingredient in around two-thirds of all processed foods. It is... [the manager of Monsanto NZ]'s mission to try to prevent mandatory labelling of these basic ingredients... [in NZ. The manager] argues that such labels would be meaningless, costly to avoid and, more to the point, potentially off-putting... Imagine, for example, if every packet of fries in a McDonald's “Happy Meal” carried a label saying “may contain [GE] potatoes”. Who wouldn't think twice before feeding them to their offspring? What [the manager] wants is labelling only where there is a substantial difference between the [GE] product and the original it comes from... However, [the manager] and other supporters of [GE] food may find themselves up against it. Even if the risks associated with such genetic modification are overstated and unscientific, risk communication experts believe that if the public wants labelling, it will get it. “We predict that it will be the perceived rather than the actual risk of gene technology that will determine whether it is acceptable to N[Z]ers and is, therefore, successfully introduced,” said HortResearch social science researchers... at an environmental risk management conference in June... [Their] research shows that although a net 75% of N[Z]ers support gene technology for medical purposes, they are much warier about its application to food, with a net 49% support. New polling under way now is asking for the first time how N[Z]ers feel about food produced from crossing genetic material from animals, viruses, and bacteria with plants and [one of the researchers] says there is considerable confusion in the public mind between gene technology and other more ethically fraught techniques, such as cloning. Moreover, scientists themselves disagree about the degree of risk which bio-technology represents. Even supporters such as [a p]rofessor... from Massey University's Institute of Molecular Bio-Sciences, willingly concede that the science in this area is only just ahead of its commercial exploitation. For [the manager of Monsanto NZ], however, the capacity to cross genes from one plant or animal to another is not a threat to the environment, but a “wonderful” opportunity to increase bio-diversity... For those who embrace a technologically advanced future with enthusiasm, this is exciting stuff, and for a food-exporting nation, it is regarded as essential by both the farming and food-manufacturing lobbies, with the strong exception of the organic farming lobby. “The food industry is worth 48% of [NZ's] export earnings,” says the executive director of the Grocery Marketers Association... “We need state-of-the-art technology. The world population has trebled because of the use of pesticides, chemicals, and bio-technology. We are almost ashamed of saying it, but I think we should be proud of it.” ...For as far as... most of the scientific community is concerned, the genetic modification of food represents either no risk at all or less risk than conventional plant breeding... However, for... a convener of the N[Z] Safe Food Campaign and author of the newly published *Eating Safely in a Toxic World*: “This issue just needs the spark that lights the prairie fire, feelings are so intense. Given that these are radically different foods from any other food that humans have eaten before and that they may contain bacteria and viruses that have never been in the human diet before, how do we know that safety testing (of new [GE] foods) is for anything more than short-term obvious effects? I'm part of an international movement of people who want food that is natural. We don't want food that has been made by industrialised agriculture... I don't trust it or the scientists who tell me it's perfectly safe. These are things which have never happened in billions of years of evolution. It touches on deep uncertainties about how far humans should meddle with nature. We have never had as much power as now.” As a European organic farmer put it for a *New York Times* reporter: “A bunch of people are trying to get rich by telling us that nature isn't good enough and that we will have to take genes out of fish and put them in a strawberry if we want to survive. They are changing the basic rules of life and they want to try it all out on us.” What opponents of genetic engineering tap into is a larger millennial angst in which public scepticism is undermining traditional faith in the ability of science to deliver truth, and of regulators to control food safety... This volatile political climate is producing a fascinating reaction in the insurance industry, which makes money from understanding where the greatest risks lie and then avoiding them. According to reports in the German media, the Swiss insurance giant Rueck is refusing to insure [GE] crops and foods... Rueck sees the risk of a sudden collapse in public support for bio-technology and attendant changes in social values as a huge risk if international legal action were sparked by alleged victims of [GE] food... In the end, however, fear of consumer backlash may prove to be more important to food producers than logic, science, or international trade regulations... [A] Wellington-based lobbyist with clients including Kellogg's

and the Mars food empire, points to the example already set by... Nestle, which has decided to label all... [GE foods (however,) in a new twist to the row over the company's demands for £3.7 million... from Ethiopia... Nestle has been accused of exploiting Pakistani dairy farmers by buying up their milk for less than it costs to produce – and selling it back to local people at inflated prices... of 200[%]... profit... as “long life” [milk]...

Why do insurance companies refuse to insure against GE-related catastrophes? It's because they know that GE is too risky. In fact, there are no long-term safety studies of the consequences of G[E]. Once these new organisms are let loose into the environment, no one really has any idea what harm they might do – to the environment or your health. That's why the biotech companies want you (through the government) to pay for the damages GE crops and products can inflict on the health and safety of the country... Does anti-GE mean “anti-science”? No. The issue is not “science” vs “non-science”. The issue is profit-oriented corporate (“no ethics”) science vs the safety of our food and the integrity of our health. There is nothing more destructive than “science” harnessed to corporate or military goals. After all, it was scientists who created deadly biological warfare agents, cancer-causing pesticides, and nuclear weapons... What do you want – a NZ where our food supply is safe from unpredictable consequences – or one where we always have to wonder if what we are eating could make us ill or give us an allergic reaction?

...THE Washington Post reported on 14 June... that G[E] StarLink corn did not cause allergic reactions in 17 people who had reported sometimes severe reactions after eating corn tacos and tortillas. Blood tests failed to find any signs of antibodies to the protein in the genetically enhanced corn, indicating none of those tested had experienced an allergic reaction, the federal Centres for Disease Control and Prevention said... The results were applauded by advocates of biotechnology as confirming the safety of StarLink in particular and modified crops in general. But, predictably environmental groups called the federal effort limited and insufficient to answer the question of whether StarLink can cause dangerous allergic reactions... StarLink is a variety of corn engineered to contain a protein, called Cry9c, that can protect crops against several insects. While many similar modified corns have been approved for general use, StarLink was approved only for animal feed because of concerns that it broke down more slowly than many proteins and might cause allergic reactions. The corn nevertheless inadvertently entered the human food supply...

A biotechnology firm is scrambling to buy millions of bales of [GE] corn approved only for animal feed after revelations that the crop slipped into the human food chain, says the *Washington Post*. Aventis FoodSciences, of Research Triangle Park in North Carolina, is offering a 25[%] premium to buy the corn from grain silos and food producers... The revelations about the modified corn, dubbed StarLink, have raised fears in the U[S] about GE] crops and whether they can be kept separate from non-modified goods.

...L[ast week]... a US advocate for... [GE food was] flown into town by the U[S] Embassy to try to convince N[Z]ers that labelling all G[E] food] is unnecessary. Apparently N[Z]ers are not to be allowed to make up their own minds. Instead, there is a major international brainwashing effort going on to persuade us G[E] food] is good for us. The thinking seems to be that if we have more “information” we would come to agree with the corporates. The implication is that objectors to G[E] food] are superstitious, fear-ridden flat-earthers, rather than educated, rational grown-ups who see things from a different point of view... [The chairperso]n and CEO of mega-corporate Monsanto, calls the objections of people like me “religious or quasi-religious” because we fear the consequences of significantly interfering with the natural world. Yet... from... a purely self-interested consumer viewpoint, what does G[E] food] offer me? There is no promise that retail prices will be reduced, nor that the quality of products will be increased. Why should I take unknown risks with my own health to increase the yields and profits of multinationals? ...Monsanto... explains its role as “providing to the institutions of society – particularly governments; the information... requested in order for those institutions to make the judgments they are chartered to make”. Gee, thanks, Monsanto. It just happens that Monsanto has “chosen to be the leading firm in the application of biotechnology of agriculture”. Does this make it a credible source of information on biotech, or a source of information that should be treated with caution? ...N[Z]ers have already spoken on this issue[– back when the]... ANZFA... asked for public submissions... The overwhelming majority supported a ban, a policy that is not even on the agenda of the various government agencies charged with overseeing genetic engineering. Officially all we've been allowed to have a say on is whether all [GE] foods... should be labelled... The deluge of “anti” submissions was clearly not the result... ANZFA wanted. Democracy being a tradeable commodity these days, the authority disregarded 85% of the... submissions it received because they were in “the general protest/form letter category, objecting to one or more aspects of the... debate (e.g., asking for full labelling, moratorium, etc)”. Only... “substantive submissions providing some detailed information” were “used as part of our assessment procedure and detailed in our assessment reports”. One of the crises of our times is that the global marketplace has bred corporates so large they can manipulate national governments and even international agencies to get them in harmony with their ambitions... Individual nation states have to be bullied into submission, not because they individually matter particularly, especially when they are as small as N[Z], but because they might set a “bad” example to the rest of the world. It reminds me somewhat of the US's persistent efforts to overturn N[Z]'s nuclear free policy, simply because of its upstart potential... [GE food] bears comparison to the issues of nuclear power and... weapons in its potential for devastation. Indeed, it is bigger because while nuclear accidents can lay waste to an area, rogue G[E] crops could permanently contaminate the entire global food chain.

...First the good news. If you're worried about eating ...G[E]... food – and scientific evidence is mounting that you *should* be worried – then you'll be pleased to know that a G[E] food-labelling regime will soon be in place. Right now, on your behalf, the A[nzfa] is busy framing regulations – building, in effect, a stable door behind which this strange new beast of a food can be penned. The bad news is that the horse has already bolted. And the worse news – if you're the worrying kind – is that the government is not exactly making strenuous efforts to get it back... No matter what plans are being made to identify it and label it from here on in, you've almost certainly eaten some already without knowing it... Welcome to your new diet. Nice of them to tell you, wasn't it? But the whole history of G[E] food has been one of giant corporates pushing the stuff into the marketplace – just going ahead and doing it anyway – while governments and bureaucracies trail some distance behind, bleating about checks and balances. Belatedly, three months ago, A[ustralasian] health ministers decided by majority vote that all G[E] food would in future have to be labelled... although N[Z's] Associate Health Minister... is pessimistic... “I don't believe... we will be able to come up with a sensible, practical regime.” This is the challenge facing politicians and bureaucrats the world over... The upshot in this part of the world is that, though Anzfa is considering three labelling categories – CONTAINS, MAY CONTAIN and DOES NOT CONTAIN (or G[E]-FREE, if the manufacturer prefers) – the vast majority of such products will probably wind up in the MAY CONTAIN basket. Which, both [the minister] and opponents of G[E] food agree, would be next to useless. The technology for identifying food components is improving all the time, however, and, no matter how tiny the G[E] trace, no matter how unrecognisable it may be in the final product, it ought to be possible to track it down and give it a name. [The minister] all but acknowledges this, but says it would cost too much to find out. “Ideally,” [the minister] says, “it would be nice to have every component listed up there. But I think that has to be balanced up with what is reasonable and practical. Society wouldn't forgive government if compliance costs doubled the cost of food.” To his opponents, this argument is a red herring, and possibly a [GE] one at that. The Alliance[Party MP]... whose private member G[E] bill died after some politically inspired dirty dealing in Parliament... points out that in “virtually all of the other foodstuff we produce we have traceability back to the paddock” and... you can make a market virtue of such traceability – think of the [NZ Beef and Lamb] Quality Mark... Such is his scepticism about mandatory labelling that [the minister] has not even given much thought to how the new regime will be policed. “We've certainly got no concrete plans to do anything at this stage... I'm not sure how we do it. Because anything would be a huge cost, and I can think of better ways to spend the taxpayers' money.” In other words, even if Anzfa devises a viable definition of G[E] food, the labelling system is likely to have loopholes big enough to build a supermarket in, and preventing people abusing the system will not be a high priority anyway... [The Alliance MP and the Green's co-leader both] believe that the government's reluctance to take a tough stand on G[E] food stems from

its fear of offending the US... and there is certainly a hint of that in leaked ministerial minutes from last year, which refer to [US] concern that even a relatively toothless labelling regime “could impact negatively on the bilateral trade relationship[.]” Last week, attempts to establish the first global treaty regulating trade in [GE] foods collapsed when the... US – along with A[US], Chile, Argentina and Uruguay – ...rejected a proposal supported by about 130 other nations... Five against 130 – you’d think it would count for something. But where the US goes, the rest of the world is bound, by free-trade zealotry, to follow. The main argument of the industry and its political acolytes is that G[E] crops will help feed the world and its burgeoning population. But the world already produces 50[%] more food than it needs. The world just isn’t very good at sharing it... In N[Z], public opposition to G[E] foods has been modest. But this year the issue exploded in the British and European press with the sound and fury you would expect to accompany your average revolution (which is exactly what G[E] food science is). Monsanto was ordered to pay £17,000 for failing to prevent the spread of pollen from a trial site of [GE] oilseed rape in Lincolnshire. (An amount environmentalists condemned as “lunch money”.) A British company was fined £14,000 for a similar offence... Much of the current furore was sparked off by revelations that... several million [pounds were]... lent... to a biotechnology firm... [by the British] science minister... and... supermarket billionaire, [who owns]... the worldwide patent for a key gene.

...N[Z] has been in cahoots with the U[S] to stop Japan labelling [GE] foods, papers released last night by the Alliance show. The... Alliance health spokes[person said the NZ PM’s]... assurances about labelling [GE] food in N[Z] did not measure up against her Government’s action... Last week, [the PM] repeated in Parliament that the Government supported labelling. In the same week, National ministers bagged the Greens co-leader... as “anti-big business and anti-American” for her campaign against [GE] food. It followed a warning from... [the US ambassador that NZ] could face trade sanctions if it went ahead with mandatory labelling.

...A compelling argument for [NZ to adopt GE] foods is that the U[S] has already decided to sell this food in shops... “If we choose to label that food, we are creating a trade barrier with the US... In turn, the [US] may complain to the W[TO] and slap economic sanctions on our food exports in retaliation,” says [a] former senior lecturer in biochemistry and molecular biology... [at] Lincoln University... “We export about \$2.1 billion-worth of goods to USA per annum, they are our third biggest market and represent 2[%] of our GDP]. The economic fallout will be substantial. That doesn’t detract from the safety issues about [GE] foods but it is an important consideration. One thing that may protect us is that Europe and Britain appear to want clear labelling of GE foods, too, and we can take support from that. Unfortunately, it is looking increasingly likely there will be a trade war between Europe and the US and we don’t want to be caught in the crossfire. As we sell our produce to the top 3[%] of the world’s markets, producing high-quality, high-value product, the first thing we should do is ask each market individually what they want. If they don’t want GE products it would be sensible not to deliver. It may be we can get a premium price for something that is not [GE] and market our clean, green food internationally... British supermarkets have turned to their suppliers and said they don’t want any [GE] products... And it’s a good selling point. One British supermarket, Iceland, announced they were GE free and customers beat a path to their door... In terms of us not having the resources to safely test GE food, the comparison is imported motor vehicles. The N[Z] Government defines regulations and standards and it is up to the motor vehicle manufacturer to meet them. We don’t test the cars themselves, as the cost would be prohibitive, but instead put the onus for safety on the producer... [But there] have been some negative aspects of genetic modification and I would expect there to be a few more cropping up. A Japanese firm produced a food supplement for insomnia which killed at least 37 people in America. There’s some debate whether it was [the] genetic... modification process that did it or poor purification, but it is seen as a negative aspect. Yet since 1987 every diabetic has been using [GE] insulin at least four times a day, which is the flip side. There are a[iso a]t least 130 current uses of Thalidomide... You have to balance the good and the bad...”

...The Alliance... presented a 27,000-signature petition to the... parliamentary select committee on health... yesterday calling for labelling of G[E] foods, but... the... Alliance’s health and environmental spokes[person said NZ’s parliament should]... require all foods to be traceable to origin...

Someone needs to tell... [NZ’s] Minister of Health... there’s many a slip between a ministerial communique and a supermarket checkout. The [minister]... and his A[US] counterparts have agreed on mandatory labelling of foods containing G[E] ingredients. We’ll all be mightily cheered when foodstuffs with G[E] ingredients are clearly marked as such. But the absence of a label may prove nothing except that there’s no label there. Keeping a G[E]-free supply line is the chief article of faith in the food business these days, the 90s equivalent of the 70s’ “no preservatives” and the 80s’ “no artificial colour or flavour.” ...the owner of the Bake Haus Swiss Bakery, says [it] stopped buying soy oil when reports began circulating about [GE] soybeans. But... like every other operator who relies on suppliers for raw ingredients, [the owner] knows his guarantees of purity are often based on trust. “We do our best to make sure... but it isn’t that easy, really. We rely on our suppliers, who rely on their suppliers not to tell porkies.” [The owner] of the Pandoro Italian Bakery, devotes endless energy to gaining assurances from suppliers that ingredients are G[E]-free – and finds new ones when assurances aren’t forthcoming. But yesterday... admitted that absolute certainty was impossible. “There’s a grain of truth in what you’re saying, that the labelling can be meaningless... It’s a huge undertaking and with the best will in the world there are going to be times when you’ve got ingredients which are [GE]. It’s so pervasive.”

...Shopping for groceries is to get more complicated with new rules on [GE] food. Labels will be introduced in a year or so for food with more than 0.1[%] of GE ingredients. Thousands of items will be affected – about 60[%] of processed food has a GE component. The changes could also mean more expensive food. And the complexity of sorting ingredients will mean items such as tofu will be labelled, but not food colouring. Under the rules announced by transtasman Health Ministers... food... sold at point of sale, such as fresh foods from supermarkets and meals from restaurants and takeaway outlets, will be exempt... [However, a] Green Party MP and safe food campaigner... said exempting highly refined foods made a mockery of the new regime. Foods with no detectable GE ingredient in the final product, such as highly refined cooking oils... would be exempt, even if they were made from GE crops or were genetically engineered at some stage during their manufacture. “This will make manufacturers and retailers very happy, but not consumers,”... But... [NZ’s] Health Minister... said the new rules were the most comprehensive in the world and consumers would be pleased. The Ministry of Health would police labelling, and anyone who broke the rules would feel the full weight of the law. [The Green MP said it] would be asking where the money was coming from to monitor the labelling regime because it was not in the Budget... Future meetings of the ministers will set the size of labels, where on packaging they must be displayed and exactly what they will say.

...The world’s most powerful leaders have labelled [GE] food alongside Aids and the millennium bug, as one of the greatest threats facing the planet... [Even the British PM and US] President... – two of the genetic modification industry’s strongest supporters – were bounced into agreeing to support a new global inquiry into the safety of such foods while attending the G8 summit in Cologne at the weekend. Environmentalists welcomed the development as “significant,” but warned that the public would not be “duped by international committees interested in rubber-stamping products of biotechnology firms.” Friends of the Earth[’s] director... said: “It shows just how far the thinking in the U[S] and British Governments is from those of other leading nations. If this G8 initiative is to have any credibility, there must now be a five-year freeze on all G[E] food being used commercially.” ...The U[S] has threatened an all-out trade war if Europe tries to ban... [GE food, but opposition to it] is also beginning to grow in the U[S]... A 500,000-signature petition was given to Congress last week demanding that G[E] products be clearly labelled as such... Monsanto... welcomed the [G8] move, saying it hoped it would speed international approval of its controversial products.

...The controversy over Monsanto’s introduction of [GE] crops and foods in Europe and elsewhere may be rather more than just another clumsy American boot trampling on the sensitivities of others. At stake is more than the profits of a single company, or even one industry. Rumbling under

the surface are issues that may influence the boundaries between company, market and Government responsibilities for decades. Genetic modification is the pivot on which these possibilities turn. At the management level Monsanto got it wrong. "It's a classic case of good intentions gone awry," says... [the chairperson] of the Global Business Network, an influential California-based research and consulting organisation. Because it believed it was doing right, [the chairperson] says, Monsanto was unprepared for public hostility based on a different reading of the issues. It compounded the problem with an arrogant initial reaction and is now condemned to chase an agenda set by others – an unwinnable battle. The serious damage that Monsanto has suffered... will take years to recover from. The [GE] mouthful that Monsanto has bitten off is not just a social responsibility problem – on a par with the employment policies of Nike's suppliers in Asia or Shell's relationship with the Nigerian Government. Manipulating genes could hardly be more psychologically potent, appearing to go to the heart of what it means to be human. Pressure groups are insisting that there are limits to consumerism and that some things, such as playing with nature, cannot be left to business alone. As a result, the firm has found it hard to stop the debate shifting from the technical (are [GE] foods and crops safe?) to something simple: given past experiences (such as the mad cow disease), should we let the [GE] genie out of the bottle? Although Monsanto managers really do believe they can improve the world... people in Europe and many other places are sceptical. They see that Monsanto makes money from killing plants, not growing them, and that for a firm boasting a commitment to life, it did pretty well out of the defoliant Agent Orange in the Vietnam War. The clash of values is stark – and what happens will be decided in the short term as much by consumers and markets as Governments. This is a tribute to the remarkable and near-invisible rise of the newest actors on the international business stage: non-governmental organisations such as Amnesty International, Greenpeace and the aid organisations. In a measured and thought-provoking new book, *When Good Companies Do Bad Things* [– which was co-written by the network chairperson –] it is calculated that there are now 16,000 [NGO]s. In many respects they are more formidable opponents than Governments or governmental institutions, being more agile and much more adept users of the media. Companies are only just beginning to recognise what such organisations have long understood: that the two are sides of the same coin... As Governments have withdrawn from international roles, companies and such [NGO]s are the only bodies capable of swift global action. They complement each other. [NGO]s lack resources, but are nimble and directly tuned into public concerns in a way that Monsanto or Shell can never be. [NGOs] are the public conscience. And, despairing of the ineffectual U[N] bureaucracies, they know that waiting for international governmental agreement on contentious issues such as biotechnology or human rights is not an option. And it is their mortal enemies, the corporations, with their powerful resources and worldwide organisations, that offer the best chance of getting things done. A good example of this... is the environment, which 20 years ago barely figured on companies' radar screens. If it did, it certainly was not their responsibility. Now, however, sustained pressure by organisations such as Greenpeace and Friends of the Earth means there are few companies in resource-related industries that refuse to accept, grudgingly or not, that they have environmental responsibilities... [Incidentally, last] March... a little-known cotton seed enterprise called Delta and Pine Land Company acquired American patent No 5,723,765, which gave it exclusive rights to technology enabling it to promulgate plants that will produce "self-terminating" offspring, the so-called "terminator seeds." The "terminator" is a [GE] mechanism triggered by an outside stimulus... The preferred trigger is the antibiotic tetracycline. Two months later, Monsanto bought Delta and Pine Land and a new prospect opened up – that this giant multinational could control the seeds of most of the world's farmers. Already the Terminator patent is registered, or in the process of being so, in 87 countries... The minor acquisition could be the key to Monsanto's continuing profitability since its patent on glyphosate... expires in 2000.

...Monsanto's decision not to commercialise technology that makes plants sterile is a relief to N[Z]'s arable farmers, who feared it could eventually be introduced here. The concept of a terminator gene was "something of a concern to all farmers," the national grain council chair[perso]n of Federated Farmers... said yesterday. The new technology would have resulted in farmers being forced to buy seed every season rather than harvesting their own... Monsanto... said on Tuesday that it had found other biotechnology capable of achieving the same ends and it did not now intend to use the genetic engineering technique... Monsanto... already holds patents on other technology that would discourage farmers from planting seeds from a previous crop – but would not render those seeds infertile. It was not yet developing those technologies, but would not rule it out... [A] South Canterbury arable farmer... warned that just because Monsanto had decided not to commercialise the terminator gene it did not mean other companies would not try to develop their own... Other biotechnology companies have announced that they have found ways to create extremely high numbers of different mutations in conventional plant breeding. They then select the traits they want to breed into the commercial seed lines. Because no genetic engineering is used, the resulting seed can be sold as "GE-free."

...Applications to sell 13 [GE] foods in A[US and NZ] will be advertised today. Eight applications to... Anzfa... are from... Monsanto... Most of the foods for which applications are being advertised were among the 20 [GE] crops which Anzfa said in May were undergoing "rigorous" safety assessments. It allowed foods containing those engineered ingredients to stay on sale... at the same time as it... effectively shelved any labelling of such foods until at least 2001... The engineered foods to be advertised include... [cotton] seed and canola from plants tolerant of bromoxynil (a herbicide used around small and coarse grain crops)... The inclusion of tolerant canola has positive implications for N[Z] chemical company Fernz. Fernz has recently taken over the French chemical group Compagnie Francaise de Produits Industriels (CFPI), which has about 20[%] of the world market for the bromoxynil herbicide. At the same time it has done a deal with global chemical giant Rhone Poulenc, which controls the other 80[%] of the market, so that the two of them have a stranglehold on supplies.

...The local arm of... Monsanto is withdrawing its application for N[Z] field trials of [GE] wheat. "It is clear... N[Z]ers want more time to consider the technology, and look at how it is introduced," said Monsanto's NZ biotechnology business manager... The application to grow Roundup-Ready wheat on a 22m by 32m test site... sparked an explosion of public submissions when it was advertised... With 1418 submissions received, and 433 people asking to speak to the E[rma] directly, its staff faced the logistical challenge of organising the necessary public hearings... Monsanto wanted to use the Canterbury Plains to test 11 strains of bread wheat, changed to tolerate its herbicide, in line with field tests on the crop in the U[S], Canada and the Czech Republic... The... [business manager's] statement said that as Monsanto had agreed last year to the voluntary moratorium on [commercial] releases of engineered crops requested by the... Independent Biotechnology Advisory Council, it was appropriate to put the company's field test on hold as well... [■ Yesterday, the] *Independent* newspaper said the [British] government had summoned the heads of biotechnology companies, including... Monsanto, for talks about a voluntary code that would delay wide-scale planting of [GE] crops until 2002.

...The British Government has sought to reassure consumers over the safety of... [GE] foods after shops warned they could lose billions of dollars if confusion was not resolved. Retailers had called for an "unequivocal" Government statement a day after 21 top international scientists demanded the reinstatement of a British researcher who claimed that rats fed on modified potatoes suffered a weakened immune system... [In local news, a] multinational seed company plans to grow [GE] maize in South Auckland. The plan has outraged environmentalists... At a hearing in Wellington yesterday, Greenpeace's spokesperson... urged the Government's watchdog on new organisms to delay approval of Pioneer N[Z]'s planting plan. Appearing as a witness for... Rage... [the spokesperson told the Erma] that one line of the GE maize seed gene posed a threat to N[Z]'s ecological systems. The maize was engineered to create a toxin which killed corn borer insects. But laboratory tests had shown large amounts of its pollen, dusted on other plants, would kill other caterpillars, such as the larvae of monarch butterflies... [The executive of] Pioneer NZ, a subsidiary of Pioneer Hi-Bred International... told the hearing the project was worth \$600,000 to the company, which employed 25 people. Neighbours of the Glenbrook field where the maize tests are believed to be planned were last night unconcerned... [One neighbour], who owns a nearby garden centre with [his] wife... said Pioneer had been doing seed trials for years. "But they control what they do quite thoroughly. The risk of something getting

loose is quite small.” But [his wife] added: “If it kills off butterflies, it is not good.” ...Meanwhile, it should be known by the end of the week if [GE] canola being tested in the South Island has spread to surrounding areas. The Ministry of Agriculture and Forestry is investigating.

...A study of [GE] corn has raised new concerns about the crop after finding that it spreads enough pollen to nearby weeds to kill monarch butterfly caterpillars feeding on them. Iowa State University scientists found that one in five monarch larvae died after being exposed to the toxic corn pollen for two days. Three days after the initial two-day exposure, more than half the larvae were dead. The biotech corn, known as Bt corn for a bacterium gene that makes it toxic to the European corn borer, became controversial last year after a laboratory study at Cornell University showed it was toxic to monarch butterflies. The Iowa State study was set up to find out how the pollen would affect butterflies in their natural environment. The Cornell finding produced a public outcry in Europe and calls from environmental groups to curb the spread of gene-altered crops. But biotech supporters have criticised both studies as being unrealistic... [The] vice-president of food and agriculture for the Biotechnology Industry Organisation... said caterpillars were unlikely to encounter the pollen in nature in any great amount, and the monarch population increased almost as much as the plantings of Bt corn last year. Environmental groups have petitioned the US Environmental Protection Agency to have farmers surround Bt corn with buffer zones of conventional corn to prevent the pollen from spreading to milkweed.

...IN 1992 THE AMERICAN ENVIRONMENTAL PROTECTION AGENCY SANCTIONED THE RELEASE OF A GENETICALLY ENGINEERED VARIANT OF A COMMON BACTERIA... DESIGNED TO CONVERT DECAYING PLANT MATTER INTO INDUSTRIAL ALCOHOL... IT HAD BEEN TESTED TO ENSURE THAT IT WAS NON-TOXIC TO HUMANS AND ANIMALS[. BUT.] JUST WEEKS BEFORE ITS RELEASE AND QUITE BY CHANCE, A GRADUATE STUDENT WORKING ON HIS PHD DISCOVERED THAT THE NEW BACTERIA WAS ACTUALLY TOXIC TO LIVING PLANTS... HAD THIS... BACTERIA BEEN RELEASED INTO THE ENVIRONMENT... IT IS ESTIMATED THAT... WITHIN A FEW SHORT YEARS, IT WOULD HAVE DESTROYED THE WORLD'S ENTIRE PLANT LIFE.

...Research by a leading German zoologist has shown that genes used to genetically engineer crops can jump the species barrier. A three-year study by [the p]rofessor... at the University of Jena found that the gene used to modify oil-seed rape had transferred to bacteria living inside honey bees. The findings, reported in British newspapers, will undermine claims by the biotech industry and supporters of GE foods that genes cannot spread. They will also increase pressure on farmers across Europe to destroy fields of oil-seed rape contaminated with G[E] seeds... Asked if his findings had implications for the bacteria inside the human gut, [the German] replied: “Maybe, but I am not an expert on this.” The *Observer* said [the German] was reluctant to talk about his work until it was officially published and reviewed by fellow scientists. The reports come a day after Britain's Agriculture Minister... urged farmers to destroy crops contaminated with GE seeds.

...Alarming results from official trials of G[E] crops show them interbreeding on a large scale with conventional crops – and weeds. A Government report, the result of six years' monitoring of G[E] crops in Britain, gives the first results from the official farm-scale trials, originally begun to study the effects of pesticides but later expanded to study “gene flow” as a result of public pressure. Carried out... by the National Institute of Agricultural Botany and the Laboratory of the Government Chemist, the trials show... G[E] oil seed rape that had escaped from a crop... persisted for at least four years. The report also shows that the G[E] crop interbred with... wild turnip, giving it resistance to herbicides...

Vital “politically explosive... devastating” detail on the genetic engineering controversy may have passed you by... In N[Z], the topic got scant attention – four paragraphs on an inside page in my *Herald*, behind commendable accounts of animals needing foster homes, reports on the plight of rain-drenched campers, the latest doings of trivial people who are deemed to be famous and the misdeeds of the criminally minded. The *Herald*... gave the bare bones of a very frightening report. What was available in the original item but not included was that, in Britain, the report's findings were deliberately and callously handled in official tactics which were just short of actual suppression... I don't in any way suggest conspiracy... [– abetted by] the Auckland news editors [who] chose to print... [a] highly truncated and underplayed version... [– but] I thought you would be interested in a fuller transcript... QUOTE: *Alarming new results from official British trials of G[E] crops are severely jeopardising plans for growing them commercially. The findings, in a new Government report, show, for the first time in Britain, that genes from G[E] crops are interbreeding on a large scale with conventional ones, and with weeds. The study is so devastating to the Government's case for G[E] crops that ministers sought to bury it by publishing the first information on it on the Department of the Environment, Food and Rural Affairs website on Christmas Eve. That is the one day in the year when no newspapers are being prepared. Even then it only produced a heavily edited summary of the main report. Unusually the full report, which will contain much more devastating detail, was withheld from publication on the website. The department said that it was available on request, but when The Independent on Sunday tried to ask for it, the department said that no one was available to provide it. The report, the result of six years of monitoring of G[E] crops in Britain, is politically explosive and gives the first results from the official farm-scale trials. The Government has repeatedly said the results would settle the question on whether G[E] crops endangered the environment. But it has been playing down their significance in recent weeks. [A spokesperson from] Friends of the Earth, said the results showed that if G[E] crops became widespread, almost all similar crops would become contaminated, threatening organic agriculture. It is not surprising the Government has tried to cover this up. It shows we need to know a great deal more about these issues before we contemplate growing G[E] crops commercially.* UNQUOTE Need I say more? Not really, except that incidents like this highlight the total contempt which people in positions of political power sometimes show for the rights of the public to be informed. They blatantly ignore their obligations to brief fully the people who give them their vote and who pay their salaries. More than that, it shows clearly that public concerns over GE here and overseas are totally justified. And, not surprisingly, it simply fuels conspiracy theories among some sections of the community who are convinced that facts are withheld or downplayed for purely political reasons... Never forget the old definition about politicians and the way they handle their public. The way you grow mushrooms – keep them in the dark and feed them on what, for the purposes of this publication, we will define as “bull manure”... From the significant to the ridiculous[, ‘Monsanto has successfully sued to claim a North American farmer's crop which was cross-pollinated by one of its GE crops’.]

...Tree breeders use a technique called control-pollination. Plastic bags are placed over... flowers to keep wind-borne pollen out. Instead, selected pollen is applied. It's breeding with a purpose, so trees can be developed for economic advantage, such as improved growth and wood properties like straightness and density... The... Forest Genetics... team's success... recently led to the development of the Maxel brand. Customers can choose from [4] different categories of tree stocks, based on the genetic characteristics they require. Forest Genetics' business is also focused on striving to satisfy customers' future demands... Forest Genetics give[s] new meaning to the term ‘customers of the future.’ ...Forest Genetics... is an innovative world leader in the development of this type of technology. Basically, it takes the gamble out of forestry... “Not all trees are created equal,” says [the team leader. “While]... elite family forestry... is new... [e]lite families of plants, vegetables and fruit has been around for a long time...”

...Canterbury scientists believe they can save bananas from extinction using the same technology they used to create pest-resistant potatoes.[A] Crop and Food, Lincoln... banana expert, said G[E] could be used to develop a banana with resistance to black sigatoka disease, which experts predict could wipe out conventional bananas within 10 years... Developing disease-resistant bananas through conventional breeding was not an option since all edible bananas were sterile clones... [T]he lack of seeds and pollen meant there was a zero risk of contamination of other crops by G[E] bananas... Unless bananas were developed with resistance to the disease, many communities in the [Last] World faced economic and social ruin... Bananas are grown in most of the countries receiving N[Z] aid and in some, such as Samoa or Tonga, are one of the most important cash crops. N[Z] had the capacity to do the genetic engineering, [which could become a form]... of foreign aid to countries all over... the [world]...

Starving nations wary of aid shipment... A 120,000-tonne shipment of food from the U[S] is languishing in Durban, South Africa, because famine-stricken Zimbabwe and Zambia are reluctant to accept... G[E] corn... say aid officials. More than 13 million people in southern Africa urgently

need food aid, according to the US Agency for International Development. But Zimbabwe and Zambia have said [GE] food could contaminate their crops and threaten exports to the E[U], which does not accept [GE] food. Zambia's President... said: "It is necessary to examine the maize before we can give it to our people and I'm certain if it is found to be safe then we will give it. But if it is not then we would rather [our people] starve than get something toxic." ...a spokes[person] for the Zimbabwean Embassy, said... "It is unfair that we are being put in a situation where people are saying, 'Beggars are trying to be choosers'... If we are not prudent, we will be laughed at later." ...his nation would accept the shipment of kernel corn if the grain was milled first so it could not be planted. The US and Zimbabwe were now deciding who will pay the milling costs.

...A[US] will pay the African nation of Eritrea A\$1 m... to take a shipload of 52,000 unwanted sheep off its hands. The Federal Government said the MV Corno Express was in the process of unloading the sheep in Eritrea. The sheep had been stranded at sea for almost three months after being rejected by Saudi Arabia. As well as... financial assistance, Eritrea will receive 3000 tonnes of fodder. Eritrea's Agriculture Minister... said measures had been put in place to ensure the welfare of the sheep. The sheep crisis has cost A\$10 m... [and lots of bad will after their plight was highlighted in news articles around the world, resulting in a fresh round of protests against live exports. In related news, thousands of AUSNs] are calling on state and federal Health Ministers to inquire into the unregulated sale of [GE] foods, says the A[US]n Conservation Foundation. Demonstrators gathered in central Melbourne outside the office of [the] Victorian Health Minister... yesterday to call for a delay on today's introduction of a new gene technology food standard... Food standard A18 of the A[USFA] takes effect today. This means food products of 20 [GE] crops will remain in the food supply for the next year untested, unassessed and unlabelled... ACF GeneEthics Network's director... said there was a great risk to public health if [GE] foods went on the shelf... "The risks are that people will be unable to make choices in protection of their own health and safety,"... Those at risk included children with allergies, people whose immune systems were weakened and those recovering from cancers and other disorders... "The onus is on the companies to show before, not after foods go on the shelves, that they are safe and they haven't done that."

...Jellyfish genes will go into grapevines as part of a Victorian study approved by A[US]'s... Genetic Manipulation Advisory Committee (Gmac)... The gene will be used to identify the flow of pollens and seeds from... laboratory vines... at the centre of a CSIRO study aimed at producing low-brown raisins, altering the colour of grapes, and modifying fruit taste. Last month Gmac approved a [GE] sugar cane trial in Queensland using the jellyfish gene. It has also approved a 500ha trial of 50 million GE cotton plants in the Kununurra area of Western A[US], where the state's agricultural department is carrying out the trial in an effort to develop cotton that is toxic to certain types of insects... A further 1.8 million GE cotton plants are to be planted over 20ha near Broome. Gmac has also approved a CSIRO study into GE field peas that have genes taken from the common bean to make the plant resistant to the pea weevil. About 10ha of the crop will be planted in the Naracoorte and Lucindale areas of South A[US]... The committee is about to consider a proposal to allow genetically altered poppies to be grown in Tasmania... [By the way, NZ's national GE] watchdog... said yesterday that its investigations had shown widespread unauthorised work throughout research institutions... Nearly 20[%] of the 1065 [GE] developments reported at 27 universities and crown science companies have been declared illicit because they were not properly authorised... None... posed significant environmental risk, said... Erma's... chief executive... But the authority had also found evidence of similar experiments being done in polytechnics, and was extending its inquiry into those tertiary institutions, [the CEO] told scientists at an Erma conference in Christchurch. The row over illicit genetic engineering by some researchers escalated into a slanging match between regulators and scientists after the voluntary disclosures in April by the University of Otago's school of medicine in Christchurch. Students were genetically engineering E coli bacteria and DNA material from native species. When the Hazardous Substances and New Organisms Act took effect... Erma set up a process so that low-risk GE work could be approved by committees in research institutes. It said that after the... experiments were reported, it had found 113 instances of unauthorised genetic research, and another 196 cases of research not notified to the Environment Ministry [last] July... when the new organisms law took effect. But Erma's efforts to bring unauthorised work inside the framework of the act drew criticism from senior scientists. One said... a third of senior biology classes in the U[S] used the same techniques that were now heavily regulated in N[Z], "and for which our scientists are being vilified." [Erma's CEO] said such criticism was unprofessional, as the law said that low-risk GE work should be regulated.

...*Brave New World* THE CONCEPT that the genetic engineering debate is about facts is philosophically naive, says... [the] author of *Brief History of the Future* and a director at the Open University of Cambridge. "It's never like that in these issues... It is actually an argument about values which arouses deep tensions." The Irish[person] is right. The controversy over GE has much more to do with intrinsic values than science and safety. Certainly, genetic engineering holds a key to global sustainability and our long-term health. But at the same time it arouses our deepest fears: about creation, scientists playing God, animal rights and the delicate relationship we all have with the environment. The notion of purity of species – that a lamb is a lamb and a dog a dog – is buried deep in each one of us. Much of the tension is driven by major misconceptions as the long-overdue food safety debate becomes more and more tangled with the equally urgent GE debate. Mention a food safety issue and many of us assume that the food in question is genetically engineered. GE, with no related deaths to its name, is perceived as far more dangerous than pesticides, fungicides and herbicides which are known to be carcinogens... [An] associate professor of philosophy at Canterbury University, suggests that the "so-called moral objections to cross-species recombination [GE] are based on ignorance. Every person... shares 50[%] of his or her DNA with a banana. All life is one – and that's not a nebulous, mystical claim, it's a scientific fact." As [the associate professor] points out, the only reasons to be for or against GE are empirical: "Will it make us happier, improve our health, increase our lifespans? Will it make farming easier and more productive? ...Part of any technology ought to be to improve human well-being – human flourishing, as Aristotle put it." And will it? For medicine, definitely. For food production, maybe. Scientists, conservationists and agriculturists do agree on one thing: that contemporary farming methods are biologically damaging and, in the long term, unsustainable. By 2050, when the world population reaches eight billion, we will need new answers. Right now, however, in the [First W]orld at least, food is cheap and plentiful. Driven mainly by supermarket groups, the price of food has dropped dramatically. In the 1950s, 40[%] of the household budget went on food. Now, led by North America, it's down to 12[%], with most of the cost in processing. What we want now, as displayed by the huge backlash against GE food and the exponential rise in organics, is not cheaper food but healthier and safer food. And we're willing to pay for it. In N[Z], where our future still rides on primary production, questions on whether to go with GE technology or opt for organic productions are crucial. It is no surprise that the Government has taken months setting boundaries for the high-powered Royal Commission into GE which will start on June 1.

...The U[S], a hotbed of ...G[E]... has much to learn from N[Z]'s approach to the contentious issue, says a visiting US Government researcher. [The]... senior specialist in agricultural policy in the US Congressional Research Service, sees the Royal Commission on Genetic Modification as an "exciting process, unlike anything we have in the US. The need for more public information on this broad issue is something the US could benefit from. We're moving in that direction but we still have some way to go." The commission... will begin a series of public meetings next Monday, will launch public hearings from 109 interested persons a month later, and will take written submissions from others... The commission will investigate how N[Z] should best deal with genetically modified organisms and products. Our Government has already announced plans to introduce compulsory labelling of G[E] food, and the main reason for [the researcher]'s visit was to examine these moves. [The researcher] said the US Government had initially resisted labelling but recently [the] President... had introduced a voluntary labelling scheme and US food producers recognised that they had to label to get into overseas markets. US companies, the food industry and grain handlers were finally taking steps to meet demand for non-G[E] food, or anticipating demands to do so. But their output of non-G[E] food was relatively low. "US farmers would like to see international uncertainty about biotech reduced, but at the same time they're continuing to plant biotech crops, as the demand for G[E]-free corn, soy beans and cotton crops are still tiny,"... G[E] issues were also far down the list in the issues dominating public debate... In Congress, legislation

to move to compulsory labelling was being introduced but... would have little impact on US trade policy as it affected New Zealand... Meanwhile, [one of NZ's]... largest bakers, Goodman Fielder, has announced it will no longer use possibly genetically altered soy oil in its products.

...G[E] food may be slowly disappearing from N[Z] shelves, as more and more food manufacturers shun the technology. Greenpeace's "true food" website guide says... three companies, which... produce some of N[Z]'s best-known brands, including Chicken Tonight sauces, Oxo cubes, Refresh and Raro drinks, Amco cooking oils and DYC vinegar, have moved from a "red" classification to an "amber"... Greenpeace classifies companies in the "red" if their products might contain G[E] ingredients or if a company supports genetic modification. The "amber" category is for companies that are committed to being G[E]-free but are not yet sure their products do not contain G[E] ingredients... 227 companies were listed on the website, up from 89 six months ago... The information on the website was supplied from the companies, said Greenpeace's spokesperson. The spokesperson, [who helps run the website, said the gradual change by food manufacturers was good news. "It's a good result. It's nice to see companies moving away from GE but we won't be happy until the N[Z] food chain is GE-free altogether." Companies that have moved from a red category to amber since the website was created include Unilever, Mainland, Goodman Fielder... Allied Foods... Pillsbury NZ, Frucor, Cerebos Greggs, Tip Top Ice Cream and Chateau Ice Cream... Five companies... [- the most notable being] Effem Foods, whose products include Dolmio pasta sauces and the Master Foods range... [-] have moved from the amber category to the green, meaning they are now guaranteed G[E]-free.

...All life on Earth could be destroyed by [GE] bacteria, a scientist has told the Royal Commission on Genetic Modification. Four scientists gave evidence for the Green Party at the hearing this week via video link from the U[S. A s]oil ecologist... spoke about a plant-killing G[E] bacteria her Oregon State University research team prevented from being released into the environment... [T]he bacteria had been approved for field trials when her team discovered its lethal effects. [The soil ecologist] believed the widespread plant deaths caused by the bacteria would in turn affect all life on Earth. The G[E] *klebsiella planticola* produced alcohol from post-harvest crop residue. The leftover organic sludge, containing the bacteria, would be returned to fields as fertiliser. [The soil ecologist said it] had independently tested the bacteria on plants, which the regulatory authority had failed to do. "After seven days, all wheat plants turned to slime." This example showed the need for better risk assessment of ecological impact.

...The Government faces a possible showdown with the Green Party next month after yesterday's report of the Royal Commission on Genetic Modification. The commission's four-volume report, which will be made public on Monday, is expected to give a cautious go-ahead to restricted use of genetic engineering in agriculture. The Greens, whose seven MPs hold the balance of power in Parliament, are strongly opposed to allowing any genetic modification outside the laboratory... The sensitivity of the issue was demonstrated yesterday when members of the pro-GE Life Sciences Network protested to the P[M] about the Government's decision to give a copy of the royal commission report to the Greens several hours before it is released publicly... [One member] said the decision "makes it look as though the Government has decided it doesn't want a balanced debate". The Government has also rejected a request from the Life Sciences Network to be allowed to take part in the media "lockup" which will give journalists up to an hour to read the report before [the PM]'s press conference on Monday afternoon. Although financial analysts have their own lockup before release of the annual Budget, [the PM's spokesperson] said it was not usual to hold analysts' lockups for other events. The contents of the report were still a closely guarded secret last night, and... [the] Green co-leader... said [it] could not understand why there seemed to be "a sudden consensus" that the report would give a restricted go-ahead to genetic modification... not[ing] that so far no [GE] crops had been approved in N[Z]. "A recommendation that we should proceed cautiously to release [GE] crops for planting, or to approved GE pine trees for commercial release, is actually taking us a giant step closer to a GE future," [the co-leader] said. "I don't sense that that's where the balance of forces lies at all." [The f]ormer Chief Justice... who chaired the royal commission, is remembered for abolishing wigs in court and is regarded as relatively liberal. [The chairperson] is said to have been "fastidious" in checking every word in the 1500-page report, and to have been its main writer. The only scientist on the four-person commission... a biologist who convened the 1993 [Gals'] Suffrage Centennial Science Conference... is said to have asked many questions at the hearings and is expected to support limited genetic engineering. The Anglican Dean of Auckland... appointed to provide an ethical perspective, is seen as the commission's most likely Green supporter. The fourth member, [a] [Papakura GP... is described as "a maverick who doesn't always follow the expected channel". [The GP] has Ngai Tahu tribal links and spoke up for a Maori perspective, but Maori groups making submissions were divided on the key issues. A spokes[perso]n for the Alliance leader... said Alliance MPs would not necessarily join the Greens in rejecting any genetic engineering outside the laboratory. "We are looking for the royal commission to sort out a lot of these issues."

...The Royal Commission on Genetic Modification has rejected a G[E]-free future for N[Z], plunging into doubt the Green Party's backing of the Government. A furious Green Party is not yet threatening to withdraw its support for the minority Labour-Alliance Coalition but that cannot be ruled out. The party is devastated that the... commission has effectively given a big tick to the present approval system for [GE] organisms... and food labelling. "I find it very hard to think of anything further they could[']ve recommended to take us closer to a GE future than what they have," [a] disappointed Greens co-leader... said last night. "The issue won't go away and the fight isn't over. We were quite prepared not to get everything we were looking for. We were quite prepared to work in a spirit of compromise. But... this goes too far." ...The commission's \$6.2 m... report says it would be "unwise" for N[Z] to turn its back on the potential of G[E] technology, but urges caution. "As in the past, we should go forward but with care," the report says, comparing biotechnology with such great advances as the use of fire, the wheel, steam power, electricity and the microchip. Many scientists, research groups and businesses welcomed the report. [The] Auckland Medical School dean... said: "It looks like a pragmatically sensible road map ahead for N[Z]." The P[M]... described the report as thorough, measured and balanced and conducted by a group of people "with no axe to grind... It rejects the idea of N[Z] being free of all [GE] material at the one extreme and the option of unrestricted use of [GE] at the other." [The PM] indicated broad support for the result of the commission's work... [among] over 10,000 public submissions, but dismissed the possibility of drastic action from the Greens. "What I can say is that any suggestion of an election between now and Christmas... on issues of supply and confidence is completely ridiculous." The commission wants to make it easier for low-risk research to be carried out by lowering compliance costs and allowing for approval on a project-wide basis rather than for each individual organism used... No application has yet been made for the public release of a G[E] crop in N[Z]. But the commission says the first case will be such an important event that the Minister for the Environment... should use her statutory powers to make the decision... The commission said organic, [GE] and conventional agriculture could exist comfortably in the same environment - a claim rejected by the Greens and organic farmers. It did not recommend any move to prohibit field tests... Industry and research groups agreed to a voluntary moratorium on field trials while the... commission carried out its inquiry. No decision has been made on what to do when the moratorium expires on August 31, but it is likely to continue during the Government's three-month deliberation on the commission's findings... The commission has virtually left the food labelling regulations alone, saying that the ...Anzfa... is doing a good job.

...The Royal Commission on Genetic Modification believes N[Z] should adopt a "proceed with caution" approach to genetic science. But the term "caution" didn't go far enough for thousands of N[Z]ers, who want genetic modification... banned. The public's distrust of genetic science is partly due to a number of scare stories... In 1989 thousands of people in America were affected by a new illness, resulting in painful and swollen muscles, rashes and gastro-intestinal problems. The condition left 37 people dead and disabled 1500 others. Authorities found that all of those affected had taken a health food supplement called L-tryptophan, used to treat conditions such as insomnia and depression. The outbreak was traced to a Japanese company, which had used [GE] material in the manufacturing processes. But court authorities blamed the problem on a build-up of toxic contaminants in the product rather than [GE]... Last year a N[Z] salmon-farming company accused of breeding mutant chinook salmon killed all its

[GE] fish and buried their remains. Anti-G[E] groups fought for more than a year to stop NZ king salmon from breeding G[E] fish after leaked papers showed deformed heads and other abnormalities had occurred during the breeding programme. The so-called “Franken-fish” experiment, involving a new growth-hormone gene, led to the salmon growing three times faster th[an th]e normal rate. Some of the fish developed lumps on their heads due to apparent genetic deformities... A[US]n scientists this year reported a G[E] experiment which accidentally created a deadly version of mouse smallpox in the laboratory. They said a similar change in human smallpox... [-] a much feared disease... eradicated by a huge vaccination programme... [-] could produce a far more virulent strain which could even be resistant to vaccines... Police in Italy raided a warehouse of US biotech company Monsanto this year and seized 112 tonnes of [GE] maize, the use of which is illegal in that country.

...New GE crops will be in the ground by Christmas after the Government overruled opposition from its Maori MPs to reopen the door to field trials. The long-awaited Government response to the recommendations of the Royal Commission on Genetic Modification came as a voluntary ban on applications for field trials was due to expire today. The decision allows medical and laboratory experiments and reopens field trials but bans commercial releases of [GE] organisms for two years. It walks a fine line between scientific and economic demands and a need for assurances to the public that the environment will not be put at risk. [The P]M... said science was critical to ensuring N[Z] developed a knowledge-based economy. “We cannot afford to turn our back on science... but nor can we ignore the concerns raised about aspects of [GE,” the PM] said yesterday... The Greens[’ co-leader]... said the party had not signed up to the Government’s package and would continue to fight for a G[E]-free future.

...*Silent Spring*, published in 1962, shocked us into understanding the extreme and enduring damage to our environment of the wanton use of synthetic pesticides. From this shock emerged the modern environmentalist movement. However, it was not the use of pesticides that was threatening to our environment but their uncontrolled, profligate use... The Green Party and its supporters did their job well by forcing the Government to have a Royal Commission on Genetic Modification. Their next task is to make sure the implementation of the controls emphasised in the report are monitored and carefully applied. But the Greenies will be the new Luddites if now, on the principle that it is essentially unnatural, they obstruct genetic research which promises so much for the health and food supply of people in an increasingly crowded world. They should remember that almost every step in the advancement of [hu]mankind since the first of us came down from the trees has been the result of yet another victory over the forces of nature. Ned Ludd is described as “a simpleton” in one... reference work I have and as “an obscure individual” in another, but [Ned] and his early-19th-century companions were right when they predicted the spinning jenny would change the lives of their generation from workers in a cottage industry to wage slaves in battery-hen factories. The huge misjudgment they made was to use their energy to smash the new machines rather than try to manage the workers’ place in the change. Social and economic globalisation and [GE] are inexorable and those expending their energy so resolutely against them are a distracting sideshow. The real concentration should be to force governments to make sure that globalisation is not left to the profit-driven devices of transnational corporations at the expense of people of all socio-economic groups, and that scientists’ G[E] research and development is closely monitored and defiant transgressions are severely punished.

...experts from 174 nations are... meeting... this week... at... the exotic old Caribbean pirate port of Cartagena, Colombia[, to debate]... how to regulate trade in [GE] potatoes, cotton, grains and trees. The U[N]-backed summit represents the first global attempt to reduce the risks laboratory-designed species might pose to public health and the environment. For 20 years, biotech companies have been genetically manipulating plants and animals.

...N[Z] environmentalists and politicians are hailing an international agreement allowing countries to restrict imports of [GE] crops. The deal, reached in Montreal on Saturday after meetings involving 130 countries at a U[N] summit, is the biggest setback suffered by the beleaguered [GE] food industry. The Biosafety Protocol allows countries to ban imports of modified food without breaking international trade rules... Five years of negotiations went into the agreement. Talks collapsed last year after six big agricultural exporters, including the U[S], rejected the deal. The Friday night deadline for agreement in Montreal had already passed, with the US and six others steadfastly blocking a consensus. Talks continued until near dawn, when the [US] agreed to sign, conceding that the agreement would not unduly disrupt trade... The protocol has comparable status to the W[TO] but will not take effect until ratified by 50 countries. It is open for official signing at the next meeting in Nairobi... [NZ’s] Biosecurity Minister... was proud ...he[r] Government had achieved its aims. “Virtually since the Government took office we have been working on this biosafety protocol.” The... Green Party co-leader... said the pact... puts environmental and health concerns on an equal footing with free trade agreements.

...Simmering tensions between Labour and the Greens erupted into open warfare yesterday over claims that the Government covered up an accidental release of [GE] sweetcorn. A furious P[M]... savaged the Greens co-leader... and TV3, claiming [it] had been ambushed by the claims. [The PM] and senior Labour ministers were caught flat-footed by allegations in [the] book *Seeds of Distrust*. Yesterday, they scrambled to reassure the public they had not allowed G[E] corn into the food chain. It took the Government’s spin machine six hours to issue a rebuttal of the book’s claims. [The PM] cancelled a trip to Whangarei to front a press conference in Auckland. [The PM] flayed the book’s author and the Greens’ co-leader, accusing the author of concocting a conspiracy theory and rejecting [the co-leader]’s claims that [it] had been surprised by details in the book. [The PM said the Greens’ co-leader] had been well briefed... when the problem was first identified... [The PM] also attacked TV3, accusing it of unethical and unprofessional journalism after [the PM and a TV3] presenter... squared off in a tense interview screened last night. [The PM] said TV3 had set her up, and during the angry interview, filmed on Tuesday... accused [the presenter] of ambushing her. [The PM] is now considering whether... [it] should lay a formal complaint. At her press conference yesterday, [the PM denied that it] and other ministers covered up the release, which allowed G[E] corn seeds accidentally imported from the US to be grown, harvested and sold for food here and overseas. “I am sickened at the way these allegations have been levelled at me personally and at the Government and its officials in general. I am going to sing from the rooftops that this is a very dirty campaign where the Greens and their supporters have descended to the gutter of the National Party.” [The PM added that] it would be very hard to rebuild trust with the Greens. [The PM] said the Government’s first reaction... when it heard of a possible release of G[E] seeds, had been that the crop must be removed. “Later evidence suggested strongly that there had been no such release, so no such action was taken or required to be taken.” The Government had then set standards to ensure there could be 99[%] confidence that contamination did not exceed 0.5[%]. Since then the Ministry of Agriculture and Forestry had proposed even tighter controls, to take effect from [next month]. “The so-called release [the author] wrote about was a corn seed where there was a theoretical outside limit of a 0.04[%] contamination, and not necessarily of G[E]. The PM] insisted that no G[E] was detected in the corn. If it had been detected, the corn would have been uprooted and destroyed. [The]Finance Minister... also attacked [the Greens’ co-leader’s] credibility, saying the co-leader] had clearly known about [the] book in advance because it was published by [a]Green list candidate... [However, the co-leader said the list candidate] had not breathed a word to the Greens about the book.

...Sweetcorn seeds that sparked the [GE] scare may have been contaminated by nothing more than soil from a Gisborne farm. Crop & Food Research yesterday revealed what a genetic scientist calls “the missing piece of the puzzle” to explain an apparent false positive result after the seed was tested for any G[E] contamination. The scandal... erupted after... publication of the book *Seeds of Distrust* by[an] environmentalist... The Government sought to distance itself yesterday by wheeling in several top officials to take over the debate. The senior Wellington bureaucrats were instructed to answer all inquiries. Also yesterday, the P[M] let fly against [a]TV3 news presenter... saying [it] was being told to “take the little creep on”... [The little creep] said last night that the show was “legitimate journalism”. In a new revelation, the *Herald* learned yesterday that a bag of soiled corn seeds returned by a Gisborne farmer seeking a refund might be behind the G[E] scare. Farmers were entitled to return the expensive

seed for a refund if they initially buy more than they need, and often do so. Two years ago Cedenco – one of the companies that imported the 5.6-tonne shipment of the seed in question – wanted to sell its leftover seed to Japan and submitted several batches to Crop & Food... to test as standard procedure. It was in this testing process... that the problem of potential contamination was revealed, prompting Cedenco to alert the Government. Fearing that it was dealing with G[E] contamination, the Government initiated further tests, which came back inconclusive. On that basis, the Government decided that the seeds already distributed by the importing companies could stay in the ground. Yesterday, Crop & Food[']s... communications manager... explained that the sample that tested positive was one of eight batches Cedenco submitted for testing... “Subsequently the origin of this sample was found to include a bag of seed which had been returned by a farmer. The seed had talcum powder added to it to make the seed flow better through the drill.” ...the presence of talcum powder indicated that the seed had been removed from the bag, “therefore introducing the opportunity for soil and soil bacteria to contaminate the sample. Contamination with soil and soil bacteria could account for the positive result.” ...But the explanation has not convinced [the environmentalist]. Reacting last night, [the author] said the Government was in damage-control mode and in the past 48 hours had pushed forward every single voice it could find to “muddy the waters”. [The author] agreed that theoretically seed exposed to soil on a Gisborne farm could account for the contamination. But that did not change the fact that... when the Government thought it was dealing with a G[E] crisis, it chose not to subject the seeds to more tests but instead changed the rules to allow the seeds to stay. [The author] said there were two sets of tests that threw up a positive result, but no further tests were completed to contradict those results... At a special press conference in Wellington... officials, from the Ministry for the Environment and MAF, said initial tests on the... consignment of corn seed planted in Hawkes Bay, Gisborne and Blenheim raised serious concerns about possible contamination. But later tests by independent laboratories in N[Z and AUS] raised strong doubts about the accuracy of the early results. [The]Environment Ministry chief executive... who has been in the job for eight days, said [it] had a “very high degree of confidence” that there was no cover up.

...The Government would have been liable for compensation claims of nearly \$1 million if it had ordered the destruction of corn crops suspected of containing [GE] seeds. Almost 400 pages of official documents relating to the contaminated corn scare were released by the Government yesterday. Among them was a copy of an email to [the]Environment Minister... setting out the cost of ripping up 178ha of suspect sweetcorn growing in Gisborne, Hawkes Bay and Marlborough. The identity of the person sending the email has been blacked out.

...About 30 tonnes of suspected [GE] corn seed produced on farms around Pukekohe and Gisborne has been discovered and will be destroyed. The Ministry of Agriculture and Forestry is moving quickly to contain damage from the country's second major G[E] contamination scare in a month. [The]Green Party... said last night the new discovery showed G[E] corn... was now so widespread in the US that N[Z] should stop importing any more seed from there. Officials have been much swifter this time to disclose their findings after a[n a]uthor... last month dropped a bombshell... by revealing an alleged contamination cover-up almost two years ago. Word of the new scare came late yesterday when MAF said Queensland-based Pacific Seeds had reported possible contamination from tests conducted on Monday on seeds produced by contract growers. MAF[']s acting director-general... said the firm offered to destroy the lot, before being directed to do so, to protect its reputation for being G[E]-free. The... seed was grown to supply farmers rather than for direct human consumption, and none had entered the food chain. But [the director-general] could not rule out the possibility of contamination of neighbouring crops... [It] was reasonably confident all the suspect seed had been gathered into three secure locations, but further checks were being made. While there remained a possibility of “false positives” from the tests, [the director-general] told the *Herald* it appeared likely at this stage that the country had its first genetically contaminated crops. The contamination was a mystery, because parent seed was tested as G[E]-free before being imported... [The director-general] said MAF and Erma were impressed with the speed with which Pacific Seeds told them of the possible contamination... Pacific Seeds['] managing director... said his firm took action as soon as it received positive tests. “It is a serious issue – your jails are probably like A[US]n jails – not very pleasant.” [The managing director] would not disclose the name of the company's two U[S] seed suppliers, except to say neither was Novartis, source of the seed involved in the earlier scare. [The]Environment Minister... said between 20 and 21 tonnes of corn from the latest imports was harvested from seed planted by Seed Solutions on 15ha of leased land near Pukekohe, and nine tonnes from a paddock in Gisborne. Seed Solutions['] manager... said Pacific Seeds had tested the parent seeds in A[US], even though testing was not required by N[Z] law until the beginning of this month. “It's disappointing that despite all the care and professionalism that they've shown this has happened.” [The manager] said the G[E] contamination would not ruin Seed Solutions' reputation. “Our reputation isn't at stake because we've done what we're required to do, but it makes N[Z] look stupid for taking it to this degree. It just demonstrates to the rest of the world what a farcical policy this country has on GE. We have to meet the rules, but the reality is I'd eat it, I'd sleep in it, I'd do anything with it.”

...Tests ordered by biosecurity officials on the parent seedlines of 30 tonnes of maize destroyed because it was contaminated with [GE] seed showed two types of G[E] strains... Bt179... and... Yieldgard... Government officials said yesterday it was likely that G[E] seeds in the imported parent lines were missed in testing by the seed companies involved because of the relatively small amounts of contaminated seed present.

...The [GE] material which contaminated sweetcorn grown near Gisborne is one of the G[E] corn varieties approved for consumption in N[Z]. The MA[F]... said yesterday that testing over the weekend had shown the presence of Bt11, an insect-resistant G[E] sweetcorn variety. N[Z and AUS]n food standards class this type of corn as safe to eat... On Wednesday, the ministry revealed that a N[Z] company had alerted it to G[E]-positive tests carried out in Japan by a pizza-maker of a topping mix containing the sweetcorn grown near Gisborne... MAF is still investigating how the sweetcorn grown by Sunrise Coast NZ was contaminated.

...Subway sandwiches made in N[Z] use the same bread dough that has caused an outcry in Japan because it contains a product made using a... G[E] organism... But... Subway says the dough is approved for use in N[Z] and has been exported to Japan for years... Staff at [the]Taranaki bakery... which produced the dough, have been working day and night to make a new dough that does not contain the product, believed to have been imported. Yesterday... the family [that runs] the business, said the news had come as a shock. [It] hoped to have the new dough [in] Japanese stores by Wednesday... Subway's development agent in N[Z]... said the problem appeared to be an enzyme in the... dough... and... questioned whether Japan had changed its restrictions... [A] Japanese newspaper... said the chain removed the dough as a precaution... [T]he news... comes only months after a Japanese pizza maker rejected a Gisborne firm's corn when it was found to contain G[E] material, and... has sparked further debate in N[Z] over the lifting of the G[E] moratorium... ■ Add[ing] weight to the concerns of local food safety campaigners, spices... dosed with radiation have been allowed into the country despite a Government ban. Officials admit they turned a blind eye to shipments of paprika believed to have been exposed to radioactive treatment. The revelation comes as debate rages over the safety of irradiated food and authorities consider overturning a decade-old ban on selling it here. Food safety campaigners are shocked that paprika was allowed on to shop shelves without prior warnings to unwitting consumers – and in contravention of the law... “It's outrageous if they have knowingly allowed irradiated food to be sold without investigating it, and without labelling it,” said... Friends of the Earth. “It illustrates their eagerness to foist it on consumers.” ...the Safe Food Campaign, said: “If they've done that, what else have they let in?” The Associate Minister of Health... was told about the shipments in a Ministry of Health briefing paper last month. It has now been released under the Official Information Act. In the paper, [a]ministry staff... member says... “Health officials who examine imported foods have, in the past, noted that some shipments of paprika appeared to be free of contamination, while being free of fumigant chemical residues... The officials inferred that the paprika had more than likely been treated with irradiation. No action was taken.” Contacted by the N[Z *Herald*], the paper's author said it had no more specific information, and declined to answer further questions. The director of public health... confirmed... in a written answer to questions... [that] a “small number of shipments” treated with

irradiation had been introduced. "In 1994 [the ministry] tested 28 spice samples. The results showed that one sample had been treated by irradiation,"... Figures for... other years... were not available. The ban on irradiated food was imposed in 1989 after an outcry over plans to build a gamma irradiation plant in Mangere. Asked why the ministry had ignored the ban, [the director] said: "Because of the small level of food involved and the fact that irradiation does not present a health risk to people... The priority for action by the ministry has been in sampling and treating [with fumigation] shipments of spices known to be at higher risk of bacterial contamination." Last month, the... A[NZFA] began a consultation process over its proposal to allow certain foods to be exposed to radiation doses of up to three million times the strength of an x-ray. The treatment, which is proposed as a replacement for chemical controls of pests and micro-organisms, could[also] be used for herbs... fruits and vegetables.

...food for thought... Should N[Z] guarantee pest-free exports by using chemicals or by zapping food with radiation? ...Irradiation of food may prove crucial to the continuation of important horticultural exports from N[Z], say health officials. The Health Ministry says food irradiation is important to exporters because at present the most widely used treatment for fresh fruits, vegetables, nuts, cereals and grains is methyl bromide gas. N[Z] has signed international agreements to phase out the use of methyl bromide by 2005 because it depletes the ozone layer, although there would be some scope for its continued use in quarantine procedures. "Without the ability to permit the sale of irradiated foods, N[Z] could continue to be dependent on chemical alternatives to safeguard certain food while other countries are phasing out or banning the use of these chemicals, says the ministry. It argues that since there is "overwhelming" scientific consensus on the safety of foods irradiated to specified standards, it would be difficult to justify on technical grounds a continued prohibition of irradiation... The official view is that world trade rules are likely to make it difficult for N[Z] to continue its present ban on imports of irradiated foods. The A[NZFA] is preparing to consult N[Z]ers on a standard for the treatment of food with radiation... In irradiation of food, the products are bombarded with radiation from cobalt-60 or from an electron-beam accelerator... The treatment does not make the food radioactive, but can make small changes to it. At present, a regulation under the Food Act 1984 allows the sale of irradiated food with the permission of the Health Ministry. But a policy developed in 1989 says the use of the process or its products should not be permitted in N[Z]. Last month it was reported that the only irradiated foods that had been sold in N[Z] were spices, which are often contaminated with soil micro-organisms. Paprika, especially, is often contaminated with salmonella bacteria... In A[US], where there is also an official moratorium on food irradiation, a standard for irradiated food was already being drafted when the [ANZFA] was established in July 1996. In January, the authority released a discussion paper presenting the A[US]n draft standard for use on both sides of the Tasman. The A[US]n proposal was for a general ban on irradiated foods, with exceptions granted for specific foods and an evaluation of the likely nutritional impact of individual foods on diet. Irradiated food would have to be labelled. Health Ministry advice published last year said irradiation was a highly effective method of destroying micro-organisms in food, including those which might spoil it or cause illness, "purportedly without compromising safety or affecting nutrition and sensory – taste, flavour, texture – quality." But it noted that while the World Health Organisation had said irradiation was "the most thoroughly investigated food processing technology," it was still controversial and moves to establish a food irradiation industry in N[Z] had so far been unsuccessful. The ministry's director of public health... said adoption of the standard on which the authority was seeking public comment would resolve ambiguities over the import of irradiated spices.

...The minister appointed to a trans-tasman committee considering overturning a ban on food irradiation has been accused of making his mind up without listening to public consultation... [T]he Associate Minister of Health, told Parliament yesterday... "I for one support the proposal... The alternative to irradiation is to eat the residues of toxic fumigants that we now use." ...The Green party co-leader... said... "It's of concern to me [that the minister] supported the proposal... I assume the consultation process is specifically to inform [the minister – who] is the sole N[Z] representative [on the transtasman committee of health ministers which will make the final decision][– of NZer's opinions. Therefore, the minister] should be listening[to what other NZers are saying on the issue]."

...Ministers give a green light to nuked produce... Bureaucrats have ended N[Z]'s... ban on irradiated food, sparking an outcry among health campaigners. As part of the talks this week that saw agreement on reaching a common standard for labelling [GE foods – the compliance costs of which] might range up to \$300 m... [– the NZ and AUS]n Governments decided to allow irradiated food to be manufactured in N[Z], or imported. Applications would be considered individually... [The] Safe Food Campaign... said last night the issue raised environmental and health concerns, as irradiation reduced vitamin and nutritional levels... "Consumers don't want to eat... nuked... food... They want natural, fresh, nutritious food."

...Zapping food in the suburbs... Snuggled among 1950s state houses in Upper Hutt... N[Z]'s only irradiation... processing plant uses a cobalt-60 radioactive source to sterilise a variety of goods from pot-pourri to plastic bottles[, but primarily]... the animal vaccines it[s owners –] ...Schering-Plough Animal Health... [–] manufacture... and export... around the world... And thanks to a policy change made this week, food, too, could soon be on the irradiation menu... [A spokesperson for the plant's owners] said yesterday: "We won't be turning into a food irradiation company overnight, but we certainly have been keeping our eye on the discussions and certainly see it as an opportunity to get a little bit of extra business." ...Within the confines of a lead-lined room, the gamma-rays pass through the food in much the same way as microwaves. But rather than heat the food, they break down the genetic make-up of certain components. A 1988 Ministry for the Environment briefing paper produced by a working party convened to study irradiation listed the benefits as decontamination, disinfestation and reduction of spoilage. Detrimental effects identified in the paper were flavour changes, nutrient loss and oxidation of fats... [The] manager of isotope applications at the Institute of Geological and Nuclear Sciences, was a member of the working party that recommended the Government ban irradiation. Since then, [the manager] has been chair[perso]n of the International Consultative Group on Food Irradiation, and... now believes the time is right for N[Z] to adopt the process. "From my point of view, I... regard it as a safe process, and it's a very effective one because it deals with all types of insects." ...the controlled use of irradiation has gained... so much... acceptance... that [it] is considered safe by the W[HO] and is approved in 30 countries... But another member of the working party... is flabbergasted that something... [the] volunteer with Friends of the Earth... fought for so hard has been overturned. Although the public will be able to make submissions on each application, [the volunteer] believes it will be hard to stop irradiated food slipping on to supermarket shelves. "How much notice are they going to take of objections?[" An AUSn-based]... sterilisation company... Steritech in Melbourne, ...is expected to be the first applicant to take advantage of the relaxed food-irradiation rules.

...N[Z] Government papers show officials considered a failure to relax the ban... on food irradiation... could result in a challenge to the W[TO]. But the manager of isotope applications at] the Institute of Geological and Nuclear Sciences, said the greatest political pressure came from A[US]. "There was not pressure from big brother, but there was internal pressure." ...[AUS] had wanted to change to the new regulation... [3 years ago when an AUS]n Senator... wrote to the then [NZ] Associate Minister of Health... trying to get the issue moving. [The NZer] replied that irradiation affected the Government as a whole, not just the health sector. Last year, Ministry of Health officials advised the [ANZFA] that a communications strategy would need to be formulated to deal with the issue in N[Z]. "It is anticipated that the issue... will cause significant public debate... possibly similar to that raised by [GE] foods," wrote... the ministry's food and nutrition section. "Particular thought will need to be given to how this information and the consultation process is to be carried out in N[Z] for a successful result." ...• Zapp[ed]... food allowed on to shop shelves would be labelled.

...Food labelling changes hard to swallow... Most people oppose changes to food-labelling regulation, a survey commissioned by Sanitarium Health Food shows... 70[%] of people did not know that regulations governing food labelling were about to change. Once questioned on the subject, 87[%] said information panels proposed by the A[NZFA] would not give them all the information they needed. The authority has called for extra information on content, nutrition and allergy risks to be available to customers. Labels showing the [%]age content of a food's key ingredient

would let shoppers directly compare products, it said. But sugar content, along with information on dietary fibre, potassium, cholesterol, fatty acids, calcium and iron, would have to be listed only on foods claiming health benefits, such as being low-fat or low-sugar. The survey found that 85[%] of people wanted sugar content disclosed regardless of whether the... manufacturer had made a claim about the sugar content, and 87[%] said the nutritional content of food should be labelled... Sanitarium N[Z]... said a third of people were trying to make dietary changes, usually by altering their intake of foods with a high sugar and fat content. “[The authority] is going against the N[Z] health strategy, and common sense, by making it harder for people to choose healthy food when they’re shopping.” Sanitarium had asked the authority to make it mandatory for all foods making a nutritional claim to list sugar content, type of fat and fibre... The... Health Minister... [– who] accepted a petition yesterday from the National Heart Foundation, calling for food packaging labels to be made mandatory... [(t)he petition had been signed by more than 100 health workers, including many leading cardiologists and public health experts] –] ...said yesterday that [it] would push for mandatory labelling of saturated fats and sugars on food packaging to be included in the... food standards code... The minister... had gained cabinet support to move the... amendment to the code when the council meets in Sydney on Friday... The code would ensure consumers received more information about use and storage instructions and food additives, as well as enforcing date marking and legibility requirements... “I have a duty as Health Minister to listen to health groups who have sensible and practical proposals to put forward. The mandatory labelling of sugars and saturated fats is vitally important for consumers.”

...New labelling requirements are costing food manufacturers hundreds of millions of dollars, and may also reduce buyers’ choice. The label regime will give buyers more information but may cost them the choice of smaller lines... as overseas manufacturers balked at the cost of the new rules and stopped exporting to N[Z]... Seven years in the making, the 520-page A[NZ] Food Standards Code is set to take effect from December 20. The Grocery Marketers Association, which represents processed food and beverage manufacturers, says 35,000 product lines are being relabelled to comply... [The association’s] executive director said companies were only now starting to work on the new labels. It was costing N[Z] manufacturers between \$2000 and \$5000 a label to comply with the requirements. In some cases extra staff were being hired to cope. Some companies are having to change 2500 labels... The... industry was willing to bear the cost because it supported the code, which would create some of the most stringent food regulations in the world. The industry had been able to introduce the changes gradually and existing stock which did not comply would be given grace periods and not have to be pulled from shelves when the rules took effect... [The executive director couldn’t] name any [imported] products that might be withdrawn from shelves. But Auckland importer Beer Force International says some beers may be pulled from N[Z] because the new labelling requirements do not make the effort worthwhile. The general manager of the A[NZFA]... accepted the argument that N[Z] was a tiny market, but said that with A[US] it would be much larger... [The general manager believed] the harmonisation of food regulations might, in fact, give consumers even more choice as manufacturers outside Australasia took advantage of the common standards to introduce products to both markets... “[And s]o much of our food is traded trans-tasman [that] for both countries to be able to work to the same law is really cost effective.”

...Warning: ice cream contains real thing A fake ice cream is being pulled from shop shelves because it is contaminated... by ice cream. The Sanitarium Health Food Company said yesterday that it was recalling its soy-based So Good Creamy Vanilla ice cream substitute as a precautionary health measure... The problem was limited to one-litre tubs with a best-before date of February 6... and did not affect any other flavours or products. Sanitarium said customers who were sensitive to dairy products could have an allergic reaction, and should return containers to the company for a full refund... Sanitarium has set up a freephone number, 0800 100 257, which was not [being answer]ed last night... A... “real” milk-based ice cream was somehow mixed in with a single batch of the soy product... [Speaking of “real” milk-based products, c]heesemakers in the north Italian town of Parma have gone to the European Court of Justice to protect the name Parmesan, saying their traditional product is being besmirched by forgeries. They have named N[Z] as their public enemy number one. The case was filed by a consortium of cheesemakers, Parmigiano Reggiano, who have been making the hard, dry cheese for centuries with traditional methods. They say their business is affected by cheaper rivals made to less-demanding standards. Parmigiano Reggiano has been a brandname since 1996, but the name Parmesan itself (Parmigiano in Italian) has no such legal protection, and cheese described as such is sold around the world... packed in plastic bags emblazoned with an Italian flag... “To sell cheese described as Parmesan which was not made in the Parma area is fraudulent,” said Parmigiano Reggiano... “These producers are using the word Parmesan to make consumers believe that their product has an origin and characteristics which it hasn’t.” The case is a classic one in Europe, where producers of local products such as Bayonne ham, Camembert and Brie cheese, Scotch whisky, champagne, port and sherry fight tooth and nail to protect their name from generic competitors... [A] part-owner of Albany luxury food store Vinotica, said that while many N[Z] cheeses were stocked, the store did not use Kiwi Parmesan. “My personal opinion is that there is no comparison... And for that reason it may only be fair that producers toe the line and stop passing it off as the real thing. But this argument could go round and round for ever. We make Feta cheese in N[Z] and call it Feta, and you don’t hear the Greeks complaining.”

...[a] National MP... has accused Enza’s corporate shareholders of an “immoral, but legal” conspiracy to force apple growers to pay for Enza’s \$50 million in foreign exchange losses. [The MP] said orchardists would be forced out of business unless the Government amended legislation to stop Enza taking money out of growers’ accounts. [It also] said growers had not been given full information about the value of Enza, their shares and documents about how foreign exchange dealings were handled and who was liable for them... The Nelson MP said... [t]he bringing forward of losses was illegal and being done now because Enza feared growers fleeing the company when the export market was deregulated... GPG and FR Partners, who own about 40[%] of Enza, were... trying to tidy up their balance sheets... and... extract money from growers before the monopoly on exports was lost, [the MP] said... FR Partners and GPG were... trying to protect the profit they made on their initial purchase of shares through a legal loophole. [The MP] estimated that if all Enza shareholders... paid to cover the losses, the two corporates would have to hand over \$19.5 million, leaving them with a profit of \$3 million on their purchase price of \$11.94 m[. Incidentally, the]... fungal toxin patulin has been found in some apple juices available in N[Z]... Patulin comes from a family of toxins responsible for tens of thousands of deaths worldwide and consumers should be worried by the discovery of even small amounts, say scientists. It is one of the mycotoxins, which... can... [be] eaten, inhaled or absorbed through the skin... Their presence in the body may be undetected for years... The A[NZFA] monitors mycotoxins using standards set by the Codex Alimentarius Commission, a Rome-based international committee on food quality. It is advised by the W[HO] and other expert bodies... [NZ’s] Institute of Environmental Science and Research (ESR)... and other scientific organisations test imported foods, particularly peanuts, deemed at high risk of being contaminated with mycotoxins. Among these poisons are aflatoxins, one of the most carcinogenic substances known. They occur most commonly in peanuts, but are also found in other nuts, maize, and occasionally spices, dried fruit and figs... A recent study in Indonesia revealed 25[%] of samples taken at random contained aflatoxin levels often higher than 1000 micrograms per kilogram – compared with the generally accepted level of 15 micrograms for peanuts in world trade. “These were not selected samples... Most... samples were taken from ordinary trade consignments. The take-home message here is that if you’re travelling in Indonesia, don’t eat the peanuts.” ...Another group of mycotoxins, called fumonisins, are occasionally found in maize. They cause a disease in horses and other equines where their brains literally turn to mush. In humans, fumonisins have been possibly linked to throat cancer in parts of China and southern Africa. The fungi, which create a family of mycotoxins known as trichothecenes, are endemic in wheat and related grains. Fortunately, trichothecenes rarely occur in quantities to be a serious threat to human health – with notable exceptions. This type of toxin killed thousands of Russians during and after... [WW2] when the fungus

bloomed in wheat left over the winter before harvesting. Victims often died of the common cold because the toxin suppressed their immune systems... [T]here have been a few recent cases in North America where children died from inhaling mycotoxins.

...For years, parents have been telling children to eat their greens and fill up with fruit to keep healthy. But new research shows some... [natural foods] we have been encouraged to eat are likely to make us ill. Symptoms among those sensitive to the foodstuffs include migraine, eczema, lethargy, depression and irritable bowel syndrome... The findings by York Nutritional Laboratory, a company that has tested the food sensitivity of thousands of patients, surprised doctors and nutritionists. In tests on 93 common foods, it found eight of the 25 to which patients most often reacted were fruit, vegetables or pulses. Of those, blackcurrants, closely followed by kidney beans [of which there 'are 40 varieties'], were the worse offenders. Peas, olives, tomatoes, grapefruit, orange and lettuce also fared badly. The foods themselves to not cause the symptoms but trigger an adverse reaction in people with a disposition to those symptoms... Foods the least number of people reacted to were ginger, chicken, beetroot, garlic and venison. It was already widely known wheat and milk could cause adverse reactions and allergies in many people. But more surprising to researchers was the finding [that] 10% of those tested were sensitive to lettuce... [The] professor of biology and vice-chancellor of the University of York... said: "Who would believe the friendly old lettuce would make someone feel very unwell..." ...food sensitivity was triggered by the rejection of an ingested substance by the body's immune system. "The human body has developed a sophisticated defence against being attacked on all sides. When it sees something it does not like it produces an allergic response." ...[but a spokesperson for] the British Nutrition Foundation was sceptical [and was concerned that] if diets dispensed with too many fruit and vegetables, they would not deliver adequate vitamins and minerals... [T]he Fruit and Vegetable Information Bureau said: "For the general population these foods are healthy. They affect you only if you... are allergic to them."

...Suffer from headaches? Take a look at your diet before popping a pill... Foods with high levels of chemical compounds called amines (which affect physiology and brain function) can trigger headaches. Here are foods with amines to avoid and some that are OK to eat... AVOID... instant foods such as soups and gravies, frozen... food... aged, canned, cured or processed meats, organ meats... yeast bread... doughnuts... and passionfruit... EAT... cereals... starches... eggs... most veges, legumes and seeds... most fruit, but limit citrus fruit and drinks to half a cup per day...

Fruits with the highest concentration of immune system-enhancing vitamin C include blackcurrants and guava while mangos are the best fruit source of beta carotene, which also boosts immune responses. But for the most effective all-round benefit when you are feeling run-down, opt for kiwifruit... Rutgers's University... ranked them best out of 27 fruits, based on the percentage of nine recommended daily nutrient intakes they provide...

A KIWI FRUIT laxative could flush the economy with... million[s of dollars]... Dietitians have long known of the humble kiwifruit's magical bowel-shifting properties... The pill, called Zylax, is made from an enzyme extracted from the furry green fruit by a new hi-tech process. Vital Foods believes the natural relief pill could unclog the N[Z] export industry with a predicted \$100 million in sales each year and the creation of 500 new jobs. The Auckland-based firm originally developed a kiwifruit juice which hospitals used to help patients' digestion and prevent constipation... a side effect for patients suffering from cancer, spinal injury and burns... ■ [In a recent]... *Herald* column a food expert wrote of Aucklanders exchanging bags of feijoas picked up from under backyard trees... Some Aucklanders were willing to pay far more for their neighbours' feijoas than the \$5 a kilo growers receive. Growers do not let their mature fruit drop to the ground. They and their staff go round every feijoa tree each day picking fruit by touch, just before it is ready to fall to the ground. They handle the delicate skins with the upmost care, avoiding bruising and skin breaks and thus prolonging the fruit's shelf life. Their finest fruit is probably air-freighted to California and Asian markets. A well-grown, fresh, ripe feijoa is a taste delight. To a feijoa addict... the first sniff of the fruit's distinctive aroma... usually brings... a mouth-watering promise of that delicious flavour... It is a flavour appreciated by many nationalities. Asians, especially, respond to the sweet, aromatic taste. [A veteran Whakatane grower... has an orchard and cafe on the main highway to Rotorua and... testifies to tourists' appreciation of feijoas, both fresh and made into wine. [The veteran] had bred several new varieties for the fresh fruit market, but it is in processing that [the veteran] sees the feijoa's potential. "It retains its fresh fruit flavour when processed for wine, juice, yoghurt, ice cream, or for adding to confectionery or cereals... The possibilities are unlimited... We could be selling to the world. We have a unique product. We are the only country with a feijoa industry. Though the fruit is commercially grown in... coastal Victoria... California, Israel and some other Mediterranean countries, it is a minimal crop compared with its situation in N[Z], where soil and climate are just about ideal..." [The veteran] likens the feijoa to the mango. While some mangoes are available as fresh fruit, many more are processed for use in drinks and ice cream... The formation of a grower co-operative for marketing process[ed] fruit means processors can now obtain reliable volumes of quality fruit, and give growers better returns. [The veteran] sees the day when carefully tended orchards will produce large, high-quality fruit for processing, and orchardists will make a return at least on a par with that of kiwifruit growers... Many feijoa growers are part-timers, leaving their fruit to drop and harvesting it into bins for processing... [T]hey are missing out on higher returns. More care in management, including feeding, irrigation and pruning, would result in higher yields of larger fruit. Processors reward suppliers of large fruit because they have proportionately less peel and more flesh... The... neighbourly gifts, mostly small and misshapen, are a far cry from the huge and luscious beauties, weighing more than 300g and the size of a small apple...

Eating apples may be good for you lungs. British researchers, reporting in the journal *Thorax*, on a study of 2512 middle-aged [guys], conclude that more than five apples a week could protect the lungs from atmospheric pollutants and irritants including nitrogen dioxide and cigarette smoke. Previous studies have linked both fresh fruit and antioxidant vitamins to respiratory health but this study reveals a strong link between lung function and the number of apples eaten weekly. Good lung function was [also] associated with eating citrus fruit.

...[*'Foods That SHARPEN Your Mind* "EAT YOUR FISH," my mum would say. "It's brain food." Mum wasn't, of course, a nutritionist. Mum was merely citing an item of food folklore that has been around for ages. Another mother, on the other hand, is a nutrition scientist at the Massachusetts Institute of Technology. When her daughter was studying to become a barrister, the mum recommended tuna "to keep her mentally alert." And when the mum travels, it carries cans of tuna for snacks. The mum and her colleague and spouse – who is the director of MIT's Clinical Research Centre – have measured the reactions of the brain to different types of foods. They and other researchers have discovered that food affects the mind in powerful and surprising ways. What you put in your mouth can change your mood, alertness, memory and clarity of thought. "It remains peculiar to me," the director has said, "that the brain should have evolved in such a way that it is subject to having its function and chemistry depend on whether you had lunch and what you ate. I wouldn't have designed the brain that way myself." But nature apparently did design it that way, and what scientists have learned about it can be of great value to us. Use their findings in the course of an average day, and you may well gain mental acuity: *Breakfast*. The first thing in the morning, many of us feast on carbohydrates such as toast and jam and, even worse, sweet cereals. These sugars and starches increase the presence in the brain of the soothing neurotransmitter serotonin. As a result, we might not reach our normal morning energy peak. Bacon and eggs contain high fat and cholesterol. They are slow to digest, diverting blood from the brain and thereby reducing mental sharpness. "When I see people eating bacon and eggs for breakfast I feel like shaking them and saying, 'Why are you eating that food? Don't you know how you're going to feel?'" A good breakfast, scientists now believe, features foods low in fat. This means choosing lean ham instead of sausage or bacon, low-fat cottage cheese as a butter substitute, and fresh fruit or juice instead of preserves and sugary foods. (The fructose sugar in fruits digests slowly and does not trigger the reaction that table sugar and honey do.) *Lunch*. Most people recognize the dangers of the "liquid lunch" and its ability to dull the mind all afternoon. (Alcohol might be called the antibrain food; chronic use can cause structural and functional damage.) But few are aware of the effect of a carbohydrate-heavy lunch featuring only such foods as bread, pasta or potatoes, and sweet desserts. One study, headed by a psychologist, found such meals made gals sleepy and guys calmer and lethargic. Moreover, says the psychologist, "we found that people over 40 were less able to keep their minds focused on work for up to four hours after eating carbohydrates than were

those who ate a high-protein meal instead.” Why? Protein-rich meals of poultry or fish, for example, charge your bloodstream with amino acids, including tyrosine. Tyrosine is carried across the protective filter called the blood-brain barrier. In the brain this amino acid is available for conversion into the alertness chemicals dopamine and noradrenaline. If stress exhausts the brain’s supply of these neurotransmitters, the result may be confusion, indecisiveness, anxiety and depression. Another key nutrient that is carried across the blood-brain barrier is choline – found in fish, meats, egg yolks, soy products, oatmeal, rice, peanuts and pecans. Choline is a chemical precursor of the brain neurotransmitter acetylcholine, which plays a major role in memory. *Dinner.* Unless you need energy and stimulation to work or study through the night, avoid proteins – such as a juicy steak or chicken – at dinner time. Instead choose carbohydrates. These foods alter brain chemistry indirectly: by triggering a release of the hormone insulin, they cause muscle cells to take up most amino acids in the bloodstream. One amino acid not taken up is tryptophan, a scarce chemical that competes with other amino acids for transport through the blood-brain barrier. With its competition reduced, more tryptophan enters the brain, where it is converted into soothing serotonin. What about the glass of warm milk your mother told you would make you sleepy at bedtime? Your mother was wrong. While milk does contain tryptophan, nutrition scientists now find that the protein in milk cancels the effect of this amino acid. The best snacks before bed are carbohydrates: oatmeal biscuits or an English muffin with jam. Carbohydrates may have a deeper influence on the mind than scientists used to suspect – in addition to making a person drowsy, tryptophan can also help reduce sensitivity to pain. In recent years, we’ve learned to choose foods that help the heart and help prevent cancer. Now we should learn to choose them with our brain in mind.’]

...Even modest deficiencies in a mother’s diet around the time of conception can lead to premature birth and affect the long-term health of their child, says a study... [Another] new study concludes... [that n]ewborn babies who are fed too frequently are likely to sleep badly. Researchers studied 600 healthy British babies and discovered that newborns who were fed more than 11 times during 24 hours in their first week of life were nearly three times as likely to have disruptive night-time sleep three months later. The researchers’ work has been published in *Archives of Disease in Childhood*...

“There is so much research about little kids not getting enough exercise and learning good eating habits,” [say the Auckland couple who brought a US]... idea... Stretch-n-Grow... here... “If you teach them early enough, they grow up with healthy attitudes to fitness and food.” ...[they] visit pre-schools, kindergartens and childcare centres to teach... [t]he new... programme... “The [kids] love it, from the warm-up and the aerobic exercise, to the cool down and a talk about nutrition, exercise and other health issues afterwards,”... The[y]... plan to expand Stretch-n-Grow throughout [NZ.

...The Weekend Herald] asks the experts about healthy, and hassle-free, food for children. Two small pieces of lettuce are the only things standing between [a] 3-year-old... and his pudding. [It] pushes them around the plate, hoping to make them smaller or, better still, disappear altogether. [The boy] has already finished a plateful of spaghetti bolognese – a lot of it by hand. But the salad is a bit of a hurdle. His two big brothers and little sister are enjoying their plates of ice cream. [His sister] even has her plate tipped up to her mouth to get every last morsel. [The 3-year-old’s] pudding plate sits, waiting. “You know the rule,” says father... “If you haven’t finished your dinner before we’ve finished our pudding, you won’t be having any. Just eat that lettuce.” “I’m just cutting it up,” comes the speedy reply. It’s probably just a slight variation on the comments being made by hundreds of children around the country in a nightly battle otherwise known as dinner. While parents seem to have no trouble getting kids to eat pudding, how do they get them to first eat their main course? And what should they be feeding their children to make sure their diet is healthy and nutritious? [The 3-year-old’s parents] have four hungry mouths to feed, and although they favour meals that are easy to make in bulk, they are conscious of giving their growing children a healthy diet. That means... things such as rice and pasta are on the menu a lot, although they make sure there is always a decent helping of veges or salad as well. Scanning a Health Ministry sample diet for a 6-year-old, [the mother] says it contains a lot of the things her children eat... A comprehensive national study of children’s diets – what they eat and how much – has never been done in N[Z], but plans are under way to start one next year. A pilot study for the survey has almost been completed in a joint effort by Massey and Auckland Universities and the Auckland University of Technology. The pilot will pre-test the best ways for the nationwide study to be done, and how it can best find out what our children are eating, when they eat, what food groups they eat from and how they are growing. The study also aims to collect information about the average heights and weights of N[Z] children – information that also has not been compiled in such detail before... [The] project leader of Massey’s human nutrition department, says the study is well overdue and is a “very exciting project to be involved in.” It will take [a] year and... observe children selected at random. But dietitians, working on information and experience they already have, say children will eat practically anything if you teach them early. And junk food from time to time is not all bad – provided the rest of your child’s diet has all the right ingredients. [One d]ietitian... says parents have to remember that children have small tummies. They need to snack often to fill up, and that is a golden opportunity to make sure they are getting their “5-plus” – at least five servings of fruit and vegetables every day. “That is a minimum, so you can keep on feeding them fruit and veges as long as they will eat it, really,”... Water, milk or pure juice are always going to be the better options to drink, but occasional doses of fizzy soft drinks are not going to hinder a child’s development. The trick is to get children used to eating healthy foods at a young age... If they grow up snacking on fruit and veges, they will usually continue to do so, and... then pass the habit on to their own children. Education... is the key. And it is a lesson some children appear to have learned. At Richmond Rd School in Ponsonby, Auckland, this week, the... *Herald* talked to children about the contents of their lunchboxes. Sandwiches or filled rolls were most popular, with a good smattering of fruit as well. [One], aged 10... liked her chicken sandwiches, but if it was up to her [the 10-year-old] would have a pie every day. “But that’s not healthy. Sandwiches and fruit are healthy and much better for you.” Another authority on good lunch fare... also 10, said [it] liked to eat lots of fruit – “especially cold oranges” – although a packet of chips would never go amiss. [A boy, aged] 9, says “bananas are best,” even though [it] would rather wash them down with a can of Coke than a bottle of water. Their schoolmate, [also aged] 9, was enjoying a very large packet of chips and an ice cream for his lunch – something that may not have looked like the makings of a particularly healthy diet. But, as [the dietitian] pointed out, “you don’t know what [this boy] eats for breakfast and dinner. It could be that the rest of his diet is more than adequately addressing his nutritional needs.” Teaching children to eat their greens early has been the subject of overseas research as well, starting even before birth. U[S] scientists at the Monell Chemical Senses Centre in Philadelphia have found that foods eaten late in pregnancy tend to be favoured by children as they grow up... [T]heir discovery is the first demonstration that exposure in the womb affects taste preferences later in life. N[Z]’s Ministry of Health has its own guidelines about healthy eating for children, containing common sense advice for parents... The ministry has also put together sample diets for 3-year-olds, 6-year-olds and 11-year-olds, which it has published on its website... While the diets are not necessarily to be followed rigidly, they do give an indication of what portions to give and variety. Despite what children are eating the rest of the time, breakfast is still considered the most important meal of the day. A recent study into its impact has just been completed in Auckland. The results prove what dietitians and nutritionists have been saying for years – breakfast gives kids more energy and can improve their performance at school. The month-long study, called Get Going With Breakfast, involved both secondary and primary school students... In the study the children were given cereal, bread and other breakfast foods and were watched while they ate them at school. They were also surveyed about their normal breakfast eating habits and how they felt in the mornings at the start and the end of the programme... [T]he... results confirmed that breakfast was crucial to mental, physical and academic performances, as well as improved behaviour... □ [A local]... health food manufacturer has halted plans to market its vitamin supplements in schools after criticism from dietitians. Healtheries had offered to sell vitamin C and echinacea direct to selected schools, but the Dietetics Association said it had serious concerns about vitamin supplements being promoted to children... [because] supplement use could undermine healthy eating and healthy food choices[, and] was also concerned schools might give children supplements without obtaining parental [consent.

...NZ]ers are swallowing up to \$145 million in nutritional supplements every year for little or no benefit, says the author of a new report. The study... calls for regulations on the sale and manufacture of supplements... [The] senior lecturer at the Otago School of Dentistry, said yesterday... "A lot of stuff being sold and marketed out there is basically, as far as we can tell, probably giving people very expensive urine but maybe not much else... In spite of the large scale of the industry in this country, there is a paucity of information about the use of nutrient supplements." ...research was needed into how well supplements, including multi-vitamins, minerals, herbal remedies, garlic preparations and sports formulations, worked... Most research around the world has concentrated on the habits of older people, although a 1997 N[Z] nutritional survey reported that over 60[%] of 19 to 24-year-olds had taken vitamin or mineral supplements... Of all the supplements, [guys exceeded gals] in the use of only one category – sports formulations. The study[']s author]... said there was a potential for supplements to be used misguidedly, although no one in the study group was "overdoing" things... Most supplements are not covered by the Medicines Act, which sets out regulations for labelling and testing. The executive director of the National Nutritional Food Association... said the study offered no basis for introducing regulations. "There is no evidence... in the study... that products are not what they say they are. There is no evidence there that the products are toxic. There are about 1500 deaths in N[Z] every year from properly used medical drugs, compared to zero deaths from dietary supplements. I would ask the question: Why the excitement?"

...[']supplements don't work as well as the real thing', yet 'instead of simply adjusting their diet, some people experiment with "smart pills" said to improve brain function. Some are as commonplace as choline, a highly impure form of which is marketed as lecithin. Others include carnitine, a carrier molecule involved in fatty-acid metabolism, and tyrosine, which in its pure form – that is, without the other amino acids that normally accompany it in dietary supplements – can cause dangerous changes in blood pressure. Tryptophan pills used to be sold in NZ to relieve insomnia and pre-menstrual tension but, following 28 deaths in the US, the Ministry of Health has recalled all products with a recommended daily dosage of more than 100 milligrams.

...at a natural-foods market the true believers in vitamins linger over labels, comparing dosages, trading health sermons and nutritional arcana. One faithful customer, a middle-aged gal plagued by chronic fatigue syndrome, admits to taking "tonnes" of vitamins C and E, plus calcium and a daily vitamin-mineral complex. "Basically, I'm looking for anything to make me feel better." For every true believer, however, there is a sceptic who insists that popping supplements doesn't do any good. "With some exceptions, such as pregnancy and infancy, we get all the vitamins we need in our diets," says a professor of medicine at New York's Mount Sinai School of Medicine. "Barring these exceptions, taking supplements just gives you expensive urine." The vast majority of us wonder whom to believe. If a diet doesn't regularly contain fruit and veggies over the long haul, taking supplements can be good insurance – although improving one's diet is still the healthier choice. Supplements are also helpful to people with special conditions, including the house-bound, alcoholics, those on very restrictive diets who tend to be poorly nourished, and the elderly. A US government study indicated that people over 60 may need about a third more vitamin B-6 than young adults do to maintain good nutrition. Vitamin D consumption apparently should increase with age as well. Opinion is divided, however, about high doses of vitamins to prevent chronic disease or delay ageing. Some experts argue that enough evidence is in to justify taking moderately high amounts of antioxidants. Several researchers say they already do. Others believe it is too soon to make recommendations to the public. The long-term effects of high-dose supplements are unknown, and doctors warn of dangers even in the short term. Advises the chairperson of the department of nutrition at the Harvard School of Public Health: "At this time I say don't take megadoses, but I'm not ruling out that in two or three years we might change our minds." The wisest strategy right now may be to eat more broccoli and carrots, spinach and pumpkin, and to follow the familiar exhortation: get moving, cut down fat and cut out smoking. No matter how powerful antioxidants and the other supplementary nutrients turn out to be, they will never be a substitute for salutary habits.' ● An eastern European government is alleged to be freely 'supplying its population with the dietary supplement GH4'...

The question is: Where can we obtain minerals and trace minerals in an adequate balance? The answer is: Ripple Creek – the most comprehensive natural mineral supplement in America and now available in NZ for the first time. Ripple Creek supplements – containing over 65 major and trace minerals which are microscopic enough for your body to absorb quickly and effectively – are extracted from a pure, cool, clear mineral spring running through an ancient rainforest over 60 million years old. There is no other spring of this type in the world. A 2 times nobel prize winner once stated: "You can trace every sickness, every disease and every ailment to a mineral deficiency." The 74th US Congress was told: "The alarming fact is that food no longer contains enough of our major needed minerals and is starving us no matter how much we eat. 99% of Americans are deficient in minerals, and a marked deficiency in any one of the major minerals results in disease." Gals] are also at risk from nutrient deficiencies if they are menstruating, on a diet, pregnant or breast-feeding. Studies of [gals] who use birth control pills, show that blood levels of several nutrients are low despite adequate intake... [However, according to] the latest research, [gals are consuming] more iron, calcium and... 35[% a]re taking... folate supplements.

...this year... despite opposition by pure-food activists... the Ministry of Health... recommend[ed that folate be added] to bread for health reasons... [The] proposal to dose our daily bread with folic acid may help others besides pregnant [people] and unborn children. Research shows that besides preventing birth defects... folate may help stop heart disease and strokes. [The]National Heart Foundation... medical director... says that, while the research is not conclusive, it could help a great number of people... Another possible additive being considered for bread is iodine. Scientists are urging the Government to find an alternative way of boosting N[Z]ers' iodine intake. They say the 70-year-old practice of adding iodine to salt is no longer working because a health-conscious generation is cutting back on salt. Iodine prevents goitre, a swelling of the thyroid gland in the neck, and deficiencies are linked to impaired intellectual performance and hearing loss... ([...]iodine deficiency disorder... affects... 13[%] of the world's population; ...50 million people suffer from some degree of IDD-related brain damage...; i]odine-deficient people may forfeit 15 IQ points... [- a] lack of iodine in the diets of N[Z and AUS]n children is "an insult to our children's intelligence", says a leading paediatric specialist...)... Because N[Z] soil has low iodine levels, goitre affected almost a third of children in some towns until the Government legislated to add iodine to salt.

...WHAT did your child have for lunch today? Some tasty 310 and 280 followed by a dessert of 210, 160b [– propyl gallate, propionic acid, benzoic acid and annatto extracts (bixin, norbixin) respectively –]and a healthy salicylate snack. Did junior sit down nicely afterwards and read a book or did his head spin round on his shoulders, his eyes glaze over and his fists fly? ...[an AUSn author]'s latest book *Fed Up* throws a lifeline to frazzled parents who suspect or have already made the association between what their children eat and how they behave. [The author] received a big response to her first book *Different Kids: Growing Up with Attention Deficit Disorder* in which, after being driven to exhaustion with her daughter's behaviour, [the author] discovered the effects of food additives and chemicals on her child. *Fed Up* explores the wider theory that some children, and adults, suffer varying side-effects to food chemicals, both artificial and naturally occurring and includes charts of problem additive numbers. Until [the author]'s research, conducted with a paediatrician, there were few scientific experiments to test the affect of food additives. Most research focuses on allergic reactions rather than food intolerance. The difference between the two is that an allergic reaction is usually immediate, easy to see and involves a measurable development of antibodies by the immune system... [The author's] daughter had been a difficult and sleepless baby, [then] grew into the terrible twos but never grew out of them. [The daughter] was aggressive, defiant, irritable and resentful. For 11 years [the author] talked to doctors and psychologists, trying 30 different treatments... [Eventually, a doctor acknowledged the daughter]'s food reactions and the process of elimination began. They discovered [the daughter] reacted to food additives but also, surprisingly, to salicylates – natural food chemicals that occur in plant foods, including most fruits... "Doctors need to realise that if the parent comes in saying 'I think my child is affected by food' they should take it seriously." ...while many parents believe food additives can have an effect on their children, they find it hard to understand how healthy foods like fruit and vegetables may also have detrimental effects... [The author] advises people who have recognised food intolerance as a problem to... [try her] elimination and challenge diet... This removes all potential problem foods from the diet and gradually

reintroduces groups... *Fed Up* provides convincing cases of studies of children who... have had their lives improved by eliminating additives from their diet... Unfortunately, the overwhelming feeling in these fast-paced days is of a society where it is now so difficult to avoid food additives it isn't worth trying. But [the author] says it can be done, and is writing another book containing "failsafe[]" recipes. The author] also features recipes on her Failsafe newsletter on the Internet... [The author's] main bugbear is... [the] bread preservative... 282 (calcium propionate)... [The author] believes this is the most insidious and dangerous of all food additives... "It builds up in the body over a length of time. Nobody ever notices it affecting their children, at first..." ...[the author] cites the case of a mother with a fidgety, asthmatic seven-year-old with reading problems who said: "My child doesn't eat food additives. We eat healthy food." "I often hear this," [the author] says... "When I explain to mothers what to look for they realise just how many additives their children eat every day." The first two daily items the mother mentioned included bread... ([containing] 282) and diet cordial. "I asked the mother to read me the label on the cordial. It contained preservatives 211 and 203, colours 102 and 110... All five of these additives have been found to cause problems including restlessness, irritability and asthma..." ...[another of the author's] big concerns is a new additive 635, present in some chips... pies and instant noodles in A[US] and, if imported, N[Z]. Children may break out in rashes from its ingestion.

...IN THE black hole that seems to be our sum of knowledge about childhood nutrition... Auckland University's community health department... study... [of] the iron status of nearly 1500 adolescents... was... a tiny, worrying pinhead of light... And the skeleton outline of what... the [department's] epidemiologist... saw has frightening implications for this country's long-term health. [The epidemiologist] and his research student... discovered almost one in five of the... 900 girls tested were iron deficient. Not one of them had any idea they had a problem. The deficiency was most prevalent in minority groups... Fewer than 10% of European girls lacked iron... The rate for girls was 10 times higher than boys... With such dramatic differences among boys and girls, periods seem an obvious contributor, yet other studies have found iron deficiency often begins before menstruation starts and does not worsen once periods become established. Frequent tea drinking, especially among pre-schoolers, is a well-recognised risk... but it is a popular drink among Maori and Pacific Island children. "Tea? Don't drink it till you're 21," says [the Starship Children Hospital's] paediatrician... only partly tongue in cheek. Other potential culprits are more subtle. *Helicobacter pylori*... – ...a common infection of the gut – ...has been linked with iron deficiency... The prevalence of the infection is high in Pacific Island (48%) and Maori (21%) children, but low in Europeans (7%). Then there's even the weather. Vitamin D, which we get mainly from exposure to the sun, is thought to increase iron absorption. But vitamin D levels are inversely related to skin pigment – Pacific Island adults have only half the amount of Europeans. Doctors are casting about in the dark partly because there is so little information about what Kiwi kids eat. That's about to be rectified by a national nutrition survey of 5000 children aged from one to 14. Expected to cost... \$4 m... and to start at the end of next year, it follows a similar-sized probe of adult eating habits and will include biochemical analysis of blood samples from all the participants... Many teachers – and [the epidemiologist] himself – believe iron deficiency and the more severe iron deficiency anaemia, are primary causes of lower academic performance among Maori and Pacific Island groups. While it isn't exactly clear how a lack of iron affects the brain, studies have shown iron deficient children are more likely to have impaired memory and ability to concentrate. "There is a lot of scepticism in public health circles about the clinical effect of iron deficiency... but my attitude is you have to treat it like you treat high blood pressure." ...Anaemia... is associated with increased infections, lethargy, irritability and tiredness. The groups most at risk – infants, pre-schoolers, adolescents, athletes, [gals] of childbearing age and vegetarians – may be commonly misdiagnosed because their malaise can be so easily attributed to other causes... While vegetarians usually have lower iron levels, "dedicated vegetarians" are more likely to modify the rest of their diet to compensate... But some, especially teens who gave up flesh foods on a sudden whim, might develop a deficiency over several months then not link it to their diet. In babies, two things make iron deficiency especially scary. The first is it is often symptomless; the second is by the time it is identified, it's too late to reverse the damage. Babies are most likely to start developing a deficiency when their birth stores of iron begin to run out at four to six months... Baby food manufacturers have increased the iron content in a range of weaning foods over recent years and doctors say in some cases they may be better for baby than meals prepared at home with inappropriate ingredients or in unhygienic surroundings... 30% of children admitted to the Starship... with infections are iron deficient – and the admission rate for infections has increased 25% in the last year. "Compared with other [First World] countries, we have a lot more children with more serious infections... Our pneumonia hospitalisation rates are... four times higher than the U[S.] A... Massey University human nutrition lecturer... suspects many families simply do not have enough money left after paying rents or mortgages to feed their children balanced diets. "You'd have to have a PhD in nutrition to feed a family of six on \$60 a week." There is evidence many babies are being weaned from breast milk to cows' milk before they are a year old, instead of on to iron-fortified infant formulas. Cows' milk not only has a low concentration of iron, but the iron in it is poorly absorbed. Some babies may even suffer through being exclusively breast fed for too long by well-intentioned mums... While taking... an iron pill or placebo every day for eight weeks... might allay the effects of iron deficiency, [the epidemiologist] is more concerned with prevention. But the causes may be many... And even the suggested answers raise more questions. While low or no red meat intake is commonly associated with iron deficiency, the Maori and Pacific Island girls in [the epidemiologist's] study appeared to eat more red meat than their European counterparts... [E]ating foods high in Vitamin C... at every meal [will also] help increase iron absorption a[s will] trying to reduce foods that might reduce absorption, for example, cabbages.

...Dust off the barbie... [– with caution (AUS's) Minister for Emergency Services... has launched the inaugural Barbecue Safety Awareness Day... [because] 100 children had been killed in barbecue-related incidents around A[US] in the past five years...)]... – a rare steak is the most concentrated form of iron available, according to a study commissioned by Meat N[Z]... An as yet unidentified "meat factor" enhanced the body's ability to absorb not only the iron in meat, but other iron in the same meal... ■ *Two famous iron myths*... A low iron level does not necessarily mean you're anaemic... Spinach is not high in iron – one cup of boiled spinach provides just 0.02mg of absorbed iron – less than two Weetbix[(according to *Sanitarium*, '30g of Weetbix – two biscuits – provides 3.0mg of iron, or 25% of the RDI; in comparison, 30g – approximately one cup – of Ricies rice cereal provides 16% of the RDI for the average NZ adult, or 25% of the daily iron requirements for children up to 11 years of age': according to *Kellogg's*, '30g – one metric cup – of corn flakes provides 3.0mg of iron, and 100g provides 10mg'; in comparison, one nutritional content table says '100g of beef, wheatgerm, oysters and offal provide 3.5, 4.07, 5.7 and 7.9mg of iron respectively', while another says 'beef contains 1.8-3.0mg, oatmeal and dried apricots 4.1mg, dried figs and almonds 4.2mg, dried haricot beans 6.7mg, dried lentils 7.6mg, liver 8.8-11.4mg, black pudding 20mg and cornflakes 0.6mg').

...A] Briton... who sneezed hundreds of times a day for 37 years, may sue health officials after discovering [w]hat... was causing the problem. [The Briton], aged 52, estimates [it] sneezed six million times because of the ailment, which was so bad [the Briton] gave up his job so [it] could try to find a cure for himself because doctors had failed... A private clinic specialising in nutrition finally diagnosed an allergy to the egg yolk and oats [the Briton] ate every day in... his breakfast bowl of... muesli... [N]ow sneeze-free for the first time since the age of 15, [the Briton said it] might take legal action against a local health authority after 60 doctors failed to diagnose his problem. The *Times* said there might be one unexpected bonus for [the Briton] – the *Guinness Book of Records* was looking to see if [the 52-year-old] had achieved the world sneezing record.

...[Dr. Bircher-Benner's] *muesli* is not strictly speaking a porridge, because it is not boiled, but its consistency is so mushy that it has the appearance of porridge. Attaching great importance to the nutritive value of raw food, the Dr prescribed this mixture as a breakfast and supper dish. At lunch time the Dr allowed various cooked foods and even meat, in addition to raw vegetables and fruit served as an *hors-d'oeuvre*. The *muesli* is prepared overnight. Soak 2 or 3 tablespoons of rolled oats in cold water for 12 hours. On the following morning, drain and mix with condensed milk, raw grated unpeeled apples, or with any other fruit in season, sometimes with grated carrots. Add honey and lemon juice.' By the way, a] new tablet that stimulates an optimum amount

of insulin will allow diabetics to eat when they like... [R]epaglinide or NovoNorm... needs to be taken only with a meal... Research has shown that nearly 40[%] of diabetics eat when they are not hungry because of fear of low blood sugar, leading to weight control becoming a challenge.

...Many diabetics can significantly lower their blood sugar – and maybe even reduce their medication – by eating lots of fruit, vegetables and high-fibre grain... The experimental diet – tested on 13 diabetics... taking... once-a-day pills... – contained 50g of fibre a day, or about twice the amount recommended by the American Diabetes Association. That is equivalent to seven or eight servings of fruit and vegetables and three of whole wheat or other high-fibre grain. The... diet reduced blood sugar levels by about 10[%]. The... drop in blood sugar was about the same as a second pill might have brought... The diet also improved the diabetics' cholesterol levels, which was encouraging, because heart disease is a major cause of death among diabetics... Diabetes occurs when the pancreas does not produce enough insulin, the hormone needed for the body to process sugar for energy.

...Refined carbohydrates (such as white flour and sugar) are foods where much of the natural vitamin and mineral content has been removed, affecting the body's ability to convert them to energy. [But you can compensate by consuming various seeds (r:p1345, lns43-4 + p1372, lnl1), roots (r:p1580, lnl25) and plant-based products (e.g., 'Ginsana – the root of energy'). Incidentally, geneticists estimate]... there's a 50/50 chance... Hollow Viscous Myopathy... will be inherited... [The] rare and incurable condition... prevents [people] from digesting food. Fed intravenously through a tube in [their chest, people with HVM] endure... up to 14 hours a day linked to a machine that pumps liquid nourishment through [their]... body...

I can think of no gourmet foodstuff whose taste lives up to its billing. Pate de foie gras, for example, is not only made by force-feeding geese through a funnel, but is also indistinguishable from the standard meat paste made from nostrils and knee-gristle. I once ate frogs' legs. Actually, it's the thighs that you eat. The calves aren't worth bothering with. Nor, after 20 minutes of fiddling with a tiny fork, are the thighs. Snails taste like rubber bands but are more chewy. I have been known to order snails but they are best served without the snails. It's the garlic and melted butter that please. Indeed, a drenching of melted butter improves all foods except ice cream, and perhaps cucumber. Asparagus is best eaten with butter, too. Where I grew up, asparagus was an unthinkable luxury, but when I came to N[Z] I discovered that asparagus is okay as far as it goes, but that isn't far. Furthermore, it does unpleasant things to the urine... [Someone once told me] of being taken by a friend to Bromley cemetery at night. Amid the tombs... moved a shadowy, silent crowd of human forms. Each bore a knife. They were hunting asparagus. Asparagus apparently likes nothing better than to sink its roots into human corpses and feast on the remains. On reflection, that seems fair enough. One particular grave was a renowned asparagus bed and the hunters clustered round it to hack off the spears the moment they pushed their innocent little heads above the soil. I asked... if by any chance the grave was that of a hanged [person], which I thought would be a delicious irony, but [the storyteller] didn't know... OYSTERS have a narrow emotional range and make poor pets. Passive is a good word to describe an oyster, but phlegmatic is better. Phlegmatic captures both an oyster's attitude to life and its quality as food. Oysters may be able to tell whether they are alive or dead but I find it hard to. So when, as happened at a dinner party, I am presented with a plate of oysters in their shells I wrinkle a nostril and pass the plate on. But an artist at the table insisted that I was missing one of the great joys. [The artist] told me to lay an oyster on my tongue and to squeeze it against my palate in the manner of Cleopatra attacking a peeled grape. I had, [the artist] said, to let the oyster-juices ooze. Though I half expected the oyster to squirm, I did as I was bid. The only juice I detected was seawater. Then I bit the little darling into extinction and doused it with wine. The artist announced that if [it] were due to be executed the next day [it] would order for his final meal a bowl of oysters. [The artist] would chase them down with a properly made trifle. Then, [the artist said, it] would go happy to the gallows. The hostess pointed out that oysters and trifle made a poorly balanced diet but it was generally agreed that at that stage of one's life it hardly mattered. Allowing a doomed [convict] to choose his last meal from all the menus of the world appears to be a humane gesture but it seems to me to be a cruelty. It only reminds the convict of what [it]'s about to lose. Of course, everyone at the dinner party had then to choose a hypothetical final meal. I dithered between Mars bars and fried cod, then declared that I too would choose oysters and trifle, and I stipulated that the trifle should be soaked in sweet sherry and have hundreds and thousands sprinkled on the custard – on the grounds that after such a meal, death would come as a relief. One [guest] chose to meet her maker replete with caviar. I wondered if [the guest had] ever eaten caviar. It tastes in equal measure of salt and socks. Caviar has gained its reputation as a food of the gods simply by being expensive.

...[‘Gourmets eat caviare as it is, without toast or butter, simply adding a sprinkling of lemon juice. Caviare is the “fruit” of the sturgeon, a migratory fish, of which there are a dozen or so varieties, each belonging to one of two species. The sturgeon lives in coastal waters and in the spring, when fully grown, it swims up the rivers to spawn. The time of this migratory movement depends upon the temperature of the water, which itself depends on the severity of the preceding winter and the melting snows. At one time, the Cossacks of the Ural River harpooned the fish through holes in the ice, thus obtaining the first caviar of the year. This yellowy-gold caviare was superior to all the rest, a gift worthy of the Tsar, to whom they presented it. Extracting the caviare is a knack acquired only through experience. Immediately the fish is caught, it is gutted (while still alive, and after having let its blood through an incision under the caudal fin so as to diminish its reactions). The eggs are immediately extracted and placed on a special sieve to be washed, drained, and salted. Soviet scientists perfected a type of Caesarean operation for sturgeons that made it possible for them to be thrown back into the river alive and recommence the reproduction cycle.’ Speaking of exploiting ‘cold-blooded animals with gills and fins that live wholly in water’, aquaculture is “contributing] to the collapse of fisheries stocks worldwide,” warn scientists from the U[S], Scotland, Sweden and the Philippines... Supplies of farmed fish rose from 10 million tonnes in 1987 to 29 million... in 1997. Asia accounts for 90[%] of the total. By comparison, global tonnage of trawled fish remained unchanged, around 85 to 95 million tonnes a year. However, claims that fish and shellfish farms can provide cheap, risk-free protein are bogus... This is mainly because huge amounts of seafish, especially anchovies and mackerel, are scooped from the oceans and ground into meal to feed penned fish. The research says fish farms, especially ones specialising in carnivorous fish and shrimp, are wrecking the environment by destroying habitats, devastating non-native species, encouraging fish disease and causing pollution from fish effluent and decomposing, uneaten food. Thailand is singled out for its conversion of mangroves into shrimp farms. For every k[g] of farmed shrimp, 400g of wild fish and shellfish are lost because of habitat conversion. China, which accounts for [2/3]rds of farm fish tonnage, is praised for embracing a centuries-old technique of sustainable fish farming based on non-carnivorous freshwater species. This entails using four types of carp, which feed on different food and filter algae, keeping a balanced ecosystem. But the farming is intensifying, meaning more fish are... crammed into ponds, causing farmers to use fishmeal to sustain them.

...studies have yielded contradictory findings about the possible heart dangers of eating mercury-laden fish. Plenty of research shows... mercury accumulated from fish can harm the developing brain of a foetus or child. Far less is known about how the toxic, wide-spread pollutant affects the heart. Two studies in the *New England Journal of Medicine* on the long-term effects of mercury exposure on the hearts of middle-aged and elderly [guys] had opposite findings. One found no clear link between mercury levels and the risk of developing heart disease; the other found [guys] who... suffered a heart attack had higher mercury levels than similar [guys] who had not. That left the researchers, US F[DA] officials and other experts agreeing on just two things: more research is needed, and people should not stop eating fish, because minerals and fatty acids in fish protect the heart. Also, many fish, such as salmon and shrimp, contain little or no mercury. “The bottom line is, yes, you should eat fish, and yes, you should know which fish have mercury” levels considered unsafe, said... a cardiologist at Robert Wood Johnson Medical School in New Brunswick... who was not involved in either study. [● Another study has found that ‘people who eat fish once a week have 60% less risk of developing Alzheimer’s.’]

...A British brain and nutrition expert warns that N[Z] is at risk of rising rates of mental illness because people eat too little seafood.[The] Professor... of the London Metropolitan University, said that despite huge coastal resources, the bulk of the population consumed relatively little seafood. Seafood, particularly oily fish, was a good source of fatty acid linked to brain growth and function... The... Professor... said seafood

consumption should be encouraged by the Government, which should ensure it was available at affordable prices and not treated as a luxury... Oily fish... were not widely available in N[Z. In related news, fish]... oil may give protection against colon cancer, according to the latest study to heap praise on the health-giving qualities of the Mediterranean diet. Researchers from Barcelona report... that rats fed on safflower oil had more pre-cancerous tissue, such as bowel polyps, than those fed on fish-oil or olive-oil diets...

FOOD and the art of CANCER prevention A CHEESEBURGER or a caesar salad? If you sift through the available evidence, it's hard not to agree with... the American Cancer Society's director of prostate and colorectal cancer. "We don't need years of research... If people would implement what we know today, cancer rates would drop. It's that simple." ...Population studies have consistently linked a high intake of plant foods to a low risk of cancer. And as molecular biologists have discovered in the past decade, the compounds contained in those foods can work in specific ways to block the development of tumours. No one is holding up green tea and garlic as adequate treatments for advanced disease. The goal of the new prevention diets is to reduce the need for such treatments. As... [the] head of medical oncology at New York's Strang Cancer Prevention Centre puts it, eating the right foods is "as specific to stopping cancer before it starts as wearing a seatbelt is to lowering your risk of a fatal automobile accident." ...Researchers have recently identified several plant chemicals that may have far stronger effects... [than] vitamins... Grapes and red wine are rich in an antioxidant called resveratrol, which reduced the incidence of skin tumours in mice by 88[%] in one study. Green tea contains several potent antioxidant chemicals known as polyphenols. Researchers estimate that one of them, a compound called EGCG, has 20 times the [free] radical-quenching effect of vitamin E and 500 times the effect of vitamin C. Then there's lycopene, the pigment that gives tomatoes their blush. You can't get much lycopene from a raw tomato because it is too tightly bound by the fruit's proteins and fibres. But cooking frees it for absorption by the body and dietary fat helps to carry it to the bloodstream... [S]tudies suggest that lycopene may help to ward off cancers of the breast, lung and digestive system. If you do make tomato sauce, don't forget to add some garlic. Just as lycopene helps to ward off oxidative damage, the allyl sulphides found in garlic, chives and onions may help the body to process cancer-causing chemicals more safely. Enzymes from the liver continually battle potential carcinogens that enter the body. Allyl sulphides can modulate enzyme activity, presumably reducing the volume of debris that our cells have to contend with. "Even modest amounts of garlic have a marked impact on metabolism," says [a] nutritionist... of Pennsylvania State University. You don't have to cook the clove to get the effect, but the allyl sulphides won't fully form unless you cut it up and let it sit for 10 minutes. [The nutritionist] suggests buying aged garlic extract, which has shown the most potency in laboratory studies... Cruciferous vegetables such as broccoli, cauliflower and cabbage may boost production of another set of enzymes that cart away chemical debris. The credit goes to sulforaphane, a sharp-tasting chemical that insects (and some humans) find repellent... Soy foods are another good bet, especially if you're worried about breast or prostate cancer. One of the strongest promoters of reproductive tumours is oestrogen... Soy contains weak oestrogens, or isoflavones, which compete with the full-strength hormone for access to cells. Isoflavones bind with cell receptors that would normally attract the body's own oestrogen, but the growth signal they deliver is only one-thousandth as strong. That means less cell division and, presumably, less risk that a lesion will become cancerous. No one has tested that assumption in a controlled clinical trial, but [in one] population... study, Chinese [gals] on high-soy diets had only half the breast-cancer incidence of [those] on low-soy diets. If a transformed cell eludes all these obstacles to form a palpable cancerous mass, diet alone can't be counted on to reverse it. Still, plant-based chemicals might help to deprive it of a blood supply. A number of plant foods – soy, rosemary, turmeric, carrots and grapes – contain compounds known as Cox-2 inhibitors, which can impede the growth of new blood vessels. In a test tube... tumour cells doused with Cox-2 inhibitors stop spitting out the growth factors that trigger vessel growth. Needless to say, a tumour without arteries is a tumour without a future. Diet won't eliminate cancer from the world. And until many more studies are completed, we'll have to speculate about its potential to keep people healthy... Could other foods affect the odds that a precancerous lesion will bloom into a tumour? Dietary fat may play an important role. Precancerous prostate lesions are equally common throughout the world, notes... a urologist at Memorial Sloan-Kettering Hospital. Autopsy studies find them in nearly a third of all [guys] in their 30s. Yet advanced tumours are six times more common in the U[S] (where fat accounts for nearly 40[%] of calories) than in Japan (where it accounts for less than 20[%]). Breast-cancer incidence follows a similar pattern. And laboratory studies have shown that tumour cells behave less aggressively in animals on low-fat diets than in those fed higher-fat fare. But total fat intake is only part of the story. Many experts now agree that the type of fat you consume is as important as the amount. Saturated fats, for all the havoc it wreaks on the heart and blood vessels, doesn't seem to affect cancer risk one way or the other. Monounsaturated fat (as in olive oil) seems equally innocuous. But the two forms of polyunsaturated fat – omega-6 and omega-3 – are another story. The omega-6 fats, which abound in corn and safflower oil, seem to promote tumour growth; the omega-3s, found in flaxseed and fish oil, may help to inhibit it... [- although h]ealthy people should go easy on high-dose omega-3 supplements, for they can disrupt normal blood clotting.

...A study has found that the more overweight a person is, the higher the chance of developing almost all types of cancer. For obese [guys], the risk can be up to 52[% greater; for gals], it can be 62[% more. The problem is compounded because fat]... makes detecting lumps and bumps more difficult.

...[The Essential Fatty Acids (E.F.A, also known as "Vitamin F") are the "Assimilation Factors". Their function is to make it possible for the cell to receive nutrients and discharge wastes. The cell wall or membrane has the ability to select from the bloodstream the nutrients it needs to function. If the cell wall is adequately supplied with E.F.A, it can do its job effectively. Without E.F.A it becomes leathery and impermeable, and the cell is poorly nourished. Toxins accumulate, it ages faster, and is subject to disease. Without E.F.A, nutrients will be wasted. You can get some E.F.A. from stored oils, but rancidity damages E.F.A. There is some in the wheat germ oil in wheat, but E.F.A. is damaged in cooking or baking. E.F.A. is also altered and damaged in hydrogenation. You should be sure that your supplements have E.F.A in concentrated form in generous amounts. The soft gelatin capsule will protect it from rancidity. Look on the label for Linoleic Acid, Linolenic Acid, and Arachidonic Acid. Look on the label or promotional literature for the "Essential Lipids and Sterols". Sterols are made from E.F.A. in the body. They are components of hormones. You can't make hormones without them. Under stress your body steps up its production of hormones, and sterols are used up. Your requirements will increase just when the available supply is disappearing. If you have a good supplement, containing enough, you don't have to worry. There is probably enough vitamin C in any multi-supplement to prevent scurvy, but not to meet the requirements of stress. Most experts agree stress destroys vitamin C in the body. Vitamin C is an integral part of your white blood cells, and as they multiply when you are fighting infection, you use up vitamin C rapidly. Connective tissue (collagen) requires vitamin C, and your body can't make collagen without it. When healing from surgery or injury, collagen is the repair tissue, so vitamin C is used up rapidly. Humans, guinea pigs, apes, and a species of Indian fruit bat, are the only animals that don't manufacture their own vitamin C in the liver. If we took as much vitamin C for our body weight, as other animals manufacture for their weight, we'd take between 5,000 and 20,000 milligrams a day! So much for the Recommended Daily Allowance of 60 mgs!]

...[The discovery and study of vitamins began just in the 20th century. As long ago as 1720, it was discovered that citrus fruit juices aided in the treatment of *scurvy*, now known to be a vitamin C deficiency disease. In 1906, an English scientist made the discovery that milk, in addition to being an excellent food, also contains other substances necessary to good health. These substances later became known as *vitamins*. In 1911, Casimir Funk, a Polish biochemist, found a substance in rice and bran which Funk used to cure polyneuritis in pigeons. Funk gave it the name of *vitamine* (Latin: *vita*, life plus *amine*, hydrocarbon). It was soon found that the substance Funk had discovered was the vitamin B group, also called *B complex*. Of all vitamins, only A, D, and K can be synthesized by the human body. For example, vitamin K is produced by certain bacteria that grow in our intestines. In humans, water, water-soluble vitamins, and minerals need no digestion. Among the necessary minerals' is *zinc*...

'Zinc isn't just that coloured stuff you smear on your nose at the beach, but one of the most important minerals in the body. It occurs in the body in greater amounts than all other minerals except iron, and is needed for the normal function of every cell in the body. Zinc is a healer – it assists in the production of new cells to replace damaged ones. It assists wound healing, burns and injuries and helps to prevent scarring. It improves our immune response by helping to regulate the white blood cells, and is one of several nutrients required to restore a lowered, or depressed immune system. Zinc is required for the sexual development and maturation of both sexes, and can prove beneficial in the treatment of infertility. Soil exhaustion and modern food processing techniques can reduce the amount of Zinc we get in our diet, and lifestyle factors such as the use of alcohol, smoking, an inadequate diet, etc., can mean we don't have enough of this essential mineral. Our skin, hair and nails are good indicators of Zinc status in the body. Falling hair and premature greying, some forms of acne, and stretch marks can be caused by low levels of Zinc. White spots and ridges on nails, as well as an opaque nail bed may be visible signs of possible Zinc deficiency. One of the first signs of a deficiency may be a loss of taste. The Zinc Taste Test has been developed to give a quick diagnosis of a possible deficiency. Zinc is found in the following foods: seafood (especially oysters and herring), meats, eggs, mushrooms, brewer's yeast, wheatgerm, whole wheat or oats and rye, nuts (with brazils and pecans the richest), pumpkin and sunflower seeds, ginger root, mustard, chilli powder, black pepper' and spirulina...

*'Spirulina is an almost microscopic fresh water plant. An aquatic micro-vegetable/organism composed of transparent bubble-thin cells stacked end-to-end forming a helical spiral filament. Imagine a plant without roots, leaves, seeds, flowers or fruits, that grows by the hundreds in a single drop of water. Barely big enough to be seen with the naked eye, yet it contains over 100 synergistic nutrients and is incontestably the richest and most complete source of total organic nutrition in the world! Ancient cultures with a native awareness of Spirulina's exceptional biogenic-life-force energy, have perhaps since time immemorial, esteemed its remarkable energising and rejuvenating properties. The Aztecs considered it a "Sacred Power Plant". Priests and warriors sustained themselves (at times solely) on dried Spirulina wafers. Living in a retreat on Mt Hakone near Tokyo, an old Japanese philosopher is reported to have lived for the past 15 years exclusively on Spirulina as a living proof that Spirulina is a total food for human nutrition! A superior strain of Spirulina has been developed from a wild African parent-stock which blooms naturally in Lake Chad in the Sahara Desert. Like wild sun-dried Spirulina in its native Saharan habitat, our **New Generation Spirulina** also grows **organically**, and is dried at normal sun temperatures (only inside a controlled environment). This ensures preservation of the vital enzymes and living essences contained within the fresh plants! Additionally, this new strain has a superior nutrient profile to even better fulfill the total human nutritional requirement; for instance: • **Iron** levels have been increased over **300%** • **Calcium** levels have been increased over **1000%**. Coupled with state-of-the-art low temperature dehydrating technology, improved **New Generation Spirulina** establishes a new quality standard by which all others will be measured: Fact: **New Generation Spirulina** is 2-6 times richer than its nearest rival raw beef liver as a source of Vitamin B-12 (not only is Spirulina the richest source of Vitamin B-12 in all of nature, but it is the **only** plant source of B-12); is 28 times richer than raw beef liver and 58 times richer than raw spinach as a source of biochelated Organic Iron; is 3 times richer than raw wheat germ as a source of Vitamin E, and its biological activity is 49% greater than synthetic vitamin E; is 25 times richer than raw carrots as a source of Beta-Carotene or provitamin A (unlike the preformed vitamin A of synthetics and fish liver oils, beta-carotene is completely non-toxic even in mega doses); contains a spectrum of practically every natural antioxidant known, including the antioxidant vitamins C, B-1, B-5 and B-6, the minerals zinc, manganese and copper, **all 8 essential amino acids plus an additional 10 "non"-essential amino acids**, and the trace element selenium. Fact: **New Generation Spirulina** has nature's highest Complete Biological Value (60-70%), compared to: Soybeans – 30-35%; Beef – 18-22%; Eggs – 12-16%; Tofu – 8%; Milk – 3%, contains virtually **no saturated fats, poisons or toxic chemical residues** (the UN has conducted a 5 year toxicology study on Spirulina and found it to be **completely non-toxic**), is remarkably **low in cholesterol** (230 times less than eggs!), is **low in sodium**, AND it's one of the only (if not the only) **non-mucus forming** and **non-acid forming** proteins! Unlike other high-protein foods which are characteristically difficult to digest, **New Generation Spirulina is extraordinarily easy to digest – It has an unmatched digestibility coefficient of 95.1%** (its amino acids are delivered in an essentially "free form" state for almost instantaneous assimilation). Within moments, its concentrated nutrients, enzymes and living essences are absorbed into the bloodstream without the momentous loss of energy incurred in the digestion of ordinary foods (**more energy is spent on digestion than on any other bodily function – it actually exceeds the amount consumed during strenuous exercise!**). Spirulina is the missing link in vegetarianism. It complements the specific weaknesses of vegetarian (particularly vegan) nutrition as no other plant can. From around the world, doctors, naturopaths, weight-loss clinics and slimmers by the hundreds of thousands have discovered the remarkably effective Spirulina Way to Leanness and Aliveness! The surprising success of Spirulina seems to be in its ability to facilitate low-calorie dieting without the energy draining and health destroying nutritional deficiencies that underlie the failures of most weight-loss programs. Slimmers claim that Spirulina effectively suppresses their appetite while at the same time actually boosting their energy levels. That's because Spirulina is one of nature's richest sources of **phenylalanine – the superstar of natural appetite suppressants**. Additionally, Spirulina's supernutrition satisfies hunger because it so totally fulfills the body's real biochemical needs. The familiar syndrome of cravings, psychological stress and fatigue is eliminated. When the appetite is appeased, overeating is automatically reduced in a natural way and with a minimum of inconvenience.'*

... 'Auto-intoxication – due to healthy foods ingested in excessive quantity and subjected to bacterial putrefaction in the intestines – should not be confused with alimentary intoxication due to ingestion of toxic foods or foods which have gone bad.' Speaking of toxic foods, **edible plants grown in city gardens can contain dangerous levels of lead... lead[ing] to people ingesting more than the daily safety limit... of 15g a day for [kids] and 75g... for adults...**

...an unusually heavy meal does not just add calories, it also might trigger a heart attack, especially in people who already suffer from heart disease. A study... found that heart attack risk jumps four times in the two hours after a large meal. A very large meal may start the whole process of a heart attack, said... Brigham and [Gals'] Hospital in Boston... "Overeating should be considered as a heart attack trigger, in much the same way as extreme physical activities and severe anger episodes." ...Of... nearly 2000 patients... interviewed... shortly after they had had heart attacks... 158 reported having an unusually large meal during the 26 hours before the attack. [25] patients had the meal in the two hours before the attack.

...A fat test may help... kids who are paying dearly for overeating and not exercising. Call them the supersize generation. American children aged 6 to 11 are three times as likely to be overweight today as they were 30 years ago. And the news on adolescents (12 to 17) is not much better – the proportion of fat teens has nearly doubled since the early 1970s. The reasons are obvious... [- b]ut help may be on the way. The US Government has issued a "body mass index" (BMI) for those aged 2 to 20. The index, which considers a child's age, weight and height to calculate body fat, is similar to one used for years to identify overweight and obese adults. Gender differences are also considered. For example, an 8-year-old boy who is 122cm tall and weighs 30kg would earn a BMI score of 20.4 – and be considered overweight. A girl with the same score would not – falling into the lesser category of children at risk of being too heavy... The... scientists who assembled the index hope plotting such numbers on the new BMI chart will become a standard part of children's annual physicals, and make it easier for paediatricians and parents to monitor weight gain and determine when pudginess is becoming a problem. The... Government has also laid out plans to study the effectiveness and safety of two popular but diametrically opposed diets, the high-protein, low-carbohydrate variety and the low-fat, low-meat ones. Both announcements came at the first National Nutritional Summit sponsored by Washington in 31 years. Last time the topic was hunger. This time, obesity. That's food for thought.

...Myriad Genetics says it has discovered a gene that appears directly linked to human obesity and drugs could be relatively easily developed to combat the condition. The biotechnology company, based in Salt Lake City, said the gene, HOB1, also appeared to provide an important molecular link between obesity and diabetes... Myriad compare[d] the DNA of Utah people who were obese with that of family members who were not. Many

Utah families can trace their ancestry directly to pioneers, and the company discovered a mutation in one gene that it was able to follow back through numerous generations. What is not clear is what percentage of people with the mutated gene become obese. It could be high, based on equivalent studies into breast and ovarian cancer. Myriad said that unlike the genes which caused those conditions, the structure of the mutated obesity gene meant it could be attacked with a small molecule drug, which means a pill rather than an injection. It might also be easier to develop drugs to compensate for the genetic mutation because the gene is too active rather than not active enough.

...Raiding the fridge at midnight seems harmless enough, but it's a craving that has life-threatening repercussions for some. The urge to eat continuously is overwhelming for children born with the rare genetic condition Prader-Willi Syndrome. "Despite the amount of food they consume these children never feel full," says... a Wellington paediatrician... As few as 230 people in N[Z] are thought to have Prader-Willi Syndrome, which affects just one in 15,000 people. Surprisingly though, it has been identified as the most common genetic cause of obesity. Children born with the condition have a chromosomal abnormality in the brain that usually leads to low IQ, delayed development, stunted growth and an uncontrollable, never-ending urge to eat. The problem is exacerbated by the fact that such children require fewer calories than usual anyway, resulting in life-threatening weight gain. They also suffer from reduced muscle mass, fragile bones and clumsy mobility, dramatically limiting their ability to enjoy exercise or participate in outdoor games. Learning that your child has this genetic disorder is devastating for parents, says... [the] national co-ordinator of the Prader-Willi Syndrome Association... Policing eating habits can mean putting padlocks on the fridge and locks on the kitchen cupboards... Their parents have now been given new hope with the availability of the world's first drug to treat it, a growth hormone called Genotropin... [-] a genetically engineered protein that is identical to human growth hormone. It has been in wide use since 1987 for children with other growth disorders associated with Turner Syndrome or chronic renal failure... Clinical trials show that daily injections of Genotropin renew growth to near normal height, increase muscle mass, and help to reduce body fat. In Florida, a 14-year-old boy who was predicted to never grow taller than five foot, grew four inches in his first nine months on the hormone... is now already 4ft 11ins and is predicted to eventually reach 5ft 8...

As an overweight teenage girl, [the]... West Auckland author... often had to put up with cruel nicknames and insensitive comments about her size. After half a lifetime of being referred to as Two Ton Tessie, Tub or Bessy Bunter, the Waitakere writer is fighting back against fat phobia through her first book. *Largely Happy* offers a fresh perspective on body image to those who are struggling with unworkable diets and low self-esteem, backed by strong medical and scientific research... [The westie] recalls an episode where a [guy] held a door open for her as [they] walked into a bakery, but... then turned to her and said, 'I've made a mistake there, there's not going to be anything left in a few minutes'. [...] I've had friends who've had their faces pushed into their meals and things taken out of their supermarket trolleys or food snatched off their plate at a restaurant,"... [The westie] discovered size acceptance herself when her son bought her a computer with unlimited Internet access: "That really opened my eyes to what happened in the rest of the world." ...[the westie] says 165,000 people in the US died last year as a direct result of dieting, weight loss products or related suicides. It has even been proven that excess weight is 70[%] due to your genes, and that the human body is biologically programmed to prevent loss of fat as a survival mechanism... In 1998 [the westie] founded a support network in west Auckland called N[Z]-Wide and Wonderful, though... had to withdraw from it following a serious motor-bike accident. [The westie] is also co-chair-person of the International Alliance for Size Acceptance... ■ ['While the problem of obesity often begins in infancy and childhood, not all obesity is the same. Some people get fat early in infancy and childhood, while others become obese only after puberty. While most obese individuals – regardless of the timing of onset of their weight problem – have cells with a higher fat content, people with early-onset obesity have *more* fat cells than either the nonobese or those with late-onset obesity. Moreover, those who get overweight early may have more difficulty keeping weight off later, since weight loss in children and adolescents reduces only cell size but not the number of fat cells. As the proliferation of weight-reduction clubs, magazines devoted to weight and diet, and fad diets indicates, we are a weight-conscious society. In fact, as many as 70 to 80% of American girls have been on a diet by middle adolescence']...

Sleepless Auckland shoppers will soon be able to indulge their nocturnal trolley passions around the clock. From Monday, the Woolworths supermarket at LynnMall City will be open 24 hours a day, every day of the week. The supermarket now closes at 10 pm... [A]part from some promotions, it was the first time a big [NZ] supermarket would be open around the clock. A further 12 staff had been recruited and others had been given the opportunity to extend their working hours. Alcohol is not sold in the supermarket, as the area is controlled by a licensing trust.

...Woolworths' store at LynnMall is extending its trading hours following the success of the company's 24-hour ventures at BP Swanson and Herne Bay... The company's joint ventures with BP service stations have shown there's a demand for around the clock shopping... "Both the sites have had good business right through the night, particularly at the Swanson site,"... says... [Woolworth's m]arketing and business development manager... [T]he open all hours approach aims to ease car parking congestion at LynnMall and better meet the needs of shift workers out west.

...[West Auckland s]upermarkets have been given food for thought with council set to serve them a \$30,000 bill for recovery of trolleys dumped in Waitakere streams and roadsides. The move is a new Waitakere City Council bylaw under consideration and is a response to what[one] Henderson Community Board member... says is supermarkets being "too bloody lazy" to clean up their act. His attack came at a meeting of the Environmental Management Committee, which considered the bylaw option. It is estimated that replacing the... \$400 trolleys costs supermarkets up to \$50,000 a year. Council now wants supermarkets to adopt trolley control devices being trialed at Glen Innes Pak 'n' Save. The device would cost each shop about \$30,000. But West Auckland supermarkets say the charge threat is unfair... "A bylaw gives the implication that it's all our fault. Are they going to introduce a bylaw for any dumping of rubbish in West Auckland?"... Foodstuffs spokes[perso]n... asks. Progressive Enterprises' general manager... says the company has looked at locking up trolleys but it would cost business. A bid to get customers [to] pay for the trolley years ago also failed. "It's a hassle and customer reaction is 'We don't want to see them on the streets or in the creeks, but we don't want to put a deposit down'." [The board member] says the decision is the result of years of non-action by supermarkets. "The council has decided to stop pussyfooting around."

...Waitakere City Council is looking at a new bylaw to make supermarkets and shopping malls more accountable for their trolleys... "The Council spends thousands of dollars a year removing trolleys... from local streams and streets – and supermarkets pay even more to replace trolleys that are taken from their premises – so we're hoping to find a solution to the problem that works for everyone concerned." ...The [bylaw could] see supermarkets installing coin-operated or electronic wheel-locking on their trolleys... [By the way, NZ] supermarkets may be the battleground for a banana war after a decision by one of the world's biggest fruit companies to set up shop here... "There'll be a bloodbath, I guess," was the response yesterday of a Dole executive... [to] Florida-based fruit giant Fresh Del Monte[']s... purchase of local fruit distributors Ventura Pacific and Shafers International... Del Monte is the world's largest marketer of pineapple and third largest marketer of bananas. At present, Dole sells almost all the pineapples sold in N[Z], and Del Monte has confirmed it is likely to bring in its own brand. But it has not yet decided whether it will try to snare a slice of banana sales, estimated to be worth around \$130 million a year. N[Z]ers, who already enjoy low banana prices, are among the world's biggest consumers of the fruit, gobbling up around 68 million kilograms a year. Bonita and Dole claim there is no room for another player in N[Z]... Since buying out the N[Z] arm of Chiquita in 1994, Dole, which is aligned with distributor MG Marketing, is believed to have secured

around half of all banana sales. Bonita, linked with distributor Turners and Growers, has the other half. Both companies note Chiquita's restraint of trade will expire soon, allowing the company to operate back here. But they are also concerned about Del Monte... However... the new general manager of Fresh Del Monte in N[Z], said the company's arrival was... a fantastic opportunity for N[Z] fruit exporters... "There is huge value in the Del Monte brand, and it has the ability to hopefully market N[Z] products in a different fashion than is being done today, with resources that haven't been available to those products before."

...[In the Hindu religion there is a legend in which the banana was the fruit forbidden to Adam and Eve in the terrestrial paradise, which, according to the legend, was on the island of Ceylon, where the parents of the human race covered their nakedness with banana leaves. This explains the names of *Adam's fig-tree* and *Paradise banana*, which the Indians have given to two species of banana tree. About 30 species of banana are known. The dietetic qualities of the banana are undisputed. It provides 100 calories per 100g. Bananas are sometimes dried in their country of origin and exported in this form. Their calorific value then rises to about 285 calories per 100g – twice that of meat. Figs also are more nourishing when dried. In the south of France, figs are preserved by drying in the sun. They have to be turned over several times during the drying and, before they are completely dried, are slightly flattened. Treated in this way, figs will keep a very long time. Besides being the sweetest of all fruits, the fig contains appreciable quantities of Vitamins A, B and C. The tomato is another fruit rich in Vitamins A, B and C. In olden days tomatoes were called *pommes d'amour* – "love apples".]

...Pommy] scientists have discovered that loud rock music and thumping drum and bass tunes could ensure a bumper crop. Researchers at the British Tomato Growers Association... revealed that the vibrations caused by... [such] music boosts the quality of production by dislodging pollen so it falls on the stigmas causing self-pollination... [In local news, t]he huge fruit trees and lawn carpeted with fallen figs, guavas and persimmons hint that [a West Auckland widow's backyard] is no ordinary suburban garden and [it]'s been getting some extra help. But... [the g]reen-thumbed gardening guru[s]... secret isn't attributable to freak weather patterns, alien visitations... acts of God... or even... [loud rock music], it's good old rock dust. "It's really done marvels for all the fruit trees,"... [H]er... huge persimmon tree grew a further 2-3m after putting the miracle dust on... The persimmon tree is actually supposed to be an umbrella persimmon, a dwarf variety, but has proved to be more of a giant... While her late husband moaned about having to mow under the tree, [the widow] says it's always been her favourite... This year's fruit crop is a bumper one. "It's never had this much fruit. Generally I pick about 35 and have one a day... The... neighbourhood... kids come and ask me if they can have some. They love them,"... With four children [of her own] the... fruit never went to waste. The fruitful bounty also makes her garden a popular haunt with local birdlife... Even though the... 1/5 acre Te Atatu plot... keeps her busy [the widow] has no intention of giving it up for a retirement unit or apartment. "People say 'it's too much for you, get a smaller place' but what would I do? You never retire when you have a garden."

...West Aucklanders should be alarmed that the only community permaculture gardens in all of Auckland could be under threat, says [a] Glen Eden resident. St Benedict's Community Gardens in Basque Park, off Newton Rd[in Auckland City], face an uncertain future on July 18 when the Hobson Community Board will decide if they should be redeveloped as landscaped park land... "It would be a terrible waste if they ripped them down," says [the resident], who... found the courage to create her own permaculture plot at home after seeing the concept put into practice at St Benedict's. "There is nothing which measures up to this in the west, and what happens in the city affects us too." Permaculture describes a philosophy of growing and landscaping based on what happens in nature. It includes self-seeding, edible plants, self-sufficiency organic gardening, and recycling natural resources. [The resident will ask the] Mayor... to establish a similar garden in Waitakere City, to provide schoolchildren and the public with an educational resource. St Benedict's Community Gardens are managed as a non-profit incorporated society by two facilitators, who also coordinate tours and permaculture workshop classes for anyone interested in learning. [One f]acilitator... says the gardens' vision is to sustain "a living outdoor community centre" that shows people how food is produced, and demonstrates sensible ways of reducing the ecological damage we cause to the planet so people can transfer these ideas into their own backyards at home... The gardens are collectively maintained through a mixture of regular working bees, shared resources, and individual efforts... 90 people have worked their hands through the soil over the last two and a half years, with about 30 people involved at any one time... They are regularly used for practical assignments by UNITEC and Auckland University students, and visited by a dozen interested groups... But the Friends of Basque Park are no friends of St Benedict's, and have voiced strong opposition to their continued existence... [The group] says the gardens promote a preferred lifestyle that is "better suited to a commune than to a public park". The group has collected 129 signatures from people who want the gardens closed for good. "It is morally reprehensible that the subtenants of the St Benedict's Urban Farm seek continued access to public park land – for conversion to allotments – whilst householders pay rates for the land on which they garden," [the group] told Hobson community board members at an informal meeting last Wednesday. [The group] says the gardens are being run for the benefit of its leaseholders "to do as they please", and that there is no shortage of private gardening land within reach of the city which should be used instead... UNITEC[s] Sustainable Land Management and Design tutor... says there is room for everyone in the park. "This is a small, dynamic, successful project which is easy for people to achieve, and Auckland needs a lot more like it... it costs peanuts. The management of the gardens could be improved on, so they may need some help, but let's build it up rather than this overkill attitude."

...Auckland's only community permaculture gardens have been given a 12-month stay of execution before they must go, but organisers and west Auckland supporters are digging in for a fight. The Hobson Community Board last Tuesday voted 5 to 3, with one abstention, to get rid of St Benedict's Community Gardens in Basque Park... The gardens' spokesperson... says the decision effectively bulldozes Auckland City Council[s]... consultation process with the community. Local residents clearly signalled they wanted the gardens retained in the park's new design, [the spokesperson] says, with a petition to keep them receiving 607 signatures. [The council's] open space planner... also recommended they be included in the park's redevelopment. The board will however ask the council to prepare a report investigating the suitability of and demand for community gardens within Auckland City... There have... been criticisms that the gardens are untidy and poorly managed. A new management team is currently setting up a trust board to address those problems, and hopes to overturn the board's decision within 12 months. However, there is no appeals process in place. A rally to raise public support for the gardens will be held in Basque Park this Sunday... at noon. [A tutor], who teaches permaculture at Rutherford High's night school, says: "It's basically turned a green city backwards, and now I'll have to find somewhere else to take my students. The percentage of land is so small, I can't see why they've focused on this one garden." ...[Incidentally, a father], 30, was astonished to find a gigantic earthworm, measuring 45cm, under some cobblestones in the backyard of his Te Kuiti home. "It was lying on top of the dirt and I kept pulling and more and more of it would come out... I got quite a fright when I finally pulled it out." The Conservation Department said while the creature was huge, the biggest earthworm ever found in N[Z] was 142cm long. [The father] said his two sons [aged] three, and... five, had taken the worm to school to show their friends. It was now part of an exhibit in a natural display at the Te Kuiti kindergarten.

...KITCHEN GARDEN If you're not planning to plant a winter vegetable garden then sow a green crop such as lupin or mustard seed. Dig this in when it matures and this will provide the soil with a high level of nitrogen which will be readily available to your next crop of vegetables... Seeds can be sown such as beetroot, broccoli, broad beans, onions, radish, spinach, swedes or turnips. Seed potatoes can be planted now in frost free areas. Rhubarb can be divided and replanted in compost enriched soil. Perennial herbs including parsley can be planted now also, with the exception of basil which does not overwinter well so it is better planted later.

...JULY and August are often the coldest... wettest months of the year. Listen to the weather forecast... and be prepared to protect tender plants from frost, freezing and flooding. Much gardener anguish occurs in midwinter when seedlings of winter crops suddenly turn yellow, keel over and

die. Few of us naturally inherit open and well-draining earth – heavy, wet or clay soils are a big problem. They bring instant rot to seeds and death by drowning to... seedlings. But you can do a lot to stop waterlogging by conditioning the soil to make it drain more freely or by building simple raised beds – a system used over many centuries... A raised bed system is also invaluable where a garden has to be created on a sloping site... Building raised beds is not difficult and involves few tools other than hammer and nails or lengths of strong wire and pliers... Raised beds should be of a size to provide easy working access from all sides. If you need one of larger design, plan for pathways of bricks or pavers to avoid treading all over and compacting your fill – thereby defeating the object of the exercise... During the drought months... bed surfaces can be mulched with organic materials such as shredded bark, pea straw, well-rotted manure, or... grass clippings to conserve moisture and inhibit weed growth.

...*‘Organic’... redefined...* Bowing to public demands to ban biotechnology and irradiation of foods labelled and sold as “organic,” the [US] Administration has unveiled regulations for the fast-growing organic food industry. The Department of Agriculture’s 650-page proposal aims to provide a nationwide standard for food and clothing marketed as “organic.” The label at present falls under a hodgepodge of state, regional and private certifier standards, giving rise to confusion about its meaning. A nationwide organic standard, which Administration officials hope will become final by the end of the year, should not only clarify the meaning of “organic” for American consumers but also for foreign nations, who are increasingly shying away from conventional American growing practices... “The organic label is about giving consumers a choice,” said A[merica’s] Agriculture secretary... “It’s about giving consumers and farmers a definition of organic that takes the guesswork out of the process. Consumers know what they’re buying and farmers know what’s expected of them.” ...There are 12,000 organic farmers in the U[S] and that number is rising by 12[%] a year. The... proposal was the strictest organic standard in the world and might force other countries to tighten their regulations. The proposal bans food from crops that are genetically altered to fight off weeds and pests, withstand droughts and floods and provide extra nutrients... Also banned... is food irradiated by... electron beams[, or] fertilised by sewage sludge recycled by municipal waste plants. Meat produced from animals that receive antibiotics could also not be labelled organic... The move may help sell American organic products in Europe and Japan...

Organically produced food has yet to make a significant impact here, but... it is already becoming a significant export earner Some authorities want to irradiate pests on food instead of using chemicals. And ingredients from [GE] crops may turn up in... many... processed foods. What, you may ask, is safe to feed your children? The answer may turn out to be that either there is no real problem with such techniques, or there is. Until it is clear, more consumers may be inclined to try something else – food that is organically produced. The difficulties are its availability and the cost. Organic food prices are anywhere between 10 and 15[%] higher than for conventionally produced goods. But about 600 primary producers and processors are licensed to use the Bio-Gro symbol, meaning produce has been grown to an internationally agreed standard. The number has almost trebled in the past two years. The products range from fruit and vegetables (both frozen and fresh), meat and grains such as oats and wheat to dairy products, wine and baby food. In response to the increased demand for organic agriculture both here and overseas, the fledgling industry is rapidly organising itself. The Organic Products Exporters Group... expects members’ exports to be worth \$65 million [in] 2000, triple the 1997 figure. Its founder members include Heinz Wattie, the Kiwifruit Marketing Board, Only Organics, Northland Dairy Products, Agriculture N[Z], Bio-Gro, the Bio Dynamic Association and Trade NZ... 5[%] of Heinz Wattie’s frozen vegetable production is organic and includes peas, sweet corn and carrots. All is exported because the local market has failed to develop. The [company]... says that through the 1990s demand for certified organic produce... increased in Japan, North America and Europe at a much faster rate than the general growth in food sales. Because of a shortage of supply, the company has a policy of helping growers to make the conversion to organic production and more recently of converting land itself and producing its own organic vegetables. For consumers, identifying genuine organically grown products is relatively simple... Look... for either a specific symbol on the label... or evidence that it was produced in accordance with the California Organic Foods Act 1990. In N[Z] there are two registered symbols – Bio-Gro and Demeter. Demeter is the trade name of the Bio Dynamic Association, an international organisation whose symbol is recognised worldwide. It is considered the high priesthood of organic methods because of its holistic approach. Bio-Gro is the trading name of the N[Z] Biological Producers and Consumers Council, which was set up in 1983. It is a member of the International Federation of Organic Agriculture Movements, based in Germany. Produce that carries the Bio-Gro symbol has been... produced without fungicides, herbicides, insecticides, growth regulators or the addition of colour or flavour enhancers. The symbol is also used for processed food derived from organically grown produce without synthetic additives such as stabilisers, emulsifiers, antioxidants, preservatives and colourants. Certification of organic products is a rigorous procedure that takes two years – and often a big sacrifice on the part of... farmers because productivity inevitably drops when they stop using chemicals in the operation. A producer has to furnish the council with a management plan, maps, test results, spray diaries and receipts for farm inputs. The licence has to be renewed annually. The only fertilisers allowed are manures, composts or mulching materials from on-property sources. Others have to be documented as free of pesticide residues. Permissible mineral additives include sulphur, limestone, rock phosphate, dolomite and unadulterated seaweed and fish products. Permitted pest and disease controls include biological controls, sodium silicate, herbal sprays, soft soaps and pheromones for mating disruption. This year the industry set up another body, the Organic Federation of N[Z], to act as a watchdog, promote its products and lobby. Its convenor... who also chairs Bio-Gro, says organic farmers are affected by an enormous amount of legislation on which they have had limited input. As an example, [the convenor] cites the effect of spray drift. “Organic farmers cannot sue [the offender] if drift from a neighbour’s property is below a certain level. But the levels allowed by current legislation are above those permitted by Bio-Gro, so a farmer can risk losing certification.” [The convenor, who] has an organic farm near Wellington and a retail shop in the city... says it is small wonder that prices for organic produce are higher. “Conventional growers don’t have to pick up the downstream costs of environmental pollution their methods cause. That’s strange in these days of user-pays.” What kind of a diet is an organic one? Quite exciting, I thought, after a visit to... the major retail outlets in Auckland, Ceres Wholefoods in Ellerslie and Huckleberry Farms in Greenlane. As well as an organic range of the familiar breakfast cereals imported from the U[S], I found something called peach cereal with echinacea and elderberry, and another with amaranth flakes. Pasta and a range of sauces were available, as was organic olive oil from Mexico... Organics is a way of life that not only avoids chemicals but has as its priority long-term benefits to the environment, the humane management of livestock, genetic diversity and the fair distribution of profits. In this context the word sustainability becomes more than a political buzzword.

...ORGANICS is the fastest growing agriculture in the world. Despite commercial horticulture spending millions marketing chemicals they guarantee will improve results... it seems a discerning public has become better informed about the potential dangers associated with [GE] and chemically treated foods. There is a growing public awareness that chemical pesticides and hormone sprays may contribute to a wide variety of health problems, as well as contamination of soils and drinking water... This realisation has led to an increase in public demand for “natural/pure” foods. Demand far outstrips supply and consequently people are beginning to grow their own. Commercial growers, aware of this trend, are moving towards large-scale organic farming with an increasing number of journals and publications to guide them... Fundamental to organic gardening is improvement and replenishment of the soil. This is done primarily through composting. All organic materials are recycled into compost... Burnable materials too large to break down or mulch are returned as ashes. Compost is added to the land regularly to build humus in the soil... Mineral soil (subsoil) has no humus while topsoil has a varying amount of mineral soil mixed with humus. Mineral soil absorbs about 20% of its weight in moisture but humus can absorb 300%-500% more water. Humus acts like a sponge, holding water needed for sustained plant growth over long periods... Inorganic materials are discouraged because they chemically burn worms and kill soil microbes ultimately leading to the decline in humus or collapse of “living” earth... [One] additive frequently used is lime. Gypsum, especially when applied with round river sand or gravel, will “sweeten”, loosen and open clay soils. Crushed limestone rock and dolomite are to a plant what milk is to a baby. The calcium

strengthens plant tissues helping them withstand stress attack from fungus and disease... Rock phosphate, a natural source of phosphorous, is applied to increase quantity and enhance quality of fruits and flowers[(note that another natural source of phosphorous is 'wheat and other grains – you need two parts of calcium to one part phosphorous in your diet; too much phosphorous creates an imbalance resulting in a calcium deficiency' and, interestingly, wheat 'contains phytic acid, a phosphorous compound which inhibits your utilization of calcium')]. Wood ashes are a natural source of potash essential for root development and plant vigour... Trace minerals are sometimes added to replenish depleted soils. Granite dust or powdered rock are natural sources of trace minerals which strengthen tender, difficult crops. Dried blood is a natural source of nitrogen, an essential element needed for leafy growth... Liquid food is usually applied with rain water. Most popular feeds include fish emulsions, seaweed extracts, manure tea, or snail tea. These are made by soaking the fish, manure and/or dead snails in a bag of water for a week or more. The resultant liquid is watered down... before being applied to already watered plants and foliage... Organic pest/disease control relies on the notion that... [the] more balanced the natural environment... [is], the healthier plants will remain. Some plants emit chemicals or odours that deter disease-spreading insects. Garlic and most members of the onion family repel ants. Ants herd and 'milk' aphids. By planting garlic near a susceptible host... the aphids will be reduced or eliminated. Planting basil with tomatoes nearly eliminates whitefly attack. French marigolds eliminate nematodes from the soil and prevent blackfly attack. Onions and rosemary reduce carrot rust fly. Pyrethrum, daisy, mint, sage, thyme and many strongly scented herbs repel a variety of insects... [Encourage birds] to catch insects for you by creating shelters for them, feeding them and training them. This could be a whistle, call or a coloured marker placed next to their food. The birds will associate this with food. At the first sign of insect invasion stop feeding but call the birds to where the unwanted insects are. There are also helpful insects that should be encouraged. Ladybirds eat many small insects and praying mantis tackle almost anything. Asian wasps are hunters of caterpillars... Bees are not predators but disturb intruders while pollinating. At the first sign of disease or infestation act immediately and burn anything contaminated before it can spread... Soapy water is effective at reducing both pests and diseases. Sudsy bubbles lift, drown and smother insects but are most effective when used regularly on wet foliage to create a protective film around plants that might be attacked... [Plain water can also] play a part in insect and disease control. Most insects hate getting wet. Effective spraying can wash away many insects or put them in vulnerable positions where birds find them. Some blights and mildews can be scalded off plants by watering during hot, sunny weather but care must be taken not to damage tender growth. Evening watering will revive a dry garden during drought but allow enough time for foliage to dry before nightfall otherwise fungal growth will spread... Learn to water with celestial cycles. Just like the tides, water in plants responds to sun/moon cycles. If the sun is rising ahead of the moon (a waxing moon) the upward 'celestial' pull is vigorous. This is an excellent time to liquid feed. When moonlight wanes toward the new moon in the last quarter gravitational extremes increase. This can be used to draw water and food downward to encourage strong root development. Cuts made in unwanted vegetation near new moon would draw air deeply into the root system killing regrowth without the need for herbicides.

...Angry growers have called for more care after several herbicide spray drifts badly damaged north-west crops. Greenhouse tomato crops at Whenuapai and Waimauku have been hit, and one grower is seeking legal advice... Vegfed['s] spray drift assessor... has inspected 12 properties [near] Waimauku... About 14 growers have collectively suffered more than \$600,000 losses and have little or no redress... One grower hit four times has lost all profit for the year... Most growers don't have insurance because of the expense, and pursuing the matter through the courts can be difficult... Vineyards, tomato crops and beans are particularly susceptible to mainly hormone-based sprays, such as those used to control difficult weeds like gorse. Spray residue can drift in the wind for many kilometres. In some of the most recent incidents, a few contractors have been implicated... [O]ne was seen spraying gorse with Tordon in wind gusting up to 18 kilometres per hour and then abused a concerned grower who asked what [the contractor] was doing. Spraying should not be done in winds over 8km/h or in temperatures over 20 degrees because of evaporation and drift risk, says [the assessor], who helped formulate the code of practice for spray use... Before using sprays, people should talk to neighbouring growers – even those up to a few kilometres away – about the best time to spray... People using contractors should ensure they are properly qualified... Those affected by spray drift should record details such as the day, time, weather, sprayer location and identification, chemical name (if known), colour and smell; any witnesses and whether humans, animals, crops, gardens or water supplies are affected. Incidents should be reported to the Auckland Regional Council's Enviroline, phone: 0800-80-60-40, or 379-2090 after hours. The ARC says it will help investigate spray drift incidents and work with neighbours to find answers and avoid further incidents, but it does not have direct powers to prosecute.

...The sudden onset of "loopy" behaviour among pupils at a rural Tauranga primary school has been linked to toxic spraydrift from a growth hormone chemical sprayed on nearby kiwifruit orchards. Staff and pupils at Te Puna School, 10km northwest of Tauranga, are suffering the effects of chemical fallout from hydrogen cyanamide, a plant growth regulator, marketed as Hi-Cane. It is sprayed on dormant kiwifruit vines annually during late July and August... before the onset of buds... [The] principal... could virtually predict behaviour changes among his senior pupils this time of year – changes [it] puts down to the hormone residues carried in the air from the spray. Hydrogen cyanamide is... regarded by orchardists as a critical part of their regime because it stimulates uniform budbreak following the vine's dormancy. At his school this week, [the principal] said the Hi-Cane effects had returned. In a 20-pupil senior immersion class, between Monday and Wednesday, six pupils had crook stomachs, two were vomiting and eight had headaches. The changed behaviour had been occurring every August for the past four to five years... After seven years at the school, [the principal] has no doubt that the "hormonal" properties of Hi-Cane were the villain. [The principal] had contacted the National Poison Centre and others in the scientific community with his concerns but "nobody wants to know"... [The centre's] medical toxicologist... said "bystander exposure" to Hi-Cane should not be a major health concern because of the low levels of the chemical in the air. "I doubt that level of exposure would create problems... I don't see its effects being long term or irreversible... It would be a relatively low risk..."

...N[Z]ers' food is relatively free of contaminants and pesticide residues. The total diet survey, released by the Ministry of Health, analysed 114 common foods for five contaminant elements, 90 pesticides and three key nutrient elements. Overall, the results were very encouraging and showed that any risk to public health was negligible, said [the ministry's] chief adviser on safety and regulation. Pesticide residues remained low compared with international standards and contaminants were similar to levels overseas. The estimated intakes of pesticide residue and contaminants were not expected to affect health. The survey, taken in 1997-98, found the intake of lead through food had fallen by more than half since the previous study in 1990-91. Iodine intake was lower than the recommended level... [In related news, AUS]n research shows that the banned pesticide DDT may have left a legacy of thinning bones in [gals] now going through menopause. A study of northern N[SW] gals] aged 45 to 65 found those with traces of the pesticide in their blood had lower bone-mineral density than those with none. The head of population health for the Northern Rivers area... and [the] Southern Cross University in Lismore, said the research was the first to highlight the impact of DDT on human bone. The organochlorine pesticide was used widely in A[US], including as a cattledip, from the 1950s until the 1970s. Concerns about its environmental impact led to a ban in 1987... The... Southern Cross Institute of Health Research, said a majority of A[US]ns growing up in the 1950s and 1960s, whether rural or city dwellers, were exposed to DDT through diet... In the body, DDT metabolises into DDE, which is known to affect human hormones.

...The U[S] Government is poised to declare that dioxin, a toxin found... throughout the world's food supply, causes cancer. Dioxin became notorious when it was fingered as the toxic component in Agent Orange – the herbicide used... in the Vietnam War. It also caused the evacuation of Times Beach, Missouri, in 1983. The town was later bulldozed when... found to be contaminated with the chemical. In N[Z], the widely used 2,4,5-T herbicide attracted heated protests in the 1980s until Ivan Watkins-Dow stopped manufacturing it in New Plymouth in 1987... [- though]

difficulties in reaching a new dioxin limit set by the Government was one of the reasons for stopping production. Now, a draft report leaked to the *Washington Post* upgrades dioxin to a “human carcinogen,” but also concludes that health and environmental officials have done as good a job as possible to control it. Officials at the US Environmental Protection Agency, who have been reviewing dioxin for 10 years, confirmed the report. Dioxin has hormone-like effects on the human body, causing cancer, infertility and other sexual changes. Vietnam vet[s]... claim it... caused... cancer and birth defects in their children. The National Toxicology Programme and the National Institute of Environmental Health Sciences also tried to declare dioxin a human carcinogen in its report on cancer-causing substances released last week. However, a lawsuit by New York restaurant owners, who claim the link to cancer will scare away customers, has blocked its publication. The EPA report, due out next month, notes that emissions of dioxin have plummeted from peak levels in the 1970s but still pose a significant cancer threat to some people who ingest it – mostly in food, especially... of animal origin... [The] director of the National Toxicology Programme and author of some of the... report, said there was no avoiding dioxin. “Even penguins in Antarctica have dioxin in them,”... Over the past five years, the EPA has imposed regulations on major dioxin emitters, including municipal waste combustion units, medical or hazardous waste incinerators, cement kilns that burn hazardous waste, pulp and paper operations... Dioxin attaches, or binds, tightly to the AH receptor – a kind of cellular doorway found in virtually all cells in the body. Once there, it changes the function of hundreds of genes. “It can make them more, or less active,” said [the director, who]... hoped... his programme... [would] raise the status of dioxin to a known human carcinogen, mostly so Government agencies could be encouraged to monitor its effects on the population... [Incidentally,] Chinese eggs have been found with excessive amounts of the industrial chemical melamine that may be traced to fertiliser fed to chickens... China has been caught in a food safety scandal over dairy products tainted with melamine. More than 3600 children remain sick in China from contaminated milk, with three in a serious condition.

...Chinese police have arrested two brothers suspected of adding an industrial chemical to milk they sold to a company that produced infant formula that has killed two babies. The news came just hours after Fonterra[s] chief executive... said [it] was happy with the way the NZ dairy giant had acted over the crisis... “I can look myself in the mirror and say Fonterra acted absolutely responsibly in this one,”... Contaminated milk powder made by Chinese dairy company San Lu was publicly recalled last week. Dairy co-operative Fonterra – the world’s biggest dairy exporter – paid US\$107 million for 43[%] of San Lu [two years ago] and has three directors on the seven-member board. The two brothers... are accused of adding melamine, a chemical used in plastics, to the milk to make it appear higher in protein, the official Xinhua News Agency said... Melamine is rich in nitrogen, and standard tests for protein in food ingredients measure nitrogen levels. [Fonterra’s chief executive] said San Lu had rigorous testing procedures “but it’s impossible to totally exclude sabotage of a product”. [The chief executive] was frustrated with the handling of the situation by the Chinese authorities... The San Lu board was informed about the contamination, met officials and ordered a trade recall of infant formula on August 2, [the chief executive] said. However, it would have been irresponsible for Fonterra to have gone public that day... [NZ’s PM] yesterday said a full recall had earlier been blocked by Chinese local officials. [The PM said it] found out about the milk powder issue on September 5 and the N[Z] Government blew the whistle in Beijing. “I’m confident Fonterra wanted the product recalled from the beginning but could not get the local authorities in China to do that... Eventually, Fonterra quite properly came to the N[Z] Government.” The PM... did not believe the tragedy would damage the N[Z] national brand. “...there was a lesson from this for Fonterra and any Kiwi company looking to have joint ventures in anything which can have a product impacting on consumer safety...” ...San Lu has been reported to have received complaints in March and to have recalled products but not reported the problem to officials... Taiwan is the only export destination.

...Milk and dairy products sold in Asian supermarkets are being tested for melamine by the N[Z] Food Safety Authority. Food safety inspectors started taking random samples on Thursday night... after initially focusing on infant formula... But Asian supermarket customers are not taking any chances. A check with 10 customers at three Asian supermarkets in Auckland... found most are shunning milk and dairy products from China.

...[NZ] Government officials are helping Fonterra keep its directors in China safe as authorities there crack down on those involved in the tainted baby formula scandal. Four Chinese babies are dead, 158 have acute kidney failure and 6244 have kidney stones... Police have detained San Lu’s chair[perso]n... Meanwhile, new allegations have emerged, suggesting San Lu knew melamine was being added to its milk products more than three years ago... It also emerged yesterday that the melamine content in San Lu’s tainted milk powder was vastly higher than samples from other companies, prompting China’s Health Minister... to blame San Lu for the four deaths and the majority of the illnesses. Hundreds of parents have streamed into San Lu’s office, demanding refunds and worrying over what products they could safely give to their children.

...*Toxic trade* Fonterra’s business relationship with... the company at the centre of the tainted milk powder scandal in China, raises questions about the responsibility and involvement of international partners in the safety of the goods they sell... Farmer shareholders would expect N[Z]’s biggest multinational... to be acutely aware of the risks, with its global growth strategy heavily aligned to soaring demand for dairy products in Asia, South America, Africa and the Middle East. These emerging markets promise infinite rewards; but you enter at your peril. They tend to lack infrastructure needed to ensure robust quality assurances... Such markets may be fledgling and remote, but scandals related to product safety or quality quickly reverberate around the world and damage the brand – no matter how diluted... Fonterra’s subsidiary, San Lu, lied for eight months to hide complaints about its melamine-contaminated baby formula, an official Chinese investigation has found... [□ The health spokesperson for NZ’s] Green Party... is concerned that a Ministry of Health report, the Total Diet Survey, found high levels of mercury in some... battered fish... say[ing] the ministry has failed to point out the information to the public, which has a right to know that high levels of the cumulative toxins can be dangerous... [O]ne meal a week of larger fish such as shark (or lemon fish) could add up to too much, especially for pregnant [people] and infants. The larger the fish, the more mercury it is likely to have in its body... As for oyster lovers, the... [s]urvey found oysters from Bluff were over the cadmium limit because of high levels of naturally occurring cadmium in Foveaux Strait. Too much cadmium can damage kidneys and bones. “We don’t want to be alarmist,” said [the spokesperson] last night. “I mean, fish are very good nutritionally and so forth. But I think consumers have a right to know, and because information might be a bit alarming is no reason to conceal it.” The ministry disputes that the average N[Z]er should cut back to less than one meal of battered fish a week, and says only Bluff oyster “binge eaters” need be concerned about cadmium. [In response to the spokesperson’s comments], the ministry’s chief adviser of safety and regulation, said the report had been made public and had not concealed anything. [The adviser agreed pregnant people] and infants should not eat too much of the larger fish. “But when talking about a weekly visit to the fish and chip shop rather than having fish as a staple diet, the chance of getting to levels that are above the provisional tolerable intake – it’s just not possible.” [The adviser admitte]d some of the samples of fish tested did exceed the current N[Z] standard for mercury but there had been an ongoing debate about whether the level was set too low. A[US]’s level was twice that of N[Z]’s... “So that would mean all A[US]n fish and chips were unsafe, and that’s just not so.” ...Not all takeaways sell shark and other fish... high in mercury.

...LONDON – Too many Chinese takeaways can damage the eyesight, researchers claim... [S]cientists have found that eating large amounts of monosodium glutamate (MSG), used to flavour oriental and processed foods, injures the retina. Glutamate is an amino acid which acts as a neurotransmitter... Previous research has already shown that it causes nerve damage when injected directly into the eye. But the [latest] study... was the first to show eye damage can be caused by eating food containing MSG.

...Despite a massive increase in the availability of exotic and gourmet foods, nearly nine out of 10 British people admit to a penchant for a plate of chips. The findings come after a poll for National Chip Week, which starts today. However, vinegar and tomato sauce are often giving way to a generous helping of curry sauce or following the Belgian example, chips and mayonnaise. Fish and chips proved to be the top takeaway in Britain, selling in excess of 300 million meals a year, compared with 219 million Indian meals and 210 million Chinese takeaways.

...Fish and chips are still N[Z]'s number one fast food... Young people are leading the fast food trend. Outlets have become meeting places for young people... [However, as] young people become more concerned about animal issues, there is a growing number of vegetarians. Although no real research has been done there is thought to be about 70,000 vegetarians in N[Z].

...TOO many greens can make you blue – that's the finding of a study into the effects of a meat-free diet. Scientists have found vegetarians can suffer mood swings... and... depression... because their diet is too low in carbohydrates and protein. [Although – because most vegetarians are sensitive to the problems of others or the world at large, and they have to exist in societies which aren't based around their beliefs – it would seem to be obvious that they are more likely to be depressed than meat-eaters, t]he absence of those vital ['for large brains'] nutrients causes low levels of serotonin, an amino acid responsible for feelings of optimism and well-being. "I've seen a lot more cases of vegetarians who aren't getting adequate nutrition in the last five or 10 years than before," said [a]Christchurch dietitian... "But people who go on vegetarian diets for philosophical or religious reasons usually have a very healthy diet. Some studies have shown that vegetarians live longer and healthier. Seventh Day Adventists, for example, are known to be very healthy, although it's not known how much not drinking and smoking helps... [I]t's important to recognise most vegetarian diets are as healthy as people make them – just like a meat-eater's diet can be unhealthy if they eat badly..." Vegetarians are advised to eat plenty of carbo-rich foods like tofu, cereals, pasta and rice to boost serotonin levels... Scientists from England's York University also found many young [gals] take up vegetarianism to lose weight. Being vegetarian legitimised eating disorders by extending the range of foods to be avoided, they found. Parents need to be careful their children are not claiming to be vegetarian to mask bulimia or anorexia... ■ Vegan diet warning – [see page]A3...

How vegan diet can put babies in peril Many more children could be at risk from the diet deficiencies that led to Caleb Moorhead's death, says an Auckland paediatrician... [The] Starship children's hospital [paediatrician] said about 40 cases of B12 deficiency in babies had been described in medical literature but [it] believed there were likely to be many more. "This was an avoidable tragedy but there are many left unreported,"... said [the paediatrician, adding that t]he only source of B12 available to humans is in bacteria found in dead animals, such as meat. Humans store B12 in the liver but once someone is on a B12-deficient diet, the store begins to run out. Often people who switch to a vegan or vegetarian diet as adults have enough of the vitamin to last years, as many as 20. But a baby has only what it gets from its mother in the womb and a tiny amount from breastmilk. At 6 months of age, the baby's store needs replenishing... It was not always obvious that long-term damage to a child, such as lower intelligence, was because of a lack of B12. "The presentation of B12 deficiency can be quite subtle,"... [A] registered nutritionist in private practice in Auckland, said some vegans used injections to boost B12 levels[, adding that t]he only source of the vitamin in a non-animal protein diet was mushrooms. There are eight amino acids the human body does not produce but which it needs to stay healthy. Animal proteins contain all eight, and in the right proportions, but vegetable proteins contain only five to six and not always in the right quantities. "I mean, you really have to know what you are doing... To eat a proper vegan or even vegetarian diet is quite time-consuming..." A quick scan of the internet shows there is a wealth of information on vegetarian and vegan diets and societies. A US-based group called Physicians' Committee for Responsible Medicine says children of vegetarians and vegans should have a reliable source of vitamin B12 in their diet. Good sources include B12-fortified foods such as soy milk, breakfast cereal, meat analogues (a "meat" made up of usually high-protein non-animal foods such as nuts) and vitamin B12 supplements. An A[US]n website called Vegan Voice gives special advice to vegan parents of children and teenagers, suggesting they be given a multivitamin tablet daily and making sure it contains B12.

...Prophet's message cost baby his life The religious group at the centre of the Caleb Moorhead case follows the teachings of a 19th century... Seventh-Day Adventist prophet... who advocated natural healing and a strict vegan diet. The dozen members of the White Horse Ministry do not smoke, drink or take drugs and do not own televisions or believe in unisex clothes... Their first headquarters was the Dargaville home of... a grey-haired 55-year-old, who outlined her beliefs in an exclusive interview with the *Herald* yesterday. [The 55-year-old] follows a strict regime of eating twice a day and drinking water one hour before and two hours after each meal. [The 55-year-old – who also] refuses prescribed medicines, instead relying on natural remedies, and prays often... [-] is a close friend of... [the parents] whose 6-month-old son, Caleb, died after they refused to get him medical treatment for vitamin B12 deficiency brought on by his mother's vegan diet... The [parent]s are in custody awaiting sentencing after an Auckland jury this week found them guilty of [hu]manslaughter and failing to provide Caleb with the necessities of life. The couple took the boy out of Auckland's Starship hospital and went on the run in March last year. Two weeks later, Caleb was dead. The case ignited widespread concern among doctors. Developments include: ■ New calls for a formal body to arbitrate disputes between the parents of sick children and doctors. ■ Draft guidelines for Starship doctors facing similar situations. ■ The Starship seeking a legal opinion on whether staff could have physically stopped the [parent]s leaving – the view was that this case would not have met the legal criteria. [The 55-year-old], a lifelong Seventh-Day Adventist, told yesterday how [it] took up the "health message" six years ago after reading books by Ellen White... Like [Caleb's parents, the 55-year-old] shuns meat, dairy products and sugar... say[ing] the *Bible* teaches that [humanity] was to eat fruit, grains and nuts. "Later vegetables were added when [Adam] sinned... Sugar is poison, a killer." [The 55-year-old adds that] meat is only to be eaten in an emergency... [The 55-year-old] does not believe in drugs prescribed by doctors, saying they simply treat symptoms but do not cure people. [The 55-year-old] does not believe a vitamin B12 deficiency led to Caleb's death, and backs the [parents 100%] in their decision to refuse treatment... [The 55-year-old] formed... the White Horse Ministry... with six others in Dargaville... The group has now doubled in size and operates out of the Seventh-Day Adventist church in Dargaville... The Seventh-Day Adventist Church has distanced itself from the group, saying its lifestyle and beliefs are not in harmony with church teachings.

...On a sunny lawn, two young girls are tickling the tummy of a chubby puppy and giggling with delight. Laughter from [the girls aged]12... and ...10... has been rare since the death of their baby half-brother Caleb... Their dad... welcomes the happy sound as another sign that his daughters are moving on from the tragedy... When Caleb was born, the girls were thrilled to have a baby brother. "They talked about him all the time; they adored him... When [Caleb] died, they were devastated. [The elder sister] carried around a bag with one of his disposable nappies in it for a while... I think the girls feel responsible for his death as they helped with his treatment,"... The girls' mother... and her [new]husband... were jailed recently for five years for Caleb's [hu]manslaughter. Caleb had severe vitamin deficiency... A simple injection and supplements could have saved him. Deeply religious, [Caleb's parents]... believed modern medicine was evil and that God and herbs would cure their son. The couple went into hiding with Caleb... and [his two half-sisters] after concerns were raised about the baby... Now [Caleb's mother] has given birth to a baby girl, conceived while on bail awaiting trial... [Her ex-husband] has custody of his two traumatised daughters. The... transition from a deeply religious and restricted life has been tough on the two girls... "[Their mother] was home-schooling them but the education was all to do with Jesus and God... They were so far behind when we put them into school..." Interaction with people outside the church was limited. The... only books they were allowed were religious... "Everything was controlled and God took precedence, even over the children." The girls always wore long, dowdy dresses and hairbands. They were put on the "God's Plan" strictly vegan diet, which [their father] says they ate reluctantly... Once a month... the girls... visit [their mother in]... Auckland's Mt Eden Prison... "They put on their dresses and read their Bibles again..." [Their mother] also sends... letters full of religious verses. "In one [their mother] drew a big love heart with 'Caleb is waiting for you' written inside it... We've asked her to put in less about God and Satan and more of herself but [their mother] doesn't listen... To[o]... fanatical." ...Doctors checked the girls after the[ir mother and step-father's] arrests. They both had vitamin deficiencies. "They are much healthier now... The only vegan thing they still have is soya milk. They love schnitzel and sausages." ...● [A guy's 'irreversible blindness has been blamed on his strict vegetarian diet that including no supplements' ...

The other night] on *Holmes*... N[Z]'s greatest rugby player... [- who 'broke an arm during a test but didn't leave the field' and] has been named... as a distinguished companion of the N[Z] Order of Merit... [-] said the All Blacks should be eating more meat if they want to be consistently winning again... "Pinetree"... is right. Human beings are by their physiology predators. We have predator eyes in the front of our faces and canine teeth. Prey animals have their eyes at the sides of their heads so they can see all around and watch out for lions and eagles and the likes of us. Since the idea that eating a lot of carbohydrates became popular, the meat industry in N[Z] has caved in and it took our standard of living down with it from fourth in the world to bloody near the bottom third. The thing about carbohydrates is that they are simply sugars, chains of sugars that can keep a prey animal running all day. Since the western world embraced the carbohydrate fad, there has been an explosion of diabetes. It is no wonder. On top of that the world has become full of fat people who cannot understand why. They think they have no willpower to resist food when all it is they are addicted to sugar. This is easy to prove. If you eat a diet of quality meat and salads with a minimum of starchy carbs, you get lean very quickly and you get strong with only moderate exercise. Give the All Blacks more red meat. Honour them for the predators they ought to be.

...The secret to living to be 100 – and enjoying it – may not be pots of money and a personal trainer. It could be down to eating plenty of porridge... and nuts... Researchers at the University of Keto... measured the blood cholesterol levels of 75 centenarians against a group of people 40 years younger. The [subjects]... who had made it to 100 had much lower levels of LDL (or "bad") cholesterol than the younger subjects. But, equally, the healthier centenarians had higher levels of HDL (or "good") cholesterol than their weaker peers... "Good" cholesterol binds with a lipoprotein that takes cholesterol away from the tissues to the liver, which excretes it. "Bad" cholesterol goes the other way – from the liver to the cells... ['While it is a delicate matter to wrestle with the excessive formation of cholesterol internally, it is very easy to put a stop to excessive intake of cholesterol simply by eliminating certain foods from the diet. All foods containing animal fats should be avoided'.] Soluble fibre, found in oats, beans and pulses such as lentils, actively helps reduce levels of LDL cholesterol... But lowering levels of LDL cholesterol is only half the story. Maintaining levels of HDL cholesterol – which tend to drop naturally with advanced years – is equally important... All nuts, but particularly almonds, reduce harmful LDL and raise helpful HDL... Almonds and other nuts also contain chemicals similar to those in red wine, which act as antioxidants. They prevent the oxidation of the LDL, a process that results in the cholesterol being deposited in the walls of the blood vessels... leading to cardiovascular disease... Although nuts have a high fat content, they are high in mono-unsaturated fatty acids, which are... good... as long as you do not gorge on them.

...Slow down and make a meal of it... Many people have problems because they eat too quickly and in a manner that stops them gleaming the maximum benefit from food. More often than not, meal times are rushed. A croissant is bought while running for the bus; a sandwich is devoured at the desk. The most likely evening scenarios are a TV dinner or bowl of pasta downed before crashing into bed. Society seems to collude in encouraging such unhealthy eating patterns. Schools urge their pupils to eat lunch in 10 minutes flat and long working hours force people to ignore hunger pains to the point of having to eat immediately after arriving home at the end of a punishing day. All in all, eating has become a joyless procedure that people tend [not] to... savour. Changing how you eat is not an easy task. It is like learning to ride a bike: you will get the hang of it for a few seconds and then you will fall off, discouraging you from trying again. But if you are determined to conquer bad eating habits, you will reap immeasurable rewards. As soon as you start eating in a way that assists your body in knowing when it has had enough, and also helps it to digest food efficiently, then the final part of the puzzle – eating health-giving foods – will slot smoothly into place. If you eat well in the basic sense – that is, chew food properly and in a manner that aids digestion – nutrients will be released to begin to work on improving your general wellbeing.

...NITROUS oxide canisters... are being pushed by dodgy dairy owners as legal hits of laughing gas. "Enjoy the quick harmless revelations and feeling of spontaneous laughter," says an advertisement being circulated around Auckland stores. The flyer says the tiny gas canisters... – designed to fit in whipped-cream pumps [and sold] for \$1... – ...are "on everyone's lips", and promises they will make "extra money for your business"... [But k]ids who inhale the gas... risk brain and lung damage. Overseas users have died from head injuries after collapsing while inhaling the gas.

...His weapon concealed under his jacket, the young assailant eyed his target: [that being the person who was] about to make his swansong as managing director of the... [IMF. The assailant] pushed through... a phalanx of bodyguards... until [the assailant] was at point-blank range, reached for his weapon and let rip... SPLAT! [The target] reeled. His face was a mess – of whipped cream, chocolate and fruit sauce. There was a stunned silence, broken only by the sound of camera shutters as they recorded the humiliation. The commandos of Pastry International had done it again: another... emblem of greed and pomposity had got what [it] deserved. The head of these pie-throwing protesters is... the French-speaking world's wackiest prankster. An anarchist, occasional writer and film-maker, the 53-year-old Belgian has been flinging the flan for more than 30 years at celebrities, business[people] and politicians whom [the Belgian] considers stuck-up or vacuous... The greatest coup of [his] career was the pie attack on [the head of Microsoft] in April... "It took 32 people to take [on the world's richest entrepreneur," says the Belgian,] explaining with pride how a mole within Microsoft with no liking for his boss tipped off the pie[-throwers about his boss's movements. The Belgian] and his co-conspirators lurked on the streets, carrying tarts in camera bags under their clothes, until [the target] came into sight. [The Belgian]'s favourite target, though, is [a] French "new philosopher"... famous for writing grandiose tracts with such titles as *The Testament of God* and *The Last Days of Baudelaire*, for flaunting Sixties-style long hair and a hairy chest unbuttoned to the navel... [The new philosopher] has been pied five times in 11 years.

...The phrase "socialite and ecologist" first found its way on to the front pages of newspapers a month ago when... [a] grandmother of two... [and] full-time eco-warrior... [- who was] christened... after the ancient queen of Carthage... [and whose] family gave its name to one of the most exclusive squares in Mayfair... – ...threw a chocolate eclair into the face of [the] British Agriculture Secretary... in full view of the British media. The point, apparently, was to help the British countryside and British farmers, but the message was rather obscured by the pre-pie photographs of her modelling, in various seductive poses, in the papers the following day... [The grandmother] is no mere posh eccentric[, but] is part of a new wave of aristocrats championing environmental causes – and going out of their way to be seen doing it... [Eco-grannie] is now using her sudden fame to publicise a Website... set... up to promote environmental issues... Part-American, part-German and independently wealthy ("I have a portfolio of technology stocks")[, one]... of her connections is [the] heiress... of... the billion-pound Vestey food empire. [The heiress], who recently posed nude – apart from some strategically placed body paint – in *Tatler* to promote animal welfare, is a living stereotype of the upper-class Sloane Ranger... [Although the heiress] and her brother... are part of a family that made its fortune in the meat business[, the heiress] is an avowed vegetarian, and [her] brother is standing trial for his involvement in last June's Carnival Against Capitalism in London, which ended with £2 million... of damage being done. [The heiress] insists that people with trust funds make natural environmentalists. "If you're a trustafarian, you have more time and money to find out what is going on. If you're on the work treadmill, who has time to read *Ecologist* magazine? People like me should be applauded for using their time well." Indeed, the last remaining practical problem for eco-toffs has been overcome. "You can now get organic champagne... It's rather good." Establishment interest in the environment goes back at least to medieval times, when monarchs preserved huge swathes of countryside so they could go hunting. The Queen is patron of the Council for the Protection of Rural England, the Duke of Edinburgh is patron of the World Wide Fund for Nature and [their eldest son] grows organic crops. In the more recent tradition of aristo-radicals, the old Etonian Second Baronet of Hampstead... is director of Friends of the Earth and the Marchioness of Worcester... is a trustee of Friends of the Earth[as well as being the] associate director of the International Society for Ecology and Culture. The most influential of the radical eco-toffs is the old Etonian Fourth Baron Mond, great-grandson of the founder of ICI, one of the UK's most polluting companies. [The Fourth Baron Mond] is now executive-director of Greenpeace, and recently gained headlines for being arrested while trampling on a field of G[E] crops.

...Three activists convicted of battery for creaming San Francisco[']s Mayor... with cherry, pumpkin and tofu pies last year have been sentenced for six months' jail. [The]Judge... levied the maximum sentence for a misdemeanour after the pie-tossers declined probation. The trio were members of the Biotic Baking Brigade, which seeks to make political points by hurling pastries at the prominent... [In local news, t]he avocado industry is being hit by well-organised raiders who are stripping fruit for sale on the black market... Some orchardists have taken to staking out their properties at night, using cellphones to call in neighbours. They warn they may arm themselves. Police have... warned against [orchardist]s confronting the raiders. They should report suspicious behaviour and vehicles... [The person] who chairs the Avocado Growers' Association... has another warning: ...people buying cheap avocados from unknown sources risked being poisoned because the raiders "flogging and flicking them off" would not know if the fruit had been sprayed with insecticide the day before... The avocado gangs disguise their raids by leaving the end trees in rows fully laden so that the missing fruit is not noticed immediately. Police and the growers believe the avocados, which fetch from \$1.50 to \$3 in supermarkets, are being sold cheaply in markets around Auckland... A[n] thenree orchardist... who had a quarter of this season's avocado harvest stripped, said yesterday: "I would do just about anything to stop these people intruding on our livelihood. It's sickening. I can see how farmers and horticulturists would very well take the law into their own hands." ...Fruit worth tens of thousands of dollars has been taken in some raids in the western Bay of Plenty, home to 60[%] of the country's 1000 growers in the \$40 million export industry.

...Several Bay of Plenty kiwifruit growers are upsetting neighbours by burning tyres and diesel in a desperate bid to protect crops from frost. Environment Bay of Plenty took four complaints about thick black smoke coming from kiwifruit orchards last Tuesday... No action had been taken because the complaints were made the next day, when no evidence remained... [A council spokesperson] said staff felt sympathy for growers who had suffered three harsh spring frosts in four weeks. If frost hit a crop when the buds had burst, the grower was likely to lose a lot of kiwifruit... But burning tyres released toxic contaminants... said[the spokesperson, who]... understood growers burned tyres when warmer air was too high for helicopters to effectively push it down on to vines. The maximum nuisance-fire fine was only \$300, and burning tyres was cheaper than paying \$3000 in helicopter hire or up to \$100,000 for frost fans or an overhead sprinkler system. Kiwifruit Growers Incorporated... said if orchardists had burned tyres, it would be out of sheer frustration. "It's their livelihood sitting on the vine and it means no income next year [if the crop is damaged]."

...Losses are mounting in the powerhouse rural sector from an almost unprecedented run of cold, frosts, hail storms and drought. Earlier in the month, the M[AF] predicted nationwide production would be down across a range of agricultural and horticultural sectors by between 2 and 5[%]. But sector policy analyst[s]... now believed the drop in production would be at least 5[%] – a figure which will mean millions of dollars lost to the national economy. Marlborough grapegrowers were the latest to be hit by frost, only last Monday. One grower expected up to 20[%] of the prime growing region's grapes could be wiped out by the season's frosts... some vineyards have been totally wiped out... The true picture would be clearer after flowering over the next month. The wait and see story is the same in Hawkes Bay, where it is feared frosts have destroyed up to 70[%] of the chardonnay crop – the region's most important grape variety... Tales of weather woe are coming in from all over the country, and from virtually every type of farming. Kiwifruit growers from Auckland to Nelson have suffered either from hail or from frosts, possibly to the tune of \$50 million. Marketer Zespri said crop assessors had yet to report and even then the full cost would not be known until next year's harvest. In Hawkes Bay, [the]Fruitgrowers' Association pipfruit sector chair[perso]n said last month's frosts could cut \$48 million from the incomes of the region's pipfruit growers. At least 30[%] of the Braeburn crop of almost one million cartons was knocked off the trees by three hard frosts and up to 20[%] more could be damaged but still on the trees. Damage to the other apple varieties was between 15 and 25[%] and the Bay's average harvest of eight million cartons would be cut by two million. Nationwide, MAF estimated the expected apple crop of around 10 million cartons could be cut by 12[%]. In the Waikato, the main growing region for asparagus and blueberries, crops have been knocked by frosts and slowed by cold temperatures... Otago's spring has been labelled the worst in 30 years. Snow, freezing winds and persistent rain killed more than 750,000 lambs, stripped stock of condition and slowed grass growth... The cold was right across the country and no area had the feed to take on the stock to be fattened... Marlborough farmers were responding well to drought and many had destocked early. There was no move yet for a drought relief committee to be set up and in the past two weeks some of the driest areas had up to 50mm of rain... But... Marlborough farms needed a lot more rain, and that isn't being forecast... "The ground water is now critically low and there are no indications of any end to the dry spell,"... said... [a] MetService weather presentation specialist... The rain that had fallen would produce pasture growth but a strong, cold southerly wind had been quickly drying off moisture. ■ ...A[US]'s once-mighty agricultural industries are a shadow of their 20th century forebears, crippled by vast paddocks of salt or stripped of their soil. The continent's rivers are seriously, if not terminally, ill. The cost of just staying alive is fearsome. The nation's foreign earnings have been clamped by falling farm exports; the proportion of national income devoured by the need to preserve the remaining reserves of water and productive land is fearsome and rising. An apocalyptic fantasy? For the moment, perhaps. But this scenario for 2050 has been drawn from the projections of A[US]'s leading researchers, many now written into Government policy. This week a national summit of political, industry and community leaders, chaired by [the acting P]M... met in the Victorian city of Mildura to save the quality of the nation's soil and water. Along the endless banks of the Murray River, the heart of a system that nurtures most of eastern A[US], communities are being asked, in effect, to reduce their standards of living by pumping water back into a dying artery. The suburbs of Melbourne and Sydney will soon face similar decisions. Authorities are considering plans to increase the cost of water – with permanent summer hikes – to write water-saving systems and appliances into building codes, and to introduce national efficiency standards for everything from shower heads to dishwashers. Last week their message could not be ignored. Driven by searing northerly winds, a wall of red dust reaching 400km from Mt Isa in Queensland down through N[SW] to southern Victoria, billowed across A[US]'s largest cities and towns, cloaking homes, cars and businesses in a film of ochre and turning backyard swimming pools into mudholes. This was prime agricultural land blowing in the wind. At least 7 million tonnes of irreplaceable topsoil was whipped out to sea: some of it, similar dust storms have previously shown, will cross the Tasman and tinge the snow of the Southern Alps. The immediate cost will be enormous. After a smaller storm blanketed Melbourne two decades ago, blowing 2 million tonnes of farmland into the Southern Ocean, the federal science agency CSIRO estimated the cost of replacing lost nutrients at A\$4 million... The long-term cost to productivity is infinitely higher. Twenty years ago Queensland scientists calculated that if nothing changed, the soil of the state's grainbelt had a lifespan of 100 years: 60 of those years had already passed. Environmental audits since then have shown that soil erosion is as severe as ever... Time is running out for a dying continent. A[US] is only starting to come to terms with the reality that it is the driest inhabited continent on the planet – one third is arid, another third semi-arid – and has fewer rivers and less run-off than any other continent except Antarctica. Its soils are among the world's most deficient in nutrients, with less than 10[%] of its mass wrapped in land capable of sustaining intensive agriculture or dense vegetation. The enormous groundwater reserve of the Great Artesian Basin, which extends beneath one-quarter of the continent, is being drained much faster than it can replenish. State and federal government, while rapidly facing the inevitability of action, continue to wrangle over questions of jurisdiction and cost. "The national ability to manage the environment is continually hamstrung by structural problems between different areas of government," the federal Government's state of the environment report says. Environmental demands are gaining priority, but economics are still frequently more important to policymakers. Land clearing continues at an alarming rate: 687,000ha of native bushland vanishes every year, more than Mexico and rapidly gaining on Brazil, Indonesia, Zambia and Sudan, the world's worst land clearers. Cities, especially Sydney, Melbourne and the Brisbane-Gold Coast-Sunshine Coast triangle – devour land and resources at a frightening pace. The consequences are tragically clear... Water, wind, land clearing and agriculture are... casting A[US]'s future to the wind, burying roads, rail lines, and fences, and choking its

waterways. Every year, between 2 and 20 tonnes of soil are stripped from every hectare of farmland on the continent – and with every resulting fall in productivity, the pressure on the remaining soil increases. A[US], finally, is starting to tackle its mountain of environmental problems... It will be a long process, says... the A[US]n Conservation Foundation, but at last the first step has been taken. For a continent in peril, there is no other option... The nation's biggest cities have become virtual islands in which water is the single most valuable commodity and where declining national wealth is further distancing the handful of rich from the increasing mass of poor. The gracious metropolis of Adelaide is gasping, its water undrinkable for most of the year.

...[‘Quite simply there’s nothing better than water for your body.’ ‘Water – which accounts for 65% of an adult’s weight – is the only natural beverage, and only our species can claim to appease thirst with any other liquid.’ *This week’s question: Why is carbonated water more thirst-quenching than ordinary tap water? Answer: Reaching for that ice-cold refreshing can of soda on a sweltering hot day – as everyone seems to do on the TV ads – is more of a fraud than thirst quenching... The fizziness... does little to actually meet your thirst needs... Not only are... soda[s]... high in sugar, they can leave the stomach feeling bloated and unreceptive to further drinking – remember we all need at least eight glasses of water a day to be healthy.*

...*Researcher pours cold water on fad* The only benefit from drinking eight full glasses of water a day may come from running to the bathroom... Newspaper articles, health and beauty magazines all advise drinking at least eight full glasses of water a day for optimal health. But... 10 months of research found no scientific evidence to back up this advice, which has helped create a huge demand for bottled water... The Food and Nutrition Board of the National Research Council has recommended drinking about one millilitre of water for each calorie of food eaten. This adds up to 2 litres, on an average 2000-calorie diet. But the council also noted that much of this is already contained in food. “I did 43 years of research on the osmoregulatory system. That system is so precise and so fast that I find it impossible to believe that evolution left us with a chronic water deficit.”... said[the person who headed the research at]... Dartmouth Medical School in New Hampshire... If a person gets low on fluid, the body compensates by bringing fluid back out of the kidneys and by slowing the loss of water through the skin... Thirst kicks in long before dehydration starts. [The head] and colleagues became concerned after seeing dozens of... articles urging people to sip water all day... [The head] hopes people will be relieved of the guilt of not getting enough water, and of the expense of buying bottled water... Overdosing on water can lead to confusion and even death.

...The health fad for drinking filtered and bottled water is raising... concerns that a generation of young people are doing serious damage to their teeth. Leading dentists fear that an increasing number of children and teenagers are inadvertently cutting fluoride from their diet by replacing tap water with bottled and filtered varieties. There is also concern that constant sipping of sports drinks is causing an “acid attack” on... teeth... Research shows an approximate 20[%] increase in the worldwide consumption of bottled water, with sales reaching more than \$4 billion a year in the U[S]. Bottled water contains a maximum of just 0.1 part of fluoride per million, compared to N[Z] tap water, which is usually about 0.7 per million.

...Dentists... say anecdotal evidence suggests a big rise in children with significant tooth decay, who come from homes where water filters are used... But Just Water, a company that supplies 25,000 water coolers and filters to businesses and schools, says the dentists’ comments on fluoride removal are misleading... “Filters remove chlorine, taste and any impurities from the water, but not fluoride.” It was wrong to put filtered water in the same category as bottled, which often had fluoride removed... Distillers, which purified water by steaming it, also extracted everything, including fluoride... Pure Water N[Z]’s managing director... said there was no conclusive proof that fluoride protected teeth against cavities... [By the way, a]nts, crickets and scorpions, baked, coated in chocolate and promoted as a high-protein snack, are proving popular among peckish Londoners... “They are very... low in fat,” says... [the person] who... has sold 5000 chocolate-coated bugs... for about £3 [each] at upmarket London stores... [The entrepreneur] trained as a chef in Louisiana and acquired a taste for cooked insects while travelling in Asia and Central America...

If you’re hungry enough you’ll eat anything, and even the barest cell can be a larder for the starving con... Last year, two Russian prisoners in Siberia cooked and ate a fellow con. The pair strangled the 23-year-old and kebaped body parts over a fire made from an old blanket[‘cannibalism isn’t illegal in Germany, where a citizen used the Internet to find someone to eat’]... In many cultures, insects are delicacies and form an important part of the diet. They apparently taste similar to seafood or nuts. Grasshoppers, ants, termites, beetles and stingless bees are all fine sources of natural sugars; while grubs, worms and moths are rich in protein. In a stroke of pure desperate genius during [WW2], Allied prisoners of the Japanese buried dead cockroaches, left them for a month then dug them up and used the decomposed, salty paste to season bland bowls of rice...

Rice is nice. And a Mt Albert scientist believes the dietary staple could be a money-spinner for [NZ producers. The guy who] worked as a rice scientist in Bangladesh for... 20 years, before emigrating to N[Z] in 1995... says the popular dinner dish has been over-looked by [local food] scientists, who say the grain doesn’t grow well in N[Z] terrain. But... there are... 80,000 varieties of rice, some of which suit [NZ conditions. The guy] is experimenting with a long grain rice called IR50. Results from early experiments show good growth, but when [it] discussed his project with Auckland University they were not interested... “N[Z] imports its rice from A[US] and Thailand. Our researchers and growers are missing out on a great opportunity.” However, the unemployed [rice scientist] is not giving up and wants to approach Hortresearch in Mt Albert with his theory.

...The battle over who controls the world’s food supplies has escalated dramatically, with the Indian Government launching a legal challenge in the U[S] against a... company... granted a patent on the world-renowned basmati rice. It is thought to be the first time a... developing country has challenged an attempt by a US company to patent and thus control the production of staple food and crops in what campaigners dub the rush for green gold. Basmati rice, sought-after for its fragrant taste, was developed by Indian farmers over hundreds of years, but the Texan company RiceTec obtained a patent for a cross-breed with American long-grain rice. RiceTec was granted the patent on the basis of aroma, elongation of the grain on cooking and chalkiness. However, the Indian Government has filed 50,000 pages of scientific evidence to the US Patents and Trademarks Office, insisting that most high-quality basmati varieties already possess these characteristics. The office accepted the petition and will re-examine its legitimacy. The patent, granted only in the US, gives RiceTec control over basmati rice production in North America. Farmers have to pay a fee to grow the rice and are not allowed to plant the seeds to grow the following year’s crops. India fears the patent will severely damage exports from its own farmers to the US. In 1998, they exported almost 600,000 tonnes of basmati rice. India has also objected to RiceTec calling the rice basmati, insisting the name should be used only for rice grown in the Basmati region of India. [● ‘Originating in India and China, rice was introduced first of all into Egypt, then Greece, where it was already highly prized at the time of Theophrastus. Its popularity spread to Portugal, then Italy and America. In France Cardinal Fleury’s first attempts to grow it in Auvergne were not a success. Today French rice is of good quality, though there isn’t enough of it to satisfy the demands of the home market. Rice requires a great deal of heat and humidity to grow well.’ Rice is ‘a kind of grass (*Oryza sativa*) grown in marshes’]...

Growing plants without soil When I was a child I visited a horticulturally inclined cousin and was given a guided tour of his extensive glass houses... In the early 70s, [my cuz] was a horticulturalist pioneer, and had what I believe was one of the first commercial operations in N[Z] to experiment with growing crops hydroponically. At the time of my visit [my cuz] was full of enthusiasm for his new venture, and we were all rather blown away by the automated systems for circulating the nutrients to the crops and testing and replenishing the nutrient solution. I remember being amazed at the fact that tomatoes could grow in what appeared to be water with no soil and still produce crops that were prolific... This new technology has continued to fascinate me and I was intrigued to visit an uncle last summer and see that [it] had a very successful hydroponic unit installed in a small glass house in his backyard. With a simple mostly homemade system [uncle] was producing all the tomatoes that his family

could eat and... made it all seem very simple. Hydroponics is not a new system and in fact the principle of growing plants without soil goes back to the Hanging Gardens of Babylon. The Aztec Indians also produced crops in floating gardens or rafts moored in shallow lakes. The western world... didn't start to experiment with the concept until 1699 when a scientist named Woodward... gr[e]w plants in a solution of water with a small amount of soil added. The research was developed no further until the 19th century when several scientists began to study plant nutrients and growing plants in nutrient solutions without using soil. Research continued into the 20th century and by 1925 horticulturalists were beginning to apply the research to glasshouse crops. In 1930 the first commercial unit was established and from there on the industry has never looked back. American troops even used hydroponics to grow vegetable crops in the Pacific during W[2]. In the 1970's a new break-through called NFT... resulted in hydroponics becoming a viable way to grow a wide range of crops commercially... This system uses a covered light-proof channel with the plants growing through holes in the cover into a shallow nutrient solution... circulated over the roots of the plant by a pump that pumps the solution from a central holding tank via a system of pipes and channels... Air must also be bubbled into the water in one of a variety of ways or the plants will not remain healthy. Because the correct nutrients are always available to the plant it does not need to put a lot of energy into growing an extensive root system and can devote more energy to producing fruit or leaves. Growing plants using a hydroponic system has many advantages over growing plants in soil. Plants usually grow faster, crop earlier, and need no weeding and feeding, cultivating or watering. Plants can also be grown successfully even when you have terrible soil or live in an apartment with no access to soil at all. In fact using artificial lights you can produce your own vegetables totally indoors... There are many commercial hydroponic units in N[Z] producing everything from tomatoes to strawberries.

...Many rural blocks cut up for horticulture failed but... times are changing... Telegraph cucumber is the star performer of the... glasshouse at Dairy Flat but in a hundred other factory plant-growing operations in Rodney and Franklin districts it could be tomatoes, beans or flowers. [The Dairy Flat farmers] bought 2ha in the Rodney greenbelt 20 minutes from downtown Auckland. They planted an ornamental garden for 1ha around their new home and on the rest set up a sparkling 2800 sq m glasshouse and a water supply pond. They believed they could make a living from that area, although people with 10 times as much grass would find it a struggle. "We wanted something large enough to be a business but small enough not to need staff," says... [the] former manager of research and development for Turners and Growers. The modern, European-designed glasshouse keeps their dream alive. Similar modern glasshouses... are sprouting all over the greenbelt surrounding Auckland. The highly intensive farming shows that a buck can still be made on rural land near the city – providing you have the upfront capital to invest. The [Dairy Flat farmers] harvest 11 months a year for a steady Auckland market. Cucumbers grow hydroponically... in radiata sawdust, which receives plant food and moisture controlled by a computer programme. The glasshouse ventilation and heating systems are also automatically controlled. Like others, their glasshouse is ranked squeaky clean for environmental friendliness by Greenpeace and the Rodney District Council. Rainwater... collected from the glasshouse's ample roof... is... stored in the dam... The glasshouse does not discharge wastewater into streams because water is filtered and reused. Sawdust is changed between plantings and used as a mulch on the shrubbery. Plant pests are controlled by predators instead of nasty chemical sprays. C[O₂] gas is recirculated in the glasshouse for the plants to use. Rodney's deputy mayor... says the council is excited about the boost that glasshouses, with their year-round jobs, are bringing to areas starved of industry. A 9ha glasshouse has been built near Helensville for NZ Gourmet Ltd – an export capsicum joint venture with a Dutch company. Such developments are heartening... after the disappointment when scores of horticulture blocks created 10 to 12 years ago never came to anything. Warkworth also has a Dutch joint venture growing capsicums in a new 2.5ha glasshouse. The operation is run by... [a company that] also has a 1ha glasshouse at Pt Wells. Both sites will employ 22 people year round. Glasshouses were not unanimously welcomed by lifestyle residents during discussions on what was fit for the "countryside living" zone of the proposed Rodney District Plan. [The p]lanning policy manager... says there were concerns that a neighbouring glasshouse would produce noise from automatic vents and fans, reflect sunlight and look like acres of factories. But the council decided to allow glasshouses as part of rural production in the lifestyle block area where sites can be smaller than 2ha, but only on condition they covered less than 10[%] of the section.

It is common for science-fiction cities to be completely enclosed by glass domes (or other forms of glass structure). Although these structures are useful for protecting a city from rain, snow and wind, the occasional benefits hardly seem to justify the effort (i.e., use of labour and material resources) that would be required to construct them – and will they withstand violent storms? However, although 'vegetables or fruits cultivated under glass have less flavour than plants grown in the open air', the benefits gained by constructing glasshouses to produce food justifies the effort of doing so.

The most obvious benefits are that crops grown in glasshouses don't suffer damage caused by pests, snow (assuming that glasshouse roofs are capable of eliminating snow – e.g., by heat – before it gets too heavy), frost, winds, hail or heavy rain (if well-designed, it should even be possible to protect crops from floodwaters in the middle of a floodplain); and – by using artificial sunlight – crops can be grown out of season (the energy expended generating artificial sunlight is offset by saving energy on refrigerating out-of-season crops or transporting them half-way round the world). A less obvious benefit is that top-soil won't blow or wash away. Glasshouses also enable GE crops to be grown safely (i.e., without threatening other crops or wild plant and animal species growing outside a glasshouse) – assuming all necessary precautions are applied thoroughly. However, if animal pests can be controlled via a closed environment (or semi-closed – i.e., if the glasshouse has windows or vents, because 'ventilation is an important factor', although fans and pumps can be used to aid air ventilation – in which case netting can be utilised to prevent birds and unwanted insects from gaining access to the crops; glasshouses might enable much of Africa's 10 million hectares of unusable fertile land – r:p2035, ln26 – to become usable), and specialised technology or increased labour utilised to control unwanted plants, the justification for using GE crops would be severely diminished if not completely removed (at least there ought to be no excuse for mixing the genes of animals and plants, but plant genes could continue to be mixed if doing so can improve the nutritional content of a crop or remove unwanted items such as pips – especially if used in conjunction with cloning [by the way, America's 'FDA has tentatively concluded that milk and meat from cloned animals are safe to consume'], which has the added advantage of eliminating the need to set aside land for seed production; increase the yield; decrease the harvest cycle or amount of physical attention, fertilising or watering that a crop needs; make a crop more suitable to being grown inside a glasshouse – r:p2055, ln2 + ln42 above). Other advantages of glasshouses are that any sprays used will remain contained within their walls (i.e., no spray-drift), and it is easier to manage the amount of water crops receive (plus the times when they receive water) – as well as carbon dioxide levels.

Specialised technology or increased labour should mean that organic farming practices can be applied universally (in addition, knowledge of which crops – or which strains of a particular crop – best suit particular soil types ought to be utilised; where soil is unsuitable to grow any crops, or unavailable, methods such as hydroponics could be adopted – perhaps utilising each floor of a multi-storey building; where water is scarce or unavailable, 'dry farming' – the cultivation of arid or semi-arid land without help of irrigation – could be utilised), and might also render insect pollinators obsolete (it may eventually be possible to perfectly replicate the action of insect pollinators mechanically – be it with 'hormone sprays and hand-held mechanical vibrators', music or robotics – or simply by using many hands; such methods of pollination could mean that, for example, all of a tree's fruit are able to be harvested on the same day – or, if pollination is staggered, a percentage of its fruit will be ready for harvesting one day, some more a week later than again the following week, and so on, thereby eliminating the need to check each tree every day for fruit that is ready to be picked). Obviously, crops grown inside glasshouses can still be pollinated naturally – and if natural pollinators are released inside a glasshouse, not only are they protected from predators, but the crops and by-products are protected from contamination by unwanted pollen – i.e., pollen from plants other than the designated crop).

As much as possible of a district's food ought to be grown inside glasshouses (the larger the better – although certain crops may suit smaller units) in order to maximise the district's year-round self-sufficiency in food production (i.e., eventually, most of the arable land surrounding each city should be

enclosed in glass – or a plastic substitute; if each district is able to construct a few suitably sized and equipped glasshouses per year, most of the arable land could be covered within a century – and if the materials they are built out of are designed to last a long time, the requirement to replace them will be decreased). Obviously, some land can be unsuitable for glasshouses – ‘about two-thirds of NZ’s 21.2 million ha of farmland is too undulating or hilly’ (although different designs – e.g., ‘tunnel houses’, the long, thin glasshouses currently used for crops such as herbs; or netting – might partly or completely solve that problem), and there is no need to cover grassland used to produce meat and other animal-based food products (it is estimated that ‘53% of NZ’s total land area is used for pasture and only 2% for crops’; of the ‘342,416 hectares contained within the Auckland Regional Council’s jurisdiction – divided among 7,351 farms as at June 30, 1993 – 9,109 were used for horticulture, 34,251 for plantations of exotic timber and 252,116 for grazing; the corresponding figures for the 2,018,502 and 981,128 hectares contained within the neighbouring regions of Waikato and Northland were 8,686, 412,341, 1,322,289, and 5,501, 131,613, 679,962’ respectively; note that although it is preferable for districts to be self-sufficient, there may be instances where it makes sense to continue trading certain food products – e.g., using Canterbury’s plains to produce cereal crops for neighbouring districts, which would supply Christchurch with a different food product, or non-food product, in return). However, the requirement for *meat and other animal-based food products* is likely to decrease in future as more people learn that such production is wasteful, unnecessary and even unhealthy. Indeed, although humans are defined as being OMNIVORES, only HBs consume animal products or exploit animals in other ways as a matter of choice (a human only consumes animal products if it is threatened with starvation and nothing else is available, or if it has allergies – or unusual genetic attributes – that prevent it from adopting a vegan diet even when bolstered with supplementary pills)!

The word ‘vegan’ was coined in 1945 by the newly formed Vegan Society to describe those who avoid animal products for food, clothing and other consumer goods... Vegans do not imagine that their food bypasses every possibility of death and suffering for the animal kingdom. The grain fields needed for the bread we eat rob many animals of their natural habitats and mean that many more are killed as pests. It is not necessarily compassion for animals alone which leads people to veganism. But veganism is about having a consistent approach to human... and animal rights, ecology and world food problems... Veganism is not about cats’ homes and being kind to furry animals, about living in cloud cuckoo-land... It is a very important subject indeed, since each of us is responsible through what we consume for the management of the Earth’s resources, and ultimately for peaceful coexistence with others on the planet... The threat of destruction of the world through atomic fission hovers over us and we fear for our children’s future, yet millions are already watching their children starve to death in conditions similar to a post-holocaust famine. Despite the fact that the world production of wheat alone is 1 kg. per day per person alive (according to a recent Oxfam hand-out), twelve to 13 million children die each year through malnutrition; that is the equivalent of a Hiroshima every three days... It is the over-consumption of meat, eggs and dairy products in the West that underlies the inequitable distribution of the world’s food resources... But colossal vested interests on the one hand, and blinkered table habits on the other, encourages us to continue in ignorance of the fact... that... [animal] products are not even necessary in any proportion in our diet... At the moment, the economics of our country is geared to meat production whether we like it or not, and we are all paying for it through taxation... That meat is a wasteful way of producing food protein is beyond doubt. Weight for weight, there is only about a 10[%] conversion rate from plant to animal protein (less if you count how much of the product is unusable or wasted) which means that it takes an awful lot of plant material to produce a certain amount of steak, eggs or milk... For instance, using body weight as a measure, one study has shown that it would take ten kilos of fish to make a person gain one kilo in weight. The fish would have consumed 100 kilos of shrimp and worms, and the shrimp and worms 1,000 kilos of plankton. So one kilo of the person’s body weight represents one tonne of matter two steps further down the food chain! ...using land as a measure of efficiency, cereals produce five times as much protein as meat, peas and beans ten times more and spinach twenty-six times more... Another estimate has shown that soya beans can produce 260 kg. of protein per acre, lucerne 675 kg. per acre and prime grade beef only 49 kg. per acre... So it takes approximately five times as much land to feed a meat-eater as it does a vegetarian. Now, if you have a limited amount of land, and a growing number of people, you would naturally use that land in the most efficient way in order to feed the people – unless you deliberately intended some of them to starve. In terms of our farming industry’s efficiency, there is also to be considered the cost in energy of shipping animal feed halfway around the world and of running the intensive units which comprise the majority of modern-day farms... In 1983 the EEC imported 14 million tonnes of grain just to feed animals. Britain alone imports 4 million of the 14 million tonnes... Yet 92[%] of farmland in the UK is already devoted to feeding livestock... [The] *British Medical Journal*, July 1977... [stated that:] ‘Food imports are, in fact, unnecessary. Our farm land is productive enough to support 250 million people on a vegetarian diet.’ ...Despite the absurdities of Western food production, there are still many who think that modern developments are our main hope for feeding our huge populations. Factory farming, for instance, was hailed as a necessary evil which was to alleviate food shortages by confining farming operations into a smaller space. But confined animals take an even higher proportion of their food from good arable land than do animals which roam in the fields... But surely, you may say, we can still have milk and other dairy produce, since cows produce it so abundantly it must make good sense for us to drink it. Unfortunately... a... cow gives as milk only about one-tenth of the protein [it] eats, and the modern dairy industry involves an extremely artificial and intensive use of resources. Partly by genetic manipulation, and partly by feeding hormone stimulants and food concentrates, the annual production of a typical cow has been increased from 1,500 litres of milk in 1950 to over 5,000 litres in 1983... The methods of modern dairy farming are a very expensive way of producing a European surplus of one million tonnes of skimmed milk and a butter mountain which costs us £500,000 per day to store... In any case, the dairy industry is really part and parcel of the beef industry, with 80[%] of beef now sold being a by-product of dairy farms. The calf which each cow has to produce each year to maintain her milk supply will either be slaughtered very early for veal, or go to a veal unit or a beef herd; a minority of [young cows] will become part of another dairy herd. The fuss that the farmers made when the milk ‘quotas’ were imposed in 1984 played heavily on the public ignorance of these facts; the farmers wept crocodile tears at having to send cows to slaughter to cut their losses – as if the cows were not going to die anyway... and as if milk production itself did not rely on the mass slaughter of calves. The myth is so strong that the public continues to be conned by the crocodile tears; in Cornwall, where I live, there are car stickers to be seen with the message ‘Save Cows – Drink Milk’! Incidentally, there are more bizarre ways to off-load surpluses in the dairy industry than the flavoured drinks now being produced. Currently in Devon, as a local paper reports, waste whey from cheese-making is simply dumped over the fields... In recent years, whey has popped up in various surprising places in foods which are not normally associated with milk, as habitual readers of food labels will realise. In terms of the Earth’s resources, the dairy industry is responsible for a colossal amount of wastage... Advocates of animal farming would say that animal rearing is necessary so that the animals’ dung can keep the soil in good heart. Indeed, in the natural course of events both animal and human waste would be returned as nutrients to the soil by the process of decay. But so much animal waste is produced by intensive farming that it is impossible to return it to the land locally and it is either transported elsewhere, dumped in waterways or simply burned so that it is totally wasted. Far from being good for the land, modern husbandry is a major pollutant of the country’s water systems. In 1982, 2,523 cases of pollution from farms were reported to water authorities in this country, and many more no doubt went unreported. This is in addition to the chemical spin-off from farms, which is responsible for the alarming amounts of nitrates in our drinking water... All our energy needs as well as food needs could be met, even with our relatively high population, if animal farming could be brought to an end... The vegan landscape would include many trees as a prime renewable source of food as well as fuel... In fact, a far larger amount of food per acre can be produced by tree-growing than by any other means. Walnuts, for instance, have an astonishingly high food value... supplying many essential nutrients. ‘An acre of walnuts will supply more than 1,000 lbs of shelled meats with a food value of 3,000,000 calories. This is 20 times the amount that the same acre would yield in beef. The protein quality

of the nuts would be as great as in beef and of superior quality.' ['Two brazil nuts provide the same amount of protein as one egg'. Chestnuts – which 'are technically a nut but contain no oil and are low in fats and sodium' – also 'have considerable food value. 1 1/2 kg supply sufficient calories to satisfy the needs of an average person (although they contain a high percentage of starch, which is difficult to assimilate and makes them indigestible for many people); moreover, their richness in mineral salts (particularly calcium and potassium) makes them an excellent food for growing children.'] ...The fact is that our bodies seem to be 'designed' to be vegetarian, or, more accurately, like the great apes, to absorb a diet of fruit, nuts and shoots... From teeth, jaws, and saliva right through the alimentary canal, our bodies are enormously different from those of the carnivores. We loosely call ourselves 'omnivorous', but that is through our own choice, not 'design'. Meat-eating nations have enormous health problems, with the so-called 'degenerative diseases', those caused by accumulations of wastes our bodies can't deal with, reaching epidemic proportions[('as early as 1961, the *Journal of the American Medical Association* stated that 90 to 97% of heart disease, the cause of more than half of the deaths in the US, could be prevented by a vegetarian diet')]. After digestion in the intestines, meat becomes infested with putrefactive bacteria; carnivores have a short and smooth bowel for quick release of toxic wastes, unlike our own longer bowel... and [carnivores also have] ten times greater internal secretions of hydrochloric acid... As soon as an animal's death occurs, putrefaction begins... Only careful cooking and preserving can cheat the bacteria from entering our systems live... A substance which can so quickly become actually harmful to us, and which needs such careful treatment, can hardly be considered our 'natural' food. The last remnants of the disease-ridden Eskimo culture, with their high meat intake, are a very poor advertisement indeed for the diet... After infancy, the enzymes necessary to digest milk disappear from our bodies... Far from being a 'natural' food, [cows'] milk has been consumed by humans only in comparatively recent times (6,000 to 8,000 years) and purely dairy herds were not developed in this country until the late 19th century... Though modern-day researchers cannot be sure of human origins, it does seem likely that the traditional view of early [humanity] as a violent hunter has got it very wrong. The picture which has filled the early pages of many a school history book, of a club-bearing brute about to batter to death his next meal, is quite incorrect, though it might serve as a fitting model for the origins of a culture which has developed through belligerent self-interest. This is perfectly in line with the old school of history which has battles as its main landmarks, offering to young people stories of extreme brutality and selfishness (like the War of the Roses) as our 'heritage', rather than as something of which people, particularly the landed aristocracy, should be deeply ashamed. As regards the origins of humankind, it is much more likely that we began as frugivorous creatures and took to flesh-eating only as a result of a migration to inhospitable regions, or a catastrophe like a drought or an ice age. In any event – and for whatever reason... – ...early humans 'broke the ancient primate habit of vegetarianism'... There are many... ways of getting the nutrients that we need... and a varied vegan diet can provide them adequately. After a period of veganism, one does not worry whether one is getting adequate amounts of this or that nutrient, and I have found that, given freshness and variety, a non-animal diet is automatically fulfilling, even and especially during its severest test, pregnancy and lactation... The thing about vegan infant feeding is not that it is specialist or difficult in any way, but only that it differs from the norm, at present, in our society. The difficulty lies not with the vegan diet but outside it, when most books on babies, and infant foods available, assume an omnivorous diet... Fresh, whole, organically grown foods are obviously preferable to denatured foods from factories, but aside from these considerations, new vegans, victims of a lifetime's habit of thinking of animal foods as our 'protein', may first of all panic that a vegan diet will not provide enough protein... And people subscribe to the popular myth, perhaps, without even knowing what this magical substance is. In fact protein seems to consist of amino acids, that is, compounds of nitrogen and other elements, essential to all plants and animals... There are 20 or so amino acids all together, 12 of which are made in our bodies and 8 of which must be taken as food in order to sustain tissue building and repair.['Your body cannot make protein tissues (such as muscle, skin, hair, lungs, heart, brain, enzymes, hormones, digestive fluids, etc.) out of your food, unless all 8 essential amino acids are present, *at the same time, in the same meal*. Some foods have all the essential amino acids and are technically, "complete" proteins, but are *low* in one or more of them. The body, then has only limited use of the other amino acids.'] Grains and seeds are good sources of protein but have low proportions of two of the essential amino acids; legumes... have a high percentage of these two, whilst being low in two others. Therefore, eating foods from both groups at one time provides complete protein requirements from non-animal sources... Another over-played worry about the vegan diet is the question of vitamin B12. Years ago, someone whom I respected told me that this was 'the animal vitamin', and without it we would die... Commercially, it is produced by bacteria growing on vegetable matter. It is possible that humans have the ability to synthesise the vitamin in our own intestines and that this ability has been diminished by our turning to an omnivorous diet and thereby changing the bacterial content of our gut. Certainly, the constant dosing of ourselves with chlorine through our drinking water will not help the functioning of the micro-organisms which inhabit our intestines, and civilised 'hygiene' prevents the accidental intake of some bacteria from the environment... Before 1912, nothing definite was known about vitamins at all and in our own times the research is still going on... With so many variables and unknown factors, individuals vary greatly in their need to have a dietary source[of B12], so an intake of about 3 micrograms daily is a good insurance policy. This can be got from various yeast extracts... or in tablet form... Most vegans are healthy people who have taken the trouble to educate themselves about nutrition... Vegans are still pioneers in the sense that we have to show everyone else that our common sense viewpoint and diet also foster happiness... [S]peaking personally, once I had made the decision to do without animal food I felt a sense of exhilaration and release from a cycle of exploitation. It was a very life-enhancing decision, and looking back now it seems that it was more like a liberation than an act of self-discipline. The reason why vegans are careful where possible to see that they never take animal products is not a sanctimonious attitude of wishing to keep their moral integrity untainted (...[although we] should never forget that daily mass slaughter... – ...a thousand million animals are slaughtered each year in Britain[–] ...is the basis of any diet that is not vegan...), but it is usually because we think it important to illustrate to others that good health can be maintained entirely without animal products... It seems obvious that all living creatures are 'designed' for certain lifestyles (only the lifestyle most suited to humankind is most variable and in question). That humans' extreme possessiveness over material things has spilled over into the weaker species, so that they can actually have the arrogance to say that an animal 'belongs' to them, seems to me a distortion of the natural order... Perhaps one day we will reject the notion of 'owning' animals, just as we have now rejected the practice of owning humans, i.e. slavery. Meanwhile, the keeping of 'pets' is part of our culture, though to me it is unjustifiable. There must be something wrong with us when we live in overcrowded cities and yet confine animals with us for 'companionship'. And if we are true animal lovers, we would not wish to be responsible through the food we feed to cats and dogs for maintaining the slaughterhouses, which can cut their losses by selling the least attractive meat to the pet food industry. To keep an omnivorous pet, and to feed it on the dead flesh of other equally sensitive and intelligent creatures, is surely a gross irony. I believe it is possible for some dogs to be vegan when reared on the diet from an early age[– after all, many dogs (not just sheepdogs) already eat the odd blade of grass! –] but the cat is unquestionably a true carnivore. It is a mark of our insensitivity and our double standards when the pet food industry in a nation of animal lovers actually props up the meat industry, not to mention encouraging the mass slaughter of such creatures as whales and kangaroos, which we are only just dimly aware of, as if it took place on another planet... The main obstacle to... [veganism] being widely adopted, however, is not people's illogicality but their indifference. Most people, unfortunately, seem not to be truly concerned about any tragedy which takes place outside their own home or workplace (nor even about the possibility of a nuclear holocaust). The millions who starve in silence and the dumb victims of animal farming are not particularly high in their consciousness. But I think that the change is at least possible. After all, every reform in our society from the abolition of serfdom and slavery to the opening of public libraries and contraceptive services has had to overcome the fierce resistance of the powerful and the broad indifference of the majority. Our next reform must strike at the roots of cruelty, violence and exploitation. A move towards proper vegetarianism is the next step for us to take. - Why Vegan

While it may have been hard for humans to exist on a vegan diet prior to the 20th century, and still is in some parts of the world, First World countries are able to continuously supply a wide enough range of fresh and dried non-animal food products to make being a vegan relatively easy for anyone who isn't allergic to every non-meat-product! Supermarkets sell a range of soy milk products – which, partly through lack of demand, currently are more expensive than cows' milk (fresh soy milk is slightly more expensive, but highly-processed products such as *Vitasoy* – the brand which 'has been providing families with delicious, nutritious soymilk for over 60 years' – are roughly twice as expensive) – that can be used for drinking or when cooking. Alternatives include rice milk and coconut milk. Most breads in NZ are now made without adding cows' milk powder, margarine can be substituted for butter (though some margarines include cows' milk powder), 'plant-based yoghurts are available', there are plant-based products that can be substituted for eggs in some recipes (e.g., 'No Egg' – excellent for baking, fillings, batter & custard'), cornflower can be used instead of eggs as a thickener, gelatin can be replaced by arrowroot, pectin, salep or agar-agar, to name a few, and there are also a range of processed foods (e.g., *Vege Hot Dogs*), not to mention all of the supplements available for people who are diagnosed as lacking particular nutrients. Although a type of cheese can be made from soya beans ('juices' – extracted by passing soya beans, softened and swollen by soaking, through a press – are fermented, then the liquid is mixed with a little sulphate of lime or magnesium, coagulating it into a grey mass which is left to ferment like curds'), 'substances contained in certain plants (thistle, yellow bedstraw, common fig, etc.) have the property of coagulating milk', so it should be possible to produce a vegan-cheese – if it isn't already possible (vegetable-rennet cheeses available in NZ supermarkets still contain animal products such as casein – although *legumin*, a 'proteid substance found in pulses that resembles casein,' might work as a substitute for the milk protein) – but cheese isn't an essential food product ('if you get migraines, don't eat cheese'), and people who have freezers can make a savoury white sauce, freeze it, then grate it over pizzas, etc., in place of cheese. People with freezers can also store vegan ice cream.

Flavoured ices have been made since the very earliest times, and it is generally recognised that the Arabs and the Chinese knew the art of making iced sweets, especially water ices (sherbets). The Chinese, it is said, taught the art of ice cream making to the Indians, the Persians and the Arabs... Although the Romans used to cool drinks with ice or snow, this practice was not introduced into France until the seventeenth century, and even then it was only adopted by persons of great refinement. In the *Dictionnaire de Monnet*, 1636, the word *glaciere* (ice chest) does not even appear. Yet some forty years later the custom of drinking iced wines was so general in France that any departure from it was much frowned upon... Ice creams and water ices were introduced into France about the year 1600 by a Sicilian, Francisco Procopio. Some ten years later [Procopio] opened a cafe in Paris... It was here that Procopio (who had changed his name to the more Gallic-sounding Procopé) sold variously flavoured ice creams and water ices to the Parisians, who acquired a taste for these sweets... Other Parisian *limonadiers* quickly followed Procopé's example, and soon there were so many of them [– 250 –] that, in 1676, it was necessary to give statutory recognition to their corporation and to authorise its members officially to sell ice creams and water ices... Until about the middle of the eighteenth century, ices were only sold in Paris in the summer. In 1750, Procopé's successor, Buisson, started making ices all the year round. His competitors at once followed suit. But the ices were of poor quality. It was not until 1776 that ices more delicate in flavour began to be made. These had more body to those of earlier times and could be moulded into different shapes. It was around this time that *fromages*, as well as a number of frozen desserts, were invented... At the end of the eighteenth century, the manufacture of ices developed considerably, especially in Paris. This was the age which saw the invention of the ice bombe. It was soon the custom to serve a *bombe glacée* at the end of any formal meal, and the savouring of ices at the cafes of the Palais-Royal had by this time become fashionable. During the period of the First Empire, thanks to the Italian ice cream manufacturers, of whom there were many in Paris, ice cream and water ices of various kinds improved still further in quality. Ices began to be made from a basic mixture of egg yolks and syrup, which led to the creation of more elaborate sweets. These took the place of cylindrical ice cream blocks at formal dinners. Under the Second Empire the 'surprise omelette'... was invented. This remarkable sweet, with a centre of cold fruit and ice cream and a hot crust of meringue browned in the oven, was cleverly devised to produce a gastronomic paradox, a ball of ice in piping hot casing... Under the Second Empire, too, *coupes*, mousses, and *parfaits* were first made. The manufacture of ices, sherbets and ice creams has developed into an industry of some magnitude being, as it is, an important outlet for agricultural dairy produce, eggs and fruit.

If dairy produce and eggs are to be eliminated from the agricultural landscape, it won't be considered important to have industries that use them – and, although ice creams, etc., can be made without using animal-products, there will be no justification for producing such non-essential food products in a non-economic climate. But, while the ice cream-making and related industries ought to be shut down immediately, the process of eliminating animal-based foods from our society may have to be gradual (i.e., demand for animal-based products is unlikely to end overnight, and might not end completely until the last HB has become extinct; in addition, people should ease themselves into a vegan diet by, for example, adopting substitutes for red meats first, then – when they are familiar with that diet – adopting substitutes for white meats before, finally, repeating the process with dairy products and eggs). When society has ceased to produce animal-based foods for the consumption of its members, people who wish to continue eating them (or have a genetic quirk that means they have no other option but to continue eating them) could still do so – as long as they are prepared to go out hunting, fishing or shellfish gathering (obviously, it would be difficult for society to prevent citizens from doing these things – and obtaining such food for free – while society is still supplying them at a cost!). However, if it remains necessary to continue using bees (or other suitable pollinators) – r:p2084, ln63 – excess by-products of natural pollination (e.g., honey) could continue being collected for nutritional or medical use.

Changing to a vegan diet will help future societies to make better use of land while minimising the amount of land used (which ought to be an aim). This process can be accelerated by ceasing to produce flowers and other crops which have no value in a moneyless system or a society of humans (i.e., only HBs purchase flowers and, therefore, think that society should be responsible for growing them for non-industrial purposes – obviously, there would be justification for continuing to grow a flower species if it provides a product that is essential for some industrial purpose). It necessarily follows from this that no people will be employed as florists in a moneyless society. Amongst the other crops that there is no need for society to grow are tobacco and plants used to produce alcoholic beverages (and, hence, a moneyless society would have no tobacco and brewery industries – unless the alcohol is to be used for industrial purposes). The same logic can be applied to beverages such as tea and coffee.

Coffee, introduced to Europe by the Arabs in the sixteenth century, is the most widely drunk beverage in the world... Leading coffee-drinking countries include the U[S], West Germany, France, and Italy... ['More than 18 million 132-pound (60-kg) bags of green coffee, or over one million metric tons, were imported by the US in 1980. This was more than twice the imports of West Germany, the 2nd largest consumer.'] **Coffee plants reach maturity after four years and remain productive for about 30 years more, but there is usually a drop in quality in about the 15th year, after which the trees are usually replaced... Each tree yields an average of about 1.5 pounds (0.7kg) of green beans each year.**

Coffea arabica is a shrub with glossy, evergreen leaves. It is 4.3 to 6.1 metres high when fully grown. As a rule, coffee growers prune it to under 3.7 metres. It has white flowers that are self-pollinating... Most beans are handpicked. However, some are harvested by machines that vibrate the berries off the trees... Each berry contains two *beans*... The beans lose about a sixth of their weight during roasting... The average plant produces enough berries each year to make about 0.7 kilogram of roasted coffee... Most coffee is made in *percolators*, *filter* pots, or *vacuum* coffeemakers, which strain boiling water through the coffee. The best results are obtained by using one standard coffee measure, or two level tablespoons of

coffee, to each cup... The U[S] uses about... one-fifth of all coffee grown in the world annually... A coffee plant is usually six to eight years old before it bears a full crop. The common variety grows best at altitudes ranging from 1,100 to 2,400 metres in a tropical climate... Around 500 to 1,000 seedlings are planted per acre...

Plantations are usually established in cleared forestland. The young shrubs are planted in rows spaced so that the density varies between... 1,200 and 1,800 plants per hectare... Irrigation is required where annual rainfall is less than 40 inches... For a long time coffee was cultivated in the shade. This is still done in many areas but is losing popularity because better results can be obtained without shade or with very light shade if other practices, such as trimming, weeding, and fertilization are followed. Yields as high as 2,000 to 3,000 pounds per acre (2,300 to 3,400 kilograms per hectare) can be grown, compared to 450 to 900 pounds per acre... by traditional methods.

Consider the yield of 3,400kg/hectare. It was stated previously that *one kg of coffee makes 150 espressos*. If we assume that the average coffee-drinker has only 2 cups per day, each will annually consume 730 cups. Therefore, under the best growing conditions, each hectare of coffee trees caters for no more than 700 coffee-drinkers (less if we take into consideration the land used to grow immature coffee trees, the production of sugar, milk or other flavourings, plus the energy used to roast the beans, grind them, package and transport them, then brew them). If every citizen of a district which is populated by 1 million people was to consume 2 cups of coffee each day, the district would need to utilise a minimum of 1431 hectares (5.5sq. miles) – be it local or foreign land. That's a lot of land and energy (including labour) for a district to devote to producing a mere drink – especially one which has little nutritional value ('100g of instant powder coffee provides 424kJ of energy, 14.6g of protein, 11.0g of carbohydrate, 160mg calcium, 4.4mg iron, 0.11mg riboflavin and 25.1mg of nicotinic acid; ground coffee provides 12kJ, 0.3g, 0.4g, 3mg, 0mg, 0.2mg and 10.0mg' respectively) and dubious effects on a drinker's health! Obviously, not everyone drinks coffee – or drinks as much as 2 cups per day (the 'average coffee drinker has 6 cups per day') – but some who don't might instead drink tea (and many people drink both), which a human also considers to be a waste of land to produce (nutritionally, it only provides a little amount of 'riboflavin and nicotinic acid'). Coffee and tea are drunk in many parts of the world where it is unsafe to drink unboiled water, but supplying such places with improved technology could perform the same function – alternatively, hot drinks may be flavoured with a squeeze of fresh fruit juice; or boiled water can be chilled before consumption.

After uniting the food industry, the initial concern of the Food Ministry must be to ensure that everyone who doesn't have access to enough nutritional food gains it. Hopefully it would be possible to do this without affecting the intake of those who do have access to enough. However, if food prices in First World districts have to be increased to encourage well-fed citizens to decrease their intake of nutrients – at least until everyone is well-fed – this should be done (prices of animal-based food products could also be set at a level that encourages HBs to phase out their consumption of these items).

Where food has been scarce, it can be divided into portions dependent on family size, then be distributed to families free-of-charge. Elsewhere, the Employment Ministry would have to include an allowance for food in the money it pays to citizens. If citizens know how much that allowance is, they could budget to spend roughly that amount on food (the Employment or Food ministries should freely provide budgeting advice to those who need it, while the latter ministry ought to also provide free courses on food preparation to those who lack culinary skills – such courses might be broadcast via television). People who over-eat in the past and are unwilling to decrease their consumption in future, would have to decrease their spending on non-food products. If food scarcity is a problem, the Food Ministry ought to look at mass producing algae (e.g., spirulina) and, if necessary, insects as food sources.

WITCHETY GRUB, a name, Aboriginal in origin, used for several species of large insect larvae. They are used as bait for freshwater fishing and were relished by Aborigines as a prime article of diet, supplying the equivalent of European's butter[('6 grubs provide enough daily protein for one person')]... Among the largest witchety grubs... is one found on the roots of several forms of the red gum at depths of up to two metres... Aborigines detected the grub holes by scrapping the surface of the soil near faint cracks on the ground indicating the trend of the roots. They then deftly hooked the insects out with a long flexible hooked stick. Each grub may be as large as 13 centimetres long. Not only were the larvae and pupae eaten, but when the adult moth... emerged in autumn, the Aborigines attracted the large-bodied insects to the light of specially-built fires and feasted on their bodies as fast as the flames singed off the wings.

In Ecuador people have a... close... relationship with beetles... The people... use fallen palm trees to cultivate their favourite beetle. The scent from slots cut in the trunk attract palm weevils within minutes. These large black beetles come here to mate... Two months later... it's time for an unusual harvest – weevil grubs. A single tree yields over a hundred of these giant grubs and they are considered well worth the effort of collecting. These grubs are truly tasty and full of proteins and nourishing oil... Some are boiled up to extract their oil[which]... is... considered a cure-all... One-in-four animals on Earth is a beetle. 300,000 beetles have been described and we know that's only a small fraction. There are probably anywhere between 5 and 20 million beetle[species out there. But]... most beetles that are flashily coloured taste foul and some are highly poisonous.

...aquatic bug[s known a]s... water boat[people] swim about in a crazy fashion. They eat algae and diatoms. In turn, the Mexican Indians eat them.

...in Mexico, fried palm and agave grubs are sold in the streets like chestnuts... [S]everal other insects, such as white ants, are used as food by savage tribes... The Chinese, too, eat certain insects, caterpillars, etc... [In particular, they] feast upon the chrysalis of the silk-worm... Considering the prodigious number of insects, which, for the most part, feed on the greenstuffs which are also eaten by [a perso]n and his flocks and cattle, one cannot help being surprised that in the west, even in times of famine, no one dreams of eating them. They are usually objects of disgust among western peoples who do not, however, hesitate to eat prawns and other shellfish. On the other hand, the Arabs and other peoples of Africa and Asia look upon certain insects as great delicacies, and are surprised at our taste for shellfish... **ENTOMOPHAGE** [is a w]ord of Greek origin meaning insect-eating. The ancient Athenians ate grilled cicadas. Even today many peoples, including the Arabs and Egyptians, enjoy grasshoppers... Grasshoppers are greatly relished by African natives who eat them in the most diverse forms, boiled, roasted, grilled, salted, dried and reduced to a paste. Moses permitted the Hebrews to eat four different species... which Saint Jerome in his Latin translation calls *locusta*, *bruchus*, *ophimachus* and *attacus*. The *locusta* must have been the locust, but naturalists have been unable to identify the other three... **ACRIDOPHAGE** [is the word used to describe a person] who feeds on locusts... It appears that the taste... resembles, if somewhat remotely, that of raw shrimps.

Another insect that might be useful for human consumption is the mealworm – which is 'familiar to almost everyone as a handy food to give pets (at one time the problem was how to keep down the numbers of mealworms, now it is how to breed enough of them).' Whichever insects are used, some could be processed into sausages or patties, for example, to make them more palatable – at least to First Worlders. Likewise, krill and other small sea creatures (including shellfish) could be harvested – or bred in captivity – for human consumption until the Food Ministry can regularly provide enough plant-based foods (including seaweeds, which also don't have to be consumed as is – e.g., 'kombu' is an ingredient of some soy milks) for everyone. Obviously, temporarily continuing to harvest larger fish is another option – assuming less wasteful trawling practices are adopted (eliminating other wasteful practices – 'the annual "Tomatina" battle in Bunyol, Spain, the biggest tomato fight in the world, takes place when the town erupts into a fiery blaze of tomato-hurling on the last Wednesday of August' – would also be helpful).

Wastage is a major problem with the modern food production and distribution systems of countries like NZ. Because there are so many locations where food is sold, and consumers demand freshness, most shops are unable to sell everything before it becomes unsaleable (because it has overripened, passed its used-by date, etc.). To help to overcome this problem, the Food Ministry should initially eliminate small vendors (e.g., corner stores) in favour of larger ones (e.g., supermarkets) – and the people who are made redundant could be re-employed in food production instead of food retailing! Eventually, however, all of the food that society produces has to be provided to consumers free-of-charge. In order to do that, each district's Food Ministry would need to send food to depots (which initially could be former supermarkets or warehouses) where it is divided into houselots and then delivered to each house. An advantage of this is that citizens would no longer have to go food shopping (which is more advantageous to parents with mischievous children than people who enjoy the chore) or carry their food home. A disadvantage is that citizens would no longer be able to exercise personal choice in the range of food they get. However, as long as a broad range of food items is provided, consumers would have plenty of scope to exercise personal freedom in the type of meals they prepare from them. But, until everyone in the world has access to an adequate diet, each district should concentrate on producing a range of the most basic food items first, then expand the range provided when the worldwide food situation has improved.

If food production within a district is being managed by one united ministry, that ministry should – in conjunction with the use of glasshouses and other technology or farming practices (the best knowledge would be freely exchanged between districts in a non-economic system which is united worldwide) – be able to arrange for a sufficient supply of each crop to be ready for harvesting each week (grains, whose harvest time would no longer be dependent on weather conditions if grown inside glasshouses, could be managed in a similar fashion, but don't need to be harvested each week because they're able to be grown in bulk during favourable seasons then stored and distributed as required – 'wheat can store almost forever; in fact, some found in King Tut's tomb is one of the ancestors of the new hybrid grains that have created the "Green revolution"') and, in addition, equipment can be shared between glasshouses, exposed fields and even other districts (NZ's combine harvesters lie idle for nine months each year, but during the three months when they are being used there aren't enough because 'everyone wants to harvest at the same time').

There are three primary options for how food can be distributed: (1) All of the harvesting is undertaken on one day of the week (i.e., crops would be managed so that enough food to supply the district reaches harvest maturity once every 7 days), then all of the deliveries to households are completed within the next day or two. (2) Crops are managed to reach harvest maturity on one of 3 or 4 consecutive days each week, and deliveries to households are made during subsequent days – with 1/3rd, or 1/4th, of the district's households receiving their delivery on one of these days. (3) Harvesting is a 7-day-a-week exercise, and the proceeds of each day's harvest – which should be uniform in volume and variety – would go to 1/7th of the district's households.

Option (3) appears to be the most practical. It means that people employed as harvesters could move from field to field – depending on where the mature crops are situated (but each harvester would only need to work for 3 or 4 of the 7 days – as will the people responsible for deliveries). For this option, the district should have 7 food warehouses (one for each 1/7th of the population) – or multiples of 7 (approximately one warehouse per suburb, perhaps) – which need to be climatically controlled (or have a coolstore) to help maintain the freshness of produce while being held in them. Crops can be harvested during the morning and afternoon then be transported to one warehouse – or 2 warehouses out of 14, 3 of 21, 4 of 28, etc. – at the end of the day (alternatively, transporters might travel backwards and forwards between the area of harvesting and the relevant warehouse – or warehouses – throughout the day), while non-fresh foods (e.g., stored grains, nuts, etc., and processed foods) are being transported from their point of production or storage to the warehouse at the same time (or transporters could go between the processing or storage facilities and warehouse in the morning, then between the fields and warehouse in the afternoon – or vice versa). If more than one warehouse is to be supplied each day, food products may have to all go to a central warehouse first, then be divided into amounts to be delivered to each warehouse. The next day, warehouse workers would divide the harvest into household lots (although they could begin the process the previous day if any food items are available to them – especially non-fresh products), then each houselot can be delivered later that day or the following day. To assist with making deliveries, each household should be allocated a bin into which its weekly food allowance can be packed and then be used to carry the food to the household (there could be one size bin for houses and a smaller size for apartments, but all such bins ought to be capable of protecting their contents from sun – or heat – rain and insects, especially if no one is at home to receive it; however, if householders know what day – and even approximately what time of the day – their delivery is due, many should be able to arrange for someone from the household to be home when the delivery arrives). Warehouse workers and delivery workers could work at 3 or 4 different locations each week, or at one location where each week such workers could start with a 6-hour day while receiving produce, followed by a 6-hour day of dividing produce into houselots, then a 6-hour day of delivering the houselots, and end their week with a 6-hour day during which they collect the empty bins from households and tidy up the warehouse (alternatively, this sequence could be spread over 3 8-hour days). Householders ought to be responsible for keeping their bins clean.

Food allocations would have to be sufficient to last each household until the next delivery (but, ideally, they should be slightly more than sufficient). Although fresh vegetables can 'lose their vitamins in 1-3 days', most will remain edible for up to a week in a fridge – some longer – and others (e.g., potatoes, onions) will last much longer than a week at room temperature. Vegetables that last the least amount of time should be consumed first. Unfortunately, while each household has to effectively receive an equal volume of each food item per occupant so that food is distributed fairly, not every household with an equal number of occupants will consume an equal volume of food each week! However, if each warehouse had a computer which was programmed to divide the amount of each food item available by the total number of residents within the warehouse's delivery area, in order to give a weight total per household (weights would have to be rounded down – i.e., if the programme says a household is to receive 12.5 apples, the household should get 12 – so that the warehouse doesn't run out of an item before every bin has received its allocation), it should be possible to make adjustments to allow for the fact that some households consume more than the average (an allowance will definitely have to be increased if members of a house are losing too much weight despite consuming all of their weekly supply) – especially if the extra amounts can be offset by households that consume less than the average – and even to take into account personal preferences or allergies (i.e., a household could arrange to receive more of some food items and less of others). If it isn't possible to programme the computer to make such adjustments, or until such a programme has been set up, householders would have to try to find some neighbours, friends or relatives with whom they could swap preferred and unpreferred food items – or receive excess food items from (or give excess food items to). Some households might occasionally, or repeatedly, have some food wastage at the end of the week (especially if households receive more than sufficient allowances) but, overall, there should be much less wastage than occurs with current food distribution systems. Unless a householder wants to use leftover food or food scraps as compost for its own purposes, they could be returned to the Food Ministry when household bins are collected in order to be recycled as compost for farmland use. Significantly, while such a system wouldn't prevent people from under-eating, it should make over-eating less viable!

The Food Ministry should try to identify the most popular food items – perhaps with the assistance of past sales figures – when working out which to supply (or to supply in the greatest volume), but another concern must be to provide items that give the greatest nutritional value from the least input ('cucumbers are very watery and contain little nutritive value – they contain Vitamins A and C, but it is indigestible; so they should only be eaten by those with good digestions'). This concern is particularly relevant when it comes to processed foods – therefore, these should be kept to a minimum (which would also minimise the need to use packaging in conjunction with food – and, if most or all of the non-dried processed foods are consumed within a week or two of the date of production, there won't need to be much or any use of artificial preservatives). Processed foods that ought to be supplied are margarine (or vegetable butters) and soya milk (householders could request their preferences from a range of recipes). Householders might like to also receive a selection of basic sauces (e.g., soya, tomato – or at least tomato paste), dried egg-free pastas (e.g., spaghetti, lasagna, macaroni) or noodles, tofu and maybe even TVP.

Society shouldn't produce sweets (including chewing gum: people who enjoy chewing gum must prefer to be classified as ruminants rather than humans; and only people who lack a tongue or the ability to generate saliva naturally need to use chewing gum to protect their teeth from decay – but, alternatively, such people could keep a toothbrush in their pocket), cakes, biscuits, etc. – but the raw ingredients can be provided instead (dry goods could be delivered in amounts that last longer than a week – either a few items each week, then a few different items the next week, and so on; or all such items could be supplied on, for example, a monthly basis). Children who aren't raised on sweets and similar products are unlikely to miss them – especially if they have access to fresh or dried figs, dates ('since dates are a concentrate of sugar – 73% of their weight is rapidly assimilable sugar – they are full of nourishment; while figs are more nourishing when dried and, like prunes, are improved by soaking for 24 hours before use') and other fruits – but parents ought to have enough time to make treats like biscuits and cakes if they are only working 24 hours each week. Likewise, they would have little excuse for not being able to make their own bread if provided with yeast. However, if a district deems it necessary to supply households with one or two standard loaves each week, the district could have one central bakery that supplies each food warehouse on the morning that deliveries are due to go out (or the afternoon of the previous day) – and still provide households with yeast so they have the opportunity to make their own bread after the supplied loaves have been consumed (but there is no need to provide households with bread-making machines!); alternatively, there could be two or more deliveries of bread directly to households each week, unrelated to the general food delivery – and, to avoid congestion, not on the same day as the general food delivery). A limited range of popular jams could be produced and supplied to households (if the level of consumption doesn't warrant operating production facilities for at least 3 or 4 days each week of the year, the people who are responsible for growing berries could also be responsible for harvesting them and turning them into jam).

If householders are supplied with one or more loaves, they could have toast for breakfast (especially when the bread is a few days old); if they are provided with oats, they could make porridge. However, cereals are just as good as a breakfast for adults as for children, make preparing breakfast fast and easy, can be consumed as snacks at non-breakfast times, or can be combined with oats, dried fruit and nuts, etc., to create a muesli, so society should produce a basic selection – perhaps wheat biscuits (according to a 'survey of 63 NZ dietitians of their 3 most recommended cereals for kids, 9 out of 10 nutritionists recommend kids eat Weetbix'), corn flakes and rice bubbles – and households could receive a supply of each (people who don't like one of the selections could arrange to do a swap with someone who does – rather than allowing households to have the food warehouse computer allocate just their preferred cereal). Individual pieces of fruit, or fruit salad, can also be eaten as a breakfast, but if people want to drink fruit juice they should squeeze their own – rather than have society produce, package and distribute a selection of juices (if the Food Ministry does produce beverages, perhaps to use unpresentable pieces of fruit, the empty bottles or containers could be returned to the ministry when household bins are collected – along with any empty soya milk, margarine, etc., containers – so they can be sterilised and reused). Householders could grow their preferred selection of herbs in their own home or garden, so there should be little or no need for the Food Ministry to supply any herbs. Sprouts (which 'add colour, roughage and garnish to a diet, and can be used in salads, sandwiches, soups, etc – sprouting increases the vitamin content of the grain by as much as 600% for A and C, but don't over estimate its value; seeds are low in these vitamins, so even a 600% increase isn't a lot') should also be something that householders produce themselves – using whatever whole grains or seeds the Food Ministry delivers – if that's what they want to consume.

A new report says not everyone is born with the same number of taste-buds[(in 1990 so-called 'super tasters – who have 5 to 10 times more taste-buds – were identified')] and some have a more sophisticated palate than others.

Influential chefs and traditional gastronomes recommend people eat simple meals (as the majority of their species' members did in the past, and continue to do through economic necessity – although, in such cases, their diets might be better described by the word BASIC than SIMPLE) – which not only minimises the amount of preparation that goes into constructing them, but also the amount of cleaning up required afterwards. Simple food is also best for society because it consumes less energy. Anyone who possesses a little bit of imagination, has been provided with a range of non-animal-based food items, and received basic training in cooking methods, should – with practise – be capable of creating a varied and appealing selection of raw or cooked vegan meals (without needing to garnish them with, for example, gold – 'edible gold sells for \$2 a sheet'). Furthermore, this potential, combined with having more time to prepare meals, means that it ought to be unnecessary for society to provide restaurants – including takeaway bars, cafes and cafeterias (people can always take a packed lunch to work or school; people who want to dine away from home can go to a friend's or relative's place – 'to make things easier on the host, it has been a well-observed ritual that [dinner] parties are always bring-a-plate' – then return the favour at a later date) – in future.

The origin of restaurants, as we know them, is not very old. In the eighteenth century one could eat only in the inns, which served at fixed times an equally fixed menu, or at the shops of the *traiteurs* (eating-house keepers) who could only sell whole pieces of food. In 1765... a vendor of soup in the Rue Poulies, gave his soups the name of *restaurants*, i.e. restoratives, and inscribed on his sign: 'Boulangier sells magical restoratives'... Wishing to augment his menus and unable to serve sauces or *ragouts* because... Boulangier... was not a member of the corporation of *traiteurs*, [Boulangier] had the idea of offering his clients sheep's feet in white wine sauce. The *traiteurs* did not fail to bring a lawsuit against him, which was a tremendous advertisement for the innovator and his sheep's feet. In the end, Boulangier won the case, a solemn judgement of Parliament having decreed that sheep's feet in white wine sauce were not a *ragout*. This was a great triumph; all Paris rushed to Boulangier's to taste this extraordinary dish... Louis XV himself had it served at Versailles, but the king, who was a real gourmand, did not share the general enthusiasm. It is nevertheless true that Boulangier created... a profession which commands a fortune for all who pursue it with good faith, orderliness and skill. After Boulangier, the first restaurant worthy of the name was that which Beauvilliers founded in 1783 – an establishment which, because of the revolutionary activities of 1793, its founder felt obliged to close. Then followed the restaurant... at the Palais-Royal... This restaurant shut its doors in 1869, and it was in this house that Duglere, Casimir Moisson and several other great *cuisiniers* of the nineteenth century carried out their first campaigns.

The Food Ministry of each district could compare the current number of diners with the number of seats available within the district, then close down the least popular restaurants so that these numbers match (a similar process would have to be adopted for takeaway bars, etc.). Citizens would have to pay for their meals, the price of which could gradually be increased to further reduce demand, thereby allowing the ministry to close the remaining restaurants one by one until there are none left – which might coincide with the time when money is completely removed from society. Most of the buildings housing restaurants ought to be converted so that they can be used for other purposes, but a few could be left virtually as they are so citizens can book them for group *bring-a-plate* banquets (e.g., for birthdays and other personal celebrations) whenever someone's home is too small to cope with an intended gathering. If people are preparing food before arriving at banquet halls, the halls' kitchens should only need to have reheating equipment. Apart from these self-servicing halls, catering equipment (and caterers) would only need to be employed to prepare meals for hospital patients (and any people who live at home but are unable to prepare their own meals due to injury or age, and have no partner, relative or friend that will prepare their meals for them).

Hospital catering is classified as welfare catering, the object being to assist the nursing staff to get the patient well as soon as possible. To do this it is necessary to provide good quality food which has been carefully prepared and cooked to retain the maximum nutritional value, and presented to the patient in an appetising manner. It is recognised that the provision of an adequate diet is just as much a part of the patients treatment as careful nursing and skilled medical attention.

SICK

...a distinguished A[US]n physician and a Nobel Prize winner, considers it 'one of the most significant medical features' of our time that, 'as a by-product of more and more powerful therapeutic procedures and the production of chemical substances outside of biological experiences, the normal protective barriers that kept mutagenic agents from the internal organs have been more and more frequently penetrated.' The study of human chromosomes is in its infancy, and so it has only recently become possible to study the effect of environmental factors upon them... The whole concept of genetic damage by something in the environment is also relatively new, and it is little understood except by the geneticist, whose advice is seldom sought... [S]cientists have been more concerned with identifying the chromosome abnormalities associated with disease and defective development than with speculating about the causes. It would be foolish to assume that any single agent is responsible for damaging the chromosomes or causing their erratic behaviour during cell division. But can we afford to ignore the fact that we are now filling the environment with chemicals that have the power to strike directly at the chromosomes, affecting them in the precise ways that could cause such conditions? Is this not too high a price to pay for a sproutless potato or a mosquitoless patio? ...No longer are exposures to dangerous chemicals occupational alone; they have entered the environment of everyone – even of children as yet unborn. It is hardly surprising, therefore, that we are now aware of an alarming increase in malignant disease... Judging by the present incidence of the disease, the American Cancer Society estimates that 45,000,000 Americans now living will eventually develop cancer... The situation with respect to children is even more deeply disturbing. A quarter-century ago, cancer in children was considered a medical rarity. *Today, more American school children die of cancer than from any other disease.* So serious has the situation become that Boston has established the first hospital in the U[S] devoted exclusively to the treatment of children with cancer. [12%] of all deaths in children between the ages of one and fourteen are caused by cancer. Large numbers of malignant tumours are discovered clinically in children under the age of five, but it is an even grimmer fact that significant numbers of such growths are present at or before birth... [C]ancers in infants may be related to the action of cancer-producing agents to which the mother has been exposed during pregnancy... Experiments show that the younger the animal is when it is subjected to a cancer-producing agent the more certain is the production of cancer... [T]he University of Florida has warned that 'we may be initiating cancer in the children of today by the addition of chemicals [to food]... We will not know, perhaps for a generation or two, what the effects will be.' ...These chemicals seem to initiate the malignant change, which may then be completed by other chemicals of types prevalent in the environment... Water pollution experts throughout the U[S] are concerned by the fact that detergents are now a troublesome and practically universal contaminant of public water supplies. There is no practical way to remove them by treatment. Few detergents are known to be carcinogenic, but in an indirect way they may promote cancer by acting on the lining of the digestive tract, changing the tissues so that they more easily absorb dangerous chemicals, thereby aggravating their effect... The chemical agents of cancer have become entrenched in our world... through [our] search for a better and easier way of life; [and]because the manufacture and sale of such chemicals has become an accepted part of our economy and our way of life. It would be unrealistic to suppose that all chemical carcinogens can or will be eliminated from the modern world. But a very large proportion are by no means necessities of life. By their elimination the total load of carcinogens would be enormously lightened, and the threat that one in every four will develop cancer would at least be greatly mitigated. - 1962

Cancer kills about one thousand Americans a day... To combat this killer, thousands of scientists are working hard to understand the exact mechanism of cancer and develop cures. Laboratory research is vital, but we must... debate... the bankrupt logic of a medical system costing 10.5[%] of GNP, predicated on ever more technology and research to "cure" diseases, rather than a preventive health-maintenance approach to reducing stress and hazards of industrial culture that lead to "disease" ('the question we must seriously ask ourselves is to what extent are we as physicians prepared to disappear? What we should be asking in our relationships with patients is "What have I done so this person can manage to do without me in the future?"').

...Every cell of the body carries within it the genetic code for the entire individual, and biologists are just beginning to learn how to "clone" from one cell a microscopic bit of tissue that can grow into an adult body... Perhaps in a century biologists will learn so much about the complexities of the human cell that they can take a tissue sample from each human... in childhood, freeze the sample, and then grow from it a heart, liver, kidneys, eyes, and other critical replacement parts, in anticipation of their being needed in later life... Machinery can be kept going indefinitely if we are willing to replace parts that wear out. Artificial organs made of the inert plastic Teflon (the same one used to line frying pans), and of certain metals, especially tantalum, don't produce any immune response at all. Such metal and plastic parts are already used routinely to replace damaged or diseased blood vessels, bone sockets, portions of the... eye, kneecaps, and other human parts... The road ahead for bionics is not entirely clear, though, because of a problem that may not be solved...: though muscle, bone, and skin cells can regenerate after damage, nerve cells cannot... In every cell there are small, specialized groups of molecules continually moving up and down each strand of the DNA helix, checking for signs of damage... When the DNA-repair mechanism finds an error, it performs an act of "recombinant DNA." It excises the bad section of the strand and replaces it with a newly assembled good one. In a healthy cell, DNA repair occurs in a matter of seconds, as can be shown by experiments in which damage is induced by ultraviolet light. But in certain cells, there are indications that DNA repair can become sluggish, and possibly aging is a symptom of such slow or careless performances on the part of the DNA-repair mechanism. Aging may therefore be like cancer, a kind of disease – and so, by inference, curable. There is, of course, a long distance between such a speculation and a full understanding. We can acquire a respect for the distance yet to go by appreciating that roughly two-thirds of the DNA double-helix is there for reasons that we do not yet understand. - 1981

By examining the DNA, doctors will eventually be able to screen fetuses for the diseases that will afflict them throughout their lives. Even now, it is possible to predict the illnesses to which we are prone by studying our HLA antigens, the cellular markers that identify our tissue as being our own. There are five sets of HLA antigens – A through D and DR... Each antigen is known by a letter and a number; A1, for example, or B8. All of us are born with a unique selection of antigens, five from each of our parents. Hundreds of millions of combinations are possible. For reasons no one yet understands, many illnesses are far more common in people with certain HLA markers than in others. For example, psoriasis is five times as common in people with an HLA antigen known as Cw6 as it is in others. And ankylosing spondylitis, a kind of arthritis in which the spinal vertebrae fuse together, is 175 times as frequent in people with the B27 antigen as in the general population... About 100 of these correlations are now known, and a dozen or so more are discovered each year. - 1982

Most of the diseases we get are really failures of our “doctor within.” You can call them heart disease, or infections, or herpes, or stroke, or high blood pressure, or cancer, or AIDS, or the common cold, but the truth is that they are all due to a breakdown in our natural defences. If your immune system is strong, you can shrug off most diseases... Many years ago, as a resident in Internal Medicine at Los Angeles County Hospital, I was in charge of the adult infectious-disease ward. For 10 to 15 hours a day, I was exposed to just about every infectious illness you can imagine. These patients had tuberculosis, meningitis, the very deadly septicemia and other dangerous diseases. They coughed and sneezed on me; I got their blood, sweat and even feces on my hands. But I didn’t “catch” any of their diseases. My “doctor within” kept me in perfect health. Some time later, I was rotated out of the infectious-disease ward and into surgery. Months later I came down with meningitis... What happened was that I was working double shifts, going to every class and lecture offered and moonlighting besides. In other words, I ran my immune system into the ground. Without immune-system protection I was “easy-pickings” for any disease... Cold, flus, polio... cancer, forms of arthritis and other disorders are all symptoms of an immune-system dysfunction. AIDS is the immune system disorder getting the most press at the moment, but terrible as it is, it’s far from being the only immune-system disease. When I check the blood of patients who “just don’t feel good,” I may find... a virus such as CMV (cytomegalic virus), which can cause an immune-system disorder that may leave you feeling terrible, with enlarged glands and a sore throat. A sore throat may not bother you too much, but remember that CMV is attacking and weakening your immune system... Under ideal conditions your immune system would keep you free from many diseases, from colds to cancer. Unfortunately, we don’t live in an ideal world. Your goal, therefore, is to... make your immune system as strong as it can possibly be. Remember: the stronger your immune system, the better your health. - 1986

Medical technology should be used with caution. G[P]s are seen by many patients as tribal witch doctors with almost supernatural curative powers, from whom they expect miracle cures. Many people are not satisfied unless they walk out of the surgery with some kind of pill or potion, but they should be taught instead how to involve their natural processes of healing. The medical profession has for too long provided a ‘sickness service’ rather than promising a genuine health service. Medicine is too often used to ‘cure’ socially created ills... as this is both ‘easier’ and more profitable than attending to real causes... The problem is that drug companies make their money by selling as many drugs as possible, giving doctors an incentive to over-medicate and create patients dependent on drugs or damaged by their side-effects... 5[% of British] hospital admissions are patients made unwell by prescribed drugs... It can be argued that tranquillizers, laxatives and cough medicines are all useless. £30 million a year is spent on ‘peripheral vasodilator drugs’, despite the fact that there is no evidence that they work, and tranquillizers have created a far bigger addiction problem than heroin... Given that [1/3]rd of NHS spending is taken up by the drugs bill, it is essential that... drug manufacturers’ profits should be reduced drastically and the savings used to supplement pay, boost hospital building and promote preventive medicine... Prevention is better than cure. Hypertension causes raised blood pressure... increasing the possibility of heart attacks or strokes. The total bill for a [patient]... treated... with Navidrex K between the ages of 40 and 80 will be £164 at 1989 prices, but [the patient] runs the risk of developing diabetes or gout, and there may also be psychological side-effects. If the newer Capozide were used instead, the bill would rocket to £8.356 over forty years... On the other hand, hypertension can be treated at zero cost by reducing salt intake, cutting alcohol consumption, losing weight or taking up relaxation techniques such as meditation. This example could be matched by many similar cases of cheap, effective, non-pharmaceutical treatment. Sadly, medical training tends to forget such alternative approaches... We need to put alternatives into the NHS: acupuncture, herbal medicine and traditional techniques all have a role to play... Many people gain relief from techniques that fall outside medical orthodoxy, yet at present alternative therapies are just as much a middle-class luxury as BUPA... The NHS needs more resources... NHS... hospitals... [have been] described... as ‘the most rigidly hierarchial society to be found in Britain since the Middle Ages’. Even if we were to ignore the epidemics caused by freeze/thaw catering... there are many other reasons why hospitals are far from healthy. Vast and uninviting, they hardly make us feel at home or encourage the natural rhythms of healing. Hospitals need to be rehumanized. Caring should be emphasized rather than high technology. - 1990

Powerful new weapons now being developed help kick-start the body’s natural defences... FOR 18 MONTHS, [an American] suffered worsening night sweats, nausea and fatigue. By early 1988, the 51-year-old primary-school principal could work barely two hours a day. In July, her doctor diagnosed renal cancer, and two weeks later, at the University of Rochester Medical Centre, a surgeon removed a massive tumour that had wrapped itself round [her] right kidney and filled her abdomen. After x-rays showed the cancer had spread to her left lung and adrenal gland, doctors gave [her] only a 20[%] chance of living two years or longer. Then... [the] associate professor of oncology and medicine at the university, stopped by to see her. [The associate professor] had developed an experimental vaccine... “So far, it has been used on only about 50 patients... but it stopped the cancer in 20[%] of them.” “What are my other options?” [the principal] asked. “There is no other effective therapy,” [was his reply]. Unlike traditional vaccines, cancer vaccines don’t prevent the disease. Administered after a primary tumour is removed, they may help destroy secondary growths and prevent recurrences of some cancers. That is critical because 90[%] of all cancer deaths are caused by micrometastases. These are tiny clusters of cells that escape the surgeon’s knife or the radiation-treatment site, and often elude chemotherapy. They then erupt into tumours that kill months or years after initial treatment. Cancer vaccines appear to prompt the body’s immune system to destroy these tiny clusters before they grow. And, once switched on by a vaccine, the immune system seems to keep destroying any new cell clusters... A month after her meeting with [the associate professor, the principal] received the first of three vaccine injections... Her immune system quickly mobilized, and by early December the lung tumour had disappeared. Before Christmas, [the principal] was back working full time. Then, in July 1990, the tumour on her adrenal gland was removed, and [the principal] began a second round of injections. Today, [the principal]... is doing well, despite a small tumour on her left shoulder and one on a bone in her hip. “I’m not out of the woods yet... but at least I’ve returned to a normal life.” ...IN MID-1987, [another American,] 35, noticed that the thumbtack-size mole on her right shoulder had turned from dark brown to sooty black. A surgeon removed the mole and sent it for biopsy. It was malignant. [The 35-year-old] had melanoma. A first round of tests showed no sign the cancer had spread. But in January 1988 doctors found three tumours, one in the lymph nodes under her right arm and two others near the original mole. After... surgery to remove the new growths, her doctor told her about an experimental vaccine being tested by... [the] chief of surgery at St Vincent’s Medical Centre in New York. “It can’t hurt to try,”... said[the 35-year-old, who]... has been free of cancer now for more than three years. - 1991

THE DEVELOPMENT by researchers at Melbourne’s St Vincent’s Hospital of a laser technique for “welding” body tissue could end the need for stitches after surgery. Bowel tissue has been joined over a plastic splint that looks and feels like pasta, and dissolves within hours of an operation. The splint holds the bowel ends in place while laser energy seals the edges together... The researchers have found that tissue rejoined by laser heat heals faster and better than if stitched. As well, the pen-size laser-light delivery system needs only about 25 seconds to rejoin bowel tissue, compared with ten to 12 minutes for traditional stitching or stapling... Research is also under way to use the technique in vasectomy reversals and to rejoin fallopian tubes, severed hand tendons and facial nerves cut by injuries. - 1992

In another A[US]n breakthrough a research team has discovered a potential new treatment for diabetes which is 3000 times more potent than medication at present available... although human testing of the compounds was three to five years away... The compounds could provide an oral medication for non-insulin or type II diabetes with its extra potency resulting in fewer side effects. “...This means that people would not have to take as much of the drug. In addition it operates by two different mechanisms, by increasing insulin secretion and by improving its effectiveness.”

...[‘injecting healthy pancreas cells cures diabetes (although patients still need medicine to ward off rejection’). By the way, ‘computers are more effective in detecting heart disease than trained experts. In one case, a computer at the University of Missouri Medical Center, which was programmed to scan X rays and diagnose rheumatic heart disease, was 73% accurate. In contrast, a team of ten radiologists scanning the same X rays was correct only 62% of the time.’]

...A laser beam that vaporises life-threatening blood clots has joined the battle against heart disease. By threading a thin, light-reflective tube called a catheter into a major blood vessel until it reaches a clot, doctors can fire a laser to burn away the blockage without damaging the blood vessel... Three kinds of laser are being studied as ways to blast a clot: excimer, holmium and pulsed-dye. The pulsed-dye laser also shows promise for treating stroke victims by reaching into the tiny vessels that supply blood to the brain, which now can be treated only with clot-busting drugs.

...A common hospital procedure used to investigate the condition of the heart... – ...right heart catheterisation... [-] does patients little good, researchers say... “Despite the widespread use of this procedure and its attendant costs, there is no evidence that it benefits patients,” [the]... editor of the A[MA] journal *Archives of Internal Medicine*, wrote. “To the contrary, there is evidence that it may increase morbidity and mortality.”

...A new twist on a revolutionary heart surgery technique developed in Brazil could lead to a cure for many people who would normally need a transplant to survive, heart surgeons say. They warn that the jury is still out on the long-term benefits of the new technique, but say it is promising. The technique combines the use of a pump device that helps ailing hearts pump blood... [A] Brazilian surgeon... working at a rural hospital, found [it] could improve the function of enlarged hearts, which can cause heart attacks, by cutting away part of the left ventricle and sewing the heart back together... While 40[% of]... 420 patients... had died... the long-term survival rate would be higher at a better-equipped hospital.

...As [NZ] doctors fight to keep some illnesses at bay, health officials have realised the country must be better geared to turn the tide. An international focus has been adopted to anticipate, track and swiftly contain new and persistent outbreaks... [of] infectious diseases. The key to pinning down emerging diseases quickly is a direct link between public health specialists and the laboratories which identify illnesses... Public health offices rely on [GP]s notifying them of illnesses. The problem... is that this might be months after the patient is seen, or the information may be incomplete. “There was the classic case last year with the hepatitis outbreak. It was three months after it had first started that there was a significant rise in notification... [W]hen we looked back through lab information, it had been evident quite a lot earlier. If we had a system whereby a disease like that was automatically notified by labs or by doctors, we could do something sooner[,” says an]... Auckland public health specialist... [who] also cites a whooping cough outbreak in West Auckland that spread across the city. “We could have used more sophisticated systems to plot it and identify areas in the district which were at high risk.” However... patient privacy issues have to be worked through before specialists would be allowed to tap directly into doctors’ or laboratory files... [C]omputer systems used overseas automatically delete patient names to solve privacy issues... “I went to the GP Sentinal Network in France. It has 500 doctors around the country reporting each week on eight diseases which they are not legally required to notify. It is fed into a database... and means they are able to take that information and put mathematic models to it to predict what the pattern will be in the future...” ...The Ministry of Health is looking at the feasibility of laboratories reporting to medical officers of health on notifiable diseases. Such a move would require legislative changes... The ministry’s pilot programme involves the Communicable Disease Centre in Wellington, which has started collecting information from laboratories... In Auckland, four public health offices have been blended into one regional service. This allows medical officers to work from one place and specialise in different areas to give a better overview. [‘■ If you think that doctor/patient confidentiality is as sacrosanct as a confessional box, consider this complaint that went to the Privacy Commissioner. A patient was being treated for depression and had talked about killing himself before. So when his doctor found a message explaining the patient had missed his last appointment because it was buying a gun, the doctor agonised, consulted colleagues, then told the police. The patient claimed that his privacy had been unlawfully breached, but the commissioner disagreed. Rule 11 of the Health Information Privacy Code allows doctors to raise the alarm to prevent serious harm. You may see your health as no one’s business but your own but for all sorts of reasons – ranging from public safety to containing and analysing the spread of disease, running an efficient public health system to claiming insurance cover or accident compensation – when you get sick and see a doctor, some other agency will invariably be told. For instance, catch one of the 40 diseases that are notifiable in NZ, such as tuberculosis or campylobacter, and a medical officer of health has to be told, with your name, address and test results. If it’s a food-borne illness even your local council will be notified. Your illness may be further investigated and, if you’re a cook or work with children and have food poisoning, you will have to stay home from work and your employer will be asked to help you comply with those rules. You can certainly expect to be mailed information on your disease. If your doctor or optometrist considers you are too sick or too blind to drive, they have to tell the Land Transport Safety Authority. But even if your ill health is not a threat to others, someone other than your doctor will be collecting information about you. If you have ever spent more than a day in hospital, the NZ Health Information Service, a division of the Ministry of Health, will have something on you. If you have ever used a healthcare service, you will have been tagged with a National Health Index number, revealing your name, address, ethnicity and any aliases you have gone by. There won’t be any clinical information alongside that number, but it will have a flag showing whether there is significant medical information held about you in another database called the Medical Warning System. Information about you in the MWS will have been gleaned from the National Minimum Data Set – the information about your hospital stay of more than one day that is routinely sent to the ministry to provide a national overview. All personal information is removed when the overview is produced. If you’ve got a malignant tumour your name will be on the Cancer Register, having been sent there automatically by the pathology laboratory.’]

...because of its pioneering achievements and the comparatively cheap labour rates... [m]ajor research is under way in N[Z] to come up with cancer drugs without harsh side-effects. The Cancer Society Research Laboratory in Auckland is working with five international pharmaceutical giants to develop drugs that specifically attack cancer cells... [E]xisting “classical” drugs attacked all cells which rapidly divided. Although the drugs largely honed in on cancer cells, they also attacked types of normal cells affecting hair growth, the stomach lining and bone marrow... [T]he laboratory team had recently been awarded the Royal Society of N[Z] Science and Technology gold medal. It is regarded as the country’s premier scientific award... The co-director of the laboratory... said the medal had boosted morale among the team of about 40 scientists, based in the Auckland School of Medicine... “On a day-to-day basis it’s hard. It’s all blue sky stuff... you can work for 10 years and find it doesn’t work...,” ...

A Christchurch immunologist... is on the brink of finding a vaccine for cancer and HIV. Whether [the immunologist] succeeds... will depend less on scientific sleuthing than scrambling for money to keep his research alive... Two major grants run out at the end of the year, and of the 19 researchers in [the immunologist]’s haematology-immunology team, only four have financial support to the middle of next year... [The immunologist] has about one-fifth of the \$1 million a year... need[ed] to keep his laboratory running. “We’re desperately underfunded in terms of what an international research group needs. It’s very hard to keep a top quality scientific group together here. The Government does not provide the funding for hard core medical research. A[US]ns are doing our experiments with our reagent... because we’re underfunded – and that’s irritating.” [The immunologist] is not alone in his frustration. Only one in four applications to the... Health Research Council... wins backing – a ratio[the] Auckland Medical School dean... calls woefully inadequate. Medical research accounts for just 0.4% of health spending, less than half that set by many other Western countries... About 200 fulltime researchers are spread throughout the medical schools of the four main centres. Hundreds of other researchers piece together a career on short-term contracts, in some cases not knowing more than a month in advance whether they will remain on the payroll... From July 1, the HRC’s budget was boosted by almost one-third to \$25 million – the first significant increase in a decade. An additional \$600,000 is earmarked for next year. But to pour millions more into long-term research projects at the expense of hospital waiting lists would be political dynamite... [In related news,] American researchers believe they may have found a way to stop cancer tumours in

their tracks with injections of an agent that occurs naturally in the body. The... agent called angiostatin... stops the blood vessels in cancer tumours from developing, therefore halting the tumour's growth. The... Harvard Medical School... team... injected angiostatin into mice with lung cancer. "We injected the mice every day... and the tumours were held in check..." [the team leader] said. But there is a problem in producing the agent to use against human cancers – it takes about three litres of plasma and a week of laboratory time to produce just 0.15g of the substance.

...An A[US]n scientific and medical team says it has invented a new way of detecting skin cancer that can do away with the scalpel and save thousands of lives... [T]he breakthrough will allow ordinary doctors to detect melanomas with a camera and computer, instead of cutting off a suspect mole and sending it to a laboratory for a biopsy... The camera, acting as a low-power microscope, sends an image of the mole, or lesion, to a personal computer. The computer uses digital image analysis and stored information from melanoma specialists to analyse the mole's colour, texture, symmetry and general appearance to facilitate the diagnosis.

...Geneticists believe they have found a way to beat the harmful side-effects of chemotherapy, which often leaves cancer patients more ill than they were before they went into hospital... Scientists have successfully developed a mutant version of the protein ATase which repairs DNA inside cancers and thwarts the benefits of chemotherapy. Substances have in the past been used to inactivate ATase and stop the tumours repairing themselves. But this has had the drawback of affecting healthy cells as well.

...About 60 N[Z]ers develop Hodgkin's Disease each year... [and c]hances of recovery in newly diagnosed cases are around 75%... Because of its sensitivity to chemotherapy and radiotherapy, an almost always fatal cancer has been transformed into one of the most curable... [By the way, e]ye-catching billboards displaying naked breasts are part of a nationwide campaign targeting breast cancer awareness... The breasts... looked healthy... to reinforce the message that often [gals] have cancer for two years or more before there is a lump. Each year... 600 [NZers] die from breast cancer.

...regional health authorities and the Breast Cancer Foundation are bickering over the pert appearance of a pair of breasts. The foundation has launched a campaign aimed at encouraging older [gals] to have a mammogram (breast x-ray) and regular breast checks to deter cancer in its early stages. But the [RHA]s, which will launch their own free national screening programme next July... [- which] will target those [aged] 50 to 64... – ...are disappointed with the youthful appearance of the breasts used in the foundation's campaign... "Did they expect us to have a [model] with her breasts hanging down to her navel?" ...asked... the foundation's... president... The Cancer Society has also distanced itself from the foundation campaign. "We are concerned about how [gals] will interpret the messages given and we're concerned that many... will be seeking mammograms before they are free and accessible,"... Mammograms... cost about \$90... Two-thirds of breast cancers occur in [gals] over 50.

...An experimental technique for treating patients who have locally advanced prostate cancer that is inoperable or resistant to other therapies is being tested at several American medical centres. Called cryosurgery, the procedure uses extremely low temperatures to freeze and destroy tumour cells. Doctors stress, however, that this approach should be an option only when conventional treatment has failed. While they're hopeful cryosurgery will be beneficial, they do not yet have data on long-term effectiveness... Freezing body parts as a treatment for disease is not new: surgeons use the technique to treat easy-to-reach areas such as the... cervix... skin... and... eyes...

[A US]-based Professor... has inserted tiny electrodes into the eyes of eight blind people in tests, restoring their sight. [The professor] is confident a commercial version of the implant will be widely available within five years... [and] the cost of a 2mm grid of electrodes could be just \$70... "I believe it will deliver the gift of sight to 50% of blind people... It works with retinal blindness where the photo-receptors on the retina have died or not formed properly but the layers of cells beneath are still intact." The damaged light-sensitive cells on the retina are replaced with electrodes only 1/100th of a millimetre long, in a unit that is superglued to the retina. "When light hits the electrodes, they transmit an electrical charge to the nearby neural unit, which leads to the brain,"... [w]here signals are interpreted in the usual way to form an image.

...Around 1400 people from 87 countries are... in Auckland to attend the 18th World Congress of Rehabilitation International... [Amongst the conference-goers is] Europe's first blind Cabinet Member. [The Swede], who turned blind at 15, and is the U[N]s' Special Rapporteur on Disability, says it is still necessary to point out that disabled people are not creatures from outer space. "We are often hidden away in institutions and by families who were ashamed to show that they had a disabled family member. Unfortunately these practices still occur in many countries. As a result houses, streets, schools[,] workplaces, vehicles... have been and are still being designed as if we do not exist." Auckland is believed to have more disabled people than ever attending the conference. That means more wheelchairs, motorised scooters and guide dogs than ever seen at the Aotea Centre... [Another conference-goer is a 41-year-old Aborigine who] is angry that... [as a 3-year-old it] caught polio, when vaccinations were available, free and compulsory. "I think it was because I was Aborigine. They didn't bother to vaccinate the Aborigine kids out where I was living."

...Mesothelioma merits particular attention because... the virus in question appears to be new among humans and its DNA 'looks suspiciously like that of SV40, a monkey virus accidentally given to millions of people between 1954 and 1963 as a contaminant of polio vaccines'. Perhaps what we have here is the worst accident in the history of medicine. Similar suspicions have been voiced in connection with... genetic engineering[, which] might be considered extremely dangerous. The fact is that the complexity of the field makes its risks very hard to evaluate. At least in public, most experts say they are no great cause for concern, as shown both by calm scientific reasoning and by the absence of any disaster so far... Without actually being ill informed or irrational, however, you might think the risks as great as any which humankind now faces. The apparent consensus among the experts might perhaps itself be explicable more by social pressures than by scientific findings: instead of just affecting industry, as in the case of regulations applying to nuclear power plants, attempting restrictions on genetic engineering threatened the salaries and research grants of scientists in universities and research laboratories. The outcome, it has sometimes been suggested, was a speedy presentation of a united front despite quite a severe lack of evidence... There were certainly some excuses for relaxed regulations. In particular, many techniques of gene-crippling had been perfected. Organisms could be engineered so that they survived only in the presence of chemicals not normally available, or genes could be inserted to limit how many generations of descendants they could have. Still, no firm legislation prevented engineering of organisms potentially capable of reproducing themselves better than natural ones when released into the wild. This situation continued despite discoveries showing that gene-crippling might succeed only temporarily, and that alterations engineered into one species could spread to others. In particular, it was fast becoming plain that... 'a blizzard of genetic material blows freely through the microbial world, not only between bacteria of the same species but also between members of distantly related species and even between bacteria and viruses' – viruses being, so far as risks are concerned, even worse than bacteria because they evolve by the exchange of whole functional genetic units, and because they can so readily transport genes from one species to another. Genetically crippled by being deprived, for instance, of elements essential to their replication, microbes can fairly readily acquire the missing material from elsewhere: British safety inspectors gave precisely this reason for ending some University of Birmingham tinkering with organisms which were cancer-producing in their uncrippled form. Using viruses as their carriages, genes can travel from one type of plant to another, or between humans and other mammals.

...British scientists are working on a breed of genetically engineered mosquitoes to act as a sort of flying hypodermic needle against malaria, [and]... have already received a patent on the idea... The... mosquitoes... would transfer a protein through their saliva to act as a vaccine against the disease. [Incidentally, scientists have developed an 'air-pressured hypodermic needle that is better than the standard model.'

...[Timaru] residents are pleased that Health South Canterbury is rethinking its controversial plan to start burning medical waste... [-] including syringes, needles and dressings... [-] from a hospital incinerator... as a way of cutting costs... The crown health enterprise has applied for resource consent to discharge contaminants... into the night air. It admits the end products from burning up to 208kg of medical waste per hour is likely to

have a detrimental effect on air quality... The material is now transported and processed in Otago. Another option being considered is sending the waste to a commercial incinerator in Christchurch.

...An international conference on leprosy ended yesterday [in New Delhi] with experts saying they were on the threshold of a wonder medicine which could reduce cure time from two years to one month. The World Health Organisation did not unveil a time frame for the latest drug's introduction in hospitals, but said it... needed about \$US370 million... until the year 2000 to reach its neglected sufferers worldwide. [Editor's note: leprosy is 'a chronic infectious bacterial disease affecting the nerves, skin, and certain other tissues of the human body, resulting in mutations and deformities. It is caused by the presence of the bacillus *Mycobacterium leprae*, first demonstrated by the Norwegian Gerhard Hansen (1841-1912), and is now almost entirely a tropical disease, with many millions of sufferers in Africa and Asia. Common in medieval Europe, it was gradually stamped out by strict isolation and improved hygiene. To the layperson it was always a disease that created both fear and superstition, but modern methods of treatment are effective if applied in the early stages. The disease takes two main forms, of which the more acute malignant type is sometimes fatal.' There are also different forms of another disease affecting the nerves: 'epilepsy' (a nervous disorder with seizures accompanied by changes in the rhythm of the electrical current of the brain) – *grand mal* involves loss of consciousness, and convulsions; *petite mal* lasts for only a few seconds, with partial loss of consciousness.' 'Ancient doctors, in particular Hippocrates, recognised the importance of diet in the treatment of this disease, and since then all kinds of conflicting diets have been concocted. Some definite conclusions can be drawn from certain facts, however. Epileptics are generally hearty eaters and bulimics: cutting down on food therefore diminishes the number of epileptic fits. A vegetarian diet, or particularly a milk diet lessens the frequency of fits in the majority of cases.']

...Down syndrome affects one in 700 people. Usually not inherited, it is the most common cause of mental retardation. The culprit is an extra chromosome – trisomy 21 – which forms at conception when either the egg or the sperm misdivides. A person with Down syndrome has 47 instead of 46 chromosomes. The presence of this extra chromosome affects the whole body, impairing motor skills and muscle tone along with mental capacity. [60%] of babies born with Down syndrome also have a heart defect, typically a hole in the heart... The syndrome was identified late last century, but it is only in the last 20 years that health professionals have realised the potential of early intervention, says the national co-ordinator of the [NZ] Down Syndrome Association... "There is a huge difference in the skills of younger people with Down syndrome who have the benefit of early intervention,"... Between 2 and 3[%] of all pregnancies result in some congenital abnormality. These range from the very severe to something relatively benign, like having an extra finger... • [In]... Minnesota... a mother... [d]istraught over her infant son's birth defect... shot the baby and killed her husband and herself, saying in a note [that it] did not want him to grow up deformed.

...Technology advances mean doctors must consider the point at which their care should be withdrawn when treating ill premature babies, says a report in the [NZ] *Medical Journal*. It says the continuing revolution in neonatal technology means more infants are surviving against the odds of "human viability." "A number of these infants are seriously disabled, others experiencing lingering and distressing medical complications... At what point, if any, does the prognosis of an individual become so poor that it is unacceptable to prolong life?" ...although the sanctity of human life is deemed to have a value exceeding all other considerations, "...could there be qualities of life that hold less value than death?" The report says the predicted quality of life for a seriously ill or disabled infant is rarely questioned. It says it seems the choice for or against treatment should not be seen as between the "absolute" right or wrongs but rather as occurring between the "greater and lesser goods and harms."

...The hearing industry has bought into the stigma attached to deafness by trying to design smaller and less-visible hearing aids. "They got so small in the end, there was nothing in them," says... [the] director of audiology for the Swiss hearing instrument company Phonak, who was in Auckland this week to introduce the latest digitally programmable and remote-controlled hearing instruments. Phonak's new devices are still small, fitted either in or behind the ear, with a palm-sized hand control, but large enough to contain a computer chip and a system of directional microphones. The trump card, exclusive to Phonak, is... "audio-zoom." Thousands of [USers] who had been fitted with other hearing aids in the previous two years identified their biggest problem as conversation in large rooms. [A US] psychologist and market researcher... found a 92[%] level of satisfaction with available hearing devices in a one-on-one situation. But in a group conversation, such as around a dinner table in a restaurant, only 26[%] were satisfied with their level of hearing. The audio-zoom system involves two microphones, one pointing to the front, the most likely source of what should be heard, and one to the back. Tiny computers discriminate between the received sounds, enhancing the quality and volume in the front microphone and filtering out background noise in the other. Wearers, including... [the] patron of the Deaf Association in... [NZ – where about 400,000 people] have some sort of hearing problem and up to 50,000 are so badly affected they need to use hearing aids or sign language... – ...report an "incredible" hearing difference... [□ A Statistics NZ] study proves once and for all that people with disabilities make up a significant part of the population... What constituted a disability was defined according to the... WHO[, which] defines it as any restriction or lack of ability to perform in the manner or within the range considered normal for a human being. Disabilities identified in the study could include anything from occupational overuse syndrome to spina bifida. The important criterion was that the disability was long-term... Initial results show that nearly one in five... live with the long-term effects of a disability. Many are elderly – one in two people aged 65 and over reported some form of disability. That compared with 17[%] of people aged 15 to 64 and 12[%] of children under 5... The Government Statistician... said the... findings were similar to recent surveys in Canada and A[US] but detailed results would not be available until next June. They will cover the nature and severity of people's disabilities, the underlying cause and details of social characteristics. "The survey results will also include information about the use of, and unmet need for, special equipment and support services... in education, employment, housing, transport, health services and home help."

...Provided back-up care is available most health professionals agree that home is the best place for sick children[, which is the reason behind]... the Middlemore Hospital mobile care team. The seven nurses of the team travel to the homes of children recently discharged from hospital to check their progress, set up contacts with doctors and other caregivers, and administer medication... [T]he travelling nurses were visiting on average 9.2 children each day... Without the home visits the children would have to be back at Middlemore for daily check-ups, and might have had to stay in hospital longer. The visits also relieve some of the pressure on the hospital, which dealt with overflowing waiting rooms and full paediatric wards throughout winter... Often the children visited by the nurses were quite sick, but generally the parents felt comfortable about looking after them at home because they knew a health professional would be visiting regularly. For the nurses it was a case of weighing up whether the family could look after the sick child, and ensuring that they knew the signs to look for if the illness deteriorated. "If we are not happy with how a child is going we can fast track them back into hospital,"... Children's health could deteriorate quickly, and... 10[%] of the discharged patients were readmitted.

...Middlemore Hospital is among more than 20 Australasian hospitals which admit using bodies of newly deceased patients to train doctors... in resuscitation skills. The issue has caused huge debate among the health profession and is expected to similarly spark public feeling. The clinical head of Middlemore's emergency department... last night said that using deceased patients as a teaching tool was valuable but had to be done extremely sensitively. "There's a certain amount of teaching that goes on over a newly deceased body, but there has to be a limit to what's appropriate. If it is something that can be done briefly and is non-invasive, doesn't mutilate the body or affect coroner results, then it may be appropriate to do." ...None of the 22 hospitals which used the bodies sought consent from patient's families... Most... believed the practice was ethical[– even though]... there were now simulators and manikins[, which replicate 'human responses to operations and medical emergencies'.] available for training doctors... [● NZ]'s first bone bank has opened for business in Auckland – but you have to be dead to make a large deposit. The bone bank, run in conjunction with the Auckland Regional Blood Services, wants donors to bequest their bones for use in orthopaedic

surgery... Previously, surgeons used bones from overseas, which were costly and difficult to obtain, or synthetic material, when treating such common afflictions as bone cancer or performing hip-replacement operations... Post-operative discarded bone was already stored... Although some people might regard the collection of dead people's bones as ghoulish... the bone banks would save people's lives... Any bones taken for the bank would be replaced with a reconstructed plastic model so the body appears undisturbed... Donated whole bones are tested for a range of diseases such as Aids, the marrow extracted and the remaining "calcium scaffolding" frozen at -80 deg C. Other bones are made into powder, chips or wedges for bone reconstruction... These products are freeze dried. Using bone rather than a synthetic product in an operation was preferable as the bone implant attracted other bone cells, which assisted the healing process.

...*Kidney bank would aid donor hunt* Doctors are investigating setting up a national pool of live kidney donors amid controversy over an Auckland[er]'s cash bid for a new organ. This was confirmed by an Auckland Hospital renal physician... to whom [the 29-year-old... [w]as... referred for dialysis treatment at the end stage of renal failure. [The 29-year-old] sparked heated debate with an offer in the *N[Z] Herald*... to pay \$10,000 for a kidney to keep him off expensive publicly funded dialysis. The Government has ruled out any such trade, which is also prohibited by W[HO] guidelines, so Mr [29-year-old] is considering about 20 offers of free organs. Although doctors say they would not dismiss out of hand offers from strangers, there were only three cases in the decade to 1994 of transplants from other than blood relatives. All involved people related by marriage. Most transplants come from people who die of brain failure while on life-support systems, but only 35 donors were available from this source last year, contributing 70 kidneys to a waiting list of about 290 patients. About 40[%] of families choose not to authorise donations when a relative dies and the Health Ministry is urging would-be donors to make their intentions clear to their families... Mr [29-year-old], who is making arrangements to start dialysis treatment next week, has... confirmed his cash offer for a kidney followed reluctance by family members to donate an organ, but said [it] respected their wishes and was anxious not to put pressure on them. "Everyone else in N[Z] has the right to say 'No', so why can't they?" ...Some dialysis patients have expressed concern that Mr [29-year-old] is trying to "jump the queue" for transplants but others have voiced support, pleased that his novel bid... brought the shortage of donors to public attention.

...a recipient of a transplanted kidney which is now failing, says recent offers by two fellow sufferers to pay for a kidney should prompt a drive for more donors instead... [W]hile the risks associated with donating a kidney are quite low, it is... hard logically to justify [seeking] living kidney donors without first making a concerted effort to use the many perfectly good kidneys which are buried and cremated each year. The operation to remove the organs is probably simpler, the efficiency is doubled, the risks to the donor are nil[] and it means death can provide a *new lease of life*.

...Matthew Howard was killed after being hit by a car while riding his bicycle near his home in Essex. The 11-year-old who insisted on carrying a donor card has given a new lease of life to as many as 40 people.'

...A 72-year-old former MP is enjoying a new lease of life – studying the ancient art of homoeopathy[], which... involves the use of liquid and cream remedies to cure diseases, injuries and other health problems. It dates back centuries in Europe and has found favour with the royal family... [(The 'discipline originated by the Swiss citizen called Hahnemann – who claimed his distilled water retained "vibrations" of substances that were once in contact with it – also found favour with Himmler, who directed tests of homeopathic remedies to be used on more than 100 prisoners at Dachau concentration camp. These unfortunates were purposely inoculated with tuberculosis bacteria and a variety of deadly blood infections, then given the experimental medications. The results were disastrous'.)] The 72-year-old, who] will today gain a diploma from the Auckland College of Classical Homoeopathy after five years of study... said his studies had given him personal satisfaction by helping others to help themselves... "Homoeopathy is a method where you help stimulate the body's immune system... rather than use antibiotics and other drugs." ...the [former]National MP... now expects to spend more time using his new skills. [And] will need it. A consultation can take as long as 2 1/2 hours. "You can't diagnose a person's problems in five minutes. It takes time to reach into that person."

...Herbology is the practice of using whole plant remedies to relieve symptoms, tone organs and stimulate the body's healing powers. It has been used since ancient times... Practitioners are naturopaths or herbalists... Avoid prolonged use without professional supervision... Some herbs[are] unsafe in pregnancy... See your doctor for proper diagnosis. - 1996

...twelve years ago... [a guy] from Hampshire... was diagnosed as... suffer[ing] from... irritable bowel syndrome (IBS), a... condition which affects an estimated 12 million people in the U.K. alone... 'The doctors didn't seem to know much about the condition. I was told simply to eat less fibre. For more than ten years I put up with debilitating pain to the point of almost being hospitalized'... Orthodox treatment for IBS is either antispasmodic drugs to control the muscles of the intestine, or bulking agents... which help material pass through the intestine. These can suppress symptoms, but are not a long-term cure. However, sufferers are now claiming that by taking a daily dose of the bitter-tasting extract of the... cactus-like... aloe vera plant, they have cured the problem permanently... Although aloe juice has been readily available for many years, converts believe it is medicine's best-kept secret... [Yet] a doctor with Britain's National Health Service, for many years a staunch supporter of orthodox medicine, says: 'Last year a patient asked me if I had heard of aloe vera as a healing agent. I ordered all current research on it and was astonished to find 39 out of the 40 research papers were positive...' ...Last year [the 33-year-old]'s wife... recommended aloe vera, having heard from friends that it could help... 'I was having a painful attack. After a few minutes I had this warming sensation as the aloe vera went down. It seemed to soothe the tension and the spasm disappeared'. [The 33-year-old] took a tablespoon of aloe every day for four months. As his symptoms didn't recur, [the 33-year-old] cut the dose down to a tablespoon every other day. 'The relief is marvellous... For the first time in ten years I can eat what I like'.

...[the patient] looked uneasily at the 2.5cm sardine swimming in a handful of water in a plastic bag... [Someone] dressed in saffron robes grabbed the fish, placed a bead of yellow paste in its mouth and deftly popped it down... [the patient's throat. The patient – who] came all the way from Srinagar... about 1800km to the north[, and had]... stood in line for two days[– believes]... this unconventional treatment... is a miracle cure. Every June, on a date chosen by astrologers, asthma patients from all over India show up at a house in Hyderabad to receive the free treatment... This year, police... estimated that 500,000 were in the line snaking through a rabbit warren of city lanes. The federal Government operated a dozen special trains; Indian Airlines flew a special planeload of patients from New Delhi... The family that organises the one-day annual event says a Himalayan saint revealed the formula to an ancestor 152 years ago, in gratitude for being given dry clothes and food on a rainy day. "I don't know how it works. Perhaps it [i]s God's blessing," said... one of the five brothers who knows the secret. The [brothers] refuse to give anyone, not even medical researchers, the formula, for fear it will be used for profit. They say the saint warned that the remedy would lose its potency if it were commercialised. Family members refuse any payment. Instead they pool money earned as landlords, farmers and office workers to raise the 40,000 rupees... needed every year to buy the herbs stuffed into the fish. After swallowing the live fish, patients are advised to begin a strict 45-day diet that requires them to consume 25 different foods – including lamb, old rice, white sugar, dried mango, spinach and clarified butter – and abstain from alcohol, caffeine, tobacco or any deep-fried food. They must repeat the treatment for at least two successive years. [One of the brothers claims 90%] of patients are cured, but... offers no evidence. Those queuing were unconcerned with scientific proof. They simply wanted to breathe freely.

...ROLL up, roll up, do yourself a favour. Take home this magic elixir which for a small consideration will cure everything from warts to whooping cough. The quacks who flourished in fair-grounds 100 [years] ago were well aware of the public's desire for a quick-fix remedy. Today... the same whiff of quackery exploiting human credulity lurks around the many health food shops which have sprung up in almost every shopping centre, and around the rows of vitamins and mineral supplements on the shelves of virtually every supermarket. Up to half of N[Z]ers say they've used some sort of vitamin, mineral or herbal supplement at least once in the past year... While conventional medicine continues to complain there is

no scientific evidence the[y]... work, there's a growing trend for people to buy them, and a corresponding increase in reputable research that backs many supplements... [But t]he... head of Otago Medical School's Human Nutrition Department... is... concerned by the herbal supplements available which... have the potential for lethal results. "There's no scientific evidence for... any... benefit... If you've got money to spare from buying Lotto tickets, you could spend it on supplements. But unlike Lotto, the herbal supplements might kill you." Royal Jelly, for example, hit the headlines in A[US] recently when a coroner decided an asthmatic... died because of taking one capsule... [The coroner urged AUS]n health authorities to ban sales of Royal Jelly... In... [NZ] bottles of Royal Jelly warn people not to try the substance if they suffer from asthma. Other vitamins, however, are not as well marked. The American Dietetic Association has warned that the trace mineral selenium, which one European study showed could reduce prostate and bowel cancers by up to 45% can also be toxic if more than five times the recommended daily allowance is taken. That's the sort of useful information you'd probably hope to get from your GP in an ideal world. But if the GP dismisses all such supplements as a load of hokum, self-dosing could lead you into trouble. The relationship between pharmaceutical-based medicine and the use of vitamins and herbs as well, or instead of, proprietary drugs, remains basically in standoff mode, regardless of what research has been done... [The NZ] General Practitioners Association chair[perso]n... dismisses as unfair criticism by [a]health food lobbyist... who told [local]health food proponents recently that doctors only have time to read drug companies' literature and... don't look at other research[– but goes on to] say... doctors are brought up in the scientific method and place a lot of credence on reputable journals... They don't have time to read the "little pamphlets" put out, frequently, by health food companies. [The chairperson] agrees people are turning increasingly to herbal and vitamin remedies, but says that usually happens after they've tried conventional medicine and it's failed. [The chairperson is] underwhelmed by any possible benefits... "You can have herbal remedies for insomnia, and that makes someone go to sleep... [but i]t's difficult to say whether or not that's just a placebo effect. I'd agree there are lots of situations where herbal remedies have a small role to play. But... [you] don't get herbal remedies for heart failure."

...A nun who studied medicine and botany... has been the guiding light behind a range of herbal remedies... WHEN people came to Mt Eden[s] medical herbalist... last winter with a particularly debilitating flu, [the herbalist] gave them "marupa," a fragrant concoction of houhere, kareao, kawakawa, manuka, pinatoro, rata, tarata and tawa. Asthma, bronchitis, chest colds, sore throats and coughs also respond well to marupa... The remedy has a long history. Its original source is the branch of Maori medicine called wairakau, literally "tree-water," which was taken up and adapted with great success last century by a Roman Catholic missionary nun, Suzanne Aubert. The original formula for marupa was Aubert's own... Aubert was born in France in 1835 and suffered an accident at the age of two which left her a sickly child. But her suffering and an invalid childhood resulted in a strong compassion towards the sick, especially children, in later life. [Aubert] trained as a nurse... and came to [NZ, where the nun] founded the order of the Daughters of Our Lady of Compassion. In Wellington and later Jerusalem, on the Wanganui River, [Aubert] worked closely with Maori, who shared with her their traditional knowledge of the medicinal properties of bark and berry, root, leaf and stem from the indigenous flora. Aubert's medicines, with their pigeon Maori names, a la Francais, became immensely popular with Maori and Pakeha alike and were credited with saving many lives... Aubert destroyed her original recipes before... [dying], but many of the herb combinations... used were remembered and [the Mt Eden herbalist] was given permission by the Order, now known as the Sisters of Compassion[,] to produce tinctures based on this remaining knowledge. In return [the herbalist] has pledged a 10[%] tithe on all [of her] sales, to go to the Order.

...TO the growing number of traditional Maori healers, now practising in 186 clinics around [NZ] and serving... 400,000 people, the Western preoccupation with conventional drug treatment leaves [patients with no option but to seek out alternative cures]. "In Western style medicine you give drugs to cover up the symptoms – then wait until the condition gets bad enough for surgery," says [a healer] from Piki Ora, the traditional Maori health clinic at... Hoani Waititi Marae, Glen Eden... The Maori approach to health is a far more holistic one. There are four branches of healing in the Maori tradition, dealing with spirit, mind, body and extended family and environment. Each aspect is considered equally important and no... healer expects to restore health to anyone without addressing all four... The Maori concept of health is more than an absence of illness... Health is a positive feeling of the energy running through the body. The word Hauora carries the meaning of health within it... The first syllable "ha" means breath and "u" symbolises the entering of the breath into the body... "O" was the old name for kai, or food... And "ra" is the sun. Health... is associated with light, a pure white light called "ma." "...health or the absence of health begins with the spirit, moves into thought forms and into the person's belief system. Ultimately, it reflects in attitudes which are expressed in some physical form." ...prayers, said at the beginning of every consultation acknowledge the spiritual aspect of the patient. There may also be an acknowledgement or discussion of spiritual beliefs: if the belief in the laws of tapu, for example, are powerful and dominant, and a tapu has been broken, there will almost certainly be an affect on physical health. Moemoea are dreams, and the interpretation of a dream can also be significant. [In]Makakite, or psychic healing, [the]... healer might... "see" a patient's cancer and be able to link specific tumours with events or aspects of her life. "We believe everyone has this intuition... The healer is just the tool, an open channel for connecting with the spirit of the ancestors and moving beyond to the realms of the Atua, or Gods." Such healing is never "sold" because it is seen to come from the Gods... Taha hinengaro, the second aspect of Maori healing, which deals with the mind, is far less other-worldly. Its basic tool is waha korero or speaking out... Taha tinana deals with the physical aspects of health, in hugely varied ways... [One is] rongoa (health practices including herbal medicines); another... is mirimiri... incorporat[ing] a range of massage and manipulations. Massage is carried out with the hands – or feet – and sometimes with sticks and stones. [Other]times, one stone is held over the point and tapped with another to create both pressure and sound. There is even a Maori form of Tai Chi, called manawa pou[, that]... offers... health benefits... [to] the elderly, in particular, by "getting them out in the sun, gently moving the body and increasing the flow of the breath." ...The resurgence of interest in... Maori healing is reflected in the membership of Nga Ringa Whakahaere o te Iwi Maori, the equivalent of a medical association. Acceptance of the important role traditional healers can play is also being increasingly acknowledged. The Central Regional Health Authority led the way by contracting a traditional Maori health clinic, in August 1995. Clinics like Piki Ora, in West Auckland, certainly do not have to advertise for clients.

...most South African blacks... see... a Western-style doctor only for X-rays, immunisations, broken bones and the like. For most ailments, physical or spiritual, [they] visit... an indigenous healer who relies on herbs, ancestors and ancient folklore for... cures... [Typically, such healers will] lift a goatskin bag, press... it to [their] forehead and tap... it on each knee before spilling the contents on the floor. [Next, they] poke... a stick at the scattered bits of bone, shell, ivory and coins to form... [their diagnosis. In one healer's] home... herbs, branches and other ingredients are stored in dusty bottles, bags and jugs on the floor. Perhaps the most unusual object in the room is a certificate on the wall. It is from Thamba Administrators Ltd, and means that a visit to [this "doctor"] now may be covered under certain medical insurance schemes. Ever since democratic elections ended white rule in 1994, the government has pledged to incorporate the estimated 200,000 traditional African healers into the formal health delivery system, which includes some of the best health care in the world. The problem is that traditional healers... – ...70 to 80% of... [whom] are functionally illiterate... – ...attend no special school, are not licensed and have no written body of knowledge... [Consequently, m]ost Western doctors scoff at what they consider the unhygienic and unscientific practices of indigenous medicine... ■ [The conflict that]... has raged between advocates of traditional science and of alternative healing... [is] one of the most heated but overlooked battles... of modern medicine... Into the breach comes... a physician and author who is fast emerging as a family doctor to America. Only a physician who trained in medicine's mainstream could credibly question its methods. And [the 55-year-old] studied in the most mainstream place possible: Harvard Medical School. While there, [the physician] conducted some of the earliest lab studies of marijuana and concluded that there are no bad plants, just inexperienced users. Later

[it] travelled to South America to study medicinal flora. "Local healers were using these marvellous plants... and established medicine had never even heard of many of them." [The physician] began preaching the word of alternative medicine (though downplaying his pot position of old). Now that word has been heard. *Spontaneous Healing*, published in 1995, has sold more than a million copies, and his latest book, *8 Weeks to Optimum Health*, has become a best-seller as well... The extraordinary thing about [hi]s medical gospel – a liturgy of nutrition and life-style tips – is its ordinariness. That has not stopped some doctors from arguing that woefully little science documents the value of much that [the 55-year-old prescribes. The 55-year-old] responds with an olive branch. "Mainstream medicine handles some things quite well – particularly emergencies... But when it comes to helping the body stay healthy, alternative methods are the way to go." ...many Americans are going with him.

...Since his landmark book *Spontaneous Healing* was translated into 22 languages, th[e] acclaimed botanist and champion of... alternative medicine has been in big demand... "I wanted a medical education and a medical degree, I never saw myself becoming a practitioner. I'd had a great time as an undergraduate, so I was shocked to find the teaching in medical school so narrow. You could see people losing their diversity over the course of the four years – their whole focus became centred on disease, not health. I was interested in how else you could 'do' medicine... that's when I began travelling." The worldwide quest for information in medicinal plants, altered states of consciousness and alternative healing that started in 1969, would span over a decade. Undoubtedly, part of the considerable folklore built up around his work today can be attributed to the fact that [the botanist] operates like a slightly rotund Indiana Jones – trudging through the hinterlands of Colombia in search of a powerful Shaman (medicine [doctors] mostly just out for fame and fortune) or dabbling with PCP (angel dust)... With a writing style that blends crisp doses of science and infectious jabs of humour, Dr Feelgood may not read off the wall – but whether [the botanist] looks off the wall is another chapter altogether. If it wasn't for the firm traces of sanity shrouding that signature beard and smile, one could be forgiven for thinking the only reason [the botanist] missed the recent Hale-Bopp tour party was because his Nike sneakers were at the cleaners. "I think that's part of my appeal too. Y'know, the way I look – yet I've got two degrees from Harvard. In America, two things happening at the same time have also created an audience for this. The first is this economic collapse of the medical system. The second is that the consumer trend toward natural medicine has now reached a point where it is a significant political and economic force that can't be ignored any longer." And the [botanist's] diagnosis? Patient – heal thyself. An elaborate healing system already exists in the body, a system capable of repairing wounds, renewing bones and, most importantly, correcting glitches in our DNA blueprint that, if left uncorrected, could germinate into cancers and other diseases. By modifying diet and lifestyle, we can all increase our body's innate healing potential, enabling "spontaneous healing" to occur... "In the last 100 years or so, western medicine has turned it's back on nature and lost sight of the fact that healing really has it's origins in the natural world. We're so dazzled by technology that we've lost that perspective. There's also a lot of nonsense out there in the world of alternative medicine – the challenge is to sort it all out and take from it what we can use." Aside from the crippling cost, [his] most damning critique of conventional medicine lies in it's betrayal of the patient through what [the botanist] called "medical hexing!" – ...doctors telling patients there's nothing they can do for them or that they're not going to get better... The [person] named in *Time* magazine as one of 1997's 25 most influential Americans, has a simple message. "...Most of the diseases that kill or disable people prematurely are diseases of lifestyle, and you've got to look at all aspects of it. I'm not rejecting conventional medicine or telling people they have to become vegetarians or live in caves. I am saying 'more... broccoli... walk more!' Most of my work could fly under the banner of common sense – plus good information." There is good money in good information. Paid a million dollars up front to write *Spontaneous Healing*, his sixth book, does [the botanist] ever feel like something of a modern day Shaman, lost in a jungle of self-help hustlers? "I'm not very comfortable with celebrity and I'm not going to keep grinding out books for the sake of it... There were a lot of periods when I was very lonely in my work. Money was tight. But through it all I stuck to what I was saying. Looking back now, it... definitely feels like I'm on some kind of path that you could say is not entirely of my own choosing... I'm looking forward to getting back to the University of Arizona." Indeed, [in two months] the department of Integrative Medicine – "his baby" – will launch it's inaugural fellowship programme to train qualified doctors in the best of both worlds.

...In the last 100 years it is the application of science more than any other activity that has, for better or worse, transformed our world. Science is a discipline by which we seek to explain the world around us... In medical science general ideas have been built up about the way the human body works, how it becomes ill, and the way it is treated. As these are tested so it becomes clear that there are sub-groups which need special attention. In medical science the individual differences are considered more important than in other scientific fields. Humans think, rightly, that humans as individuals are more important than tulips. By contrast with medical science, the general medical practitioner approaches the patient as an individual with individual needs... At first sight there would not seem to be any conflict between the interest of the medical scientist, the GP, or the sick patient, but there is. The sick patient has a very personal want to be healthy without necessarily understanding why they are ill, while medical science offers a range of general treatments, of greater or less effectiveness, to populations at large. The GP in the middle must make the diagnosis and prescribe suitable treatment for the particular person. However, the GP, while trying to do good, can also do harm. The clearest example is in the prescription of antibiotics. GPs very commonly prescribe antibiotics – sometimes for relatively trivial illnesses – without knowing the organisms responsible for the illness and therefore whether the drug will be useful. In treating the want of the patient the doctor has met the feelings of personal need without detailed consideration of the medical need. Basically the GP hopes that the patient will get better according to nature's way and, maybe or maybe not, the drug will help. This approach to prescription contributes to about 20 million doses of penicillin-type antibiotics and about 10 million oxytetracycline-type antibiotics being prescribed to N[Z]ers every year... A consequence of this approach world-wide is that some of our most valuable antibiotics have been retired early and... some patients are now dying because there are no equally effective replacements... A GP of my childhood had a prescription for a general purpose "Pink Medicine." Whenever we were ill, for whatever reason it seemed, we were dosed with the Pink Medicine. This not unpleasant concoction probably did little... [but n]obody with any involvement in or knowledge of medical science doubts the importance of the psychological component in illness. Doctors have understood this from their professional experience for generations. Perhaps the clearest examples are the studies of the effectiveness of pain-killers. In these it was shown that some doctors obtained consistently better results with sugar solution (placebos) than others did with proved drugs. Hence the requirement that all new therapies be tested by double-blind experiments in which neither doctor nor patient knows whether a real drug or placebo is being given. But the point is... it was only by such formally conducted experiments... made by medical science teams, that we distinguish useful from useless treatments and the extent of the emotional component in any particular illness and its treatment. The danger to the community is that doctors themselves do not make a clear distinction between useful therapy treatments and their emotional support... Homeopathy is an example. Anecdotal reports of success by patients and their doctors using homeopathic remedies will almost certainly be shown to be mistaken when these measures are subjected to the rigour of double-blind tests... No doubt there are actually useful ancient remedies such as the old herbals. But it... pay[s] for us to know which are useful and which are useless lest we be treated by a good doctor only with a gentle touch, when what we want is a good doctor... who also has a useful drug.

...Auckland cancer researchers are optimistic of a drug breakthrough which spares patients harsh side-effects. The Cancer Society Research Laboratory is testing a drug which kills cancer cells by starving them... For the past year the drug, called DMXAA, has been given to patients in Auckland and... Britain. U[S] giant Parke Davis has first rights to the drug if it is deemed a breakthrough... Qualified success might come later this year... when first-stage clinical trials finished... [T]ypical stage-one trials went for two years, with a new patient joining the programme every fortnight. Patients usually had a variety of cancers... DMXAA cut the blood supply to cancer cells, causing them to run out of energy and die. The drug also sparked the immune system to wipe out any remaining cancer growths... Despite the possibility of success, [the]... laboratory director...

said it was unwise to think scientists had the upper hand. "Many cancers have learned to survive. The body's natural defences are always killing cells before they become serious so the ones that do develop into cancers have somehow toughened themselves. They can also change under different circumstances but we always hope there is some weakness we can tap into."

...*Immunity lost with constant drip of poison...* A remote island destroyed by a ferocious hurricane (6,000 killed) in 1900 lies at the end of Interstate 45 in Texas, an hour from Houston, past the space centre... The only sights of significance are the white ellipses: discs of stored gas, nestling close by their spindly flame-topped parents in Texas City. The sky rests overhead, a blanket of orange sulphurous excrement lit by the dimming sun. The refined skyline of "Toxic" City drifts for miles. There are stories of unusual brain cancers in the area. The *Houston Chronicle* reports the dissemblings from the British defence minister about the use of organophosphate pesticides around British forces in the Gulf War. There is justifiable alarm about the figures. More than 4,000 ill, perhaps as many as 100 dead, and children with birth defects. All these chemicals, what do they do? Can they cause tumours to sprout? Do they insidiously disable? Some say they do. There is a modern diagnosis for their subtle effects: multiple chemical sensitivity. Clinical ecologists suggest repeated tiny exposures (or a single heavy exposure, as in the Gulf War) can sensitise our immune systems into decline. Once sensitised, they argue, we become intolerant to the huge range of synthetic chemicals we employ to ease our, and our governments' vanities: perfumes, exhaust fumes, natural gas, food additives and preservatives, and chemicals in clothes, carpets and building materials. It's a 20th century disease for a 20th century phenomenon. Physicians flinch at this sort of thing. How can there be a "disease" when the [myriad of] symptoms... simply go on and on, refusing to organise themselves into any clear pattern? Despite the amused scepticism of orthodox medicine, multiple chemical sensitivity has an American Academy (of Environmental Medicine, made up of physicians and osteopaths) to promote it and a celebrity doctor to shout for it. Sitting in his Environmental Health Centre in Dallas, [the celebrity] claims to have treated a hardly trivial 20,000 patients. [The celebrity] explains away this vast cache of human disease with disarming simplicity. Not only do we develop symptoms when our immunity collapses with toxic overload, but ironically, because of our addiction to pollutants, we also experience withdrawal symptoms... More orthodox medical colleagues will have nothing to do with it, of course. The American Medical Association has ridiculed this hokum (as it sees it). Its leaders accuse the so-called ecologists of clouded understanding, relying on junk science published by third-rate journals, and applying the label of multiple chemical sensitivity when no condition exists... And yet people remain ill. So somehow I... [- the] editor of *Lancet* [-] ...cannot accept that pesticides, sprays and gases are the harmless accoutrements of today's life.

...Two Auckland public health specialists have challenged their colleagues to take a broader view of the real threats to human health, drawing a prickly response from the prestigious British medical journal the *Lancet*. In their book, *Public Health at the Crossroads*, [the] Professor... and Associate Professor... [from the] Auckland Medical School, say public health practitioners are too narrowly focused on disease eradication and on medical studies which ignore the social and global origins of disease... The journal acknowledges that clinical epidemiology may sometimes be too narrow in focus but concludes that reorienting public health to social and global issues may just "muddy the water." "Woolly breadth will help no one," the editorial declares. [However, the] Professor... rejects the charge of "woolly breadth," saying public health is much more than the medical specialty implied by the editorial. Physicians who have campaigned against nuclear weapons have enjoyed success... and public health professionals working with environmentalists and climatologists raised concerns about global warming, which turns out to be a major health issue. "Public health specialists have a particular role because they have a population perspective for whole countries. But it is easier to elucidate the finer points of new risk factors for coronary heart disease than to study global warming." The] Professor... is critical of "the extremely disappointing performance" of the W[HO] in recent years. "A block of small countries can dominate the WHO and ensure that local concerns are given priority." That can mean WHO resources are misdirected to satisfy the short-term priorities of member governments, while problems affecting huge numbers of people go untackled. "We spend more money on preventing 500,000 maternal deaths a year than on preventing 10 million cardiovascular deaths. The major killers are not infectious diseases but chronic diseases." Those chronic diseases are not given priority because they are seen as affecting rich countries. But poor countries are affected by them too... The health needs of the population will change dramatically over the next two decades... Non-communicable diseases are expected to cause seven out of every 10 deaths in [First World] countries within the next 20 years, compared with under half now... The impact these changes will have on our future is obvious. The number of beds, numbers of staff, facilities and even future organisation structures will need to be revisited as the focus of priorities change...

Cancer Genes Revisited... CANCER RESEARCHERS AREN'T ACCUS-tomed to breakthroughs, but three years ago, they thought they had scored a big one. That's when scientists revealed they had found and begun mapping the first of two genes that appeared to be behind most cases of inherited breast cancer. Suddenly it seemed possible that a [gal]'s odds of getting the disease might be determined by simply scanning her genetic schematic. Thousands of U.S. [gals] with a family history of breast cancer rushed to take blood tests designed to look for the rogue genes. Of those who tested positive, as many as 20% underwent prophylactic mastectomies. In some cases that may have been premature. In papers published last week... investigators took a good look at the suspect genes and found them less guilty than originally charged... High-risk [gals] who have had preemptive mastectomies may not regret the decision, since the procedure can mean a 91% likelihood of remaining cancer free... [and e]ven if gene screening remains inconclusive, not everyone wants to toss the tests aside... For now, researchers say, the key may be to look at genetic testing not as form forecasting but as mere odds-making. As with all rolls of the dice, the outcome is never a sure thing.

...MENTION breast cancer and most [gals] dive into their bra cups to check for the first dreaded hint of an irregularity. But the message from... a survivor of three cancerous tumours in one breast, is "don't panic": Breast cancer is not always the death penalty [gals] presume it to be. The Christchurch mother of eight, including [a] former world triathlon champion... [whose sister was an] Olympic rower... has had three operations for the disease in the last two decades. Two of them occurred after [the mother of eight] had already lost her right breast and the glands in her armpit in what is known as a radical mastectomy. Yet [the 66-year-old] doesn't consider herself a victim. "I've been a lucky survivor...." Next month is international breast cancer awareness month, a time when scary statistics abound on the potential of "the big C". Breast cancer is the biggest killer of [NZ gals] aged under 50. Nearly a dozen... die of the disease per week; about one in 12... will get breast cancer during their lifetime and the rate is believed to be on the rise. Even that half of the population without real cleavage cannot escape this cancer: It is a little-known fact that 1% of sufferers are [guys]. Amid the gloom surrounding the disease... [doctors] say, overall, 70% of [gals] with breast cancer who get treatment will survive. Success rates vary, depending on how early the cancer is detected... [In the 66-year-old's] case it was fate rather than early detection... "I noticed one breast was standing right up. I... had no thought of breast cancer when I... mentioned it to another [gal] who I worked with and... [my colleague] made me ring a doctor... That was Thursday - by Tuesday I had a mastectomy... It was so quick I never thought I was going to die... I was 42 and there... was too much else to think about." ...Now [one of] her high-profile daughter[s]... is... promoting a nationwide 5km run/walk to raise money for breast cancer... the idea... [was] borrowed... from the U[S] where a series of fun runs has raised more than \$100 million towards research... Regular exercise, a low-fat diet and early detection are the keys to fighting the disease. A Norwegian study has found that [gals] who exercise at least four hours a week before the age of 40 can cut their breast cancer risk by one-third. [A co-promoter] hopes that will be an added incentive for [gals] to join the ANZ Race for a Cure in Christchurch on September 21, Wellington on October 5 and Auckland on October 19. So far, around 2000 have registered and [the co-promoter] hopes that will grow to 15,000...

THE Breast Cancer Foundation has emerged as a political lobbyist with its recent, highly publicised tour by... [a US radiologist] well-known as a vociferous advocate of breast cancer screening for [gals] younger than 50, against the trend to discourage mammography in this age group. Earlier this year, the National Institute of Health in the US held a conference to review the evidence for screening this younger age group. By an 11-2

decision, it stated there was insufficient evidence to recommend screening. People who disagreed with this assessment have since successfully lobbied the National Cancer Institute to have the decision over-ruled. In scientific circles, this debacle has caused consternation that a time-honoured scientific method could be overturned by ill-informed politicians and emotive lobbyists. In [NZ, the radiologist is maintaining it] has evidence the conference didn't see, but [the USer] gave testimony to the conference... [It] claims there is a 16% reduction in deaths among [gals] who start screening when they are in their 40s. The trouble is the conference said this small benefit only shows up after 10 to 16 years of screening, that is, after [gals] have reached their 50s. So it is not clear whether it is the screening before 50 or after 50 that is doing any good. Against this, screening young [gals] can do harm. Because the technique is less accurate in young [gals] there are more unnecessary biopsies but fewer cancers are found. More mammograms means more radiation, and the possibility has been consistently raised of spreading cancer by compressing the breast in young [gals] who have more blood vessels. [The radiologist] is clever with figures, claiming on television that breast cancer is the greatest cause of death in [gals] in their 40s. So it is, but [gals] do not die often in this age group. Only four... in 1000 die from breast cancer in their 40s compared to 52 in 1000... over 50. There is more evidence to argue for screening [gals] over 64, the cut-off age for the proposed [NZ] programme, but I don't hear [the radiologist or the foundation] lobbying on behalf of these older, voiceless... [gals]. It is a worry that the [foundation] is promoting only one side of the debate. Especially since the foundation extracts large amounts of money out of the public and sponsors. My repeated requests to the [foundation] for information about what it does with this money has so far drawn a blank. When I went to the Companies Office I was told that trusts don't have to file accounts. I was referred back to the trust's accountant who failed to produce them, despite two letters asking. From other sources I found out that in the financial year ending March 31 1996, the foundation raised around \$150,000 from the public and over \$100,000 from sponsors. Last year's campaign listed 31 corporate sponsors, as well as gifts from trusts. Since that time [another sponsor] has donated \$250,000 and the planned "Race for the Cure" has 12 sponsors. This is a huge amount of money going into an organisation which resists accountability, and which seems to spend the money on media hooplas. I am not aware of the foundation funding any practical support for [people] who have breast cancer, some of whom are waiting months for treatment... In the US the money raised by the "Race for the Cure" goes into research, and that is the logical inference one would take from the title. Not so here. The small print in press releases reveals that the money will send "a member of the medical profession to train for one year at the Memorial Sloan Kettering Cancer Centre in New York". Hardly a cure. Why should [NZ gals] pay for the training of health professionals? Is there anything to suggest that [NZ] physicians are deficient in their training? ...Is this the best use of [gals'] hard earned money? Once again, the activities of the [foundation] raise more questions than we are likely to get answers.

...A COLUMNIST who is rendering advice on life and death issues has an ethical obligation to provide accurate and factually correct information. I... an Associate Professor of Radiology at Harvard Medical School and Director of Breast Imaging at Massachusetts General Hospital, Boston... am surprised that... [a] *Sunday Star-Times* columnist... would write such a scathing column about my visit to N[Z]... Not only did [the columnist] not speak with me first to get her facts checked, but, to my knowledge... did not attend any of the 17 talks I gave... at the invitation of the [NZ] Cancer Foundation... Her assertion that, in [NZ, only 4 gals] in 1000 in their 40s die from breast cancer compared to 52 per 1000 for [gals over] 50... is the type of data manipulation that has been so misleading by comparing [gals] in a 10-year age span with all [gals] from age 50 to 80 and above... [If her comparisons were consistent... [the columnist] would find that [gals] in their 50s have only a slightly higher death rate compared to [those] in their 40s... Because of the "baby boomers", last year, in N[Z] as in the US, there were actually more [gals] diagnosed with breast cancer in their 40s, than... in their 50s... Finally, contrary to her assertion, I addressed the issue of screening... beyond the age of 65. I pointed out that there was no evidence that screening stops working at age 64. In the U[S] there is no upper limit on screening. It should be made clear to [NZ gals] that the 50-64 year age range for your upcoming national screening programme is either based on cost or outdated studies...

FOR some years I have been a bit of a lone voice locally, warning about hormone replacement therapy. For this stance I have been criticised as not serving [gals] well, expecting them to guts out the horrors of hot flushes and crumbling bones and spurn the salvation offered in the form of pills, patches and hormone implants. Now a succession of studies have vindicated my stance, although this does not give me pleasure as the news is discomfiting... The Collaborative Group on Hormonal Factors in Breast Cancer compared 52,705 [gals] with breast cancer with more than 100,000... who did not have breast cancer from 51 studies in 21 countries, including N[Z]. By analysing these very large numbers the study was able to conclude that after five years, the use of HRT increased the risk of breast cancer by 35%. This increase is related to duration of use and seems to disappear within five years of stopping HRT... The study mainly covered users of oestrogen alone, whereas most [NZ gals] use oestrogen with added progestogen. Earlier studies had shown an even greater risk of breast cancer among users of such combined therapy. Breast cancer is not the only problem with HRT shown in recent studies. Contrary to doctors' assertions, the progestogen added to HRT is often not enough to cancel the risk of endometrial cancer, and HRT, like the pill, doubles the risk of blood clots... Although the figures are hard to find out, around 20% of postmenopausal... [NZers] probably use hormones, and the cost to the country escalates every year. Some doctors are routinely sending [gals] at menopause off for bone scans to test the strength of their bones as a prelude to hormones. Almost invariably they are told they have "the bones of a 70-year-old", so, fearfully, they gobble up the hormones, not realising that the results of bone scans can vary from week to week, operator to operator, and even whether the [patient] was sitting or walking before... ha[ving] the scan done. Scientific reviews of bone scans in a number of countries have decided against population screening because of its inexactitude. And [gals] who think hormones will prevent fractures often do not realise they need to stay on them for decades, or lose the benefit when they stop. Breast cancer is a common, feared cancer among [gals,] and countries such as N[Z] are making major efforts to decrease deaths by promoting early detection. How illogical, then, to increase... risk by unnecessarily giving [gals] hormones. [Gals] on hormones are often told to have more mammograms, but mammography does not work well in [patients] on HRT because of increased breast density. Reducing unnecessary HRT use is probably the single biggest step that could have been taken to reduce the number of breast cases in N[Z] as little is known about other ways of preventing breast cancer... [while, for most gals], hot flushes are self-limiting, and if uncomfortable, not fatal... [By the way, b]reast cancer surgery is more successful if performed when a [patient] is at the most fertile phase of her menstrual cycle, says a report by the Royal Australasian College of surgeons.

...Medical researchers said yesterday they had developed a vaccine that targets breast cancer tumours before they become malignant, possibly making a new treatment for the disease... [T]he University of California, San Francisco, has applied to begin human trials within three years.

...Of 57 [NZers] studied with vulva cancer between 1965 and 1974, only one was under 50 years old[. In comparison, of 57 NZers] studied with the... rare type of... cancer between 1990 and 1994, 12 were under 50... Auckland researchers have started studying why vulva cancer is taking hold of younger generations, including [patients] in their late 20s. [A] Dr... from the Research Centre in Reproductive Medicine at National [Gals'] Hospital, said most younger [patients] got the cancer through a common [STD, whereas t]he cancer developed in older [patients] as part of ageing... generally [among those with] a history of a chronic skin disease... "It's unusual to see one type of cancer caused by two different ways. Academically it makes it a very, very interesting study." ...[the] research leader... said there had been a huge surge in the number of younger [patients] with the pre-cancerous condition, called VIN. "This is a new disease [in younger [patients]] and it... has gone up 10 times over the past 20 years. What's it going to be like in another two decades?" ...While researchers around the world had noted a rise in younger cases, N[Z] specialists were the first to come up with explanations. [The leader] said cancer was never caused by one single thing. [Patients] with the pre-cancerous condition were found to carry t[he] papilloma virus, were usually smokers or had low immune systems. The cancer symptoms include itching and a wart-like growth... Overseas researchers were trialing a vaccine to protect against the papilloma virus, which is also linked to cervical, penile and anal cancer.

...[NZers will] be among 430 high-risk families on an international bowel cancer registry as part of research into one of the Western world's main killers. The four-year project, based at the University of Queensland, has been awarded a \$4.4 million grant from the National Institutes of Health in the U[S]. There will be registry centres in six A[US]n cities and Auckland. [The head of the research team], who has already set up the Queensland Bowel Cancer Family Registry, said the medical profession had been slow to accept the genetic link in bowel cancer... [One NZ] family whose members had a high incidence of the disease were repeatedly told by their GPs that it was not hereditary.

...A new class of drugs known as "super aspirin" could help prevent and treat bowel cancer... The drugs[, which are]... 50 times more effective than aspirin in making [cancerous] cells kill themselves... have all the benefits of normal aspirin but none of the side-effects when taken in high doses, say British doctors... Regular aspirin has been shown to help prevent heart disease and bowel cancer, but used over a long period of time or in high doses it can cause ulcers or bleeding of the stomach lining.

...Cancer and cardiovascular diseases are two of the great medical problems of our time and it is exciting when products come along that may be of assistance... [T]he Michigan Medical Foundation announced in the "Journal of The National Cancer Institute" that a modified form of citrus pectin prevents the spread of prostate cancer in rats... The researchers believe that the compound may also inhibit the spread of other malignancies, including breast and lung cancers and melanoma. The researchers suggested that the ultimate goal may be to have... [everyone] take a modified citrus pectin supplement after the age of 30. Then, if a primary malignant tumour develops, they would be helping to protect themselves from the cancer cells spreading throughout the body... [Incidentally, guys] treated for testicular cancer have a 43[%] higher risk than average of contracting other types of cancer within 20 years... The metal-based drugs and radiation therapy used to treat the cancer are thought to be factors.

...Targeted blasts of radiation have proved more effective in treating... skull-base meningioma... than open surgery, according to a new study... Neurosurgeons at... the Stanford University School of Medicine... used a technique called LINAC radiosurgery, in which radiation is generated by a linear accelerator that rotates around the patient's head, delivering the radiation dose in a series of precisely computed arcs converging on the target... A meningioma is a relatively common and usually benign type of brain tumour, but it can cause seizures by putting pressure on adjacent brain structures and by irritating surrounding brain tissue. In many cases meningiomas are on the surface of the brain and are easily removed through surgery. But for meningiomas along the skull base, surgery has the risk of damaging cranial nerves or arteries... [In related news, a] Massey University research team has discovered a small compartment inside human nerve cells that determines whether such cells commit programmed "suicide." The discovery has widespread implications in the search for cancer cures, and for those trying to understand the triggers of mental illness. [The b]iochemist... who made the discovery, said it was believed the compartment, known as a "transport vesicle," was transported down the longest part of a nerve cell, carrying a signal which told each cell to stay alive. Some spinal motor nerve cells can be up to a metre long. Programming cell death was a form of deliberate suicide, the body's way of getting rid of unwanted cells. More nerve cells were created during development than were needed, and those which did not make the right connections were allowed to die. Normal nerve cells neither divided nor died through out life, but if they did, tumours such as childhood neuroblastomas could result. Some psychiatric and neurodegenerative disorders might also result from premature cell death... [The biochemist, who] began his research at the University of California in San Francisco... [and] has been at Massey for three years... has just been awarded a \$138,000 grant over three years from the Health Research Council.

...THE N[Z] medical research centre that earlier this year unveiled its breakthrough cancer vaccine has made another new discovery in cancer treatment. Wellington's Malaghan Institute has found that particular stimulation of the body's immune system allows it to fight disease more strongly and possibly sooner than it normally would. The research means the body could fight cancer more effectively and has implications for fighting many other diseases. The work is part of the institute's cancer immunotherapy programme... T-cells activate the immune system, but a protein called CTLA-4 turns off the t-cells. The research has shown that by using an antibody to the protein, CTLA-4 can be stopped from turning off the t-cells, therefore allowing the immune system to fight better. The institute[']s... director of research... is excited by the development, which will be published in the prestigious international *Journal of Experimental Medicine* later this month... [The director left NZ] last week on a six-week tour of Europe in an attempt to attract \$1.5 million... "The money will be essential in keeping us going, there is just not enough money in N[Z]."

...NZ] scientists have reported two potential breakthroughs in cancer treatment. Wellington researchers have identified an antibody which stimulates the body's immune system to fight cancer and other infectious diseases... The... Malaghan Institute of Medical Research... director of research... is in Europe, attempting to raise \$1.5 million to fund research. The present research is funded by the Cancer Society. The institute recently announced plans for clinical trials of a new cancer vaccine. Meanwhile, a South Island research team said it had moved a step closer to developing a cancer vaccine. Christchurch Hospital and Otago University have isolated white blood cells, known as dendritic cells, which trigger the immune system to recognise cancers and attack their proteins. The vaccine is made from a patient's own dendritic cells, purified with an antibody and combined with cancer proteins. The research leader... said [it] hoped the first human trial of the vaccine would take place this year.

...A research team has moved a step closer towards inventing a vaccine against cancer. The treatment being developed by Christchurch Hospital and Otago University... has fewer side-effects than current cancer treatments such as chemotherapy and radiotherapy... The method works on minute components of white blood cells... Because of their small quantity in the blood (0.1% of white blood cells) some scientists believed dendritic cells did not exist. But after 17 years of research, [the] team not only confirmed they existed but developed an antibody, called CMRF-44, which helps purify the cells so they can act more efficiently... The first human trial of [the] vaccine is expected to take place in N[Z] later this year.

...A new weapon in the fight against cancer[, which]... offers "extreme promise" with fewer side-effects than other therapies... should move out of the laboratory and into Wellington Hospital later this year... After three years of work at the Malaghan Institute of Medical Research... [- NZ]'s only independent medical research organisation, [which] is funded by donations and research grants... - ...researchers and hospital cancer specialists are about to start testing a process that involves modifying a particular type of cell to stimulate the immune system to fight the tumour. The... process involves removing dendritic cells from the patient and growing them to relatively large numbers before stimulating them with an antigen from the tumour. The "armed" cells are then replaced in the patient... Initial trials, which doctors hope will get ethical approval soon, will be with patients who have had chemotherapy but in whom some residual cancer remains.

...More than five million of... the... 10 million new... cancer cases occurring around the world each year are preventable, says an editorial in the *Medical Journal of A[US]*... "The single greatest barrier to improving the control of cancer is human behaviour;"... [The editorial claimed that] the critical point in cancer research had been passed. The main priority was to think strategically about gaining the benefit from what was already known... By 1980, controlled trials had shown that [gals] who had surgery for breast cancer could have their chance of survival improved with post-operative chemotherapy. By 1985, similar trials had shown that radiotherapy could prevent local recurrence of cancer in [gals] who had less than a total mastectomy. "However, evidence from breast cancer treatment surveys indicate that many [gals] who could have benefited from post-operative chemotherapy and radiotherapy were not receiving it up to a decade later... How long, then, will it take us to fully capitalise on the great discoveries in molecular biology and molecular genetics now being made?"

...[T]he folks at tiny Cell]-Pro, Inc... like most biotech researchers... prefer to toil far away from the gritty reality of illness and human suffering. So when the chief executive of their Bothell, Wash., company announced a year ago that [it] had developed a deadly lymphatic cancer and that his slim chance for survival might rest on their lab results, it was more than they'd bargained for. They already knew their company was fighting for survival, locked in a legal battle over patents with a competitor. Now they were also supposed to save their boss? [The boss didn']t mean to put pressure on his employees, but his life hung in the balance. At 49, the deceptively tanned and fit executive had... a rare case of advanced mantle-cell

lymphoma. Doctors told him the average life expectancy for the disease was 30 months, and indeed, his initial round of conventional chemotherapy was unsuccessful. But by coincidence, CellPro scientists were experimenting with a new way to boost the success rate of the very operation recommended for this type of cancer: a bone-marrow transplant. In one form of this procedure, doctors remove from the patient's bone marrow a supply of stem cells... and put them aside for safe-keeping. Then they use powerful doses of radiation and chemotherapy to destroy all the cancer cells in the blood – in the process, destroying the healthy blood cells as well. Finally, they try to rebuild the blood supply from scratch by reinfusing the patient with the original stem cells. Invariably, however, some cancer cells slip in with the stem cells. CellPro was working on a procedure that would reliably separate cancer cells from stem cells. If those cancer cells could be completely purged from the blood, the cancer might not recur. The problem was that CellPro's experiments were still in their infancy... First the stem cells were collected in an elaborate maze of plastic tubing, then they were purged of cancer cells – a confetti of malignant cells sticking to columns of coated beads like flies to flypaper. Unfortunately, the purging process wasn't eliminating all the cancer cells. The experiment seemed to be failing. Then, in a last-minute brainstorm, [the scientists] decided to reverse the order: purge the cancer first, then collect the stem cells. "It worked,"... With a "compassionate use" waiver from the U.S. government, the procedure was ready for testing. "[Our boss] was the guinea pig,"... Almost a year later, [the boss] shows no sign of cancer.

...Scientists have managed to wipe out cancer in some laboratory mice by creating blood clots that cause "miniature strokes" that kill the tumour. The experiments eliminated 40[%] of tumours within hours and succeeded in shrinking many of the other cancers. But the scientists caution that there are still considerable hurdles to overcome before the technique can be tried in people. When cancer tumours form, blood vessels develop to nourish them. In addition to allowing the tumours to grow and thrive, these vessels can also carry cancer cells to other parts of the body. The... University of Texas Medical Centre in Dallas... developed an antibody that can... tell the difference between newly formed blood vessels and established ones... and deliver a clotting factor... directly to the new blood vessels... The researchers also hop[e] to develop a tumour necrosis therapy that would use a monoclonal antibody to carry toxic substances such as radioisotopes into the core of a tumour and kill it from the inside... this approach could eventually be a follow-up to the blood-clotting approach, delivering a "one-two punch" to tumours.

...[a] Yale cancer biologist... ha[s] genetically altered salmonella... to seek out and destroy tumours in mice... [The] expert in melanoma biology, said... salmonella strains could potentially be used to fight cancers of the skin, breast, colon, prostate, liver and lung... Yale has licensed a New Haven-based company, Vion Pharmaceuticals, to develop a clinical product. Vion said on Monday that it anticipated clinical trials on humans by the middle of next year.

...[People who are] fortunate enough to survive a BONE-MARROW TRANSPLANT may face another problem later: an extremely high risk of developing a new tumor in the brain, liver or elsewhere. These tumors may be caused by the treatments with high doses of radiation that transplant patients require.

...*Forget about transplants. Soon, people with failing tissues or organs may have new ones fabricated in a laboratory...* THE world saw him on TV a while back, the 10cm mouse with the 7cm ear. It wasn't just the size of the appendage that looked so strange, or its placement on the middle of the creature's back. The weird part is that it wasn't a mouse ear. It was a perfectly formed human ear – and it was alive. Tissue engineers at the Massachusetts Institute of Technology and the University of Massachusetts had grown the thing in a laboratory, from human cartilage cells, then implanted it surgically under the mouse's skin to see if it was viable. It thrived there, and though it may have been a nuisance, the recipient suffered no apparent problems. The three-eared mouse is a pretty good emblem of where medical science could take us in the new millennium. The burgeoning field known as tissue engineering didn't even exist 15 years ago. Today its pioneers are finding that almost any biological material can be coaxed from a culture dish. Bioengineered skin, bone and cartilage are already reaching the clinic... Several biotech companies are... racing to license skin substitutes that could revolutionise the treatment of burns and other serious wounds. Starting with cells from the foreskins of circumcised infants, engineers can now mass-produce postcard-size sheets of durable, uniform tissue that the body readily accepts... Working with calcium phosphate, [a] University of Texas chemist... builds structures that approximate the various textures of bone. When surgeons implant these devices, they're continually broken down and refurbished along with the surrounding tissue. So far only a half-dozen test subjects (all dogs) have received [this] bone substitute, but all have fared well. Implants placed in the animals' front legs converted to new bone within three years... Lab-grown organs, though farther off, are also in the works... The basic technique is to seed a biological scaffold with cells for the needed replacement part. When the structure is bathed in the right nutrients and growth factors for a period of weeks, the cells overrun the scaffolding, creating a ready-to-wear tissue implant. Researchers have already used the technique to fabricate... heart valves grown from blood-vessel cells [that] function normally in lambs. If human trials yield similar results, 60,000 Americans who now receive troublesome pig valves or mechanical devices each year could soon be growing their own. A Boston company called Reprogenesis has already launched human trials of lab-grown urinary valves and expects to start producing them commercially within two years. The same company hopes to generate natural breast tissue (an obvious improvement over saline or silicone implants). A company named Advanced Tissue Sciences, of California, has purchased the rights to market lab-grown facial features. As the MIT mouse showed the world, replacing a damaged ear, nose or eye socket is now theoretically as simple as building a scaffold from an MRI scan image. WITH luck, then, the tissues that hold us together will be fully replaceable within a few decades... Like engineered organs, lab-grown prosthetics for the brain and nervous system are still far in the future. But scientists are learning to cultivate nerve cells, and a few... are designing biomechanical substitutes. One of the early entries is LIVES, for Low-Vision Enhancement System, which costs about \$NZ7000 and has been commercially available for two years. Designed as a pair of goggles, the system features two wide-angle cameras and a zoom lens, which feed images to a battery-powered waist pack. After magnifying images and adding contrast, it projects them onto a pair of goggle-mounted screens. The effect is like that of watching a 1.5m-wide TV screen from a distance of 1.2m. Future models will offer advanced features, such as freeze frame and instant replay, as well as ports to accommodate video and computer feeds. But the system will still require at least partial vision. When the eyes can no longer receive data, the question becomes "Where can you plug in?" Scientists are pursuing at least two possibilities. Researchers at MIT and the Massachusetts Eye and Ear Infirmary are developing a tiny computer chip that would sit on the back of the eye, receiving visual data from a goggle-mounted laser and relaying impulses through the optic nerve to the brain... – a la cyborg... And researchers are fiddling with a system for mapping camera signals straight onto the brain's visual cortex. [Scientists are also trying to 'use brain activity to work as a mouse cursor, which may help paralysed people. "This type of system has application in only a very small group of disabled persons, but for those people it can make a very large difference in their quality of life." For the person who can't move or speak it is a huge leap forward. In the laboratories of a USAF base in Ohio, a link is made between the subject's brain and a computer, which will translate pilot mental actions into flight commands. "People have always dreamed about controlling objects or events or things with their brains and there's been a large body of research conducted over the last 30 years or so which has shown that people can learn to control their heart-rate, blood pressure, that sort of thing. It's called biofeedback. So we decided to take a look at harnessing that as an alternative control technology that might be applied in the Air Force for people with disabilities." Returning to the subject of low-vision enhancement, one company has developed 'adjustable silicon glasses' (they can be used by people with different eye-sight strengths), an AUSn company is producing '30-day contact lenses made from a plastic that allows the eyes to breathe', doctors are now 'putting new lenses in the eye', and 'plastic rings are being inserted to correct short-sightedness (the procedure – not yet available in NZ – isn't as accurate as laser surgery but is reversible').]

...Tiny, transparent rings implanted into the cornea may be the newest hope for near-sighted adults fed up with glasses and contact lenses. The plastic rings, slightly thicker than a contact lens, would be an alternative to permanent vision correction... Doctors implant two crescent shapes to form a ring around the cornea, a clear window that covers the pupil and iris... The rings, which took 10 years to develop, are made of a type of

plastic that is used in cataract surgery implants. Patients remain awake for the operation but are given anaesthetic eyedrops to numb the eye... Using a tiny spatula, the doctor inserts the crescents into pockets cut into the cornea. The procedure takes about 30 minutes... In the U[S] about 30,000 people have sought... photorefractive keratotomy... [and a]bout 250,000 people a year receive radial keratotomy...

So many N[Z]ers are having refractive eye surgery which enables them to throw away their glasses that medical insurance companies are no longer prepared to pay for it. Photo refractive keratotomy (PRK) using a laser can correct myopia, hypermetropia and astigmatism, complaints listed by the W[HO] as diseases, but rated by insurers as "elective surgery" because glasses and contact lenses make the conditions "bearable." Yet for patients like [a] 34-year-old Auckland accountant... who couldn't see the clock beside his bed without putting on his glasses, PRK has been "brilliant. It has changed my life..." [The accountant, who] had the operation four years ago and had 80[%] of the cost met by medical insurance... thinks it "disgusting" that it's been delisted. Southern Cross Healthcare['s] general manager... is not about to argue the toss over the condition or the operation. However, Southern Cross regards it as "a procedure of choice" as opposed, for example, to an operation for a cataract which has to be removed otherwise it will cause blindness... [The manager] confirms that PRK is "very popular," costing about \$3000 for the operation on both eyes. Southern Cross had been processing more than 4000 claims a year before removing it from claims on January 1. Other companies cancelled coverage last year and worldwide the procedure is not generally covered by insurance... Refractive surgery was pioneered by a Russian eye specialist... in 1977. [The Russian] devised radial keratotomy, involving microscopic incisions on the cornea which, upon healing, contracted and altered the cornea's curvature. The application of lasers to refine the technique came about a decade ago and has been available here for more than five years. PRK uses a laser to reshape the curvature of the cornea, in cases of myopia and hypermetropia, and is done directly on the cornea. A new procedure known as Lasik – short for laser insitu keratomileusis – is now being introduced. It is said to extend the chances of successful treatments for people with extreme myopia. Lasik is done after cutting a hinged flap from the front of the cornea. This is replaced after the cornea curvature is corrected by laser and bonds fully in minutes without stitches. It lessens recovery discomfort and pain... [but if] the... \$770,000 laser machine... calibration... is[set] too high, the extra power could destroy too much corneal tissue... a North Shore [GP] had the surgery for "lifestyle reasons." [The GP is] a competitive yacht[ie] and mountain bike rider, both activities which require a keen eye at a distance and quick judgment... [H]is surgeon... operated on only one eye[and the GP] is delighted with the outcome... The initial surgery was no problem but [the GP] did suffer severe pain 11 hours later. [However, the GP] was ready for it with prescribed painkillers. [The GP] recovered in two days and was driving within a week although it took nearly three months for his eye to lose ghosting of image. That made him anxious and upset but now his vision is sharp... [The general manager] of the PreMac Group of consulting companies, wore glasses for nearly 30 years before having PRK... "...I found it a big decision. They can't guarantee a 100[%] success rate. Thoughts like 'will I be blind in one eye?' go through your mind... They expected there was an 85[%] chance I'd get 20-20 vision and a 90[%] chance I'd be able to get my driver's licence without glasses. I now have perfect vision and don't wear glasses for anything." Blindness is less of a risk than wearing contact lenses, according to... ophthalmologists... They understand patients' concern about the outcome of the operation, but say at the worst there will be no improvement. Worldwide there have been no reports of blindness attributable to PRK. There have been some cases of sight being worse... PRK (and Lasik) only take about 10 minutes – several pre-operative consultations may be necessary... Ophthalmologists ban LASIK on patients under 18 because the eye is not fully developed until then.

...an Auckland University English lecturer... is only 40 but has the eyes of an 80-year-old. The mother of two has always been scared that by the time [the lecturer was 80 it] will be blind, but as of today, World Retina Day, [the lecturer] has reason to hope for a brighter future. Otago University researchers report a breakthrough in the study of her condition, retinitis pigmentosa, an inherited eye disease which affects about 1000 people here and millions around the world. It causes progressive degeneration of light-detecting cells, leading to night blindness, tunnel vision and blindness. In collaboration with the Institute of Human Genetics in Hamburg, [the researchers]... have discovered defects in two genes found in the retinal epithelium – a layer of cells at the back of the eye. The genes provide instructions for two proteins that play a vital role in transporting vitamin A to the eye's light-detecting cells, which require a continuous supply of the vitamin... [The lecturer] was diagnosed when... [aged] about 28 but four years ago it was found the condition was occurring in the middle of her eye in the macular... "That's where your fine focus is, where colour vision is. It's the part of your eye that means you can read." [The lecturer] has a field of vision, but anything more than arm's length away is just a shape... [The lecturer] can see her husband and children by getting close enough to hug them but teaching is trickier... "News like this is incredibly important to anybody with that disease because what looks like a dream – 'oh God, one day I might be able to see' – is getting a lot nearer."

...[Have you ever healed a blind person? Did you know that most blind people in the world today – over 30 million – live in poverty stricken areas where health services are virtually unknown? 50% of these unfortunate adults and children have lost their sight to cataracts, which can be easily removed by a simple 15-minute operation costing only \$27! To protect blind children and adults from such a dark fate, Christian Blind Mission International conducts its programme to restore sight to these people. Last year, every three minutes a blind person's eyesight was restored through CBMI's world wide programme. Removing a cataract is not a difficult feat for an eye surgeon, but for a penniless, blind person, it seems a miracle that someone would find his way to their village and heal the poorest of the poor at no cost. Nearly all of the formerly blind people who regained their eyesight through this programme have been able to earn their own livelihood instead of being forced to survive as beggars. Many of them also want to learn more about the God of their helpers. Who can deny these curably blind adults and children? They depend upon gifts from compassionate people like yourself, who consider CBMI's programme worthy of their support. Even if you can only send \$5 for the necessary cataract eye-glasses, you can help turn despair into hope. No gift is greater than eyesight; it is priceless.]

...*Surgeon's cash plea for gift of sight IN THE [LAST] WORLD...* a... N[Z]-born eye surgeon['s]... gift of sight to the blind must appear almost god-like. However, [the surgeon] (41), one of the Fred Hollows Foundation's four medical directors, describes his work more humbly: "It is to give choices to people who have no choice." ...A campaign to be launched this week hopes to raise... \$500,000 to extend this... programme. "When I was in public practice I operated on a journalist who was blind in one eye. [The journalist] asked what would [it] have done if I hadn't been there. The answer was 'go down the road to another surgeon'... many others do not have that choice,"... Around 40 million people worldwide are blind, half by cataracts. N[Z] eye surgeon Fred Hollows realised the greatest obstacle to restoring sight to those with curable cataracts was the cost of intraocular lenses[, and] set about establishing laboratories to make them. This week marks the fifth anniversary of the foundation's establishment.

...In the five years since the Fred Hollows Foundation was established in 1992, 100,000 people with cataract blindness have been helped to see and 360 surgeons have been trained in modern cataract surgical techniques. Surgical training programmes have been established in Eritrea, Nepal and Vietnam, and state-of-the-art intra-ocular lens laboratories have been built in Eritrea and Nepal. Intra-ocular lenses are small perspex discs inserted into the eye to replace the cloudy cataract, in what some call the most successful surgical procedure ever devised. Professor Fred... established himself as a pioneer in the treatment of eye disease among the A[US]n Aboriginal people before becoming a consultant with the W[HO]. The NZer visited many Last World countries where [it] was inspired, in particular, by the remarkable work of people in war-torn Eritrea, who were producing medical supplies and performing life-saving operations with only the most primitive resources. The charismatic and plain-speaking doctor died on February 10, 1993, aged 63. But his work, tackling the huge backlog of cataract blindness in [Last World] countries continues unabated. In 1995 N[Z]ers donated the initial money needed to begin an African Microsurgical Training Programme designed to train 66 surgeons in 12 countries over three years – giving... \$300,000 in the "Fivers for Fred" campaign. They are being asked to contribute again, over the next month, to support the ongoing work in Africa. In a region with 500 million people (excluding South Africa) the number of new cases of cataract blindness is estimated to be... 500,000 a year. The backlog... is about 2.5 million. The focus of the Africa Campaign this year is the \$25 total cost of

a cataract operation, including the intra-ocular lens, suture, pharmaceuticals and surgical costs. In the West the lens alone... cost \$400. Creating laboratories in Eritrea and Nepal, which use sophisticated "clean room" technology and operate in accordance with international standards but can still produce the lenses for just \$5, is a key point in the foundation's success. Both laboratories sell their lenses to other... countries for from \$NZ10.94, depending on volume, making them self-sustaining facilities. Profits pay for health care programmes... The foundation has also developed... a compact, portable, operating microscope which, at \$4523, is half the cost of those on the commercial market... [I]t can run on mains or battery power. A portable laser for treating "capsular opacification," a side effect of IOL implant surgery... [is] also on the foundation's drawing board.

...During the past 30 years, lasers have become a familiar and versatile tool. After years of effort, a research team said it has created the first atom laser – a device that shoots out a tight beam of atoms instead of photons, making possible even more precise surgery. However... an atom laser can exist only in an extremely low vacuum – at temperatures close to absolute zero, where atoms slow down and assume a new form of matter... At... only 40 billionths of a degree above absolute zero... the atoms overlap, forming a single blob known as a Bose-Einstein condensate, named for Albert Einstein and the Indian physicist Satyendra Bose, who predicted its existence 70 years ago. Instead of flitting about independently, like normal atoms... the frigid particles move in the same direction. The final step came when the MIT team extracted a focused beam of atoms from the condensate by applying a powerful magnetic field. On their computer screens, the physicists saw multiple pulses of "droplets" each containing 100,000 to several million atoms.

...*Laparoscopic surgery explained...* It differs from conventional "open" surgery because the laparoscopic technique allows the surgeon to operate from the outside, through very small incisions, and view the process on a monitor like a tv screen... "The image on the monitor is magnified 16 times so the dissection is far more precise. There is almost no blood loss. There is little pain so the patient does not need to be drugged heavily... [- but] is under full anaesthetic... [-] and is mobile much sooner, recovering far more quickly." ...While the laparoscopic procedures themselves sometimes cost a little more, this... [is offset by] a much shorter hospital stay and period of convalescence... [It] shortens convalescence for cholecystectomy (gallbladder removal) for example, from six weeks to just ten days and for an appendectomy from three weeks to around five days.

...[an Aucklander] can steer her bike with both hands these days[, and] is also coming to grips with tying shoelaces and brushing her hair with her left hand. No big deal for a 5-year-old? Perhaps not, but her left hand is not the usual run of left hands. [The girl], who was born with a severely short arm, is the first N[Z] child to receive a myoelectric one. The advanced artificial limb offers more control over movement than other equivalent types. Tiny fingers... move[d] by flexing muscles in her arm socket make the limb seem almost real. It is also less cumbersome than other prostheses made for children. Previously the young were not fitted with electronic arms because of cost and the difficulty of training them to use one... A German company... supplied the \$8000 limb... At the moment [the girl] wears it... only four hours a day. Occupational therapy classes are teaching her how to grasp objects and twist her wrist. As [the girl] grows the artificial arm will be replaced with a bigger one with a larger hand.

...[a Christchurch] gynaecologist... made medical history for... [NZ and AUS yesterday by using] a voice-controlled robot to perform an operation. The Oxford Clinic surgeon said the robotic "third hand," known as Aesop, had performed well during the videoscopic hysterectomy. Aesop... acts as an assistant... [by] holding and positioning the telescope and camera and allowing the surgeon to control the view of the patient's anatomy.

...Telemedicine is increasingly a staple in the doctor's bag of tricks... [T]he use of video link-ups has boomed in the past three years. In N[Z and AUS] video links are used mainly by psychiatric services, but in the U[S] a wide range of clinical specialists are finding innovative ways to use the technology... Medical peripherals can be pressed into service, for example by video-enabling diagnostic or surgical scopes, or hooking up X-rays, CT scans or motion scans... [Telemedicine] has particular application to rural areas, where some studies say up to 60[%] of people delay seeking care because of location, economics or culture. This means when they finally get help, the costs of treatment are likely to be higher... [The] Asia Pacific telemedicine marketing manager for video conference equipment supplier PictureTel... is... pushing its value for medical education. Students, or specialists in other hospitals, can link with operations or to ward rounds, to pick up the latest ideas or techniques... While most video conferences are conducted over an ISDN line, they can also be done with T1/E1, ATM or LAN technologies... Pilot programs are being conducted in Thailand and China using VSat... [In another development, geographically scattered NZ] public health workers are... using World Wide Web pages to network and plan strategy. Even tiny dissident community groups will now be able to keep in touch with the bigger players – debating in open forum, and forming closed groups once they become serious about strategy. To boost this trend the [RHA]s have funded a project run by[an] Auckland public health academic... A first move for the project was to set up a public health Web site – www.publichealth.org.nz... [T]his site provides a neutral meeting place... The Web allows collaboration and reduces duplication of effort... It is going to become the normal mode of communication... [because in] the hard-strapped public health sector face-to-face meeting has become too costly.

...*Disease sufferers are finding comfort as well as information on the Internet[, and]... the global communication system is also transforming the patient-doctor relationship...* The Internet has transformed the way people throughout the world deal with health issues... [A] telephone connection to the Internet [links patients with] Web sites that offer medical information, advertisements for products, and bulletin boards with the latest news and gossip... There are literally hundreds of sites people... can look at. Some contain information from medical journals, others summarise conference proceedings. Many Internet browsers find their new-found knowledge gives them a better background for dealing with the once-mysterious medical profession. "It gives me back-up information to ask questions of the doctors," says [a mother], whose 10-year-old son has cystic fibrosis. For her, the word of a doctor is no longer the ultimate authority... [The] president of the New York-based Body Health Resources Corporation, which runs a popular HIV site, says: "The HIV/Aids population has led the way in changing the physician-patient relationship, through maximum preparation for the clinical encounter and the evolution of the role of patient as advocate. Do we find people become more informed and empowered when they talk to their doctors after visiting our site? Definitely." Doctors have recognised this too, and many give patients with HIV an active role in determining what their treatment should be... Health professionals use [the Internet] too, but sometimes worry about the quality of information. Some of the forums, they complain, amount to little more than gossip sessions. "I am a strong advocate of the use of e-mail discussion forums," says... a pharmacist in Alberta, Canada. But [the pharmacist] points out that no one screens what goes on the Internet, and desperate people grasping at any bit of information could become misinformed... • [The West Auckland]... Crown Health Enterprise... Waitemata Health has challenged other [CHE]s to follow its example by using information systems to reduce long waiting lists, endless paper trails and inefficiencies... On general surgery, patients needed to fill out 30 forms and see 20 people before going to the operating theatre. "In other departments it was worse[...]" said the[...] senior general surgeon at Waitemata Health... The CHE has re-engineered all its processes after a two-year multimillion-dollar overhaul... The project involved patient management systems from Information Builders of A[US], Digital Alpha servers, and facilities management and networking services from EDS. Auckland-based health systems developer Galen Group developed emergency department, surgical centre and operating theatre software specifically to meet the CHE's requirements. The system runs across multiple departments and buildings so data can be shared and analysed. The software was developed in Visual Basic using SQL Windows and runs on an Oracle database. The new systems will link directly into the National Health Index and other outside systems, such as those of GPs, using a product called DataGate... While the system has the potential to connect directly with GPs, none are currently doing so.

...Auckland company Orion Systems is leading the way in health systems connectivity with its locally developed standards-based messaging software, Symphonia. The advantage of the software is it gets different health computer systems that could not previously talk to each other working in harmony. The software... has hooks into most databases, handles objects and can work with Web browsers. To date 60[%] of Orion's

business is in exports... [-] Symphonia... has just... [been] sold... to a managed health care system in Florida[, while other] sales include KPMG Health Systems in England, Siemens AG in Germany, Washington Hospital and 350 veterans' hospitals throughout the U[S -] ...although local users are quickly becoming aware of the efficiencies they can gain from the software. Orion Systems[] account manager... claimed a six-doctor practice, for example, could save about \$60,000 by electronically connecting into laboratory and radiology results... [The manager] said the international success of the product could be attributed to product information made available on the Internet and Internet-based fax marketing. Orion's major client, however, continues to be the HealthLink network, run by its subsidiary SectorNet. HealthLink is a value-added network connecting the National Health Index and most major health suppliers in N[Z]. "We have 80[%] of all hospitals, 100[%] of laboratories and 35[%] of GPs who transfer pathology and radiology results online... Laboratory results transmitted electronically last year would have previously taken 120 typists about 40 hours a week." ...there was pressure from the pharmaceutical area for accurate information on the use of generic drug equivalents. "There's huge amounts of information on the N[HI] and all sorts of little data bases that could be used for effective disease management, for example diabetes. A huge percentage - about 20[%] - of the national health budget is spent on diabetes but there are no major disease management initiatives in place." [The manager, who believes NZ]... is a world leader in terms of making health systems talk to each other... claims it will ultimately become a requirement for users to have better access to information about medication, side-effects and recommended dosages. "That kind of information is kept all over the world in medical libraries and private companies, databases and health magazines. If you have a national network system, GPs or pharmacies can connect into [it] and get relevant information."

...Major health reforms announced in Britain last week have been welcomed by a contingent of local software developers who are planning a trade mission to promote N[Z] as a leading provider of health technology solutions. Five... software developers, who often compete for the same business, have agreed to cooperate in the joint mission which comes just as the British Government published a white paper on the future of its National Health System... Included is the requirement for all British doctors to be connected to a new nation-wide computer system by 2002.

...[according to the] general manager for information systems at health funding agency North Health... N[Z] Health Information Services (NZHIS) should not be imposing its idea of integrated health information systems on the whole country... a[s] the nationwide "health intranet" network was an "idiotic idea" which would prove to be a "wasted investment." ...Health professionals will be asked to foot half the \$750,000 bill for rolling out the Internet-based network but there is concern the benefits may not be there for those who have built or are building their own systems. It is estimated that North Health, and Health Benefits Ltd which handles electronic claims, have each spent \$400,000 to \$800,000 on electronic communications with GPs and other health professionals. [The NHI] run by the NZHIS was only important if it made a difference to people's health. "At the moment it makes no difference at all." [The manager] suggested the NHI database, which provides a unique identifier for medical records, could be regionalised so there was more incentive to ensure the data was accurate. The database... had just had a major technology overhaul. However, the N[HI] is significantly out of date with 4.5 million names on it, including duplicates and people who have died. [The manager] was also critical of the Government's... up to \$3.95 million... investment in health information solutions being evaluated by the Ministry of Health. The Government is evaluating... 62 proposals [-] requesting just under a total of \$12 million... in funding... [-] from doctors, pharmacists and groups of health professionals to enable them to better share information. "We're here to buy health services for people. Anyone who supplies health services has an obligation to supply information to others in the health services area. It's their problem to surround themselves with computer systems - not ours..."

Health computing dollars would be better spent on the clinical side where real efficiencies can be made rather than on large, incompatible administration systems... That is the view of [a]medical practitioner and software programmer... who believes health organisations are buying administrative systems with little thought as to how they will be integrated with clinical systems... "Doctors are overburdened. Instead of creating more administrative processes for them we should be putting in systems to save them time and ensure they are fully informed. That will have a huge impact on the quality of care." [The medical practitioner] was heading for a career as a surgeon at Middlemore when... [it made] a decision... to... develop software that would make the process easier for doctors and specialists. [The practitioner] formed Plato CIS and installed the first of his new specialist systems at Middlemore Hospital's orthopaedics department. From there, Plato modules were developed for plastic and general surgery, ear, nose and throat, audiology and radiology departments. The most recent approach has been to set up a paperless office trail in the surgical department at Middlemore so doctors can have access to patient records even at the super clinics outside the hospital using a secure intranet... [The] orthopaedic surgeon at Middlemore... had considerable input... on how Plato would work in orthopaedics several years ago. Now Plato is seen as a major time saver. "We've seen a one third increase in secretarial efficiency. Even though we've had an increased amount of work going through the department we've been able to get away without employing more staff... Plato... minimises the loss of clinical information and has allowed us to conduct electronic audits which has had a major impact on quality control by patient and by surgeon. We are able to review progress every six weeks..." Plato uses a fuzzy logic-based artificial intelligence which... is patented here and pending in the U[S]. The object-oriented product was developed using Microsoft SQL Server, Visual FoxPro and Visual Basic. It runs OLE (object linking and embedding) on Windows NT Server and its integration engine works with most databases... Plato is now installed at departments within Auckland, Palmerston North and Tauranga hospitals, a government health pilot in the Hokianga and at Whangarei Hospital... [The practitioner, who] is having the product redeveloped in Java... has... been invited to demonstrate the product at the Royal Prince Alfred Hospital and a new children's hospital in Sydney and Sheffield Hospital in Britain... [In related news, the Privacy] Commissioner... is investigating concerns about patients' health records being kept on computer databases. [The commissioner] is examining whether the data collection breaches the Privacy Act and whether health agencies should collect and hold sensitive information. The... possible misuse of information and lack of confidentiality is upsetting patient rights advocates, including [the]Alliance health spokes[person, who]... said multiple access points would make it impossible to ensure unauthorised people did not see personal information. The Health Information Service denies this and says security will be as tight as the latest technology can be - similar to the Internet's banking services. [The commissioner said it] took seriously any concerns about health information because it was such a sensitive subject. Part of his investigation will look at North Health's supply of computer disks containing confidential patient information to [GPs]... Last month [the Alliance] criticised North Health in Parliament for sending a disk containing patient names and code numbers through the mail. North Health... said the CD ROM is protected by encryption and can be activated only by someone with a password unique to that disk... Under the health information privacy code, patients must be told if information is being collected, the purpose for which it will be used and who will hold it. Patient databases already exist. The Royal N[Z] College of General Practitioners has collected information from the patient records of around 800,000 N[Z]ers. Patient names are not included... Doctors have also expressed concerns about the proposed record-sharing network, mainly about funding issues. Support for the system has come from smaller doctor groups who lack the resources to analyse their own data.

...Plans for a national database to monitor children's health records have been labelled invasive and a waste of money. [A] civil libertarian... said [it] understood legislation would be put in place which forced health workers to supply patient details to the database. Tabs would be kept on children from birth ensuring they got care, such as vaccines, at the appropriate age. Parents of children with incomplete health records would be tracked down... A Ministry of Health manager... last night said moves towards a national database had been signalled for years. [However, the manager] would not discuss the matter further as... the Associate Minister of Health... was yet to publicly release details. [The libertarian] said... doctor-patient confidentiality would go out the window if medical professionals were forced to supply information... [and] it was folly to spend millions of dollars on a computer system while children languished on waiting lists for ongoing problems like glue ear.

...the Associate Minister of Health... told a child health conference in Auckland yesterday that a pilot project... [for a] national health database covering every child in the country... would begin next week in Hamilton... [E]very newborn baby would have a number, which would go to a health provider, such as Plunket. The provider would be chosen by the baby's parents, who could refuse to take part if they wished. The child and its health details could then be tracked, no matter where the family moved around [NZ]. Information on the file could be passed from one health provider to another, but only with the consent of parents or caregivers... [T]he information could not be passed on to other agencies such as social welfare or the police[(the)... Government is looking at ways to link the [social welfare]Community Services Card... with the unique health number assigned to most N[Z]ers... held on the... NHI)... [The minister] compared the process to taxpayers handing over private information to the Inland Revenue Department and rejected claims it could invade people's privacy and put extra pressure on parents. "Society has got to make a choice here. They either accept poor, [Last] World health statistics or they want to go forward. I'm happy to entertain the debate but I'm not going to back off on the niceties of this when children miss out. I don't think society will tolerate that." ...[the minister] had not yet discussed the issue with his... colleagues[but] did not believe the database would require any change in legislation. Many health professionals at yesterday's conference supported... better co-ordination and "tracking" of children who slipped through gaps in the system. Some said up to 20[%] of children were victims of problems such as cot death, child abuse and teenage suicide in later years because they missed out on good health care when they were young. But the privacy commissioner... said that once a database was established, people would be tempted to extend it to tackle other problems, such as truancy. Last year North Health was accused of using a similar planned scheme, called Healthy Homes, to collect information on parents who could be child abusers. The programme is still on hold – although from lack of money rather than any controversy over how it would work.

...A new programme under way in Auckland to care for acutely sick children in their homes is growing with the addition of a second intake of... nurses. Eighteen have graduated at the Auckland Institute of Technology's Akoranga campus in Takapuna after 17 weeks' specialist training... 15 nurses graduated earlier in the year and were now working in parts of Auckland and Northland... They are all senior registered nurses who were hand-picked for the North Health-funded specialist paediatric nurses training course. The course co-ordinator... said the concept of caring for sick children at home was modelled on successful overseas programmes. "It takes nursing into the home environment, where we feel best helps the children get well sooner... There's nothing wrong with hospitals, but this would add to the effective recovery of children... because of the support and comfort of family and friends,"... [By the way, a] widespread backlash has greeted a health manager's claim that children should get priority over the elderly in health spending. The child health manager of North Health... said yesterday that most people would rather have an extra \$100,000 spent on them when they were younger, as it would pay off over the rest of their lives... [T]he \$50,000 cost of a year's dialysis treatment in old age would amount to having an extra Plunket nurse as a young child... [The manager] was not suggesting taking existing money away from the elderly, but recommending that future increases go to children. But his comments... were publicly rejected by his own boss and... by the Associate Minister of Health[who]... was concerned to hear [RHA]s arguing for different priorities in spending. [The minister] said the authorities existed to set these priorities when they bought health services, so it was up to them to make the decisions... The president of the Association of Gerontology... said it was not helpful to pit young and old people, "our two more vulnerable and voiceless groups," against each other. But... debate was necessary so society could decide "what it is permissible to die from, when to draw the line between cure and care. It may be more cost-effective and beneficial to the individual and society to give an 80-year-old a new hip if the result otherwise is expensive care in a rest-home."

...WE all want good health, but how much are we responsible for ourselves and how much do we leave to the health professionals? ...health must be seen in a broader context when we start to question who bears the responsibility, says... [the] medical director of primary care for North Health and a senior lecturer in general practice at the Auckland School of Medicine[– who] believes responsibility for health exists on several levels, beginning with the individual. "Making informed choices about lifestyle is the basis of good health,"... While people may tire of hearing the same messages, individuals have an obligation to themselves and their families to weigh up the pros and cons of their lifestyle and how it may affect their future... The next stage of responsibility is picking up the warning signs of ill-health. Here the individual is still the first line of defence. Unfortunately, [the director] says, too many people ignore symptoms such as bleeding from the bowel or breast lumps. Whether they are scared of what it may mean or believe it will go away, such people risk a condition – which should have been easily treated – becoming difficult to cure. Children need regular health and dental checks, immunisation and to be taught good diet and hygiene habits. Doctors and health professionals, meanwhile, are responsible for more than just health management. Providing best practice in a good and safe environment, ensuring accessibility particularly for the disabled, making patients feel comfortable in the surgery and being aware of cultural sensitivities – all are within their role. "Whichever way you look at it we are all responsible, either directly or indirectly, for our health and the health of others,"...

"Physician, heal thyself," wrote St Luke. Fine. I'll buy that. But what about, "Physician, research on thyself?" "Not bloody likely," would be the response from my friends. Bravery in the field might extend to late nights or lost weekends, but when it comes to self-experimentation, count us out. Fortunately, not all doctors are yellow-bellies. Take... an A[US]n physician who thought the unthinkable, and did something about it. In the early 1980s, several perspicacious researchers saw tiny, wriggly bugs on the walls of stomachs chopped out of patients with peptic ulcers. They had no idea why they were there; most thought they were just hanging around feeding off the remains of the last meal. An unimportant finding, was the conclusion. A few people went against this grain of opinion and got it into their heads that these innocuous bacteria now known as *Helicobacter pylori* were not so innocuous after all. But how could one be sure? [The AUSn] had the answer. In April 1985, [the AUSn described how it] ate a sample of these bacteria, scraped from inside the stomach of someone else and grown in the laboratory. [The AUSn] "swallowed the growth from a flourishing three-day culture of the isolate." Clearly a [physician] with an original, if not discerning, palate. A week later, [the AUSn] was doubled up with bouts of nausea. Despite his anguished state, [the physician] allowed one of his clinical colleagues to take a look inside his stomach and clip off bits from his gastric wall. When these were placed under a microscope, it became clear these bugs were up to no good. They had caused a florid inflammation... In one selfless exercise, [the AUSn] had provided evidence that *H. pylori* caused disease. His story is now part of medical folklore. Since then, there has been an explosion of research about this casual acquaintance of our stomachs. Not only is it associated with peptic ulcers and gastritis... but it is also linked with gastric cancer and other rarer types of stomach tumours. For one unusual type of lymphoma... killing the bacterium also kills that cancer. So how many of us have this annoying creature? The frequency of infection rises the older you are. About one in five of us under 40 will have *H. pylori*, while that figure jumps to 50[%] over 60. Luckily, once it has been diagnosed, a cocktail of antibiotics provides the best chance of relief. All of which makes the recent description of the complete genetic signature of *H. pylori* quite remarkable only 12 years from its discovery as a human pathogen... The library of information that resides in these genes is arranged in a circle. There are more than 1500 books (the individual genes) and together these contain two million bits of data.

...While academics freely exchange data, companies – concerned about securing patents for their discoveries – maintain tight secrecy and insist that university scientists who collaborate with them sign complex agreements that ensure their silence. Medical research suffers as a result. "It's helicopter science," said... [a] former Harvard researcher... "Companies fly in, take what they want and then fly out again. When I was at Harvard, I saw this happening and I decided no one was going to do that to Iceland." [So it] set up DeCode, with the backing of local government and academics, and funded by international venture capital. Tens of thousands of Icelanders have given blood and their family histories. Eventually... DeCode's president... hopes most of [the nation's population of] 270,000... will contribute. Companies will then have to pay for access to Iceland's unique genetic heritage, formed when the island was settled by Vikings 1100 years ago and distilled through two subsequent population crashes – an outbreak of bubonic plague in the 1400s and an eruption of the volcano Heckla, which triggered famine in the 1700s. The reduction in Iceland's

gene pool has been dramatic and the usefulness of this limiting effect to science is revealed through the first ailment that was tackled by scientists using DeCode's database. In only 10 weeks they were able to pinpoint the gene for the world's most common neurological movement disorder – "familial essential tremor," an inherited shakiness of the limbs. Now projects aimed at pinpointing genes associated with... pre-eclampsia and... multiple sclerosis... are being established between DeCode and various pharmaceutical companies. And once these genes are found, the abnormal proteins that they are responsible for manufacturing can be isolated and studied. Drugs can then be made to counter their effects, tested and eventually marketed around the world... – though not in Iceland, for one of DeCode's stipulations is that all medicines made from use of its DNA database must be provided free to Icelanders... Tightly inbred populations such as Iceland's are invaluable for tracing disease genes and have led to the creation of a generation of "gene prospectors," scientists who pore over the world's isolated peoples – in Tristan da Cunha, Easter Island, the Brazilian highlands and Iceland – in search of DNA that can be linked to ailments... Gene prospecting has been labelled the ultimate exploitation of the [Last] World, with companies – such as Sequana Therapeutics of... California; Millennium Pharmaceuticals, of Massachusetts; and Genset, of Paris – being accused of acquiring the DNA of indigenous peoples in order to fill corporate coffers without thought, concern or benefit to natives.

...*Genes know their... rights*... Researchers have found two of the genes that help the developing embryo tell left from right when deciding where to put the internal organs. The heart, stomach and spleen normally end up on the left side of the body, the liver on the right. That placement is almost always determined within a few weeks of conception... But one time in 10,000, in a condition known as heterotaxy, the embryo never distinguishes left from right. The organs end up in the wrong orientation, and serious medical problems can result. People with heterotaxy rarely live past young adulthood... Mutations in the human gene, ZIC3, have been found in four families with members who have heterotaxy. And mutations in another gene, 1rd, can cause heterotaxy in mice... Although heterotaxy will never be cured... a number of treatments can be developed if the genetic causes of the disorder are better understood.

...Scientists have identified genetic defects that make people smell like rotting fish, an uncommon disorder that can lead to ridicule, loneliness and depression... No cure is known for "fish-odour syndrome," though avoiding certain foods... [–] fish from the sea, eggs, liver... [–] and taking antibiotics can help... It is not clear how common... [the syndrome is ('there are about 200 documented cases – the latest is a 4-year-old girl in Spain') but] it is mentioned in some ancient literature and even caught the attention of Shakespeare, who in *The Tempest* describes a character with "a very ancient and fish-like smell." The newly found defects... in a single gene... cripple the body's ability to produce an effective version of an enzyme called FMO3. The liver needs that enzyme to process a smelly protein called TMA, or trimethylamine, which is produced by bacteria in the gut. When TMA goes unprocessed, it seeps out in a person's breath and perspiration... [A] member of the... Imperial College School of Medicine in London... told of a [gal] who divorced her husband because [the wife thought the husband] was not keeping himself clean... Some affected people reach their teens without finding out why others avoid them... Many victims go into jobs where they can work alone. Some start smoking heavily to try to disguise the smell... [In local news, s]cientists at the University of Otago have found a significant cause of inherited deafness... [M]any genes affected the ear, and it had been thought testing each gene to see why people were deaf was too difficult. But now a simple molecular test could show whether people had the gene essential for hearing. About 500 N[Z]ers were believed to be deaf as a result of missing both copies of the gene, but many more hearing people were missing one copy and could have deaf children.

...[mums] need to think long and hard before having a screening test which estimates the risk of having an imperfect child, a... health specialist warns... [A] \$73 blood test being offered... was only the first step in determining the risk of birth defects, ranging from brain failure to Down's syndrome. The test was often imprecise and could cause a lot of undue stress. The risk could be confirmed only by an amniocentesis, which takes a fluid sample from the [mum]'s abdomen with a needle. This was very intrusive and could... [create] more risk of miscarriage than having a disabled child... [The specialist] took the blood test in Britain when... [aged] 32 and carrying her first child. Results suggested that [the foetus] had a one-in-300 chance of a birth defect. Yet an amniocentesis to confirm the risk carried a one-in-200 chance of causing a miscarriage. "I went into a real panic..." However, her husband reasoned that the odds were heavily stacked in favour of a healthy child. They chose not to have the amniocentesis and subsequently delivered a healthy child. The N[Z] *Herald* yesterday revealed that health officials want to give [mums] free access to the screening test as a service to them. It also had the potential to reduce the number of disabled or handicapped people... who used large amounts of health funding... [North Health] estimated that at \$1 million a year, a free test for all pregnant [people] would eventually pay for itself... A North Health public health medicine specialist... said most [gals] who found their foetus had major defects had an abortion. While there were no N[Z] figures, a British study found 15 out of 16... chose to end their pregnancy. North Health supported the test as a service... rather than for its money-saving...

I am dismayed that once again the ethical issue of the prevention of Down syndrome arises. The only means to prevent Down syndrome is termination, therefore it is not possible to cloak this discussion under the guise of a "good service to [pregnant people]." The issue must address the place of the person with Down syndrome within our society... without the constraints of the accountant's bottom line. The move by health planners to give... free access to a screening test... supposes that the birth of babies with Down syndrome or other disabilities is a tragedy. That they will be a burden to both society, in terms of financial cost, and to parents in terms of emotional cost... The huge advances in health and education have impacted positively throughout our society, including on people with Down syndrome. Society demanded we change the institutionalisation of people with disabilities. It recognised everyone had the right to a valued place in the community. This is the same society which now seems to condone pressuring prospective parents into decisions to terminate so-called "imperfect" children... We have very quickly accepted the "user pays" concept in other aspects of our lives. Will there come a day when the question will be put to parents that they chose to have a child with a disability so therefore they must carry the financial cost of education and health needs?

...Under "ideal" conditions (ie. carefully organised clinical trials)... maternal serum screening (MSS) tests... reduce the number of Down's births by approximately 70[%]. Again, at best, the test will indicate possible Down's syndrome in 4 to 5[% of pregnant people] undergoing the test. That means that if all who tested positive chose to have amniocentesis, there will be between 40 and 50 [gals] tested to detect one case of Down's... In last year's *British Journal of Obstetrics and Gynaecology*, obstetricians reported on the success rate of the MSS test in areas of London. The overall reduction in Down's births was 21[%]. There are many reasons for such a "disappointing" result. Firstly... the MSS test is normal in approximately one third of Down's pregnancies so a number of cases are missed... Secondly, the concept of "seeking and destroying" a Down's syndrome child is unacceptable to many [people]. Thirdly... as the test has to be performed before 18 weeks of pregnancy, it is not available to [people] who seek care quite late in their pregnancies. Generally "late bookers" are those... from socially disadvantaged circumstances. It is easy to see that if the test is provided free in Auckland, it will mainly be used by educated Pakeha rather than disadvantaged Maori and Pacific Islanders. In addition the test is virtually uninterpretable in twin pregnancies or those complicated by diabetes.

...Respiratory infections in infants may protect them from diabetes later in life[. D]octors... believe the early infections helped to equip the babies' immune systems to respond more effectively to other illnesses as they grow older... decreased exposure to common infections during infancy... could account for the increase in diabetes in northern Europe over the past 30 years. Children with juvenile onset, or type 1 diabetes, produce little or no insulin... Although the condition can be controlled with insulin injections, diabetics face a lifetime of treatment and up to four injections a day.

...[A NZ medical research company claims an international breakthrough in diabetes treatment that could eventually provide a cure for 11,000 NZers and 15 million people around the world with type 1 diabetes who now need daily injections of insulin. The Auckland company, Diatranz, says a Mexican schoolgirl given insulin-producing cells from the pancreas of newborn piglets has overcome diabetes. Diatranz's medical director said the girl, who is now

18, was “naturally very pleased. This is a young, very attractive Mexican girl, who is very relieved indeed.” Twelve teenage diabetics – six girls and six boys – received the pig cell transplants 14 to 20 months ago. Four of the girls and one boy now produce enough of their own insulin, using the transplanted cells, to at least halve the daily injections of insulin keeping them alive. The director said even halving insulin injections made the transplants worthwhile because of the risks and costs of total dependence on injections – \$12,500 a year for a standard type 1 diabetic. By comparison, extracting insulin-producing cells from piglets, flying them to Mexico and transplanting them into diabetic patients costs only \$20,000 to \$25,000, saving many times that amount over a patient’s lifetime. Diatranz scientists have made 12 trips to Mexico carrying the pig cells in their hand luggage to get them there quickly. At the Mexico City Children’s Hospital, a doctor developed a unique method of transplanting the cells. The doctor inserted a cigarette-sized stainless-steel tube on each side of the stomach just under the patient’s skin. At first, the tubes contained just a plastic rod. After two months, the rod was removed and the insulin-producing piglet cells replaced it. It then took up to a year for the piglet cells to mature and start producing full quantities of insulin. Diatranz and the doctor plan a further trial starting within two months to improve their success rate. The company will then seek financing, possibly from a pharmaceutical company or a big institute such as America’s Mayo Clinic, to do full clinical trials in the US. Diatranz has spent \$7 million to \$8 million so far and would probably recover its money by licensing the rights to the procedure and teaching other people to do it. The company is owned privately by individual shareholders, most of whom have close relatives with diabetes. The biggest single investor is the Warehouse founder, who became involved when it had a diabetic dog treated by Diatranz. A 12-year-old diabetes sufferer who attends Long Bay College said it was glad not to have been the first to get the pig cell transplants. “I wouldn’t really want to get diseases and stuff from pigs. But after some other people have had it done, and if it has been successful, then yes, I would.” However, the NZ Health Ministry has banned the process here. Submissions close on Friday on a new law that would extend the ban until at least June next year and possibly two more years because of a risk that pig viruses could spread into people. The Green Party co-leader said there was a risk that transplanting animal cells into people could transmit viruses in the same way that influenza originally spread from animals. “It’s a question of whether you can put the whole human population at risk in order to treat some individuals. It’s a difficult ethical question.” The process began with killing newborn piglets to extract their pancreas. But the director said any animal rights objection would be “hard to square up with ham”. The procedure does not involve genetic modification – in contrast to most insulin which was originally also taken from pigs but is now made in laboratories through genetic manipulation.’]

...Tiny worms could hold vital clues for the development of new treatments for diabetes, a disease that afflicts up to 135 million people. Doctors at the Massachusetts General Hospital have discovered... that... mutations... in a gene called daf-16... allow a... worm, *Caenorhabditis elegans*... to survive without the hormone that controls human metabolism and blood sugar levels... The gene encodes a protein that passes along insulin signals within the cells to control the production of enzymes metabolising sugars and fats. Humans carry two daf-16 equivalent genes... [The doctors] believe that in the absence of insulin, the daf-16 protein becomes unregulated, and its runaway activities may be the key cause of diabetes. “Our discovery that animals do not need insulin signals if they also carry an inactive daf-16 gene was completely unexpected...,” [one of the doctors] said... Studies have shown that obese people have a much higher risk of developing... Type 2, adult onset diabetes... The worms that are missing insulin or another hormone called daf-7 get fat. In the worm, daf-7 is a metabolism-regulating hormone like insulin... but unlike daf-16, scientists have not yet found the human equivalent of DAF-7... [However, if the doctor’s] hypothesis was correct... [the method] could be used to treat both type[s] of diabetes, the... disorder [that] causes... strokes, heart attacks, blindness... nerve damage... can result in amputations... and... kidney disease...

[‘A kidney is liable to damage by infections, vascular disease, a tumour, or an obstruction (*e.g.* an enlarged prostate or stones).’]

...‘A few weeks in jail seemed a small price to pay for a penniless Palestinian suffering from kidney stones. Unable to afford the operation, the 32-year-old attacked his neighbour, forcing police to arrest him. When in jail the 32-year-old complained of stomach cramps and his kidney stones were promptly removed – at no cost to him. When police found out about his sneaky surgery, they kept him behind bars for a few more weeks – just to teach him a lesson.’]

...Getting married, divorced or sued could hurt more than your wallet. Such changes also may trigger kidney stones, according to a study that, for the first time, links the painful ailment with stress... The... study... could lead to increased focus on stress management to prevent recurrences of kidney stones[, which]... occur when excess calcium and other substances crystallise in ducts connecting the kidneys and bladder, causing pain from the blockage of urine or the sharp edges scraping the ureter as the stone passes through. About 12[% of USers] develop a kidney stone at some point, and each has a 50[%] chance of recurrence within 10 years and an 80[%] chance of eventual recurrence. Kidney stones cost an estimated \$NZ2.75 billion annually for medical treatment consisting generally of medication, removal of the stone through a tiny device threaded up the urethra and bladder, or the increasingly popular and less-painful use of shock waves to break the stones into tiny pieces.

...SIX years ago... a 23-year-old line[person]... was... working for the South African equivalent of Telecom. Today, [it]’s a millionaire and South Africa’s Young Businessperson of the Year – thanks to a magic box that relieves pain. Famous users include... tennis... and... rugby players... and [an F1] racing driver... Now the box is available in N[Z]. The battery-powered machine, weighing under 2kg, is called an Action Potential Simulation (APS) Therapy machine, and generates an electrical current that matches the body’s natural nerve impulses. It was the only technology in the world that could do this, said [its inventor], who has patented it in 38 countries. However, health professionals here said electro-therapy devices similar to APS are already available and are used by physiotherapists, anaesthetists and others, with good results. “We’re not quite sure how these things work,” said one professional, “but the electrical simulation seems to succeed in confusing nerve impulses and blocking pain.” While more basic pulse massagers retail for a few hundred dollars and are used privately, devices comparable to APS tend to be used only by health professionals... The machines retail for about \$3300. In South Africa, [the inventor] has sold 30,000... [His] Pretoria-based company, Tech Pulse, had also established distributors in Germany, Ireland and the US, where the device has won approval from the F[DA].

...A new one-a-day pill that stops hair loss and encourages hair to grow back in some [patients] has won approval from the U[S FD]A... Merck and Co said in Washington that its Propecia might be available by prescription as early as mid-January. The drug, developed for baldness after [guys] taking it for prostate enlargement noticed hair growing back, will not be available to [gals] because it causes birth defects...

[‘Hair loss is now as big a problem for gals as for guys, according to the magazine *Hair International*. It says this is the result of lifestyles and stresses brought about by equal opportunities with guys’ – as opposed to genetics (the genetic opposite of baldness is the aptly-named ‘werewolf syndrome’).]

...‘how an experiment on my wife led to a breakthrough in hair transplants. Over the past few days our department at Durham University has been deluged with letters, e-mails and calls from people with all sorts of distressing stories about their hair problems. They’ve all seen headlines claiming my wife and I have discovered a new way of transplanting hair from one human being to another – because that’s exactly what we did with each other. We took a cluster of follicles from my scalp and implanted tiny bits of them in my wife’s inner arm. My wife looked after the transplanted cells by putting a little plastic dome over her skin. Air got through, but if my wife had a shower the follicles weren’t damaged. When the domes were eventually removed, you could see very clearly a small dark hair fibre which was quite different to anything growing on the rest of her forearm. It was amazing – one of those moments that make you understand why you became a scientist. If our interpretation was correct, my cells were organising hers to produce a new hair follicle. What was exciting about our experiment is that, although our cells weren’t compatible, the follicles weren’t rejected. What this suggests is that these cells have immune privilege. One reason we did this experiment on ourselves was because transferring tissue from one individual to another can cause health problems, such as the transfer of infection. But research has suggested that husbands and wives may develop some sort of immune tolerance

through contact – to put it delicately! So we carried out another experiment with a colleague, using his hair follicles. They, too, grew in my wife's arm – another brick on the edifice.'

... 'In recent medically supervised trials by the AUSn Photobiology Testing Facility at the University of Sydney, 90% of the patients with genetic baldness stopped their hair loss and reversed the balding process. They actually grew back more hair, thicker and healthier, thanks to the unique *RealGROWTH* Treatment Program. Call today for an obligation-free, confidential consultation with one of our fully experienced Consultants. They'll tell you how to stop your hair loss – with a money back guarantee (naturally some conditions apply)! For your free consultation call 0800 HAIRLOSS' [...]

Nothing, absolutely nothing known to science can do more to [save your hair t]han Clive's guaranteed Hair Gain Methods... Hormone imbalance, stress, wrong food, poor nourishment, bad habits of hair care are but a few of the factors that will take their toll on your... scalp and lead you towards a hairless future... For thousands of years, balding... [people] of all ages and nationalities have had to put up, not only with the jibes of unfeeling friends, but also with the various lotions, potions and tonics that are meant to restore everyone's thinning hair to a full head of glorious locks. Until now there has been a great silence on the major cause of baldness – genetics... [For] only \$25... Clive Clinics are not only willing to talk to you about why your parents are the reason for your baldness, but we also want to talk to you about the latest in invisible Hair Replacement Units, undetectable Hair Slit Grafts and treatments that block the genetic messages from advancing your years unnecessarily!

...Ageing, says... the new Masonic Professor of Geriatric Medicine at the Auckland University School of Medicine, is not something that begins when you're 65. It begins when you're in your 20s and you start to lose bone. If you're 35 and can't remember where you left your keys – that's normal, because memory begins to slip away, if imperceptibly, soon after 30... With each generation, health improvements are lopping about 10 years off how we can expect to feel. For instance... today's 75-year-old has the health of a 65-year-old about 15 years ago... [The professor] came to Auckland last month from Flinders University, Adelaide. His training in both neurology and geriatrics, combined with his interest in epidemiology, make him relatively rare in medicine. What brought him to North Shore Hospital – where the Medicine School's department of geriatric medicine is based – was the supportive professional environment offered at the hospital for him to continue his research interests, particularly into strokes... a condition which has many facets to it. "It's a big problem in the community and there's a lot of uncertainty about its causes, treatment and prevention..." Each year about 2000 people in Auckland suffer a stroke. [The professor] finds the processes of ageing generally, and the care of old people individually, intellectually challenging and professionally satisfying. "Geriatrics straddles the interface between acute hospital care and looking after people within the community. Some people think it's hard work. It requires a different sort of brainpower from other areas of medicine. You have to have empathy and the ability to communicate and understand the older person in their own setting..." His long-term plans include establishing a Centre of Ageing which would offer enhanced under graduate and postgraduate education in the ageing process, such as masters degree programmes in gerontology and geriatrics. (Gerontology refers to the sciences related to ageing while geriatrics is concerned with the medical and health-care aspects.) ...How would such a centre fare in the competition for the scarce health dollar? The department of geriatrics was set up with money from the Freemasons but partly depends for its continuation on outside support. Yes, [the professor] says, there's a struggle. Cardiology gets five times more financial help than stroke and yet statistically it's just as big a problem. And 10 times more is spent on research into child health than on ageing. "It's going to be to the benefit of us all. It's investing in our future – like superannuation."

...*HELP DEFY AGEING!* ...research shows the importance of getting enough vitamins and minerals from the diet... especially from fruit and vegetables! These help maintain good health and slow ageing. However, [a]... good basic nutritional anti-ageing program could include a multivitamin, such as... Kordel's Pycnogenol Plus... [-] which... is derived from the bark of the French Coastal Pine... [-] with the evening meal. Talk to your Pharmacist or Health Food Adviser for more specific recommendations for you! ...[Or come to the] *AGEING WITHOUT ILL-HEALTH SEMINAR*... [on] Thursday 13th November... [at the] Centra Auckland... Cost: \$10. Includes Refreshments on arrival and FREE SAMPLE BAG...

Cracking the keys to longer lifespan... [W]hen a French[per]son turns 122 this month the whole world... [will take notice. The old gal], who entered the record books as the world's oldest person two years ago, was born in Arles, France, in 1875, a year before the invention of the telephone. [It] remembers the builders erecting the Eiffel Tower... met Vincent van Gogh... as a teenager... and [was] a pensioner when Hitler invaded France... With every remarkable milestone [the 122-year-old re]fuels the hopes of researchers around the world who believe it is possible to extend the human lifespan. [The old gal] is already proof that people can live beyond 120, a feat even the experts would have said was impossible until recently... The key to eternal life still lies in the realm of science fiction but longer, active life, is becoming reality. It is also big business: in America, \$1 billion is spent on anti-ageing treatments every year. The catch is that nobody knows how people like the [122-year-old] do it. The old gal] was not athletic in her youth, nor is [it] a health fanatic. [It] gave up smoking... at 117 and has only recently forsworn her daily glass of port. [The 122-year-old, who claims it] enjoys everything, has spent her life with a smile on her face, and expects to "die laughing". According to... research published last week, this may be the key. A 22-year study of 750 white, middle-class [USers] now aged around 70 showed that "socially dominant [people]", the type most likely to monopolise conversations, interrupt others and constantly compete for attention, were significantly more likely to die earlier than their more relaxed counterparts... The theory in vogue is that mood can affect the immune system and that changing emotional behaviour and outlook may be just as important in maintaining good health as giving up smoking or losing weight... The idea that ageing is largely mind over matter is also the conclusion of... [a] chess grandmaster and co-author of "The Age Heresy", a guide to determining – and possibly lengthening – lifespan... Never retire, says [the co-author], who believes 120 is the age everyone should aim for. "If you finish one job, start another... or take a degree in philosophy or whatever interests you and will keep your brain active. Once the brain stops working it shuts down frighteningly fast." ...Contrary to the popular belief that we lose brain cells every day, leading to inevitable degeneration, [the co-author] believes it is possible to strengthen the brain's grey matter... [with] "mind sports" – taking up chess or learning to play a musical instrument and practising on a daily basis... – ...and that, combined with a healthy lifestyle, this will prolong life... [T]he trendiest anti-ageing remedy has been dehydroepiandrosterone (DHEA), which is produced by the adrenal gland and converted into testosterone and estrogen. Production of the naturally occurring hormone falls off after the age of about 35. There have been some studies showing that low levels of DHEA can increase the risk of heart attacks... and breast cancer... [However, t]rying to coax creatures past their natural lifespan is so far an imperfect science. Experiments on fruit flies, which were not allowed to breed until much later than usual, did produce a strain that lived much longer. Alas, it was much less adept at breeding – in survival terms, hopeless.

...[we aren't flies, so w]hy do spiders... bug... us so much... Is our fear of creepy crawlies irrational, or is it a part of our primal biology? ...[a p]sychologist... who works for the Anxiety Disorders Trust helping people whose fears have become phobias, says some of our reactions to creepy-crawlies are learned, but some are programmed into our genes. "For example, studies have shown that if you show a snake shape to any primate, the first reaction is to back away, to avoid it. We seem to have a similar reaction to black, creepy things, or to certain colours, like red or yellow... We've got an incredibly complicated computer system keeping us safe. Our neurotransmitter system reacts very fast, and the initial reaction is to... be safe, be careful... Many people have problems with... spiders... especially the big black ones you get in the Auckland suburb of Avondale. And a number of people have difficulties with stick insects, moths, worms... wetas... and cicadas... A lot of people [also] have trouble playing tennis... because of the three-dimensional image of a ball coming towards you fast. The instinctive reaction can be that it's a projectile, and you should avoid it." It's a great excuse for tennis incompetents... A useful test of instincts and reactions can be found at the Auckland Museum where Lifestyles of The Small and Hairy is on exhibit. Look at the live tarantulas and the dangerous mix of A[US]n arachnids... You'll probably feel just

a little bit brave, macho, even... Bravado doesn't wash with some people, though, whose instinctive fears have expanded to... the extent where their anxieties actually affect their lives. Their reaction to even the threat of their particular fear leads to physical reactions: Increased heart rate, increased breathing, a sense of tightening in the chest... [The psychologist] works with them to reduce the anxiety... People need to learn, [the psychologist] says, that anxiety oscillates. It increases, it hovers around a peak, and then it reduces. And getting used to the fact that you do eventually become less anxious is the key to getting over a phobia.

...more overseas children with a deadly brain disorder are waiting for cutting-edge brain treatment in N[Z. Two US] tots were treated at Auckland Hospital last year after [a NZ p]rofessor... led development of the world-first therapy. Now the parents of five more children from the U[S], and one each from Germany, A[US] and South Africa want their children to undergo the treatment... The therapy, which involves inserting synthetic genes into the brain, aims to curtail degeneration caused by Canavan disease, a rare and fatal disorder... [However, b]efore any further therapy goes ahead, it must first go through an official process including approval by the Genetic Technology Advisory Committee. That committee, under the Health Research Council, has called for more information on the plans to extend the project... [The p]rofessor... said it had been hoped that one of the... children already treated... could be brought back to Auckland for top-up treatment. But the committee turned down the proposal because there were no animal studies to back up repeat treatments... Even if... [the girl], now almost 3... were never able to have more gene therapy, [her mother said her daughter] had paved the way for others... "Everybody wants to know it's a cure and I wish to God I could say that – obviously – but it's a first step." ...The original therapy was the source of some controversy. Critics complained that ethical approval should never have been granted for a safety trial involving children who were too young to give informed consent. The northern regional health... ethics committee, however, stood by its decision to grant approval... An independent review subsequently backed the ethics committee's decision.

...British scientists have pioneered a revolutionary technique for making medicines. They have protected animals against disease using a vaccine made from plants – a world first. The plant process could dramatically cut the cost of manufacturing drugs and vaccines, allowing medicines to be derived from viruses that blight plants but which have been genetically engineered to make proteins found in humans... Crops such as black-eyed peas and potatoes could then be infected with these altered viruses and used as pharmaceutical storehouses. Researchers say that more than 1000 doses of a vaccine could be grown on a single plant and that one room could provide the world's requirements for an individual vaccine. There would be no need to build complicated fermenting plants, where many drugs and vaccines are now made, or to design transgenic animals... that make human hormones in their milk – another route to pharmaceutical manufacture being explored by scientists... The critical technology which permitted the vaccine's creation was developed by scientists in Norfolk, England, and Purdue University, in the U[S], seven years ago. The rights were obtained by the British company Agricultural Genetics Company... Convinced that AGC's plant virus techniques were the company's most valuable asset, [one scientist] persuaded several of his colleagues to join him in a management buyout of the technology in November 1993. Axis Genetics was the result. In 1995 the company won \$4.7 million of private funds to carry out research, and by the end of 1996 was valued at more than \$47 million – even though it has yet to produce a commercial product based on its plant virus technology. Axis is developing versions of the vaccine for dogs and cats while carrying out research on human varieties... The company is also investigating the possibility of using plant vaccines to stimulate the body against cancer. "Tumours can hide from the body's immune system quite easily... The aim is to create a vaccine that can stimulate T-cells so that they are primed to hunt down cancers growing in the body..."

...Forget about... nasty needles – vaccinations of the future are likely to come in the friendly form of a banana or carrot. Auckland scientists are working on developing an edible, everyday food which contains a vaccine against diarrhoea... aided by \$110,000 from the Lottery Grants Board. A project outline states the work is "an important international public health priority" given that diarrhoea kills 3.5 million people... each year... While deaths are uncommon in [First World] countries, hospitalisations are common... The researchers needed first to genetically engineer plants so they carried the infectious protein responsible for diarrhoea. The [GE] plants would then be tested to see if they built immunity... Researchers in the U[S] hope to come up with a banana that will guard against a range of diseases including hepatitis B, measles, yellow fever and poliomyelitis.

...Researchers believe they have made a breakthrough in the fight against tuberculosis. In their research for an effective vaccine against TB they have discovered that by boosting a small section of the immune system it will fight back and control the disease... TB, once a major problem in N[Z], has largely been controlled, just 728 cases having been reported between 1972 and 1985. But the disease is still the top killer overseas... The research has been carried out at the Malaghan Institute... in Wellington... [but] all attempts to get Government funding... had failed. Much of the... research is paid for by the British Wellcome Charitable Trust, with help from the L[GB] for equipment.

...*Malaysia says mystery child killer now under control...* The death toll from an airborne virus that has killed at least 26 children... under the age of four... and baffled international medical experts has stabilised, Malaysia's health minister said yesterday... As of Saturday, 1240 children had been admitted to hospitals throughout Malaysia for suspected Cocksackie B and A infection and 968 had been discharged... What has puzzled health officials is why the virus is killing children in Sarawak and nowhere else in Malaysia[, which]... called in experts from Atlanta's Centres for Disease Control and Prevention earlier this month. They found traces of another virus in at least two of the victims that has no known cure or vaccine...

Wuhan, a deadly strain of flu... killed more than 20,000 people across the U[S] last winter. This winter, flu vaccinations... are giving companies hard hit by winter illness a shot in the arm. Large organisations are slashing sick day costs and maintaining productivity... Workers who get flu shots at Cigna insurance company take 1.4 fewer sick days a year. Shots were introduced to the company's Nashville office last year. Employees reported flu-like symptoms fell 92%. Eastman Kodak estimated it saved as much as \$4m in absenteeism alone last year... But while flu shots for workers in the US are increasingly viewed as "business critical", N[Z] companies have not yet caught the vaccination bug[('every year flu viruses affect 300,000 NZers')]... A dose of flu will usually knock someone out of action for around 10 days. The attention and performance of workers who soldier on will typically be affected. The up side is once stricken, people can develop some immunity. But because the flu virus mutates, this immunity might not be able to stave off a new strain. That is why the flu vaccine must be changed every year. If the drug company has got the brew right, the vaccine should protect 60%-90% of fit adults. Vaccination is considered safe as it does not stimulate the immune system. Minor side effects might include a tender arm and minor muscle aches for a few hours. Employees who take the annual jab also help slow the spread of influenza to workmates who have not taken the vaccine. But this spinoff – called herd immunity – will not be felt unless the bulk of employees (70%) have been vaccinated. There's the rub. Most staff opt out of vaccination... Acceptance at most N[Z] companies peaks near 30%... A *New England Journal of Medicine* survey showed on an average day at a typical company, three workers out of 100 called in sick. By reducing absenteeism to two workers a day, a company of 5000 workers could save \$1.47 m... for a \$58,000 investment in shots... [– which] cost employers \$12-\$23 each, depending on the provider. [□] 'Two studies concluding that the flu exacts a major toll on children may re-open the debate over whether youngsters should be vaccinated. The influenza vaccine is not recommended for children unless they already have health problems, such as asthma, that could make an influenza infection deadly. But during an epidemic, the disease can strike more than 40% of children, who often spread the illness' ('about two decades after Europeans first made contact with Maoris, a severe epidemic called by Maoris rewha-rewha – possibly influenza – broke out, which missionary William Colenso estimated destroyed about three-fifths of the people in the southern part of the North Island; about 1795, an epidemic called Te Ngara spread among the Maoris – there were so many fatalities that "the living with difficulty disposed of the dead"; one of the most disastrous epidemics of rewha-rewha occurred about 1810'; 'the great influenza epidemic beginning in 1918 caused nearly 7000 NZ deaths'; during its administration of Western Samoa in the 1920s, the 'NZ Government allowed an influenza-infested ship to dock at Apia then refused to provide medical treatment – 25% of the native population was wiped out').]

...Paraparaumu School... is recovering from what appears to be the first big outbreak of type-A flu the Public Health Service has seen this year. The school closed on Friday afternoon and Monday after 110 of its 300 pupils and half the staff were away sick... The service has advised parents to keep their children home and watch for secondary infections such as earache... [Incidentally, a] bionic ear implanted in profoundly deaf young children has enabled them to speak and hear sounds... Results of the world's largest study of cochlear implants showed that 87[%] of all children aged two to 11 who had the implant before the age of five were able to speak functional language after three years. Almost as large a percentage were able to understand common phrases without lip reading... Unlike hearing aids which amplify sound, the cochlear... [positions] electrodes in the inner ear [that] bypass the damaged area and create a nerve impulse which stimulates the auditory cortex of the brain. An external microphone receives sound signals which are converted into electrical signals by a small speech processor and fed through the transmitter coil to the implanted receiver... Children who were born... deaf benefit as much, and often more, than children who lost their hearing early in life... [but a]dults who have never heard are not suitable candidates because the auditory part of the[ir] brain will not respond to the stimulus... Most children in the programme continued using the implant, even into the teenage years, unlike an American study that showed 48[%] of children refused to wear it. "For me it's been an absolute miracle," said... [a] 74-year-old member of Britain's House of Lords[, who] was left deaf after an operation 28 years ago... "It isn't perfect by any means – voices are a bit distorted and birds sound husky... but who cares? At least I can hear birds,"...

A record number of cochlear implant procedures performed in the last year has brought the joy of hearing to 26 profoundly deaf people. The high-tech implant devices... available in N[Z] since 1986, make hearing possible for people so deaf they cannot be helped by hearing aids. Half the recipients are children, some as young as two. Adult recipients include elderly people... [The] manager of the A+ National Audiology Centre, says the highest number previously undertaken in one year was 19... "We are still dealing with a backlog of clients. When we've dealt with that backlog we will be working on newly deaf cases and the demand for implants should settle down to about 15 to 20... per year... They are expensive devices, each costing around \$25,000. The final cost with all the services involved, including the operation, is about \$40,000 for each client." [The manager] is delighted that funding for clients was available from all four [RHA]s for participation in the scheme... "The RHAs have chosen to invest because we have been able to show from overseas how these implants can improve the quality of life of clients and produce economic benefits. People can function more independently. One cochlear implant recipient was a trades[person] who had always worked with his wife because [it] could not use the telephone. The implant meant [the husband] could use a phone and his wife could get another job... We are expecting to achieve even more with children because of the impact on their future earning capacity and their reduced need for social services." ...approximately 380,000 [NZers] have hearing loss but only a small percentage of these are profoundly deaf and an even smaller number meet the criteria for cochlear implants.

...In a N[Z] first, a Christchurch Hospital surgeon has implanted a stainless steel hip and half a pelvis in a patient... one of the most extensive hip-pelvis operations in the world. People with hip replacements usually have artificial sockets implanted but never whole stainless steel hips – until now... The computer-designed stainless steel hip and pelvis was shaped at [the h]ospital, then taken... for "Rolls-Royce" cleaning at Air N[Z]'s depot. The patient... is fully recovered and enjoying life after a seven-hour operation to save her leg. [The 73-year-old] had a malignant tumour the size of a cricket ball in her hip socket and pelvic bone... was in constant pain and it seemed inevitable that her leg and half her pelvis would have to be removed. [However, the o]rthopaedic surgeon... decided on a landmark operation to save the leg. "Basically it meant chopping off her whole leg and reattaching it..." ...[The patient] still suffers a little pain, and her left leg is not as subtle as it used to be. But... it was better than... a wooden leg.

...A judo champion and a national badminton player are among 500 British patients to have benefited from an alternative to hip replacements. They have undergone a process involving the same effect as total replacement but is far less invasive – and far more liberating, judging by initial results. Joints affected by osteoarthritis become painful and swollen when the bones rub together as cartilage is lost. The conventional operation involves cutting deep into the femur or thigh bone to allow a plastic or metal joint to be implanted... But this [new treatment] simply involves stopping the rubbing by replacing the diseased tissue with a metal-on-metal lining which contains a bonding substance. The amount of bone removed in the resurfacing operation is about the size of a large knuckle; in a replacement it is the size of a fist. A replacement [also] leads to further bone loss because the artificial joint interferes with growth... Total hip replacement, developed by Sir John Charnley in the early 60s, is acclaimed as one of the most successful operations ever. Each year in Britain there are 40,000 hip replacements, and a further 13,000 revision operations to replace loose artificial joints. But Sir John always regarded total hip replacement as second best. Before developing the "Charnley hip" [John] tried in vain to perfect a simpler "restructuring" operation. Surgeons are now realising... [hi]s original vision, 15 years after his death... John's original idea "failed for lack of the right material. [John] used teflon, but this wore out within two years, making further surgery necessary." Attempts at relining continued to fail because surgeons used weak materials. It was not until 1991 that the... Royal Orthopaedic Hospital in Birmingham... started to come up with the winning combination... [In further news from Britain, a] doctor has cut off a... head in a pioneering 17-hour operation and screwed it back on again. The patient[, aged 36, who]... had a crippling condition which meant her face pointed downwards... survived... [The surgeon] detached the head from her spinal column, leaving it connected by the spinal cord, key blood vessels and the skin at the front of her neck... then cut a wedge from the base of her skull and the top vertebra before fixing her head back with a metal plate and two screws, leaving her looking forward.

...The operation was performed in February but presented at the British Society of Neurosurgeons only last week... [The patient, who] suffers from a bone condition called ankylosing spondylitis, a rheumatic condition which progressively fuses bones in the spine together[– but was compounded after the patient] broke her neck in a fall four years ago... – ...thanked [the surgeon] for changing her life. "I had become a recluse. I was too scared to go out and couldn't cross the road because I couldn't see straight ahead."

...Microsurgeons have reattached the face of a Victorian... in a surgical first for A[US] which the team leader says has saved her from a life as a recluse. The 28-year-old mother from Shepparton had virtually her entire face and scalp ripped off when her hair caught in machinery in a milking shed last Tuesday... The [28-year-old], whose identity and personal details were not being released to protect her distraught family, was found by her partner. When [the 28-year-old] arrived at St Vincent's the skin and tissue of her face were packed in ice and totally separate, with only her chin, lower lip and left ear remaining intact... [The p]rofessor... who headed the St Vincent's Hospital team for the 25-hour operation, yesterday described the [28-year-old]'s injuries as "the most horrific and horrendous that we have seen." [The professor] told of going home "terribly depressed" last Wednesday night, fearing the surgery... had failed and [it] would have to tell the [patient's family that the 28-year-old] faced months of surgery, the result of which could only be "very inferior to normality." ...But by the next morning it was clear the blood thinner injected when circulation to the reattached tissue was failing had worked. Surgeons used microscopes to magnify tiny blood vessels, some just 0.5mm in diameter, up to 30 times, matching the vessels in the amputated tissue with the remaining tissue. The team is now sure... that the [patient] will look as [it] used to with only some join scars... [The patient, who] was being kept unconscious while her surgery began to heal... may be able to go home within two weeks. If not, [the patient] faces further surgery and skin grafts but could cover them with a wig.

...[the] surgeon who reattached a... face... says... the day might come when major trauma victims left hospital with someone else's face sewn on. "This is a dry run for actually transplanting faces. This is what we could only dream we could do... I understand there is a film in town at the moment, *Face/Off*. I have not seen it, but the comparison is being made." *Face/Off* is... [about] enemies whose faces are swapped by surgeons... Last night, the patient was still in intensive care, but [the surgeon]... was fairly confident all the face would survive. [The surgeon] said face transplants were too risky at present because of the potential side effects of the immuno-suppressive drugs used to stop rejection of transplanted organs.

...A [28-year-old] whose face was ripped off... is awake and recovering well, the head of the surgical team said yesterday... [The AUSn, who is] able to drink but was being fed intravenously... was still sedated but had been able to talk to her family and hospital staff. During the operation... [it] received... 30 units of blood – almost double the eight pints contained in the body... [By the way, NZ h]eart-attack patients will take part in an international trial to test a potentially lifesaving treatment using a thin balloon that boosts blood flow. The simple-looking medical gadget could save many from the devastating effects of heart damage. When inserted into the coronary artery, the balloon is expected to help the heart pump better and dissolve very damaging blood clots... Drugs are available that dissolve blood clots and boost the survival of heart-attack patients. But they fail to clear clots in some people, who can go on to develop heart failure and undesirably low blood pressure. This happens in... 150 Green Lane patients a year... [T]hese patients had a high death rate in hospital or were sent home, often with severe breathlessness. Their doctors hope... the balloon, inserted within 12 hours of an attack's onset, will change that. The balloon, connected to a pump machine, must stay inside the patient for up to five days and will be used alongside clot-dissolving drugs. Patients treated with the balloon will be compared with others treated solely with the clot drugs... A similar study is already under way using the balloon on patients in "shock" – where blood pressure had dived dangerously.

...A Washington surgeon said yesterday [it] had performed the first-ever quintuple bypass operation through a keyhole incision – which meant [the surgeon] did not have to crack open the patient's chest... [T]he new method, involving only a 7.5cm incision, [also] meant his patient could recover and go home more quickly... [In local news, more] people are sustaining serious brain damage from assaults and some doctors are unable to respond effectively, recent studies show. Releasing details of an Auckland study, the Brain Injury Association chief executive... lashed out at GPs for their inadequate handling of brain-injured patients... [The] study in South Auckland by his association showed GPs had a poor knowledge of brain injury and often had no idea where to refer such cases. But the problem was more widespread. A central North Island mother... took her brain-injured two-year-old daughter to three specialists before an adequate diagnosis was made... [In addition,] the South Auckland study, involving 154 people, found that half of those who suffered a head injury never reported it to their doctor... Each year more than 9000 people are admitted to hospital with a head injury and most suffered a subsequent brain injury[but it is]... hard to gauge the extent of brain injury... as many problems developed months after an accident... [The author of a] Waikato University... study... [that] had looked at only the most severe cases, was particularly disturbed by the rise in the number of [gals] suffering serious brain injury from being attacked. Another disturbing trend was the increase in relationship breakdowns after a brain-injury incident... Divorce rates rose from 3[%] before brain damage to 22[%] afterward.

...55%... of... physiotherapists... said it was wrong to invite a patient to meet at a bar after work for a drink, and carry on providing professional services when a sexual relationship developed... [But ove]r... 40% said "this was okay, and I might do it if the circumstances were right"... Sexual attraction toward a patient was... reported by 44% of physiotherapists in a survey of 1365 members of the N[Z] Society of Physiotherapists on sexual contact in the professional relationship... 20% of physiotherapists have dated one of their ex-patients, while almost 5% have dated a current patient. "There is little doubt that significant numbers of physiotherapists see, and are seen by, patients as sexual beings," the survey reported... 40% of physiotherapists have been sexually propositioned... by a patient or a patient's relative... [The society's] executive officer... was not particularly surprised by the survey's findings. "If you look at a profession such as nursing you would... find a similar situation." ...[● T]he former Associate Minister of Health... [has] released a Government report... that [suggests] Northland Health should operate commercially... The chief executive of Northland Health... said the [report] reflected international trends... Meanwhile... the... [PM has] challenged doctors and nurses to show leadership and side with [the Government] to convince the public that large, old hospitals were no longer needed to deliver modern health care.

...Could nurses do the work of junior doctors in hospitals – and do it better and cheaper? The Minister of Health seems to think so[(r:p428, ln46)]. Junior doctors disagree. The 1800 house surgeons, house officers and registrars working on hospital wards throughout the country are responsible for the day-to-day diagnostic treatment and wellbeing of all patients... [J]unior doctors at Green Lane Hospital... average... 60 hours a week, and they often work 12 days in a row. The rate of pay after six years of lectures, study and clinical work is \$18 an hour. "If you are going to take junior doctors out of the system, you would need to upgrade nurses, and there is no way that would work out cheaper," [one junior doctor] said yesterday. Not only would they need extensive – and expensive – training; they would then command higher rates of pay. [The junior doctor] cited specialist neo-natal nurse practitioners. "They work 40 hours for \$55,000; we work 60 hours for the same amount. I don't know how the minister is going to save money by training nurses to do our job." ...nurses did not have indepth training... This was very relevant when it came to prescribing drugs, one area the minister has suggested nurses could be involved in... "Nurses are very well-trained in their speciality. A gastroenterology nurse will know more about that than I do when I start on that ward. But I have the responsibility for the over-all management of each patient," [the junior doctor] said. Junior doctors change wards every three months. It is not their job to be specialised... "The specialists spend a lot of time doing surgery and in clinic. They are not here to deal with medical problems on the ward. This is where we come in."

...Doctors could soon be paid to keep their patients out of hospital under a revolutionary health agreement signed yesterday. The joint venture between Auckland Healthcare, the country's biggest C[HE], and Procare, the largest group of [GP]s, is expected to create dramatic changes to the way GPs work. Instead of receiving a Government subsidy each time they treat a patient, they will be given annual budgets based on the number of patients in their area and the estimated cost of managing illnesses. Supporters of the "integrated care" system... say it will give all doctors the right incentives to treat patients early and keep them out of hospital. Opponents fear patients will suffer because they say GPs will cut corners to save money on their limited budgets. The new system is a blueprint for the way the Minister of Health... wants to see all health services run... The chief executive of Auckland Healthcare... and the chair[person] of ProCare... said the main early benefits lay in better teamwork, which avoided waste and duplication... [C]hildren with asthma in West Auckland... [– where an] asthma project was based on an existing partnership between ProCare doctors and the Starship children's hospital... [–] would be the first patients affected...

The Starship children's hospital is battling to stem the tide of patients to its emergency department... [R]esearch showed that many West Auckland parents were bypassing local doctors in favour of taking them to the straining Starship[, which is why]... it launched WestKids with a West Auckland [GP]s' group... The programme involves the GP group Integrated Primary Care Services funding seven nurses to resettle patients after they leave the Starship... [while two specialist doctors] are based in Henderson to take questions from local doctors, give training to boost skills as well as seeing more complicated cases... A Starship paediatrician... said the aim was to support and back up GPs and build confidence in local services so kids were better managed in the community... [Incidentally, a]ccidents kill around 100 children under the age of ten each year. And for every fatality, almost 130 other children are admitted to hospital for treatment. Yet many... injuries to... youngsters can be prevented... "Each year nearly 450 kids are admitted to hospital as a result of scalds,"... Many children are scalded by tap water because in homes built before 1991, hot water systems supply water well above the 55[°C] limit required by N[Z]'s current building code. A child's skin is thinner than an adult's and at 60 degrees it takes one second to inflict a serious burn... Over the past 12 months, 15 of the 35 children killed in motor accidents were unrestrained... Each year, more than 700 children under the age of 15 are hospitalised as a result of bike mishaps; several die... "Each year around 400 children are injured because they misjudge traffic and step out into the path of vehicles." ...Each year approximately 7400 children under 15 are treated at emergency departments for injuries sustained in mishaps with playground equipment in schools, pre-schools, public places and at home... Every year, an estimated 2800 kids under the age of 14 are treated for injuries incurred in trampolining accidents... While some 70[%] of schools in N[Z] have their own pool, learning to swim is not compulsory... Every year around ten children under the age of ten perish in house fires... Each year the National Poisons and Hazardous Chemicals Information Centre in Dunedin receives around 16,000 inquiries, more than half

of which involve children swallowing poisons... [■] Copies of a book on poisonous plants have been donated to Auckland kindergartens and playcentres by the Auckland Regional Council... to help educate the public about harmful plants in their gardens and methods of treatment for poisoned children.

...rain forests are bountiful – and seemingly inexhaustible – ecosystems that have supplied the human race with a staggering treasure trove including timber, fruit, spices and medicines. Although much more bounty lies in wait, the pace of discovery... is naturally slow. The sheer number of plants to study is staggering! (according)... to conservative estimates, about 30 million species of plants and animals – more than half of all life forms on Earth – live in the tropical rain forests... and scientific experimentation takes time and money. Even when a chemical needle is found in a rain forest haystack, it still takes years to get a new drug to market. [An English naturalist... assailed those who would ravage the rain forests – loggers, ranchers and miners – for acting “with the savage, unthinking ferocity of a troupe of apes in an art gallery.” But... “whereas pictures can be repainted, tropical rain forests can’t be recreated.” Indeed, what could replace the wondrous electric fish of the Amazon River, the poisonous-sweating frogs of Panama, or the host of plants and animals whose secrets – and potential benefits – have yet to be fathomed? In a word, nothing. When they are gone, they are gone, even if the trees that shielded them grow back... JUST AS THE PHYSICAL WORLD AROUND US STILL HOLDS MANY mysteries, much about how our own bodies and minds work remains to be discovered... Genome researchers are making steady progress... As of late 1997 they have identified some 50,000 human genes and determined the function of 5,000 of them... Last year alone, 21 new disease genes were discovered, ten more than in 1995. Among those already found this year are a mutated gene that causes a rare and fatal childhood cholesterol disorder... a third breast cancer gene... and a gene that appears to control whether cells die naturally or duplicate themselves without limit, the way cancer cells do... AS EVERY CHILD KNOWS, LOP THE TAIL OFF A LIZARD AND, astonishingly, it grows back. Unfortunately, the ability to regenerate missing or damaged organs and body parts is largely lost in adult human beings. Except for blood, skin and a few other types of cells, we are unable to repair or renew most tissue after we leave the womb – even though we retain the same genes that built those organs in the first place. Given the huge implications of being able to, say, repair a damaged heart, it is small wonder that developmental biology is attracting a growing number of researchers seeking to tease out the mysteries behind cell growth... Once scientists locate a disease gene and determine the complete sequence of its genetic code, they can devise a test for the presence of that gene in any patient... But with almost routine ways now available to test DNA samples for the presence of specific mutant genes, there is increased anxiety that an individual’s genetic heritage may be vulnerable to unwanted prying. The DNA from a single human hair... may be sufficient to alert a prospective employer or health insurer to a person’s genetic predisposition to disease. Broad privacy laws must therefore be enacted to forbid genetic tests without the informed consent of the individual involved. But even with such laws, dilemmas will arise when individuals do not realize the significance of the proposed genetic screening. These tests warn of impending disease, but do not cure. And how many people would want to have certain knowledge that they will contract a disease for which there is no cure? Banishing genetic disability must therefore be our primary concern. We would not worry about testing for a predisposing gene for Alzheimer’s disease if we already had the cure. In this case, knowing that an individual is seriously predisposed might allow drug therapy to begin before brain functioning is irreversibly diminished... We must never, however, live under the misconception that we will ever effectively control the majority of genetic diseases. Many are likely to prove intractable to drug therapies or gene therapies, in which good genes are introduced into cells to compensate for bad ones. It will be particularly difficult to compensate for genes that malfunction during fetal development. If key genes controlling the networking of brain cells don’t come into action in the womb, no drug or gene therapy procedure will be able to correctly rewire the brain later. There is a difference of opinion as to whether steps should be taken to prevent the birth of genetically impaired children. Many are opposed for religious reasons to trying to control the genetic destinies of children. Others, recalling Germany’s eugenic practices, have an equally strong abhorrence of genetic-based reproductive decisions. These people fear a more powerful eugenic practice, whereby the crude racial and class prejudices of early eugenicists are replaced by scientific demonstrations of genetic inequality. But the possibility of controlling our children’s genetic destiny strikes me as only good. It is grossly unfair that some families’ lives are dominated by the horrors of genetic disease... Mutation has been – and always will be – an essential fact of life, since it is through mistakes in gene replication that the positive genetic variants arise which are the lifeblood of evolution. If the gene copying process were perfect, life as it now exists never would have come about. Genetic disease is the price we pay for the extraordinary evolutionary process that has given rise to the wonders of life on Earth. I thus do not see genetic disease in any way as an expression of the complex will of any supernatural authority, but rather as random tragedies that we should do everything in our power to prevent. There is, of course, nothing pleasant about terminating the existence of a genetically disabled fetus. But doing so is incomparably more compassionate than allowing an infant to come into the world tragically impaired. There is, of course, the question of who should have the authority to make decisions of this kind. Here the message of past eugenic practices is clear. Never let a government, no matter how apparently benign, into the process. The potential mother should have this authority... [– because it is the mother] who is likely to be most involved with the upbringing of the child. I am aware that some will argue that the fetus has an inalienable right to life. But the process of evolution never regards any form of life, be it adult or fetal, as an inalienable right. It’s better to see humans as wonderful social animals having *needs* ([e.g.,]for food... and... health...), *capabilities* (for thought and love, among others) and *responsibilities* (including... work[ing] with other human beings to see that everyone’s needs are adequately met). Working intelligently and wisely to see that good genes – not bad ones – dominate as many lives as possible is the truly moral way for us to proceed.

...Seldom has a room afforded such a view. As 150 delegates of the Privacy Issues Forum stared out from the large windows of the Ellerslie Convention Centre, each could see the winding racetrack and the cityscape beyond. But [one delegate]... could see much more. [It] was staring into the future of the whole of humanity. “It’s nothing less than the future of our species. Will we become known as the generation which started the creation of the super-species?” [The delegate], a visiting senior A[US]n judge, has grappled with this question at the highest levels. [The judge] is a member of two world organisations coping with the almost unfathomable legal and moral implications of one of science’s most extraordinary projects: the push to tinker with the basic structure of each and every one of us. Drawing on observations made from those organisations – the bioethics committee of UNESCO and the ethics committee of the Human Genome Organisation – [the judge] addressed the forum last week and charged his audience with making it their business to be concerned about what advances are being made. “It is worthy of the attention of people concerned about human rights.” The Human Genome project began in 1988 as a cooperative effort to record and study the 100,000 human genes. Its potential is mind-blowing: science is on the verge of cracking the code to our existence; catastrophic diseases lay at the project’s mercy; humankind has at its fingertips the strands which dictate hair colour, height – everything about us. “The project is assembling the encyclopaedia of medical practice in the millennium we are about to enter. The potential benefit to humanity is enormous,”... But with technology advancing so fast, [the judge] is worried legislators are not keeping up. Effective law, [the judge] says, is just not there. While some scientists are suggesting limits as to how far we should go, there is little to keep the advances in check. Some have suggested a moratorium on touching the germ line. “At one conference I attended, there were four Nobel Laureates present. They made two points: “That the genetic pool was very important in our search for the perfect human being, that we recognise the great utility of gene diversity. And they also made the point that we do not have sufficient scientific knowledge about what would happen in future generations if we manipulated the germ line.” Ethical issues abound, too... Who should be told if it is discovered that someone has a “bad” gene? “Should an insurer have access to your genetic markings? Family members, employers and the state: who has the right to know? We should be giving more attention to this subject.” – 1997

THE sci-fi film *Gattaca* sketched a world divided into two. Humans representing genetic perfection – those without flaws or unlikely to be tainted with predisposition to disease – scored the top... jobs. Those afflicted with even the most minor imperfections were consigned to menial work and became part of an underclass... [T]he word denoting those who made the grade was “valids” and the word for the failures, “in-valids.” ...Often the defects were invisible, but instant and constant DNA testing kept the... groups segregated. Science permitted the line to be drawn and 21st century society sanctioned the dumping of people on either side. Science and society – the two can never be prised apart. So when nine leading medical researchers made a foray into the future for a new book, they forecast not only the technological advances, but the social and economic shock waves likely to radiate from them... Artificial wombs, smart houses monitoring inhabitants’ health, drugs enabling the body to regenerate and robots carrying out operations, fill the pages of the *British Medical Journal* publication. But read on and the potential social scenarios left in the wake of the inventions ...provide even more of a jolt, particularly in the chapter on foetal and child development... [What if gals] could be screened for pre-fertilisation parental fitness? And what if parents could select the characteristics of their baby? It’s all in the realm of the possible, according to the chapter author... That is because scientists will continue to find it easier and more attractive to tackle genetic questions rather than the environmental ones affecting children... The scenarios, like the scenes from *Gattaca*, seem light years away, but science has an eerie way of following science fiction.

...IF A paediatrician who stopped practising 50 years ago looked in on the children’s health scene today, the sight might seem more like science fiction than medical fact. Babies born three months too soon and weighing less than 600g survive. Diseases that often killed or crippled kids... don’t strike any more, or are so rare that many children’s doctors have never treated them. Foetuses are now operated on for life-threatening disorders. And mothers-to-be are treated with drugs or vitamins to avoid dreaded conditions that can disable children or take their lives, such as blood Rh incompatibility between mothers and babies, or spina bifida... Old-time baby docs... might be amazed to see... that... 10% of current *Pediatrics* articles concern sexual or physical abuse, “a subject that just didn’t come up 50 years ago”. Obesity is also a new problem. “Our kids are couch potatoes. They used to be much more physically active,” says... [the] emeritus Stanford University paediatrician. “Social issues are driving childhood mortality now rather than infectious diseases,”... In recent decades, vaccines have nearly eradicated disabling bacterial meningitis and become available to prevent measles, rubella, mumps and chicken pox. The prevention emphasis is touching [kids] at ever younger ages. US infant mortality hit a new low of 7.2 deaths per 1000 in 1996, thanks primarily to new medications that accelerate lung maturity in premature babies and rapidly improving neonatal intensive care. The ability to save ever smaller premature babies “is overall very positive, but it raises ethical issues, too,” says [a] neonatologist... of Case Western Reserve University Medical School, Cleveland. Between 0.2% and 0.4% of full-term babies get cerebral palsy and 3% are mentally retarded; for 24-week premature babies... 10% will have cerebral palsy and 20% mental retardation. “In Europe, most of these babies aren’t allowed to survive... But here I think we’ll continue to see each family and each infant considered individually.” ...Three new vaccines are expected within a few years. They’d prevent ear infections, rotavirus... and flu. Some of the most dramatic breakthroughs will come after the Human Genome Project maps all genes, says... [the] medical genetics chief at Stanford University Medical School. “It’s realistic to expect that within a few decades we’ll diagnose prenatally and replace abnormal genes with normal genes while the baby’s in utero.”

...The announcement, expected today, that two separate teams have put together a rough map of the human genome is just the start of a long road that will eventually transform medicine, say scientists. Both the Human Genome Project, a publicly funded international effort, and Celera Genomics are expected to announce that they have completed the first big step toward unravelling the human genetic code by sequencing and assembling the DNA that makes up the genes. The... head of the National Human Genome Research Institute, said recently: “This is it. This is the book of life.” Banks of machines at Celera, based in Rockville, Maryland, at the nearby Institute of Genomic Research, at the Whitehead Institute at the M[IT], and at the Sanger Centre in Cambridge, England, have been working 24 hours a day, seven days a week to crank out the series of A, T, C and G that spell out the human genetic code. As quickly as this sequence is spilled out, it is fed into computers that have then assembled it into the correct order. It could have taken years, but in the end it took months. Celera started in September and has just finished. The slower, more painstaking work being done by the Human Genome Project has been given a shot in the arm by the huge publicity Celera has garnered, and it raced to finish a rough draft at the same time. But scientists stress that having the code is only a beginning... [The] co-founder and president of Celera, said: “This is a race to the starting line.” The real work will come in the next years and decades, as powerful computers labour to figure out where in the miles and miles of As, Cs, Ts and Gs the genes are. Only about 3[%] of these base pairs, which are repeated over and over again in different order, represent genes that are code for proteins that make up everything in the body... [The] president and chief executive officer of Lexicon Genetics Incorporated, one of many companies whose goal is to exploit genetic information, said: “One analogy we use is the dictionary... Imagine a dictionary with 100,000 words and 95[%] of it is blank where the definitions should be. Only it’s worse than that because the words are scrambled.” The next task will be to unscramble the words, then find their definitions. This has already been done with many genes, but most of the genes in the human body remain a mystery, and scientists do not even know just how many there are. Estimates range from 40,000 to 100,000.

...All over the world, there was panic and depression as word spread that the human species has only 30,000 genes. People wept openly in the street, humiliated by the thought that we have only twice as many genes as flies and worms, and barely more than cress. Not since Copernicus demoted our planet to a satellite of the Sun, or Darwin demoted our species to a branch of the ape family, has there been such a pitiless reminder that there is nothing special about us... If the quantity of our genes is humiliating, the quality does not seem to offer much reassurance. Scientists reported this week that about 60[%] of our genes are direct copies of ones used by flies, worms, yeast and bacteria: themes invented by our common ancestors and used ever since... For instance, the “hox” genes that are used for laying down the basic body plan of the human embryo are recognisably the same as those that flies use for the same purpose. They are so similar, in fact, that human hox genes can be substituted for fly hox genes to grow a normal fly. Likewise, and even more surprisingly, the 17 genes that we switch on every time we remember something are the same as the ones with which flies remember. It seems that we inherited both sets from our last common ancestor, a humble creature known as the “roundish flatworm” that probably lived over 600 million years ago. Nature, it transpires, is a careful economist. Once [nature] has invented a new trick, [nature] rarely discards it. In the most remarkable similarity of all, just one basic genetic code – the dictionary that translates DNA into protein – is good enough for all living things, a fact that reveals that all living things on the planet share a single common ancestor. It gets worse. Of the genes that we vertebrates do not share with flies and yeast, one set – of 223 genes – has been borrowed directly from bacteria. It seems that our vertebrate ancestors somehow unwittingly had sex with bacteria and incorporated some of their genes into our own genome. This so-called horizontal transfer of genes between species was probably common among microbes in the early days of life on Earth, but nobody expected to find it going on in animals. Ready for some more humiliation? The 98[%] of the genome that does not consist of genes at all is largely borrowed from viruses and still simpler types of digital parasite called transposons. The human symphony, in other words, consists almost entirely of old tunes stolen from other works... A moment’s reflection, however, dispels the humiliation... Thirty thousand is still a large number: there are more human genes than there are species of mammal, bird, reptile and amphibian put together. But our self-esteem did not rest on the expectation that we had 100,000 genes, but on 10,000 years of learning and achievement – on the accomplishments of Socrates, Leonardo... and Einstein. The learning and behaviour genes that we share with flies are activated by other actions in the living brain. They are puppets, not string-pullers. The search for what makes a human being human will go on, but it seems unlikely the raw sequence of the genome will reveal it. The key to understanding our recipe will have to wait for the result of a further scientific marathon, called the proteome. For, in one respect, we are much more sophisticated than flies. We do a lot more “alternative splicing:” this means taking different sections of different genes and recombining them in several ways. Thus, from

our 30,000 genes we probably manufacture 300,000 different proteins. Until alternative splicing is understood, the uniqueness of the human being will probably remain as mysterious as ever... The Human Genome Project, which includes scientists at 16 institutions in the U[S], Britain, Japan, Germany, China and France, is expected to complete the highly accurate version of the human genome in 2003.

...Now the human genome is almost completely mapped, researchers have launched a major effort to find genes that cause human disease. The National Human Genome Research Institute said last week that three academic centres would work to find segments in the gene structure that varied from person to person, a big step towards finding genes that cause heart disease, diabetes and other common diseases. The Whitehead Institute for Biomedical Research in Cambridge, Massachusetts, the Washington University School of Medicine in St Louis, and the Sanger Centre in... England, are collaborating in the effort... The collaboration is being funded by the National Human Genome Research Institute, the leading agency behind the Human Genome Project, and the SNP Consortium, a nonprofit organisation that includes the Wellcome Trust and 13 pharmaceutical and technical companies... Researchers will seek to find variable sequences by searching the 3.1 billion chemical base pairs that make up human DNA. These sequences are called single nucleotide polymorphisms, or SNPs... The SNPs will be located, or mapped, on the genome. This map can then be used to locate gene variations that cause disease... Officials say the new research for genetic variations is expected to identify and map up to 750,000 SNPs, only a fraction of which are expected to be medically significant. To find the SNPs, researchers will cut the DNA into about two million fragments, each with about 6000 chemical base pairs... Some of the tiniest variations in the base pairs may provide the key to why one person is predisposed to a disease and another is not... The analysed sequences also may help close some of the few remaining gaps in the working draft of the human genome... [In related news, t]he prospect of genetic testing being used to exclude some people from health insurance is alarming human rights advocates. A group representing most health insurance companies is looking at the use of genetic testing to assess insurance risk... [T]he insurance industry's interest in gene testing is a major issue and in Britain the Government has proposed setting up a group of experts to determine which genetic tests are robust enough for insurers to be able to request the results. British insurers have identified eight disorders, such as Huntington's disease, Alzheimer's and hereditary breast cancer, where genetic tests can be useful to them.

...The exploitation of genetic testing by insurers is set to be outlawed by the British Government amid fears of creating an uninsurable "genetic underclass." ...Insurers argue that using genetic testing to calculate premiums is little different from asking about family medical histories and helps spread risk. They agreed not to use results in applications for life insurance linked to mortgages of under £100,000... but a recent survey found this widely flouted. A parliamentary committee on science and technology has condemned the voluntary code as "inadequate" and... warned that... [the] Health Secretary... will signal this week the banning of the use of so-called genetic profiling tests – which could predict who will die prematurely or suffer chronic disease – to deny people essentials such as mortgage cover. [The secretary] is still awaiting final recommendations from the ethical watchdog, the Human Genetics Commission... before making a final decision, but is known to favour at least a partial moratorium.

...Use of gene 'horoscopes' to defy death sparks ethics row... Do you want to know how you will die and when? Or would you rather live without that knowledge? Such a dilemma might only be expected to face characters in science fiction. Until now. Now genetic tests that promise to foretell accurately our medical future are being sold in growing numbers. Dubbed health "horoscopes", they claim to be able to predict with certainty what illnesses you are likely to suffer throughout your lifetime by revealing inherited traits... All the... Genovation test... scientists ask from you is a sample of your DNA which can be obtained by swishing spearmint mouthwash vigorously around your mouth for 60 seconds in the morning and spitting the proceeds into a plastic test tube. The inside of the mouth is full of DNA and dead cells at that time. The sample is then sent by post to the Great Smokies Diagnostic Laboratory in Asheville, North Carolina. Within two weeks you can discover what your genetic makeup holds in store for your future health... [- d]elivered to your home wrapped like an expensive box of chocolates... Some critics believe the tests are simply a cynical marketing strategy designed to expand the lucrative market for health supplements... There is also concern that some people will learn devastating news without counselling support... However, others have welcomed the... tests... [One n]utritionist... firmly rejects the criticism: "This is all about empowering people so they can get some feedback on how their individual biochemistry is working. Anyone with a sense of doom and gloom doesn't need to take the tests. Nobody is being forced to take them. But my view is, if you can help save your life by spending a few pennies on supplements, then it's got to be worth it." [The nutritionist], who runs the Nutrition Clinic from a Harley Street, London, office, had his own genetic profile tested[and learnt it has] a gene that is linked to high levels of homocysteine – an enzyme associated by some studies with an increase in cardiovascular problems. As a result of this discovery, [the nutritionist] takes a special supplement that is alleged to reduce the impact of too much homocysteine in the body. Yet his optimism is in sharp contrast to scepticism among leading geneticists and the pressure group Genewatch[, which recently]... forced the Body Shop to stop a simple form of "life-style" genetic testing made by the British firm Sciona... Genewatch is calling for the British Government to introduce proper regulation to control the sale of such genetic tests which the group claims are just a cynical ploy to profit from the fear people have of getting ill in the future... The Human Genetics Commission is due to report... about controls for such tests.

...Scientists at the Auckland School of Medicine have found a way to treat genetic disorders that promises a pill to cure diseases such as stomach cancer and diabetes. The team... have used a gene-therapy treatment taken orally to cure the world's commonest genetic disorder, lactose intolerance, in rats. It is hoped that within a decade a "dose" of the same gene therapy will be used to combat inherited conditions in humans...

Parents of children suffering from rare genetic disorders want nothing to stand in the way of gene research. The emotional plea was made during the final hearings before the Royal Commission on Genetic Modification in Wellington. A couple with two children suffering from the rare Mucopolysaccharide type 3 (ML3) disease said gene research offered the only hope of a cure. It is one of 40 lysosomal storage diseases... which are caused by genetic defects[and affect a]bout 180 N[Zers. An Aucklander]... whose daughter suffers from lymphangioleiomyomatosis, a progressive and extremely rare lung disease, said it was "intolerable and unthinkable" that public fear should be allowed to stop medical research into the condition. In her submission for the N[Z] Organisation for Rare Diseases, [the Aucklander] said research under way in the U[S] into the gene now known to cause the disease offered the only hope of a cure to the mainly young [gals] affected by it... [A] senior research scientist at the University of Otago, said on behalf of the organisation that... the Hazardous Substances and New Organisms Act, which governed the importation and research into genetically altered organisms, was too restrictive and should be changed.

...Human genetic engineering will profoundly change the practice of medicine over the next 30 to 40 years... Genes can be used in two ways to treat disease. The first is gene therapy, in which one or more genes are injected into the patient to replace those absent or not working properly. In the second, a drug is given to the patient to modify the function of one or more genes in the body. Pharmaceutical and biotech companies are investing heavily in both approaches... Thirty years from now, essentially every disease will have gene-based therapy as a treatment option.

...“It has taken 31 years of hard labour to invent myself,” says a]... casino waitress... in Bristol, England, [who] has applied to patent herself... [to] protect herself from “genetic exploitation”... “In my application I stated that I was novel and useful and that my genetic make-up could be used to profit medical research... There is a kind of greedy, unpleasant atmosphere around the mapping of the human at the moment... I want to have sole control of my own genetic material...” ...A spokes[perso]n at the Patent Office... said: “I can confirm we have received a patent application... entitled ‘Myself.’” ...Scientists around the world are in a race to decode human genes so they can find cures for diseases such as cancer.

...Despite all of the shortcomings of modern medicine – the cost, the impersonal reliance on technology, the many ills still beyond its reach – there has never been a better time to get sick than now. The revolution in medicine during the 20th century is mind-bending... A century ago, the standard contents of a doctor's bag included arsenic, mercury and other medicines that could kill before they cured. A physical examination often amounted to little more than looking at the patient's tongue... Slowly at first, and then accelerating mid-century, medicine retooled itself. It became

less art, more science... And many scientists believe this is barely the start. Like the discovery of X-rays at the end of the 19th century, the harnessing of genes at the end of the 20th century is likely to pay off in powerful new ways to control human ills in the century to come.

...Genetics look set to provide the biggest medical breakthroughs in the new century. The Dean of Auckland University Medical School... predicts that, once [GE] foods are shown to have health benefits, controversy over their use will dwindle... foods could[then] be designed for people with sedentary lifestyles. Genetic therapies will also be developed to enhance the body's own systems for fighting illness. Cloning techniques could be used to promote cell growth for repairing or replacing limbs... Revolutionary advance in biotechnology and... IVF... means the complete genetic makeup of a child can be efficiently determined before the fertilised egg is implanted... The technology will prevent... the trauma of aborting [a] pregnancy, with a wide range of genetic diseases now able to be identified and prevented before inception. Before the technology, which uses special DNA microchips, only certain diseases could be identified, and by a lengthy, costly process of elimination. A pair of ...American twins were the first... to be born of the new technology, which still needs extensive research... The parents, who carry the gene with the debilitating disease sickle-celled anaemia, had terminated children on two previous occasions because the disease had been identified 15 weeks into the pregnancies.

...Last year was a stunner for medicine: 21 new drugs – an unparalleled number – were marketed by U[S] pharmaceutical companies. The treatments – for heart disease, multiple sclerosis, hepatitis, Alzheimer's, epilepsy and cancers – poured out of America's biotechnology giants. There has never been a better time to be ill – if you are American. For the world's richest people, things can only get better. But for the rest of the planet, fears are growing that others may have to pay the price for this meteoric rise in medical knowledge. The concerns of the US biotechnology industry are sweeping aside everything in their path. The point was starkly underlined at... [a] science forum in Lyons this week. International health officials, drug company chiefs and doctors all expressed alarm that the US genetics juggernaut has become so powerful that it threatens to force its products on the world, whether it likes it or not. At best, the consequences will be wasteful; at worst, they will be dangerous to health. In most African countries, new heart drugs are useless in towns and villages where most people die before middle age. As... the W[HO's representative] put it: "There is a simple question to consider. Will current advances in genomics help the [Last W]orld? And the answer is that they will not." ...The health of Africans and Asians could worsen because of the rise of the US genetics industry, [the representative] said. Malaria... – ...which... [can be prevented by] cheap... mosquito nets, [yet still kills]... more than a million people a year, most of them children[–] illustrated what could happen. "It is attractive to think that sequencing its genes will lead to new drugs and insecticides... It is more likely, however, that any such discoveries will be patented and only developed at prices unaffordable to those who need them most."

...Thanks to vaccines, smallpox and polio are no longer killer diseases. Vaccines... have had "the greatest impact on human health of any medical intervention." The revolution is not over. Armed with new tools for manipulating genes and proteins, scientists are concocting vaccines to fight everything from food poisoning to cervical cancer. At the same time, they are discovering radical ways to improve compounds that generate immunity. If the strategies work, future vaccines will not be manufactured in costly laboratories or doled out through needles. We may cull them cheaply from genetically altered fruits... or... vegetables... – and we'll consume them in pills, ointments and nose sprays... Another option could involve using animals. Scientists at Genzyme Transgenics and the National Institute of Allergy and Infectious Diseases are working to create goats whose milk could be used to vaccinate children against malaria. They have already had goats and mice churn out pieces of MSP-1, a protein displayed on the surface of the malaria parasite. If tests show that the MSP particles protect monkeys from malaria, the scientists will try testing them in humans... Scientists realised centuries ago that a benign substance can sometimes rally the body's defences against a harmful one. The surest way to put a dangerous microbe out of business is simply to infect people with a mild strain of it... [Modern] researchers are pursuing variations on this strategy. If a sub-unit – or a whole pathogen – doesn't trigger immunity, they fasten it to a molecule that will attract more attention. That's the strategy that yielded the new meningitis vaccines, and it may also be our best hope of controlling streptococcus pneumoniae, the leading cause of childhood ear infections. Some 83[% of US] children suffer an ear infection by the age of 3. The condition accounts for 35 million doctors visits every year, as well as a flood of antibiotic prescriptions... But many experts think they're overused, and antibiotic resistance is growing... Children's immune systems don't respond forcefully to the outer coat of strep pneumoniae, which consists of sugar molecules. So researchers have created copies of those sugars and attached them to an easily recognised diphtheria protein. If this "conjugate" vaccine works as intended, children will respond to both of its elements, and achieve lasting immunity from ear aches... Meanwhile, the... North Shore childcare facility at the centre of a diphtheria scare has decided to ban non-immunised children from enrolling... [T]he centre was introducing the ban after a public meeting last night and pressure from angry parents... Previously, it had felt legally obliged to enrol children even when parents could not provide... immunisation certificates... [One mother], who has two pre-schoolers at the centre, said parents wanted to see the ban adopted at kindergartens and childcare centres citywide. [The mother] had endured five days of fear, waiting to discover if her two children... carried the disease. Tests later cleared them... [T]he medical director of the Immunisation Advisory Centre... said those parents who decided not to vaccinate their children did so at the expense of safeguarding society. "More people are travelling overseas and could come back with anything... We are sitting ducks." [The medical director, who is] based at the Auckland Medical School, said the unvaccinated Auckland toddler at the centre of the diphtheria scare was likely to have picked up the acute infection from his parents, who holidayed in Indonesia last month. "If the parents can bring [diphtheria] back and give it to their child, they can easily give it to their neighbours." The... [medical director] endorsed the idea of childcare centres being allowed to ban unvaccinated children. But... the Immunisation Awareness Society, called the ban idea hypocritical... Unvaccinated children posed no threat to others if vaccines were as effective as often claimed. The toddler at the Beach Haven centre merely had a sore throat, even though some diphtheria bacteria were found in lab tests. The ban on unvaccinated children was an overreaction from hysterical parents.

...Fewer than half N[Z]'s young children are thought to be still protected against the meningococcal disease epidemic, despite a \$200 million mass vaccination campaign. The vaccine injections give short-term immunity against the N[Z] B-strain of the bacteria. But this drops below protective levels within months, says a report by the Immunisation Advisory Centre at Auckland University... [A h]ealth campaigner... said parents were not told how quickly the immunity wore off, leaving them with a dangerously false sense of security. The vaccine injections were available to everyone under 20... The programme ran until May this year for children under 5. Originally three doses were given, but after it was found that babies' immune responses were much weaker than those of older children and teenagers, a fourth dose was added for babies at 10 months.

...Half of all children under 6 visiting Auckland medical centres do not have a regular doctor. Health professionals say that because of this some children may be missing immunisation checks and other routine visits where problems are picked up early. The finding results from an eight-week study by Auckland Medical School researchers... One of the researchers... said anecdotal evidence suggested parents not registered with GPs were poorer, less organised and without ready transport, meaning they had to go wherever was convenient... [The chairperso]n of the Royal N[Z] College of General Practitioners, said people's health could suffer without continuity of care because their records were not kept in one place.

...CHILD health problems out west are not being dealt with by the current fee-per-consultation for GPs, says a new report on Waitakere City's health needs. The... Waitakere Health Planning Group... [p]roject manager... says there are many west Aucklanders who don't have access to primary health care. "We will win or lose the battle with child health and chronic diseases in primary health care... We want to create a more prevention-oriented health system..." The West Auckland GPs' group, Integrated Primary Care Services, says access to primary health care is a huge problem and the pay per consultation system benefits the rich. [The group's g]eneral manager... says the GPs want funding based on population to enable subsidised services for those who can't afford access to primary care. "For example if transport is a problem we can put a shuttle bus on and that sort of thing..." • A[ll NZers]... under the age of 18 would get free visits to their GP under a scheme being pushed by the...

Alliance[. The party's] leader... told the *Weekend Herald* yesterday that the proposal would extend the existing free health care policy for children under 6 to all those of school age – believed to total around one million N[Z]ers. It would cost an estimated \$35 million a year on top of the \$69 million for the under-6 scheme. The amount is regarded as small enough to give the scheme a real chance of being accepted by... the Government...

The cost of going to a GP could fall long-term – possibly to as low as \$2 – under Government plans. The Government last week proposed major changes to primary health care. Under the plan, The Future Shape of Primary Health Care, N[Z]ers would sign up to a particular Primary Care Organisation... [– which] would receive bulk-funding for each patient under a population-based formula weighing up factors such as gender, ethnicity, social deprivation and disease spread. [A p]rofessor... of the Auckland University School of Medicine said the initiative could lead N[Z] closer to fully funded primary health care, like Britain's... About 15[% of NZ GPs are already] working under a capitation system and the move to [full capitation] would take at least six years... [As for the other 85% of GPs, the Government currently] subsidises about 35[% of their] income and patients pay the rest. [The professor, who is] a board member of the Health Funding Authority, said the Government had indicated that it hoped to build on the new plan and increase subsidy levels for GP care. [The professor] believed capitation levels would increase from 35 to 85[%], so patient charges could drop to between \$10 and \$12... To lift subsidy levels, the Government would need an estimated \$350 million, on top of the \$276 million already spent on primary health care. Britain's moves to a primary health care model raised concerns that budget-holding would encourage organisations to turn away chronically ill patients trying to enrol. This practice is known as “cream-skimming.” [NZ's Health Minister] said the weighted population funding meant cream-skimming was unlikely, as sickly patients would bring more money with them to the organisation.

...If there is anything you need to know about health and well-being then make a point of visiting Sport Waitakere's Health Check day later this month. The... Health Check day is at the Kelston Community Centre from 10am to 12pm. Admission is \$4 but all the services are free. Sport Waitakere's active living manager... says the event allows... a huge variety of health professionals... to return something to the community that supports them through the rest of the year. “The health check day is now in its eighth year and has gone from strength to strength. It is always very popular as people can have so much checked out at once... It [is like] getting a warrant of fitness for your body instead of your car.”

...*Macho [guy]s happy to pull in for their pit stops* A blokey approach to medical care which invites [guys] to put themselves “over the pits” for a check-up by health workers in navy overalls is paying dividends in rural Western A[US. Guys], notoriously reluctant to talk to doctors, are responding in droves to the health initiative, which could potentially save their lives, its creators say. [The h]ealth promotions officer... from the Gascoyne Public Health Unit in central W[A said guys] appreciated the humour in the Pit Stop health programme. Mechanical terms employed in the state Government-funded project included references to checks on oil pressure (blood), sparkplugs (testicles) and duco rust (skin cancers)... Success during a trial run at a Carnarvon drag race meet led to the programme's extension throughout the remote Gascoyne region... [In local news, d]octors attending emergencies want permission to exceed the speed limit. The Rural GP Network will seek a law change after a Northland doctor received a speed camera fine while on his way to help a suspected heart attack victim. The doctor is contesting the \$510 fine imposed after a speed camera clocked him travelling... 115 km/h in a 70 km/h zone... The patient survived. The police rejected the doctor's appeal to have the fine waived and the case is now before the courts... [The] Rural GP Network chair[perso]n... said the doctor was called out as part of the Government-funded Primary Response in Medical Emergency (Prime) service, which was established about two years ago to get rural GPs and nurses working with emergency services at accidents and emergencies... [T]he network would approach ACC and the Ministry of Health, which fund Prime, to help it seek the same legal status for GPs attending emergencies as services such as ambulances and the police. The doctor involved was driving in fine conditions, with no other traffic around and was equipped with a green flashing light. “We have no intent to drive unsafely but we need to know whether we can attend as quickly as we can,” said [the chairperson. The p]olice national road safety manager... was not familiar with the case but expected that if the doctor had been exceeding the limit by over 40 km/h [it] would be prosecuted. Even police, who were trained and drove specially modified and highly visible vehicles, were not allowed to drive more than 30 km/h above the limit while attending emergencies. “The idea is to get to an emergency in one piece... You are neither use nor ornament if you're tied up in a crash yourself.” However, the Minister of Health... is unhappy the police have refused to waive the fine and plans to raise the issue today with [the]Police Minister... “I would have hoped that common sense would have prevailed but it seems the police have decided to... send it to the court, which I think shows a lack of judgment...”

...More than a third of N[Z]'s physicians, surgeons, pharmacists and general practitioners have... significant symptoms of mental illness and 10[%] more severe mental disturbances... a... Wellington School of Medicine study, released yesterday... has found. The... Medical Association chair[perso]n... said the study... was a worrying snapshot of the work stress suffered by medical professionals. Their level of psychiatric distress was higher than in the [general]community... and emphasised that medical professionals often did not make the best decisions for patients... “Unless the Government and health sector organisations are able to address some of the more potent causes of job stress, there is undoubtedly the possibility of further deterioration in recruitment, retention and, ultimately, patient care,” the study said... Doctors and pharmacists were... asked to complete a questionnaire used to measure mental health. The study... also... asked... about job satisfaction... Nearly half of the pharmacists had considered quitting, as had 22[%] of surgeons and 15[%] of physicians... Bureaucratic interference frustrated nearly 90[%] of pharmacists, 75[%] of surgeons and 64[%] of doctors. More than 60[%] of the respondents said work had interfered significantly with their family and social lives, and 80[%] of pharmacists, 60[%] of surgeons and 58[%] of physicians said they felt overwhelmed by paperwork.

...The U[S] Government has issued guidelines urging doctors and nurses to abandon washing their hands with soap and water between patients and instead rub on fast-drying alcohol gels to kill more germs. The goal: reduce the hospital spread of viruses and bacteria that infect an estimated two million people in the U[S] each year and kill about 90,000. Many hospitals have already made the change and studies show this can halve their infection rates... [By the way, c]hildren who wash their hands four or more times a day... have 24[%] fewer sick days with colds and flu, and 50[%] fewer days off with tummy bugs... a US survey shows.

...A LITTLE bit of dirt doesn't hurt anybody – it's good for us... [An] immunologist at the Auckland University School of Medicine, is one of a growing number of scientists warning that our paranoia about germs and obsession with cleanliness could be responsible for the explosion in... allergic diseases throughout the West... The theory is that during the course of evolution the immune system learned to cope from birth with a huge array of germs. The onslaught helped humans to develop specialised immune cells and chemical pathways to deal with them, especially during infancy and childhood. But if this stimulation is removed the immune system does not develop in a balanced way. “In our quest to rid ourselves of germs and infectious diseases we are not treating the immune system to all the things that would induce a state of tolerance... There is good scientific reason for believing that the fewer infectious diseases a person meets early in life, the more likely the immune system will be hypersensitive to allergens like pollens and dust mites. We keep ourselves far too clean these days.” Yes, “normal” hygiene is still important to avoid diseases such as food poisoning. But... [the] new range of antibacterial products... [– such as] soaps and kitchen cleaners, chopping boards and dish clothes, quilts and pillows... [–] and advertisements on television is sucking people into believing that we should at all times be striving for sterility. “Even if this were possible, it is not desirable...” It's a trade-off, [the immunologist] says, between preventing diseases which are potentially very serious and allowing children to be exposed to a wide range of microbes. The immune system responds in two ways when it meets an andogen or pathogen... Both Th1 and Th2 responses are activated but one will be pre-eminent. (Th means T-cell helper. T-cells are the lymphocytes or type of white blood cells that act as the defenders in our immune systems.) When the Th1 response is triggered, very few antibodies are made. Instead, killer cells are produced which identify the “intruder”... and destroy it. The Th2 response, on the other hand, makes lots of antibodies or soluble proteins which bind to the surface of the “intruder”... to neutralise it. This results in wheeziness, runny noses and itchy eyes.

In newborns, the immune system response is more skewed towards the Th2 response... The particular response triggered later in life seems to depend on which of the two gains the upper hand during childhood, and this, immunologists now think, depends on how many viruses and bacteria the immune system encounters in childhood. "As we come into contact with childhood illnesses, bacteria in the gut and microbes, putting our fingers in our mouths and sucking on old clothes, the Th1 response becomes more prominent." In most adults, bacteria mainly set off the Th1 response, restricting the Th2 allergic response. "A little bit of dirt teaches the immune system not to overreact,"... One of the first hints that lack of dirt or disease might be implicated in the asthma explosion came nine years ago... [A]n epidemiologist at the London School of Hygiene and Tropical Medicine, challenged the prevailing wisdom that infections triggered asthma when [the epidemiologist] noticed children from big families – especially younger siblings – were less likely to develop asthma, hay fever or childhood eczema. "Mucky" children bringing home bucketloads of infections somehow protected the younger children from allergies, [the epidemiologist] suggested. However, the findings are not clearcut. There is also plenty of asthma among children living in poor, crowded conditions and exposed to many infections... The increase in air-pollution and dust-mite numbers... have both been identified as culprits... But both seem to be in the clear, according to *New Scientist*. It says dust mite numbers levelled off years ago while asthma rates continue to rise; and in Europe, asthma and other allergies are more common in the relatively clean air of southern Swedish cities than heavily polluted Polish cities. City living itself is being suggested as part of the problem because lack of gardens means little contact with earth, which teems with mycobacteria. And the treated water we now drink and wash in, which at one time would have contained millions of mycobacteria a litre, now has very few, because of chlorination. "Most of the mycobacteria that live in dirt and water don't cause disease but it appears they do have a dramatic effect on our immune systems,"...

THERE'S more than one reason to be the first in your house to read your *Sunday Star-Times*. Today's newspaper is usually germ-free, since fresh ink inhibits the growth of micro-organisms. But yesterday's paper or a weekly magazine will be covered with potentially dangerous bacteria. So says... [a] health writer and author of *The Hypochondriac's Handbook*. The book, which [its author] says should not be taken too seriously although the information in it is correct... contains 128 pages of snippets about viruses, bacteria and other health risks. Unfortunately, once read it's hard not to start washing your hands frantically and considering wearing a mask to work to ward off infection from colleagues... because along with its underlying humour, the book contains hundreds of "fright bites"... that would scare even your average slob half to death... ● Flu viruses can live for years in dried spit. ● Coliform bacteria has been found on 60% of office coffee mugs while 10% had E. Coli. ● Some bacteria can survive for months on a single dust particle. ● Children bring their hands to their mouths once every three minutes on average. The amount of dirt they swallow daily would cover seven kitchen floor tiles... ● A fifth of the world's population carries hookworms that enter the human body through the feet, travel through the bloodstream into the lungs, then into the intestines... caus[ing] symptoms similar to ulcers. ● More than 90% of kitchen sinks harbour salmonella and campylobacter. Delightful, huh? ...but it's all scientific fact (at least in America)... [Here are some more reasons for living] in a plastic bubble... ● Public [gals'] restrooms are twice as germ laden as [guys' – though gals] spend more time in the bathroom and also bring in children aka walking, talking bacterial hot zones... ● There are 120 viruses including Hepatitis A that live in faeces. When you flush the toilet, water droplets containing more than 25,000 virus particles and 600,000 bacteria fly from the bowl, hover for a few hours then land on surfaces as far away as 1.8m. Closing the toilet lid doesn't help, the next time it's opened a cloud of virus-carrying water particles will burst out. (Toothbrushes are a common target of this vapour.) For a truly clean toilet regular disinfectants won't do so you will have to spray lab alcohol in the bowl and light it.

...A new front is opening in the never-ending war between germs and humans. As befits this information age, the battle is to control the enemy's communications systems – the enemies in this case being potentially lethal bacteria such as E. coli, salmonella and vibrio cholerae, the bug that causes cholera. Researchers have discovered that these and other infectious microbes need to exchange messages in order to be dangerous. They are harmless if they cannot communicate. These organisms have developed... a "bacterial language" – a set of chemical signals that enable them to take a head count, rather like a sergeant calling the roll of his platoon. The bacteria do not attack until they sense they have sufficient numbers... "If bacteria started producing toxins as soon as the infection began, it would be like waving a flag to alert the host's immune system,"... wrote... a molecular biologist at Princeton University... The messages are hormone-like molecules that certain microbes can send and receive, saying, in effect, "I'm here," and responding, "So am I." Researchers think they might be able to prevent or cure disease if they can jam the bacterial communication network, by, say, blocking the apparatus that receives messages, known as a "receptor," on the microbes' surface... In addition to its potential for preventing disease, the discovery of bacterial communication may help to explain how complex, many-celled micro-organisms developed. For its first three billion years, Earth was inhabited by single-celled micro-organisms such as bacteria... [A]bout 600 million years ago, cells began to join in larger unions, such as algae and fungi, presumably because they were better able to find food and protect themselves... [A] biology professor... of Nottingham University... says "chemical signalling between single-celled organisms is likely to have been a key evolutionary step in the development of all multicellular higher organisms." In a sense, therefore, modern civilisation – with all its complex laws and rules – can trace its ancestry back to those little quorum-sensing bacteria, which learned to cooperate and coordinate their activities for their common good.

...A new antibiotic with the power to kill drug-resistant "superbugs" and other tough infections has won approval from U[S] health officials. The Food and Drug Administration said Zyvox, made by New Jersey-based Pharmacia Corp, was the first in a new class of antibiotics. The FDA cleared Zyvox for use against a variety of infections, including some that resist the antibiotic methicillin and also vancomycin, for years a last line of defence against certain virulent bacteria... that have adapted to resist even the strongest drugs. Thousands of patients each year become ill with staphylococcus infections that resist methicillin and stubborn strains of the enterococcus bacteria that do not succumb to vancomycin... [The] FDA director of anti-infective drug products, said clinical trials with more than 4000 patients had shown Zyvox could fight both types of infections... Zyvox is the first new treatment for methicillin-resistant staph approved in the U[S] in 40 years. Its arrival follows the debut last September of Synercid, an antibiotic by Aventis SA that also holds approval for fighting vancomycin-resistant enterococcus. Zyvox, known generically as linezolid, works differently from Synercid and older drugs. It stops bacteria from multiplying by halting production of proteins vital to their growth early in their life cycle. Other antibiotics stop the spread of germs later in the process... Another advantage may be that the drug is made synthetically. Pharmacia officials said that in the past antibiotics were developed naturally, which made it easier for bacteria to outwit them... The FDA approved Zyvox for fighting pneumonia and skin infections as well as the resistant superbugs. To prevent bacteria from growing resistant to Zyvox, it said the drug "would best be used" starting only in a hospital or nursing home, where patients are most vulnerable to serious infections. Pharmaceutical industry analysts... predict Zyvox sales as high as \$US550 million... a year... Zyvox should be available within weeks.

...Garlic is effective in eliminating MRSA, the "superbug" responsible for up to 20,000 deaths in British hospitals every year. A bacterium that can be harboured harmlessly by healthy people, MRSA... can poison the blood of those with vulnerable immune systems. Last year, it was estimated that 24[%] of patients suffering from blood poisoning in English and Welsh hospitals had contracted MRSA while being treated. Until now, a cream called Mupirocin has been used to combat hospital "superbugs", but experts say it is not effective... [T]he University of East London discovered that allicin, an active ingredient of garlic, killed all 30 strains of MRSA isolated from patients in two hospitals...

THE black rat, responsible for spreading the bubonic plague that killed 25 million in Europe in the 14th century, is making a comeback in Britain. Six infestations of *rattus rattus*, thought to be nearly extinct in Britain, have been discovered thriving along the Thames in east London... The new colonies of black rats, also called ship rats, are thought to have been brought in on cargo vessels from eastern Europe, where pest control is not as advanced as in Britain. In the docks of Southampton, Portsmouth, Manchester and Glasgow, there have been no sightings of black rats

since the 1960s... So far, the newly discovered colonies have not been found to carry the fleas that cause bubonic plague known as the black death. However, the disease has not disappeared entirely. Between 1980 and 1994 there were more than 18,000 infections and 1852 deaths around the world. Last year [‘researchers from France reported in the New England Journal of Medicine that they had found a strain of bubonic plague resistant to most of the antibiotics used to treat and prevent the disease’]...

It is one of the deadliest new viruses to have emerged on the planet, and in the past few months it has begun to terrorise a growing number of victim nations. West Nile Fever looks set to become a global threat for the 21st century. Last month the disease killed 12 Israelis; France and Jordan reported outbreaks; and U[S] scientists warned that the disease has probably spread across the nation, threatening new eruptions in areas such as the Gulf coast. The bird-borne disease – which can trigger fatal... encephalitis – caused panic when it broke out in America last year, killing seven New Yorkers. It was the first outbreak in the Western hemisphere. Researchers are still arguing over the cause, with some putting the blame on an infected bird that had been imported from Israel, while others said mosquitoes on airliners had spread the disease... “The disease is now firmly established in the US,” [a doctor]... of the Institute of Virology and Environmental Microbiology, Oxford, said. “It is there for good now. It is hard to see how on earth they can get rid of it.” The threat of West Nile has so alarmed Canadian health authorities they have decided to post chickens along their border with the US. Coops are being built from Saskatchewan to Atlantic Canada, creating a poultry version of Hadrian’s Wall. The birds inside are scheduled to be tested regularly for West Nile viral antibodies, the aim being to give scientists an early warning of an impending outbreak. Such measures will probably prove futile... [Academic]s at the Smithsonian Institute’s Zoo in Front Royal, Virginia, have just reported... that they now believe more than 70 migratory species of bird, including ducks, starlings, terns and gulls, can carry the... virus, creating vast squadrons of avian hosts that can ferry the disease around the globe with impunity. “The virus is probably in every corner of North America by now,” as well as parts of South America... But although the disease has caused alarm in the West, it is by no means a new affliction to our planet. It is endemic from the Cape of Good Hope to Cairo. More than 80[%] of Egyptians are infected at some time... The virus is usually harmless in healthy people, but can cause deadly inflammations in the brain and spinal cords of immune suppressed or elderly patients... “It is without doubt a nasty illness,” said [a] neurologist... of Liverpool University in the United Kingdom. “But we should not go overboard about it. Until last year no one knew about West Nile Fever, even though there had been several previous outbreaks in south Europe. It wasn’t until New York was hit that the West gave a damn. The situation is particularly ironic when you look at Japanese encephalitis, a virtually identical bird-borne disease caused by a sibling virus. It affects more than 50,000 people a year in Asia, and kills 15,000 of them. It is much nastier, but we don’t notice it. In general, though, flaviviruses are going to be a real problem. We have not seen everything they can do yet. They are rapidly evolving entities and they are likely to adapt to all sorts of ecological niches.” Flaviviruses have already adapted to cooler climates by abandoning mosquitoes and starting to use ticks as their intermediary hosts. One such illness has appeared in Britain: louping-ill fever, which can decimate grouse populations and has triggered outbreaks of non-fatal meningo-encephalitis in humans... [Incidentally, a] pensioner who is one of the few people in Britain allergic to electricity has been told by doctors they cannot cure her condition[, although]... treatment will reduce her problems... [The pensioner] developed her unusual allergy after being caught in a violent electric storm while on holiday in Cornwall 20 years ago. The 78-year-old from Southdown, near Bath, is so affected that [it] cannot wear a battery-driven watch, has to have specially lined shoes... [-] all her shoes [are] lined with chrome leather soles, which dancers use to cut down on heat and static[-] ...and feels pain when... walk[ing] over underground electric cables. [The pensioner] also has to wrap up in survival blankets and wear rubber boots during electric storms to stop the pain becoming unbearable... [The pensioner] has to take homoeopathic desensitising drops every day and can spend up to £188... a month on medicine... [The pensioner] worries that there are plans to erect a mobile telephone tower close to her home, which would only make her problems worse.

...Scientists have confirmed the mould growing in water-damaged homes around N[Z] is dangerous to humans and may also affect animals. The toxin-producing fungus stachybotrys has been linked to serious illness and deaths in the U[S], but until now researchers had not proven the fungus found in N[Z] homes was toxic. Scientists now confirm the fungus is linked to the... rashes, tiredness, headaches, allergic reactions, breathing trouble... and chronic chest infections of some home owners. [A] HortResearch microbiologist... said tests had also found other toxic fungi growing with the stachybotrys. “We’re finding the population of fungi in the walls is more complex than we thought. Some of them... haven’t been reported overseas.” ...The preliminary results have already attracted international interest with the N[Z] evidence to be included in stachybotrys research at Columbia University in New York, Denmark’s Technical University and the Institute of Hygiene and Medicine in Germany. However, further investigation of stachybotrys in N[Z] by HortResearch and Landcare Research is on hold while applications for more funding are made to the Government... [S]tachybotrys had been confirmed in 170 [NZ] homes but the toxic rot is likely to be growing in any home which has been poorly constructed and leaks, or in old damp homes... The fungus emits toxic gases which can permeate minute cracks or wallpaper but, if disturbed, the fungus may send out spores which expose people to dangerous levels of the toxin... Builders making repairs to rotting homes were at high risk.

...[NZ m]ortuaries may be banned from doing some autopsies because... Occupational Safety and Health believes staff are at risk of infection from potentially fatal diseases. The... OSH... said yesterday that it was alarmed at safety standards at mortuaries and could not vouch for the safety of any of them... During autopsies, fine sprays of bodily fluids, known as aerosols, are released which are invisible to the naked eye. Blood, body tissue and other potentially infectious fluids can also be splattered round the autopsy room... Pathologists and mortuary staff are believed to be at risk of contracting HIV/Aids... CJD... hepatitis B, hepatitis C and tuberculosis because of poor ventilation systems and lack of protective clothing. Medical students observing autopsies have also been at risk... Staff... [at the] Auckland mortuary... have refused to do autopsies on suspected CJD cases because of the risk of infection. Some are now refusing to do other categories considered high-risk... The Auckland Healthcare general manager of clinical support services... said... [s]uspected CJD victims were being buried without a definite cause of death listed in their death certificates, but... did not believe any suspected Aids, TB or hepatitis cases had gone unidentified as a result of the OSH action... However, the Ministry of Health said all types of autopsies should continue despite the OSH safety review, which it welcomed... [Auckland Healthcare’s manager] agreed ventilation systems were inadequate and that some staff did not wear protective gear when they should. Talks had been held with the mortuary owner, the Auckland University medical school, about a \$1 million upgrade but no decision had been made on when it would happen or who would pay.

...Mercury from dead people’s fillings is endangering crematorium workers’ health because it is not being destroyed during cremations. Concentrated levels of mercury were found in the hair of British crematorium workers – an indication that it may be in their liver and kidneys. Health officials here now plan to investigate the risks posed both to N[Z] workers and people who live near crematoriums. The Waikumete Crematorium manager... whose operation uses British-made cremators... was concerned about the overseas health findings and planned to have his staff tested immediately for traces of mercury. And... a scientist at the toxicology laboratory of the Institute of Environmental Science and Research in Wellington, said: “If mercury fumes are going up crematorium chimneys it is a cause for concern. I would certainly recommend monitoring levels.” ...Previous research had found mercury in the soil around crematoriums, but... the... research published in the *British Medical Journal*... was the first time an attempt had been made to measure levels of mercury affecting workers... Neve University College, Northampton... estimated each crematorium emitted 5.4kg of mercury a year... In Sweden, selenium filters have been shown to remove 85[%] of mercury when put in crematorium chimneys... Mercury poisoning, known as mercurialism, can cause kidney damage, intestinal problems and nervous irritability... [In related news, i]t has been nearly two years since James Takamore’s body was taken from Christchurch but [his widow] is adamant the fight to have it returned will go on... [The widow] had applied for an order from the High Court at Christchurch, which, if successful, would force the Takamore whanau to disinter her husband’s body from his marae at Kutarere, near Opotiki... Mr Takamore, who died in August... said in his will

that [it] wanted to be buried but did not specify where. After a confrontation with [his wife], Mr Takamore's mother, sister and brother took his body back to be buried beside his father. The whanau have refused to relinquish the body, saying the burial was done in accordance with tikanga Maori... [The widow] said changes to the law were needed to allow police intervention when disputes arouse over bodies... [A s]choolteacher... supported the idea. [The schoolteacher] was on her way to a Hamilton cemetery to wait for her aunty (Ivy) May Ngahooro's body last year when [it] received a panicked phone call from a relative saying: "Hurry, they've taken her". Mrs Ngahooro's estranged daughter... and relatives forcibly took the 76-year-old[']s... body from a Hamilton funeral home. They drove her to Taumarunui after a police roadblock and attempts at mediation failed. It took a court injunction, a hefty legal bill... and a long meeting between the two sides of the family before Mrs Ngahooro's initial wish was agreed to two days later. The saga, [the schoolteacher] said, caused both sides of the family unnecessary and massive trauma... In response, the Ministry of Justice recommended late last year that police be given the power to seize bodies involved in disputes with or without a warrant.

...[a British guy's 'father has turned up in a rest home five years after his body was supposedly cremated. Now officials are trying to find out who was cremated'! In local news, h]eadstones of migrants who died while quarantined on Somes Island in the middle of Wellington Harbour were returned to the island... yesterday... [T]he island had been used to quarantine immigrants from Europe from as early as 1870 to the influenza epidemic of 1918... "A typical voyage during the 1870s would be up to 120 days in usually unhygienic conditions... Diseases such as typhoid and scarlet fever were common and devastating to the old, very young or weak. Of the many who were placed in quarantine on the island, at least 40 never left." ...the immigrant cemetery on the island became overrun and derelict, and during the early 1970s the remaining headstones were removed and replaced with a mass memorial overlooking the site. "The... Conservation Department... decided that the remaining headstones should be moved back to the memorial site rather than have them shut away where no one could see them,"... [a DoC officer said. A ceremony, which was attended by] representatives of local iwi... and descendants of immigrants buried on the island... was held yesterday to bless the headstones in their new location.

...New research says a web-based headache assessment test can help patients and doctors improve the diagnosis and treatment of one of the most common human ailments. The Headache Impact Test (HIT), developed by US-based QualityMetric and drug giant Glaxo Wellcome, is an internet-based questionnaire that measures the severity... of headaches... "One of the key problems is... many patients with headaches find it hard to communicate their degree of disability... [T]ools of this kind should improve the situation dramatically... I know that many patients with headaches are not achieving the quality of life... they should and are suffering needlessly," said [a Dr from] King's College Hospital in London... HIT can be found on the internet at www.amlhealthy.com. An estimated 96[% of gals and 91% of guys] suffer from some type of headache during their lives... rang[ing] from mild discomfort to crippling pain. Cluster and tension headaches and migraines, which afflict 120 million people in the developed world, are among the most common. Headaches can be the primary problem or an indication of something more serious such as a tumour.

...*How to light up your lice...* Parents fed up with... battl[ing] infestations of lice on their children's heads may soon find a disco light makes the task a lot easier. A paediatrics professor at Yale University School of Medicine... has devised a shampoo that includes a harmless dye which sticks to the outside of lice eggs... Illuminated by a "black" ultra-violet light... the dyed egg glows brightly and can be easily removed by hand... The dye was simply added to a shampoo available over the counter. [The professor] has now patented the product and is looking for a partner to market it... Lice are becoming resistant to conventional delousing shampoos, which means that if only one or two eggs survive a blitzing, the child's scalp quickly gets reinfested. That leaves parents with the literal job of nit-picking – using a special fine-toothed comb to remove all the lice eggs, which measure less than a millimetre across and can easily be missed. In addition, some head lice shampoos contain lindane, a pesticide that has been linked to cancer and, health watchdogs say, is not suitable for children. [The professor says it] felt an inventive itch after spending an hour manually removing lice and their eggs from a child with thick blond hair. Knowing that lice eggs contain a polysaccharide called chitin, [the professor] took a commercially available organic dye [the professor] knew would stick to it, but not to the hair or the skin.

...*A skin specialist says a five-minute treatment can completely clear a patient's pimples* A zit-zapping laser has been hailed as the biggest step forward in acne treatment for 30 years by an expert who tested it on patients. The pilot study of 41 patients showed that a single five-minute session with the NLite laser can produce a 50[%] improvement. Ten of the patients who took part in the trial at Hammersmith Hospital were completely cleared of acne... [The] consultant dermatologist at the hospital, and founder of the Acne Support Group, said: "The results were stunning. I was a complete sceptic but now I'm completely converted..." ...His is the only National Health Service clinic using the NLite to treat acne... The NLite, originally developed at the University of Wales to tackle birth marks and wrinkles, is now being used to treat acne at about 25 private clinics around Britain. A single facial treatment costs about £300... "A single treatment has an effect that lasts three months. It does support the idea that there is a fundamental alteration in the skin micro-environment." ...Acne is the most common skin disease in the world, affecting 90[%] of adolescents and a large number of people in their 40s and 50s... [The dermatologist – who] said it was a myth that acne was caused by bad diet, not washing, or too much or too little sex... [-] is now investigating precisely how the NLite achieves such dramatic results... It works by heating small blood vessels to provoke a natural healing response and collagen production.

...A... [NZ] 18-year-old... suffers from a rare skin disorder called erthromelalgia, which affects the nervous system and blood vessels. If... exposed to temperatures over 12 degrees C, his body swells up and [the teenager] suffers excruciating pain. Going out into hot summer temperatures could even be fatal... The 18-year-old... can't eat hot food or have a hot shower... The pain has been so bad [the teenager] has passed out several times and, at night, it's hard to sleep because his chest, neck, arms and feet feel like they're being scorched... Sadly there is no cure for the condition, which has medical experts baffled. Doctors can't even predict his life expectancy. Life has been an uphill battle for [the teenager] since the diagnosis. [It] used to love spending time outdoors – playing soccer, snorkelling and going fishing with his grandfather. Now [the teenager]'s virtually a prisoner in his own home... While most other teenagers are outside enjoying the sunshine, [the 18-year-old i]s stuck inside his Wellington home, the curtains pulled to keep out the sun and fans going so [his body] stays cool... The... [teenager] sat School Certificate, despite being in great pain, and passed six subjects with a 70[%] average but, because [it] couldn't control the temperature at school, [the teenager] had to leave... "When I heat up, my lips, my face – everything just swells up," [the teenager] explains, pacing the living room of his home because [it]'s in too much pain to sit down. "It's... so frustrating. What's worse is if I get emotional, if I get angry or I laugh or do anything physical, it hurts... like a burning pain..."

...A shortage of skin donors has pushed specialist hospital burns units to crisis point. Skin has had to be imported from... a private cultivation lab in Brisbane... for at least one critical patient... A... Middlemore and Kidz First hospital burns unit co-director... said there was only enough donor skin in Auckland to help one more serious burns victim... Burns units at Waikato and Christchurch hospitals are not as concerned about the shortage, but tend to deal with smaller burns. Donor skin is a temporary measure and is placed on parts of the body that are weight-bearing – the back, buttocks and thighs – and are most likely to be rubbed raw while the patient recovers in bed. The skin stays on for up to two weeks, helping to repair the blood vessels and to control the patient's pain. Permanent grafts of artificial skin or skin from another part of the patient's body, then replace the donor skin. In the past three months, the Middlemore and Kidz First burns units have dealt with at least five serious cases... [A]nyone with burns to more than 30[%] of their body was in the serious category, where the risks and complications were potentially fatal. The sudden influx of serious cases is the main reason for the skin shortage. Registering as a skin donor is done in the same way as for donating other organs... The skin is removed under sterile operating procedures and the donor's blood and tissues are carefully screened for HIV and hepatitis. [The co-director] said it was taken from parts of the body that were not visible. Unlike most other Western countries, N[Z] does not have its own skin cultivation facilities, something [the burns unit co-directors] are constantly frustrated by. Some of the best treatment results are gained by using the patient's own skin, which can be "grown" in a skin bank from a small sample. It is extremely beneficial with facial burns because cultivation of

their own skin gives the patient the correct pigmentation... A skin bank would cost around \$1 million to set up and the Middlemore doctors said they had started lobbying “everywhere” for money. [They added that a local] skin cultivation laboratory could save the lives of 10 people a year.

...More children are being treated for hot water burns at... Kidz First Hospital... partly attributed to Auckland’s flourishing cafe culture...

[An Auckland toddler] does not go near the kitchen bench any more. Three months ago, the... 2-year-old was balancing on a beach ball and holding onto the kitchen bench when [it] toppled off, taking the kettle with him. The water in the kettle had boiled just 10 minutes earlier. It splashed across [his] face and down his left arm, leaving the toddler howling in pain and sending his mother... into “emergency mode”. After a long time in the shower and on advice from the family doctor, [the toddler] went to hospital, ending up in the Kidz First burns unit in South Auckland. [The toddler] suffered burns to 10[%] of his body and, although most of the burns were superficial... will wear a pressure shirt for the next year to help with the healing. [The toddler] is expected to make a full recovery and the red marks from the burns that remain on his forehead and shoulder will fade over time. Despite having burns that were relatively minor, [the toddler] still suffered a great deal of pain during the early healing process... Starting today, Kidz First hospital is launching a two-week appeal to raise money to buy a bed that would have helped [him] to be more comfortable. Clinitron beds have a special mattress that support the patient using columns of air. The different columns ease the pressure on the burns and make lying down more comfortable. One bed costs \$120,000 and the money is being raised by the South Auckland Health Foundation. The \$60 million hospital itself, which opened last year, was built through taking out bank loans and embarking on a huge fundraising and sponsorship drive because public money was not available. The Kidz First burns unit expects more than 130 children to be admitted every year. Of these, 75[%] will be aged less than 3. Most of the burns treated are scalds from hot drinks, kettles and pots, although a small number are burns from flames. ■ [For 7 months a British] ...boy... lay perilously close to death after a freak fireball accident left more than 90[%] of his body burned. His injuries were so severe, doctors at first agonised over whether to try to save him. But against all the odds, the brave 16-year-old won his fight for life and is believed to be the most serious burns victim to survive in Britain. [The]Chelsea fan... was filling his moped with petrol when it sprayed back on him, setting him and his clothing alight... On large parts of his body the flames had burned right down to his bones, stripping skin, fat and muscle. Only his head – and crucially his face – escaped. The remains of his skin were stripped from his body to reduce the risk of infection.

...A... British [immigrant] who suffered horrific burns after being doused in petrol and set alight in her Sydney home... wanted to die... “There were many times I wished I was dead, wished I hadn’t survived, but the fact I did means something special... Today I’m anxious but excited and trying to think of it all as an adventure.” ...After five months of painful treatment [the nurse], aged 28, is heading home to family and friends in Britain after... an anonymous Scottish benefactor... gave the \$442,000 it cost to fly her, her stretcher and a Careflight International crew to Britain... [Her attacker] has since been charged with attempted murder for the attack... which left her with third degree burns to 90[%] of her body... [T]he initial shock caused her lungs and kidneys to shut down... [Her] injuries were so horrific that doctors at Concord Hospital gave her little chance of surviving... But [the nurse] confounded the doctors[, who]... spent \$A27,000... on importing artificial skin harvested in the U[S].

...*Miracle for bu[rm victim]*... When her 10-year-old-son... suffered severe methylated spirits burns to his face, hands and legs, [a Warkworth resident]... was afraid her son would carry the physical as well as emotional scars for life. However, after using a futuristic tool – a kind of colour acupuncture treatment called the Biopton light on her son for just a month, [the son] experienced an almost miraculous healing. The severe burning... has healed to such a degree, virtually no scarring is now visible at all... It was late last year when [the son] was badly burned after a bunsen burner full of meths, which [the boy] was using at home for a science experiment, exploded. His father immediately placed [him] under a cold shower and gave him the homeopathic remedy Cantharis, then took him to hospital. The next day [his parents brought him]... home and began immediate treatment with the Biopton light, initially for two-hour sessions twice a day, then decreasing the time as the healing rapidly began... Healing human burns is not the only application of the light... Auckland Zoo’s famous elephant Kashin responded incredibly well to Biopton light treatment for an arthritic foot condition and a recurring facial sore. [The s]enior keeper... says Kashin’s wound healed and [the elephant] was more playful, much less anxious and happier following successful treatment with the light. Previous pain relief remedies had not worked on the elephant... The Biopton colour acupuncture light was developed 15 years ago when... Swedish... scientists studying laser technology discovered that linearly polarised light – light waves oscillating in parallel planes – had a definite immunostimulatory effect on the body... ● For [Taranaki’s newest twins, life has been a battle]... for survival from the moment they were born 16 weeks premature. Weighing only 735 and 805 grams at their birth on December 28, the Taranaki twins spent 3 1/2 months fighting for life in a number of hospitals. But one of their worst moments came in March, when eye specialists discovered the babies had a condition which, if not treated immediately, would have made them blind. The condition, retinopathy of prematurity, causes blood vessels in the eye to grow rapidly until they bleed. The retina, the layer at the back of the eyeball which triggers nerve impulses leading to the brain, then detaches from the eye, causing blindness. The disease is found in 80[%] of babies born after around 25 weeks’ gestation. But a new highly sensitive laser treatment meant... [the twins’] sight could be saved. Details of improvements in laser treatment for retinopathy of prematurity were revealed at the Royal A[US and NZ] College of Ophthalmologists conference in Palmerston North last week. [A p]rofessor... who was at the conference, operated on the... twins in March[, and] said the treatment involved painstakingly tracing the outside of the entire retina, applying about 4000 individual laser burns... [T]he procedure could be available for use on patients in about two years.

...A top British eye surgeon has warned that more than a million people are in danger of having their eyeballs disintegrate after having “miracle” laser surgery... [The] professor of ophthalmology at St Thomas’s Hospital and Britain’s top expert on the Lasik technique, says evidence of long-term damage is growing... [T]he technique can lead to the cornea being so eroded that it starts bulging, and... parts of it may become dislodged... “There have been a number of reports of erosion of tissue, with people having to have their corneas transplanted.” ...The use of the Lasik technique has exploded in recent years after heavy promotion by private eye clinics, which offer it as a painless, instant cure for short sightedness. Because of commercial pressures, the technique was quickly authorised in the U[S], although almost nothing is known of its long-term effects. More than a million Americans have had the operation... Patients are rarely warned about the risks. When a reporter phoned Optimax posing as a patient, a consultant said: “All the research shows it’s a safe... proven treatment.” ...[a Dr from] Optimax, who does Lasik operations, said: “I can’t see any danger. Throughout the world, people are switching to this operation because it’s quick, relatively painless and has reliable results.” [The Dr] predicted that by 2005, Britain would match the US, where 90[%] of such eye surgery is Lasik. But... admitted: “Nobody knows what the effects after 10 years are. But how would patients wait 10 years for it? Are we supposed to do 10 patients and wait 10 years? Science doesn’t work like that.” ...a consultant eye surgeon at Moorfields Eye Hospital in London, who helped to draw up the Lasik guidelines for the Royal College of Ophthalmologists, said: “If you stick to the guidelines, there shouldn’t be a problem.” ...[however,] it was “almost certain”... British surgeons were going beyond guidelines, removing up to [2/3]rds of the cornea in patients with extreme short sight. “That’s totally unwarranted. If it’s thin, the pressure from behind will make the cornea bulge out and distort the image...” ...*Eye Facts*... The human eye sees everything upside-down but the brain turns it right side up. The only part of the human body that has no blood supply is the cornea... [– i]t takes... oxygen directly from the air. The pupil of the eye expands as much as 45[%] when a person looks at something pleasing... Computer users, on average, blink seven times per minute.

...An eye disease that can leave its victims blind in just hours is becoming rife among younger people in Britain. Experts describe the epidemic as frightening and warn that if it continues at its present pace it will make a million people blind within 15 years – and could strike people as young as 30. There has been virtually no research into the disease, although scientists are sure it is caused by something in “modern living.” Speculation about the cause ranges from more intense ultra-violet light as a result of the thinning ozone layer, to artificial sweeteners, pesticides, or chemicals

in plastic food-wrap. Age-related macular degeneration (AMD) was virtually unknown in people under 60 until 10 years ago. A recent study shows it is now the cause of sight loss in more than 10[%] of people under 64, ranking alongside diabetes and glaucoma... The number of registered blind people aged 18 to 49 has risen 43[%] since 1982, and almost 56[%] among those aged between 50 and 64. AMD – which is caused by a build-up of dead cells within the eye – is also soaring among older people, and now causes half of all blindness in Britain, afflicting 400,000. In the 1950s it was responsible for just 10[%] of blindness. A consultant at Moorfields Eye hospital... said: “It [AMD] now causes half the blindness in Britain, but it’s not a Department of Health priority, which is stunning.” ...The disease builds up over a long time with no symptoms and can strike without warning... [A] 55-year-old GP... who is now chair[person] of the recently founded AMD Society, says it... first noticed his eyesight was failing while playing squash when [it] was 48. “The squash court lines were crooked, and within a year I had lost my eyesight... I am now registered blind.”

...[there has been a medical breakthrough in Britain. Surgeons have restored a blind person’s sight using one of his teeth to repair a damaged cornea.]

...*I once was blind but now I see...* Cancer stole [a NZer]’s eyesight a decade ago. Last week a bump on the head gave it back. The 24-year-old Auckland[er]... has miraculously regained partial eyesight after knocking her head, confounding doctors who said [the Aucklander] would never see again. [Nine days ago, the Aucklander] bent to kiss her guide dog good night, but instead collided against a coffee table. When [the Aucklander] woke the following morning [it] could see for the first time in 10 years... Last weekend [the 24-year-old] saw her boyfriend of two months for the first time, along with most of her close friends. Her brother had changed from a 12-year-old boy into a[n adult]. “It’s almost too much to take in, I’m so excited. It’s fantastic, amazing, unbelievable,” said... [the 24-year-old], who now has 80[%] vision from her left eye... The cancer that robbed [her]... of her eyesight was diagnosed 13 years ago. Doctors gave her a 5[%] chance of survival after discovering a large brain tumour. Radiology and an operation to remove the cancer were successful, however, but the tumour had already damaged her eyes, cutting off blood supply and putting pressure on her optic nerves. [The Aucklander] was declared legally and permanently blind at 14, her eyes able to detect only light and dark... A[n Auckland Hospital eye surgeon... has no explanation for her recovery and has never encountered a similar case in 25 years as an eye specialist. [The surgeon] could not say whether her sight would be permanent... Unsure if her eyesight would last, [the Aucklander] waited until Friday morning before throwing away her walking cane and spreading the news.

...Bats have inspired the creation of a cane to help the blind and partially sighted find their stride. The eerie creatures manoeuvre by bouncing high-pitched sounds off nearby objects in a process called echolocation, and researchers at Leeds University in Britain used this as the model for their “Batcane”. The cane emits sonar waves inaudible to the human ear to help users detect obstacles ahead, around, or even above them. Any nearby object triggers a vibration in one of four pads in the cane’s plastic handle. As the object gets nearer, the vibration speeds up... [A spokesperson for] Cambridge Consultants, which has developed the cane in conjunction with Sound Foresight... said the Batcane would help visually impaired people to create a “mind map” of their environment and so encourage independent mobility, particularly in cities... “Obviously it won’t suite everyone, but there’s a big market out there,”... There are 1.4 million people registered as blind in Britain alone... Trials are taking place in Britain, the U[S], Canada and Germany... and... [t]he Batcane is expected to be on the market towards the end of the year...

Auckland’s blind residents will soon be... able to combine information sent from the stratosphere with their own knowledge of Auckland’s central city... to walk around the... streets. An international company has combined two hi-tech devices to tell sight impaired people where they are using positional information sent from satellites. Christchurch company Pulse Data International has developed a portable computer called the BrailleNote, which is able to record information. It also has other functions such as e-mail, a personal diary and a calculator. The 1 kilogram BrailleNote computer is connected to a small portable receiver able to receive global positioning system... signals... BrailleNote... has the exact location of 165,000 N[Z] businesses programmed into its memory. The user combines the information about the location of businesses in their area with information about their own specific landmarks... or “waypoints”... After a number of waypoints are entered... into their BrailleNote... the map can be replayed verbally via an electronic voice... The software for the communication technology is in the final stages of development... The GPS system doesn’t work inside yet. “But we are working on it,”... The cost of a basic BrailleNote begins at \$4500 and a GPS receiver costs about \$1400... [A Royal NZ] Foundation for the Blind... member... says the best thing about the technology is that it “remembers” fine detail. “Guide dogs are trained to avoid things... They have no idea that there is a toilet or telephone booth nearby.”

...*Blind dogs see the light again...* Scientists using gene therapy say they have restored sight to dogs suffering an inherited form of blindness – an achievement that offers hope to infants born with a similar handicap. The work in the U[S] centres on a gene, RPE65, which controls a protein that helps to build pigments in the photo-receptors. These are cells in the retina that translate light into nerve impulses, which are sent to the brain. Flaws in RPE65 mean that the photo-receptors do not work, and the retinas gradually degrade. A tragic but rare inherited condition implicating RPE65 occurs in infants called Leber’s congenital amaurosis... A team... from the University of Pennsylvania, in Philadelphia... described... in the journal *Nature Genetics*... how they took retinal cells from blind dogs with this disorder and “infected” them with a disabled virus into which a normal RPE65 gene was tucked. The repaired retinal cells were then injected back into the dog’s eyes, which eventually were able to respond to light as well as the eyes of seeing dogs... Previous gene therapy on RPE65 has worked to reverse blindness in mice, but this is the first time it has succeeded in a large animal... Experts are cautious about trying experimental work on humans, mainly because so much still needs to be learned about how genes work together. Fixing one gene may have a knock-on effect on another, causing health complications elsewhere.

...*‘Bionic eye’ offers new hope of sight* American scientists hoping to give sight to the blind say they have successfully inserted silicon microchips in the eyes of three elderly [patients]... They have given no indication, however, of whether the[patients’] eyesight has improved... It was the second stage of a clinical trial being closely monitored by U[S] Government regulators and rival researchers around the world. The device inserted, known as an artificial silicon retina... has been developed by a private research institute team from Chicago called Optobionics, run... in association with the University of Illinois. The chip is smaller than a pinhead and narrower than a human hair. It is inserted beneath the retina, and the plan is for it to take over the light-sensing functions performed by a healthy human eye and permit people suffering from degenerative retinal disorders to make out shapes in a room or even read large-print books... The search for a system of “bionic eyes”, as this field of research has been dubbed, sounded like science fiction when first proposed a decade ago, but intensive research in Germany, Japan and the US has significantly raised hopes.

...A tiny camera wired into the back of the brain could give the blind the gift of sight. The makers of the device claim it has already enabled a [person] blind for 26 years, to read 5cm-high letters from 1.5 metres. Experts here are excited but cautious about the artificial eye technology announced yesterday by an American biomedical company... – the Doherty Institute in New York... The Foundation for the Blind says it will be extremely expensive, may take years to arrive in N[Z] and that money would be better spent on more basic needs for blind people, such as talking computers... [A]n Otago University lecturer and the foundation’s chair[person], said the device and surgery could cost upward of \$500,000 per person. [The chairperson] would rather see money put into award-winning “sonic spectacles” invented by a Northland [resident]... which enabled blind children to learn to perceive objects in a room... [O]nly a few pairs of the \$50,000 spectacles existed in this country... American experts have also greeted the announcement with a blend of excitement and caution... “For many blind people it would be a totally high-risk, ridiculously unnecessary thing to do,”... But... a 46-year-old Auckland[er]... blinded 25 years ago by a shotgun blast, says [it] would definitely undergo the delicate brain surgery involved: “I... know what I’m missing...” The “Doherty Eye”... uses a tiny television camera and an ultrasonic distance sensor, both mounted on a pair of eyeglasses. The sensors connect through a cable to a miniature computer worn on the person’s belt and wired to the brain’s visual cortex. Tiny electrodes stimulate the brain cells, resulting in specks of light allowing a blind person to make out large... objects.

...A joint team of Anglo-Israeli medical scientists have boldly gone where no one has gone before: they have recorded a video film of a journey through a person's entire digestive tract. A pill-sized capsule containing a camera, light and radio transmitter – but no wires – has emulated science fiction by making a “fantastic voyage” from the mouth to the rear end. In the... 1966... sci-fi thriller... *Fantastic Voyage*... a submarine and its crew are shrunk and injected into a [perso]n's bloodstream. Their mission is to destroy a blood clot in the brain of a Czech scientist who was the victim of an assassination attempt. The real-life fantastic voyage was performed on a group of... volunteers who each swallowed a torpedo-shaped capsule while wearing a special belt with recording equipment, which monitored the capsule's passage through the body... [They swallowed the capsule] after an eight-hour fast and eliminate[d] it eight hours later after it ha[d] travelled the length of the[ir] intestines... On its way through, the device shines a light, takes two pictures a second and transmits them by radio waves to [the]... belt. Doctors transfer the digital images to a computer. They can view the images as still shots or run them together quickly like a video... The team leader, [who is] a professor of gastroenterology at the Royal London Hospital, said one great advantage of the capsule was that it could be used to take images in the small bowel. This was a region not normally accessible with conventional endoscopes inserted through the rectum... The Given Imaging Diagnostic System has a battery life of eight hours, which is long enough to photograph the small intestine but not the large intestine... [The p]rofessor... said the capsule was easier to swallow than many antibiotic pills and patients could not feel it moving inside them... The... disposable... camera[– which i]s not appropriate for certain patients, such as people with intestinal obstructions... – ...has been approved by U[S] regulators. The... deputy director of the FDA office that reviewed the camera, said it did a better job of detecting bowel abnormalities than did computer tomography with ingested barium, a method known as CT... [But the deputy director also] said... capsule endoscopy... should complement but not replace endoscopes, x-rays or other traditional diagnostic tools.

...British researchers have invented a diagnostic tool startlingly similar to [the equipment used] in ‘Star Trek’. It was Dr McCoy's trademark – a gadget you simply waved across a patient's body to provide instant diagnosis. Now British scientists have invented a real-life version... Their super-sensor can monitor a person's heartbeat or brainwaves from 90cm away and could mark the start of a revolution in remote medical testing... Remote monitoring could be invaluable for doctors treating patients who cannot be touched, such as severe burns victims... The team from the University of Sussex in Brighton made the breakthrough while setting out to improve the accuracy of electro-cardiograms. Via stick-on contacts, ECGs measure minute voltages on the surface of the skin which respond to electrical activity in the heart. The data is displayed as a wave on a screen, or a printout. But conventional ECGs suffer from the fact that the skin contacts drain some of the current, so the signal is weak and distorted. The Sussex team... developed an alternative system that measures the changing electric field in the air generated by the shifting voltages on the skin's surface. Their prototype remote device, unlike Dr McCoy's, is not hand-held but fastened rigidly in front of the seated patient. It does not look particularly space-age either, consisting of a copper disc mounted on the end of a metal box. Details are being kept secret because of patents pending. But the results of tests on volunteers have been so startling that [the inventors are] convinced it will completely transform the business of monitoring the vital signs of patients. “What we're talking about is a real paradigm shift. These devices are orders of magnitude more sensitive than anything that has gone before, yet they are cheap and relatively easy to produce. You can go from close non-electrical contact to more than a metre away. In five years' time you could be able to monitor from five or 10 metres.” There are two versions of the device, one which monitors from a distance and another that touches the skin and produces a much stronger signal... [T]he “close-contact” version of the device could lead to portable ECG monitors which could be used in GP surgeries, or even at home. Looking further ahead, arrays of the sensors could provide a complete picture of a patient's electric field. They may also help scientists unravel the secrets of acupuncture, which many experts believe works by altering electrical pathways in the body. [It has been] predicted that the technology could even give rise to a form of electro-acupuncture. “The body runs on electrical signals... If you can pick them up in a way that hasn't been possible before and learn about the relationship individual signals have with the overall harmony of the body, clearly there's a possibility that you could feed back signals and alter activity in the body.”

...[First we heard about ‘the “constantly expanding” computer that can diagnose a patient's condition when a doctor can't (the computer considers everything and produces the most likely diagnosis’). Now we hear a team of medical technicians has created ‘a “sniffer” machine for diagnosing illnesses’.

...researchers are] working on a way to diagnose diseases with a breath test. [A b]iochemist... of the Scottish Universities Environmental Research Centre, has been working with Glasgow University researchers for 10 years to perfect [the] technique... Initially, trials involve giving isotopically labelled urea to patients. This compound breaks down in the stomach, and the resulting breath-test sample can be analysed to see if the bacterium *Helicobacter pylori*... is present. The technique is non-invasive and safe. Other trials have been devised to check that therapy given to children with cystic fibrosis is not damaging their liver. Caffeine labelled with the stable isotope 13C is given to a child and its breath sampled and analysed. The 13C content indicates whether the caffeine is broken down normally by the liver. Similarly, tests using lipid tracers have been used to check that enzyme supplements in cystic-fibrosis therapies are working effectively and that children have an adequate nutritional intake. The technique... – ...[which has already]been applied to the study of digestive diseases in dogs and ponies... – ...is popular with doctors because the tests can be made fun by allowing children to blow up balloons to provide breath samples that are then analysed by mass spectrometry.

...Picture this: a doctor examines a patient suspected of having stomach ulcers and asks him to blow on a specially impregnated card. Chemicals in his breath, released by the ulcers, cause blue spots to appear within seconds, confirming the diagnosis. Or consider a factory believed to be spewing cancer-causing pollutants into the air. Environmental health officials leave a similar card in the neighbourhood, which also blotches quickly to betray the presence of a harmful chemical. Finally, think of an athlete thought to have taken a banned drug. No need to wait for complex blood or urine analysis. The same simple card trick will instantly reveal guilt or innocence. These diagnoses may soon be commonplace, thanks to a remarkable universal sensor based on the sex life of yeast... [T]he bio sensor team at Leeds University in England, has developed a “library” of millions of genetically engineered yeast cells capable of responding to virtually any chemical in existence... [The] research has focused on membranes, the gossamer-thin skins that cover all living cells and protect them from chemical and biological invasions. Membranes form a coat around a cell, except at key points where long protein receptors form pathways from the surface into the cell's interior. These control the exchange of chemicals, nutrients and waste products. When a chemical latches on to the external end of the receptor it triggers a signal that activates the other end in the cell's interior. “Yeast uses receptors to detect... pheromones... given off by other yeast cells... The cell then knows it is near another yeast cell – and can mate with it.” In exploiting this yeastly sexual urge, [the team] took the receptor protein gene and mutated it, creating thousands of versions, each changed in a unique way. These receptors no longer reacted to the yeast pheromone, but to a vast number of substances ranging from relatively simple chemicals such as carbon monoxide to highly complicated organic molecules, including those given off by living organisms. Then the Leeds team used a [GE] yeast strain whose receptor protein – when stimulated by a chemical visitor – released a special molecule that triggered a biological cascade to spread through its interior, causing the cell to turn blue. “Essentially, we have a line of yeast cells so they no longer react to a single pheromone, but to a vast range of other chemicals,” said [the team's leader]. “In fact, we still do not know exactly what chemicals the yeast will react to, for we created our library only a few months ago. However, we do know we now have millions of different mutant yeast sensors. All we have to do is put a chemical near a sample, and, if it turns blue, we have found a yeast sensor for that chemical.”

...Disease diagnosis could come in the form of a pill next century... [The] director of London's Central Public Health Laboratory, said patient testing kits could range from smart capsules that could detect micro-organisms through to computerised breath analysers. The impetus for the technology came from the space programme's wanting to provide medical backup for astronauts and the military's need to detect agents of

biological warfare. However, [the professor] wrote in the *British Medical Journal* that “there may be little incentive to develop kits for which the perceived market is small even though the need is great... such as rapid determination of HIV status in pregnant [gals in Last World] countries.”

...The search for an Aids vaccine has been dealt a blow by the discovery that a group of Kenyan prostitutes thought to be immune to HIV have now caught the virus... The [prostitutes] all have large numbers of special white blood cells, called cytotoxic T lymphocytes, that are primed to destroy other cells in which HIV lurks. Oxford University specialists have sought to mimic the response by devising a vaccine containing fragments of the HIV virus tucked inside a disabled cowpox virus. Administered to monkeys, the vaccine triggered a big response of the white blood cells and protected the animals against HIV infection. Safety trials begin this year on 30 British volunteers. They will be followed by further safety trials in Nairobi if all goes well. The next step would be a trial in Kenya within five years, involving hundreds of people. But the... *New Scientist*... says the vaccine designers may have to go back to the drawing board... [because] six of the... 43 Kenyan prostitutes who had astonished researchers by remaining HIV-free for more than 15 years, despite intensive exposure to a range of virus strains... had become HIV-positive. Their immunity apparently fell away once they were no longer being exposed to HIV daily... “This implies that to maintain immunity you need to have continual exposure.” In turn, that means people would have to be given repeated shots of the vaccine in order to be protected – something that is financially out of the question in poor countries where Aids is most prevalent... HIV/Aids has exploded into the worst epidemic humanity has faced... The disease has struck 42 million people... [-] half of them... [gals -] and killed 24 million worldwide... Ominously, the disease is also starting to take its toll on agricultural output and is worsening the food crisis in some of the world’s poorest areas... ■ Sunday is World Aids Day.

...The virus that causes Aids can hide in the body for as long as 60 years, even when patients take strong cocktails of drugs, according to researchers. Their findings are bad news for those who had hoped the drugs, which can suppress the virus to near-zero levels, could eventually wipe out the virus within a person’s lifetime... [In related news, m]editation produces lasting beneficial changes in immune-system function and brain electrical activity... says... an American study... [that] looked at 25 employees of a company who underwent an eight-week meditation training programme... At the end of the eight weeks, flu shots were given to the meditators and a group of 16 other employees who did not receive meditation training. When... checked for antibodies to the vaccine one month... later, the meditators had significantly higher levels... On average, the meditators had about a 5[%] increase... but some showed increases of up to 25[%]. More importantly, the level of antibodies increased directly in relation to the level of increased brain-activity... The study... is the latest in a growing body of research into the so-called mind-body connection.

...Your state of health – and recovery – could be affected by how you think. [The NZ Herald] considers a catchy little number: psychoneuroimmunology... A [gal believes it] developed breast cancer because [it] hasn’t been in relationships where [it] could express her emotions. A normally robust [guy] spends a week in bed with a virulent flu – his worst illness since... child[hood. It] is deeply sad, having just separated from his wife. A mature [gal] suffering from severe gastritis undergoes a painful process of revelation and understanding about her relationship with her father[, then] recovers within hours. Humans have long been aware that our health is closely linked with our thoughts, emotions and relationships. Common sense tells us that we’ll probably feel grumpy or uninspired when we have a cold, and that people possessing hope and willpower can sometimes recover from the most threatening of diseases. Now science is catching up with our intuition. A new field of... investigation has sprung up. It’s... the study of how our thoughts and feelings work with our immune and nervous systems – a way of adding our psychological selves into the traditional medical health equation... [T]he University of Auckland already has a researcher devoted to its study... His research has uncovered surprising connections between mind and body... [- e.g.] when we write about personal, painful subjects, there’s an increase in the activity of our immune systems. The idea is simple: emotional disclosure seems to help our capacity to develop antibodies... [So] by acknowledging the pain in our lives we can help to protect ourselves... Not exactly the classic Kiwi stoic approach to life. But another Auckland[er]... has preliminary findings that support such an idea... [The] medical psychologist... has been working with breast cancer patients... [a]nd... noticed a remarkable trend. [Gals who didn’t] express emotions about their illness were less likely to be alive five years after treatment. To put it unscientifically, not letting negative feelings out, can do you in... [Hi]s findings match research in the U[S] which suggests... that those with stoic personalities... may be more likely to get cancer... [Other] research published in [US] medical journals suggests that... those who score high on the... stress scale are much more likely to get an infection than those who score low, even though you spray the same amount of virus up their noses... And once they have the virus, the people in the high stress group have more trouble keeping it under control. BUT stress was not the whole story. The study was repeated... This new study found again that stress correlated with becoming ill but it also found that the more, and the more varied, social support you had, the less likely you were to fall ill... Our immune system works best when we have a clear sense of who we are and what gives meaning to our life. Self-identity and self-defence are linked.

...Research such as the Auckland-based development of two revolutionary neurological drugs is under threat from inadequate funding, says the [person] behind the discovery. The new drugs, which stop damaged brain cells from “committing suicide,” may help millions of people worldwide who suffer from distressing disorders such as multiple sclerosis, Parkinson’s disease and Alzheimer’s disease. Clinical trials of one of the drugs, which were developed by an Auckland Medical School team... could start within months and the other within the next few years. They could also be worth billions of dollars and prove a pharmaceutical cash bonanza for the economy... The only available drug for multiple sclerosis – and not a very effective one – sold more than \$1 billion in the U[S] in its first year on the market... But... [the team leader] would not predict how “big” the drugs would be until the clinical trials were complete. Until now only the symptoms, such as the tremor for Parkinson’s disease, could be treated.

...When the tremors of people with Parkinson’s... or multiple sclerosis cannot be controlled with drugs, doctors sometimes destroy a small portion of the brain to relieve the quivering. But... delivering electrical impulses to the same area of the brain may be just as effective, with fewer serious side-effects... [because] the newer technique, thalamic stimulation, is less destructive than the traditional surgery, known as a thalamotomy... Some people who underwent the thalamotomy surgery could not reason as well afterwards... developed language problems... [or] felt decreased initiative... However, [at least one thalamic stimulation recipient has] died from complications of the... procedure, [during which] surgeons insert a wire with four electrodes into the thalamus... [N]either treatment is effective in all patients[, but they]... seem... to work best in patients with Parkinson’s[disease (‘also known as *Parkinsonism* – named after the English surgeon who described it in 1817 under the names “paralysis agitans” and “shaking palsy”).

...a young Aucklander] could barely stand six months ago. Now [it] challenges her school buddies to races around the playground. The 6-year-old has cerebral palsy, but that no longer stops her from playing soccer or walking around the supermarket with her mum or dad. [The mum and dad] have watched their daughter’s life turn around since [it] was fitted with a Hart Walker... The creation of [a]British medical engineer... allows children with moderate to severe physical disabilities to stand and experience hands-free walking. Now [the 6-year-old] hardly stops smiling... has grown taller... healthier and can breathe properly, making it easier for her to speak up in the classroom... Yesterday, [a]physiotherapist... and... a[n]... orthotist... from the Spastic Centre in N[SW], were back in Auckland to adjust the walkers fitted to Auckland children [six months ago. The physiotherapist] says her team is delighted with the progress made by the children. All of them are walking more fluidly and, importantly, can play with their peers. While the walker looks simple, it has 1000 components designed to straighten a child’s body and teach him or her to step. The Government does not subsidise the walkers but Lions clubs have helped 14 families to pay for them.

...[a] Swedish cerebral palsy sufferer – a celebrity in his home country – slipped into Auckland this week on his honeymoon but took time out to pass on a passionate message... [C]onventional treatment is killing people with motor disorders such as his – including stroke victims and others with brain damage. The [guy] voted Sweden’s most intelligent person for 1997 is dismissive of physiotherapy and [GPs, who]... generally have no

idea how to treat these patients yet do not promote alternative treatments that work. So people die... of depression and they frequently die of pneumonia through lack of movement. Their bodies are weak and without the correct training they remain useless. Only a few years ago the 38-year-old prolific writer of novels... was trapped in a body that would not respond when [his brain] wanted it to. In 1995 [the Swede] became a disciple of conductive education, and a year later his campaign was the main reason a controversial decision to outlaw the alternative treatment in Sweden was overturned. Conductive education is not a therapy or purely body exercise and massage, such as physiotherapy. Exponents say it is an educational practice where the brain is retrained to learn or relearn to carry out tasks such as movement. N[Z] does not have a bad record with conductive education compared to the rest of the world, [the Swede says. But the]... Auckland Conductive Education Foundation... accuses doctors of failing to refer people to their educators. The chair[person] of the Medical Association... confesses to knowing nothing about conductive education but takes strong issue at the claim... The [Conductive Education Foundation] also says the Stroke Foundation fails to promote the one effective treatment... [T]here are 10,000 stroke victims in N[Z] without effective ongoing treatment, and of the 140 babies born with cerebral palsy each year only a handful were referred... [In reply] the Stroke Foundation's medical director, said [it] is not against conductive education but its benefits had not been scientifically proved so the foundation was not able to endorse it. "There is plenty of anecdotal evidence from people with strokes who say it worked for them. [However,] I do know other people who say it hasn't..."

...[the guy was] young for a stroke victim – only 48. But that wasn't what most puzzled [a neurologist and a] neuropsychologist... about the political journalist recuperating at University Hospital in Zurich. Although a lesion in the right frontal part of his brain had made his left side so weak [that the journalist] couldn't walk, the patient didn't complain about being bedridden. [The patient] griped instead about the lousy hospital food... After the patient recovered [it] returned to work. As a dining columnist. Of 36 other patients newly preoccupied with fine food, [the neurologist and the neuropsychologist] found 34 with a brain injury exactly where the journalist-turned-food-writer's was. "Gourmand syndrome," they reported last year, can be a sign of neurological damage. The link between a sudden fixation on food and a brain lesion is one more piece of evidence that idiosyncratic behaviour and personality quirks once thought merely "odd" or "interesting" might be, in a sense, mental illnesses, a reflection of an abnormality in the brain... Ever since Freud, the number of psychiatric illnesses has soared. The first edition of *The Diagnostic and Statistical Manual of Mental Disorders* (DSM), published in 1952, listed 60; the... fourth and latest version, in 1994, lists 410. Until recently it was easy to blame this psychiatric bracket creep on therapists trying to expand the population of paying clients. But two recent developments make it harder to dismiss. The first is brain imaging. MRI, CT and PET scans that peer into the structure and activity of the brain are turning up real physical correlates of eccentric behaviour. The second is genetics. Researchers are finding genes that seem to increase the risk of particular mental illnesses. Because virtually all such illnesses are thought to involve several genes, it is tempting to label people who have only one or two of them "a touch" schizophrenic, or "just slightly" paranoid. And since the genes and brain quirks seem common, "ultimately it might just mean that we're all a little bit crazy," says... a leading behavioural geneticist at the National Cancer Institute who is best known for discovering the so-called gay gene. Mental health, in this new view, is a continuum. At one extreme might be... the Unabomber suspect described by his brother's lawyers as obsessive-compulsive, out of touch with reality, delusional, anti-social and paranoid. At the other end of the spectrum lie what are usually considered normal, even wonderful, human differences. The computer whiz who hasn't a clue how to engage in small talk is... not merely socially awkward; [it] suffers from a mild form of autism. The emotionally needy person you can't get off the telephone has a frontal-lobe abnormality. And the originators of religious dietary rules and hand-washing rituals? They had mild obsessive-compulsive disorder... [Guys] who are unable to talk about their feelings suffer "from an unrecognised adult form of attention deficit disorder"... Mild ADD also marks the business titan who can't file his taxes on time... This labelling is more than a party game ("[That person who] thinks we're whispering about him... must have mild schizophrenia"). It has consequences. Doctors who blame their patients' peculiarities on biologically based mental illness, rather than seeing them as individual responses to life's circumstances, are quick to prescribe psychoactive drugs. TEENAGE girls with "body dysmorphic disorder" – deep unhappiness with how they look – are candidates for Prozac even before they develop anorexia or bulimia... Some psychiatrists worry that their colleagues are dispensing brain drugs to treat symptoms rather than causes. Putting teenage girls on Prozac to cure them of their sense that their bodies are imperfect is so much easier, after all, than changing the Barbie culture. Or changing pro sports and its fans so that anger and aggression are not rewarded... [A doctor from] Columbia University admitted that since many people have occasional and temporary symptoms of mental illness – from sadness to exuberance bordering on mania – "it's very difficult to say where mental illness shades into normalcy. And that poses real questions for treatment: when should you prescribe anti-depressants?..." ...A new book, *Making Us Crazy*, by [two] social scientists... blasts the DSM for being scientifically unsound... "The psychiatric bible has been making us crazy when we are just human," they argue. The debate might have remained a standoff. Except that psychiatrists who believe in shadow mental illnesses are, to even their own surprise, getting support from science... Researchers found the first hints that mental illness comes in mild forms when they examined relatives of seriously ill people... [Their data] suggests that while the patient has many mental-illness genes, the relatives have only a few, and thus have "shadow syndromes." SCHIZOPHRENIA offers the classic illustration. Schizophrenics have less grey matter in the frontal cortex, the seat of higher thought... and in the hippocampus, which helps to run memory and emotion, cells are out of place. People with mild schizophrenia, whose symptoms are not severe enough to keep them socially isolated, have mild versions of these brain abnormalities. People with severe schizophrenia, who are unable to distinguish fears and fantasies from reality, have severe versions. Last year, addiction, a mental illness, was found to be on a continuum with a normal personality trait. Researchers discovered an abnormally long version, or allele, of a gene on chromosome 11... The allele was found more often in heroin addicts than in non-addicts. The job of this gene is to produce a receptor... for the brain chemical dopamine. Here's where the continuum comes in: the long version of the gene is also common in mentally healthy people who exhibit "novelty-seeking" behaviour... This gene is only one of 10 or so that determine novelty-seeking... Someone with two or three... might be a little impulsive. Someone with all 10 might be a risk freak – or a heroin addict... Genes associated with mental illness might keep society supplied with the personality traits it needs... [Novelty-seekers] are the world's race-car drivers and its explorers... Those with a touch of OCD are the dogged employees who don't let go of a task until it is complete. Long ago they may have been shamans and witch doctors... The visions of Joan of Arc... [(incidentally, the saga of Joan of Arc is one of France's greatest stories but a new investigation suggests her martyrdom at the hands of the English never happened... [-] research into the skulls and skeletons of France's long-dead royals has led ...an orthopaedic surgeon... to conclude that the [gal] on the pyre was not Joan at all but another French [gal; the one] known as "Joan"... lived on for decades after her supposed execution...[)], the prophet Muhammad and Saint Paul are suggestive of hallucinations produced by temporal-lobe epilepsy. And in 1990 researchers in Minnesota, studying identical twins, calculated that religious belief is 50[%] genetic. Mercifully, they refrained from calling it the God Gene. EVEN if neuroscientists find brain lesions linked to holding grudges or spending too much time on the Internet... that will not prove that biology is destiny. For one thing, the structure and activity patterns of the brain reflect experience, not just the biology one is born with. The idea that eccentric behaviour may be mild forms of mental illness is so new that its implications for society are unclear... Will couples count their respective "crazy genes" before they have children – or abort fetuses with too many of them? Will prospective mates demand to look at each other's brain scans? What will that do to the world's supply of artists and dreamers, adventurers and inventors?

...Scientists have shown for the first time that adults grow new brain cells, even in their 60s and 70s. The discovery... contradicts the traditional wisdom... [and] raises a distant hope for treating brain diseases or damage by getting the brain to fix its broken circuitry. The new neurons... were found in just one small part of the brain – the hippocampus... That our adult brains... [-] even diseased brains... [-] create new cells and can repair themselves is good news for all of us. For sufferers of diseases such as Parkinson's, Huntington's, Alzheimer's and epilepsy, it's downright brilliant.

The discovery was made this year by [a]Professor... and his team at Auckland University's medical school and turns the way we think about our head on its head. "When I went to medical school I was told that by the age of 15, whatever size of brain you had, that was it for life, and you had to look after your brain because you were gradually going to lose a few more brain cells each year,"... It turns out his teachers were wrong.

...Memory loss, far from striking late in life, creeps up on people from their mid-20s... research shows... "It's not as though you hit 60 or 70 and fall apart. We're falling apart as we speak," *New Scientist* magazine quoted... [t]he University of Michigan... [psychologist as saying. It] tested 350 people from 20-somethings to octogenarians... [and] found... the decline in performance between the 70s and 80s was the same as that between the 20s and 30s, dispelling popular notions that mental abilities fall sharply after a particular age... [A] psychiatrist at the University of Toronto, said the results were surprising... because the decline started so early and... it seemed to happen at the same rate for many different memory tasks.

...Adults with hobbies that exercise their brains, such as reading, jigsaw puzzles or chess, are two and a half times less likely to develop Alzheimer's disease than those who have passive mental recreations... The finding supports other studies that have shown that brain power unused is brain power lost. The study was more bad news for the couch potato... "Television watching is not protective and may even... increase the risk of developing the... disease," said... [the] author of the research... an associate professor of neurology at Case Western Reserve University School of Medicine... [A] senior medical adviser to the Alzheimer's Association, said the study was important because it supported other research that showed the onset of Alzheimer's was delayed by education and by working in intellectually demanding professions... "The brain is an organ just like every other organ in the body. It ages in regard to how it is used. Just as physical activity strengthens the heart, muscles and bones, intellectual activity strengthens the brain against disease." It was believed that healthier brain cells were better able to control or slow the Alzheimer's process... the effect seemed to be that brain-challenging activities "built up a reserve" of neuron connections. Because of this reserve it took longer for the Alzheimer's process to destroy enough neurons for there to be identifiable symptoms... Alzheimer's disease is a fatal... disorder that... progressively destroys memory and, eventually, the ability to care for oneself. There are millions worldwide diagnosed now...

Researchers say they have found a way to tag the waxy "plaques" that clog the brains of patients suffering from Alzheimer's disease. Their discovery offers new routes for diagnosing and tracking progression of the disease... Writing in the *Proceedings of the National Academy of Science*... the University of Pennsylvania Medical Centre... research team... said the tag could offer a way to... check the extent of Alzheimer's in living patients... Alzheimer's[], which] affects 22 million people worldwide... can be diagnosed with tests of cognitive skills, but the physical diagnosis is not final until a brain autopsy is done after death... The waxy blobs are associated with the death of neurons, which result in memory loss...

Some memory loss in old age may have nothing to do with Alzheimer's and lots to do with blood sugar. Research has found that people who don't process blood sugar normally are likely to suffer poor memory and the region of their brains crucial for recall may actually shrink. If the small study from New York University is confirmed, diet and exercise could help many people prevent the memory loss of ageing. "That's a great motivator to stay off the calories and stay off the couch," said... a... New York University psychiatry professor. For every Alzheimer's patient, eight older people suffered enough memory loss to harm their quality of life, yet had no dementia-causing disease... Scientists have long known that diabetics are at higher-than-normal risk for memory problems, possibly because diabetes harms blood vessels that supply the brain. [However, the latest] study... found that people's memory may be harmed long before they ever develop diabetes.

...Genetic engineering has produced a strain of super-smart mice and may point to a way to help patients with Alzheimer's, mental retardation and perhaps even the annoying "senior moments" that come with ageing, researchers say. The protein GAP-43, has long been associated with learning. Mice given extra boosts of the GAP-43 gene did much better in mazes used to test rodent intelligence, [the researchers]... at Northwestern University have found. What they do not have, [the head of research] stresses, is a smart pill. "...it's a gene, so you can't take it,"... But [the researchers] think it may be possible to manipulate brain cells so that they produce more GAP-43 when necessary. "The important point here is that we have the first good evidence that this protein actually regulates learning,"... GAP-43 was found early in the development of all animals... But the gene had to work just right. Tweaking it to produce a slight mutation ruined the effect. "The protein by itself is not active unless it has phosphate group on it,"... The process of adding a phosphate molecule, called phosphorylation, is the key to activating many genes. If researchers could find a way to phosphorylate GAP-43 in humans, it might be a way to help learning without resorting to genetic engineering... [The head of research said it] would oppose moves to create a designer drug for people who wanted to be smarter, or who wanted their children to have an advantage at school. "But I think that we are moving ever closer to finding an agent that will facilitate when we are learning."

...Alzheimer's disease, which primarily affects industrialised nations, is expected to hit more people around the world as life expectancies in developing nations increase... [The] vice-president of the Alzheimer's Association, told a world congress on the disease in Washington that "we are on the edge of a worldwide epidemic." The association estimates Alzheimer's hits 10[%] of people over 65 and nearly 50[%] of those older than 85... Increased life expectancy also means an increase of the age-related illness of dementia, which is primarily caused by Alzheimer's... In 1996, there were 1.2 billion cases of cancer around the world and 600 million cases of dementia. In 2050, the two could be nearly equal, with 2.5 billion cases of cancer and 2.5 billion of dementia... The experts meeting in Washington have compiled data on the disease, but have made no breakthroughs. [One speaker], of Johns Hopkins University... noted the progress made in understanding the disease over the past 10 years. Researchers have found a genetic link to Alzheimer's, better understand the biological processes of the disease and have conducted tests of treatments on mice – including a medication to slow its progress... Elan Pharmaceuticals, gave the conference a glimmer of hope when [it] announced that a vaccine which has reduced in mice the development of amyloid plaques, a manifestation of Alzheimer's, was safe for humans. However... tests were still necessary and any vaccine would not hit the markets "for three to six years." Specialists are therefore left to try to slow the development of the disease through low-fat diets rich in vegetables, reducing high blood pressure, stopping smoking and taking adequate doses of vitamins E and C. Patients should also maintain stimulating mental activity and avoid blows to the head. However, these precautions could not stop the world growing older...

You have heard of the type: they eat whatever they want and maybe they smoke. Some of them exercise, some don't. And they live to be 100. What is their secret? Is it good genes, good habits – or just good luck? It is a question that researchers are trying to answer... So far, centenarians have shattered myths, and raised more questions about extreme old age. Researchers know for certain that few 100-year-olds have had heart attacks, developed Alzheimer's or been hit by diabetes. The only thing researchers have found they share is that many had a family member who lived long as well... Just one in 10,000 Americans have lived a century. [But t]hey are the fastest-growing age group, and by 2050... there could be nearly a million people that age or older in the US... [(t]here are 400 people aged over 100 years in N[Z; i]n another 50 years... there will be 12,000[].

... 'US scientists say they've found the way to stop human cells ageing by as much as 40% by adding a natural chemical' ('when cells divide they lose part of their DNA until they are unable to divide any more, but a "cell's clock" can be reversed by enzymes – a process that could raise the potential age of humans to 150 or 200'). ● A] Malaysian... who says [it] is 141 years old has staked his claim to the title of world's oldest living person, currently held by an American... [The Malaysian, who claims to have been] born on September 26, 1857, has received the support of Malaysia's Health Minister and the *Malaysia Book of Records*. The... [Malaysian] does not have a birth certificate... [(t]he Malaysian citizens were not issued birth certificates until June 1926[])... but the registration department where [it] lives has verified his birth date. That would make him more than two decades older than [a resident] of Pennsylvania, currently deemed the world's oldest living person at 118... [The Malaysian] married in his late 60s and still lives with his wife, [who is] said to be 100 years old. The couple have four children, 24 grandchildren, 101 great-grandchildren and 4

great-great-grandchildren... [H]is secret to longevity was “simple living”, balanced with moderate exercise and a careful diet filled with fruits and vegetables.

...A team of scientists in St Petersburg has developed a new style of drug from the organs of newborn calves which, they claim, slows the human ageing process so radically that life expectancy could be increased to 110. Some senior Kremlin politicians, prominent business[people], leading footballers and ballerinas have started to make twice-yearly visits to a clinic in one of the city’s up-market suburbs, hoping to prolong their lives with a course of treatment from the former military doctors responsible for the formula. One of the most popular aspects of the therapy is that there is no need to begin early; on the contrary, doctors claim the best results are achieved among people who start treatment when confronted by the symptoms of middle age. This year the directors of Gazprom, the gas giant that is Russia’s largest business, signed a contract with the institute to provide the therapy for about 300,000 members of staff in a drive to reduce sick leave and boost employees’ enthusiasm for work. Preliminary results, they claim, are very positive. The treatment centres on a series of medicines, named bioregulators... Scientists at the institute are particularly excited by the effects of two of their creations – thymalin and epithalamin – which they say mirror the work of the body’s immune system and hormonal system, respectively. By taking these drugs, they claim, patients can rejuvenate the functions of these systems, thus staving off both the ageing process itself and the illnesses that accelerate it. “These discoveries are as important as the development of the atomic bomb. It is colossally significant for the whole of [hu]mankind,” declared... a specialist in gerontology... who is responsible for much of the research. Judging by his huge apartment in an ostentatious new development for St Petersburg’s elite (equipped with a television in every room), his work has proved extremely lucrative... No independent research has been done to corroborate the[institute’s] claims, but the mere suggestion that the institute may have discovered an elixir that prolongs youth has aroused huge international interest. A team of venture capitalists from Britain is negotiating to sponsor research as well as patent and register several of the preparations. Pharmaceutical corporations in Germany and the U[S] are also interested in backing the development of new synthetic versions of the original animal-based products. “Doctors in the West are very suspicious of medicines developed from the bone stems and inner organs of animals because of the BSE crisis, so we have been forced to work on synthetic copies which are much more acceptable to the Western mentality... These synthetic drugs are the future.” There is heavy scepticism among those who warn that some kind of charlatanism always lies behind such claims... [The] deputy director of the UK charity Research into Ageing, said [it] would caution against spending money on this kind of drug. “As far as we know, it is just not possible to extend human life expectancy like this.”

...Let’s get this straight – at 16, with a bright future ahead of me, the last thing I’d planned on doing was falling in love with a 40-year-old... But that’s what happened and there wasn’t a thing I could do about it... We were never blessed with children, but still, I never dreamt that such happiness existed. Not that we didn’t have our disagreements, of course. When I refused his proposal, Helmer was shocked. ‘Why won’t you marry me?’ [Helmer] demanded. ‘I thought you loved me!’ ‘I do, darling. I simply don’t believe in marriage.’ Still, [Helmer] kept asking me at least once a year. Then one day I read an article about... a procedure where people’s bodies were preserved after death. I thought it sounded fascinating. ‘Just imagine, Helmer,’ I said. ‘People can be frozen in the hope that one day, when there’s a cure for whatever killed them, they can be brought back to life in their own repaired healthy body and carry on as before.’ ‘It’s not right,’... Helmer... cried, appalled. ‘How can you make a deal with death like that? And who’s to say it would work?’ ‘Who’s to say it wouldn’t?’ I replied. In the end, we let it drop. Time passed and before we knew it, we’d been together 20 years. Then one day Helmer... got a stomach-ache so painful [Helmer] went to hospital. ‘We’ll keep him in, just in case,’ the doctor said. ‘Why don’t you go home and come back tomorrow?’ So I kissed Helmer and left – but late that night the hospital contacted me and asked me to come quickly. I was terrified. Once there, I discovered Helmer’s heart had stopped beating three times and [my lover] was technically dead. Only machines were keeping him alive. ‘You’ll be OK, darling,’ I whispered, but the thought of life without him was unbearable. That’s when I thought of cryonics again. Even if my precious Helmer died, it didn’t have to be the end permanently. Three days later, to my utter joy, Helmer regained consciousness... ‘Helmer,’ I cried. ‘Thank you for coming back to me, darling!’ But it was a hard road. I had to quit work to care for Helmer full-time and we relocated to our farm. Over the next few years, Helmer suffered from one life-threatening scare after another – a heart attack, serious kidney and liver problems and finally, an inoperable brain tumour that doctors said would eventually kill him. I had to do something. Again, cryonics came to mind... But Helmer wouldn’t be swayed, so I decided to do my own research. Naturally a sceptic, I set out to disprove cryonics, but even after three years of research I have found no reason it couldn’t have at least a reasonable chance of success. I found out that certain living creatures, like insects and even mammals, had already been revived from the dead[(plus a species of ‘snake becomes frozen when caught in winter snow and moves again after it has thawed’; while young members of a tiny spider species are ‘carried by winds to the upper atmosphere where they freeze and can remain for long periods of time – possibly even floating around in outer space – before falling back to earth, thawing out’ and carrying on with their lives)]. The way science and technology was progressing these days I felt confident they could do that with humans some day. Then Helmer caught a virus which hospitalised him for two months. By the time [Helmer came out, Helmer] could barely see or stand. We both knew [Helmer] didn’t have long. That’s when I made a decision. ‘Helmer, at least every year for the last 22 years you have asked me to marry you. Well, the answer is now yes. It’s my gift to you.’ A tear rolled down his cheek. ‘Thank you... Now I have a gift for you. I’ll go through with cryonics. I don’t agree with it, but I’ll do it for you. If there’s the slightest chance we can one day meet again, it will be worth it.’ ...I... signed us up with the Cryonics Institute in Michigan, one of several US companies who perform the procedure. It cost around \$80,000 each, which included the transportation of our bodies and the cost of potential revival at a later date. We only had enough money saved to pay for Helmer outright, so the Institute arranged to take the money out of my life insurance when I died... We made it to Michigan, where... the cryonics people... located a hospice for him. One evening soon after, Helmer reached for my hand. ‘Au revoir, my darling,’ [Helmer] whispered to me. Then [Helmer] passed away. Nothing could have prepared me for the loss I felt. How could I go on without him? But grief was a luxury right now: I had to rush him to the Cryonics Institute before decay set in. Then I watched as they prepared his body for cryonic suspension. It was a confronting sight – his vital organs and blood had to be removed and replaced with a liquid similar to antifreeze – but this was my own private funeral... Eight years have passed since Helmer was... frozen. I’m now 47 and still living on our farm... I still yearn for Helmer’s touch, his wisdom, the warmth of him in bed beside me. While I’m here I’ll live life to the fullest, as [Helmer wanted] me to. But when my time comes, I won’t be scared. Death will just bring me one step closer to Helmer and one day, if I’m very lucky, I’ll wake up and see him beside me. Then hopefully we can fall in love all over again.

...The frozen heart technique was developed by a Siberian-based surgeon... who decided to persevere with supposedly outdated ice operations... pioneered in the US in the 1950s. [US] surgeons had abandoned the method as they believed patients could survive for a maximum of only eight minutes at low temperatures without the risk of suffering permanent brain damage. This was nowhere near long enough for anything more than the most simple operation to be carried out. Meanwhile, the heart and lung bypass machine was being developed as an alternative method. In addition to [the Siberian]’s own curiosity to develop the technique, three major factors spurred him on. First, his Siberian hospital – under-funded even by Russian standards and positively impoverished compared with the big Western heart centres – could not afford to buy enough heart-lung machines. Second, [the Siberian] was convinced that the greater use of complex equipment, the greater the number of risks. These ranged from a breakdown of the immune system to a breakdown of Novosibirsk’s unreliable electricity system – which might stop the blood pumping mid-operation, with fatal results. Third, and most obviously, the professor wanted to make good use of Siberia’s most overlooked natural resource – its abundance of ice... Outside the hospital, in the Siberian mid-winter, the temperature... plunge[s] to -32 degrees C and the air is so cold it stings your face. But for [an] 18-month-old... now lying semi-conscious on the operating table, the big chill is only beginning. As the ether takes hold and her eyelids grow leaden, a deep metal tray piled high with ice is placed beside her. Then, rather like a party host about to mix cocktails,[the]

anaesthetist... rolls up the sleeves of his surgical gown and crushes the cubes with a hammer. His preparation complete, [the anaesthetist] fills both his fists with steaming clumps of ice and forces it under [the girl's] naked legs, buttocks and back. Soon her stomach has disappeared under a mini-avalanche. Her blond curls are enveloped by a frozen white bonnet, and snowballs are wedged in her half-clenched palms, turning her tiny fingers lobster pink. Five minutes later, when... step[ping] back to assess his work, [the anaesthetist] might be casting his eye over a sleeping ice maiden from a Walt Disney film. In fact, [the girl's] life has been placed in cold storage ready for the surgery that offers her the only hope of a normal existence. When her body temperature drops to 24 degrees C – more than 13 degrees below its normal reading – her heart will be stopped while a hole in the lower ventricular wall is patched up. For the 41-minute operation all her physical functions – including that of her brain – will grind to a halt. Clinically, [the girl] will now be dead. Watching this vulnerable little Russian doll of a child being frozen alive in such a seemingly primitive manner jolts one's emotions like a cattle-prod, arousing deep protective instincts. But then the incredible work being carried out at the Institute of Circulation Pathology, in the remote Siberian capital... flies in the face of instinct... Today... the... method [that] is as simple and effective as it is inexpensive... [– but is] practised nowhere else in the world and [is] virtually unknown outside this icebound city... [–] is saving thousands of children... Until recently, great thick swathes of... [ice] were cut from the ground around the hospital everyday and carried up to the operating theatres on pallets. These days, to lessen the workload and enable operations to continue uninterrupted through the summer, ice is bought from the local meat-freezing factory, which has a handy German-built ice-making machine. It's a long way in the future, but it's possible this technique could eventually stop the ageing process. "We know... that when the body temperature is near to zero, a human being ages only 10 years in an entire century... This would, of course, be useful in long-term space travel. Personally, I'm more concerned with the health benefits, which could be enormous. The terminally ill... could be kept frozen in suspended animation until new drugs were found to treat them. We also have evidence that hypothermia could be used to treat spinal injuries, gynaecological problems, head injuries[–] ...research shows that cooling [a] baby's head alone has the potential to dramatically reduce brain damage to asphyxiated infants... [–] poisoning cases and some nervous and psychological diseases."

...Anxiety disorders are on the rise... [O]ne of the Phobic Trust of N[Z]'s typical customers... has suffered from panic attacks and agoraphobia for the past 25 years and links them with an incredibly dominant mother and husband. "I was married at 19 in 1955. It was a time when husbands told you exactly what you could do, and you did it... The panic attacks were incredibly creepy... They are so terrifying you become scared of experiencing another one. I consider myself a fairly intelligent person and over the past 10 years I began to see they were being brought on by me in one way or another. With my marriage gone and my mother dead there was no one left to dominate me so it's almost like I'd punish myself if I began to enjoy myself." ...the... head of... [the trust] deals with thousands of similar people as they seek to free themselves of demons. Anxiety in certain situations – going outside, eating in public, having recurrent negative thoughts – can be so great in some people they avoid the situation or develop complex rituals to manage... [their anxiety. P]hobias apparently affect 10 to 15% of the population to varying degrees[, including]... often highly intelligent and sensitive people... At a time when many organisations are struggling for survival, the Phobic Trust is undergoing large scale expansion... Perhaps, more than anything, the trust is an organisation whose time has come: we live in the veritable "age of anxiety". Read: "It's not simply a matter of people needing to pull themselves together. This is a huge problem that has been kept shut away for far too long."

...Snorers are a health hazard... [to] loved ones... says a study by Scottish scientists. On average, snorers wake up partners 26 times a night and cut their sleep by 40[%] – contributing to irritability, anxiety and depression, says the Edinburgh Sleep Clinic study. "It's often partners who have the biggest problems," the clinic's [spokesperson] says. "People move into separate rooms. A few even get divorced."

...[an Aucklander] is in his late thirties and has snored since [it] was a teenager. "I used to share a room with my brother [who]... would throw things at me when it got bad, which... was all the time. Usually [my brother] would run out of things to throw." Now[the Aucklander]... can control his chronic snoring through breathing exercises but is finding out what it is like to live with a snorer as his pregnant wife has started snoring. "Some sort of justice, I suppose,"... [I]t makes no difference whether [the Aucklander] sleeps on his side, stomach or back[– but c]ertain foods or drinks do seem to make him snore louder. "Red wine's a classic. And creamy products, too much dairy is another bad one,"... [In addition,] his snoring appears to be worse when [the Aucklander] is over-tired. "When I'm really tired, you can usually guarantee my snoring will be bad. It just comes down to lazy breathing." And waking him or prodding him or shaking him appears to have no effect either. "My partner will shake me if it's bad. Sometimes [my partner]'ll wake me up... I'll... talk for a while, and have no recollection of that conversation in the morning. But just a couple of breaths later I'll be back at it again." ...[the Aucklander] had a surgical trimming operation about 12 years ago to try to cure his snoring... [I]t was painful, and made little difference. [The Aucklander] has also tried hypnosis. Both [the Aucklander and his partner] found it upsetting, especially initially, to be forced to sleep in different rooms to get a good night's sleep... "We used to have to meet halfway if we wanted a kiss and a cuddle, and then go our separate ways. It took a lot of getting used to, certainly[," his partner says. The Aucklander] says: "It was quite disturbing in the beginning and it does affect your marital life." But they have got used to sleeping alone. "It has become something we live with and accept,"...

UNLIKE most people who sleep alongside someone with sleep apnoea, [one person's] partner did not move into the next room when the loud snoring, snorting and gasping got too much, but insisted [her bloke] see the specialists at Green Lane Hospital's sleep clinic. Looking back, the computer company executive realised [it] had many of the typical apnoea symptoms – feeling tired during the day, trouble staying awake through company presentations, loss of short-term memory and poor concentration. [A] Stanford University Professor... describes sleep apnoea as the "most undiagnosed deadly problem in medicine." [The professor] believes that each year an estimated 38,000 fatal heart attacks and strokes in the U[S] are caused by sleep apnoea, and... urges anyone with high blood pressure to ask themselves if they feel tired in the daytime. The terrible thing about apnoea sufferers is that they believe they are getting a good night's sleep when in fact they are barely sleeping at all. Instead, their airway is constantly collapsing, preventing them from breathing. Their oxygen-deprived and panicked brain fights to snap them back into consciousness so that breathing can resume. This pattern can be repeated hundreds of times each night. Snoring in itself is not necessarily a problem, although the research debate is whether snoring is the beginning of a sleep apnoea problem. N[Z]ers with high blood pressure who feel tired during the day may have trouble finding out if they indeed suffer from apnoea and then having it treated. Auckland has two sleep clinics to make the diagnosis – a private one at Mercy Hospital and a public one at Green Lane. The Green Lane clinic is funded to see only 350 of the 1000 people referred to it each year with suspected sleep apnoea. The waiting list is up to seven years, so unless your case is so bad you are falling asleep at the wheel, you may never be properly diagnosed or treated. [The head of the clinic says guys] are more susceptible to apnoea than [gals] and testosterone is thought to play a role. All of us probably stop breathing in our sleep at some time, especially if we've been drinking alcohol. But there are other factors, too, such as a small jaw and throat, having suffered a nasal obstruction like tonsillitis in childhood and being older, because an old throat collapses more readily. Weight and thickness of neck are also risk factors showing up particularly in this country, where Maori and Pacific Island[ers] dominate the numbers attending clinics and are highly represented in those dying from heart attack, stroke and car crash – the side effects of sleep apnoea. Which is part of the reason why a study on the incidence of apnoea is being run out of the Wellington School of Medicine in conjunction with the Eru Pomare Maori Health Research Centre. The 400 participants are monitored in their homes with equipment that measures heart rate, snoring levels, blood oxygen and body position while they're sleeping to indicate if they have apnoea... The standard treatment for apnoea is to sleep with a continuous air-pressure machine (CPAP) that forces air down the windpipe. In this country you have to stop breathing 20 times every hour to qualify for publicly funded CPAP treatment. [One patient who] did not take well to CPAP... was referred to an ear, nose the throat specialist who recommended an operation to prevent the airway collapsing during sleep. "It... helped enormously... Since the operation the symptoms have gone."

...It's a familiar story to many N[Z]ers. One partner snores while the other lies awake at night – pillow over head, occasionally prodding or shoving the offender, or stumbles, bleary-eyed, down the hall to the spare room. Snoring and sleep apnoea are common problems in N[Z] but are not taken seriously, says... [the] clinical director of the Auckland Physiology Sleep Laboratory. "People with sleep apnoea do have an increased mortality risk. No doubt about that... The public health service is woefully inadequate. If you are nodding off while driving it takes four to five months to get a sleep study done. I understand that it's hard to take money away from things for the new kid on the block, but this is being treated as a serious issue in other places, including A[US]." ...there are several predisposing factors for snoring. Anyone with a nasal disease or nasal airflow obstruction is likely to be prone to snoring or sleep apnoea... Those with flattened mid-face, such as Asians, tend to be snorers as the whole of the face, including the palate, sits nearer the back. "Skeletal predisposition is quite a good predictor. If your dad snores and you look like your dad, you are in serious trouble." People with a big tongue are more likely to keep their partners awake at night snoring. Overweight or obese people have a bigger neck circumference and a much smaller airway, so obesity is also a predictive factor. Alcohol acts as a muscle relaxant, which is why people who are intoxicated tend to snore. Despite lifestyle factors such as smoking, alcohol intake and excess weight being highly influential, [the clinical director] says few of his patients feel able to change their habits. [The clinical director says it] has heard of every snoring remedy. Every remedy – [including] the old wives' tale of putting a ping-pong ball between the snorers' shoulder blades to prevent their sleeping on their back... – works for some. Throat sprays work for some because they are made of a detergent-like substance which stops the throat closing and sticking, making the "snap" sound sometimes heard. Other remedies include nasal strips, soft collars, dental devices and surgical techniques. Some apnoea sufferers are hooked up to a continuous positive airways pressure device every night. It is a rather drastic but effective measure which works by constantly forcing air into the wearer through a mouthpiece. The first of the surgical options involves trimming the edge off the soft palate, including the uvula. This procedure can be quite painful. "It works in a percentage of people but you have got to pick your case very carefully,"... A laser surgery procedure, called laser-assisted uvuloplasty, involves making a burn of about 1cm across the midline of the soft palate. As the scar heals, it causes some tissue shrinkage and stops the palate going floppy... [T]he latest procedure, which [the clinical director] has been carrying out for about three years, is somnoplasty... An area of palate tissue is heated, and as the cells heated die and are removed by the body the palate shrinks and stiffens. The technique is also used to shrink the back of the tongue... [S]omnoplasty is expensive – between \$1000 and \$1200. Often several treatments are required, but it is a much less painful treatment than the other surgeries. "If you're rich it's a reasonable thing to do but it has an unpredictable outcome,"... says [the clinical director, who] cites a 60 to 70[%] success rate... ■ SNO[REX] is a remedy offered by the... New Clinic at Manukau City... The Snorex sleeping aid is a plastic oral appliance individually made from impressions of both the upper and lower teeth. Plastic moulds similar to those in an athlete's mouthguard are formed over stone casts and then welded together so that the lower jaw is brought forward. The result is safe, easy and comfortable – and most importantly, effective. Snorex has been described as a scientific breakthrough... The airway will remain open in a constant position during sleep... All it takes is just Two visits to get your Snorex and stop snoring forever.

...Apnoea is only one of a growing list of sleep disorders which now number more than 80. Arguably more common, affecting about 10[%] of the population, is a condition known as periodic limb movement. It means your legs thrash around so violently when you are asleep that it rouses but never fully awakens you. It will be accompanied by restless leg syndrome – an uncontrollable urge to move your limbs while... awake... [P]eriodic limb movement can be caused by anything from neurological disorders, renal failure, anaemia or antidepressants... [A] [Wellington sleep specialist... says it is easily treatable. Sometimes all that is required is reassurance that there is nothing seriously wrong. Then there is narcolepsy which, according [to the specialist], is woefully under-diagnosed in our community. It affects .06[%] of us, making it twice as common as multiple sclerosis. People with narcolepsy suffer from extreme daytime tiredness and muscle collapse, or cataplexy. They have extremely vivid dreams, or hallucinations, and tend to wake up feeling paralysed. The cause is unknown but... there may be a genetic predisposition. The most important thing with narcolepsy... is to have it diagnosed. It can be treated by planning to get adequate sleep, using stimulants or drugs to suppress REM sleep.

...Question: Sometimes when I'm lying in bed I suddenly wake up with a jolt – it's as if the body's mechanisms have been switched off and on again suddenly. I have spoken to others who say they also suffer this infrequent "spasm". What's happening? Answer: The case of your body going "bump" in the night is called a Myoclonic Jerk – they can be frightening and exhilarating but for the most part completely harmless. N[Z]'s resident sleep expert... from the Sleep/Wake Research Centre in Wellington, says they haven't quite got to the bottom of this mystery but scientists offer a plausible explanation. When we sleep we go through five stages, with Rapid Eye Movement... being one of the most significant stages. Dreams are most vivid in this stage, and the bod[y]'s muscles are relaxed to the point of paralysis. However, when we are going to sleep, sometimes we reach a state of REM in mind, but the body hasn't fully been put to rest yet. So when we begin to dream we might actually, physically, respond to an event in the dream, causing us to jerk awake and experience a "hypnic myoclonia". Frequent attacks of this sort can be due to stress or poor sleep patterns. So if you're bugged by an attack of the myoclones then you may wish to look at your habits – for good reason. A study by the American Cancer Society concluded that people who sleep less than six hours or more than nine hours each night had a death rate 30[%] higher than [people who] sleep seven or eight hours.

...A 10-minute power nap is more beneficial than longer or shorter sleeps, says an Adelaide researcher. [The] Flinders University school of psychology researcher... has found that 10-minute naps reduce fatigue and significantly improve alertness and vigour. [The researcher] oversaw a recent study in which 24 people were assessed before and after taking naps lasting 5, 10, 20 and 30 minutes. "There were only limited benefits gained from a 5-minute nap... However, immediate benefits lasting up to 155 minutes were achieved by a 10-minute power nap. The alertness and performance of participants after the 20- and 30-minute naps didn't improve until at least 35 minutes after the nap." Tests after 20- and 30-minute naps showed immediate impairment of alertness and vigour, which indicated sleep inertia – a period of disorientation, confusion and sleepiness sometimes experienced when waking from a longer sleep... [U]ntil recently there had been little scientific research to justify the benefits of naps.

...Most people know that... a fabled Dutch[perso]n... fell asleep under a tree and woke up seven years later. And in real life a Canadian... actually did sleep for years... before waking up... – ...liv[ing] a life and a love story like no other... [gal in history. C]alled Ms Rip Van Winkle because [it] accomplished what no other human had... Anne Shapiro... awakened from a 30-year coma, entering a strange new world... [It] fell into a coma in 1963, on the day John F. Kennedy was assassinated... During her long sleep, Anne's body began breaking down. [Anne] underwent cataract surgery, a hysterectomy and a hip replacement operation... When... finally w[aking] up in 1992, [the Canadian] was shocked to find that [it] was 79 years old... and... her teenage son... and 25-year-old daughter... were now middle-aged. And [it] was awestruck to learn about mobile phones, colour TVs and that [a guy] had walked on the moon... [H]er husband Martin... died two years later. Their son Marshall soon followed, and Anne was placed in a seniors' health centre. Her biggest excitement in her last years was when a TV movie, *Forever Love*, was made based on her life... Anne lived in the nursing home for several years, talking only when spoken to. Mostly [Anne] just looked out a window, drifting back and forth between 1963 – the year [it] preferred – and the present... [T]his year... Ms Rip Van Winkle returned to 1963 for good... [While his wife was in her coma,] Martin bathed her, dressed her... brushed her long hair... put drops in her eyes every two hours to prevent them drying out – and went on to do it for 30 years... At night, [Martin] lay next to Anne praying [his wife] would come back. [Martin] consulted every expert, but no one could help her.

...The oldest trick in the doctor's black bag – giving patients dummy pills to make them feel better – may have to be abandoned after scientists yesterday reported that the placebo effect is a myth. Countless patients have been comforted by fake pills, believing they are real, or so doctors have long believed. The effect has been supposed to demonstrate the power of suggestion... until now. Danish medical researchers... say they have

analysed medical research over 45 years and concluded that the placebo effect does not exist. If patients say they feel better after taking a dummy pill, it is most likely to be because they are feeling better... Dummy pills are used in medical research to measure the difference between patients receiving genuine medicine and patients who only believe they have been treated. Medical textbooks assert that on average, 35[%] of patients improve simply because they are told they were being treated... The doctors, from the Nordic Cochran Centre in Copenhagen, an organisation which studies medical trials, analysed 114 published studies from 1946... which used placebos, involving 7500 patients... In each of the 114 studies analysed, there was a third group of patients who had not been given any pill at all and many of these also reported feeling better. [The Danish researchers] said any apparent placebo effect could be due to researchers seeing what they wanted to see, or patients trying to please the researcher. Researchers had also failed to take into account the fact that diseases naturally wax and wane, [one of the Danes] said... "There are just as many trials where the... placebo causes... a negative effect... as where there is a positive effect."

...Whereas lead can seriously harm health, heavy metal bismuth... – ...which sits next to highly toxic lead in the periodic table of elements[–] is increasingly being used to... treat... stomach ulcers and disorders, as former Iranian leader Ayatollah Khomeini and Pope John Paul, who both suffered from internal bleeding, could testify. Now, bismuth medicines can combat the bacteria which specialists say cause peptic ulcers, and with bismuth-based alloys being used in x-ray screening... magnetic resonance imaging scanners... and [other]medical diagnostic equipment... prospects for the metal are healthy... Pharmaceutical – medicines and diagnostics – account for about 10[%] of the 5000 tonnes-a-year global bismuth market. Although rare, bismuth is a metal that has been used since antiquity and traces have been found in Roman coinage. But it is only in the last 200 years that usage has become widespread. Other alloying uses include steel cutting tools and iron castings, while compounds are also used in electrochemistry, ceramics, plastics and pigments. In the medical field, research now suggests that bismuth compounds [administered]before treatment reduce the lethal toxicity of some cancer therapies, and may even combat Aids, although rapid progress will not happen in these fields... Outside the body, bismuth alloys and crystals are making steady inroads in... MRI scanner diagnosis. Bismuth germanium oxide crystals are at the heart of scanners. Their use was kick-started several years ago when the European Organisation for Nuclear Research built its gigantic multiple-particle accelerator... Bismuth germanium oxide crystals neutralise lethal gamma rays, as well as improve overall imaging, and there are no viable technological alternatives on the immediate horizon, nor is there any financial stimulus, as metal prices have a track record of stability... Bismuth alloys, which are used in the protective radiation shields in oncology centres, are likely to see similar steady growth rates. These are solid castings, sometimes cut into complicated shapes, that are placed on certain parts of the body that need shielding from radiation during cancer treatment. Each shield will be different, depending on the patient... The advantage of bismuth alloys is that they can be cast in polystyrene moulds – a cheaper process. "The alloy is totally reusable,"... [a spokesperson for] alloy-producers Mining & Chemical Products... said. "When it is used the block is recycled and then used for another patient." Because of this, explosive growth is unlikely, unless more oncology centres are built.

...A visiting oncologist's claim that mammograms increase the risk of breast cancer is worthless without evidence, says the chair[person of the NZ Medical Association. The]... director of the Oasis of Hope Hospital in Mexico, says every mammogram boosts the risk by 2[%]. Physical examinations and ultrasound scans are safer... [while e]xamination of a single strand of hair can [also]indicate whether a [patient] has breast cancer, a Sydney scientist claims. The technique... may [even]predict whether a [patient] will develop the cancer... Very young [patients] had tested positive to breast cancer, although they had no clinical signs of cancer... [R]esearch... found that a hair from a cancer sufferer showed a different molecular structure when examined by x-ray diffusion... The hair of all [test subjects] with breast cancer showed the same feature... [The AUSn] discovered the technique by accident while seeking a cancer indicator in skin samples from cancer patients. When the samples were accidentally thrown out [it] decided to examine the 600 hair samples instead... [S]cientists do not know how cancer can affect the molecular structure of hair, but speculate that abnormal proteins may attach themselves to its keratin... The equipment... used to detect the different molecular structure was in N[Z] universities and could be more widely available if it proved useful in detecting cancer and there was a demand from the community.

...For more than half a century, doctors and scientists have been intrigued with the idea that light might be a better way to detect breast tumours. Clemson University... in South Carolina [is] working on a prototype machine that shines invisible laser beams through a... breast. This and other projects worldwide have raised hope for an alternative to the squeezing, pressing x-ray mammogram, derided by some... as the "slammogram." "We are encouraged by our early findings, but the research is still in the preliminary stages," said [an]assistant physics professor... [who was] part of the Clemson team. The problem is that light scatters wildly inside breast tissue and the tissue's density poses some unique viewing challenges. "The holy grail is to find the wavelength to isolate cancer," said... a laser physicist at City College in New York and a pioneer who holds a patent for optical imaging of breast tissue. Clemson's machine uses a laser diode that shines infrared light through a breast at 16 different points. A computer analyses the pattern of photons... to reconstruct an image of the breast's interior. Out of 10 [volunteers] in the first clinical trials, the system found five malignant tumours and one that was benign. They were confirmed by biopsies and were as small as 5mm. Mammograms usually cannot detect lumps any smaller than twice that. X-ray mammography is the only breast-cancer screening system now approved by the federal FDA. Other methods – ultrasound and magnetic resonance imaging among them – are used to follow up if a suspicious lump is detected.

...Research shows that in [gals] over 50, mammography picks up 90[%] of tumours. The procedure's effectiveness is reduced for those aged 40 to 50 because breast tissue is different in younger [gals]. Only about five out of every 1000 [gals] screened will be found to have a lump that turns out to be cancerous. A free mammogram is available every two years for [gals] aged 50 to 64 as part of the national breast cancer screening programme – BreastScreen Aotearoa – which begins in December. Also, as part of... October's International Breast Cancer Awareness Month, the Breast Cancer Foundation is... asking all N[Z]ers to wear pink ribbons to highlight the impact of the disease... The incidence has increased enormously since 1960 when fewer than 40 in every 100,000 [NZ gals] died of breast cancer. In 1994, the figure was more than double that, at 81.2 for every 100,000... This trend is projected to reach 89 in each 100,000 by the year 2000... [A] member of the medical advisory committee of the foundation, says overseas trials of [gals] aged 50 to 69 in screening programmes have shown a reduction in mortality by about one-third if the programmes achieve a participation rate of 70[%]. The age limit of 64 for the BreastScreen Aotearoa programme may eventually be extended to 69, but overseas evidence shows that participation rates drop considerably in older [gals].

...Many international studies have shown a probable link with breast cancer among [gals] who have had abortions. The studies say the risk increases with the abortion of a... first pregnancy; if [the mother] is young; if [it] has had other abortions; and if [it] has not born children.

...most British hospitals are ignoring... evidence... [that gals] with breast cancer sharply improve their chances of survival by timing surgery in the second half of their menstrual cycle... according to a leading cancer specialist. [Though research shows that patients] who have breast cancer tumours removed during the first part of the cycle... have a survival rate after 10 years of 45[% – compared with a survival rate of 75[%] if the operation is done in the latter part... [– the professor] who led the research, said it had had no impact. "Surgeons are very happy to try new technologies but when it comes to something as simple as the timing of an operation – it just hasn't caught on." ...In Britain, where there are 13,000 deaths from breast cancer a year... the change could [annually]save 300 to 400 lives. In the U[S], where there are 30,000 deaths, it could save 2000. The importance of timing is linked to the effects of the hormones oestrogen and progesterone on the cancer. Those patients who do best have hormonally sensitive cancers.

...A common herb used for medicinal purposes for more than 700 years is providing scientists with a new weapon in the battle against cancer, say British experts. The starflower, commonly known as borage, contains a substance called gamma linolenic acid (GLA) that studies have shown can kill brain and prostate cancer cells and inhibit the spread of malignant tumours by restricting blood vessel growth. In a recent study of [patients]

with breast cancer... a cocktail of GLA and the anti-cancer drug Tamoxifen speeded up patients' response rates... The starflower has the most potent concentration of GLA in nature. Oil from the plant is 24[%] GLA. The compound is also found in evening primrose oil, which is used to treat premenstrual problems... [Incidentally, n]early three years after... [being] cleared of poisoning her former partner, world-respected Professor David Lloyd, [the ex-defendant] is herself poised to become a famous scientist... [The doctor] found not guilty at her second trial in the High Court at Christchurch in April 1996 of attempting to murder... Lloyd with the debilitating chemical acrylamide... is part of a team working on ground-breaking research which is closing in on developing a natural treatment for breast and ovarian cancer... using deep-sea sponges from Kaikoura.

...Screening tests for ovarian cancer could save thousands of lives every year if they are done for all [gals] over the age of 50, say U[S] researchers. But the tests would have to be done every year as the disease grows quickly and gets to a potentially deadly phase within two years... "We estimate the minimum impact of this approach would be a 30[%] reduction in mortality." Every year, 15,000 American[s] die from ovarian cancer. Only 20[%] of ovarian cancer patients survive for five years because most cases are not caught until the cancer is advanced. When caught in its earliest stages, ovarian cancer is 90[%] curable. But gals... are not routinely screened for ovarian cancer the way they are for breast and cervical cancer.

...A study [has 'found that self-examination doesn't detect breast cancers early enough.' On a positive note, a completely different study]done in South Africa indicates that a self-test using a vaginal swab may provide an alternative to the smear test in the battle against cervical cancer. "A single Pap [Papanicolaou] smear misses about 40[%] of cervical disease," said the study's chief author... [from] Columbia University's College of Physicians and Surgeons. "[Furthermore,]Pap smears require a gynaecological exam, which many older [patients] don't get. In addition, Pap smears are not available in many parts of the world." The study involved... [having patients] self-collect... tissue DNA samples used to detect the presence of human papillomavirus or HPV[, plus]... the same test administered by a clinic worker and a standard Pap smear test... The study found that the sensitivity of HPV DNA testing in the patient-collected samples was equivalent to that of a Pap at detecting high-grade cervical disease. However, the HPV DNA tests also had higher rates of false-positive results than Pap smears performed in a clinic.

...Beneath the microscope, spread over a glass cervical smear slide, thousands of cells conceal a deadly secret. Hidden among the tiny normal cells are large dark dots that should ring alarm bells for the screener checking the slide. The dots are signs of cancer. At the Diagnostic Laboratory, N[Z]'s largest private medical laboratory... 500 slides are examined daily by 18 skilled screeners... Senior staff examine up to 60 slides a day, spending five minutes tracking over smooth glass plates. Each plate gets a two-minute re-read by a different screener as part of the clinic's quality-assurance measures. Slides that appear abnormal, and a percentage of normal slides, are examined by cytologists, specialist pathologists who decide whether they are studying a [slide] with signs of invasive cancer... Recognition of precursors means the condition can be detected and the patient cured. Sometimes, but not often, these highly trained specialists and lab staff make mistakes. Labs worldwide miss around 5[%] of abnormalities, mainly because of sample problems. N[Z] pathologists say as many as one in five tests may be misreported as clear... Screeners can get distracted... and sometimes cells get mixed with blood and mucus... In the past decade N[Z] pathology has been shaken by two scandals where specialists did not get it right. The consequences for patients were disastrous. Both involved the misreading of cancer tests. Five years ago, 4000 tests from Wanganui Hospital were reviewed after an elderly pathologist misdiagnosed samples from dozens of patients. Six [patients] had needless mastectomies and at least 15... developed cancer despite being cleared... The latest bungle involves a former Gisborne pathologist accused of misreading cervical smear tests. Like [the Wanganui pathologist, the Gisborne pathologist], who was nearing retirement, worked in an isolated laboratory without the advantage of skilled colleagues close at hand for second opinions. One [patient], who had four separate tests misreported by the pathologist, developed cervical cancer. Other patients also claim their tests were misread. The Health Funding Authority is settling a process for investigating the doctor's work back to 1990 and perhaps further. The Gisborne case, profoundly unsettling for many East Coast [citizens], came to light through a High Court ruling which concluded the doctor was negligent... [However, when] specialists were asked to review the contentious slides, one of five unidentified labs[also] misreported two... One... [pathologist], who works at Auckland Hospital, feels the public's faith in the infallibility of pathology tests is "probably misplaced." The former head of the Royal A[US]n College of Pathologists says there always will be degrees of uncertainty... [A] former Medical Association chair[perso]n, says that a searching review of any clinical pathologist's work would throw up mistakes... N[Z] has around 170 specialist pathologists... [F]or their work on the Ministry of Health's \$20 million cervical screening programme, labs get \$16 a slide. Despite the much publicised failures, pathologists argue that N[Z] has a high-quality diagnostic service, comparable to that available in A[US], Britain and North America. Specialist pathologists spend a decade training. They qualify as doctors, then complete the royal college's oral, practical and written exams. The college runs a voluntary professional development programme... to keep consultants up to date with present thinking on pathology... which by 2001 will be compulsory... Specialists are encouraged to read the latest journals, attend lectures and conferences and submit to peer review of their work. The Sydney-based college provides a computer programme so consultants can check whether they need to step up any area of study. Best practice includes random audits of biopsies by outside pathologists, slide swapping around the country, and second opinions... For [one]Alliance MP... a review of the entire screening programme cannot come soon enough. It was promised two years ago, and... [the MP] believes that the review, if initiated earlier, might have spared East Coast [gals] the anxiety of not knowing whether their pathologist got it right.

...Authorities are preparing to use the national cervical screening programme's register to track [gals] whose smear tests might have been misdiagnosed at Gisborne Hospital. Why? The screening programme is a shambles. Its contribution to [gals'] health nil. Since 1987, the year of the... inquiry into the treatment of cervical cancer at National [Gals' Hospital, NZ gals] have been the most intensively smear-tested population in the world. A survey commissioned by the Department of Health in 1990 showed that 82[%] of gals] aged 20 to 64 (the target group) had averaged a startling 2.4 smears each in the previous three years. There has been no benefit. The decline in deaths since 1987 is no greater than the decline seen before the introductions of limited screening in the mid-1960s. The clear conclusion must be that few, if any, of the so-called pre-invasive conditions we are screening for have the capacity to progress to invasive cervical cancer. Mass screening, therefore, is no more than a chimera – chased at great expense. Unfortunately, that simple deduction, made... by [a]Professor... more than 30 years ago... was lost on the posse of pro-screeners who lynched him [in the 1987] inquiry, then persuaded [the head of the inquiry] to write: "The benefits of a well-planned N[Z]-wide cervical screening programme are now indisputable." What the screening posse now needs to explain is why it masterminded a programme so deficient it should carry the warning "Injurious to [gals'] health." Common sense demands that a programme should: be able to track a mobile population; employ highly trained staff at entry level; strive for consistency by processing smears in one centralised laboratory where smear results are matched with biopsy results; educate [gals] about the symptoms of invasive cervical cancer – post-menopausal bleeding, bleeding after intercourse, discharge, unpleasant odour and pain; and issue results directly to its customers. The national cervical screening programme does none of these... Laboratories continue to employ poorly trained staff because a course for technicians set up in 1991 was abandoned in 1993, having trained the equivalent of just two full-time students a year. Smears are processed in a multiplicity of laboratories which have no legal obligation to improve standards by participating in inter-laboratory training programmes. Laboratory accreditation remains voluntary... Then there is the matter of the smear test's false negative rate... Last week one pathologist said it was 10[%], another 20[%]. The literature puts it closer to 50[%]... One paper by Canadian researchers... calculated a false-negative rate of 45[%] for carcinoma in situ, the most severe of the pre-invasive conditions. Their conclusion was: "These studies show the false negative rate to be so high that it cannot be ignored in the design of strategies for cancer prevention." A flurry of studies, all published in 1995, confirm their findings... So where to now? Gisborne [gals] need to be reassured that, terrible

though it is, invasive cervical cancer is a rare disease with a higher survival rate than most cancers. A campaign emphasising the symptoms of the invasive condition would probably save more lives in Gisborne than another subjective look at smears.

...The Cancer Society is supporting seven Gisborne families who believe cancer tests were misdiagnosed. The society's chief executive... said two of the people involved had since died and two others were seriously ill... [A] specialist has re-read some of the patients' original slides and some families were now taking legal advice. All seven had contacted the society before [an] Alliance MP... announced last week that the pathologist at the centre of the controversy had worked in Gisborne. The chair[person] of the Health Consumers Service Trust... said the trust had been approached by at least one patient who believed cancer tests had been misdiagnosed. The trust is financed by the Health Funding Authority and works to find a resolution where a patient has a complaint about health services. [The Alliance MP] claims at least three [gals] developed cancer after misdiagnosis and more could be at risk... Health workers in Gisborne said other [patients] suspected their smears had been misdiagnosed but were yet to have that confirmed. Some had since been diagnosed with cancer and others had later smears showing high-level abnormalities. One health worker said it was an anxious time for [the patients] who felt they were in that situation, and for others who had not had a smear since 1996 but had done so since the publicity surrounding the cases and were now awaiting results. [The chief executive] said the society was relieved that Gisborne had been named as the town involved as [Poverty Bay gals] who might be affected were now able to get information. A spokes[person] for the H[FA]... said it was still working out how best to determine which smear slides needed to be re-read and how it would review the pathologist's reading standard in regard to cervical smears. If it found evidence to back concerns about the pathologist's cervical screening it could investigate other areas of his work. The authority will contact Gisborne [gals] registered with the cervical cancer screening programme who have missed their three-yearly smear or are due for it. Local doctors have been asked to be vigilant in recalling patients over-due for a smear but not on the national register.

...Hundreds of [gals] are feared to be developing cervical cancer, after health authorities' revelations that [a] Gisborne pathologist... misdiagnosed 82[%] of seriously abnormal tests... according to early findings released yesterday... The scale of his misreading of cervical smear slides has forced the Government to... prepare law changes to prevent a repeat scare... These include... allowing the Director-General of Health access to patient information where public safety was at stake, and extending the Medical Council's powers to suspend doctors believed to be a risk to the public... The H[FA] is also arranging to review some of [the Gisborne pathologist]'s tissue-testing work, which includes breast-tissue samples... The HFA had intended waiting until all the slides were re-read but decided on an interim announcement after learning the magnitude of the misreading. The... authority sent 30,000 slides from [the pathologist]'s former laboratory, read from 1991 until h[is] retirement in 1996, to Sydney for review. Almost 4900 have been re-read. Of 157 slides showing high-grade abnormalities from 147 [patients, the pathologist] reported only 28 slides... An authority spokes[person]... said about half of the 147 [patients] identified so far had received, or were receiving, appropriate treatment. The HFA says the[y] need to have internal examinations and it has set up clinics and reintroduced free smears and GP counselling. The Minister of Health... was concerned at the findings and was setting up a ministerial inquiry, some details of which had yet to be decided. It would investigate what caused the under-reporting and whether it was an isolated case, and identify any changes needed to avoid a recurrence.

...The [person] who fought a four-year legal action against [a] Gisborne pathologist... was weary and relieved last night – and was not surprised that an official inquiry indicates hundreds of mis-read cancer tests in the area. “Jane”... who has had name suppression from the High Court trial in which... Jane... unsuccessfully sued [the pathologist], had to undergo a radical hysterectomy in 1995, after precancerous cells developed into invasive cervical cancer. [The pathologist] missed signs of high-grade abnormalities in two [of her] smears and under-reported two more. By the time the cancer was picked up it was too late for less drastic treatment. Jane has been told [it] has a 40[%] chance of the deadly disease returning. [Jane, who]... said the \$60 a week from ACC failed to come close to compensating her... has renewed her fight for exemplary damages from [the pathologist] and has lodged an appeal for a retrial on the grounds of fresh evidence.

...The sad and sorry history of the patients of [a]... Gisborne pathologist... and how... [his] mishandling of their tests remained undetected for years is behind moves to tighten laws aimed at preventing such medical misadventures. It took six “strikes” beside the name of the ailing practitioner before his patients were notified of the potentially fatal flaws in his work. With no mandatory reporting regime, health authorities spent years unaware that [the pathologist] had been the subject of separate cases involving the same [patient] with ACC, the Medical Practitioners Disciplinary Committee and the High Court. The cloak of silence over the flawed cervical smear tests [the pathologist] returned fell away only when the [patient] unsuccessfully sued him in the High Court... • [The new]... laws aimed at further spreading the net to catch errant doctors have been welcomed by the profession, but health advocates say... “The changes don’t go far enough – they are still [just] tinkering around the edges.”

...health advocates are outraged that a document revealing the names of laboratories whose reporting of abnormal smears was comparable to [the] Gisborne pathologist... has been censored by a ministerial inquiry... [The Auckland Gals'] Health Council... said the decision to suppress the information was raising concern among [gals] in other parts of the country that they might be at risk... “This is just increasing the level of suspicion that is becoming a feature of this inquiry... It’s still early days, but it is not helpful to deny [people] information that is vital to their health. It must be made clear that the full facts are going to be made known.” ...The document, comparing smear reporting rates in 1994, was “sanitised” before being presented to the Gisborne inquiry, with the names and regions of laboratories deleted. It revealed that five other laboratories had the same or a lower rate of abnormal smear reporting as [the pathologist]. Two laboratories had told the Ministry of Health that they objected to the document’s being made public at the inquiry... [The inquiry chairperson]... told the hearing on Thursday that if the document was accepted by the panel, only the regions would need to be identified. Even then, publication would be suppressed, with the document being made available only to lawyers and the panel... [The] Health Minister... yesterday refused to comment on the suppression of the document. However, [its spokesperson] referred the *Herald* to an earlier press release that said [the minister] expected the H[FA] to make public immediately any problems of a “Gisborne proportion” discovered during its investigation. [The HFA’s] lawyer... has assured the inquiry that the funding body will present the results of its investigation in [three months]. Throughout the hearing, [the pathologist]’s lawyer... has asked for information to be made available about the performance of other laboratories. [The lawyer said his client] has been heavily criticised for his reporting rate and the same attention should be turned to other parts of the country with similar laboratory results. Meanwhile at yesterday’s hearing, the ministry’s Deputy Director-General (Maori Health)... revealed that the incidence and death rates of cervical cancer among Maori... were declining steadily. But... the rates still remained double those of non-Maori and more work needed to be done to close the gap... Cross-examination of [the Deputy Director-General] will continue when the inquiry reconvenes on Monday.

...Health authorities are investigating a complaint about another N[Z] laboratory involved with screening cervical smear slides. The name and location of the laboratory were suppressed during a special sitting of the cervical cancer inquiry in Gisborne on Saturday. During cross-examination of a H[FA] witness... it was revealed that a complaint about the laboratory had been laid by... one of the lawyers representing [Gisborne gals] affected by slide misreading... [The witness], a statistician, said figures sent to [the] former Gisborne pathologist... in the early to mid-1990s show [the pathologist] was reporting within “acceptable limits.” In response to questions, [the witness] agreed the statistics may have been misleading and encouraged [the pathologist] not to make changes because they did not suggest any concerns about his work. Those changes could have included pursuing Telarc accreditation or employing a laboratory worker specially trained in reading smear slides... The cervical cancer inquiry was scheduled to finish at the end of this week, although there have been suggestions of a possible extension because there are still about 20 witnesses to give evidence, including [the pathologist] and 10 of his former patients.

...A wife had] had her life mapped out. At 26, [it] had a comfortable life working as an administrator and was about to start a family with her husband... Then [the wife] received the shattering news that [it] had cancer growing at least 5mm deep into her cervix. Not only would there be no children, but there were doubts whether [the wife] would have her health or even her life. [The administrator] had had regular smears since the age of 16 after seeing advertisements which promised “never fear, have a smear.” In 1992, her slide was read by [the]Gisborne pathologist... who reported it was normal. In the next five years, [the wife] had four smears read by pathologists in other laboratories, who also described them as “normal.” The disease steadily growing in her cervix was not found until last year, and [the wife] had a radical hysterectomy at National [Gals’] Hospital this year. “I could not believe that after having regular smears the outcome was that I was to be robbed of my right to have children,” [the wife] told... the Gisborne inquiry into mis-read smear tests. [The wife] said her battle against cancer was made more traumatic by a health system which... treated her with callous disregard. [The wife] waited weeks after diagnosis for National [Gals’] to contact her with a date for surgery, only to find [her name] had mistakenly been dropped off the list... [The wife said it] did not want revenge, nor did [it] hate anyone for what had happened. “[The pathologist] made a mistake, but it is not just him that I blame. The health authorities paid him but failed to check that [the pathologist] was going a good job... I want an assurance this will never happen again.”

...The Gisborne laboratory embroiled in a cervical cancer inquiry had cracked and broken benchtops, out-of-date equipment and textbooks and was in a generally run-down state, according to an accreditation officer who visited it in 1993... [The] former programme manager at International Accreditation N[Z]... told the inquiry yesterday that the laboratory left such an impression on him after his visit that [the officer] was unlikely to forget it. [The officer added] that in technical categories [it] had not visited another medical laboratory since that had such deficiencies... [The officer] told the inquiry [it] visited the Gisborne laboratory, owned by... [the pathologist,] again in 1994 after an application for registration with IANZ (then known as Telarc) was received. “It was my clear impression from my visit to Gisborne Laboratories that accreditation was not being actively pursued by the laboratory and that the process was being pursued begrudgingly for other reasons.” ...In a report written in November 1994, [the officer] found that deficiencies at the Gisborne laboratory included a lack of participation in external proficiency testing with the Royal College of Pathologists and a lack of records showing feedback had been sought on the reading of slides. [The officer] had... noted an apparent lack of on-going training at [the Gisborne laboratory. The pathologist’s]... lawyer... disputed parts of [the officer’s] testimony, saying his client had access to journals at the Gisborne Hospital library and had attended conferences. [The lawyer] also said a state-of-the-art haematology analyser was brought in 1994... [and the pathologist’s] microscope was in good order... – countering... evidence that [the pathologist’s] equipment was in poor condition... [The officer] stunned the inquiry with revelations of growing numbers of N[Z] laboratories becoming increasingly cash-strapped and with a desperate shortage of experienced staff. “In my view, the ramifications of this decreased funding has far-reaching consequences, which are only now beginning to show, and will, I believe, have a significant impact on standards and therefore the validity of tests.” ...Laboratories did not have budgets that allowed them to replace senior laboratory staff. [The officer] said three laboratories that read smear slides for the national programme had had their accreditation for this service suspended because qualified staff had left... N[Z] was fast approaching a situation where a qualified smear screener could be replaced only with someone who had no experience in that field. About half of all laboratories doing smear reading did not have their full complement of staff... [The officer] said standards being proposed by the national programme’s managers were unlikely to be achieved because of under-resourcing.

...Six laboratories found to have under-reported abnormal cervical smears should be named, say 50[%] of the general practitioners polled about the issue. The poll, carried out by *New Zealand Doctor* magazine, found that another 34[%] thought the labs should not be named and 16[%] were undecided... One of the labs had been cleared, but five continued to work with the [HFA] because their reporting rates for high-grade abnormalities were lower than the benchmark of 0.5[%]. The head of... the Gisborne cervical cancer inquiry said the... authority... suppressed the labs’ names because of uncertainty over the scientific value of the report and concern that the labs might since have changed owners.

...More than most, [one mum] understands the human toll of misread cervical smears. The [mum]... needed a hysterectomy – and had a pregnancy terminated to save her life – after abnormal cells were not picked up in two slides. “I already had a two-year-old[who] had to have a mother,” said the 36-year-old, who fought invasive cancer and then mustered her strength to fight for answers. But this tragedy did not have its origins in Gisborne or any other N[Z] centre. It happened in England where [the mum] had been living in the early 90s. Her battle for redress contrasts with the plight of Gisborne [residents], who because they live in a country with a no-fault ACC system cannot sue for compensation. Victims can go to court for exemplary damages, which are designed to punish rather than compensate, but no one in N[Z] has ever won such damages from a health professional. Some cases, however, have been settled out of court. The issue of compensation was raised at the Gisborne cervical cancer inquiry this week, when a lawyer representing affected [patients]... urged the committee to recommend paying victims of misreading. The inquiry head... asked... why the Gisborne [patients] should be treated differently from others who had suffered personal injury... [The lawyer] replied that significant responsibility for their plight lay at the feet of the Government and the Ministry of Health. “These [patients] were entitled to place their confidence in the screening programme and all associated procedures... If that has let them down, then the Government should be prepared to make an ex-gratia payment to them. Given the level of Government responsibility for what has happened and the extent of the suffering, common justice requires the Government to pay compensation for that.” [The lawyer] cited an example in A[US] where a patient[who] had a single smear misread was awarded \$750,000. In [the mum]’s case, invasive cancer was picked up after her return to N[Z] in 1991. Her English smear tests, which had been reported as clear, were rechecked and mistakes found in the diagnosis. With no ACC-style system preventing her from taking legal action against English officialdom, [the mum] filed her case in the High Court in London in 1994. Three years later, [the Christchurch resident] was awarded \$142,000 in damages. The Wiltshire and Bath Health Authority had already admitted liability over her treatment in 1988 and 1991, and the dispute was over the amount of money to be awarded... [T]he judge said: “If ever a case demonstrated the inadequacy of money to compensate for loss, this must be it.” ...The judgment left open the possibility of further damages if cancer returned or if secondary effects of radiation such as osteoporosis materialised. During the Gisborne inquiry this week, [the lawyer] said that the [patient] who sparked a ministerial inquiry into cervical smear misreading could have walked away with at least \$1 million compensation if [it] had lived in A[US]. The patient[, known... as Jane... knocked at the doors of ACC, the Medical Practitioners Disciplinary Tribunal and the High Court before a ministerial inquiry was ordered into the practices of [Gisborne’s former pathologist] and the health system that paid him. Her application for a retrial has since been granted.

...A stand-alone cervical screening unit which could become part of a national cervical control agency is likely to be set up as the result of a ministerial inquiry. The Gisborne inquiry into mass under-reporting of cervical smears ended yesterday after a marathon 12 weeks of evidence from [people] caught up in the health scandal... The panel must now prepare its report... The call for a new agency follows a Cancer Control workshop last year during which 110 participants agreed that a coordinated approach to cancer prevention was needed... A big failing of the [smear test] programme has been its inability to do in-depth audits of cervical cancer cases to determine whether there have been mistakes in diagnosis and treatment. Under existing health legislation, researchers are unable to obtain information identifying [patients] from the screening register without consent. If this obstacle was removed, records could be more easily accessed by researchers monitoring the programme’s safety and success. [Patients] who objected to the use of the information without their consent could opt off the register. [The inquiry chairperson] has indicated the report will not focus on blame. But it was possible adverse comment would be made, along with recommendations... In its final submission, the... Ministry of Health... and H[FA]... asked the panel to take an unemotional, analytical, objective, constructive and balanced

approach to its findings... “It is easy to be critical... with hindsight, but we need to keep in mind that no medical professionals, including pathologists... rang alarm bells.” The ministry claimed it had chosen not to challenge some evidence given to the inquiry because it would have taken too long and may have damaged relationships with some experts still involved with the programme.

...The witchhunt for those who set up a defective cancer screening programme should take a closer look at the report of the Gisborne inquiry. It does not name names but it points the blame fairly clearly at non-medical crusaders for the cause. And one culprit... all but named... is now the PM. After dealing exhaustively with the deficiencies of the Gisborne laboratory, and concluding that it might not be the only black spot on the national screen, [the inquiry chairperson] and her committee began (155 pages in) to ask how an unsound programme ever got off the ground. The question leads them all the way back to the report of the Cartwright inquiry in July 1988 and the cervical smear testing drive that followed it. “Essentially a cervical screening programme is a medical programme,” the [1988] report says. “Medical practitioners with specialist qualifications and experience in public health and epidemiology know what is essential and what can safely be left out.” However, this programme began “with a misplaced focus on the number of [people] having smear tests at the expense of other components...” Its design “was influenced by non-medical persons who perhaps failed to recognise the essential medical components...” In August 1989... an unnamed Minister of Health... was getting impatient. On August 25, [the minister] sent a memorandum to her officials which the Gisborne report reprints at length. Citing “concern among those groups who have an interest in the success of this programme,” [the future PM] wrote: “There has been too much emphasis placed on development of the national register and computing system necessary to operate the register and recall system, at the expense of action on developing smear-taking programmes.” The memorandum emphasised that money voted by the Government for the programme was intended to reach [people] who were not yet having regular tests. The register and recall system was of secondary importance. That, says the [chairperson’s] committee, was “understandable” but “not ultimately helpful... There was no point in encouraging [people] to have smear tests taken when their tests were being read at laboratories whose performance was accepted on trust and may have been performing inadequately.” ...Population screening was, and is, quite contentious in medical and health policy circles. Today N[Z] screens only for cervical and breast cancer. The one thing both sides will tell you is that unless screening is done very well, it is probably better not to do it at all. Errors give either needless alarm or false comfort. To do it well means much more than urging healthy people to undergo regular tests. It requires an elaborate medical superstructure of trained test readers (top pathologists told the Gisborne inquiry their technical skills were not up to it), routine quality-assurance checks in laboratories, a reliable record of results and a recall system for cases needing further attention. Most important... a programme needs a national register of all test results and case records so it can be properly monitored, regularly audited and independently evaluated... When eventually a national cervical screening register was established by act of Parliament, the statute gave [patients] the right to refuse to let their tests results be forwarded to the register. And identifiable case information contained in it was not readily available for the programme’s evaluation. The Gisborne inquiry ran into the statutory block itself when it tried to assess the performance of other laboratories. Says the report: “The choice for the programme is stark. Effective evaluation can not be guaranteed if [patient] consent is required. If the right of an individual is to predominate, the safety of all participants is potentially at risk.” As things stand, [patients]... are being given an illusion of consent. They are being misinformed by the programme’s written material which suggests monitoring and evaluation are being done. “[Patients] should be told the monitoring and evaluation now carried out is not able to detect misread smear tests. Evaluation teams of medically qualified people must be given unhindered access to now protected information... without the need for consent from the subjects or ethics committees.” Ethics committees, another creation of the Cartwright era, are evidently claiming jurisdiction over medical evaluations as well as research projects. The [Gisborne inquiry] committee says that has to change; evaluations are part of treatment these days. And it takes obvious delight in pointing out that the unauthorised... investigation which led to the Cartwright inquiry could probably not have been approved by today’s ethical committees and requirements for patient consent. If the Cartwright report was the beginning of the new age health culture... perhaps the Gisborne report will come to mark the return to sanity.

...The Government has offered compensation to 61 [patients affected by the Gisborne pathologist’s] misreading of cervical smears – but at least one of them is unhappy with the proposal. Most of the [patients] contacted by the *Herald* about the offer declined to comment yesterday. But one said: “I’m not happy; I can tell you that much.” The Gisborne [resident], who asked not to be named, said the group were not allowed to talk until lawyers arrived next week... A lawyer representing the 61 [patients]... said yesterday that the compensation offer was confidential... A spokes[person] for the Health Minister... said the minister would not reveal details of the offer until [it] had heard back from the... [patients. The group] – 41 of them at first – began a lawsuit against the Government and [the pathologist two years ago]... They claimed \$150,000 each – \$50,000 from [the pathologist] and \$100,000 from the Government... Separately, negotiations to avoid a court case are continuing between lawyers acting for [the pathologist and the patient] known... as Jane... [T]he Privy Council gave permission for a retrial, but [Jane] hopes to settle outside the courtroom.

...International Accreditation N[Z]... suspended LabPlus’ accreditation for chemical pathology and virology-immunology testing on the... 18[th day of] last month... T[he PM had only]... opened LabPlus, N[Z]’s largest hospital laboratory, on [the 1st day of the month!] Sited next to Auckland Hospital, it employs 350 staff and performs the widest range of tests in the country. Pathologists... expressed fears that... [the] crisis at LabPlus could cause delays in diagnosing seriously ill patients... [In related news, a] review of laws governing the reporting and investigation of medical failures has not satisfied [patients] calling for an inquiry into[a] suspended Northland gynaecologist. Launching the review yesterday, [the] Health Minister... said it was not an inquiry into [the gynaecologist]. “That is happening elsewhere.” But... the lawyer representing former patients... said the only investigation was one complaint before the Medical Council. Patients were being denigrated by not being able to have a say. The Northland [patients] wanted a full investigation along the lines of the Gisborne cervical cancer inquiry. “I have spoken to over 60 [patients. 18] have had claims accepted by ACC... The majority of them have lost or are losing confidence in the professional bodies to deal with these complaints.” ...In Gisborne yesterday, [another lawyer said that NZ]... had become caught up in “doctor-bashing.” His client, [the]... pathologist and managing director of Hamilton and Gisborne Medlabs, was... desperately unhappy about... [being] criticised this week by the lawyer for [patients affected by the cervical cancer scandal. The patients’ lawyer]... said that after Medlab bought [the former Gisborne pathologist’s] laboratory, it did not “look back” at slides from Gisborne [patients] because it was too logistically difficult. Most of [the former pathologist’s] smears were housed in a shed at the lab.

...A group of [gals] outraged at alleged medical botch-ups by [a] Whangarei surgeon... have botched up a simple act of vandalism. The debate of a court decision allowing [him] to resume practising has turned nasty in the form of a vandalism attack on a house in Whangarei on Thursday night. The vandals obviously thought the house was where [the surgeon] lived, but it was the home of a [person who has his surname but isn’t a] relation. The spraypaint attack on the Kamo home did not impress its owner... At 10.50 on Thursday night, the *Northern Advocate* received a telephone call, saying a “large group... had spraypainted [the surgeon’s] house” in Blenheim Court... The message said the [group] had carried out the vandalism to show their outrage at [the surgeon’s appeal to be allowed to resume practising. “The murderer] should not be allowed to practise again...,” the [person] who left the message said. “It is an insult to Colleen Poutsma and all the [patients] who are putting through complaints. [The murderer] should be suspended until all the complaints have come forward.” Last year, the obstetrician/gynaecologist was struck off the medical register by the Medical Practitioners Disciplinary Tribunal, after it found that his treatment of [the now deceased Paihia resident] Colleen Poutsma amounted to disgraceful conduct. The tribunal also ordered that [the surgeon] pay costs of \$56,000 and fined him \$15,000, the highest fine it had imposed. [The surgeon] appealed against the finding and penalties[, and] was partly successful when [an] Auckland District Court Judge... re[ad his] decision

on the appeal on Wednesday. [The judge... took the unprecedented [step of] reversing a tribunal finding, and ordered [that the surgeon] be allowed to resume his specialist... work. [The surgeon's] fine was also reduced to \$5000.]

...For five months doctors told... [a mother her daughter's] stomach aches were due to obesity and growing pains. They even went so far as to say her child was a hypochondriac who simply needed to be more active. Believing the doctors' diagnoses, [the mother] quickly set about changing some of the family's habits. [The daughter] (11) and her sister... (10) were talked into riding their bikes and playing at the local park for hours on end. Family walks became an everyday activity and junk food was restricted. But no matter how many changes... the family made to their lifestyle, [the girl] continued to suffer bouts of severe abdominal pain. At times the pain was so intense [it] could barely walk. "Several other doctors we took [her] to continued to tell us the same things... It was difficult because we actually started to doubt her." But [the mother] and her partner... didn't doubt [the girl] was in severe pain when [it] collapsed at home last March. They took her to Wellington Hospital's A&E... department but a few hours later [the girl] was sent home with the usual diagnosis – a tummy bug. "We thought we were going insane because one minute [my girl] was in extreme pain and the next it had settled. I remember getting into the car that day and saying... 'Well, if the hospital says it's just a tummy bug, it must be.'" [The couple] knew deep down that there must be something seriously wrong but put their trust in the medical experts. "We had to trust them. My mum was just beside herself with worry. [Mum and my eldest girl] have a very close relationship... There were times when we felt as though we were failing... as parents because we felt so helpless. When you see your child in pain and you can't say what the cause is, it's just not a pleasant experience." Less than two weeks after being taken to A&E, [the girl] collapsed at school but this time... was admitted to Wellington Hospital. "[My girl] saw an amazing doctor this time round... This doctor just took one look... and said there is something seriously wrong with this child. [It examined her] and while looking at her abdomen, commented on how there are definite differences between fat and swelling and this was obviously swelling." [The girl] was suspected of having appendicitis and booked in for surgery that night. The procedure was to take a few hours. Six hours later [the mother] was called into a... waiting room. "It was 4am and I was there by myself because I had told everyone else to go home and rest. I heard the doctor say [my girl] had a tumour... It took a while for it all to sink in. I just asked if [my girl] was going to die. At that stage it was a definite possibility." ...the operation had revealed a 3kg cancerous tumour growing on [the girl's] right ovary. "The tumour had caused her stomach to swell so much it looked as though [my girl] was pregnant... And there we were, listening to the doctors and telling her to get outside, ride her bike and go for a walk because [the girl was] overweight. Our daughter] was in pain and we were making her exercise." The tumour was removed during surgery but it had ruptured and countless cancer cells had been deposited throughout [the girl's] pelvis. The girl] needed to have three months of intensive chemotherapy... Since the operation four more tumours have been removed, including one weighing 1.2kg. There were plans for more chemotherapy but it wasn't needed thanks to the good news that those tumours were benign. A number of other tumour deposits will still need to be surgically removed from the lining of [her] pelvis. They are not malignant but if they're left, the tumours will cause pain.

...Hospitals must go to court to force reluctant parents to accept treatment for children with cancer, says a leading medical ethics specialist... [The] director of the bioethics centre at Otago University, says that if they don't, they are taking dangerous risks with children's lives. [The director] was commenting yesterday on the Starship Children's Hospital's not seeking a court order to enforce treatment of Tovia Laufau. The 13-year-old Mangere boy died at home last September with a basketball-sized tumour on his left leg. [The 13-year-old] had not wanted to go back to hospital for treatment as [the teenager] was afraid it would kill him. His parents... accepted his decision. This week they were convicted of failing to provide him with the necessities of life. They are on bail awaiting sentencing... Last month another boy – a 6-year-old Cook Islander, whose name is suppressed – died at the Starship after his parents refused life-saving treatment. [The 6-year-old] was to have radiotherapy after the removal of a brain tumour, but his parents fled home with him... before Auckland Healthcare's bid for guardianship could be heard in court. [The boy] was returned after it was too late. Starship staff say that case highlights the risks of going to court. That risk was one reason they did not go to court in Tovia's case, despite expecting him to die without treatment; another was the adverse public reaction in the Liam Williams-Holloway case. [The director said it] could understand why Liam's case might deter them but it was very worrying. The doctors involved in treating... [the] 5-year-old... for cancer came under "almost intolerable" pressure from the public reaction to the hunt for him after the court order for treatment. There was now a climate of fear over the issue of whether to seek such orders... Meanwhile, a friend of the... family... said Liam was "progressing favourably" in Mexico.

...Six years ago, [an] Aucklander... would never have set foot in a health food store – let alone get on a plane bound for Mexico for alternative cancer therapy... But that was before... [the 41-year-old] was dying of cancer. "They told me it was a matter of months, rather than years," says [the] husband... and father of [a 14-year-old boy and girl] (12)... Orthodox surgery and chemotherapy had removed the cancer, which had begun a steady march through his abdomen, but [the Aucklander] was told there was a very high chance the cancer would be back – so... began [his exploration of] alternative options, eventually settling on a Mexican clinic, American Biologics, as his one chance at survival. "I firmly believe in the power of the mind and, if you believe something, there's a chance it will happen,"... With the financial support of the Masonic Lodge and Rotary Club, [the Aucklander] and his family left NZ for six weeks at the end of 1995. Three weeks of that time was spent in the... clinic, the other three holidaying. "We weren't sure what was going to happen, so we did Disneyland and Knott's Berry Farm and had some good-quality family time." [The Aucklander] had chosen American Biologics because it combined orthodox medicine with alternatives and treated people on a case by case basis, using a combination of chelation therapy (flushing toxins out of the body), live cell therapy (the injection of animal cells), acupuncture, herbal remedies and lifestyle changes. Four years down the track, [the Aucklander] is still clear of cancer. "I'm a miracle cure,"... grins... [the Aucklander. However, his] medical oncologist doesn't believe the Mexican clinic played any part in his remarkable recovery. "...there [was a 95%] chance of the cancer returning... and [the Aucklander was in the 5%]. I've had dozens... of patients go to American Biologics and I've never had one patient go away with cancer who's come back with the cancer anything but worse. There are no exceptions." ...[the oncologist] understands why people seek alternative treatments but... doesn't believe people should go to... American Biologics, because "it's a monumental rip off" and the chances of a cure are nil. With fees for Mexican clinics rising into tens of thousands of US dollars, [the oncologist despairs when it] sees people who are not well off mortgaging their homes, spending huge amounts of money on treatments and then dying – sometimes in Mexico – leaving their spouse with a large mortgage and no income. "That's a tragedy." ...[● A British] cancer victim given six months to live by... doctors is now recovering after [it] surfed the internet to find an American surgeon willing to carry out the life-saving surgery... [The victim] from Eaton... in Herefordshire, logged on to his 16-year-old daughter's... computer to find help after [being]... told his 37cm kidney tumour was untreatable. A cancer specialist in Birmingham told him... it was decided surgery was too dangerous. But after two weeks of trawling the internet... a Californian kidney cancer expert... gave him the e-mail address of the surgeon who would eventually save his life... "I was 45 and with three children I just didn't think it was right I was going to die."

...In the debate over who should... have... treat[et] Liam Williams-Holloway for cancer, many... lost sight of the question that the proponents of all treatments must ask: where is the scientific evidence for them? [A writer's] emotive outburst in the *Herald* last Friday does nothing to advance [the alternative treatments] cause. His references to "masochism" and "barbaric treatments" on the part of medical researchers, oncologists, and countless others who are striving to help those in need with evidence-based, if unpleasant, techniques are unforgivable. Many people will read his article and decide to follow false prophets... who, while proffering hope (often at considerable expense), offer no scientific evidence their treatments are more effective than medical approaches. The treatment [the writer advocated for the now deceased Liam wa]s the Gerson method... that

[proclaims] cancer can be cured “only if toxins are eliminated from the body” – a plausible-sounding statement. Recommended detoxification methods include coffee or chamomile enemas, and a low sodium/high potassium diet that includes up to five litres a day of juices made from fruits and vegetables. Other substances... have... [been] added empirically from time to time... Raw calf’s liver was included but was discontinued after a series of... patients were admitted to San Diego Hospital between 1979 and 1981 suffering from campylobacter infection. Five were comatose and all had severe electrolyte abnormalities. Nine of these patients had cancer and all of these died shortly after admission. The American National Cancer Institute, the New York Medical Society and a team of British researchers have all concluded that... data [on the method] provides no demonstration of benefit. No doubt [the writer] regards these findings as part of a vast medical conspiracy to stifle debate. But perhaps [the writer] might care to comment on the findings of a naturopath who tracked 21 patients of the Gerson Clinic over five years and found only one (not cancer free) still alive. There are many reasons alternative therapies seem to work: initial mis-diagnosis; the disease may have run its course or be in remission; the placebo effect; and temporary mood improvement confused with cure. Many alternative practitioners have forceful, charismatic personalities and their messianic approach results in a psychological uplift. And if improvement occurs after someone has had both alternative and science-based treatments, the alternative approach usually gets the credit. Those who are antagonistic towards medical treatments that have been shown through controlled scientific studies to help many patients should reflect on the harm they may do by denying them to those in need. Unlike doctors, they are seldom held accountable for the consequences of their actions. It is time legislation was passed requiring stringent safety and procedural controls for alternative treatments similar to those applying to conventional medicine. Unhappily, in these days of managed care and overworked doctors, conventional medicine is increasingly viewed as impersonal. Doctors graduate with high student debts, then have to cope with high practice costs, political interference and uncertainties, and many other frustrations. Such constraints reduce the time available to spend on patients’ problems. The old-fashioned family doctor is becoming an endangered species. Alternative practitioners suffer few of these constraints and have more time to treat their patients... It is... well known that with many non-malignant conditions, people usually feel much better after spending time talking with a sympathetic therapist. Like many medical colleagues, I come across extreme examples of alternative medicine. Some are ridiculous... One patient, suffering from severe headaches, was relieved of \$2000 over two years by a clinic in Oxford, England, which claimed it could cure her by “radionic therapy” – beaming a radio wave of a secret frequency to the head of the Auckland sufferer. Another was told by a naturopath that all of her problems were due to the amalgam fillings in her teeth, and that her “pituitary and thyroid glands were not working.” Examination showed four small fillings in her back teeth. The remainder were in perfect condition, yet [the patient] had been told to have all of her teeth removed as “the poison has affected them all.” A blood test showed her thyroid to be perfectly normal. Toxicology tests at Auckland Hospital revealed not a trace of mercury. Yet, on further advice from the naturopath, [the patient] cancelled her hospital appointments and persuaded a dentist to extract all her teeth. [The writer] will be surprised to learn that many doctors are open minded about complementary methods... which have been shown to be helpful or appear promising and where further studies are indicated... There are a number of positive reports in the scientific literature on... various mind-body techniques such as hypnosis, meditation and relaxation techniques for stress-related disorders and chronic pain... [(using relaxation and guided imagery techniques... [c]ancer patients can think themselves to a stronger immune system... says a British researcher...)]; and herbal remedies such as ginko in stroke and St John’s Wort for depression... Folk and herbal remedies are where much modern medicine originated. But there is much work to be done to separate the wheat from the chaff.

...A leukaemia drug hailed by researchers and doctors as a breakthrough has been fast-tracked for use in the U[S]. The *Weekend Herald* highlighted the story of [a Rotorua resident] two weeks ago. [The resident] has beaten her chronic myeloid leukaemia with the help of the drug – known as Gleevec. The Food and Drug Administration reviewed the application by Novartis in a record time for cancer medication – 2 1/2 months. Gleevec should be available in the US by the end of the month. It will cost \$US2000... a month... [In related news, a] drug based on chemicals found in cabbage and broccoli may protect people against liver cancer caused by... aflatoxin, a fungus that contaminates food.

...A study conducted at the Fred Hutchinson Cancer Research Centre in Seattle found that three daily servings of vegetables nearly halved the risk of prostate cancer... [compared to eating] less than one serving a day... “And when we compared relative potency, vegetables from the cruciferous family, like broccoli and cabbage, reduced the risk even further,”... [T]he results cast doubt on research extolling the prostate cancer-fighting benefits of lycopene, found most abundantly in cooked tomatoes. “Every... magazine in the country says eat more spaghetti sauce to cut your prostate cancer risk, but we found no relation at all,”... The handful of studies that showed protective effects of lycopene were flawed because they did not take into account total vegetable consumption. Scientists believe vegetables protect against cancer because they contain a variety of phytochemicals, which are toxins produced to protect the plants. When eaten, the phytochemicals trigger the activity of enzymes that can detoxify cancer-promoting compounds in the body.

...An extract of the ancient grazing crop red clover has been used to successfully treat prostate cancer in tests conducted by Melbourne researchers. A study conducted at Monash University’s Centre for Urological Research found that the prostate cancer cells in 38 [patients] who took red clover isoflavone supplements died at a high rate. The data, presented to the Third World Congress on the Ageing [Guy], held in Germany last week, found the cancer cells in the [patients] taking the supplement died in numbers five times greater than in an untreated group... Isoflavones are found in many plants... and are chemically similar to oestrogen. In the 19th century, red clover was popular with herbalists as a blood purifier. Chinese physicians and Russian folk healers also used it to treat respiratory problems. The red clover contains four isoflavones common in the Asian diet, thought to be the reason why Asian [guys] have a lower incidence of prostate cancer. In China, 1.5[% of guys] develop prostate cancer compared with 5.3[% of guys] in the U[S]. “Guys in Asia and... in the West had a similar number of cancer cells in their prostates, but their cancer was latent or dormant... But... when Asian [guys] move to Western countries they develop cancer at the same rate as the Western population.”

...A radioactive pellet the size of a grain of rice will soon offer new hope for N[Z]’s prostate cancer victims. The pellet, dubbed the “magic bullet,” is inserted directly into the cancerous prostate tumour by a series of needles and treats only the affected part rather than swamping the rest of the body with radioactivity... [D]octors use... an ultrasound probe to guide the path of the needles, containing the radioactive iodine 125... Doctors say that because the radiation doses can be delivered more accurately, higher levels can be used to destroy the cancerous cells, with fewer side-effects such as bowel problems or impotency. In some cases, the treatment... called prostate brachytherapy... can even be given without the need for a general anaesthetic... Once inside the body, the metallic pellets can be left in permanently after they have finished delivering the radiotherapy... Initially, the treatment[– which has]... been successfully used in... Britain, [AUS and the US –] ...will be available for private patients. However, [an]... Auckland oncologist... hope[s]... the Health Funding Authority... will eventually make the treatment available to all [NZers]... suffering from the cancer[, which]... kills more than 500 [of them] a year... A further 1100 new cases are detected each year. It is increasing at such an alarming rate that it is forecast to become the most fatal cancer in [guys] within five years[. It is currently the 4th most fatal cancer behind ‘breast cancer; large bowel (1089 annual deaths); and lung, trachea and bronchus (1412)’]...

Tobacco unlikely ally in war against cancer... Blamed for millions of deaths, tobacco may soon have a role in saving lives. This transformation is being investigated at California’s Large Scale Biology Corporation, where scientists have created tobacco plants which churn out chemicals that protect against leukaemia and lymphoma. “It is a neat concept,” said [one] project scientist... “It is the medical equivalent of beating swords into ploughshares...” ...leukaemia and lymphoma... occurred when a single white blood cell... proliferated uncontrollably to swamp the body. Humans have millions of varieties of white cell, each designed to defend the body against a different virus or bacteria. There are millions of subtly different forms of leukaemia and lymphoma, each based on the spread of a slightly different type of white blood cell. “That makes it very difficult to combat

such illnesses..." Scientists have to try to find a way to tackle one form of lymphoma and no other when dealing with an individual patient, and that is where the tobacco plant has provided crucial help. They have pinpointed the distinctive part of a lymphoma-causing white blood cell, the bit that distinguishes it from all other white blood cells. They then isolated the gene that makes that key component, put it in a tobacco mosaic virus and used the modified virus to infect the tobacco plant. As the virus replicates, it spews out white cell particles, and as the virus takes over the tobacco plant, it becomes coated with these protein pieces. "Essentially, you produce a little bio-factory... You have specific pieces of white cell protein on the stalk and leaves. You just scrap them off and collect them." The scientists now have patches of tobacco plants, each making proteins tailor-made to match a lymphoma from one of 16 people... Once the protein fragment from each person was scraped from their tobacco plant, it was injected back into the patient. "Essentially, we use them as a vaccine. Our immune systems often do not recognise a cancer... as being foreign and dangerous and so allow it to spread. But by re-administering pieces of a cancer as a vaccine, it makes the body realise something is amiss. Suddenly, it starts to attack the tumour. We have opened its eyes to the danger within... You couldn't find a better use for tobacco if you tried."

...[scientists have developed a 'target-specific anti-cancer drug. STI571 is a pill which targets the enzyme that triggers a type of leukaemia and improves the condition of many test patients (it worked for 53 out of 54 leukaemia patients) without side-effects.' Speaking of which, s]tandard doses of chemotherapy can lead to permanent mental impairment for some patients, research shows... [A] clinical psychologist and professor at Dartmouth Medical School in New Hampshire, said many patients reported difficulties while undergoing chemotherapy, including cognitive problems such as memory and concentration loss. However, it was only now being established that the effects appeared to be lasting for some former cancer patients... One cause might be that toxic chemotherapy agents crossed the blood-brain barrier more than previously thought... The issue is a concern to the growing number of cancer survivors. About 8.4 million Americans have a history of cancer, with more than 1.2 million cases expected to be diagnosed this year. Little research has been done on adult cancer survivors. However... research on children had resulted in changes in both the way chemotherapy was delivered to the body, for example through a central line rather than directly into the spinal cord, and the dose schedule. More research might prove these procedures were useful for adults.

...Scientists do not expect to find a quick cure for cancer but are working to develop treatments which might turn deadly cancers into chronic but no longer fatal diseases... possibly adding to health-care costs... Medicine has already succeeded in finding effective cures for some cancers and reducing the mortality rate of others... New treatments wo[n't] replace the present, often blunt and unpleasant therapies, but complement them...

A new technique could revolutionise the early detection of cancer, giving sufferers a better chance. Researchers at the Massachusetts Institute of Technology have devised a novel method of detecting changes in the nucleus of cells in the earliest stages of the disease. "More than 85[%] of cancers originate in the epithelium that lines the internal surfaces of organs throughout the body. Although these are readily treatable if diagnosed in one of the preventative stages, early lesions are almost impossible to detect... We present a new optical-probe technique based on light-scattering spectroscopy that is able to detect pre-cancerous and early cancerous changes in cell-rich epithelia." The technique relies on the fact that... the differences... [in] cell nuclei... in the early stages of cancer... scatter light in a characteristic way. Until now the changes were detectable only after a biopsy. The technique... can be done in conjunction with a routine cancer screening technique using an endoscope... [In another development, a] six-legged robot has been [built] in Singapore and programmed to drill through the skull during surgery to remove deep-seated brain tumours in sharply reduced operating time. Engineers at the Nanyang Technological University... came up with the computer-controlled robot known as "Hexapod" in conjunction with surgeons at the National Neuroscience Institute... "Currently surgeons have to drill through the bone for up to... six hours, followed by another three spent removing the tumour... Using the robot to perform the drilling will be... more precise,"... with the time cut by nearly 50[%]... The team hopes to begin human trials by the middle of next year following the completion of animal tests.

...[doctors are applying 'proton-beam therapy' and 'neutron therapy – using sub-atomic particles – to treat brain cancers'. By the way, 'siblings could become the saviours of some cancer patients. Doctors are using immune cells from the brothers or sisters of melanoma victims to treat the cancers']...

A melanoma vaccine being tested in Brisbane has achieved complete remission in [some] patients, with deep-seated tumours disappearing after treatment, researchers say. Twelve patients have been treated with the experimental vaccine, which has been developed at the Queensland Institute of Medical Research... [The] director of the melanoma clinic at Brisbane's Mater Adult Hospital, said the results were promising given that the patients were believed to be incurable. "Half the patients had no reaction [to the vaccine] and just progressed... But three patients had total disappearance, and three others had partial disappearance of tumour. Compared with an expected response rate of zero, this is an enormously exciting response... We feel these results are so important we'd like to study the vaccine in an earlier phase of treatment, with people who have very early recurrence of melanoma to see if we can prevent the disease spreading,"... Patients with very early recurrent melanoma have a 20[%] chance of being cured by surgery. A trial [using] patients with early melanoma is expected to begin at Royal Brisbane Hospital next month.

...Sun-worshippers may be able to get that bronze tan without baking for hours in potentially lethal rays, and fight skin cancer at the same time, when a new drug implant hits the market in a few years. The implants, containing the drug melanotan, are being developed by... EpiTan... a biotech firm in A[US]... Dubbed the "Barbie drug", melanotan stimulates the production of the melanin pigment in the skin which causes tanning...

MoleMap N[Z] has unveiled a new weapon that uses the internet to help detect skin cancer early. The Auckland-based company uses Telecom broadband technology to send highly detailed melanograms – images recorded by special cameras – from its nationwide network of clinics to a central database. The images are stored and also forwarded to doctors to pass on to their patients. There are 11 diagnostic clinics, from Christchurch to Whangarei, and the company plans to open three more in the next few months... Some people can have... 100 moles, so each file can be huge to send. Telecom's Jetstream broadband internet service ensures the large files arrive quickly... All patient files are compressed and encrypted to ensure they are kept secure... "It is a very cost-effective way for patients to have moles scanned and diagnosed, and w[e]... are less likely to miss potential melanomas, or to cut them out unnecessarily[.]" the... chief executive of MoleMap, said... In the future, doctors will be able to take their own images of lesions and send them to dermatologists to get results... [T]he ability to transfer images from the point of care to dermatologists was an excellent tool for both patients and practitioners alike... ■ [They are being called]... green gold – and if cancer researchers prove green-shell mussels can cure the disease they will be worth their weight in gold for farmers. [A farmer] of Kaiua hauled 20 tonnes of the humble shellfish from his farms in the Firth of Thames yesterday. These mussels, along with another 580 tonnes this year, will be mainly sold to the U[S] and Europe for eating, but in the future [the farmer] hopes they will also be saving lives "If it works it will be great," [the farmer] said of... A[US]n... research that shows lyprinol, an extract from the mussels, has strong cancer-fighting properties. The extract, a valuable anti-arthritis preparation, will now be tested on cancer-sufferers in trials beginning in about a month. However, [the]... former scallop farmer who entered the mussel industry four years ago, is not holding his breath. "It's early days yet,"... This year the industry has "found its feet" after suffering from a high exchange rate and a toxic algal bloom which practically closed it and put consumers off eating mussels... This year export earnings have risen by \$100 a tonne, thanks to the weak N[Z] dollar, and consumption is on the rise now that news of the... research has lifted the profile of the mussel. "It will definitely have a flow-on effect. I guess this [research] will be publicised overseas as well so people will be buying mussels overseas..."

...N[Z]'s exclusive grip on greenshell mussels – a potential gold-rush industry following the discovery of their cancer-killing powers – could be wiped out within years. The mussels, which take 18 months to grow, are indigenous to N[Z]. Marine experts last night said they were not aware of their growing elsewhere in the world, but they could think of no environmental reasons why they would not... [The] director of fisheries at the National Institute of Water and Atmospheric Research, said a Californian attempt in the 1970s to cultivate the mussels in a laboratory had failed. But all it would take was the right conditions, [the director] said. There was a high probability that greenshell mussels grown elsewhere would

contain the crucial extract, lyprinol... However, Maclab, the Nelson and Melbourne business with patents on the extraction methods, said the extract could be obtained only from the N[Z] mussels because of our clean waters. An owner of the marine farming and processing business... said it would not try to cultivate the mussels overseas as [it] had “faith” that N[Z] would open up new areas of coastline to marine farming. [The]Food and Fibre Minister... expected any plans to remove greenshell mussels for cultivation overseas would need to be approved by N[Z] fisheries authorities. The Government would take a close interest in any such plans... A[US]n researchers discovered the extract... kills human cancer cells in the laboratory... The dietary supplement has been hailed overseas for helping asthma and arthritis sufferers. Fifty thousand lyprinol capsules started going on sale in N[Z] pharmacies on Friday at just under \$50 for a packet of 50. The packet recommends taking up to four capsules a day. One of the N[Z] distribution companies fears the market will go wild today with people racing to pharmacies to buy up the few packets. The Ministry of Health warned that as lyprinol was not yet fully tested, cancer sufferers should talk to their doctors before even considering it. Demand for greenshell mussels at supermarkets soared at the weekend, although shoppers may be expecting rather too much. At this stage, researchers do not know if eating raw mussels kills cancer cells, but they have established that cooking and storing them destroys the active ingredient.

...The company behind a potentially life-saving new cancer treatment... says the breakthrough is the result of 20 years spent researching the shellfish. But... Maclab has no intention of allowing overseas competitors to “poach” N[Z]’s \$118 million-a-year mussel industry... More than 100 people with cancer will take part in trials to discover the full scope of the marine extract, which it is hoped will be effective against prostate and breast cancers... [The] principal research scientist in the rheumatology research unit at the Queen Elizabeth Hospital in Adelaide... was amazed to find that in test-tube trials, lyprinol killed cancer cells in less than 24 hours. “There have been countless new drugs that seem to kill cancer cells in the test tube but fail in the human body... We know lyprinol works in the body based on its current history. This trial is simply an exciting extension of that usage...” If successful in human trials, the mussel-oil extract will provide a natural alternative for cancer treatment without the side-effects of normal drugs... “The best answer we can come up with is that the cancer-eating properties seem to be a unique combination of the plankton that the mussels eat and the way it then metabolises that diet to produce lyprinol. We have even tried growing the black mussels on the same ropes as the green mussels – you often find the two growing together in Marlborough – and we have tested them for lyprinol. We found there isn’t any lyprinol in any other type of shellfish.” ...[the owner of] Maclab... also played down fears that other countries such as Chile might try to farm greenshell mussels... “That won’t happen because we own the patent to produce the chemical from the mussels and we will only use N[Z] mussels. We have invested heavily in marine farming operations in Marlborough and we are there to stay...” ...Setting up a 5ha farm can cost more than \$100,000, and then there is equipment – starting with a \$250,000 barge... [A]n average... mussel would produce 10 million eggs... The mussels process between four and seven litres of water an hour so it is vital to ensure they are harvested from pollution-free areas.

...N[Z]’s... mussel industry could be over-whelmed by demand ...f[or] the green-lipped mussel’s cancer-killing powers. But the prospect of rich rewards has been tempered by warnings about the limits of expansion for marine fishing... Greenshell mussels were indigenous to N[Z]. The only close relation was a Chinese variety which had a green-tinged shell, but not the same properties... [A]n owner of... the Nelson business preparing mussels for lipid extraction in Germany... said marine farmers could not grow enough mussels even to meet the present demand from seafood processors. Others areas of the coast could be used but there was a delicate balance between marine-farming, conservation and recreational interests... The main... farming areas for the mussels are Marlborough, the Coromandel... Hauraki Gulf, Stewart Island and Golden Bay. Maclab was now processing 40 tonnes of mussel flesh a week to produce freeze-dried powder... compared with four tonnes previously. The lipid material could not be reproduced artificially and so could be obtained only from the N[Z] mussel. Maori had known of its medicinal properties for centuries.

...An A[US]n... is 90[%] sure that an extract derived from N[Z]’s green-lipped mussel will provide the key to the holy grail of medical science... “This is the most exciting discovery of my career. If I was diagnosed with cancer I would take as much lyprinol as I could hold down.” Melbourne-based family company Maclab, which has a factory in Nelson, will reap the benefits if... trials [on cancer patients] are successful. An owner... said the company had been chasing the cure for arthritis for 18 years – “and look what happened...” [The owner] had seen cancer cells growing in the laboratory and to watch them dying was “magnificent.” But [the owner] was concerned that N[Z] would not be able to supply enough mussels for world demand and a new supply would have to be developed. “The Government will have to make some hard decisions. If the rest of the world says, ‘We demand this material because this is going to help so many people,’ how do you turn around and say, ‘Sorry, you can’t have it?’”

...[an] extract offering hope to cancer sufferers may be banned from N[Z] shops indefinitely after a ruling yesterday that sales may be illegal. N[Z]ers yesterday rushed pharmacies searching for... the extract. But the sales bonanza – reaping a reported... \$2 million in one day... – was soon over. The Ministry of Health said... lyprinol, had been promoted as a medicine, yet had not been proved as one. And because claims in promotional material outstripped research evidence, it was a breach of the Medicines Act... Last night, the ministry was still deciding whether to recall capsules already sold, or those on the way to shops, after revealing... the N[Z] distributor, Pacific Pharmaceuticals, had voluntarily halted distribution.

...Just hours after ordering lyprinol from his pharmacist, [a]cancer sufferer... felt the rug had been pulled from under his feet... [The] 31-year-old trainee specialist at the Starship children’s hospital profiled in the *Weekend Herald* last month... is angry at the “overly paternalistic” attitude taken by the Ministry of Health in stopping sales. “What if lyprinol does have significant effects on cancer? Then thousands of N[Z]ers would have been deprived of potential treatments... It annoys me we don’t have a choice. All of a sudden that has been taken away from us... I don’t have time to wait for clinical trials to be carried out. It could be a red herring, but why can’t I spend \$50 to find out?” [The trainee doctor] said the ministry seemed to think cancer sufferers made decisions purely on emotion and were incapable of rational thought. And it appeared to be acting conservatively with the drug because of the publicity. “There are lots of other cancer drugs ‘alternative’ people seem to sell with gay abandon, and the ministry turns a blind eye. But when someone ‘respectable’ promotes it, it kills it.” ...• [The]Dr... said the support [it] had received since appearing in the *Weekend Herald* had been heart-warming... “Cancer can take many things away from me, but it can’t remove my memories.”

...The greenshell mussel seems to be proving a little too hot to handle for the doctors and drug company who announced its cancer-fighting potential to the world. As its commercial offshoot, lyprinol, met obstacles... from the Ministry of Health, the mussel [promoters] were pulling back from statements and promises they made last week. The... main researcher into the mussels’ cancer-fighting qualities... had... said... it... felt 90[%] sure that the extract would work. But last night, [the main researcher said]... “It’s a great concern of mine to even suggest that there is any evidence that it is effective in treating human cancers... We’ve not made that claim at all. What we’re saying is there is evidence it may be effective and we are launching clinical trials in Adelaide to find out if that is the case or not.” Criticism yesterday by [the P]M... of the timing of the research announcement so close to the N[Z] launch of lyprinol also saw a change in tack by... [the] managing director of the product’s maker, Pharmedica. It was [the managing director] who arranged last week for TVNZ to make the worldwide announcement of the mussel’s potential – to run on *One Network News*... The TV firm was hosted in Adelaide last Thursday under this arrangement. [The managing director] attempted to lock the N[Z] *Herald* into a similar agreement, with all details to be kept secret until Pharmedica determined, but that offer was declined. Independent inquiries by the *Herald* last Friday subsequently prompted TVNZ to screen the... material that night – four days early. [The managing director] had threatened the *Herald* with legal action if any details of the research were published before [it] was ready – and said [it] had “shut down” the... Queen Elizabeth Hospital... staff and even [the]Food and Fibre Minister... to prevent them from talking. Last night, responding to [the PM]’s allegations of media manipulation, [the managing director] said there was no way [it] would have been able to control the Queen Elizabeth doctors commenting on the research. However, a “journalistic adviser” acting for him... wrote to the *Herald* last Friday offering exclusive interviews with the doctors and scientists involved – as long as the newspaper agreed to an embargo... [on news till] the mussel extract had been tested on patients.

...The greenshell mussel extract Lyprinol ran foul of the law on several counts, and the N[Z] distributor Pacific Pharmaceuticals would have quickly found itself in legal trouble had it not withdrawn it from sale. Ministry of Health officials were yesterday anxious to stress that Lyprinol had been voluntarily withdrawn. "It has not been banned," said a ministry spokes[perso]n... "People can still obtain it from overseas..." [The spokesperson], a softly spoken [guy] who chooses his words carefully and enunciates them precisely in a distinct Scots burr, was technically correct. But it's a fine point. Pacific withdrew Lyprinol from sale once it was told that to continue distributing it would breach the Medicines Act. Individuals doing so could face six months in prison or a fine of \$20,000. For a company, the fine could be \$100,000. The legalities of the matter revolve around the definition of a medicine. Lyprinol's sponsors sought to claim it was being sold as a dietary supplement. But the information available on the Internet and circulated to pharmacies... undermined that claim... "It was also being promoted as a cancer cure... making... this product a medicine in terms of the Medicines Act." ...If a substance is going to be a medicine, it has to be approved as such by the Minister of Health – effectively the ministry which will want to be satisfied that the manufacturers' claims about the product's healing powers are true. Lyprinol not only doesn't have ministerial approval, it has not even started down the long and winding road of scientific testing on humans. By accident or design – and the ministry suspects that a little design was involved – it was allowed to look like a medicine without explicitly claiming to be. In the end, though, the law prevents unjustified claims of effectiveness whether explicit or implied. And the restrictions don't stop even when a medicine is approved. Section 58 of the act bans advertising that "directly or by implication" claims to remedy certain ailments. They are listed in long schedules – lists at the end of the act. The first, longer list is diseases that you may not claim to be able to "prevent, alleviate or cure." It includes arthritis and cancer. The second list is diseases you may not claim to be able to "prevent or cure" – so it is not illegal to simply offer relief. On that list you will find asthma, and the two commonest diseases of all – dental decay and the common cold. Make those claims and you will be prosecuted. And the only defence that will save you is that your cure works... Lyprinol is a long way... from being able to rely on that defence.

...[a medical researcher's claim that it] has approval to begin clinical trials of Lyprinol as a cancer treatment has been denied by the hospital ethics committee that supposedly gave the go-ahead. Trials of... Lyprinol's life-saving potential on human cancer sufferers are crucial to the product's gaining international acceptance. [The main researcher] yesterday continued to say [it] had approval, but a spokes[perso]n for the ethics committee at Queen Elizabeth Hospital in Adelaide... said that was not the case and never had been. [The spokesperson] said the committee could not understand [the researcher's] confusion and suggested [it] might have "jumped the gun" in announcing that a trial was to start soon. [The researcher] had been told to revise his research programme and resubmit it for further consideration... Even if that was done, it would not guarantee permission for trials... In N[Z], the Ministry of Health has launched an investigation into what it calls cynical marketing ploys.

...Claims that Lyprinol may make some cancers worse, or even promote tumours, have been dismissed by an A[US]n professor researching the... greenshell mussel... Distribution of Lyprinol in N[Z] has been halted pending an investigation into its launch here, which coincided with A[US]n publicity about cancer-fighting possibilities... [Y]esterday... the Malaghan Institute of Medical Research in Wellington... said... that the active ingredients in Lyprinol were polyunsaturated fatty acids and some of those kinds of acids were known to promote tumours... [The AUS]n company that processes the mussels, would not comment on the claims but referred the *Herald* to... [the] professor of food science with the Royal Melbourne Institute of Technology... [The] expert on polyunsaturated fats... said it was true the fatty acids in Lyprinol were polyunsaturated, but so were the fatty acids found in fish and fish oil and those acids were linked with cancer prevention... The Cancer Society said... [his] claims should be taken seriously. But [the society's] medical director... said Lyprinol had been used by people for a number of years and no side-effects had been noted.

...An investigation into the marketing of Lyprinol... as a cure for cancer, will be extended into A[US]. The Ministry of Health will work with the A[US]n Therapeutic Goods Administration and other groups over the probe.

...Eighteen charges have been laid against two companies and some of their staff over the sale, distribution and advertising of the green-lipped mussel extract Lyprinol... A lawyer for the defendants... said the charges would be vigorously defended but refused to comment further.

...The Ministry of Health has welcomed the penalty of \$15,000 imposed on Lyprinol (NZ) for selling a product... as a cure for cancer. The company was sentenced in the North Shore District Court on two charges relating to the... advertising of Lyprinol as a medicine without consent.

...Lyprinol could be back on shop shelves... as a health supplement – not a medicine – ...in months, says the Ministry of Health... as long as certain issues were cleared up satisfactorily... A product called Lyprinex is marketed on the Internet as the Life Plus International equivalent of Lyprinol. That costs ...\$57.70... for 50 capsules, plus shipping... as opposed to the \$49.95 for 50 capsules that people were paying until its withdrawal.

...Lyprinol will be available again late next week – under a new name. The product is the same... but now it will be known as HPME, or highly purified marine lipid extract... No claims were made on the packaging of HPME other than that it was a health supplement, although the box referred to Lyprinol because that was the active ingredient... A... representative for... Pacific Pharmaceuticals, said the name change allowed the company to provide the product but to back away from the controversy associated with Lyprinol – a brand name unlikely to resurface in N[Z].

...no-one] emerges with much credit from the fuss over Lyprinol. The researchers seem to have made rather too much of their findings[, and the]... release on to the N[Z] market quickly followed the media razzamatazz – a most unfortunate piece of timing. And then the Health Ministry over-reacted. It's a fine mess. The news media must bear most of the blame. A press statement issued in Adelaide – "Cancer – Hope from the Sea" – led to a TVNZ extravaganza and extravagant front-page reporting by some newspapers. The [main] researcher said Lyprinol had "the potential for remarkable anti-cancer action", a claim from which [it] later seemed to distance himself. But... [the researcher] cannot be regretting his statements as much as the journalists are regretting theirs. The news media should not make the mistake of crying "breakthrough" every time a researcher finds something interesting in a petri dish... Journalists have been confronted with this situation a thousand times before... They should know not to leap to conclusions... Sensationalist reporting raises false hopes among desperate people... The public knows now there is no evidence so far to suggest that Lyprinol is a cure for cancer. Cancer sufferers know it too. But the product also seems harmless, and cancer patients should be free to try it. The ministry is in the paradoxical position of opposing a harmless food extract while defending third-generation contraceptive pills... It needs to change its mind on both counts.

...The hype surrounding the Lyprinol launch was unethical, says a biochemist who... [is the chairperson] of the European Cancer Prevention Organisation... [Yesterday the biochemist claimed] that Lyprinol publicity should have been held back... "Everybody should have kept quiet until they had done some clinical tests... People are finding these things all the time. Every now and again one of them gets hyped up. In Britain it's usually because a university laboratory wants to get some more funding." ...The body had many mechanisms to repair damage to the DNA of cells, including cancer cells, and many other ways of preventing foreign substances, such as Lyprinol, even getting to the target area... and rather than "wasting" money on vitamin supplements people were better off getting vitamins from food...

Vitamin C pills may cause hardening of the arteries, say [US researchers. The NZ] Heart Foundation sees the discovery as further evidence that vitamin supplements do more harm than good... The study found no clear-cut sign that getting lots of vitamin C from food or a daily multivitamin does any harm. But those taking vitamin C pills had accelerated thickening of the walls of the big arteries in their necks. In fact, the more they took, the faster the buildup... [● Local h]ealth authorities are being hampered in their investigations into recalled A[US]n supplements by N[Z]'s open licensing regime. The A[US]n Government was yesterday planning a new crackdown on pharmaceutical manufacturers as panicked consumers flooded chemists and health stores following the recall of more than 200... supplements. The recall, A[US]'s biggest, also shut down Pan Pharmaceuticals, which holds... 70[%] of the booming market in herbal remedies, vitamins and painkillers. The company... alleged[ly]... fabricated

and manipulated quality control data. Some of its supplements... have caused hallucinations. Last year Pan Pharmaceuticals earned... 12[%] of its worldwide sales of A\$110 m... from N[Z, where]... dietary supplements and complementary medicines do not have to be registered... unlike A[US]...

Health officials hope thousands of health supplements will be pulled from supermarkets and health shops today as the full list of products made by disgraced... Pan Pharmaceuticals is revealed... The problem widened last night when A[US]'s drugs watchdog added a further 449 products to the recall list. That makes 668 products with possible health risks – and the Therapeutic Goods Administration indicated the list could reach 1000.

...N[Z]'s official list of suspect dietary supplements and vitamins made by... Pan Pharmaceuticals failed to include products from major local health company Red Seal Natural Health. The N[Z] Food Safety Authority updated... its website on Saturday but did not make public the omission.

...[NZ's] \$200 million-a-year health supplements business is up in arms over a Government plan to join forces with A[US] to regulate the industry... [NZ's] Health Minister... said [it] was criticised for not having regulations after this year's big recall of Pan Pharmaceuticals products.

...Medical researchers want regulations for health food stores... [whose s]taff... often recommend natural remedies that can trigger allergic responses... Their study... also found ...o[n]e health shop... actively discouraged a customer with asthma symptoms from seeking medical advice...

Junk food and ready-made packaged meals may be causing the alarming rise in the world's childhood asthma rates. Scottish researchers have found that children who have diets low in vegetables, vitamins and minerals are three times more likely to suffer from wheezing, infections and other asthmatic symptoms... In Britain, the number of children developing asthma before the age of 5 has doubled in less than a decade... [Incidentally,] British scientists... are transforming one of the world's most toxic substances into a new non-addictive drug that could relieve chronic pain caused by cancer and other diseases. Botulinum neurotoxin is released by a bacterium... found in contaminated food or infected wounds and which causes botulism, a rare but deadly illness. The bacterium has... also gained popularity as a treatment for wrinkles under the name of Botox... Experimental results... at the Centre for Applied Microbiology and Research, an arm of Britain's health ministry... show... there is potential to target the toxin to nerves... responsible for pain and to block their function for many weeks... It has... been used in small, controlled doses for... 10 years to treat patients with cerebral palsy, muscle spasms and other complaints caused by uncontrolled muscle contractions... It's... particularly effective for muscle damage resulting from brain and spinal injury and strokes and for chronic back and neck pain. Injections of the toxin also relieve sweating, drooling and writer's cramp. The... molecule is designed to treat conditions such as cancer where a muscle relaxant is not needed.

...Industrial Research... [and] the Albert Einstein College of Medicine in the U[S]... have climbed a "Mt Everest of chemistry" in designing... "immucillins" – ...drugs that... require a tiny fraction of the previous dosages required... in... treatments for arthritis, malaria and some cancers.

...Revolutionary surgery... is offering hope to thousands of N[Zers with cancer] who may otherwise die or have limbs amputated. The technique involves removing the piece of bone with the tumour, killing the cancer cells by placing the bone in a hot water bath... – ...[tumour] cells are more sensitive to heat than normal cells... – ...then replanting the now cancer-free piece of bone into the patient and enabling new bone to grow... One of the patients, who had cancer in his forearm, is doing so well that [it] has recently gone back to a job involving heavy lifting... Other surgical techniques for removing bone tumours and filling the gap left behind have been performed... at Middlemore Hospital... for... a decade, but... they are not as simple or cost-effective as re-growing a patient's own bone. The new method was developed in Japan by a professor who experimented by growing tumours in animals... [I]t could take another five years before surgeons were 100[%] certain the method was as good as the previous techniques.

...The hand of a dead [perso]n has been transplanted to a Perth amputee in a pioneering operation in France by a Sydney microsurgeon. [The AUSn microsurgeon] yesterday led a specialist transplant team of eight surgeons in the 11-hour operation at a Lyon clinic... The team hoped to create medical history by giving [the amputee], who lost his right hand in a circular saw accident 14 years ago, full feeling and movement with someone else's hand. It was believed to be the first time a limb from a dead person had been transplanted to a living one... [T]he landmark operation may bring hope to millions of people including parents of babies born without limbs. The surgeons from France, Italy and Britain worked in teams to join up the bones, blood vessels and skin. But it will be weeks before it is known if the procedure was a complete success.

...SURGEONS [in Lyon] have transplanted hands and forearms on to a person for the first time. The patient was a 33-year-old French[perso]n who lost his hands in 1996 when an amateur rocket exploded as [the Frenchperson] held it. The doctors grafted the arms of a dead [perso]n on to him in a 17-hour procedure. The medical team was headed by... [the surgeons who] performed the world's first single hand transplant... on... [an expatriate NZer, who recently] said the transplant did not quite produce the full sensitivity and dexterity of his original hand.

...To the dismay of his doctors, [the NZ]er... who underwent [the world's first] hand transplant, has broken contact with them... "I really didn't expect something like this to happen,"... [a member of the] transplant team... at the Edouard Herriot Hospital in Lyon... said yesterday... [The team-member attributed the NZer]'s disappearance to a "psychological reaction after being surrounded by doctors for three months." But... it could also be because of problems in A[US, where the NZer] faces fraud-related charges from a marketing investment scam allegedly worth \$NZ1.16 million... [The NZer], aged 48... told CBS News in New York that [it] went to the U[S] from France and no longer underwent therapy or essential skin biopsies and blood tests[, although the NZer] had probably lost "40[%] of the movement that I had in France." But [the NZer] did not acknowledge any fault and said: "They [the doctors] tend to forget... that I know my body better than they do... I'm not about to lose my hand. I'm not about to throw a dream away." ...At the time of the operation, doctors said [the NZer] would need to continue physiotherapy for at least a year but that it could be as long as 18 months before it was known if the hand had been successfully transplanted[, and, ideally, his health needs to be regularly checked for at least a decade (statistically, 'one out of 10 patients will be dead after 10 years because of the drugs that they must take to suppress their immune systems, which reject a transplant'). The NZer] lost his hand in a sawing accident in prison in 1984 while serving a two-year sentence for fraud. For five years, N[Z] doctors tried to fully reattach his hand. But [the NZer] gave up and had them amputate at the upper forearm.

...The N[Zer] who was given the world's first transplanted hand and then persuaded doctors to remove it said yesterday that [it] could not live with the pain and discomfort any more. In an interview with the *Mail on Sunday* newspaper, [the NZer] said the side-effects of the medication [it] was on made his life unbearable. "I do not believe it was a failure, but the pain just became unbearable," [the NZer] said from his hospital bed in London as [it] recovered from the removal operation... The surgeons who gave [hi]m the transplanted arm... have criticised him for failing to take his medication and not consulting them... [– although the surgeon who] removed the new hand on Saturday... reportedly carried out the original transplant... [A Sydney microbiologist], who co-led the original operation, said six other successful transplants have taken place since [the NZer]'s...

An intelligent artificial hand developed in England is believed to be the most sophisticated in the world. The... Oxford Intelligent Hand has two fingers and a thumb. Unlike a conventional prosthetic hand, which opens and closes like a claw, it is able to grasp objects in a more natural manner. Weighing half a kilogram, it can be operated by tensing two muscles in the user's forearm where two electrodes – one for each muscle – read the tiny electrical signals, which are amplified and fed into a series of circuits, prompting the fingers to curl up. The hand can pick things up between two fingers or clasp an object in a fist... [Speaking of artificial body parts, a 65-year-old NZer] didn't give much thought to the... hip... implants his surgeon put in. What his doctor recommended was good enough for him... Anything to get rid of the pain of his degenerating joints. But seven years later, [the now 72-year-old] was back on the operating table having the replacements replaced. "They showed me the kidney dishes full of what looked like black rotting meat,"... That... was his own flesh – the prostheses were flaking and the rejection reaction of his immune system was eating away his bone. The... cheaper titanium copies of the Muller 5 model... joints... [originally received] were among the more

spectacular failures in N[Z]'s 30-year history of hip replacements. Titanium, which performed so well in the stem of the device, had been used as the weight-bearing head. The result was disastrous. The combination of the titanium head and plastic cup of the implant resulted in huge amounts of flaking debris shedding into surrounding tissue, triggering the immune response and loosening the joint. [The 72-year-old] was one of hundreds of patients in whom the joints failed, but like them... has no redress because of our ACC laws. It cost him \$23,000 for the two extensive operations required to repair the damage. In Britain, the failure of another joint, the Capital hip... withdrawn from sale last year, has led to hundreds of patients having re-operations paid for by the company which marketed the device, 3M Health Care. It had been introduced without clinical trials. "There is better quality control when you are buying a video or lawnmower," said one MP. The failure led to new rules requiring the makers of all medical devices to prove they are fit for the functions they claim – nearly 10 years after the F[DA] introduced similar regulations in the U[S]. An award-winning innovation by a [N[Z]] surgeon is providing valuable clues to international researchers about why joints fail... [The] senior lecturer in orthopaedic surgery at Wellington Clinical School, has designed computer software that measures on x-rays rates of prosthesis wear. It has been used in a major U[S] study of 1050 joint operations by seven surgeons using the same prosthesis to reveal the single most important factor in replacement longevity. Surprisingly, it's not the type of device that has the most impact, but rather "the surgeon factor" – how the device was put in... The surgeon factor includes pre-operative planning, preparation of the bone, "the absolutely meticulous way the prosthesis is handled" and the operation through to closure of the joint. Damage during surgery can render the joint more likely to wear... But[an] Auckland surgeon... says some failures are still inexplicable. How is it... that a patient can have two joints replaced within a year of each other by the same surgeon, using the same prosthesis – and one will last 10 years, while the other is still going strong at 20 years? While the failure of [the titanium] joint and the 3M hip are among the more spectacular disasters, they are not the only ones. In the 1980s, the development of new joints actually went backwards as theory after promising theory failed. Though doctors still regard hip replacements alongside heart transplants as one of the success stories of modern medicine, it is a story of experimentation littered with costly flops. Of the 40 or so implants used over the years, about half have failed, on average, before the 15 to 20-year threshold regarded as the clinical yardstick by which prostheses are measured... The irony is some of the earliest joints used in N[Z] – the so-called Charnley hips – remain among the most reliable today. The first problems began with attempts to improve them.

...Two N[Z]ers are helping introduce a new type of hard-wearing plastic which is being tested in hip-replacement surgery throughout the world. The technology could eventually help N[Z]ers who have hip replacements predict when their new hip will wear out and how it will fail. Assessment of the new plastic will use a monitoring technique developed... at Otago University's Wellington School of Medicine. The technique allows orthopaedic surgeons to use a computer to measure wear with an accuracy of 0.13mm or better... The three-dimensional monitoring technique, known as PolyWare... has been evaluated in Canada and the U[S], and... is accepted as being the most accurate measurement of plastic wear available. In the U[S], the FDA has a condition that any new material used in total hip replacements must have ongoing monitoring through the [PolyWare] method... PolyWare is currently used by about 35 major university centres in the US, Canada, Britain and Europe... [A]bout 4500 hip replacements were done in N[Z] annually, and up to a million worldwide... The N[Z] Orthopaedics Association has been compiling a record of every joint replacement in the country for the last three years. [PolyWare's creators hope the record] will help monitor how well the technology works... [T]rials were promising and the new plastic was being used in patients with total hip replacements... The new plastic is also being used for knee-joint replacements. Funding for the development of PolyWare has come from the Lottery Grants Board and the... [association's] Wishbone Trust.

...Doctors may soon be fixing broken bones with dissolving plastic implants to take the agony out of traditional nuts-and-bolts surgery. Engineers at Auckland University, in conjunction with German medical researchers, are set to patent a new biodegradable polymer, which dissolves in the body once the shattered pieces of bone have knitted together, replacing the need for traditional metal plates. The development means patients could soon be spared the misery of further surgery to remove titanium plates once the broken limb has healed. Preliminary trials with plastic composites already used in aircraft... suggest they are also more flexible, lighter and cope better with the growth of new bone... And although... the polymer is... slightly... more expensive than traditional materials, surgeons hope to recoup the cost by avoiding further operations on patients to remove the plates... [T]he project leader, [who]... had already used plastic composite materials to build hip protectors for elderly people at risk from falls and was developing the world's first plastic wheelchair... said metal plates had drawbacks because of their stiffness, which can impede bone growth, slowing the healing process. In some cases patients are at risk from allergic reaction to the nickel in the plates. But initial tests suggest the plastic composite does not react with human tissue and can be absorbed into the body without side-effects. The team plan to test the effectiveness of the implants using a micro-electronic measuring device, which will monitor the amount of stress placed on the implant while it is in the patient's body.

...Recovering from a broken bone...? Perhaps best to lay off painkillers such as ibuprofen, related to aspirin: they may significantly hinder the healing of broken bones, warn researchers. Studies carried out on rats suggest that non-steroidal anti-inflammatory drugs (NSAIDs) can delay or even prevent the mending of fractures. NSAIDs, which include aspirin and drugs made from ibuprofen such as Nurofen, are taken daily by millions of people worldwide, and a common use includes easing the pain of broken bones. According to... the Kennedy Institute of Rheumatology in London... the area needed to be investigated urgently... "In the meantime, people with healing fractures should steer clear of these drugs." ...For over 20 years there have been occasional reports of impaired bone healing in patients taking NSAIDs... – although aspirin is off the hook... "Aspirin is one of the few NSAIDs that appears to kill pain without this side-effect,"... (...low-dose aspirin... [can also] stop... recurrent miscarriages... [in gals who have] a form of the autoimmune disease lupus...)... Traditional NSAIDs inhibit the enzymes cox-1 and cox-2. The latter catalyses the production of hormone-like chemicals known as prostaglandins, involved in inflammation, while cox-1 has a variety of roles. New generation NSAIDs such as rofecoxib are designed as far as possible to block only cox-2 to minimise side-effects. But research now indicates that cox-2 may be crucial in helping bone-forming stem cells and growth-triggering chemicals to do their work, said... [t]he magazine... *New Scientist*.

...Researchers have made unspecialised embryo cells transform into bone, an advance that may offer hope of repairing diseased bones and correcting genetic bone disorders. Nearly 90[%] of the mouse embryonic stem cells... [(editor's note: US] researchers... admitted producing human embryos in laboratories and killing them to use their stem cells in research)]... in the experiment placed in a lab dish in a special liquid evolved into crunchy bone nodules, says... a British scientist... "This could lead to the creation of purified bone cells to be used in bone repair without the problems of tissue rejection," says [the scientist], a lecturer at London's Imperial College School of Medicine. "This would dramatically improve the methods of bone grafting and bone prosthesis in patients with severe traumatic bone injuries or suffering with diseases like osteoporosis."

...**OSTEOPOROSIS – the myths and the truth...** THERE ARE A NUMBER OF OBVIOUS SIGNS WHICH SHOW IF YOU'RE AT RISK OF OSTEOPOROSIS... Because bone density testing wasn't available to the public until recently, you may not know whether or not your parents suffered from [osteoporosis]. If they did, it is likely you will too as osteoporosis is partly a genetic condition... You have a higher risk if you are of European or Asian descent... [Gals] who begin menstruating relatively late, age 15 and upwards, are at a higher risk of osteoporosis[, and those] who go through the menopause early (before 45) are also more at risk because the earlier [a gal] stops menstruating, the less oestrogen exposure [it] has in a lifetime... [Gals] who are tall and slender are at additional risk[(slender people] have less bone mass than normal or heavy [people – i]n addition, the longer the bones, the easier they can break[)... Yo-yo dieting and frequent cycles of losing and then regaining six or more kilos puts you at increased risk[(eating disorders –) including both anorexia and bulimia[–] increase the risk... significantly[)... Some medications can have an impact on the risk... [–] for example, steroids, thyroid hormone treatments or medication for seizures... **THE EARLIER YOU CHANGE YOUR LIFESTYLE, THE LESS LIKELY YOU ARE TO DEVELOP OSTEOPOROSIS...** The less active you are, the greater your risk of osteoporosis

and fractures... In order to produce healthy and strong bones, you need to eat five or more servings of fruit and vegetables a day. Vitamin C is crucial for healthy bones... Vitamin K is also important... If you drink more than seven alcoholic drinks a week, the bone-building activity of your cells will be diminished. The toxins from the alcohol will prevent your bones from absorbing the maximum nutrients from your food as your liver will not be functioning at optimum capacity... Drinking more than four cups of coffee a day doubles the risk of hip fracture because it is a diuretic, sucking water from bones and joints... [Gal smokers] have significantly lower bone density because smoking reduces oestrogen levels...

Athletes may be in top shape but the gruelling physical activity and competition to which they subject themselves increases their risk of suffering bone and joint problems. Footballers are 10 times more likely to develop osteoarthritis in their hip than [non-athletes], and long-distance runners are more prone... to fractures and osteoporosis. "We suspect it is just the nature of the sport. It is almost analogous to an industrial injury," said... an orthopaedic surgeon at the Royal Bolton Hospital in Lancashire, northern England[, who was part of the team that] studied the rate of osteoarthritis in 68 football managers who had been former players and 136 [guys] who had never played football. Their research is reported in the *British Journal of Sports Medicine*... In a separate study in the journal, researchers found that instead of increasing bone mineral density in [gal] athletes, long-distance running lowered it. By measuring the bone density of 52 [gals] who ran between five and 70km a week, they discovered a link between lower bone density in the spine and hip and running greater distances. [But they also]found that... athletes who do weightlifting, gymnastics and volleyball... who had more muscle than fat, had a higher bone density...

Osteopathy What is it? This therapy treats the mechanics of the human body – the bones, joints, muscles, ligaments and connective tissue. Osteopaths believe many diseases are caused by problems with the body's structure, so, if they fix the structural problems, the body will be encouraged to heal itself. *What happens when you go?* A first visit usually lasts for an hour. You will be asked about your lifestyle, work, leisure activities and your ailment. You will be examined standing, sitting and lying down, and asked to bend or stretch to see how your body responds in different positions. Your reflexes will be tested with a small, rubber-tipped hammer and you may be asked to have x-rays. The osteopath will use massage-like techniques to help relax tight muscles and tighten loose ones. Joint problems are eased with stretching exercises and gentle, repetitive movements. The osteopath may also use the high-velocity thrust technique, a rapid, painless movement, usually applied to the spine.

...A 12-year-old boy with a severely twisted spine has had his back straightened by breakthrough surgery performed for the first time in N[Z. The 12-year-old] suffered so badly from scoliosis, or curvature of the spine, that [the youngster] found it difficult to keep his balance. Now the Wanganui youngster is keen to get back on his skateboard and play basketball, using the... height [it] has gained from the operation. [Hi]s spine was repaired through small holes in his skin by Starship children's hospital paediatric spinal surgeons... using a new keyhole technique considered largely experimental. The technique means [the boy]'s recovery has been much quicker, his risk of complications reduced and the scars are much smaller. [One of the surgeons] described the technique as an exciting breakthrough but warned that it was not suitable for all children with scoliosis. [The boy] was diagnosed with scoliosis several years ago while in hospital for treatment to help him put on weight. In the past year, his condition worsened rapidly. His twisted spine caused his right shoulder-blade and ribs to protrude significantly. Scoliosis nearly always occurs during the growth spurt just before and during adolescence, although it is occasionally found as a birth defect. A small degree of spinal curvature occurs in 10[%] of the population. Only 0.3 to 0.5[%] of adolescents suffer from a severely curved spine. The straightened spine gave [the 12-year-old] an extra 8cm in height and significantly reduced the prominence of his shoulder and ribs. The operation... involved making three small incisions in his back. Doctors then inserted tubes in the holes which allowed them to pass through a camera on a scope and surgical instruments. The special instruments needed for the surgery cost \$20,000 and were financed by Mercury Energy through the Starship Foundation. Surgeons collapsed [the boy]'s lung to allow them access to the spine from inside the body. Portions of six of [hi]s ribs were removed and cut into small chips. A number of soft discs which allow the spine to sink into an "S" shape were removed and the rib chips inserted in their place to make a solid structure. Surgeons then cut along the length of [hi]s spine from the outside and attached two metal rods to either side to give it permanent support. The spine will take from six to 12 months to settle into its new shape. If doctors had used the more common technique, they would have had to make a large cut running from [hi]s side around under the shoulder blade. [The boy]'s mother... said his condition... was upsetting for him and could have led to his lungs becoming congested. "[My son] used to have real trouble... balanc[ing]. Now my son]... no longer walks like [it] is drunk."

...a horse riding fall consigned [him]... to life in a wheelchair. But [the actor] has... expressed his determination to walk again... Throughout his comfortable, light-filled home... near Boston, a nurse, a publicist, aides and assistants are busy. His actress wife... is not at home. Out back, their son... (5) plays ball with another boy and... the family dog... All around [the actor], people are moving... But... [the actor] is still. Since May 27, 1995, when [it] fell from his horse in a riding competition and damaged the first two vertebrae of his back, [the actor] has been unable to move much of anything below his neck. But the 45-year-old... *Superman* of four films and star of 14 others, believes that, because of stunning scientific advances in spinal cord injury research [made over]the past decade, [it]'ll be able to walk by his 50th birthday. "Maybe a bit sooner,"... In the meantime, [it] has written an autobiography, *Still Me*, which is in bookstores this week. The title is taken from something [his wife] said to him as [the actor] lay broken and terrified in a hospital bed in the days after the accident. "...I mouthed my first lucid words to her: 'Maybe we should let me go.' [My wife]... said: 'I am only going to say this once: I will support whatever you want to do, because this is your life and your decision. But I want you to know that I'll be with you for the long haul, no matter what'. Then [my wife] added the words that saved my life: 'You're still you. And I love you'." The couple, together for 11 years, have become a model of courage under fire and of devotion. They sleep in adjoining single beds, unable to share a bed because of the equipment [the actor] needs and the possibility of his having spasms in the night... "I've told her once I get out of this mess that [it] has a lot of loving attention coming her way,"... [The actor] is relentlessly hopeful, even... seeing some progress: On a good day [it] can breathe without the aid of a ventilator for two hours at a time by using his neck and shoulder muscles. Recently, for about half an hour a day, [the actor] has been able to breathe normally by expanding his diaphragm. That's a "significant development" because it means [the actor] has recovered function in nerve cells below his injury, suggesting some of the nerves have either made new connections or strengthened whatever connection survived. "What I'm doing now with the entire body... is getting everything ready for the reconnection of nerves." Doctors are cautious but will not say it's impossible... FOR thousands of years, a spinal cord injury meant one thing: If the patient survived the accident or the pneumonia that was likely to set in soon after, they were destined to spend the rest of their life in a chair. A spinal cord injury is "not to be treated", Egyptian physicians wrote 2500 years ago, and until the last decade... there was not much to challenge that philosophy. Few young researchers were tempted to spend their lives on what was believed to be a dead-end road. That has changed dramatically, thanks to important discoveries and areas of research that have brought excitement to scientists and others in the tight-knit community of spinal cord injury. "The progress of the last five to seven years has been truly breathtaking," sa[ys the]... director of research at the American Paralysis Association... "A true revolution has occurred in biology," sa[ys the]... director of the neuroscience centre at Rutgers University and one of [the actor]'s consulting physicians... "The recognition that regeneration can occur in the central nervous system is on a par with the recognition that the world is not governed solely by Newtonian physics." But [the neuroscientist] and other scientists say that because of the complexities of the spinal cord, there is still a long way to go... [The actor] is doing his part... speak[ing] frequently at benefits and other large gatherings. This month [it]'ll give commencement addresses at the University of Virginia and Pace University... [The actor, who] has no bladder, bowel or sexual function... exercises every day, using hi-tech equipment that prevents atrophy of his muscles by stimulating them through electrodes attached to his legs, arms and abdomen. Through exercise, "I'm helping myself from sliding backwards into negative emotion... And I'm also preparing my body to meet the scientists halfway when they've accomplished their task." ...[the actor hasn't given up his career – it] directed an HBO special, *In the Gloaming*... last

April, and... hop[es] his next project will be a remake of the classic... film *Rear Window*[, in which it] wants to show “a seriously disabled person in a positive light”... There are... 5000 people with spinal cord injury in N[Z]... 60% of them quadriplegics... 100 new cases are admitted to spinal units annually. [A local r]ehabilitation medicine specialist... said while there was promising work in rats “the unfortunate reality is it doesn’t translate into humans...” ...Methylprednisolone, a steroid[that ha]s been a standard treatment since 1990[–] when a study showed... people given the drug within eight hours of injury had less damage to their cell membranes, which contributes to death of nerve cells... [–] was used here but the benefits were “pretty small”... Researchers are trying to get the connections that remain after an injury to work again[(o)ne reason they often don’t is damage to the myelin sheath, a coating over the nerve fibres that increases the transmission of signals along nerves[by]... testing a drug, 4-aminopyridine, that acts temporarily as a myelin coating, improving muscle response. “More permanent solutions... include drugs that stimulate re-myelination and transplantation of re-myelinating cells.”

...A [guy] whose legs were paralysed in a car accident 10 years ago has taken a few steps after a microchip was implanted to stimulate his muscles... [The surgeon, who is the] coordinator of a European project called Stand Up and Walk, said that his pioneering technique worked only on paraplegics who still had viable muscle tissue... [The 39-year-old patient] underwent surgery in Montpellier... last September to implant a microchip in his abdomen to provide electrical signals to... electrodes attached to the nerves and main muscles used in walking. The technique is so complex that [the patient] needed a second operation on February 14 because of technical problems with the implant... Both patient and doctors would have their work cut out to revive the muscle action in the next six months. Another French[perso]n and two Italians will be the next patients to benefit from the project, which brings together doctors and medical experts from Britain, Denmark, France, Germany, Italy and the Netherlands.

...Japanese technology has allowed two crippled Brit[s]... to walk again. Sensors placed over certain muscle groups in the[patients’] good leg linked to stimulators implanted in their paralysed leg triggered programmed electrical impulses in 11 electrodes in the disabled leg, allowing it to move. The *New Scientist* said it could be five years before the technology became generally available... [In further news from Britain, a] clinical trial involving the transplantation of nerve cells from aborted foetuses into the damaged brains of stroke patients will begin next year... Medical researchers believe that foetal cells have the ability to develop into the fully mature nerve cells of the adult brain, enabling stroke victims to make a remarkable recovery from what has until now been an incurable condition... [A] former researcher at the Institute of Psychiatry in London and chief scientific officer of ReNeuron, the company established to develop the technique, said animal studies had shown that it was possible to recover well from a stroke, or blood clot on the brain, which could cause permanent paralysis... If the pilot trial is successful, a larger trial will follow.

...Transplants using the brain tissue of dead people could become reality after pioneering work has shown it is possible to grow nerve cells extracted from human corpses. Medical researchers have taken living cells from the brains of dead people in an attempt to discover a new source of valuable stem cells, [to complement sources such as aborted foetuses and ‘lyposuction fat’]... Using post-mortem samples from 23 children and adults, the scientists found they could grow at least three types of brain cell in a test tube for possible transplant operations on people with degenerative neurological conditions such as Parkinson’s disease. “I find it remarkable that we all have pockets of cells in our brains that can grow and differentiate throughout our lives and even after death,”... said... [the professor who] led... the... team... [at] Salk Institute in La Jolla, California... The time of death when the cells were extracted varied from two hours to 20 hours. [In related news, an ‘AUSn courier has lost a donated kidney’.]

...AN English bar[tender] who died in a Greek holiday accident had his kidney stolen by hospital authorities. His parents want it back.

...[the paramedic] is trained to save bodies mangled in road crashes. But at each horror accident scene [it] couldn’t stop thinking about a struggle for life closer to home. Her husband... was battling diseased kidneys, waiting for a donor. One accident sticks in her mind. A teenager died. A few hours later [her hubby] got the call [they] had been waiting for – a kidney match had been found. “I’ll never know for sure, but that dead boy might well have been the donor,”... Celebrations were short-lived when [the husband]’s body rejected the transplant. Life continued on home dialysis... Six months later another kidney donor match was found. This time the transplant was a success. [The husband] was able to complete his nursing studies and now works in the coronary unit at Auckland Hospital. Four months ago the couple had their first child... “Every anniversary of the transplant we open a bottle of wine and celebrate another year of life... And we pause to remember that someone is grieving the death of a person they loved.”

...The Mexican teenager who had a second heart-lung transplant after [it] was initially given a set of incompatible organs... d[ied] yesterday.

...a g[orgeous] Hamilton teenager... sleeps with a giant teddy bear to help heal the pain of losing her best friend and soulmate, Jason Uluave, to leukaemia. While the cuddly soft toy, which... has [been] christened Wax after her boyfriend’s nickname, helps to replace the physical absence of her partner, nothing will ever take the place in her heart that Jason held. “I’ll always miss him,” says [the 18-year-old], who was with Jason in his final hours. “But Jase will always be here with me.” ...[NZers] were touched by Jason’s heartfelt plea for a bone marrow transplant. Being part Tongan, [Jason] had exhausted the 4500 Polynesian people on the register without finding a donor when [Jason] appealed to the public for help... “It would only take a bit of your time and it would give me back my life... Please help me. I’d be your friend for life.” Although an extra 600 people were inspired to donate their bone marrow, [Jason’s]... family was unable to find a match... “It’s so hard knowing that there is someone out there who could have helped Jase,” says his mum... “[Jase] didn’t want to die, no way, but at least [Jase i]s not in pain and... not suffering. When [Jase] was first diagnosed two years ago, [Jase] sat on the bed and said, ‘Why me? Why did I have to get sick?’ and it broke my heart because I didn’t have an answer for him.” [Jason’s mum] says the guilt [it] feels over not being able to help her child is immense, but... is working towards healing the pain. “I’m trying to remember the good times.” One of those good times was a birthday party Jason had shortly before his death. “Jase... was turning 20... and... asked... if [it] could get some beers and have his mates around. They had a great time together. Jase even got up for a while... For a moment I forgot how sick [Jase was because Jase] was so happy.” A few weeks later, Jason was... [dea]d... “Even though it’s painful, it happens for a reason and Jason realised that. [Jason] knew that if we couldn’t find him a donor, the effort we made may have been able to help another.”

...Organ donation may be a personal choice, but who is making the decision? N[Z]’s first Organ Donor Awareness Week kicked off on Monday in a bid to publicise the urgent need for more donors and to remind people to discuss their wishes with their families. [A] Glen Eden resident... has someone else’s heart beating in his chest after a virus claimed his own in 1990. [It] waited six months for a suitable heart, and when the transplant finally took place in December 1990... didn’t have much longer to live. Despite his fears, [the resident] had the operation and now... lives a healthy life not much different to the one [it] had before... Not surprisingly [the resident] is himself a donor, but... says it is not something that should be pushed on anyone. “I have a mate who had an organ transplant that saved his life but... says [it wouldn’t] donate his own organs. I can’t understand that but it’s a pretty personal thing. The most important thing we need to get across is that you are not the one making the decision, your family and friends are. You need to discuss it with them so they know your wishes when the time comes.” Waiting for someone else’s organs and knowing that they have to come from a dead body does funny things to you... “You get quite ghoulish, you pray for long weekends because there are lots of road accidents. But of course you never lose an appreciation for that person.” ...not all organ donations have to come from someone who has died. The Auckland District Kidney Society is also holding Kidney Week this week. The non-profit organisation provides low level support for people who have to have a kidney transplant or have to go on dialysis. In some of these cases, a kidney can come from a live donor[– e.g.,] a family member. They have the same tissue as the patient, so it is more likely to be accepted by the body than one from a stranger... ■ [A patient]... who received a liver transplant got a life-threatening nut allergy from the new organ, A[US]n doctors say. The liver came from a 15-year-old boy

who died of an allergic reaction to peanuts... [A]n immunology specialist at Sydney's Royal Prince Alfred Hospital who was involved in the case... knew of only one other report in medical literature of an allergy being passed on in an organ transplant. While such cases may be rare, organ donors should be screened for allergies and transplant patients should be warned to take precautions... Such allergies generally would be noted during the organ procurement process, which involves obtaining information on the donor's health history, said... the United Networks for Organ Sharing. The 60-year-old... patient and his doctors did not know about the boy's condition, which had not been formally diagnosed. The [patient] underwent the transplant at the Sydney hospital... The day after being sent home, [it] ate some cashews. Within 15 minutes [it] developed anaphylaxis – a life-threatening allergic reaction. [It] recovered after hospitalisation and drug treatment... About 11 months after his transplant... tests suggested the allergy was waning, but the [patient] died two years after the operation... [TNX-901, a] new anti-allergy drug tested successfully in the U[S – where the p]eanut allergy... kill[s] 50 to 100 people... a year[–] ...gives hope to more than 20,000 N[Z]ers at risk of a potentially fatal reaction to peanuts[]].

...Surgeons are preparing to carry out the first full-face transplants for seriously disfigured patients. Experts at the Royal Free Hospital in north London claim that new microsurgical techniques make it possible to graft on a new face. The prospect of facial transplantation, in which a patient would undergo at least 10 hours' surgery to receive new skin, bone, lips, a chin, ears and a nose from a donor, may seem more akin to science fiction... The proposals are likely to go out for nationwide consultation next year, once surgeons have proved that it is anatomically feasible. The technique – and the considerable ethical barriers it faces – will be debated for the first time at the British Association of Plastic Surgery conference this week. Surgeons will argue that it could transform the lives of people disfigured by cancer, accidents or burns. If the public can be won over, the new procedure could be only 18 months away... New microsurgical devices, coupled with better anti-rejection drugs, have brought the transplant closer to reality. Eight blood vessels – four arteries and four veins – providing blood to the face would have to be removed from the donor. A separate team of surgeons would remove, or “de-glove”, the face, facial muscles, skin and sub-cutaneous fat from the recipient. Once they had the new face, they would begin to attach the nerves that control movement and feeling in the face. Without successful nerve regeneration, transplantation would be useless... [A] plastic surgeon... said: “It may seem an extraordinary concept, but it comes from a desire to help those who have to live with very serious deformities. If the reasons behind this are explained fully to the public, they may overcome their revulsion.”

...Surgeons have come up with a device that can change the shape of something as personal as a face, and save youngsters from the stigma and embarrassment of abnormalities... It's not that easy to spot at a glance but [the little Auckland] was born with one half of her face smaller than the other. Yesterday, in a first for the country, the three-year-old underwent a delicate new surgical procedure designed to outwit her abnormality and let her body grow new bone to make her face even... In yesterday's operation, [a p]lastic surgeon... implanted inside [the girl]'s face a tiny metal device about the size of an adult's little finger. It was locked on to the cut jaw-bone and will be slowly cranked apart over coming weeks to widen the gap between the bone ends. The device stimulates soft tissue to grow and stretch as the body's own healing mechanism forms new bone to heal the [hu]man-made fracture... Surgeons at Middlemore Hospital... say... all going well, [the toddler] should be right in just eight weeks... [W]ithout surgery the pretty toddler's face would have looked extremely distorted. The technique has in the past been extensively applied to the long bones of the leg and arm. But recently it has been applied in the head and face and ever smaller devices are being developed for use in the skull and jaw for a variety of congenital abnormalities. Without it [the toddler] would have had two options – to wear a similar device but one which protrudes from the outside of her face, or to wait until [it] was a teenager to have her face cut open and reconstructed with the use of bones from other parts of her body... “Standard bone grafting techniques don't give you the results you want, so we're using this to move bones in new directions, if you will. We must have at least a dozen kids on our books who need this kind of surgery,” the plastic surgeon... said... The new surgery should help hundreds of children born each year with facial defects such as cleft palate, which can lead to cruel taunting in the schoolyard and ongoing physical problems.

...British scientists have identified the gene that causes cleft palate. The finding could improve the diagnosis and treatment of the congenital disorder. About one in 600 babies is born with cleft palate, a condition where the two sides of the roof of the mouth do not fuse properly. Researchers at Imperial College, London, found the TBX22 gene on the X chromosome by using information from the Human Gene Project. “By identifying the gene that causes X-linked cleft palate we will understand much more about the cause of the condition,” said... the head of the research team. “In the long term it will also shed more light on other forms of the disorder and lead to effective treatments other than corrective surgery,”... The discovery may also help scientists uncover a link between inherited cases of the disorder and those that occur sporadically.

...No-one in... [a] Kaiapoi... household dares sleep with their bedroom door closed – [the]parents... fear they will wake to find one of their children dead. [Their three children, aged] 18... 16 and... 14, all suffer from Long QT syndrome, a rare condition that short-circuits the heart's electrical system. The slightest rush of adrenaline could kill them – even a late phone call in their... home... can be deadly. As a precaution against an unexpected fright, every phone in the house is switched off during the night, except the one [the parents]... keep muffled under a pillow in case of an emergency. Inherited from their father's side of the family, the rare affliction has already claimed the life of [hi]s niece and twice [dad has saved his youngest daughter], bringing her back from the brink of death with CPR... [The girl] remembers nothing about her first brush with death three years ago... Her mother... was startled from her sleep by a “strange wind-type noise” coming from [the girl's room. Mum] later learned from doctors that the sound was a “death rattle”, the body's final gasps for air... After [her] second brush with death late last year, [it] now lives with a pacemaker/defibrillator in her chest, that regulates her heartbeat and gives her a cardiac jump-start in an emergency. Doctors have warned her against doing anything on her own. At times [the 14-year-old], believed to be the youngest in the Southern Hemisphere with the life-saving device, feels as though her every step is monitored... For years, the condition that causes wild and irregular heartbeats went undiagnosed and mysterious “blackouts” were written off as fainting spells or minor heart attacks. It wasn't until [the girl], the worst affected by the syndrome, almost died after a Halloween celebration that an abnormality was spotted on a routine electrocardiogram... Further tests showed that almost 20 members of [her dad]'s family were affected by the condition. Surprisingly, [the dad's] eldest daughter... 20, and her 14-month-old son... were given a medical clearance. But [the parents say their eldest child], who is deaf, has experienced similar symptoms and they are adamant [the 20-year-old] is also affected... [By the way, two British constables] in Sunderland... nicked a deaf and dumb lad because they thought his sign language was a rude gesture. [The lad], 22, was stopped for munching pizza in the middle of a road after downing birthday drinks. [The lad] made the sign for “I am deaf” – the first two fingers held together – and pointed at an ear. But [the]... not so... PC... constables... thought [it] was giving them the two-fingered salute and arrested him... His brother, [aged] 20, was also arrested as [it] tried to explain their blunder and the pair were locked in cells overnight. The case was eventually thrown out.

...Ear, ear turn down volume TEENS should wear ear muffs to rock concerts or risk going deaf before middle age. The Hearing Association says one in five Kiwi youngsters have hearing damage from exposure to loud music. “Some music at concerts is louder than standing next to a jumbo taking off... That ringing in your ears after a concert is actually damage to hearing cells and it can be irreversible.” New technology boosting the maximum volume of music systems is being blamed for increased numbers of youngsters with hearing problems. “Proper ear muffs should be worn when there is exposure to loud noise, whatever the source... There should be breaks from noise so ears have a chance to recover. It is prolonged exposure that causes the long-term problems.” More than 400,000 Kiwis have hearing loss, with 90,000 needing hearing aids.

...Clinical trials are about to start on a microchip implant that can enable the profoundly deaf to lead virtually normal lives. Researchers at Imperial College, London, have developed an artificial cochlea that mimics the sound-processing functions of the human ear. They say the invention is a world first. In contrast to conventional hearing aids, which simply amplify sound, the microchip converts sound vibrations into

electrical signals which stimulate the auditory nerves, thus triggering the hearing process in the brain. One of the main advantages of the invention is that it is fully implantable, thus eliminating the need for bulky external hardware and allowing the user to hear while participating in... day-to-day activities. Cochlear implants available at present must be worn externally and require frequent battery changes. The Imperial College... device... dramatically reduces the power required and is also more user-friendly. Patients can control the tone insensitivity directly and need to recharge the device only once a year. With further development the device is expected to be significantly cheaper than conventional implants.

...[conventional artificial eyeballs – which are supplied to people who have lost one eye – generally remain stationary in their sockets, but scientists in ‘AUS have developed artificial “orbital implants” that can be connected to the eye muscles’ so they move like the real thing and, hence, are less obvious.]

...Scientists believe the recent discovery of a new family of proteins may lead them to a cure for conditions like gigantism, dwarfism and obesity. The hope rests on the discovery by A[US]n researchers about five years ago of a protein known as SOCS – or suppressors of cytokine signalling. The SOCS act as “negative regulators” that suppress the hormones responsible for cell growth. Since then, research has shown that regulating the activity of SOCS could “turn on” or “turn off” the hormones that influence obesity, gigantism and dwarfism... [– e]xperiments... showed mice grew to abnormal sizes when their SOCS were turned off... [–] as well as strengthening the body’s immune system to disease. The Cooperative Research Centre for Cellular Growth Factors, which was established by the A[US]n Government in 1991, is undertaking the research. [The centre’s d]irector... told a Sydney conference that the discovery of SOCS was a biological springboard for further advances – just as the discovery of histamines 50 years ago paved the way for the development of antihistamines. “These proteins just turn off the cell when it’s overstimulated. If we understood how we can turn off responses, then we can actually think about how we might regulate those processes through drugs,”... In practical terms, the discovery could form the basis of a cure for cancer and infectious diseases like HIV/Aids by increasing immune responses... “With cancer, for instance, bumping up the immune system might be able to protect the cells from the invasiveness of the cancer cells.”

...Industrial action has interrupted treatment of ...a... 16-year-old[’s]... brain tumour for the second year running and [it] fears delays could make his condition worse. And while the Auckland District Health Board girds for a fresh round of radiographers’ strikes... tensions between staff and management are boiling over. Last year, when [the teenager] was considered inoperable, radiotherapy to shrink it was delayed by the therapists’ strike at Auckland Hospital. Now [the hospital’s] neurosurgeon... is prepared to operate, but the surgery has been deferred because of walkouts by radiographers. “It’s pretty frustrating,”... [The teenager]’s tumour was growing slowly. Deterioration of his condition was unlikely because of the delay, “but I don’t know.” Last Thursday, [the teenager] received a letter from Auckland Hospital saying [it] would be admitted yesterday for surgery today. But within hours of the letter’s arrival, the hospital cancelled the appointment. [Hi]s mother... said that after... [they complained to the Health Minister]’s office an official phoned to say the operation could be done in several weeks, but gave no specific date. The hospital is cancelling nearly all non-urgent surgery and many outpatient clinics at Auckland, Starship, Green Lane and National [Gals’] hospitals from today in preparation for the 48-hour strikes starting on Thursday... □ [During]... a month-long doctors’ strike in Israel in 1973... the death rate dropped... by ... 40[%]...

N[Z] is ranked 80th in health system efficiency by the W[HO]... based on a survey of 191 countries measuring how successful [they] are at turning expenditure into positive health outcomes that improve life expectancy. Mediterranean countries dominated the top 10... N[Z] lags behind Britain (24), A[US] (39), the U[S] (72), Nicaragua (74)... and... Brazil (78)... The 10 least-efficient health systems are found in Africa... The... WHO... attributes their rankings to civil unrest and the high rate of HIV and Aids... The information used to estimate healthcare efficiency was taken from 1993 to 1997. The... information did not measure the quality of healthcare – it was more “an efficiency index charting what you get out compared to what you put in”... Oman... was ranked the most “efficient” because... [in] 40 years... it had dramatically reduced child mortality rates from 310 to 81 per 1000 live births... While N[Z] ranked just ahead of... Yemen, [the] Waitemata District Health Board chief executive... believed... we had an efficient system. “I think it’s run quite efficiently but certainly from the outcome measures, we don’t do as well in terms of life expectancy.” ...the high rate of road fatalities, youth suicides, bowel cancer and melanoma, combined with the gap between Maori and non-Maori, meant that our life expectancy was not as high as it could be. “That’s probably what’s dragging us down rather than inefficiency in terms of spending,”... said [the chief executive. However, a NZ] Nurses Organisation spokes[perso]n... said that our health system was “terribly inefficient” when it comes to staffing issues. A lack of workforce planning over the past decade had led to a severe nursing shortage. Patients were either being turned away or receiving less than ideal care, which [the spokesperson] believed was an inefficient use of the healthcare dollar. “The ranking doesn’t surprise me because we see inefficiencies all the time in our health system,”... [The] Health Minister... did not wish to comment yesterday as [it] had not read the report.

...[our correspondent] in London reports on persistent health anxiety – a condition all too real for its sufferers. For some people, feelings of pre-occupation with a disease – or indeed any number of illnesses – don’t pass as they do for most of us. Rather, they grow and start to dominate the way they think about themselves, their body and their future. The persistence of this anxiety about health is what separates the “worried well” from the hypochondriac. [One person], aged 52, is often told that her feeling that [it] has ovarian cancer is “only” her imagination. [The 52-year-old] has had three private investigative operations, countless tests and visited more than 20 doctors in England, France and Spain. Nothing has been found to be medically wrong with her, yet that does not reassure or stop her trying to find “better” medical advice. The fear, anticipation and certainty of having an illness has taken over, costing her time and money and affecting the quality of her life. Her husband... feels that this experience is marrring their life almost as much as a physical illness “because increasingly [my wife] lives like an invalid. I think I have probably gone along with it all too much, but every time [my wife] saw a new doctor I thought [it] might believe what they said.” ...the director for anxiety disorders at the Maudsley Hospital in London... treats cases of “persistent health anxiety” with cognitive-behavioural therapy... [The p]rofessor... does not test his patients for the illness they think they have because the nature of health anxiety means that this almost certainly will not offer reassurance. Instead, they go through a series of behavioural experiments in which they will find out for themselves that they may be interpreting their symptoms of anxiety as a physical illness. “For instance, someone may think there is something wrong with the glands in their neck, that their size is indicative of a serious disease, and repeatedly touch them to check. We would suggest that they may actually be causing the glands to become inflamed and/or enlarged because of this constant touching. Each case is different, though, so the cognitive therapy is, of course, personalised.” ...Hypochondriacs want a certainty that they are 100[%] well. But the truth is that there is no doctor on earth that can ever be completely certain about the health of a patient. For most of us, that slight uncertainty is something we accept as part of life, but for hypochondriacs, it becomes a daily torment – a torment that can finally be relieved only by specialist psychiatric help... [Incidentally,] last May... a... 58[-year-old West Aucklander realised it] had put on weight. A size 22-24, [the westie] couldn’t find anything to wear to a friend’s 40th. [The westie] became depressed and refused to leave the house. But as her stomach ballooned, [the westie] realised it wasn’t a dieting issue, it was something more sinister. “I hid behind my kitchen table wearing baggy jumpers. I never let anybody see how much weight I was putting on. “They didn’t realise because I was losing weight in my face and arms because I wasn’t eating.” Looking back, [the westie says it] lost interest in everything, even ...he[r] grandchildren. “I was sure I was dying of cancer so I had even prepared my will.” Her three adult sons didn’t know how to talk to their mother about medical issues, so her daughters-in-law got a doctor to visit... her... [at] home... By that stage [the westie] was 116kg. Hospital tests revealed it was a cyst which had forced her kidneys up almost to her shoulder blades and distorted her bowel... although [the westie]... was never in any pain... [The westie] made medical history... six weeks ago... when surgeons removed [the] 28kg cyst... from her stomach. The bulbous mound was the... largest even known in N[Z].

...a... 40-year-old Wellingtonian is one of 10 [gals in NZ] diagnosed with a rare lung and kidney disease – so rare that only a handful of doctors know enough about it to recognise the symptoms. Lymphangioleiomyomatosis, known as LAM, affects only [gals] of childbearing age. It produces cysts on the lungs and kidneys which restrict breathing and cause the lungs to collapse. And the disease is a killer. There is no cure or treatment and once diagnosed, sufferers usually die within 10 years. Just over a year ago, [an Aucklander who had]... a family member with the disease... set up the LAM Charity Trust, which raises money for... research... [– although t]he... main focus of the trust is to raise awareness of the disease, especially among the medical profession... “Before we can hope to start finding a treatment or a cure we have to make sure everyone knows the disease is out there... A lot of the time these kids may be misdiagnosed or not diagnosed at all because the GPs don’t know what they are looking at...”

...A... m[um] is numb... after treatment for a disease [it] probably did not have. Suffering... severe headaches, [it]... was taken to Waikato Hospital... with suspected amoebic meningitis. The Matamata m[um] had swum at Opal Hot Springs and a spa pool at Matamata Sports Centre... days before... [D]rs saw what seemed to be classic signs of amoebae in a sample of spinal fluid. “Most patients slip within a matter of days to a week into a coma and then they just die,” [the hospital’s microbiologist] said. “Early treatment is critical.” Doctors immediately injected an antibiotic, amphotericin B, into [the mum]’s spine. But [the microbiologist] could not find *naegleria fowleri* in a sample of spinal fluid [it] tested. The amoeba is associated with most cases of meningoencephalitis. The initial findings were unable to be confirmed, but [the mum] now walks with crutches and was told the numbness was likely to be permanent... [The microbiologist] wished medical science could solve the mystery of [the mum]’s condition.

...A [34-year-old mother of two] who went to hospital for a throat operation requiring an overnight stay awoke two days later to find [it] had been set alight during surgery and suffered horrific burns... “The first breath I took when I woke up was when I felt the tracheotomy. I knew something must have gone wrong.” ...[it] returned... home on Thursday, four weeks after going into Dunedin Hospital for laser surgery on her throat to clear a build-up of scar tissue from earlier operations... The Invercargill [resident] and her family now face financial hardship as her husband has had to stop work to care for their children. ACC is investigating... to establish if hers is a case of medical misadventure... and may eventually give... [he]r compensation, but the inquiry will take months to complete... Otago District Health Board yesterday conceded... the surgery “probably” should have been done differently. Surgeons used a plastic oxygen tube... instead of a metal one[, which]... was too big for the unusually narrow airway... The intense heat of the laser next to the plastic... ignited [i]t... inside her throat, and the oxygen fuelled the fire. In August, a [mum] was set alight during a caesarean operation at Waitakere Hospital, and a month before that a [patient] was burned during an appendix operation at Middlemore Hospital. [The 34-year-old] learned... her larynx, windpipe and vocal cords were burned and blistered and a lump of molten plastic discovered near her lung was removed... [Her] voice is now husky and weak, and [the 34-year-old] struggles to maintain speech for any length of time. “I’m really having to take one day at a time. I’m living on painkillers one day to the next, trying to figure out how to get through the day.” ...In 10 days [the 34-year-old] will go for follow-up surgery, with the same surgeon who did her original operation. “I figure that if it was his mistake, then [the surgeon] can fix it.” ...Medical experts say the risk of fire with lasers is well known. One said incidents were rare, but precautions were always taken.

...Hospitals have been warned about the risks of starting non-urgent surgery after hours after two swabs were left inside a patient because nurses working overtime forgot to make a final count. A... trampoline accident... wound on the... right hip... [of the] 12-year-old girl, became infected... The error led to three more operations, including one where a drain was inadvertently stitched into the... wound and had to be surgically removed. The series of mishaps caused the girl considerable psychological stress... Her father complained to the Health and Disability Commissioner... who found that the nurses, surgeon and public hospital had provided substandard care... [but] has suppressed all parties’ names. [The commissioner] told the *Herald* [it didn’t] want to make scapegoats of the[m]... and aimed to promote a culture of safety, not blame. “This could have happened at any public hospital in N[Z].” In his decision, [the commissioner] said the mistake with the swabs was an accident waiting to happen[that] was within the hospital’s control to prevent. Several factors had set the scene for human error that evening. The surgery began after-hours, at 5.50 pm, with both nurses working overtime. The orthopaedic surgery was not performed in the usual theatre, which was tied up with an emergency, so one nurse had to leave several times to fetch extra equipment. The scrub nurse was also acting as the surgeon’s assistant, and there were two wound sites... further complicat[ing] the procedure. “I consider that it is unsatisfactory to allow complex spinal surgery to take place in the presence of so many complicating factors, as this increases the likelihood of errors or omissions.” In such conditions it was better to postpone surgery. [The commissioner] agreed... the implication of his decision would be far reaching for all hospitals... [It] sent his findings to the 21 district health boards and the Royal Australasian College of Surgeons, the Nursing Council and other health authorities... [The commissioner, who] also criticised the hospital... concerned... for stopping the nurses from apologising to the patient for their mistake... had received favourable feedback to his recommendations from the hospital... and was satisfied with the action taken... [The] Nurses Organisation... said yesterday that pressure was increasing on public hospitals to perform volumes of surgery that overwhelmed their resources. [Its CEO] was unaware of the spinal surgery swabs mistake, but said it was unfair in such cases to blame the staff when the demands placed on the system meant the margin for error was too small.

...Almost two-thirds of N[Z] doctors who took part in an international survey feel hospital staff are discouraged from reporting medical errors. The... International Health Policy Survey of Physicians interviewed 493 N[Z] doctors and specialists, comparing their views with those of colleagues in Canada, A[US], Britain and the U[S]. The... findings are being discussed at a Commonwealth Fund forum in Washington, attended by [NZ’s] Health Minister... and Director-General of Health... 64[%] of general hospital doctors in N[Z] and 46[%] of specialists felt hospital staff were encouraged not to report errors... “I’m also a bit surprised, given the legal protections that are available in N[Z] that are not available in those other countries,”... [said the] Health and Disability Commissioner... These protections included the accident compensation scheme, which prevented doctors being sued by their patients, and the emphasis of the commissioner’s office on resolving disputes. “But the survey highlights that we have got a problem and I’m concerned by the clear perception I have observed... that people may think it is better to keep their mouth shut about errors.” Hospitals needed a culture change as well as a system to deal with mistakes that was balanced by public accountability for serious lapses. The... Association of Salaried Medical Specialists... said the results reflected years of under-resourcing and a lack of reporting systems. “The whole question of reporting medical errors has not been part of the central ethos of hospitals, [which]... have been preoccupied with survival.”

...All medical errors will have to be automatically reported under new guidelines health authorities are drafting. There is no consistent requirement at present to report and investigate medical errors or system failures which increase medical risk. The Health Funding Authority says international trends, impending law changes and public outrage over the Gisborne cervical cancer scandal have prompted it to begin work on a mandatory “sentinel event” reporting system. [The HFA’s] project coordinator... says work began on the mandatory reporting issue only in the past month, about the time the *Herald* was revealing horrific cases of medical misadventure where victims have limited access to compensation... In the Gisborne case a number of agencies knew about... [the pathologist]’s failure to correctly read the cervical smear slides of [a gal] at the centre of the High Court case that first brought the scandal to public attention, but none had an obligation to report the failure to the... Ministry of Health... or the authority. The move... also follows an announcement by [the] US President... last month of a nationwide system for reporting medical errors in America... [NZ’s] project has the support of both the Medical Association and the Medical Council. [The council’s chairperson]... said many mistakes in the health sector occurred “because of deficiencies in the health system as well as poor performance by the practitioners.”

...SYSTEMS failures are to blame for at least 90[%] of errors in the treatment of hospital patients, says Waitakere Hospital’s clinical leader... N[Z]’s health care system “actually promotes errors and the consequences of those errors are sometimes devastating for patients”. His comments

follow [the publication of] a study... that shows 10.7[%] of patients admitted to N[Z] hospitals are harmed by their treatment. [The clinical leader] says hospitals need a “much more sophisticated” understanding of what causes errors and accidents and how to prevent them[, but adds that NZ]... hospitals are lucky to have good doctors and staff who are “very vigilant” and... prevent harm to the[ir patients by detecting]... most of th[e] errors...

The Medical Council is pushing to be told of all cases of medical misadventure discovered through accident investigations. In a deal signed last month, the A[CC] agreed to inform the council of all findings against doctors of medical “error” – the more serious category of misadventure, which can involve negligence. But it has stopped passing on findings of medical “mishap” – defined as rare and severe complications of a treatment properly given. Under the deal... the corporation will alert the council if a doctor is the subject of five mishap findings in five years, or more than one in a year... The number of mishaps would be set higher for those working in areas where medical or surgical complications were more likely, such as obstetrics... But [the]Medical Association chair[person]... said his group objected to any use of ACC mishap findings for disciplinary action or competence reviews... [because c]omplications sometimes occurred in medicine and the doctors in mishap cases were explicitly not at fault.

...A... study... confirm[s] what most of us, especially pharmacists, have known for years: the legibility of doctors’ writing is pretty bad. The s[tudy, that] examined how health workers wrote letters and numbers, gave doctors a definite thumbs-down, even when they were asked to write neatly.

...A new family doctor internet site has over 200 articles written by doctors and specialists specifically for the public. The articles cover a wide range of conditions... This friendly, reliable information is free to view, and can be regularly used to find out more information about health conditions for yourself, family and friends. Visit www.familydoctor.co.nz today.

...the N[Z] Telepaediatric Service, which will allow specialists to treat children from a distance[, is now operational].

...A 68-year-old French [citizen] has had her gall bladder removed by surgeons who were more than 6400km away... in what is claimed to be the first intercontinental surgical operation. The French surgeon and his team... [from] the Research Institute Against Cancers of the Digestive Tract in Strasbourg... travelled to New York to test the effectiveness of a new system of robotics surgery that was linked to a high-speed telephone line. The patient was in Strasbourg... [T]he time delay between the manipulation of the surgeons’ hands and the movements of the robot, as monitored on a screen in the US, had to be constant and reduced to no more than... one-fifth of a second... Although robot surgery over short distances has been performed, this was the first time a doctor had operated on a patient from the other side of the world, across six time zones. The feat was disclosed only yesterday... [T]he operation... took 54 minutes and was a complete success with no risk to the patient... The [professor] who performed the surgery... said: “It will soon be possible for the leading surgeons in their field to conduct, or take part in, an operation anywhere in the world. At present, this kind of robot costs \$US1 million... but in a few years they will be a normal part of the surgical apparatus in all hospitals.”

...It’s a scene created in every hospital drama – and the moment every anaesthetist dreads. When the steady hum of operating machinery suddenly turns to beeps of alarm, the doctor monitoring the patient’s sedation has just seconds to find the problem and fix it. Now help has arrived in the shape of a computer programme created by Auckland University researchers. It can save lives with its ultra-sensitive watch on the patient... [- t]he program can detect minute changes in a patient’s blood pressure and temperature... [-] and speedy diagnosis gleaned from scores of previous operations. Hailed as the anaesthetist’s secret weapon, the program keeps watch on the patient, even over marathon microsurgery operations which push human concentration to the limit... The software is called Sentinel, because of its watchdog ability. It is the brainchild of [an]Auckland Hospital anaesthetist... and [a]mechanical engineering student... who is researching the project for his doctoral thesis... The pair spent... 2 1/2 years developing the program... The pair plan to eventually patent the program and hope it will one day be a standard operating theatre resource.

...Virtual reality can help doctors perform surgery... [by practising] a procedure on a three-dimensional image before performing it on a human body. “It helps to pinpoint which is the best way to go in.” A further benefit of virtual reality will be to provide a painless way to screen for colon cancer... The present test for this type of cancer is highly invasive. The doctor must insert a sigmoidoscope – a long, hollow tube with a camera on the end – into the rectum to get a look inside the colon... To use... the alternate method... doctors take images from normal magnetic resonance or CT scans and put them into a computer programme... “You are looking inside the structures without actually going inside,” said... a Harvard radiologist[, who predicts]... that it will soon be more widely available because these uses of virtual reality do not require complicated computers or software. “The technology isn’t new, but the application is.”

...The... Minister of Health... showed barely a flicker of embarrassment when... confronted with a pair of naked breasts – and invited to give them a quick squeeze. And when... asked to perform a tricky... pelvic examination and investigate a suspect prostate gland, [the minister]... also... had no problem tackling the tasks... [The minister then] examined cases of glue ear and eye disease and learned the correct way to insert a catheter... The minister’s crash course in diagnosis came as [the minister] opened the... centre for medical education at Middlemore Hospital yesterday. The centre houses a new clinical-skills laboratory containing \$25,000 of high-tech dummies. Imported from as far afield as Norway, Britain and the U[S], the dummies provide students with lifelike models on which to practise difficult and sensitive procedures, where they would normally have to rely on volunteers from hospital wards. The centre – the only one of its kind in the country – was developed thanks to a partnership between the South Auckland hospital and the... Auckland School of Medicine... in an effort to improve training for doctors... far earlier in their careers.

...Auckland’s junior doctors should have no worries in performing their first lumbar punctures – they have been practising on pigs’ spines. Short courses at Green Lane Hospital use pig carcasses and mutton legs so doctors in their first year out of medical school can polish their skills... [in] procedures they might not otherwise have the chance to do... The two-day training sessions, run jointly by Auckland Health Care and the Auckland School of Medicine[, also]... teach 24 junior doctors procedures such as chest tube insertions, cleaning wounds... syringing ears and sewing wounds. “Traditionally the way doctors learn how to do these procedures is to watch someone doing it on a patient and then trying it themselves under supervision.” The new training sessions would operate in conjunction with the traditional method, ensuring doctors were taught by experts in each field and boosting their confidence... However, a spokes[person] for Save Animals From Exploitation... was concerned... “They would be better off using dead human bodies. This just sounds like the cheaper option.” ...[By the way, a] spinal operation for people with chronic back pain which restores them to normal movement has been performed for the first time in N[Z]. The surgery involves replacing a damaged or diseased disc with a prosthesis instead of fusing the vertebrae. A[n A]uckland Hospital orthopaedic surgeon... said people who had the spinal fusion operation later suffered from stiffening of the spine, which reduced movement and put stress on other parts of their back. The new technique, known as intervertebral disc replacement... allowed normal movement of the spine and patients generally recovered within six weeks rather than the six- to nine-month recovery period taken after spinal fusion. An American gymnast who had the surgery in A[US] was performing backward flips on a trampoline six weeks later. [The orthopaedic surgeon], who performed the surgery... last week... hoped the operation would eventually be performed on about 200 people a year... [However,] it was not known how long the prosthesis would last. It was possible patients who had the disc replacement would later have the spinal fusion operation... [B]etween 10 and 30[%] of the population suffered from chronic back pain.

Why does society view alternative medical treatments so cynically while mainstream remedies are often adopted before full tests have been run? ...A PARADOX of health care this decade is the rapid rise in the numbers of people who visit non-traditional healers. Even as the numbers climb, the

effectiveness of many alternative treatments remains unproven. Late last year the journal of the A[MA], *JAMA*, published a series of studies on non-medical remedies. The conclusion was that while yoga and acupuncture have become facts of life, researchers need to continue to gauge the effects of other alternative disciplines. The journal found that... more than 40[% of America's] adult population sought out herbalists, chiropractors and other nonconventional practitioners, paying more to these healers (\$US629 million) than to primary-care physicians (\$US386 million). If some of that money was wasted on alternative treatments, some of it appears very well spent. Of the published studies, seven evaluated specific remedies and three found no apparent benefits... Dieters who took an extract from... garcinia cambogia, a popular herbal weight-loss remedy... for 12 weeks lost an average of 3.1kg, while those who got the dummy pill lost 4kg. In another study, researchers found that chiropractic manoeuvres were no better than simple massages for treating tension headaches. And a trial involving 239 HIV-infected patients found that random pin pricks were just as good as acupuncture for easing the pain caused by damaged nerve endings. But... researchers in Italy and China showed that moxibustion – a traditional Chinese practice that uses heat from burning herbs to stimulate acupuncture points – can help to move a foetus into proper position for a head-first delivery... Though the mechanism is unclear... babies [who] were still in the breech position after 33 weeks... became measurably more active, and 75[%] of them (verses 48[%] of the controls) righted themselves in time for a normal delivery. If further studies confirm the finding, says... the editor of *JAMA*, moxibustion could become a part of Western obstetrics, helping to reduce the high rate of Caesarean births... Western medicine has yet to devise a reliable treatment... for... “irritable bowel syndrome,”... but researchers in A[US] report that patients who took cocktails of powdered herbs for 16 weeks enjoyed... roughly a 60[%] improvement in symptoms... [compared to] those who took placebos... Other papers reported that practising yoga for two to three hours a week can ease the symptoms of carpal tunnel syndrome[(‘regular daily yoga exercise can also prolong good eyesight or improve weak eyes by strengthening the eye muscles’)], and that extracts from the saw palmetto plant treat benign prostate swelling as effectively as Merck’s Proscar, with far fewer side-effects. What, then, distinguishes “alternative” from “mainstream” medicine? Alternative practitioners have been known to put belief before evidence – but so have conventional physicians... [F]ewer than half the protocols now used to prevent blood clots in people with cardiovascular disease have been evaluated in controlled clinical trials. Yet no one calls the untested ones unconventional... [N]atural products... called “neutraceuticals”... are increasingly being manufactured by pharmaceutical companies... ONE way of gauging which treatments have become “mainstream” is to look at what is covered by accident compensation. In N[Z], the ACC forks out... [almost 5% of its] about \$200 million... [annual] spend... for acupuncture, osteopathy and chiropractic treatments and has, infrequently, paid for hypnotherapy.

...[‘Among the scientifically demonstrated aspects of hypnosis are that hypnotic suggestion can bring about local or general loss of sensation (anesthesia) and the absence of a sense of pain (analgesia); positive and negative hallucinations; regression to an earlier age; unusual muscular strength, rigidity, and resistance to fatigue; and bodily changes normally outside voluntary control. The anesthetic and analgesic potentialities of hypnosis were demonstrated a century ago in hundreds of apparently painless major operations, some witnessed by scores of physicians. Yet the possibility of the phenomenon’s existence was denied, and medical journals refused to publish papers documenting the work. But the important point here is that scientists once felt very uncomfortable with hypnosis, and now feel quite comfortable – despite the fact that the basic mechanism cannot be “explained” any better now than before.’

...‘Hypnosis in medicine was approved by the AMA in 1958. The basis of hypnosis – the mental state of heightened suggestibility, characterized by trance-like sleep – is the fixation of the subject’s attention upon a gradually narrowing source of stimulation, until the subject is attendant upon only the directions of the hypnotist. This is variously achieved by repetition of instructions in a low, level voice, or having the subject fix his gaze upon a light in an otherwise darkened room. The subject usually remembers nothing of what it did during the hypnotic period. Certain effects may be suggested to continue after the subject returns to consciousness; these are called post-hypnotic suggestions. Hypnotism has found its greatest use as an adjunct to medicine in relieving or diminishing pain as in childbirth and dentistry, especially when use of an anesthetic is dangerous or impractical. Hypnotism was used by Charlot, Janet, and Freud in the study and treatment of hysteria. It proved impractical because not everyone is capable of hypnosis and effects are frequently only temporary. One of the earliest exponents of hypnotism was Frederick Mesmer (c.1733-1815), a German physician. His treatments by hypnotism, known as mesmerism and popularly believed to be based upon electricity and magnetism, attracted a cultish and fashionable clientele in Paris.’

...‘Born near Constance, Franz Anton Mesmer (1734-1815) studied medicine at Vienna, and claimed that there existed a power which could be used to cure diseases. In 1778 Franz went to Paris, where the Austrian physician created a sensation; but in 1785 a learned commission reported unfavourably, and the founder of mesmerism retired into obscurity in Switzerland.’]

...AN OBSCURE South African plant credited with curing almost anything from hangovers to boils is in danger of extinction because of soaring demand from Europe and America... [Another alternative method of treatment experiencing soaring demand] is... Reiki... a universal healing life energy, which can be transferred from person to person using a particular system... The incredible spread of reiki around the world in recent years is partly due to the ease of teaching the system. No books have to be studied, there’s no equipment or products to buy – just the courses which initiate people into the universal life energy... The system[, which] is said to have its roots in ancient Tibet... is... suitable for all ages, including babies, and even pets and plants are said to be healed by it... Reiki in itself cannot claim to cure anything but the effect is said to be like turning on a switch to activate the body’s own healing mechanism. It can be used in conjunction with all pharmaceutical and complementary therapies.

...Henderson’s own Reiki Healing Centre is opening its doors to you with introductory training sessions... every Tuesday night at 7.30pm at just \$20 a time... Includes Booklet and Supper... Three levels of training are available[with a]Reiki and Seichim Master Teacher... [who] has trained in UK, USA and N[Z], so has immense experience to share... A Reiki session gives you a very relaxing experience from which you will emerge refreshed and energised... [C]ombined with massage it gives even deeper benefits... An hour long Reiki massage session is \$40 and a massage combined with Reiki techniques (some deep tissue) is... \$70, a special offer for those wishing to try it... Reiki is effectively an art of energy transmission and is one of the purest forms of healing... But... Reiki healers don’t heal, they channel energy which the receiver can use in a way that best fits their needs.

...Cabbage leaves and chemotherapy will be tools of the trade at Middlemore Hospital when Pacific Island and Maori healers work alongside hospital staff. Under a new agreement... South Auckland Health... doctors and traditional healers will share patient information and treatment methods... 70[%] of Pacific Island people and a large proportion of Maori already use traditional healing such as massage, herbal tonics and spiritual healing... [One healer] was born with deformed fingers that have a special gift. [The Papatoetoe resident] uses massage and prayer to help cure sicknesses as varied as asthma, strokes and child diarrhoea. His... finger nail[less]... massage... helped [a patient] regain movement on the right side of her body, lost after a stroke two years ago. Last week, [it] started the first of three sometimes painful sessions... and can now lift her arm above her head with ease. [The healer] says massaging for a stroke is about coaxing the vein to release the blood clot and make the blood flow to get the body working again... Sometimes more than 80 people a day use [hi]s services, which shows the widespread use of traditional healing in South Auckland.

...Coy ad[s] that dominate the personnel columns have created a wink-and-nod public perception of the ancient art of healing... [by] massage... While genuine massage therapy can play a role in a healthy sex life, the red light “relaxing massage” [wa]s merely a transparent contrivance to satisfy the law. Great strides have been made in the past 15 years in promoting the credibility and benefits of professional therapeutic massage and distancing qualified practitioners from the sex parlour stigma. Regular massage is now widely accepted as having major benefits for people of all ages, including babies. A full body massage can soothe and repair tired or damaged muscle and soft tissue, improve circulation, stimulate the

lymphatic system to rid the body of waste, increase oxygen capacity in the blood, balance the nervous system, and enhance skin condition... Headaches, insomnia, digestive disorders - including constipation and spastic colon – arthritis... carpal tunnel syndrome, [and] sinusitis can respond to massage therapy. Ancient Mediterranean civilisations understood this. They included a top-to-toe massage after bathing and exercise. Practitioners were now following the US neuro muscular therapy technique, [which is taught locally at The NZ] College of Massage in Auckland... [- where] 100 fulltime and part-time students [are trained each] year. A full year diploma study course includes learning about the muscular skeletal system, cell chemistry, and the skin, vascular and blood system... Employment opportunities are expanding for graduates. Therapists are [especially] in demand in... sport, where athletes have regular massages focusing on specific parts of the body... to treat... injuries, aches and pains.

...It feels great and it may have some psychological impact, but British doctors say using massage to ease aching muscles and improve performance has little physical benefit. "Massage enhances the perception of recovery but does not do anything physically," said ...a... professor in the sports studies department at University College, Northampton.

...If you are looking for help with long-term back pain, sell those magnets, because it seems they might not work. But then if you had no idea that magnets could help you and are interested – don't despair, because doctors in the U[S] say more research is needed to see if the popular magnetic cures really work... Worldwide sales of magnets for treatments of pain have been estimated at \$5 billion.

...*The Surprising Power of Magnets* A... Husband and Wife team... are the owners of Magnetic Energy. Together... [they] have thirty years combined experience with magnetic products. Their [b]usiness... has the largest range of magnetic products in A[US]... Magnetic Energy manufactures and sells the magnetic pillow and underlay as well as supplying over sixty other magnetic support products to assist with pain relief... Alex... from Dunedin was a big sceptic of alternative therapy until [it] tried Magnetic Energy's pillow and underlay... "I've suffered with back pain for the last ten years. I would hate going to bed because that's when the pain got worse and in the morning I would get up stiff and sore. Now with my new underlay I sleep like a baby. Even my eleven year old dog has a new lease of life since [it]'s been sleeping on the pet underlay.["] Magnetic Energy currently mail orders A[US] wide and now N[Z]. Our service is prompt so you will not have to wait an unreasonable period of time to start using your magnetic products. If you wish to view the Magnetic Energy range, they will be on display at WestCity Shoppingtown... For anyone who purchases both a magnetic pillow and underlay, [Magnetic Energy is]... giving away... a free comprehensive guide... and... a packet of magnetic body studs normally valued at \$36. These powerful little magnets can be placed anywhere on the body to assist with pain relief.

...Sleep soundly with relief from pain with... BIOMAG The Genuine magnetic underlay more N[Z]ers know and trust... Join 100,000 Kiwis... now... Fitted underlay available in all bed sizes • Priced from \$195.95 including delivery • 60 day money back product guarantee... • Also available in a luxurious Biomag Woolrest combo... Note: Individual results will vary. If you are pregnant or have a pacemaker check with your doctor first.

...[Gals] suffer from pain more than [guys] do, scientists claim. And they say that research into the reasons why will lead to more effective pain relief... [S]cientists had suggested [gals] had more contact with healthcare services through their role as primary child carers, giving them more opportunity to report pain. But... researchers at the... University of N[SW]'s... school of physiology and pharmacology have... discovered differences in the way [guys and gals] respond to the pain-relieving drug ibuprofen – a non-steroid anti-inflammatory... [- and] hormones probably play a role... A [gal]'s response seemed to depend on the stage of her hormonal cycle... It was possible some people had a genetic predisposition towards sensitivity to pain, in which case doctors could DNA-test patients before treatment to enable them to more appropriately administer pain relief.

...[a baby]'s parents have invested in a new type of bank account... [- preserving her] umbilical cord blood in Cord-bank... Umbilical cord blood is unusually rich in stem cells that are an exact DNA match for the baby... The blood can be used to treat [the]... 14 week... old, if [it] ever develops one of ...[ve]r... 45 life-threatening illnesses... People involved in the scheme pay to have their babies' umbilical cords stored... for at least 30 years.

...Ever tried to wrap a plaster around a small toe? ...Our new liquid bandage... BAND-AID* Brand Liquid Bandage... goes places plasters can't.

...IT'S hard to imagine any common health problem being taboo in an age where subjects such as impotence, depression and obesity barely raise an eyebrow. But a new study indicates thousands of [NZ gals] – particularly Maori and Pacific Islanders – would rather wet their pants than own up to urinary incontinence. One in three [NZ gals] will experience urinary leakage at some point with the rate among Maori estimated at 48%. Yet the study shows a combination of intense embarrassment among sufferers and ignorance among [GP]s has created an obstacle to effective treatment... "[L]eaking of urine that is socially or hygienically unacceptable"... is usually caused by childbirth, ageing, obesity or long-term straining problems like constipation. Improvement, at least, is often possible through pelvic floor exercises and lifestyle changes... [-] such as, oddly enough, drinking more water... [(a) common mistake by incontinent [gals] is to cut fluid intake, which worsens the problem because the urine becomes more concentrated and irritates the bladder) – although some sufferers]... require medication or surgery... [A]ttempts to recruit [subjects] for the study soon revealed the level of sensitivity. Eventually, 17 pakeha, eight Maori and nine Pacific Island[ers] of varying ages agreed to be interviewed, revealing everything from simple embarrassment to intense shame about their leaky bladders. Some had become virtually housebound for fear of having an accident, while others had become "spectators rather than participants" in life, shunning sport or activities with their [kids] for fear of a leakage. "Their bladder somehow ruled their lives. They felt governed by needing to be close to a toilet and having to always carry pads and spare underwear." Many of those who talked to their GP received little relief. They were told it was a part of life, or the ageing process or a symptom of stress. One... was told to take paracetamol; another was prescribed anti-depressants. A 53-year-old Maori... told the researchers: "[The doctor] said 'I can't see anything wrong.['] I told him it was leaking all over the place; I was wearing three or four pads at the time to hold it." Worse was to come when [the Maori] was referred to a hospital. "They took me into this room and told me to change into this gown and stuck me on this wheel. They turned me upside down and up again and didn't explain what they were doing and I thought: 'What the hell are they doing to me?'" Hardly surprising, many of the [subjects] didn't attend follow-up appointments... [The s]tudy leader... and her team also interviewed a range of health professionals and were dismayed to find many GPs lacked the knowledge and the sensitivity to deal adequately with incontinence. In one striking example, every [guy] Tongan health professional interviewed asserted: "Tongan[']s do not get incontinence"... Confident, intelligent and good humoured, [a 34-year-old] South Auckland nurse... kept her incontinence secret for most of her life, from all but those closest to her. "The worst thing as an adult was wetting at night... It's bad to wet in the day, but I could cope. Night time was worst." ...It was a contributing factor in [her] marriage break-up. "The guy I married didn't... understand... [O]nce we were driving and I said 'I really need to go to the toilet' and [the guy] said: 'I'm not bloody stopping'... I wet my pants." Eventually... [the guy said it] wasn't going to live with someone who wet the bed. "...There were other dynamics as well but it didn't help being incontinent." ...[the nurse has now] been "dry" for five years, the result of surgery to enlarge her bladder... [The nurse] was born with a small and unstable bladder... The urologist who performed the surgery was the first specialist to thoroughly test her bladder (through a process called urodynamics) and try her on drug therapies before offering surgery. [The nurse], who now works in urodynamics, stresses surgery is a last resort... with the one setback that [it] must catheterise (use a tube to completely empty her bladder) once or twice a day – to her, a minor inconvenience.

...When [a nurse] left her simple social housing home and moved into a £3 million castle... [- after] turning... her bus driver father's £25,000 redundancy... payment into a £1 billion international empire[– the]... boss of... bus company Stagecoach... had it all. But two years ago her life was devastated when her 28-year-old son... hanged himself in a forest near her home. Bewildered and distraught, [the nurse] disappeared from public life and quit the company [it founded]... with her brother... [Now the nurse] is swapping her Scottish Highland estate for a hospital in one of the

world's poorest countries where [it] will treat Aids and cancer patients. [The nurse], aged 58, has arrived in Benin to start working for Mercy Ships, a charity that provides ship-based hospitals offering free medical and dental care to some of the world's poorest people. [The nurse] decided to take the unpaid job on the 12,000-tonne SS Anastasis, moored off Cotonou, after a visit to West Africa last year. Friends say [the nurse] wants to start a new chapter after 20 gruelling years that made her Britain's second-richest [gal] – only the Queen is richer – but which have cost her her marriage and, some say, the life of her son. “[The nurse] is still deeply traumatised by Jonathon's death, but getting back to work is her way of getting on with life,” one friend says. “It is her way, perhaps, of acknowledging what has happened and of starting again and showing that some benefit can come out of it all.” As [the Queen's economic rival] prepared to treat her first patient since... quit[ting] her job as a theatre nurse in Bridge of Earn Hospital, near Perth, Scotland, 20 years ago, [it] said: “I've been fortunate in many ways. I enjoyed my years as a nurse. I enjoyed my years in business. Maybe if I can do something for these charities for a few years, it wouldn't be a bad idea.” [The nurse] has donated £4 million of her fortune to buy a new hospital ship, the African Mercy, moored at Newcastle upon Tyne[. and] wants to raise £15 million to refit and equip the ship.

...COMING to a town near you – a mobile hospital. Inspired by the military model of mobile field hospital units, surgeons are planning to set up [NZ]'s first mobile operating theatre. It would cost \$4 million to construct and could handle six to eight patients a day. Annual operating costs would be around \$3 million. The idea is to have an operating room and facilities based in a state of the art vehicle which could service many small towns... Centres with a hospital would also be able to take advantage of the vehicle's on-board satellite technology to beam in advice and support from elsewhere. The proposal is already getting the thumbs up from Balclutha[. whose] local hospital closed last December...

Health workers battling South Auckland's child health crisis went to the children at the weekend... The [local] population is mobile, and highly elusive, and many parents do not realise what free health care their children are entitled to. So in a bid to stem an ever-increasing tide of child illness and hospital admissions, the South Auckland Health Foundation set up a clinic outside the Otara McDonald's... The carpark clinic, enlivened by Pacific music, captured the attention of Saturday morning flea market shoppers... [H]undreds of children and their parents queued for health checks... McDonald's is supporting the venture and is giving cheeseburger vouchers to children who have... [t]he one-stop shop check... [on] teeth, hearing, vision, nutrition and immunisation status... The same clinic will take place again next Saturday, and will be shifted to other McDonald's restaurants around South Auckland... [– which] is home to 10[% of NZ's under 14s –] ...in coming months... [Incidentally,] Waitakere City residents who have trouble getting to health appointments now have a new transport service to their aide. Today the pilot of a Health Shuttle Service is being launched... [P]eople who have little transport or who cannot catch buses will be able to use the shuttle. “We really found there was a gap in the market. People need to get to their appointments, and they should not be disadvantaged because of their mobility or income level... We chose West Auckland because it's a region where there are a number of districts where people don't have transport,” says... [the] director of health services at The Order of St John... The shuttle service will run from Monday to Friday, 8.30am to 5pm. Bookings will need to be made 24 hours in advance, by calling (0800) 000-606... The shuttle seats eight people seated, and five people seated with two wheelchairs... The service is subsidised by the Order of St John, but still requires a donation of five to \$10 depending on the amount of kilometres the commuter travels.

...British authorities are investigating how a teenage girl fell from the back of an ambulance on to a motorway, suffering fatal injuries. The... girl's condition was not believed to be life-threatening before [it] fell from the ambulance... [I]n local news, i[f] you're sick but can't get to the doctor, help is only a phone call away. The St John health shuttle... trial... has been up and running for around three weeks and... it's already proving a hit. “People think it's great, a really good service and I think it'll catch on fairly fast when word gets around,” says... [the] driver... The shuttle... leave[s] its New Lynn base before travelling via Green Bay, Titirangi, Glen Eden, Kelston, Glendene, Ranui and Henderson to Waitakere Hospital. It... then travel[s] to Massey, West Harbour, Te Atatu South and North before returning to the hospital. The service is provided on a donation basis with recommended donations of \$5 for a trip up to 10km, \$7.50 for a journey of 10km to 20km and \$10 for passengers travelling more than 20km.

...[a West Aucklander is] accused of trading on his... late... father's name and costing taxpayers thousands of dollars to sit on a health board half the country away... The 35-year-old... son of... a prominent Wellington physician and political activist... is accused of duping the Wellington public who voted him onto the Capital and Coast District Health Board by not disclosing [i]t... lives in Auckland[. where it] is attending medical school... National['s]... associate health spokesperson... this week... [said the son] is draining an already stressed health budget. “The District Health Boards are looking at deficits for this year from anything between \$180m to \$230m... so what we don't need is having to pay for somebody's very expensive airfares to and fro. [The west]e has incurred more costs than all of the other board members put together in actually attending the meetings.” [The son, who] was brought up in Wellington, attending Wellington High School, and... has spent the last 10 years as a health science journalist in Western Europe and fundraiser for primary health services in Africa... was elected to the... board [last year. It is] also serving on the Community and Public Advisory committee and Disability Support Advisory committee, which held meetings last week. [The son didn't] return... phone calls to his home last week, and calls to the Capital and Coast District Health Board reveal [it] is overseas on business. But a board source confirmed [the son] attended all meetings. [The son] is quoted in a recent report as saying... “a few thousand extra travel expenses” is worth it to have him on the board. The same report says [the son] has already cost... \$25,000 in expenses. “What's so special about him...? ...We live in an egalitarian society[.]” says the MP – who... was herself accused of “carpet-bagging” by rivals... when standing for the Clevedon electorate but living in Remuera.

...Hospitals get treatment A \$660 million revamp of Auckland's hospitals – including the demolition of National [Gals'] and possible sale of land at Green Lane – is in full swing. The Auckland District Health Board will spend \$423 million on a new 710-bed hospital next to Auckland Hospital in Grafton, extensions to the Starship and a new day-surgery building at Green Lane. The Waitemata board is [looking at] spending \$120 million on North Shore and Waitakere hospital redevelopments. And South Auckland has already completed some of its \$120 million redevelopment projects... [T]he improvements are wide-ranging. For example, all patients' rooms in the new hospital at Grafton will have ensuite bathrooms and toilets, and most mothers will have single rooms... [Tomorrow, a Herald] health reporter... writes... the first of two articles examining the changes.

...[our reporter consults a] Dr... about his prognosis for N[Z]'s newest medical advice show... [A] Christchurch GP... hopes *Body Wise* is a prescription for success... [The GP] usually sees his patients on a one-to-one basis but, as presenter of TV2's *Body Wise*, [it]'s offering advice to the nation. A newcomer to television, [the GP]'s rapt about the latest avenue for health education. “...my job... is... to sift through lots of information and come up with a considered opinion and... people... can take it or leave it.” ...the medical information on the internet, together with a mass of advertised products, can be a hurdle for anyone. “The idea with TV is that we can present things in an attractive, interesting and entertaining way so that it's easy for people to learn... The same information could be presented in a completely different way and people wouldn't be interested and wouldn't take it on board.” The series joins with the Consumers' Institute to test... the effectiveness of... products... *Body Wise* also follows patients' experiences as they go through procedures including breast augmentation, vasectomy, laser hair removal and varicose veins treatment. “The show is very well-researched which was a necessary pre-condition for me to be involved,” says... [NZ's very own d]octor in the house...

A MEDICAL centre may join the 29 state houses to be built on the site of Glen Eden's only supermarket. But that has failed to appease 500 residents who attended an emotional meeting on Sunday to express their concerns to representatives from local and central government. They are angry at the loss of 3 Guys supermarket, the lack of consultation over plans for the site, and worried the high density housing will turn into a ghetto. A number ceremonially “turned in” their Foodtown cards at the meeting to wild applause, in protest at Progressive Enterprises' sale of the

supermarket. Progressive, which owns the... Foodtown [supermarket in the neighbouring suburb of Kelston], sold the site to developer Morningstar Enterprises last month for \$2.25 million. The sale covenant prohibits another supermarket on the site for 20 years. [A]Dr... from Westview Medical Centre Limited announced the medical centre proposal at the meeting and... hopes it will be open by July next year if consent is granted. "I think it is going to offer a wide range of facilities that few centres in Auckland presently have,"... All of Glen Eden's GPs would move to the centre, which would include two pharmacies, a physiotherapy unit, an X-ray unit and outpatient services.

...West Auckland's only 24-hour medical clinic turned away at least two patients last Tuesday... when the doctor on duty didn't turn up for work. A Glen Eden... [resident] went to Westcare Accident and 24-hour Medical Centre in Henderson at around 2.30am to get help for her 19-year-old son, but was told to go elsewhere... "I wanted to talk to the nurse, to at least tell her to ring other hospitals so they knew the centre was not open tonight because they were still referring people to Westcare,"... [A]nother family turned up with a sick four-year-old but had to go to the Starship Hospital in Auckland City... "The child was wheezing badly but the nurse didn't even come out. The security guard turned them away." ...[a local] MP... says these incidents show how inadequate the emergency health services in west Auckland are. "This is a disgrace on the part of Westcare... A fully up-graded Waitakere Hospital would provide those reliable emergency health services as a matter of course,"... The closest 24-hour emergency services, apart from the... Westcare Centre, are North Shore and Auckland Hospitals. Westcare management could not be reached for comment.

...A shortage of doctors and money are stacking the dice against west Auckland's only 24-hour medical centre. Two weeks ago... patients were turned away... when the doctor did not turn up for work... [The chairperson] of Westcare's board of directors, says the doctor concerned was sick and they couldn't find another to replace him on the graveyard shift. "We only have a small pool of doctors to do this shift and, when one is sick, the whole process grinds to a halt. If we have time, we usually try to notify ambulances and hospitals that we are closed, but sometimes the message doesn't get through... There is a distinct possibility that the service will have to be closed as we cannot afford to keep it up and running. It doesn't help that 15[%] of overnight patients don't pay their bills..."... Westcare's 24-hour service was also threatened late last year when the H[FA] considered scraping its \$50,000 top-up... At the moment [its] 24-hour service is losing up to \$60,000 per year... As [the chairperson] points out, up until recently, even North Shore Hospital has not been able to fund... such a service. Now that North Shore is up and running, Westcare's board will meet... to discuss closing [its] service altogether. "Several other 24 hour services have closed lately. The need is there, but it is unfair to expect GPs to take on the financial burden,"... [W]est Auckland needs its own facility because the time it takes to get to North Shore or into the city could make all the difference in an emergency. Waitemata Health has been promising a new facility for some time but it won't say when. Meanwhile... Titirangi's [MP]... says, "Only the public health system can reliably provide the comprehensive range of secondary and acute services of which the emergency health services are an integral part." [The MP adds] that relying on privately-run clinics with precarious positions in the market is not good enough.

...THE merger of west Auckland's two biggest private medical centres will do nothing to prevent the closure of the area's only overnight accident and medical clinic. Westcare Specialist Centre is to officially announce its 50-50 joint venture with White Cross Accident and Medical Centre in two weeks. The two centres in Lincoln Rd will combine their management and operate virtually as they are until new premises are built in four to six months. The merged centre will lease premises built either on land owned by Waitakere Hospital or on a site [further]along Lincoln Rd... The joint venture... [between Westcare's] co-operative made up of 92 GPs... [and White Cross'] more than 20 GPs... is for business reasons... [The merged centre will have] to renegotiate a new contract with the Government...

Deadline day for the fate of the proposed \$60 million revamp of Waitakere Hospital is [three weeks away – when the] Health Minister... gets briefed by Treasury's Crown Company Monitoring and Advisory Unit... Waitemata Health wants [the minister] to approve a \$120.8m upgrade for Waitakere and North Shore hospitals. The Lincoln Rd site in Waitakere City would become a full general hospital, with an [A&E] department and surgical wards. Two other proposals – just upgrading North Shore hospital or creating a new hospital in Albany – are not favoured by Waitemata Health... Labour's [MP] for Titirangi... believes the [minister's] briefing will show that upgrading Waitakere Hospital will cost more each year in running costs compared with the other options... "But I have got an assurance from [the minister that it']ll consider the needs of west Aucklanders... The need to have a primary care service in west Auckland is more important than extra dollars in running costs." ...[the minister] will be looking not only at which... option should be chosen but also where the money is coming from. Waitemata Health proposes to borrow against its own assets, a move opposed by the Alliance which believes it should be state funded... [The minister]'s office did not respond to a request for comment.

...In answer to [a National MP's comments made last month in]West Views... I... have lived in west Auckland for 40 years[, and like]... any long time resident of west Auckland... am... aware National took the money for Waitakere Hospital to upgrade North Shore Hospital to buy back East Coast Bays from Social Credit. National told west Auckland: "Your hospital is now North Shore Hospital", assuming everyone had access to private transport. National played with the idea west Auckland needed a full hospital only when an election was getting closer.

...Re [a National MP]'s letter (West Views, May 16). One would think the hospital was a recent issue. Back in 1978, Robert Muldoon called a public meeting in Henderson and explained a change of plan. As the North Shore was expanding because of the building of the harbour bridge, a hospital was needed over there. So, with apologies, our already planned hospital would be transferred to North Shore. But immediately the North Shore Hospital was completed, the Waitakere Hospital would be built [–] estimated start time no later than 1982. It was put off, I expect, because Muldoon [– a North Shore resident –]had a heart condition. Somehow the hospital issue was put on the back burner and when the Labour Party became Government in 1984, suddenly it did not come to fruition. So... it has been a sore point for... years. [The National MP] did say in Parliament a few years ago that the Waitakere Hospital was not needed. Apparently [the MP] has a short memory but I have a memory like an elephant.

...Diagnosing infections c[an] be complicated because germs could be found on all body parts' surfaces. Most were "good" bacteria, the body's first line of immune defence against "nasty" bacteria. Scientists trying to determine why someone had died had to sift through the germs to work out "what's there and allowed to be there, and what's there and not allowed to be". That was made harder by the germs that could live in many people's bodies without creating any problems but suddenly made some people ill. Every person has more germs in their gut than cells in their body, which is why[an] Institute of Environment and Science Research microbiologist and infectious disease expert... says scientists cannot pinpoint the cause of some deaths. Medical researchers are still trying to explain what caused three people to die with unexplained lung haemorrhages in Dunedin last month. [The microbiologist] said scientists had excellent tests for common and deadly causes of death, including heart attacks, pneumonia, meningococcal disease and diabetes, but not for rare diseases or benign conditions that cured themselves, such as colds.

...The Ministry of Health is monitoring a rare worldwide alert from the World Health Organisation about a deadly new form of pneumonia that has spread from Asia... [A ministry spokesperson]n... told the *Herald* last night that... the... symptoms include a high fever, coughing and shortness of breath... [The spokesperson], a virologist for the Canterbury District Health Board, said the... WHO issued a general emergency travel advisory on Saturday. "I suspect what we will see as more information becomes available will be the Ministry of Health giving specific advice to N[Z]ers as to what to look out for and who to contact. In the meantime, if people are concerned at all, if they develop respiratory symptoms [after]returning from overseas, they should talk to their general practitioner or their local medical officer of health." ...N[Z] has not had any cases of severe acute respiratory syndrome, a virulent strain of what is known as atypical pneumonia... [T]here was a national surveillance network for influenza. The ministry also had a public health emergency plan for influenza, with a national planning committee. An Air N[Z] spokesperson said the airline was keeping an eye on the mystery disease to see what developed. "The air quality on the planes is rigorously monitored, and our systems catch 99.9[%]

of bacteria and infections...” A [NZ spokesperson] for Cathay Pacific, which flies 10 direct flights from Auckland to Hong Kong each week, said the airline had received no instructions from Hong Kong about the situation. On Friday, the Singapore Health Ministry advised people to avoid travelling to Hong Kong, Hanoi and Guangdong “unless absolutely necessary”. Hong Kong’s Health Secretary... responded by angrily denying there was an outbreak of atypical pneumonia in the territory. Several travel industry operators in Hong Kong have expressed fears that tourism could be dented by news of the pneumonia cases. More than 100 people have been hit by the illness in Asia... nine deaths have been linked to the highly contagious virus. The latest victim was a young Vietnamese nurse who died at the weekend. [The nurse] contracted the disease after treating an American business[person] who died of it last week. A Canadian... and her son died last week after being infected while visiting Hong Kong. Another five deaths in southern China have also been linked. [A spokesperson for the]WHO... said: “People are not responding to antibiotics and antivirals. It’s a highly contagious disease and it’s moving by jet. It’s bad.”

...researchers say they have designed the first diagnostic test for a killer pneumonia that has spread across the world, coming a step closer to finding a cure for the mystery illness. Some 350 people in 13 countries have been infected by the pneumonia... Fifteen people have died worldwide, including seven in Hong Kong. Almost all confirmed infections are... believed to be linked to one doctor from China’s southern Guangdong province, who treated patients in China before dying from the disease. “I think what we have here is a new virus,” said... [the] virology chief at the University of Hong Kong. Scientists in Hong Kong, Taiwan, Germany and Canada had earlier identified viruses taken from patients as paramyxoviruses, a large family of microbes that includes the germs that cause measles, mumps and respiratory infections. There is no vaccine or specific cure for this strain of pneumonia. But Hong Kong doctors have been treating patients with ribavirin – an anti-virus drug – and steroids. [The virology chief] said experience showed 70[%] of patients would improve if treated in time. His research team isolated a virus from the lung of a patient and successfully grew or “cultured” it for study. They then designed the diagnostic test, which would tell within five to 14 days if a patient was infected with the disease... [E]arly diagnosis enabled early treatment and therefore a greater chance of recovery... Hong Kong officials have emphasised that the spread of the disease is slow. Most of the sick are health care workers and relatives with close contacts with the patients. The... W[HO – which ‘has no power or authority’ –] has issued its first global alert in a decade over the deadly illness, called [SARS].

...The Government is considering letting pharmacies play a greater role in the health system, as pharmacists call for more responsibility in tending the sick... The Pharmacy Guild says the swine flu scare has highlighted the role pharmacists play as health advisers – a role it says is not recognised by the district health board system... The number of patients seeking help from hospitals and GPs has spiked as swine flu compounds the usual winter peak of illness in the community... In N[Z], the number of confirmed cases since the virus arrived in April rose yesterday to 711, many of whom have recovered... The World Health Organisation’s latest update... reports 70,893 confirmed cases worldwide, including 311 deaths.

If there literally was a *World Health Organisation*, or World Health Ministry (linking all healthcare workers, facilities and other resources – including pharmaceutical production and pharmacists or chemists), it should be easier to diagnose, treat and control diseases, viruses, etc. – and make the provision of health care less complicated for both patients and health workers. Like housing, healthcare is something that can immediately be made free for all citizens who use the ministry’s practitioners. The Health Ministry ought to be open-minded about employing practitioners of traditional or unorthodox treatments (assuming they have a proven record or have undertaken an acceptable course of training) – especially when an orthodox treatment seems to be having little effect on a patient, or is causing problematic side-effects. Completely removing the profit motive from healthcare would mean that GPs will no longer be pressured by pharmaceutical manufacturers to prescribe their products when other products might work better for a particular patient (the provision of healthcare could be more efficient if, in instances when more than one drug or treatment is available for a single complaint, the likelihood that a drug or treatment will work best on a patient with a particular genetic makeup can be identified), and also means hospitals won’t have to shut wards because they’re low on money!

Providing free healthcare would increase the number of minor medical inquiries handled by GPs and hospital receptions, but incorporating traditional and unorthodox practitioners with mainstream practitioners will help to spread the load – and, if there isn’t enough work for a non-mainstream practitioner to be employed full-time at its own speciality, it can make up hours by performing related tasks (e.g., hospital reception or office work, cleaning, acting as ambulance drivers, orderlies or nurse-aides). If a district initially has a shortage of doctors but an abundance of nurses, some nurses might be capable of up-skilling to perform specific tasks (note that NZ already operates a health phonenumber which enables the public to receive free advice from nurses around the clock). If a district initially has a shortage of nurses, suitable unemployed people – or people already familiar with aspects of the health industry, such as nurse-aides and orderlies – could be trained to perform basic nursing tasks, thereby decreasing the workload of qualified nurses (such trainees who prove to be especially competent, may eventually complete proper nursing training – perhaps on a part-time basis). Trainee doctors could also start by learning a specific task so that they are able to perform some work while gradually increasing their range of skills (and range of responsibilities). Furthermore, GPs and prescription chemists could combine premises so that patients who have minor complaints (e.g., colds) can speak to the chemist first – as advocated by the British Government and advertisements on NZ television – being referred to the GP only if the chemist is unsure of its diagnosis, or if the diagnosis requires prescription medication. As far as more serious treatments are concerned (e.g., operations, long term hospitalisation, use of specialised personnel, equipment or rare medications), while demand for healthcare continues to outstrip the ability of a district to provide it, young people – especially children – should be given preference over older people, and avoidable illnesses (e.g., those related to lifestyle choices) ought to receive less consideration than illnesses which weren’t self-induced! Receiving less consideration could simply mean being placed on a waiting list instead of getting immediate attention. Although conditions such as drug addictions, alcoholism, obesity, etc., are generally classified as being self-induced, trying to immediately increase the provision of treatments that help people get over them may be more advantageous than delaying such treatments (note that a NZ MP has introduced a ‘bill on what GPs can treat’). By the way, greater community control over the work performed by the citizens of each district, and the productive use of land, will make it more difficult for people to produce large quantities of cocaine, opium, etc., while a fairer and less stressful society would simultaneously decrease the demand for narcotic drugs (as would placing everyone on the same income which is based on a figure that is meant to cover essential living expenses and not much more – i.e., it will be harder for people to afford to buy narcotic drugs, even if their price falls dramatically).

Removing unnecessary activity from the healthcare industry would also help the initial supply-and-demand situation. ‘Doctors say 1-in-5 appendectomies performed in the US (and NZ) aren’t necessary.’ The performing of plastic surgery for purely cosmetic purposes (i.e., purposes other than to repair burns, wounds or other forms of skin damage; and, if practical, unsightly deformities) should be stopped completely. If some adults believe they are unable to be happy because they can’t find a partner due to the ugliness of their non-deformed faces, that might be considered a valid reason for allowing them to receive cosmetic surgery – but maybe all they really need is to improve their personality (and, if their surgery leads to love, their offspring are likely to wonder why they aren’t physically beautiful also – unless cosmetic surgery enables the recipient to find a partner who has a naturally beautiful face, in which case their offspring are likely to be average-looking). The Health Ministry should, however, only look at performing their surgery when it is able to treat every genuine illness without delay. The same can be said of procedures such as, for example, pinning back genetically protruding ears (‘normally carried out when the patient is 4 1/2’), and operating on the eyes of people who already have adequate glasses or contact lenses. There is definitely no reason why anyone should get breast enlargements, but reductions are justifiable (though oversized breasts normally aren’t life-threatening, so maintaining this procedure doesn’t need to be an immediate concern). Treatments for conditions such as baldness also aren’t justifiable. Likewise, IVF treatments shouldn’t be performed while the world contains millions of orphans or unloved children and, especially, while overpopulation remains a concern. When humanity’s worldwide population has been stabilised – preferably at a figure closer to its present level than 9 billion or more – and a limited supply of

orphans and foster children has developed, the Health Ministry can start to reconsider the personal needs of semi-barren couples (i.e., couples that would have had to accept being barren before the advent of IVF and similar technology); and it could also start to assist couples who want to guarantee that their second child is not the same sex as their first.

In order to assist population stabilisation, the Health Ministry should insist that two children be the maximum allowed per couple in future. While some HBs are likely to be unhappy about being told how many children they are allowed to have, the ministry would be perfectly justified to point out to them that they are being selfish (which is the same reason the ministry can give to people who complain about being denied immediate treatment for illnesses caused by lifestyle choices, or because they are near to dying anyway)! While humanity's worldwide population continues to increase, the ministry ought to enforce the sterilisation of partners of mums with two children, or who have produced triplets, etc. When the worldwide population has stabilised, the ministry could relax its rules (perhaps enforcing sterilisation only after a third pregnancy) – because some couples might only produce one child and others might not produce any.

Only HBs have unwanted or unexpected pregnancies (so-called *unplanned* – or *accidental* – pregnancies). However, the invention of the *morning-after pill* means even an HB has no excuse for creating an unwanted foetus, and the removal of financial strife will eliminate that motive for termination. Nevertheless, if someone wants an abortion, the request shouldn't be denied. Abortion is an issue that pits the rights of the mother against those of her unborn child – but while a child remains inside its mother's body, her rights take precedence. If a child is unloved after it has been born, it can be fostered – but while children are starving to death, dying of curable or preventable diseases, being abused, neglected, living in war zones and rubbish dumps, etc., it is senseless to say that abortion is a sin! Call the mother "stupid" or "a disgrace to her species", but don't force her to carry a foetus it doesn't want, or to seek alternative methods of procuring a termination. What the Health Ministry could do is to insist that the mother (and, ideally, her partner also) undertakes and passes a natural family planning course in order to qualify for an abortion (so, hopefully, they won't ever need to have another abortion).

When every child receives a proper sex education, morning-after pills shouldn't need to be made, and contraceptives should only need to be supplied – via prescription – to people with AIDS/HIV or STDs, gals who have erratic periods or *who can release eggs at any time* of the month ('sex lubricants' may also be a prescription item). While society still uses money, and even though all healthcare is theoretically free, demand for items like contraceptives could be mitigated by charging for them (unless they've been prescribed). This implies that such items would need to only be distributed via chemists, family planning clinics (which will be redundant if every child received a proper sex education) and other Health Ministry offices.

In a society full of humans, rapes won't occur, so abortions would only be necessary if a foetus has been identified as being severely disabled. If the severity of disability (i.e., the child's capacity to appreciate its own existence and contribute to society) is uncertain, the pregnancy should be taken full-term and a decision – made by a committee including the parents – on whether or not the child should be *put to sleep* can be made after its birth (as has been the practice for most of humanity's history). If one parent is willing to act as a full-time caregiver (assisted by its partner when the partner isn't working; and by facilities where the child can receive therapy, plus whatever training or education it is capable of comprehending, while also giving the caregiver a break) to its severely disabled child, such a request could be considered viable after the world population has been stabilised, when every member of society is receiving the basic necessities of life, and a balanced workforce between every industry within the parent's district has been achieved. Basic modifications could be made to the parents' home if necessary, but homes or apartments that are specially designed for residents who have specific disabilities (r:p1979, ln17) should only need to be made available to adults – especially those who are single (i.e., who have to do everything – or most things – for themselves).

Further activities that can be classified as unnecessary, and therefore shouldn't be performed in future, include circumcisions (unless required for acceptable medical reasons), penis enlargements and sex-change operations.

A court has ruled that Britain's free healthcare service should pay for sex-change operations for transsexuals... The Court of Appeal's ruling means about 1000 transsexuals will be able to have the £8000... surgery... under the N[HS]. The three-judge panel said the service wrongly regarded transsexualism as a state of mind that did not warrant medical treatment, despite "overwhelming evidence" it was... a legitimate illness.

...Britain's Ministry of Defence says it has paid for sex-change operations... A spokes[person] said "a small number, no more than five" soldiers had undergone gender reassignment operations paid by the ministry. "The MoD medical services provide similar services to the military that are available to civilians on the N[HS]... If a doctor says surgery is appropriate because of the genuine psychological reasons it is considered... If the operation did not diminish the soldier's relevant job skills there is no reason why we would not keep them in the Army." The [MoD] also confirmed that "about 10" members of the armed forces had been given free liposuction... and... had paid for breast enlargements for four [gal] soldiers since the start of last year... Last week, [newspapers announced that 'members of the Canadian armed forces can get sex-change operations done for free'...

It started school as a boy, by 4th form [it] was a girl. Is 14 too young to change sex?

...[NZ's Chief Ombuds[person]] has made a landmark recommendation that a person be given a sex change and the Health Funding Authority... foot the bill. [The Chief Ombuds[person]] made his unusual recommendation to the HFA and Health Minister... after ruling that the authority acted unreasonably in the case of [a guy], aged 52, who is now living as a [gal] in the King Country. [The person] was scheduled to have gender reassignment surgery in Waikato Hospital in 1997, when Midland Health, the now-defunct regional health authority, decided against funding sex changes... [The] former Christchurch crane driver, complained to [the Chief Ombuds[person]], whose office launched an investigation into whether health authorities treated her unfairly. The HFA later conceded that [the person] had been treated "with a degree of administrative unfairness."

...As a 5-year-old living in Kaikoura, [the person] would lie in bed at night begging God that [it wanted to] wake up the next day as a girl. "I would fall asleep dreaming I was a girl. Of course, when I woke up... well, I thought it was God's cruel joke." Nearly 50 years on [the person]... may soon have her prayers answered... [It has] won the right to have a publicly financed sex change operation after... the... Chief Ombuds[person]... determined 11 days ago that [the person] had been unfairly denied... in 1997. The former Lyttelton crane-driver... spoke to the *Herald* yesterday after a roller-coaster week of relief followed by sadness at the public reaction to [the Chief Ombuds[person]]'s decision. "The electronic media have been going crazy, especially talkback [radio]. People think this is like a nose job. That's... the worst bigotry I've seen since Aids was discovered." Her King Country home is well away from the nearest town. "It's my own slice of paradise... away from the ignorance." [The person], who lives on an invalid's benefit, moved there from Hamilton... soon after... [being] denied sex change surgery... [Now the Chief Ombuds[person] has] recommended that the H[FA] arrange and pay for psychiatric assessments and, if approval was given, to pay for the surgery. "I'm so thrilled. It's been a battle,"... The operation cannot come soon enough. A heart condition means that the longer [the person] waits, the less likely [it] is to survive the procedure... "I want to speak out now because I know there are people like me being born here every year. I don't want them to suffer like I have." [The person] said fear had kept her from telling her neighbours, for whom [it] works occasionally, of her condition. "I'll call them later. I think they'll be all right. But you never know with bigotry; it's such an irrational thing." [Editor's note: How *irrational* is it to beg God for a sex-change (i.e., declare you believe God exists but openly criticise then defy the way this universal controller had created you)? If, instead of spending most of its life wishing it were a girl, the person had applied its mind more productively, it might have grown up to find a way to enhance society's resources instead of helping to squander them (an answer to the question: "If God controls the universe, why does it make people want to change their sex?"), could be that this is one of many examples intended to serve as lessons for future generations of what constitutes misuse or abuse of brainpower and technology)! Until recently, people had no choice but to accept the gender they were born with. Now, gender reassignment surgery is so common that we have a transsexual MP and even a 'transsexual Anglican vicar'.

...‘research indicates that up to 20% of sex-change patients regret the operation – the removal of their sexual organs did nothing to address their gender confusion. Faced with the prospect of living an isolated and lonely life without any real possibility of marriage and family, too many have committed suicide’.]

...The sporty multi-millionaire property developer... was born a [guy], but underwent sex-change surgery to become a [gal]. Incredibly, seven years later, [it realised it]’d made a mistake – and now, after spending more than \$200,000 on painful operations, [it] has made history by becoming the first person in the UK to have two sex changes, and now lives as a [guy] again. But... can no longer get a natural erection and uses a special pump to inflate his penis... [M]arried in 1985... his wife... left him for another [guy] 12 years later. Feeling lonely, [it]... began visiting gay clubs... became fascinated by transvestites, and began cross-dressing... “I... haven’t seen my children for over 10 years. They’re now aged 22 and 23, but don’t want to know me.” ...the... 48-year-old... reveals... it... still hasn’t found happiness and is desperate to settle down with a [gal]... to marry.

...When... [they] walk down the aisle together they will be fulfilling every young couple’s dream, with one exception – for this wedding ceremony [the groom (30)] is technically the bride and [the bride (34)] is the groom. The 30-year-old was born a [gal] and the 34-year-old a [guy], and they will be N[Z]’s first transsexual vice-versa married couple when they exchange vows... It was love at first sight for the unusual couple when they met at a dragon boat festival six months ago. When [the 30-year-old... caught sight of... [the] 34-year-old[’s]... piercing blue eyes, [it] was hooked. “I knew as soon as I saw her [it] was a transsexual...” ...The devoted couple see nothing strange about their relationship. “We do our own thing and we’re just a standard couple,” says... [the groom], who... gave birth 14 years ago to a daughter who now calls him ‘Dad’... “We’re no different to any other heterosexual couple, I suppose. The real difference is when it comes to the bed. But... even then we’re still [a guy and a gal] – it doesn’t matter which way you look at it.” Neither has had a full sex-change operation, although [the groom] has had a hysterectomy. “Sometimes we gender alternate...”

...Hidden gender [IN]BANGKOK A THAI beauty queen has given up her title after admitting [it] is actually a [him].

...Swathed in a purple velvet gown with nail polish to match, [a]transsexual... presides over the Half Moon bar in Beijing’s trendy diplomatic district. The former national [guys’] dance champion – and one-time colonel in a People’s Liberation Army dance troupe – underwent a sex-change operation three years ago. [The transsexual] makes no secret of her past, but admits that dating can be a problem. “I’m too much for Chinese [guys,” sighed the transsexual], aged 31... Still, [the transsexual] has become accepted in Beijing in a way unthinkable just a few years ago. Her colourful lifestyle illustrates a sexual revolution now sweeping China, an unintended result of economic reforms launched 20 years ago by the late Deng Xiaoping. Chinese have used their new wealth and expanded personal freedoms to throw off decades of socialist morality. Larger cities boast sex shops and gay bars; gigolos and prostitutes openly advertise for business on street corners. Divorce is on the rise, and extramarital affairs – regarded as a shocking sin in more puritanical socialist days – are now grist for office gossip. “In the days before ‘reform and opening,’ movies showed actors and actresses lying in bed together but talking about the revolution,” said a... social commentator... “Today, movies show people kissing and embracing. Ideas in the West are more advanced and we are borrowing them... We’ve begun to respect people as individuals.” ...Not everybody is happy with the new easy-going attitudes to sex and marriage... Panicked lawmakers this year proposed the first amendments to the country’s 1980 marriage law that would make extramarital sex a criminal offence. The draft revisions have met howls of public protests, and may well be knocked back. Still, they reflect the fears of authorities that the institution of marriage is under threat, and with it social stability. Old prejudices also linger. Homosexuals who cruise public parks to pick up lovers risk being beaten up by police. Gay bars are routinely closed down... “China’s opening has not reached the level that we hoped for,”... Nevertheless, the contrast between China today and China 20 years ago is dramatic... T[he transsexual]’s story is testament to the change. A sex change would have been unthinkable during the draconian days of... Mao Zedong. “I would have been punished and put in jail,”... said[the transsexual, who] was born in the north-eastern city of Shenyang and from the age of six felt [it was “a gal] trapped in a [guy]’s body.” ...Thanks to Deng’s “open door” policies, [the transsexual] was able to travel to the U[S] to study modern dance from 1988 to 1990 and worked in Italy and Belgium before returning to China in 1993. [The transsexual] heeded Deng’s call that “to get rich is glorious” and now runs a successful bar and restaurant. “Before, people had no choice... Now they have many choices.”

The estranged wife of a doctor who had a sex change has... applauded her [ex’s]... decision, saying: “I know [my ex] has no choice but to take this very positive final step... I hope [my ex] can be a more complete person and find inner contentment in becoming... [a gal.]” They have five children... About one in 30,000 [guys] would prefer to be [a gal], but only one [gal] in 100,000 wishes [it] could be a [guy]. Those statistics come from... Thailand’s Chulalongkorn University... “Thailand has become the most popular place for sex change operations... Many foreigners are coming here to have the surgery and I think the income will help shore up the economy.” ...A-[gal-to-guy]... operation costs about [double a guy-to-gal one]...

When... the Northern Territory Attorney-General, saw *Priscilla, Queen of the Desert*, [the Attorney-General] laughed along with the rest of the audience – but it also got him thinking. The hit A[US]n movie on the life and times of three transsexuals made him wonder about the unfairness of being a [gal trapped in a guy’s body. So it] set out to... ease the pain. The result: N[T] this week became the third jurisdiction in A[US] and one of only a handful in the world which actively recognises transsexuals’ new gender... Under the new law, unmarried adults who have had sex realignment surgery can apply for new birth certificates [that] classify their new gender. The changes mean official documents, including passports, also can be issued with the new gender... The amendments stem from meetings of the standing committee of A[US]n Attorneys-General. They have been in place in South A[US] since 1988, were recently enacted in New South Wales, and are expected to be introduced in Western A[US] soon.

...Cross-dressing between sunset and sunrise will be legalised under draft legislation designed to remove archaic offences from the Tasmanian statute books... [T]he Tasmanian Law Reform Commission has recommended that the Police Offences Act of 1935 be replaced with a Summary Offences Act reflecting current community values. “It’s a mish-mash of offences derived from English legislation of the last century, some of it framed in very archaic language, and new offences added since 1935... One of the more humorous examples was the offence of being a [guy] going around town in [gals’] clothing during the hours of darkness.” [In related news, ‘science is starting to reveal in extraordinary detail how genes determine the sex of a foetus and how that process can and does go awry. The head of the Centre for Hormone Research at the University of Melbourne was part of the British-based team that in 1990 discovered a crucial gene, known as SRY, that usually occurs only on the Y chromosome of all mammals. Take SRY alone and inject it into a fertilised girl mouse egg and it will become a boy mouse, as other researchers at Britain’s National Institute for Medical Research later showed. When a human foetus is still thumbnail-sized, you can’t tell a boy from a girl one – the budding sex tissues are identical. If it is a boy, however, SRY switches on about 7 weeks after conception and causes testes to form, which soon flood the developing baby’s body with the masculine sex hormone testosterone that shapes the development of masculine genitals and physical traits. Without SRY, a feminine foetus waits until 13 weeks to develop ovaries (from exactly the same tissue buds that otherwise produce testes), which produce oestrogen. It is often argued that being feminine is the default state for mammals. It now seems just as possible we start out sexless but with dual potential. It’s worth noting that SRY’s discovery was made possible with the help of French scientists who identified 4 unusual guys who had sought treatment for infertility. Tests revealed all 4 were in fact genetic gals, yet they had guys’ bodies, including testes. Further studies showed an SRY gene had somehow become attached to one of their X chromosomes. It was just a tiny glitch, enough to reverse their sexual anatomy but not to endow them with other masculine genes to make sperm. Many other such variants are now being discovered – along with true hermaphrodites and pseudo-hermaphrodites, there are people with missing sex chromosomes, extra sex chromosomes, or tiny genetic fragments tacked onto or missing from chromosomes that seem to have nothing to do with sex determination. The Intersex Society of North America asserts that one person in 500 has sex chromosomes which are neither the usual XX or XY. Many such people don’t discover

this until they seek help with fertility problems. One group is genetically masculine with a condition known as androgen insensitivity syndrome. In essence, their receptors to testosterone don't work. So, although they have masculine chromosomes and the SRY gene intact, their genitals and general body form are not masculinised in the womb. They develop outwardly feminine bodies but may have internal testes instead of ovaries.'

...The presence of an extra copy of a human sex gene can transform an embryo from boy to girl and produce genitalia that doctors cannot determine to be masculine or feminine. Researchers at the University of California, LA, say babies born with this condition are relatively common. They hope their findings will help doctors to ascertain more accurately and quickly the sex of these babies and perhaps lead to ways of correcting the defect before birth. The study shows that mild cases of malformed genitalia such as undescended testes or an enlarged clitoris are seen in 1% of all births. More severe cases, in which babies are born with such sexually ambiguous genitals that obstetricians cannot discern the sex of the infant, occur in one out of 3000 births.' □ 'In the early stages of development, a foetus contains both sets of genitals –' and sometimes babies are 'born with almost complete sets of both boy and girl genitalia'.]

...there are more than two sexes, but the small band of N[Z] intersexuals don't find life in a [guy's or a gal's] world easy... HER birth 50 years ago was registered as [that of a boy, but it was christened with a girl's name] and raised as a girl in Hamilton. At age 12, with her breasts already growing, [it] also started to develop the body of a teenage boy. Her schoolmates' reaction was predictably cruel. "Things turned from bearable to nasty in a couple of weeks... and that was effectively the end of my schooling." ...[the gal]s studies PhD student at the University of Waikato, is an intersexual. At birth her genitalia, like those of one in every 2000 babies, were ambiguous, neither completely [a penis or vagina]. "I was discouraged from undressing in front of other children, and I was permanently excused from PE. I knew I was different, but I got through school largely by being a non-gendered person as far as possible." Doctors decided to help the masculinisation along with a hefty course of testosterone and minor surgery: correcting hypospadias, in which the urethra opening is along the shaft of the penis instead of the tip. [The patient] had gone into surgery thinking the unwanted penis was to be removed and [it] could go back to being a girl. Waking up to find the penis still there was devastating. Her next visit to the medical team was her last for many years. [The patient] wanted to tell them to stop the masculinisation process. Instead, they told her it was time to remove her breasts... Statistics say... 1800 intersexuals [live in NZ], with another 30 born each year, although most people have never heard of the condition... Although everyone in her small home town knew of her unusual anatomy, and [our second subject knew it was different, her condition] was never discussed with... [her. At age 8] her parents dropped her off at hospital. [The 8-year-old] had her own room attached to a [guys'] ward, and "a constant stream of curious medical visitors to see the freak," [the now 44-year-old hermaphrodite] says. Then her penis was removed, also in front of an audience... [The child, who] was conscious throughout the operation... spent the next three weeks strapped to a hospital bed to allow the wound to heal – and still nothing was explained to her. [It] remembers her mother attempting to explain when [the daughter was 24. Her mum] was able only to recount how the young nurse attending her birth had said, "Oh my God, it's a hermaphrodite!" before starting to scream with distress. End of discussion. [The 44-year-old] came across her Plunket book after her mother died 13 years ago. Her name, Margaret, covered the original name entry, Bruce... [Bruce] had been born with a small penis and a vagina-like opening. Doctors initially decided [the baby] should be raised as a boy, but surgical exploration ([it] still has the deep scar from navel to pelvic bone) revealed a uterus and as a one-year-old [Bruce] was renamed Margaret. Finally armed with some clues to her difference and her difficult childhood, [the 44-year-old] began to reclaim her intersexuality. [The 44-year-old] researched and asked questions and underwent extensive counselling – walking through layers of shame and humiliation to come to terms with who [it] actually was. Last year [it] took the name Mani, which is Sanskrit for both ma[sculine and feminine, and] has let a wispy beard grow... IN MAY this year [it] formed the Intersex Society of N[Z]. While the majority of the 120-plus members are people who have heard the story and support the work of the society, more than 20 are intersexuals. [The 44-year-old] has had a flood of letters since starting the society, from intersexuals ranging in age from 16 to 60... "Those letters are full of pain." Through the society, [it] aims to raise public awareness of intersexuality so that others may be spared the years of secrecy and shame... [The 44-year-old] would also like to see an end to the gender-assignment surgery which is routinely carried out on intersex babies born in N[Z] (as it is in most Western countries). "...In most cases it's not medical intervention to do with physical health. In those cases we support it. They try to justify the surgery on psychological grounds, and I don't think that is proven. There's been almost no follow-up of intersex babies, and everyone has assumed it's okay but I haven't heard of one intersex person who's had the surgery as a baby or child and is completely happy with it." ...[However, the] director of paediatric endocrinology at the Starship Children's Hospital, says children develop a gender identity by the time they are 18 months old. "The worst thing you could do for babies born with ambiguous genitalia is to say, 'You're neither [a boy or girl] right now, and we'll decide later.' That tells them they're not normal, and it deprives them of gender identity, which is such an integral part of our being." [The director] says intersex babies are treated as a paediatric endocrinology emergency... [These days, most hermaphrodite babies end up being classed as girls' – perhaps because it is 'easier to construct a vagina.' The 44-year-old] acknowledges that life for a child who is physically different can be tough. But... believes that with a supportive family and school, the child will be better off not having the surgery until they are of an age to decide for themselves. In the U[S], intersexuals are more visible and stropky. The political wing of the Intersex Society of North America, Hermaphrodites with Attitude, have run protests outside paediatrics conventions. SOME [US] doctors concede that the intersexuals might have a point, but the campaigners have also hit a lot of brick walls. In this country the situation is much calmer. [The 44-year-old] has been invited to speak at medical conferences and other gatherings, and received only positive responses to her story. Doctors say the surgery performed on babies now is far more sophisticated than what [the 44-year-old faced. But the 44-year-old] says that is not the point. "I realise these children would have to be raised as either [a boy or a girl], rather than as third gender, but I'm saying that shouldn't be rigidly enforced with surgery. And it shouldn't be hidden from them. It's an issue of autonomy and human rights." ...[the PhD student] says nobody ever asked her which gender [it] would prefer... In her early 20s [it] met a transsexual, and discovered that some transsexuals chose to have genital surgery. [The PhD student] first presented herself as a candidate for this surgery in 1972 but it was 16 years before [the hermaphrodite] underwent the first of several operations in Melbourne... Since the age of 20 [the PhD student] has lived as a lesbian. "I was so repelled by the idea of [masculine]ness, there was no way I was going to have anything to do with [guys. 'It is not possible for me, at the moment, to have sex as a gal, because I'm not, but'] I regret that I didn't have the opportunity to go through the usual teen experimentation, and I suspect I'm actually heterosexual or bisexual." [The 44-year-old also 'believes her intersexualism was due to the masculine hormone drugs her mother was on to help prevent a miscarriage'. Ironically, 'a US study links lesbianism to exposure to masculine hormones in the womb.' Incidentally, another study has concluded that 'gay students are 7 times more likely to commit suicide than non-gays', and 'young gay guys are 14 times more likely to commit suicide than their non-gay counterparts'...

A US study found that one third of gay and bisexual youth reported at least one intentional self-destructive act and almost half of them repeatedly made attempts on their lives. - 1997

...Sing if you're glad to be gay Sing if you're happy that way...

...according to the U[S] Lesbian and Gay Health Foundation... three out of every 10 homosexuals ha[s] a drinking or drug abuse problem... [(that's three] times as high as for straight people...[)]; many because they suffered from "diminished self-esteem and impaired sense of self-worth." - 1990

The drinking problems of lesbians are... targeted in a new Alcohol Advisory Council (Alac) campaign. A report on [gals] and drugs in N[Z] showed lesbians are more likely to develop problems with alcohol than heterosexual [gals]... It is not easy being lesbian in a predominantly straight world and sometimes alcohol and drugs help dull the associated pain... Few specific resources for lesbians exist and the new resource material aims to fill the gap... Information is... also... provided on where [lesbians] can go for help if they are worried about their own or somebody else's drinking.

...On the gay battlefronts... DRIFTING quietly across... [her] pager was a coded message. It was a stream of number 7s, and to her its meaning was crystal clear. [The pager's owner, who is a member] of the Human Rights Campaign, a gay-rights group in Washington, had arranged for a friend at the... Supreme Court to contact her when the justices issued their long-awaited ruling in the case of *Romer v Evans*. The 7s meant the court had thrown out Colorado's constitutional amendment that barred any legislation protecting homosexuals from discrimination. The headquarters of the H[RC], which had helped bankroll the legal challenge to Amendment 2, burst into celebration... "I thought of... all the civil rights lawyers who struggled to achieve *Brown v Board of Education*," says [the HRC's] executive director... But even [the executive] doesn't think *Romer v Evans* gives gays and lesbians that kind of victory. The *Brown v Board of Education* decision in 1954... really was a landmark for black Americans. In outlawing school segregation, the court reversed years of social policy and triggered the modern civil-rights revolution. By contrast, last week's decision created no new rights for gay Americans and failed to declare them a specially protected group like blacks... To be sure, *Romer v Evans* has momentous symbolic value. It's the first time the justices have hinted they may be sympathetic to constitutional claims by gays and lesbians. The only other time the court visited the issue, 10 years ago, the justices were downright antagonistic – ruling... that nothing barred the states from making sodomy a crime. Yet symbolism only goes so far. It doesn't guarantee housing, medical care or a job – all of which can still be denied homosexuals simply because they're gay. In virtually every state and municipality, that kind of discrimination remains legal and is unaffected by *Romer v Evans*. All the decision says is that a state constitutional amendment can't *prevent* the Aspen or Boulder city councils from passing anti-discrimination laws if they so choose. Indeed, the Colorado legislature tomorrow could accomplish the goal of the amendment without any legal problems. How? By passing a law banning discrimination in employment, housing and so forth based on race, religion and other well-accepted classifications – but leave out sexual orientation. Then, explicitly say the law pre-empts all local legislation. That way, unlike Amendment 2, sexual orientation is not singled out. Just two days after the ruling, gay activists learned how quickly the pendulum can swing.[The US] President... an ally on many gay issues, stunned them by announcing [it] would sign a bill in Congress... which denies federal recognition of same-sex marriages. No state yet permits such marriages. As a practical matter, that legislation could have far wider consequences for the gay movement than *Romer v Evans*. However, it is possible the constitutional bill itself is unconstitutional because it could violate a guarantee that each state give "full faith and credit" to the decrees of other states. But that's a court fight years down the road. THE gay-rights movement has become a potent political and social force in the country... But ambivalence runs deep. A recent poll underscored how far the gay-rights movement has come – and how far it has to go... 73[% of]... people polled... acknowledged that gays were victims of at least some discrimination but only 27[%] believe more eff[or]t is needed to protect homosexual rights. The majority does not support legislation guaranteeing equal rights for gays... [84%] says gays should get equal job opportunities – up from 74[%] two years ago – but only a third support legal gay marriage. Unless the courts decide to give gays added constitutional protection, gay activists will have to fight for their cause in every workplace, school board and legislature. Without a significant switch in public opinion they won't have the electoral votes to win very often, which is why so much effort is being spent in the courts. [Another g]ay battleground in the U[S] is the [military: Seven cases are pending in the federal courts, all challenging [the President's] "don't ask, don't tell" policy. The theory is that soldiers who acknowledge they're gay should be protected by the First Amendment of the Constitution since a mere statement doesn't prove proscribed conduct. Moreover, being dismissed for such a statement may violate the Constitution's guarantee of "equal protection of the laws." For example, would a heterosexual be disciplined for saying [it] was straight? So far five trial courts have ruled for the military – two against. The Supreme court hasn't heard any of them but it's a good bet it will take on one within a year or two.

...Sexual variety has always been the spice of life for humans, says an English archaeologist... who has taken a sweeping look at four million years of passion. [The archaeologist] argues that masturbation, homosexuality, bestiality... transsexualism and transvestism... date back to the early mists of time. Sex has never been just for reproduction, [the archaeologist] says... Examples abound in [the archaeologist's] entertaining *The Prehistory of Sex* to underline his point that sexual imagery dates back at least 30,000 years. Eroticism, not biology, ruled way back then... The... archaeologist... quotes everyone from Hippocrates to [an AUSn (r:p1029, ln38)] feminist... to bring a popular touch to his academic treatise... Graphic proof is offered by a 5000-year-old Siberian rock engraving of a Stone Age [guy] on skis trying to penetrate an elk. Black Sea Scythian nomads, made impotent by the constant jostling they received on horseback, wore [gals' clothing. Amazonian gals] cauterised one breast of their baby daughters so they could shoot their arrows more effectively when they grew up. Only [gals] who had killed three people were allowed to breed... Some biologists argue that humans are slaves to their genes but [the archaeologist] says most prehistoric communities were in control of their destiny and fully able to separate sex from reproduction. [The archaeologist] concludes that variety is indeed the spice of life – especially if it keeps burgeoning birth rates under control. "To maintain a sexual morality that is based on reproduction is nonsense and, at present world population levels, dangerous nonsense..." - 1996

['THREE teams of scientists in America are searching for the genes that cause homosexuality. They are reputable scientists who are persuaded by recent research that gay guys for the most part inherit their sexual preference rather than learn it. Their work is being welcomed by militant homosexuals because it refutes the charge that they could have chosen to be heterosexual. Until recently the assumption that homosexuality must be caused by upbringing and young experience was shared by most researchers who looked at the field. Dominant mothers, hostile fathers, a failure to resolve the Oedipus complex, effeminate role models – all were suggested as the causes of homosexuality, but all attempts to find conclusive evidence for them failed. Then, six years ago, Boston University reported that brothers of homosexual guys were five times more likely to be gay than brothers of heterosexual guys, and homosexual guys are more likely to have older brothers than heterosexuals. That proved nothing, because brothers share upbringings as well as genes, but it revived interest in the idea of a genetic explanation. Then Northwestern University found that if a homosexual guy had an identical twin, in 52% of cases his twin was also homosexual; if a gay had a non-identical twin, in only 22% of cases was the twin also homosexual. From the difference between the fraternal twins and the identical twins, one of the researchers calculated that the heritability of homosexuality is between 30 and 70%, depending on how many genes are involved and how biased the sample was. Both universities have since repeated the study for lesbians and found similar results. Most neurophysicists believe that the differences between guys' brains and gals' brains depend on events in early life – the release of masculine hormones by the testes of boy foetuses. Sexual preference may well fit into the same pattern. Some rats have been given carefully timed injections that block masculine hormones in foetuses; they develop as normal boy rats – except they solicit sex from other boy rats. The Salk Institute in San Diego has shown anatomical differences between the brains of homosexual and heterosexual guys in parts of the brain noted for differences between guys and gals. That does not mean, though, that guy homosexuality can be reduced to effeminacy. Researchers doubt the oft-repeated figure that one in 10 guys is homosexual; they think people whose sex lives are exclusively homosexual make up about 4% of adult guys and less than 2% of adult gals. Things seen as natural and biological have a habit of becoming medical or ethical issues. If there are genes for homosexuality, then there can be genetic tests for homosexuality. Those would enable prospective parents to discover whether their foetus was likely to be gay and abort it if it was; in the same way it is already possible to test the sex of the foetus early and selectively abort daughters or sons. In the case of homosexuality, though, "treatment" in the form of hormone therapy might be offered instead. At which point, what price "naturalness?"]

...the Nobel prize winner who discovered DNA... has provoked outrage by claiming that [pregnant people] should be allowed an abortion if their unborn babies are found to be carrying a gene for homosexuality... [A] Regius Professor of Medicine at Oxford University, said: "To say this is controversial is a generous way to describe it." ...[the] author of *The New Genetics and Clinical Practice*, said th[e] Nobel prize winning doctor's comments were a "hindrance" to the debate about genetics. "This... is really emotive and it is a gross oversimplification,"... Although... scientists claimed in 1993 that they had identified a link between homosexuality and genetic make-up, it remains unproven... At that time the former Chief Rabbi of Britain... was criticised when [it] said that if the techniques became available, then scientists should help eradicate the "abnormality of homosexuality". [The doctor], however, admitted that it was not even known how normal sexuality was determined. "But while I think in the end we will[know], that doesn't mean that the majority of homosexuality has a genetic basis, just that genetics will help us understand." ...Speaking from his home in Long Island, New York, [the doctor] recalled a discussion [it]d had about the genetic implications of homosexuality in front of a [mum] whose son was gay... "Looking at the situation from her point of view, it was that [the mum] wanted grandchildren. Her son's homosexuality was the greatest tragedy of her life. And who am I to say otherwise?" ...Although [the doctor] claimed that these issues should be left to the individual, [it] also stated that parents had a moral responsibility to make sure their babies were born as healthy as possible. "We already accept that most couples don't want a Down's child. You would have to be crazy to say you wanted one, because that child has no future... Some day a child is going to sue its parents for being born. [The child] will say: My life is so awful with these terrible genetic defects and you just callously didn't find out. Or you knew and didn't do anything about it. Or, this disease was in the family and again you didn't do anything about it." ...[a] founder of the Genetic Interest Group, which supports research into genetically inherited diseases, said [the doctor] was not commenting on science but on social matters, and from a "prejudiced American perspective".

...*Being gay is not a matter of choice, but of rights*... IN HIS recent article "Society dilemma over hero worship", [a writer] offered an annotation upon recent history as redolent with novelty as it was with the measure of its own deviousness. Among "the most telling and dramatic" reasons for the "changes to our attitudes to homosexuality", [the writer] said, has been the American Psychiatric Association's decision in 1973 to remove homosexuality from a diagnostic manual of disorders, thereby obtaining... "one of the most spectacular cures in the history of medicines". Of course, the... [a]ssociation did not bring about a "spectacular cure" for anything – which is hardly surprising given that no one had ever actually succeeded in establishing pathology. Rather the association simply yielded to a burgeoning understanding that the listing of homosexuality in a diagnostic manual of disorders could in no way be construed as being the function of rational scientific discourse but rather was the result of what might be described as a plaintively idiosyncratic, flat-earth mentality. In addition, more and more... [people] had come to realise that to classify as a pathology something so legitimately inherent to many human beings as their homosexuality is not only merely wrong-headed, but certainly downright pernicious. Of the few psychiatrists who continued to insist otherwise[one]... persistently maintained that homosexuality was a "dread dysfunction" established in infancy through a fixation upon an overbearing mother. Ominously, [it] advocated the establishment of a "national centre for sexual rehabilitation" where [gay]s could be sent for "cure". One is reminded of the incarceration by Nazis of gay[s]... in Buchenwald, where they were variously castrated and subjected to "experiments in the reversal of hormonal polarity" by an SS-commissioned doctor operating under the alias Carl Vaernet. [The psychiatrist's] son... is today the openly gay [US President]-appointed White House liaison for the Department of Labour. Poetic justice, one might say. [The writer] went on to make the claim that gay people "display none of the characteristics of a repressed minority" because they "have higher incomes... are better educated, go on more holidays and have greater spending power". Although [the writer] does not want gay... people to be able to marry or to have families, [it] maintained that gay people "have the same rights as everybody else". It is as though ostensible economic privilege were an immunity from the social omission, religious ostracism and the various forms of discrimination which continue to be endured by gay and lesbian people in N[Z]... But the fanciful idea that a group cannot be oppressed if it is well-to-do has been widely employed at once to obfuscate prejudice and its effects and to actively fan such prejudice itself... Citing [Auckland's] Hero Parade, whose onlookers' largely benign curiosity is tainted by [the writer] with idle voyeurism, [it] expressed the fond hope that society (will be) mature enough to examine and assess the consequences of such "celebration". Clearly, [the writer] already rues these "consequences". Presenting the reality of a gay and lesbian culture in the media is, according to him, tantamount to "advocacy". Reference to homosexuality in the school curriculum, are similarly... a case of "advocacy". Implicit here, though never expressly stated, is the notion of ideological recruitment and manipulation on the part of gay people and their "liberal" supporters. And what such innuendos serve to do is to inflame fear of gay people through injecting and re-injecting popular perceptions of gay[s]... with the toxicity of the malign and of the contentious, with no acknowledgment of the distress endured by gay people (not least of all gay and lesbian youth) resulting from invisibility, prejudice, denial and popular misapprehensions as to the nature of homosexuality itself. Still the matter of gay and lesbian rights, is not, [the writer] told us, "simply one of justice". "Certain fundamental changes must take place at the heart of our culture", [the writer] declared, proclaiming that such changes must entail "elevating choice to a value in its own right". Herein lies the banal insinuation that, first, homosexuality is a matter of choice and, second, that the existence of such choice is commensurate with an amoral society which has succumbed to a depreciation of what have been called "traditional values". Hence... [his] imputation upon lesbian and gay marriage and parenting as constituting a declension of familial bonds from "social responsibility" into "therapy" and "fulfilment of the vagaries of intellectual fashion", is a grave and completely unfounded prejudice. And yet such breathtaking insolence does not alter the facts of gay and lesbian marriage and child-rearing. The late... Yale Professor of History John Boswell documented... 60 ceremonies of same-sex union, most but not all of which were used in the Greek Orthodox Church until the beginning of this century. Professor Boswell also conclusively attested that in the early church until the third century not only were gay and lesbian marriages consecrated but that there was no distinction made in respect of homosexual or heterosexual whatsoever. So – notwithstanding the largely catastrophic historical position of gay and lesbian people – gay and lesbian marriage has certainly been "traditional". And... in the U[S]... studies have all shown that where gay and lesbian couples are raising children, these children are developing into far better rounded individuals than those raised by couples of mixed gender. Common sense alone should tell us that children do not suffer because their parents are gay or lesbian or straight or because their mothers or fathers do or do not live with them. They suffer because parents – regardless of gender or sexuality – are incompetent, irresponsible or unfeeling... If homosexuality is not to be "given" the same status as heterosexuality, then it must follow that the latter is indeed in some sense superior – biologically, aesthetically, and/or morally. But of course there is no evidence at all to suggest that one form of sexuality is in any sense superior to any other.

...*This week the Court of Appeal ruled that homosexual marriages were not permitted under N[Z] law. Here are t[he] views... of... one of the litigants*... We went to the highest court in N[Z] to uphold our right to marry and to gain access to all the statutory protections, support, recognition and responsibilities that presently apply only to heterosexual couples. They turned us down. It's over. Well, no, it's not over. The next step we are taking is off-shore. We are appealing to the U[N, taking NZ] to a higher court. There are more than sufficient grounds. N[Z] has signed and ratified international covenants which bind it to upholding human rights. N[Z] courts didn't even have to contradict or distort existing legislation to do that – the Marriage Act does not forbid same-sex couples to marry. To refuse us the right to do so is in direct contravention of our Bill of Rights and the Human Rights Act 1993... N[Z] will continue to parade itself as a champion of human rights on the international stage, while at home human rights legislation has proved unable to protect the rights of homosexual N[Zers. NZ]ers may continue to believe that we have a functioning Human Rights Act and Bill of Rights, when, in fact, both have failed their first major test. This was a watershed case, and N[Z]'s human rights legislation has collapsed in impotent tatters. You may continue to believe that you are part of a fair and just society. I don't. Not any more.

...when five Court of Appeal judges said “you can’t” to three homosexual couples who would if they could... [-] ruling that same-sex marriages could be legalised only by Parliament... [-] gays and lesbians everywhere were denied rights available to heterosexual couples who choose to wed... The Law Commission has recommended giving de facto couples, including people in same-sex relationships, the same legal protection enjoyed by married couples. However, the Minister of Justice... has indicated that the initiative will not survive enactment of the draft Succession (Adjustment) Bill... Holland has just passed legislation allowing homosexual marriages, while Sweden, Denmark, Iceland and Norway either officially allow gay and lesbian union or afford those couples the same protection in law as that enjoyed by heterosexuals... [A] lawyer who has worked for many homosexual clients, sa[ys]... that eventually N[Z] gays and lesbians would be able to legally marry. It just required the political will. • The... N[SW police department], anxious to recruit staff from minority groups, has started an advertising campaign aimed at getting homosexuals to join the force. A spokes[person] said gay police were often more sensitive to victims of crime.

...*Daring to tell the truth about lesbian teen love...* ALTHOUGH [the author says it is] a bit too old to hang out regularly at McDonald’s and... no longer strives to keep up with the latest slang, [the]Dunedin writer... has a flair for entering into teenage minds without false notes or condescension. In the seven years [the Dunedinite] has been writing books for young people, [it] has scooped some of N[Z]’s top honours for children’s literature, including the AIM Best First Book Award in 1991... Her latest novel, *Dare Truth or Promise...* examines such issues as religion, prejudice, snobbery and the politics of racist or sexist jokes, but the chief focus is on the triumphs and anxieties of first love. What makes the book unusual – a first, in fact, among N[Z] novels aimed at a teenage audience – is that the tentative lovers are two high school girls... [The author], who works fulltime as an editor at Longacre Press and has a shrewd sense of the N[Z] book market, accepts in a philosophical fashion that her new novel might meet with some resistance. “There will probably be some schools that won’t stock it... although I find it hard to understand the psychology of people who will be upset by it. It’s certainly not designed to shock or provoke.” Nor is the novel intended exclusively for a youthful lesbian audience... “There tends to be a mentality, particularly in schools, only to give people books about themselves, but I think the beauty of literature is its ability to take you into worlds you wouldn’t otherwise know about...” [The author] is open about her own sexual orientation. “I had my first lesbian relationship when I was a teenager...” ...[By the way, a US] study shows that nearly 2% of BLOOD donors don’t reveal if they have had unprotected gay... sex, used intravenous drugs or engaged in other behavior that might taint their blood.

...[NZ’s] Aids Foundation surveyed just over 1850 [guys] nationwide who have had [gay] sex... during the past five years... [and found that most guys] in relationships were not using condoms. “Some... see a relationship as a buffer against HIV, as a way of staying safe, so they discard condoms. But overseas we are finding that many [guys] who are becoming infected with HIV are [guys in relationships].” It is estimated that ‘around 99% of HIV infections in guys who had gay sex have occurred through unprotected anal sex’, yet more] than half the [NZ guys] who had anal sex with their regular partners never used condoms while nearly 8[%] did not use them during sex with casual partners. Almost 6[%] never used condoms for either casual or regular partners... The average length of gay relationships was [fifty-one]... months. However, 54[% of guys] in relationships of longer than six months had sex with at least one casual partner in the six months before the survey... The survey also found that more than a tenth of the respondents were married or in a de facto relationship with a [gal. Another 25%] had formerly had a [heterosexual] relationship... - 1997

Researchers say a significant number of gay[s (nearly 8%)] ...are becoming infected with the Aids virus through oral sex – an activity that was rumoured to be safe... [O]ral sex was the only risky behaviour that... [they] had engaged in... But many of the [guys] in the study indicated that they had not been aware of the risk. “I think some investigators have actually shown that gay[s]... might be substituting oral sex for anal sex in an attempt to curb transmission.” The study showed this could be a deadly mistake. The Aids Foundation director... said the news report was worrying but [the director] wanted to read the study to check its research methods before drawing any conclusions. [The director] believed that gay and bisexual [guys in NZ] knew that oral sex was not completely risk-free. “We’re surprised by the rate reported in the San Francisco study because it’s out of step with all studies on that issue.” ...Having a cut or sore inside the mouth greatly increased the chances of transmission, and many people could have tiny abrasions of the mouth or gums without being aware of them. “It doesn’t have to be a gaping sore or ulcer,” said the]... deputy director of the... HIV prevention centre... at the Centres for Disease Control and Prevention... at the University of California[who also]... said the study had been carefully done, and the [subjects] were able to pinpoint exactly when they became infected... ■ LONG-TERM PRACTITIONERS OF ANAL SEX HAVE TO WEAR “BUTT TAMPONS”... Gay bowel syndrome is the old-fashioned term still used to describe a collection of symptoms affecting the anus and rectum... [A] consultant gastroenterologist, contends that in the space of a year a gay... with a penchant for “being burgled” will experience rectal inflammation, abscesses around the anus, anal fistules (a hollow around the perineum after a rectal abscess has burst) or blood in their crap due to stools scraping fissures. In time, anal sphincters can collapse, necessitating colostomy bags and the unconventional insertion of jam-rags to prevent insidious faecal seepage.

...Rarely does a police officer witness violations of Section 21.06 of the Texas criminal code, the section entitled “Homosexual conduct”. And almost never is an arrest made under the 119-year-old statute. So what happened recently... [to a couple of guys], in the privacy of [one of the guys’] bedroom, was highly unusual. The[y]... were having sex when a Harris County sheriff’s deputy walked into the apartment on another matter, saw what they were doing and hauled them off to jail. “In all candour, I don’t believe we’ve ever made an arrest before under those circumstances,” said... a sheriff’s spokes[person]. But the law is the law... “We can’t give our deputies a list of statutes we think they should enforce and a list of statutes we want them to ignore.” Handcuffing [the gay lovers] that night did more than just satisfy the deputy’s obligation to enforce the law. It opened up a new legal front in a long campaign by gay activists across America to do away with such statutes, which... [also resulted in] a Minnesota bartender [being] arrested for engaging in oral sex with a [gal] in the bar after closing time. Minnesota’s law, which applies to all couples, includes oral sex in the definition of sodomy, as does the Texas law. But in Minnesota, police witnessed the offence after the fact, while viewing a videotape from the bar’s security camera during an unrelated investigation... Answering what turned out to be a bogus report of a [guy] behaving erratically with a gun, [the Texas deputy sheriff entered the] apartment through an unlocked door with his weapon drawn. After finding no one with a gun, [it] later wrote in his report, “[I observed a guy] engaged in deviate sexual conduct, namely, anal sex, with another [guy]”. The pair]... spent the rest of the night behind bars before each was let out on \$200 bail. [They] pleaded no contest to violating the anti-sodomy statute and were fined \$125 each by a justice of the peace. Now the stage is set for what lawyers predict will be a long appeal process, one they hope will end with the state’s highest criminal appeals court invalidating the law as an infringement on privacy as protected by the Texas Constitution. The arrests in some ways delighted gay activists... Here, they contend, was an instance of government authority literally reaching under a person’s blankets. “You can’t get more private than a bedroom,” said... a lawyer with... Lambda Legal Defence and Education Fund, which is representing the [pair, aged 55 and 31].

...[IN] COLOMBIA... A GAY activist has been fined for complaining about a newspaper report demanding the rape of lesbians... [IN THE US, A GUY is] suing the Scientology cult for [failing to cure] his homosexuality... “They hinted they’d cured [the star of the movie *Michael*], that’s why I gave them \$500,000. But I’m still gay. It was fraud...” [The star, an a]rdent Scientologist... was embarrassed 10 years ago when a... gay... porn star gave graphic details of an alleged... affair with the actor. Since then, [the star’s] become a husband... father and vehemently denies [it] was ever gay.

...GAYNESS – THE SCIENCE... For half a century, boffins have been trying to answer one of the most controversial questions in the history of science: is homosexuality determined by genes, or is it simply a matter of personal choice? ...■ In the Forties, gayness was thought to be caused by

faulty parenting or bad moral fibre... Alfred Kinsey conducted the first study into [gayness], and stunned the world with his findings that "...whether in large cities or small towns, whether from a church school or a state university, persons with homosexual histories are to be found in every age group, every social level, in every conceivable occupation." [His] subsequent attempts to change gay people's sexual orientation all failed. ■ A decade later, [US] scientists performed experiments on [gay]s, who were viewed as mentally retarded. In an effort to turn lesbians straight, doctors forcibly removed their uteri and cut off their breasts. The operations never altered the [lesbians'] sexual orientation; nor did those performed on gay [guys], who were routinely castrated or lobotomised. ■ In 1963, [an] Indian... discovered a homosexual fruit fly. Although the fly had been genetically altered by X-rays, it added weight to growing speculation that sexual orientation was not down to choice. Researchers also found that other animals engaged in gay sex, from alligators to cows to geese... [(s)tudies of sexual preferences in sheep... found that between 6 and 10[%] of rams are attracted to other [ram]s rather than ewes...[:] scientists watched the sheep to be sure of their behaviour – something that cannot be done with humans[– t]hen they took apart their brains... and found that these sexual preferences could be predicted by structural differences in the tissues of the central nervous system[)]... ■ Gays scored a major victory in 1973, when the American Psychiatric Association declared that [gayness] wasn't a "disorder"... ■ A proliferation of other studies in the early Nineties culminated in a breakthrough report by... Washington DC's National Institute Of Health. [A molecular geneticist] interviewed dozens of gay brothers and found... [gayness] runs in families – specifically on the maternal side. Although [it] didn't find the much talked about "gay gene"... his and other studies... all pointed to one thing, now almost universally accepted by scientists: people don't decide to be [gay], they're born gay... *In the Nineties, surely the religious can embrace same-sex love...?* The evidence to support the cheeky joys of homosexuality is abundant throughout the world, from fresh-faced leather boys in San Francisco to happy lesbian couples living in harmony on the shores of Whitley Bay. But for... gays in America's unforgiving Deep South, there's little solace in the Bible...

The Bible is anything but Christian when it comes to our gay friends To err, Christians are fond of saying, is human. To forgive, they piously crow, is divine. Sadly, this open-hearted attitude to those who may have, say, crippled someone while drunk-driving or burned down an orphanage while depressed doesn't extend to [guys] who simply want to seek pleasure with other [guys]. Using that font of misinformation as their source, homophobic Bible-bashers are keen to point out the bits of the big book which clearly forbid[gay] love... Corinthians (6.9) gets the ball rolling with an all-out attack on, basically, anyone who wants to have a little fun. "Do you not know that the wicked will not inherit the Kingdom of God?" Mister know-it-all Corinthian harps. "Do not be deceived: neither the sexually immoral nor idolators nor ma[sculin]e prostitutes nor homosexual offenders will inherit the Kingdom of God." Heaven, it would appear, is going to have a mighty lot of shoulder-room for those of us boring enough to end up there. Leviticus joins in this shameless homophobia in the 22nd verse of his 18th chapter. "Do not lie with a [guy] as one lies with a [gal]... That is detestable." Mind you, this is the same book of the Bible which announces that anyone who has sexual relations with an animal must be put to death. Clearly the God-fearing folk of the Blue Ridge Mountains of Virginia aren't too keen on following the Bible to the letter of the law – thanks to this little warning, most of them would be dead by now. The Bible, while undoubtedly a good collection of fantastic stories, was obviously cobbled together rather quickly and with some very poor sub-editing. How, for instance, can the Good Book be so clear on one commandment – "Thou shalt not kill" – and in the same breath tell us that "if a [guy] lies with a [guy] as one lies with a [gal], both of them... must be put to death..."?

...The... founder of Westboro Baptist Church in Kansas, often pickets the funerals of gay people. Among his placards: "God hates fags." After gay college student Matthew Shepard was beaten and killed last year in Wyoming, [the founder] and his followers waved their signs outside his funeral. Today, [the founder's] Website features a shot of Shepard in the flames of hell... [Don't expect to see the phrase: 'I used to be straight but now I'm gay, I think that God made me that way' posted on his Website, or that of] the National Alliance[, which]... wants to carve an exclusively white, heterosexual nation out of North America... "Why can't we all just get along?" [you may well ask]... The supremacy movement... poses a similar question: "Will [hu]mankind ever stop hating?" and answers it with: "[N]ever. Without hate you can't have love. Without love you can't have hate."

... "I promise to love you the rest of my life," a tearful... [lesbian], aged 63, told [her 68-year-old girlfriend as they]... exchanged promises in a "holy union" ceremony in Sacramento, California, blessed by more than 90... ministers in a dramatic mass defiance of a church law... The... pastor of St Mark's United Methodist Church, says the church allows him to bless the [lesbians'] home, car, tractor and even their dog, "but I am not allowed to bless them." The ceremony took place in a state where voters next year will decide whether only marriages between a [guy and a gal] are legal.

...Four gay couples have exchanged rings and vows at Amsterdam's City Hall in the first same-sex marriages recognised by the Netherlands. [Amsterdam's] Mayor... officiated at Saturday's ceremony for three [guy] couples and one lesbian couple, which took place immediately after the law permitting gays to wed took effect at midnight. It was the denouement of a 15-year campaign to allow gay couples equal rights under civil law. The legislation easily passed through both houses of Parliament last year... Gays have enjoyed general acceptance in the Netherlands for years and surveys show that more than 75 per cent of the population supported the equal rights bill... As the couples arrived for the ceremony, a handful of demonstrators protested against what they called an unnatural union. "We hope these people will choose to return to the Lord," said... a 30-year-old protester. The lesbian couple were dressed in wedding gowns with long trains... Four of the [guys] wore formal suits and one pair were outfitted in leather... Foreigners hoping to marry in the Netherlands will be disappointed. Only Dutch national or resident foreigners living with a Dutch partner will be eligible for same-sex marriages. [The mayor said it] believed the Dutch law would encourage other countries to assess gay marriages.

...Gay and lesbian couples will get the same legal property rights as de facto heterosexual couples, says [NZ's] Minister of Justice... The... [minister] said the Government had no overall view on the wider issues involved, such as gay marriage. But it saw no reason to delay the... De Facto Relationships (Property) Bill... while these issues were being debated.

...Yes, [the Samoan] dresses in drag and sings on stage. But the Auckland-based entertainer and fashion designer will have you know the stereotyping should stop at this point. "People think of queens and associate them with full-on make-up, huge hair, lip syncing and *Priscilla, Queen of the Desert*. While there's nothing wrong with that, I've never really been able to relate to it. Fa'afafine literally means 'like a [gal]' and a... married [guy] with children can be fa'afafine. It's not necessarily a gay thing." ...[the entertainer] grew up as a fa'afafine in Samoa and says, despite popular belief that Samoan families without daughters encourage one son to become fa'afafine, [the entertainer] never witnessed it. [The entertainer] believes many people, from many different cultures, appear to accept fa'afafine but only on a superficial level. "Their attitude is 'We love your show and we think you're fantastic but don't tell us about your personal life'." [The Samoan] hopes to break down those misconceptions by expressing herself through music... "It's very important to me, because this is a channel for fa'afafine to encourage others to be themselves." ...[the Samoan writes its] own songs and has regularly performed at night spots, award ceremonies, fashion shows and conferences in N[Z] since the mid 1990s. [The Samoan] and her friends were the first queens in N[Z] to star in a commercial (Coca-Cola) in 1995. "When I came here from Samoa, in 1992... I created my own image. I wanted an image which was quite mysterious, so people would see me and say, 'My God, [that person is] gorgeous – oh God, [it's] a guy.'..." [The Samoan] is performing at [Auckland's] Pasifika Festival... This is her first time performing for the festival.

...do... [w]e... need another Hero Auckland welcomes back the Hero Festival on Friday after the gay pride gala decided not to come out last year. The 11th festival features a raft of arts and community events: high point for the public is the Hero Parade down Ponsonby Rd on Saturday... So what's it all about, we asked... [various celebrities: An] author "It's the Antipodean version of Heroes throughout the world and therefore is much more of a crossover party, festival and parade than anywhere in the world. This is because there is more of an inclusive community here in

Auckland. For instance, the party is for anybody who loves to dance. And the parade now is not only watched by a gay audience; there are Samoan, Maori and little children waving wands. So Santa better watch out.” ...Founder of *Out!* magazine, now in its 25th year “Having started the first openly gay business in the country, it’s gratifying to see the fantastic change in views and attitudes which allows Hero to take place... It’s really important.” ...Producer and presenter of *Queer Nation* “It’s about visibility. You look on the news and you see [Americans] wearing T-shirts saying ‘God hates fags’ and you realise it’s a hard won freedom. It’s only in recent history we’ve been able to come out of the closet and cloak rooms and cloisters and say who we are and be publicly proud of who we are. That can only be healthy. On a personal level... I remember... [a]ll those guys in the 80s I knew... who are dead... now... of HIV/Aids... So it’s about celebrating our visibility and our hard-won freedom and remembering.” ...Kamo Cafe proprietor and an icon among gays “For me as a straight person, Hero represents an individual thing: each and every one of them is a hero to me. It’s a chance to be able to celebrate who you are, celebrating each and every hero within us all.” ...Former chair[person] of the Hero project “I’m pleased to see the Hero parade back, it’s not only a good thing for the gay and lesbian community, it’s great for Auckland. It’s time Auckland stepped up and embraced it. I think Hero contributes more to the sense of social inclusion and normality than any other event in N[Z]...”

...Aids charities have yet to receive money raised during... the previous... Hero Festival... [(which began with) an \$80,000 deficit()]... and are giving organisers – believed to be facing debts of more than \$100,000 – until tomorrow to pay up. The Hero project is calling on the public to help it out of its financial woes. Its trustees went into an emergency meeting last night to discuss finances and creditors have been asked for a 90-day credit period... Charities were to have got 70[%] of the money collected during the Hero Parade... The amount raised during the parade – which attracted 200,000 people to Ponsonby Rd – had been “terrible” and [t]he... Hero project director... said last night that organisers would pay the charities when they could... A spokes[person] for the charities... said they... would discuss their next step tomorrow... The festival [has been] expanded this year and the budget for the parade and party alone [i]s \$300,000. The cost [i]s to be met by corporate sponsors, party ticket sales, merchandise sales and donations... [The director] said that like any growing company, Hero would “at some time experience some cash flow difficulties.”

...As the Hero Parade marks [its final] celebration of gay pride in [NZ, the Herald] speaks to one of the world’s most famous homosexuals... APPROACHING the towers of Manhattan, on the expressway from John F Kennedy Airport, you might well be reminded of the moment in *The Wizard of Oz* when Dorothy and her friends get their first glimpse of the Emerald City. Here is the place where dreams come true, but where success or failure is balanced on the fulcrum of a lucky break. If Manhattan could double as the Emerald City, then to whom might we turn to be its presiding Wizard...? The tinfoil crown of New York’s principal seer and underground analyst must surely rest on the violet coiffure of... an 89-year-old English[person] living on the Lower East Side, who has described his occupation as “breathing”, but whose life as “a self-evident and effeminate homosexual” has entered the mythology of modern times... “Happiness is the only thing which I can understand... so I can tell people how to be happy”... [says the guy who for] 66 years... wore a mixture of lipstick, powder and bruises as [it] struggled to survive – by his own admission incapable of forming any loving relationship – in a London which took his undisguised homosexuality as the justification to jeer at him, spit at him and beat him up daily, if not hourly. [The queer] worked as a commercial artist, a part-time prostitute and an art-school model before his autobiography, *The Naked Civil Servant*, was made into a play for television in 1975... In a rare case of literally overnight success, [the queer] became as famous and admired as [it] had once been obscure and despised: His “Case” was taken as the perfect temperature reading of England’s social climate across the 20th century. By 1981, [the queer] had moved to New York, fully engaged in what [it] describes as the profession of “being” – writing, acting, but principally being himself for a new generation of acolytes who took the defiance of his individualism as a streetwise, post-punk and glamorous form of existentialism. WITHIN the counter-culture, gay or straight, his perseverance has made him heroic. Today, [the queer] still lectures to packed halls – but... still lives, as [it] always has, alone in a single, filthy room. “After four years,” [the queer] once declared, “the dust doesn’t get any worse.” Now, listening to him as [it] sits in his little room, aware of the peevish hissing of the scalding radiator, the piles of dusty books and the limp net curtains black with grime, one begins to realise that [his] philosophy on life has been derived from simply sitting in coffee shops and talking. “...the reason why I came to America is that I need a constantly changing audience, because I say the same thing over and over again. Recently, I went to Portland... and said the same things – but it seemed new to them because they had never heard of me... In that sense, I am like Wall’s ice cream or Hershey Bars – always the same. I am infinitely visible; I go on to television and... [people] cross the road, at risk of losing their own lives, to say, ‘We saw you on the telly’ – and their faces are glowing. It is all you can do not to reply, ‘Bless you my child.’ But all I have said is this: That you should find out who you are, and do it like mad. Style is being yourself, but on purpose. And this is what I tell people, but I don’t know that it’s the secret of life. I don’t know in fact, if life has a secret...” [His] autobiography revealed a mixture of pragmatism and generosity towards the hardships of a life which was neither distinguished by artistic genius nor sweetened by money... And yet *The Naked Civil Servant* (recently re-published, by Penguin, as a Modern Classic) was only written because someone remarked that it might make a bit of money. “An art master at Maidstone said to me, ‘You despise art because you are a work of art,’ and so I smiled and lowered my eyelids. I am an autifact; I am self-creating...” Within his 66 years of struggle, prior to his celebrity, [it] found friendship with a succession of misfits and bohemian outcasts: A disabled suburban girl who became a nun, her unfaithful Czech lover who fell in love with [the queer] before hanging himself, a nagging young [guy] called Thumbnails and a paranoid civil servant... [But the] frozen core of his desire [was] reserved for the “Great Dark [Guy]” of his dreams, whom [it knew it] would never meet because the rampant heterosexuality of this “real [guy]” was essential to his perfection. “...Homosexuals don’t have ambitions, only daydreams. In America everything dates from the Stonewall riots (when police raided a [gay] bar in New York City on 28 June 1969, causing the bar’s clientele to riot and sparking the Gay Rights movement), and weren’t they lucky that it all took off in a pub called the Stonewall? Suppose you were compelled to say, ‘Yes, I was there on the barricades of the Pig and Whistle’? The queer populace has to move further and further forward, so as to vent its discontent; so they look around for something they’ve been denied and insist on having it. The armed forces, for example! I have said to my gay friends: ‘Do you really want to be a killing machine?’ And they... replied: ‘Well, I would be prepared to shoot someone if the circumstances were right’. And I say: ‘Soldiers are not people who shoot someone if the circumstances are right! Soldiers long to kill and that is why they are soldiers’. And why do gay people want marriage? I used to think that the hatred of [guy gays] was due to an envy of their freedom, because [gay]s are always making love to people they really fancy, whereas real [guys] are always making love to someone they find thoroughly distasteful – forever! But now gay[s]... want to be married!” ...[the queer] entered his 90th year on Christmas Day, sharing a birthday with You Know Who. As the witness of nearly a century of change, [the queer] is more than “the stately homo” [it] described himself to be. Now making his way down East Third Street in a long, fur-collared coat, with a blue silk scarf around his delicate neck, [the queer] is like an Edwardian dandy who might just survive to see the 21st century... “I am now waiting for death... and as long as it comes fairly soon, I shall be content.” ...[By the way, t]he reason so few accept suicide ended a lengthy career that included the worldwide TV smash *Kung Fu*, and, latterly, a starring role in... [the] *Kill Bill* films, is not so much to do with a lack of any note as with the position of the rope that killed... David Carradine... Suicides tend to put a ligature around their necks and let gravity take its course. But Carradine’s rope not only encircled his neck, but his wrist and penis as well. This is strongly suggestive of auto-eroticism, a private procedure dangerous enough to kill hundreds of [guys] in the U[S] each year. The idea is that temporarily cutting off the supply of oxygen to the brain will heighten the effects of a sexual climax.

...COMING out as a gay tourism mecca has some locals of a heartland community seeing red rather than pink. Youths fired stones at ...a... [businessperson’s] Kiwi House a day after the transsexual... persuaded fellow shop owners to declare Hokitika the world’s first officially gay-friendly town. But hours later [the transsexual] received flowers and a bottle of bubbly from supporters. The 60-year-old – who has a NZ Order of

Merit – suggested Enterprise Hokitika take the gay-friendly stance for economic reasons. “My promotion is not to turn Hokitika into Sodom and Gomorrah and have rooting in the streets... What I’m saying is that you have high income earners come and visit your town and leave some money behind. The gay travel agents are looking for destinations, so let’s put Hokitika on their map.” But not all of the townsfolk are eager for the pink dollar. “There are plenty of words floating about – Homotika, Gaymouth and Westpool – and letters in the local paper say we don’t want these sort of people in our town. But we’re not going to fly six-foot flags from the roof or anything,” [the transsexual] said. “We are going to supply smallish pink triangles for shops to put in a corner of their windows. Most have said they will put them in, but there are one or two who are anti.” [The transsexual] doesn’t know the extent of Hokitika’s gay community. “I don’t mix in the gay community. I suppose I’m gay. I had a sex change operation 30 years ago – what does that make me? ...There are gay people in business, there are a few closets. But that is not what this is about. It is simply adding to the already strong tourist trade. I think Hokitika folk are doing pretty well. It’s a pretty vibrant sort of place but I know a market I can tap into because I have a knowledge of that market obviously, so why don’t we tap into it? And I have. And it’s working.” [The transsexual] says for every gay person there might be an extended group of 50 straight family and friends. “We’re saying this is a tolerant town, come and visit us.” *Locals have their say...* Cafe Fix owner, 35: “I think it’s a great idea as long as it’s acceptable to the gay community.” ...owner of jewellery store the Gold Room: “There is no issue at all. It’s simply a media beat-up. We are just like any other small town.” But [the jeweller] will not be putting up one of the campaign’s pink triangles in his shop... [A] cleaner: “There are only a small lot of gays in Hokitika and they’re very nice people. But I wouldn’t promote them.” ...retire[e], 76: “It doesn’t really worry me what they do. If they want to be gay they can be as long as they keep away from me. I had to whack someone on St Patrick’s Day when [a guy who] was dressed up... tried to kiss me.” ...Westland[’s] mayor... 54: “Clearly this is a decision made by Enterprise Hokitika. The council has not been involved but Hokitika is friendly to all people.”

...“I was... a gentle person. I didn’t like rugby. I preferred to sit and talk and have friendships with girls,”... By 14 [it] was sexually active with [guys] and by 16, h[ad] come out to his family... Around this time [it] started dressing in [gals’] clothing and by 18 h[ad] started taking hormones... [It had] heard about sex change operations, which weren’t performed in N[Z] then... “The operation became this big thing that would solve all my problems but it seemed to get further and further away. Saving up... was the hard part. That involved prostitution and to sleep with those guys I needed to be off my face on drugs... – and there went my money.” Then in 1981, at the age of 20, [it] was approached by two [gals] from the Assembly of God church... Overwhelmed by their acceptance of him and disillusioned from the lack of love and support in his life, this meeting prompted [him] to become a Christian... [It] started working for the Salvation Army scheme, which is how [it met his future wife]. They couldn’t have been more different. [The gal], a virgin, came from a stable but very sheltered upbringing and was expecting a life of spinsterhood, looking after her crippled mother... While the attraction wasn’t mutual at first, [the guy] persisted and eventually they became great companions, which culminated in [his] proposing... Despite opposition from both of their families and their church, the[y]... went ahead and got married. Two sons and two daughters... later they are still happy together... • Many gay[s]... and lesbians disagree with the theory that homosexuality or transsexuality can be “reversed”.

...A reputable American study has... concluded that homosexuals who undergo “reparative” or “reorientation” therapy can change their sexuality.

...**HOMOSEXUALITY IN HISTORY** Long before the first *Pet Shop Boys LP*, [guys] were eyeing up other [guys]... ■ **ANCIENT ROME** Homosexuality was rife, but only slaves could be penetrated, and a law, the *Lex Scatinia*, forbade the master from being the passive partner. In fact, the biggest insult you could throw at a free [person] was: “Your breath smells of your slave’s semen!” However, the plays of Plautus hint that most courtiers ignored these rules behind closed doors, and Emperor Otho was known to massage his beard with bread pellets in an attempt to stop his stubble grazing his ma[sculin]e partner’s inner thigh. By AD533, the Emperor Justinian – concerned that the citizenry was becoming to fay – banned gay lovin’ on the grounds that it “caused earthquakes”. ■ **ANCIENT EGYPT** Anal penetration was out, and the thought of being “somebody’s bitch” made Egyptians feel so uneasy that a word for homosexuality was never even invented. This fear was inherent throughout Egyptian myth: the god Atum boasts that one of his rivals has “no power over me, for I copulate between his buttocks”. However, the Egyptians saw no problem in “pitching”, and would take great delight in sodomising their enemies on the battlefield before cutting off their penises to take home as souvenirs. The pharaoh Merneptah once returned from a tussle with the Libyans with a booty of 6,359 uncircumcised shafts. ■ **THE MIDDLE AGES** Not exactly the golden years for buggery. The church decreed that any clerics caught cassock-lifting could face castration or be hung by their “virile member”. The ruling barons were anti-gay too, and suspected Edward II of having an affair with a page boy when the king became obsessed by French fashions and poetry. [The king] was soon murdered by having a red-hot poker rammed up his arse... ■ **ANCIENT GREECE** According to the historian Ephorus, Greek boys could expect their first encounter with another[guy’s love]-milk at 13. A lad would pair with an older [guy], who would take him into the mountains for hunting, philosophy – and fellatio. [Guys] would go on to marry in their twenties, but keep a ma[sculin]e partner for trips to social functions and the gymnasium. In turn, all [fathers] wanted their sons to be desired by their pals. In Aristophanes’ *The Birds*, one irate father exclaims to a mate: “This is a fine state of affairs. You meet my son all fresh from the bath, and you don’t kiss him or feel his balls! And you’re supposed to be a friend of ours!” ...foreign boys were often smuggled home from wars... to serve as catomites.

The ancient Greeks thought it quite natural and normal for an older [guy] to be sexually attracted to, and have an affair with, a younger [guy], usually an adolescent (but not a minor – pederasty was not permitted). Such affairs were not considered incompatible with concurrent heterosexual affairs or marriage. The Greeks in fact did not, as we do, divide people into homosexual and heterosexual; rather, bisexuality was recognized as a norm and in literature and philosophy at least it was extolled as the pursuit of beauty whether [masculine or feminine]. Elaborate conventions surrounded such homosexual affairs. The older [partner], the lover or *erastes*, pursued the younger [partner], the beloved or *eromenos*, not too forwardly and with proper respect for the conventions of courtship. The *eromenos* was expected not to be too forthcoming in his response but at least to show some gratitude and affection; only much later would the relationship lead to sexual gratification of the older [partner] by the younger. Long-lasting homosexual affairs... were not all that common. Usually when the younger [partner] reached adulthood the affair ended. [Greek guys] were not backward in expressing their erotic feelings towards other [guys]... Plato portrays this erotic side of Socrates in several dialogues. However, as the speech of Alcibiades shows at the end of the *Symposium*, Socrates’ erotic desires... towards the bodies of beautiful... [guys] were... more... towards their minds, as his resistance to Alcibiades’ sexual advances shows. The *Symposium* also indicates that... homosexual affairs could be of educative value. Through associating with an older [guy] who was educated, who displayed the virtues, and who was successful as a citizen of Athens and as a soldier in the defence of Athens, a younger [guy] could hope to learn much that would benefit him in his future.

Adequate sex education should be provided that would include ‘information on the physical, psychological and spiritual aspects of human sexuality. Young people should be informed about different forms of sexual behaviour, including heterosexuality, homosexuality and chastity, and... be free to make their own moral choices. They should be brought up to understand that they may experience heterosexual or homosexual feelings or both, and taught not to discriminate against others because of their sexuality’... [A] gay activist, argues very strongly for the abolition of the homosexual as a distinct category of person: Instead of exclusive heterosexuality and exclusive homosexuality, and in place of self-identified and separate heterosexual and homosexual people, lesbian and gay liberation affirmed the universal potential for everyone to experience both the homosexual and heterosexual dimensions of their personality. Given the plasticity and social determination of human sexuality, if the institutional restrictions and ideological pressures against gayness were removed and if [gayness] were positively promoted as an equally valid form of sexual

and emotional expression, then [gay] experiences could become part of the typical range of erotic desires for the whole population, on a par with heterosexuality.

One of the basic instinctual drives is for sensual gratification. This drive is called “libido.” During the first year of life, the highly developed nerve endings in the mouth provide the greatest opportunity for libidinal gratification. By the second... year... the nerves of the anus have also become sensitive to pleasure, and anal activity is the focus of libidinal energy... The genital stage of psychosexual development follows the anal stage.

With his introduction of psychoanalytic theory... Freud initiated a revolution in thinking about human motivation and personality... According to Freud, development is governed by unconscious drives and instincts... To Freud, development was a discontinuous process that proceeded in a series of discrete stages. In each stage, certain biological forces play a central role in organizing how the infant and child relates to the world. In the first phase, the *oral stage*, which covers the first year of life, the infant is preoccupied with activities such as eating, sucking, and biting, and with objects, such as food, associated with the mouth... Freud assumed that the infant derived great enjoyment and satisfaction from these oral-related behaviors. In the second year, priorities change and the *anal stage* begins. The infant... is now involved with anal activities. At this time, too, parents are concerned with toilet training. In the third year, and until approximately the fifth... the infant’s focus shifts... to the *phallic* or *Oedipal stage*; the child’s sexual curiosity is aroused and attention is drawn to the genitals. Pleasure from stimulation of the genitals is discovered. At the same time... awareness of... sexual anatomy, and particularly of anatomical differences between the sexes, begins. In this period, boys experience the emergence of the Oedipus complex, which consists of sexual feeling for the m[um] and jealousy of the [dad] and rivalry with him for... [her] attention. Girls, in the Electra complex, experience similar dynamics in relation to their parents but to a less severe degree than boys. Freud called the next stage the *latency period* because [Freud] believed that sexual drives are submerged or latent in this period. It is partly to avoid reminders of sexual feelings that occurred during the phallic phase that children avoid relationships with opposite-sex peers and become intensely involved with same-sex peers during this period from 6 to puberty... Finally, in the last period, the *genital stage*, sexual desires reemerge, but this time more appropriately directed... As in earlier stages, the onset of biological changes – in this case puberty – plays a significant role in defining the focus of the particular stage of development. According to Freud, the ways in which each of these stages is managed by the child will have a profound impact on the later adult personality... [– e.g.], infants who have unsatisfied needs for oral stimulation may be more likely to smoke as adults.

As long as it doesn’t lead to a disease or injury, homosexuality between consenting partners should be considered a harmless type of behaviour (from a moral perspective, eating meat is far worse). But homosexuality (together with the harmful or exploitative sexual activities such as paedophilia and bestiality; plus the bizarre activities such as masochism, necrophilia, having sex with dildos, blow-up dolls, vacuum-cleaners, etc.) isn’t something that interests humans – only HBs, plus species such as *alligators, cows and geese*. Regardless of whether a person becomes gay by genetics, personal choice or due to a Master Plan, the easiest way of defining homosexuality is to say: children are sexually immature emotionally and physically; gays are sexually mature physically but not emotionally. To paraphrase Freud: gays are guys who never got over the *anal stage* of development! Of course, ‘not all gays are interested in anal sex’ (some may suffer from haemorrhoids, or know ‘the anus wasn’t designed for intercourse and all types of infections may result’), in which case it could be said that the gay hasn’t got past the *phallic stage* (i.e., the gay’s fascination with its own penis develops into a fascination for penises in general; or the gay’s inability to do everything it wants to with its own penis – e.g., fellatio – causes it to seek out other penises). Other alleged causes of homosexuality (e.g., domineering mothers) also satisfy the definition as they would have had a retarding effect on the child’s emotional development. In addition, most gays could just be sexually lazy (i.e., it is generally easier for a guy to give sexual pleasure to itself or another guy than to a gal). Ironically, as with transsexuals, during their childhood many gays began thinking of themselves as being that way because they were sensitive and not interested in rugby, fighting or other boyish activities – which suggests that at the time they were actually displaying more of their potential to be human (i.e., gender-neutral, possessing a blend of masculine and feminine non-physical characteristics – r:p1878, ln66 + p1925, ln17) than other boys of the same age. Unfortunately, they never fully developed that potential – probably because they spent most of their time wondering about whether or not they were gay!

Though many of the above points apply to lesbians, gal homosexuality is more complex than guy homosexuality because more gals are turned off guys as a result of having bad experiences with them than vice versa. However, an inability to realise that not all guys act like untamed animals is a form of emotional immaturity. Other lesbians may simply have found sex with guys unsatisfying – but the previous statement can also be applied to this scenario (i.e., just because all of the guys a gal has slept with were sexually inept doesn’t mean that all guys are sexually inept – after all, a guy can do everything sexually to a gal that another gal can, and then some!).

An adult can be *sexually immature emotionally* without being gay – for example:

My fiancé is 21 and still has wet dreams. Is this normal? I [’ve asked him who [it] is dreaming about and [my guy says it] can’t remember. The thought that [my guy is] getting aroused by another [gal] makes me crazy with jealousy. [Your fiancé is] simply having a young [guy]’s physiological response to a fleeting sexual thought while asleep, and... hasn’t a drop of conscious responsibility for this. No doubt [it’ll] outgrow bed wetting soon. Meanwhile, you’d better outgrow silly jealousies and stop badgering him for doing something [it] can’t control any more than sneezing!

Actually, wet dreams aren’t simply *a young guy’s physiological response to a fleeting sexual thought*. Older guys can have them as well, and they don’t always follow a fleeting sexual thought or any kind of erotic vision. Wet dreams are most often caused by lack of sexual activity (including masturbation) – as a guy’s body doesn’t stop producing sperm just because it isn’t having orgasms! After a period of time (e.g., a month) the build-up of sperm is such that the testes have to get rid of the excess. However, wet dreams aren’t the only means of expelling excess sperm – if a celibate guy’s body is in sync, sitting on the toilet may cause its brain to send a message to the testes that tells them this is an opportunity to clean out a dollop of the old swimmers, either with or without urine, and without requiring the penis to be erect (although some people might prefer to have wet dreams – as they can seem extremely realistic at times). Incidentally, considering how many guys allegedly fail to wash their hands after going to the toilet, the custom of shaking hands when greeting other people would seem to be unhygienic – although encouraging everyone to wash their hands is a solution, it might be easier to discourage people from maintaining a custom which, since the end of the days of knights (‘in the days when arguments were resolved by hand-to-hand combat, being left-handed gave people the benefit of surprise over right-handers’) and gun-slingers, serves no useful purpose but may cause many contracted illnesses. The only greeting one needs to give to platonic friends or strangers is a smile or a word or two (e.g., hello, hi, howdy, giddy, good-morning – assuming that’s true).

Instead of allocating workers a set number of sick days each year, every worker should be given time off to have medical check-ups (including examinations of their teeth, eyesight and hearing). ‘British pilots used to have to complete physicals every three months, now every month’ – but for most people one or two check-ups per year might be sufficient (kids also need to have annual or biannual check-ups – so working parents may have to be allowed time off work to go with them, especially if a grandparent or other suitable adult can’t go instead – and younger children, particularly pre-schoolers, probably need more than two check-ups per year). Such check-ups could be designed to include as many tests as possible – the aim being to identify any medical problems (including vitamin or mineral deficiencies) before they become serious. Most tests can be carried out by taking a blood sample (current blood tests may be ‘able to detect up to 50% of cancers’; ‘a blood test has been developed that can be performed without needles’) – so

blood samples ought to be taken each visit (the Health Ministry should also take extra blood to store for donor purposes – although utilising synthetic blood for medical emergencies and operations might be more practical) – while checks that can't be done via blood samples (e.g., brain scans) may only need to be carried out biennially, every three years or longer. People who are on long-term medication could receive enough of a supply to last them until their next check-up (unless the medication is perishable). Check-ups needn't be compulsory for people who aren't on long-term medication, but only a fool (i.e., an HB) would decline them!

Each suburb should have a central medical centre where people can go to have their check-ups, and where recuperating patients can stay close to home (unless they're able to be cared for in their home); which ought to mean that each district only needs one genuine hospital – where operations and intensive care (including treatment of contagious diseases) can be carried out. Furthermore, instead of making people who feel sick travel to their suburban medical centre (SMC) to see a doctor, SMC doctors should always make house-calls. If the patient needs a prescription, the doctor can arrange for that to be sent to the house (but the doctor's vehicle could carry basic medicinal supplies, as well as basic medical equipment); if the patient needs to be hospitalised, an ambulance can be sent to the house instead. Preferably, SMCs and hospitals will normally be able to provide each patient with a private room.

SMCs would need to have enough doctors on duty to be able to cater for expected demand (doctors can revise or improve their medical knowledge during periods of low demand, or assist in cleaning and other general activities). However, if SMCs have two streams of doctors working during the daytime – one stream being available for housecalls, the other performing general check-ups – one or more of those performing check-ups could delay that work in order to assist the housecall doctors when they are over-extended; and doctors from neighbouring SMCs can be called in during the night-time hours when only housecall doctors are on duty. Alternatively, check-ups could be carried out by nurses or technicians – and SMC doctors can act as their assistants when not on housecalls.

Historically, when citizens go to hospital accident and emergency departments they are examined or treated by unfamiliar doctors. Therefore, nobody should be concerned about not having the same person perform its check-ups or housecalls. However, if the people doing check-ups are always rostered on the same days each week, it ought to be easy – unless the structure of check-ups requires patients to be seen by a series of different doctors, nurses or technicians (e.g., one for a blood test, another for a scan, a third for a physical) – for patients to book the same person, if that is their preference. They could also request a specific doctor each time they order a housecall, but it is unlikely that their favourite doctor will always be rostered on when they feel sick. In most instances, though, it should be possible for patients to request a guy or gal doctor – depending on their preference. By the way, there is no longer any justification for guys to train as, for example, gynaecologists or mid-wives!

Although SMCs could have birthing rooms, babies ought to be delivered in the mother's home – unless a delivery is expected to be complicated, or the baby is premature, in which case the mother will have to go to her district hospital. Homebirths should minimise the number of babies born whilst in transit to a clinic (or hospital), and the potential for babies to accidentally or deliberately end up with the wrong parents, be abducted, etc. – although simple security measures can also largely eliminate these events. Incidentally, to eliminate all or most of the risks associated with vaccinations, health practitioners would need to ensure that a child *with a particular genetic make-up* is never administered a vaccine which will give it an adverse reaction.

It may be impossible to completely eliminate medical mistakes, but doctors could always use computer programmes to gain second opinions – thereby minimising the potential for misdiagnosis – and, as the industry becomes less pressurised (due to supply of medical treatment generally matching then surpassing demand), the number of mistakes made during surgery or post-operative treatment are likely to decrease as well. A lot more thought should be given to post-operative care (e.g., patients who have had haemorrhoids removed ought to be put on a liquid diet until their wounds have healed). Note that if everyone received the type of care given to injured professional sportspeople, the majority of patients will recover faster than they currently do!

Ideally, each district will have the capacity to be able to treat every known medical complaint locally (r:p863, lns70-1). However, rarer treatments could continue to be performed only in a few districts – in which case patients (and some or all of their immediate family) would need to be temporarily accommodated by the relevant district. Specialist medical teams (and their equipment) could be sent from district to district, but it's normally more efficient for such teams to remain in one place – because the time the team spends on travel and setting up can be used to treat more patients. There is also the option of surgeons in one district operating on patients in another district via telecommunications and robotics (r:p2147, ln18).

While incurable medical complaints continue to exist (or the available cure remains unsatisfactory), the people who have the complaint could be used as guinea pigs – which, if necessary, can be classified as their full-time employment. This infers that the use of animals in medical experiments should be stopped immediately – unless the animal develops the same complaint naturally (obviously, testing on an animal is valid if this is necessary for veterinarians to save its species from some kind of disease or other life-threatening medical condition). It is far more useful for society to experiment on people who have the relevant complaint than inducing the complaint in animals, healthy university students or the unemployed, and leaving the genuine sufferers in limbo! As long as satisfactory controls are maintained or implemented, the experimental treatment is unlikely to make the patient's condition any worse than it already is – and, even if their condition doesn't improve at all, the knowledge gained from that lack of improvement (or from the worsening of their condition) is likely to play a valuable role in eventually obtaining a cure (i.e., such patients ought to consider themselves obligated to participate for the sake of future generations). Likewise, the use of animals to assist disabled humans is barely justifiable today (e.g., although it is less companionable, a '\$NZ4,000 sonar that tells what objects exist within a 4m arc of blind people' is obviously far more efficient to produce and maintain than a guide dog – r:p1066, ln40). AIDS, cancer and Down's syndrome patients are encouraged to swim with dolphins (because their 'sonar is 4-times more powerful than human sonar-cell therapy'), and in Turkey cirrhosis is allegedly cured by 'allowing a certain fish to nibble at the skin of sufferers' – but it should be possible to imitate the latter treatment, and increasing the power of human sonar-cell therapy would mean that patients don't need to swim with dolphins (although 'just being around dolphins generally makes the patients feel better – and the dolphins, who are accessed in the wild, are happy to oblige').

It would be ideal if every illness could be cured simply by prayer or the touch of a holy person. Unfortunately, that scenario is unlikely to ever become reality. Therefore, society will always need to train doctors and nurses, and produce medicines and medical equipment. Furthermore, while our environments and fetuses continue to be affected by harmful products, and people continue to directly harm their own bodies as a matter of choice, diseases will continue to be a major problem and cause of premature death. But if the environments and people's bodies can be cleaned up, and most medical problems are identified then treated before they do irreversible damage, the demand for healthcare should decrease (i.e., society may be able to cope with having less nurses and doctors – the 'rate of physicians per 100,000 population in the US increased from 184 in 1980 to 210 in 1988' – although the decreased demand for medical personnel might be completely offset by having a thorough check-up system), and most people would die peacefully in old age. In instances where a person can't die peacefully, euthanasia ought to be an acceptable option for people who have a valid reason (confirmed by a council of relevant people – i.e., senior medical professionals, the patient, its family and friends) for wanting to terminate their own life.

The Health Ministry should insist that the practice of burying dead bodies comes to an end. It is a wasteful use of land and other resources, and is based on beliefs that are ignorant. Whenever someone dies, the body ought to be sent to the district's main hospital (unless it is already there). If any organs or other body parts are suitable for use in transplants – assuming that there will continue to be a need to perform transplant operations (less premature deaths would, however, affect the supply of suitable bodies) – they could be removed (following the autopsy if one is required), then the remains can be cremated. The hospital would need to have one or more rooms where family and friends of the deceased can meet and farewell the body, but there shouldn't be any kind of plaque or memorial produced to acknowledge the dead person's life – the dead ought to only live on in the memories of those who loved them (and if no one remembers a dead person, then that is its own fault!). Eliminating burials means there will be no call for coffin-making and associated forms of employment.

MAKE

Whereas the earlie[st principle guiding human society] *compares* goods, and does so not by means of the reason only, the late[st (or postwar) one *compare*s the... economic... value... of wares, and does so by rigid unqualitative measures... The... system of values... is reduced exclusively to quantities, whereas the important point about “goods” had been their quality. - 1962

Another characteristic of postwar technology has been the progressive substitution of relatively nonbiodegradable synthetics for natural materials, and energy-costly materials and operations for less energy-intensive ones. Examples of the former are the substitution of nylon and polyester fibers for cotton[(which, around the middle of this century – when ‘annual world production averaged about 45 million 500-lb bales – was used for 90% of the fiber employed in clothing and numberless other fabrics’)], wool, and silk, and of detergents for soap. An example of the latter is the replacement of lumber and steel by aluminium for building and packaging materials. Natural fibers depend ultimately on a renewable energy resource, sunlight, whereas the synthetics rely on fossil fuel derivatives for their manufacture. Unlike the natural fibers, which are subject to decay by molds and bacteria, and thus return to enrich the soil, synthetic fibers and polymers are extremely resistant to decay[(e.g., nylon – ‘a strong light polymer that may be produced as filaments, bristles, moulded objects or textile fabric – is resistant to destruction by bacteria, fungus, insects, and rodents’)]. Synthetics end up either being burned (thus contributing to atmospheric pollution) or accumulating as essentially nondestructible rubbish (contributing to environmental degradation). Plastic packages and containers, aluminium cans, artificial fertilizers, synthetic pesticides, detergents – the consequences are similar in each case. They consume energy when they are made, and they damage the environment after they have been used. Technological gains bring economic benefits but are accompanied by severe social and environmental costs... The... developed countries, whether their economies are planned or free, contain less than 30[%] of the world population but produce approximately 85[%] of gross world product... [The US], with only 8.5[%] of the total population of the free-market economies, produces almost 45[%] of the total GNP of the [free] world. - 1976

Every year the mines of the free world produce around three thousand million tonnes of ore ready to be processed for metals and minerals – quite apart from coal production and ignoring the necessary waste rock and overburden which accompanies mining. This amount of rock would be yielded by a tunnel 3m... in diameter driven 3 1/2 times round the world at the equator, and reflects an average demand of about one tonne of ore per annum for every... [adult] and child in the free world... As minerals are the raw materials which have given rise to and support our complex civilization, we... [need] to exploit the Earth’s not unlimited resources with wisdom and foresight. - 1977

God created the earth and its fullness for all the people of the earth... Its resources are not meant just for those with the economic, political or military power to take them for themselves. The Scriptures are definite about this.

...The Industrial Revolution was in part powered by the resources of the New World, by way of the fertility of virgin soils and the removal of forest from much of North America. This, combined with [UK] iron and steel... meant... we were exploiting several hundred years of accumulated riches, and it will take as long or longer for them to accumulate again. Also, the I[R] is still exploiting natural resources, in the form of minerals, on a planetary scale. Here the period for accumulation is of the order of... millions of years, and there is no hope of ever accumulating this stock again.

...resources can be described as exhaustible[if they] consist... primarily of concentrated deposits of fossil fuels and metal ores, which are dispersed and modified by use. They are not literally consumed, since an atom of copper or cobalt is never actually destroyed. But they may be so degraded or dispersed by use as to be, effectively, used up. The resources I call degradable can, in principle, be reused forever with proper care. This is not true of the metals and fossil fuels deposits. Admittedly, the distinction between degradable and exhaustible is fuzzy. For fuels, normal use means combustion. Here the degradation is inevitable and essential to the process. No fuel can be burned twice. However, many metals, in some of their applications, can be used again. In fact, some items like gold jewelry, lead automobile batteries, steel rails, and copper tubing or cable are nearly 100% recycled. On the other hand, other uses of the same materials are seldom or never recovered for secondary use. For instance, gold paint or gold plating for electrical switches, tetraethyl lead in gasoline, tungsten welding bars, incandescent light filaments, coatings for TV tubes or fluorescent lights, silver compounds used in photographic film, titanium, zinc, chrome or lead pigments, iron nails, copper sulfate fungicide, and scores of other metal or metal-containing products are virtually irrecoverable. Since large fractions of every finished material are ultimately lost or dispersed as such, one can roughly relate the rate of consumption of scarce materials to the rate of approaching exhaustion... The effective stock at a given moment is the amount that is discoverable and recoverable, based on the current technology of exploration and extraction. As the technology improves, the recoverable fraction grows in relation to the total amount in the earth, but at a decreasing rate. Eventually it must approach some upper limit, which is the ultimate stock. I should add, however, that the ultimate stock... can be defined to take into account the recyclable fraction of the scarce material. Recycling may extend the available stock considerably in some cases, but since there is always some loss in use, the ultimate stock is still finite unless there are natural biogeochemical cycles that are capable of renewing the supply indefinitely... For some materials, at least, the ultimate stock must eventually be exhausted... However, technology offers one “out” from the apparent dilemma of inevitable exhaustion, namely, the possibility of substitutions between materials or, more significantly, between the uses of materials... Copper was once used for roofing and sheathing the hulls of wooden ships. It no longer is. Aluminium, a much more abundant metal, has already replaced copper in many applications, including high-voltage electrical transmission lines... Brass, an alloy of copper, is rapidly being replaced by other materials, including aluminium, for all sorts of hardware applications... The telephone industry... has worked out the technological problems of voice and data transmission by means of modulated light beams transmitted through tiny glass fibers and amplified by lasers – a system using virtually no copper at all. The fibers are made mostly of silica, a material in unlimited supply... [P]lastics (notably PVC) developed by the chemical industry are already beginning to replace copper water pipes. As a consequence of these accumulated technological changes, the world copper industry is already facing the prospect of a long-term glut – not a shortage... For extremely demanding structural applications, there are also exciting new high-strength materials becoming available, consisting of very fine filaments or fibers of carbon, beryllium, quartz, or boron embedded in a plastic or ceramic... Natural rubber was once the sole basis of automotive (and other) tyre production. It was thought to be a unique and irreplaceable product on which a number of industries depended absolutely. [But ‘a guy named Grenville Williams had discovered *isoprene*, and in 1879 a French chemist converted isoprene into a rubber-like solid. When WWI cut the Germans off from natural rubber, they experimented and produced *methyl rubber* in the first synthetic rubber factory. After the war, chemists gave up making synthetic rubber, since natural rubber was very cheap.’ Natural r]ubber was derived from the sap of a tropical tree... growing wild in West Africa and Brazil... [‘Columbus saw Haitian kids playing with

black rubber balls made from the juice of the *hevea tree*. Rubber is a material that has the wonderful ability to stretch and return to its original shape over and over again. It also is an excellent insulating material for electricity.' 'Crude rubber is formed into sheets and its strength and elasticity are improved by vulcanization with sulphur. Hard rubber requires about 30% sulphur.'] **For a while the rubber barons enjoyed a monopoly, and... Manaus on the Amazon... was, briefly, the "fifth richest city in the world."** But its wealth was ephemeral: The seeds of rubber trees were smuggled out, and raw material production was shifted to rubber plantations in such places as Malaya and Vietnam, where output could more easily be controlled. By 1940 most of the world's rubber supply came from... Indochina. When Japanese military expansion threatened Southeast Asia at the beginning of [WWII], it appeared to many that this event would deprive the Western world of a unique... resource essential to rearmament! [US] policy toward Japan prior to Pearl Harbor was strongly influenced by this misconception. As we now know, the consequences of Japanese takeover were minimal as far as rubber was concerned. Within... three years natural rubber was largely replaced by synthetic rubber made from petroleum, and this substitution was not only swift but irreversible[– assisted 'by the discovery of a rubber synthesis called *copolymerization*'. 'Although less elastic, synthetic rubber has better wearing qualities. Synthetic and natural rubbers are sometimes used together to make the most of the best qualities.'] **...Quite apart from the possibilities of substitution for scarce materials, it must be pointed out that some materials are *not* scarce and will always be available and extractable. This is probably the case for some [fif]teen elements that are major constituents of air, seawater, crustal rock, and biological organisms... These elements... [– H, C, N, O, Na, Mg, Al, Si, P, Cl, K, Ca, Ti, Mn, and Fe –] are not all obtained right now from their "ultimate" sources, but all easily can be. There are also one or two marginal elements, such as sulfur, that are quite widely distributed on the Earth's crust and might conceivably be added to the list. One could add nickel and copper, which will be available in very large quantities from deep-sea nodules as a by-product of manganese. Note that basic components of plastics (carbon), glass (silica), and ceramics (silica, lime, alumina) are all abundant. Plastics need *not* be produced from fossil hydrocarbons, although it is convenient to do so; they can be manufactured from other organic materials[– especially *cellulose*, which is 'the essential material of the cell wall in plants, serving for strength and support. A white, opaque carbohydrate insoluble in water, it is nearly pure in the fiber of cotton, linen and hemp, and is the main constituent of wood. Boiling with dilute sulphuric acid changes it into dextrose. Nitric acid converts it into nitrocellulose, the base of celluloid. With acetic anhydride it reacts to form cellulose acetate, which is made into plastics and other products. With caustic soda and carbon disulphide it becomes the viscose which yields artificial silk (*rayon*).'] ('In contrast to this mechanical process, the SILKWORM'S *enzymes* change the cellulose into a protein from which it spins silk' – 'an ounce of eggs will produce about 30,000 larvae and with good management they should produce 12 lb of silk, consuming a ton of mulberry leaves in the process'; note that researchers are currently trying to replicate 'one of nature's strongest materials – spider's silk.')** Another 'artificial fabric is Nylon, which is made of furfural found in corn cobs and oat hulls, and was developed in 1938 by a chemist who combined two organic chemicals – *hexamethylene-diamine* and *adipic acid* – by forming POLYMERS of them. Many plastics are formed through polymerizing simpler chemicals. *Polymerization* means joining together small molecules into larger ones under the influence of heat and a catalyst. The high polymers are of particular importance. High polymers include rubber, protein, starch, wood, and hormones. Plastics are either *thermoplastic* or *thermosetting*. Thermosetting (hardened by heat) plastics such as Bakelite, Textolite, Urea-formaldehyde and Melamine-formaldehyde, are obtained using raw materials such as air, water, limestone, coal, oat hulls and fillers. Like casein, celluloid (which was discovered about 1869) is a thermoplastic – it can be softened again and again by high temperatures and remolded. One of the earliest products produced from cellulose was *Cellophane*. *Cellulose nitrate* is made into explosives, varnishes, oil cloth and leather substitutes, and other artificial fabrics. All synthetic fibers and fabrics are made of *monomers*. There are true synthetic fabrics and human-made fabrics. In true synthetic fabrics the monomer is chemically made out of inorganic compounds. Human-made fabrics are made of organic monomers. Molded synthetics are made by mixing the monomer and a catalyst with a solvent and then freezing the mixture. When the solvent is evaporated, a clothlike material that doesn't have to be woven results. The newest synthetic fabrics, the eutectics, are formed by roasting a synthetic fabric such as rayon. The results are pure stretched carbon crystals called whiskers. They are used in the cones of rockets, heat shields, the metal skin of airplanes and in the new F.R.P. (fabric reinforced plastic). Some day plastics may be used in place of metals in the building of houses' – although steel won't] **ever be in short supply. Most of the intrinsically scarce alloying elements such as nickel, chromium, molybdenum, and niobium are probably replaceable by combinations of other elements such as silicon, aluminium, titanium, and nitrogen... The problem with mining is that the ancient method of underground mining is now rapidly being replaced by the open-pit or strip method, which facilitates the use of very large machines and is much less dangerous to the workers. However, the resulting scars to the Earth's surface are very damaging. In regions with heavy rainfall they can lead to serious erosion and acid drainage problems that affect the downstream river valleys. In extremely arid regions only the scenery may be affected, but this too is a permanent loss... Techniques for restoring the land surface after open-pit mining have been perfected in Europe... With care, the end result can, in some cases, actually be an improvement on the original. However, it is much harder to restore the land if mining is not carried out with eventual restoration in mind. Thus old strip mines in most places tend to be permanent unhealing wounds in the Earth. Moreover, restoration requires ample water to establish a vegetative cover... The process of winning and smelting metals from their ores has also left extremely long-lasting scars, particularly in the neighborhood of copper, silver, lead, or zinc refineries. All these are mainly found in combination with sulfur and extracted by a process that typically includes roasting... in which the sulfur is recombined with atmospheric oxygen and driven off as gaseous sulfur oxides... [T]hese gases are highly water soluble, and... quickly combine with any water droplets in the air to form... sulfuric acid... Mountain valleys where copper smelters have long been located tend to look like the surface of the Moon. Nothing green grows for miles around – nor will grow for decades, even long after the... smelting stops. Lead and zinc smelters also tend to poison their surroundings with arsenic and/or cadmium-containing dust. These are highly toxic... Silver smelters once saturated the neighboring area with mercury vapor. Now they use a different process based on an equally toxic chemical, sodium cyanide... Placer mining... is another technique that is extremely damaging to the land. Whole mountainsides are deliberately washed away by high-pressure water jets to dislodge and capture a tiny metallic component. Yet long after the miners' fortunes have been made and spent, the fertile downstream river bottom lands lie buried under sterile gravel heaps.**

...the early [detergents] were not biodegradable and led to foaming problems in rivers; later ones were made biodegradable and therefore do not persist long enough to give a foam problem. There is evidence that this may be just sweeping the problem out of sight, for many modern detergents encourage bacterial growth by the very fact that they are a foodstuff for them: this can lead to a great increase in bacterial numbers which may alter the biochemical balance of a waterway. - 1979

[Biodegradable detergents were developed in response to consumer concerns.] **Citizens also fought corporate energy waste in the form of one-way containers and bottles, which use 3.11 times the energy of returnables. New laws banning one-way containers in Maine and Michigan have saved 5.5 trillion BTUs a year, the equivalent of 40 million gallons of gasoline. Container litter was reduced 82[%], and total solid waste was down 4.5[%]** (many detergents and similar products are now distributed in plastic refill bags as well as plastic containers, thus enabling consumers to top up an originally purchased container then throw away the bag – which takes up less room in the local landfill than a discarded container)], **and four thousand new jobs have been created at a savings to taxpayers of \$15 million... [Incidentally, we] are... learning fast in mass-consumerist societies that overemphasis on material things diverts us from achieving fuller human maturity. Here it is interesting to contrast the views of human needs held by economists and psychologists. While economists see human needs in material terms, not only food, clothing, and shelter but actually postulating that material needs and desires are, *in principle*, insatiable; psychologists, on the contrary, see most human needs as *nonmaterial*: acceptance by others, self-esteem, loving interpersonal relationships, the challenge of useful and interesting work, the desire for meaning, purpose and harmony,**

and the urge to pattern and make sense of our experience... An expanding calculus of self-interest, increasingly coterminous with group and species "self-interest," culminating in the holistic perception of oneness with the global ecosystem, is characteristic of this progression toward maturity. - 1981

"The golden rule[," said Gandhi, "... is resolutely to refuse to have what millions cannot[have]... The first thing is to cultivate the mental attitude that will not have possessions or facilities denied to millions, and the next immediate thing is to rearrange our lives as fast as possible in accordance with that mentality... so... one [does] not possess anything which one does not really need. It would be a breach of this principle to possess unnecessary foodstuffs, clothing, or furniture... In observing this principle one is led to a progressive simplification of one's own life." - 1982

In order for all of the present population of the world to reach a standard of living equivalent to that of the U[S] in 1970, it would require extraction of some seventy-five times as much iron as is now extracted annually, 100 times as much copper, 200 times as much lead... 250 times as much tin, and increases of similar orders of magnitude in the production of many other basic resources... The explosion of our capacity to produce a multitude of material goods and services which accompanied the Industrial Revolution has brought unprecedented benefits to the peoples of the [First W]orld. It has also made it technically possible to improve radically the conditions of life available to the entire human population. Despite this, economic and political barriers continue to prevent the two-thirds of the world's people who live in the [Last W]orld from realizing these benefits. Today, the mass market in the [First W]orld for whom the mass production was designed has been largely satisfied, if not over-saturated. Most of the unsatisfied needs in [First World] societies today are of a non-material nature which industry rarely searches out as they do not accord with its traditional industrial logic. The remaining large unsatisfied markets for material goods and services are principally in the [Last] World where people cannot afford them. But response of our industrial machine is to expand its markets by creating new wants and new appetites amongst the people who can afford them. We are thus caught in the paradox of having created an industrial system able to meet the basic needs of all the world's people but in fact using it largely to foster further growth in the demand by the wealthy minority for goods and services well beyond what we need or is good for us. Perhaps worse, this forced new growth is increasingly illusory. Illusory because the industrial-economic system we have inherited aims at the largest possible production of the most simplified goods. Thus competition, which has been vaunted as the essential condition driving our systems to offer greater and greater choice in the market place, has gradually lost that function. In fact, it has been reversed. The financial need for large production makes innovation into a dangerously expensive risk. To avoid risk, competition increasingly pits almost identical products against each other in sectors where basic markets have already been established. The principal differences within that competition are in presentation and publicity. In other words, this forced growth is not real; it simply offers greater and greater quantities of increasingly similar products – which is to say, of fewer and fewer real products. This system, like the bicycle, can only maintain its equilibrium when it is moving forward at sufficient speed... The great backlog of unfulfilled basic needs in the [First World] countries together with the massive reconstruction required following the two world wars of this century gave our industrial system a dynamic momentum which has now receded. There is nothing in prospect that is likely to see this momentum renewed in the foreseeable future. We... could... now... be in a period of degeneration for western industrial civilization... Social degeneration has always been marked in history by overkill through concentration on quantity rather than quality. This was true in ancient Greece where concentration on quality was a sign of the civilization's innate rigor; its subsequent degeneration being marked by encrusting that quality with a plaster-like over-emphasis which eventually dragged the society down... At the end of a long siege, Athens eventually fell to Sparta because of an epidemic caused by the polluted... water... running... through the city... In seventeenth and eighteenth century France, [there]... was a very real decline in the actual quality of life during that period as exemplified by the disappearance of adequate sanitation and water supply systems, even in the palaces... Medieval Europe's inability or unwillingness to deal with the waste produced by a growing urban population led to an increase in rats which carried the plague which in turn proved so destructive to that society. Degradation of water systems in China in several periods led to disastrous floods, rivers changing routes, agricultural disasters, followed by revolts and the collapse of the empire. Similar circumstances affected the histories of Rome and of Egypt... Interestingly enough, the decline of efficient sanitation and water systems has symbolized the decline of societies since before the Greeks. One of the effects of our society's concentration on production has been... the pollution of water systems in [First World] countries, the decline in the quality of water available for consumption, especially in urban areas, and... the abandonment of water systems in the [Last] World... - 1983

The opinion leaders we surveyed are pessimistic about... the future. They believe, and I share their belief, that unless current efforts to correct the waste-dumping problems are intensified, the outlook for the environment... is bleak. For example, here is a list of some of the problems currently facing my own state of New Jersey, as compiled by *The New York Times* (June 19, 1983): • ...More than 45,000 barrels of chemicals stored in Elizabeth have exploded and left toxic debris that hasn't been cleaned up. Storm sewers are contaminated, and the waterway between Elizabeth and Staten Island hasn't been checked for contamination, as of this writing[– although the]... state... has warned [people] not to eat striped bass, bluefish, white perch, white catfish, or eels more than once a week if they've been caught off sections of the coast... • About 50,000 chemical drums filled with toxic wastes are buried in Burnt Fly Bog and Lone Pine... Burnt Fly lies above the water source for 150,000 people. • Radioactive contamination has been discovered in Sheffield Brook in Wayne, where children play... • There's a marsh full of mercury near Giants Stadium in the Meadowlands. The source... is a nearby processing plant. The area is regarded as the world's worst case of mercury pollution. - 1984

We are entering the final years of the twentieth century with a planet at risk. Around the world we face a crisis in reality. It is an invasion, not from outer space, but from ourselves; in the way we have over-exploited and degraded the Earth. We have ignored warnings about causes. Now – all too late – we are desperately reacting to effects... However, we need not be without hope. New understanding and policies could see the human race working together as one. But we will need to be content with sufficiency, not affluence; quality, not quantity... Industry and technology must play a major part in willingness for new attitudes. Technology is not the enemy. To call for a "non-technological age" would be futile... and would disown the whole course of human evolution. Used with ingenuity and conscience, technology could be the instrument to save planet Earth... [Some] companies... have revealing stories to tell about their part in helping to keep our environment safe for the future... Last year, Lever-Rexona substantially reduced the amount of raw packaging materials by substituting reusable one-tonne bags for 50kg bags[, and]... will shortly begin selling commercial Handy Andy in a big 20-litre bag-in-a-box... If it is successful, other products will follow... The company recycles plastic waste to be used in new plastic products. Lever-Rexona is introducing identification codes for the base of all plastic bottles to help with sorting for recycling... The company is installing a new recycling system in its... factory to deal with the liquid effluent from the detergent powder manufacturing process, instead of discharging it into the sewage system... The company stopped using chlorofluorocarbons... for aerosol propellant last year... Back in 1976 when people didn't know about the ozone layer or... CFCs... [someone] made a major decision which, in retrospect, was visionary. As the head of S. C. Johnson Wax, [that someone] made a worldwide edict banning the use of CFCs in his company's aerosols. The move came after his research scientists told him there was a possibility the chemicals could harm the ozone layer. The mere use of the word "possible" was enough to make S. C. Johnson Wax... provide alternatives. The company invented the "water-based" aerosol system that uses... hydrocarbons... But S. C. Johnson Wax didn't stop there. The company says whilst hydrocarbons are a far better and completely safe alternative

to CFCs, they're not sure hydrocarbons are the ultimate solution. Currently, its researchers are looking at other propellants because they believe there are even better substitutes waiting to be discovered. Today... people have learned that in order to have the advantage of aerosol cans, they have to exercise common sense, because the aerosol – like the automobile, or even a simple stepladder – can be dangerous if not used properly... But S. C. Johnson Wax [also] believes that aerosols are good and useful, otherwise they would not manufacture them... Like most people, you probably do not give a second thought to the batteries you use in your portable sound system, camera, children's toys and the countless other battery-powered devices around your home. But if you consider the fact that your home is just one of the... million households in N[Z], it does not take long for those discarded batteries to become a mountain. As a nation of environmentally conscious people, N[Z]ers are becoming increasingly concerned about the potential impact of discarded batteries, because batteries use mercury and other potentially environmentally damaging heavy metals. Eveready understands that concern and company research scientists applied their years of knowledge to come up with better batteries. The result? Environmentally-friendly batteries that maintain the company's traditionally high standards of reliability and long-lasting performance. Eveready says its worldwide use of mercury has been cut by 97[%] over the past 10 years. Its current breed of carbon zinc batteries has a mercury level of less than 100 parts per million... Eveready... ultra-low mercury alkaline batteries... will be 99.975[%] mercury-free. However, the company says even that is not good enough, and continues research towards totally eliminating the use of mercury in all its batteries... Eveready believes it has a responsibility to minimise the environmental impact of its products. Eveready is committed to leading the way with technology to help make the Earth a cleaner, safer place... Committed to protecting the environment and conserving the world's resources, Reckitt & Coleman's new range of Down To Earth household cleaning products is designed to care for you and the environment. The range... are all biodegradable, phosphate free and have not been tested on animals... Wherever possible, the ingredients used... are naturally derived and include chalk, fruit acid and vinegar. The fragrance is another gift from nature – eucalyptus... The company believes we all have to start caring for a world that is worth sharing.

...[“Like telephones, cameras have become virtually universal items, with 91.9% of all US households owning at least one (between 1985 and 1988, the percentage of US households owning videocassette recorders grew from 20.9% to 66.5%). NZers] buy 200,000 cameras a year and take 140 million photos. Most of the cameras are simple point-and-shoot models[(increasingly they are ‘disposable cameras’ – designed to be discarded after they have taken one film’s worth of photos)]. But rarely does the amateur photographer capture that singular image that becomes more than a mere record, expressing for everyone who sees it, as [one] writer... put it in *One Time, One Place*, “something of our common feeling.” ...For... [the photographer who] once taught a class called “How to Look at the World[,”] ...the whole point of taking photographs [is] to gain a new appreciation of everyday life. “Celebrate the wonderful, ordinary things you see around you,”... One of [his] loveliest prints – of a tree’s shadow falling gently on a snow-covered field – hangs over my desk... It reminds me that seeing the world through the camera’s eye can make the joy of a passing moment eternal.

...[“How much is this moment worth? \$100? \$1000? The moments of your life are priceless. Are you saving them on the right film – *Kodak Gold*?”] ...while... our intuition... might persuade us to agree about the value of Nature’s ‘spectaculars’, it might not stretch as far as other offerings such as the anopheles mosquito and the tsetse fly... [V]alue is a quality invested in an object by human beings. In other words, objects are not the carriers of value; we are... [Ecologists] have set themselves the goal of... investing the environment with value... Reducing material consumption is an integral part of ecologism’s project and so the Green movement has... [to persuade] potential supporters that this is a desirable aspiration, [but] it is saddled with a series of intellectual arguments for its position that presently appear too weak to do the job required. The assertion... that a society organized around reduced consumption just *would* be more pleasurable to live in seems unlikely – in present circumstances – to cut the necessary ice. Likewise, the most favoured alternative strategy, the building of a theory of need, is notoriously difficult to carry out. How... [do we] arrive at the conclusion that washing-machines are legitimate objects but that electric toothbrushes are not? There is evidently a theory (or more likely an intuition) of need at work here, but how is it to be persuasively expressed? ...most expressions of theories of need are far too vague to be of much use: ‘needs [are] those things that are essential to our survival and to civilized human existence, wants being the extras that serve to satisfy our desires’... The problem with such a formulation is that, while it gives us an idea of the general differences between needs and wants, it does not help us concretely to fill out their content. At the same time, to be able to fill out their content in any universal sense presupposes that ‘fundamental human needs are finite, few and classifiable’... The obvious objection to this – that needs are historically and culturally mediated – can be partly met by saying that ‘fundamental human needs are the same in all cultures and all historical periods. What changes, both over time and through cultures, is the form or the means by which these needs are satisfied’... [However], the sense of scarcity that informs the whole discussion... generates another characteristic of the sustainable society to which most of its supporters will subscribe: a tendency towards egalitarian distribution of the material wealth that is available. Thus... ‘redistribution is a precondition for any transition to a stable society’, and, more fully... ‘If there are limits to the needs for which society can provide, their fair distribution is even more urgent... Limiting differentials between people is as essential as limiting economic growth and technological innovation’... Greens will insist that... basic answers can be provided only by... answering the following question... in the affirmative: ‘If something cannot be manufactured, built or grown without causing irreparable ecological damage, can’t we strive to create something to take its place, or simply decide to do without it?’

...The Greens’ critique of *what* is produced includes their rejection of armaments, wasteful packaging, dangerous chemicals, and frivolous household gadgets... The Green critique of *how* things are produced... addresses the problems of monotonous work... and... undignified working conditions... Moreover, the Greens advocate decentralizing production to bring it closer to local and regional markets, thus reducing traffic and saving energy. The necessity of such measures is also becoming apparent in the U[S], where distances are huge compared to... Germany and where more and more large enterprises suffer from excessive centralization... [– although] in some cases large-scale factories are more efficient... Many Green groups at the local level monitor the emission levels of factories to see whether they are complying with federal law, and some Greens have successfully initiated local ordinances in this area[– e.g.] a Green proposal in... Nuremberg resulted in that city’s becoming the first in... Germany to restrict the emission levels for its municipal power plant. Not only were nitrogen oxide and sulphur dioxide emissions almost eliminated, but a procedure was installed whereby sulphur dioxide is processed into nontoxic gypsum and sold to the housing industry. The... ecological measures proposed by the Greens flow from their rejection of purely quantitative growth – especially growth that entails environmental destruction. The fallacy of unlimited quantitative growth is eloquently exposed in their Economic Program: In 1950, 1[%] growth meant increased goods with a value of 1.9 billion [Deutschmarks. Today, 1%] growth brings... additional products with a value of 9 billion DM. To cure unemployment by means of growth – a method... Greens... reject... – would require a growth rate of 6[%] per year. This would mean that in ten years we would have to produce and consume twice as much per year as we do now... It requires only common sense to see that... this course... is neither possible nor admissible... In a mere blink on the timescale of human evolution, industrial society has been depleting and impairing Earth’s “supply system” at a phenomenal rate... [and USers] used more minerals and fossil fuels during the past half-century than all other peoples in the world throughout human history...

By any sober analysis conventional politicians and economists are apologists for the most excessive system of all-consuming greed in human history... As our economies grow, so the waste mounts up. After just a few decades of consumerism we are already running out of rubbish dumps... New York City once offered a local council in Cheshire \$1 million to dump its rubbish in the Manchester Ship Canal! Much has been made of the decline of traditional ‘dirty’ industry... but silicon can be just as dirty as smoke stacks. Information technology is by no means clean technology. Silicon Valley... has had its pollution scares. A computer-components factory in Thailand caused so much damage that the local population burned it to the ground... Soviet... industry produces 60 million tonnes of atmospheric pollution each year... If responsibility for eliminating pollution were

placed on those that caused it in the first place, industry would quickly find less polluting methods of manufacture... The next step is to... assume personal responsibility for the state of the planet... [by analysing] our own consumerism. Is what I buy really necessary, and do my purchases waste resources or damage the environment? ...Greens argue that the increasing use of gadgets like electric carving knives, power-assisted toothbrushes and automatic tin openers creates unnecessary waste and that such devices could be phased out without causing the able-bodied any real inconvenience. It is tragic that so much research is devoted to trivial electrical goods when the majority of our disabled citizens lack the tools they need to lead independent lives. An electric wheelchair gives genuine freedom rather than the illusory freedom so many of us think we have when we purchase quite useless products... We need to use less, rationing the content of the larder today and allowing it to be replenished naturally, instead of gorging ourselves today and leaving our children to starve tomorrow. An ecological economy would conserve, rather than consume, resources for the future. Non-renewable resources such as metals would be used as sparingly as possible and replaced by renewables wherever possible. The substitution of high-performance ceramics for steel components is one particularly exciting example... Potentially renewable resources, from rainforests to the living soil, would be used in a sustainable manner rather than ripped apart for short-term profit... In essence, a Green [society] would recycle all its elements so as to maintain prosperity on a long-term basis... Items such as fridges and cookers could be made to last for longer, repaired with cheap, standardized parts and reused, finally recycled so as to reduce waste while maintaining what we have. The average milk bottle is used forty times. If milk bottles, why not all other bottles? ...Smashing up bottles in a bottle bank is like throwing away after just one year something that has a life of forty years. A Green government would swiftly introduce a Minimum Packaging Act with specifications for packaging that would ensure that waste was minimized and that the shape of bottles was standardized to allow for maximum reusability... [(most NZers) will recall the days when they could return a soft drink bottle to the dairy and receive a refund[– f]or many children collecting and returning bottles provided an important source of pocket money[; t]oday, thanks to government reluctance to intervene in the marketplace, such incentives are history[– but t]he Ministry for the Environment has promised to review the waste problem in December 1991 to decide whether a mandatory deposit-refund system should be started[; m]eanwhile, across the Tasman, South A[US] is living proof that such a system works[– i]t has the highest beverage container recycling rate in A[US], because i]t is also the only state with mandatory deposit-refund legislation on the books[)]... In 1989 Avon County Council sent half a million tonnes of rubbish to a dump in Buckinghamshire at a cost of £14.35 per tonne. [Yet m]embers of the Bristol Green Party have pointed out that the scrap value of glass [is] £15 per tonne, paper [is] £12, light iron and plastic... £20, and aluminium... an extraordinary £600 per tonne... Sheffield City Council, which has introduced the first large-scale recycling scheme in the country, estimates that 40[%] of the city's population participates in some form of recycling and that if everybody reused 50 kilos of paper, this would save 250,000 trees every year. 10,000 homes in the city have been supplied with separate 'blue boxes' for organic, paper, glass and metal rubbish... A new Standards Commission... would make sure that consumer goods were produced in such a way as to maximize energy conservation, recyclability and long life while minimizing energy consumption and waste... A typical fridge uses 270 kilowatt hours of electricity a year, yet the best-designed models on sale... use just 70 kw hours... Better motors and seals would reduce the energy demand of a wide variety of appliances[, while]... the introduction of low-energy light bulbs into every British home would reduce energy demand by the equivalent of two pressurized water reactors... It would be possible to reduce the energy bills for commercial and home heating to a mere 5-10[%] of current costs, but this would demand the rebuilding of most of Britain to conservation standards, a task that would be... physically... impossible. [● 'Demand for salt and water is shrinking the Dead Sea.']

...the *Economist*... reported... [recently that due to Uzbekistan's] 'internationalist duty'... to produce cotton... the... Aral Sea[–]...the world's fourth biggest lake... [–] has lost over half its water in the past twenty years. The last fish died in 1983; fishing villages lie abandoned 40 miles from the receding coast; large ships lie beached on the giant salt flats that were once the seabed... Every year 75,000 tonnes of salt and dust are picked up by the winds from the dry seabed... and blown over the cotton fields. It will require billions of roubles merely to prevent the fields becoming deserts by the end of the century – by which time the Aral will be a series of salt puddles. The extinction of the Aral is likely to make the climate of Central Asia hotter and drier... [A]lready this crisis of nature kills Soviet citizens: two thirds of those living in the Kara-Kalpak republic suffer from liver disorders, typhoid and cancer of the oesophagus. Many children die within one year of birth... and... millions of people who cannot get unpolluted water... are forced to drink what is essentially dilute pesticide solution – and all because of a grandiose, and unsuccessful, scheme for cotton. - 1990

"I REMEMBER too clearly for my own good,"... said... [the] slight, gently spoken ship's captain [while] reminiscing about his career at the helm of *Albatross*, a scientific-research vessel. Suddenly, [the captain] wondered aloud, perhaps for the first time in almost 40 years, whether [it] could have found the courage to speak his mind that fateful July day in 1954. But the government officials did not ask his opinion of the plan – and to volunteer it would have been unthinkable. Barely a year had passed since Stalin's death, and the dictator's hand still lay heavy on the land. [The captain] knew little about the officials... who had arranged to use his ship for their first look at Lake Baikal in southeastern Siberia. They were, of course, well-informed. All Soviet schoolchildren were taught that Baikal is special. It is the deepest lake on earth, measuring more than 1600 metres from top to bottom, and one of the largest, 635 kilometres long by 80 wide. It holds one-fifth of the planet's fresh water – more than all of North America's Great Lakes combined. And it is so immense that if all of its 336 tributaries dried up tomorrow, its volume... could keep its one out-flowing river, the Angara, moving for close to 400 years... [The lake] sits in the planet's deepest land depression, a rift over nine kilometres deep that has been opening for at least 25 million years. Judging by the thickness of sediment at the bottom, Baikal has been there for much of that time, which [also] makes it the world's oldest body of fresh water – and its most interesting... In school, these [officials] had traced Baikal's elegant crescent shape and learned to call it the Pearl of Siberia and the Sacred Sea. Yet as days passed, [the captain] overheard enough of their conversation to know that they weren't admiring the lake so much as evaluating it, probing its shores for a place to put something. The officials were convinced that the lake's sparkling-clear, nearly mineral-free water, when run through the pulp of Siberian pines, would produce "super" cellulose for jet-aircraft tyres. To be sure, some chemical pollution of the Sacred Sea would result. But that was the price of keeping up with the Americans... Thirty-eight years later, [the captain] is still haunted by the sight of the Baikalsk cellulose-paper plant. "Helping to bring that monster to Lake Baikal... is the one great regret of my life." ...Baikal is a living museum of aquatic plants and animals... Fifty-two species of fish and more than 250 varieties of fresh-water shrimp inhabit the waters... *Epischura baicalensis*, a tiny crustacean, renders the water strikingly clear by straining out algae and bacteria. But water at the southern end of the lake tells a different story. Around Baikalsk, bacteria discharged by the cellulose plant contaminate some 200 square kilometres of water... All summer I had heard Russians... refer... to Lake Baikal in the past tense, as if it were already dead. Most scientists disagree with that dire conclusion, but there's no doubt that the plant fouls the area. Its airborne emissions make Baikalsk one of the most polluted cities in Russia. And biochemists worry that industrial wastes from the pulp-bleaching process may one day accumulate to toxic levels in the food chain. In 1957, when the public first heard about plans for the pulp factory, ordinary citizens banded together to fight it. Their protests were mostly ignored, but 30 years later, the Soviet government issued a decree protecting Lake Baikal. Among other things, it pledged that the cellulose plant would be "re-profiled" for activities harmless to the environment by 1993. Today, few believe that the government will actually shut down a top-producing plant. (Super cellulose never worked out, but the mill makes bleached cellulose for clothing.)

...[a 'Swedish mill makes chlorine-free paper by bleaching pulp with hydrogen peroxide (chlorine is one of the major pollutants of North America's Great Lakes'). Alternatively, the 'chlorine used to bleach pulp for paper production can be replaced by enzymes, as can chemicals needed in newspaper recycling' ('unbleached paper is cheaper, but it is yellowish in colour and turns brown and brittle in a few years'). 'Enzyme processing will revolutionize the field of chemistry. Enzymes will be able to duplicate the reactions of petroleum refining, plastics synthesis, and high-temperature reagent processes.

Combining with genetic engineering, enzymatics will command the lion's share of the fuel, plastics, and specialty chemical markets'. By the way, environmental benefits may arise once plants are programmed to produce polymers, enzymes, pharmaceuticals and other industrial raw materials. "Fifty years ago plants provided almost everything we needed, and then petrochemicals took over," explains [a scientist from] Michigan State University. "Now we're going back to plants, but with a lot of new tricks." [The scientist] has produced biodegradable plastic by inserting a polymer-producing gene into a bacterium. The next step: transfer the gene into potatoes or sugar beets, and eventually churn out plastic for only a few cents a kilo.

...the tropical forests produce from 1 to 3.5 kilograms of organic matter, dry weight, per square meter per year; the temperate-zone forests, 0.6 to 2.5 k[g]; the savannas and grasslands, 0.2 to 2 k[g]; and the oceans, from 0.02 to 0.4 k[g]s over their vast pelagic reaches and 0.2 to 0.6 k[g]s on the continental shelves... Alternatives to petroleum and natural gas, even for the supply of liquid fuel, are to be had from abundant supplies of other fossil fuels. There is even, without doubt, more petroleum to be had at much higher cost and risk to the environment in unproved deposits in the fragile ecosystems of the Arctic or the outer, deeper slopes of the continental shelves. They might stretch the petroleum age to the length of a full human lifetime... So long as the liquid fuels last, they will probably find their principal use in transportation... A wiser disposition of resources, if one could be devised, would save those molecules for better uses than combustion; they are the starting materials for the huge volume and diversity of industrial organic chemicals and plastics that serve so many useful (and sometimes essential) purposes... To the number of different organic chemical compounds currently marketed – a low estimate says 40,000; a high estimate, 70,000 – the chemical industry adds a conservatively estimated 1000 new compounds each year. In 1940, the industry shipped 10 million pounds of these chemicals. In 1980, it was shipping 80 compounds in volume exceeding 100 million pounds each and 100 billion pounds in all, a 10,000-fold increase. Much of this increase in poundage is accounted for by the tonnage of plastics. By volume, if not by weight, plastic materials bulk larger in the U.S. economy than steel. After one stop in the kitchen, a significant fraction of the output of plastics makes a large and imperishable contribution to the [USs'] accumulation of solid waste... [T]he U.S. economy continues to produce some 80 million tons of steel each year. [But what] counts increasingly in steel production is the tonnage of iron above ground. Except for a momentary rise in the consumption of new iron ore occasioned by the favored basic oxygen process, the steel economy is approaching steady-state recycling of its scrap. The [US currently] has 5 billion tons of iron above ground, 20 tons per capita. The rest of the [First W]orld has 10 tons per capita... [Incidentally,] less than 30[%]... of the... U.S... labor force remains engaged in... the production of goods.

...[an oligarchy of] rich capitalists and powerful commissars despoil the world and con the people into buying needless things when critical life-needs have not been met, nor even produced... To put it bluntly, capitalism (and socialism as well) have been socially blind in their pursuit of production. They've used up vast amounts of the planet's true capital, its resources and energies, and... poisoned vast sections of the planet's bio-regions in producing and over-producing the wrong kind of goods for the wrong kind of people... The oligarchy... have a far too privileged position in offices of governmental power, and this makes them blind to their own responsibility. They are far too rich and lead such incredibly opulent lifestyles that it makes them unaware of what life is like for 99% of the human race... Merrill, Lynch – one of their most prestigious firms, an icon of Wall Street and industrial capitalism – ran a brilliantly executed advertisement in the '80s that featured the catch phrase, "A Breed Apart." ...[i]t's a fitting accolade for the entire oligarchic stratum. They do not inspire the world with confidence that they, who are so "apart" – apart from nature and from others – can provide the creative, responsive and responsible leadership in these new times... They continue to charge forth in terms of the strengths and values (autonomy, instrumental rationality, macho self-importance) which they are used to. They are like a Goliath strutting about trying to convince the world that they are still "the greatest." ...Consequently, how would they respond to the following... requirements for business and government (assuming they could [be] convinced to listen to them)? ...The... requirements are: Ban all hazardous waste exports... Immunize environmental protection and health and safety laws from the General Agreements on Tariffs and Trade... so that they will not be overturned as nontariff trade barriers. Stop all pesticide use and make a transition to organic farming techniques... Stop all production of... CFCs... Expand governmental cost-benefit analyses to include the environmental impact of products and projects so that agencies no longer make choices without taking into account the full costs associated with their decisions. Build and maintain mass transit systems; stop the tax subsidies going to individual auto transport... Ban all nonessential use of plastic and asbestos... Mandate recycling for paper, glass and plastic. - 1992

RECYCLING has taken a rubbishing – so much so that a group of recyclers plan to make it an election issue. Many schemes are in danger of folding as material stockpiles, markets dry up, processes run at a loss and consumers shun expensive recycled products... Previously, recycling was treated as a business and only profitable materials were recycled. Now, there is a drive to recycle everything and it just doesn't pay... Some say the only answer is for the Government to get involved. RONZ (Recycling Operators of N[Z]) intends to lobby the Government to keep the industry afloat. [A c]ommittee member... says the Government should subsidise recycling, put levies on packaging, tax raw materials which can be replaced by recycled material and encourage the use of recycled products... Overseas some governments take a tough line, forcing councils, householders and industry to reduce waste and recycle. In N[Z], the Environment Minister has admitted the country faces a significant waste management problem and the Government has set a target of reducing waste by 20%. Its policy on waste management is voluntary, however, legislation may be passed if the voluntary approach fails. [The] Minister... says it's a step the Government is reluctant to take. [The minister] told plastic recyclers in Auckland: "I do not want to see N[Z] going down the same track Germany has taken in stringently regulating its manufacturers to control the level of waste. Blanket levies or other forms of taxation can often create more problems than they solve if not targeted correctly. I would prefer to see industry take the lead." There are many who would like the Government to get tough. One is... [a former chairperson] of the Auckland Regional Council's... works committee... [who] urges a co-ordinated nationwide approach to waste management. "A lot of councils are re-inventing the wheel. Everyone has their own idiosyncratic view on how to do it. No one is looking at the macro view or even the global view. Local authorities don't like being told what to do and until that weakness is dealt with, rubbish will continue to be a political football. The free market will not produce a good response. The Government needs to be involved in some way." Private companies have always competed to collect our waste. Now they're competing for the chance to throw it away. Disposal used to be controlled by councils who dictated where waste would go. Now, private industry is taking control. Companies own the two biggest landfills, are working part-share in a third and are about to open a fourth. Some councils are determined to hang on to control. Others want to hand the lot over to private industry. The three big players in the market are Northern Disposal Systems, Waste Management and Waste Care. Competition is so fierce workers are forbidden to talk or associate with staff from other waste companies. So just what effect will this competition have? Here's what the companies think... *WASTE MANAGEMENT*... already runs the bulk of waste collections, and its 84 hectare landfill in Redvale, Dairy Flat, is due to open this month. [The r]egional operations director... says running both the collection and disposal systems will allow the company to control its own destiny. It's a fast-growing company, buying three to four smaller refuse companies a year. Last year, it made an after tax profit of \$3,646,184 – up 16.8% on the previous year. [The director] wants to see councils get out of waste management. "Private enterprise is a lot more accountable than councils have been and there are greater reasons for doing the job properly. If we don't do a good job, we'll be shut down, so we have a vested interest in making sure we do the best job ever." And councils are too inclined to meddle. "Refuge is a complex subject and I don't think you can just pick it up by sitting around a council chamber at a low level debate and make those sort of decisions." ...*NORTHERN DISPOSAL SYSTEMS* plan to be around for many years. Time on its two

landfills, Greenmount and Rosedale, is running out, but the company intends replacing them with a waste disposal facility... The company evolved out... of the ARC's... refuse department and is now a private company owned by the Auckland Regional Services Trust. It also operates the Pikes Point, Constellation Drive and Devonport transfer stations... NDS is... not involved in waste collection, an area it's keen to be involved in. [The director] says competition means each company is taking less waste and that has put up the cost of operating landfills. Prices to councils will remain static for years. "At the moment, if you're not price-competitive, you're out of the race." NDS posted an after-tax profit of \$1,354,000 in the eight months to June 30... *WASTECARE*, keen to secure its future, is working on plans for a joint partnership with Manukau City Council to run the Whitford tip. The plan includes extending the site and running it another 30 years – a move unpopular with many local residents. Waste Carel[s] managing director... believes waste management should be done by private industry with regional and local councils setting the standards... [The managing director] denies suggestions private industry will ignore waste minimisation... Wastecare is a private company and [its managing director] is not prepared to reveal last year's financial results... *So where do our recyclables go?* ... • *Paper* In Auckland, most paper recycling is done by C[HH] through the Paper Chase collection and its Te Papapa mill... [T]he company recycles around 40,000 tonnes of paper, 25% of the N[Z] total. Now, they have about as much paper as the market can handle and... they are becoming selective about what grades they take. The big problem is glossy paper, the type used in magazines. It's uneconomical to recycle and there is no market for the end product... Apart from that, [the company's recycled fibre manager] says his paper recycling scheme makes money. Paper recycled through the Te Papapa mill becomes corrugated liners for cardboard boxes. Paper through the PRINT PAC-UEB moulded pulp plant in Otara becomes things like egg cartons and hospitality trays... [E]ach... *PAPER CHASE*... truck... is... owner-operated and contracted. An interdenominational trust, Children's Homes United Council, gets \$6 for each tonne collected and last year made \$200,000. Paper Chase runs a free household kerbside paper collection and is now starting to target industry. [The company's k]erbside manager... reckons they'll collect a record 28,000 tonnes of paper this year[but] believes this could double if all councils encouraged recycling... *PAPER RECLAIM*[the]... biggest commercial collectors of waste paper... picked-up 30,000 tonnes last year. But 20% of that was virtually useless... the problem is the low grade. Prices are so poor they don't cover the cost of freight. Paper Reclaim has 16,000 tonnes of low grade paper stockpiled waiting for the market to improve... [T]he stockpile may be dumped if they can't move it. Other grades are still selling and the company is now targeting them... • *Glass* ACI have the market wrapped up. It produces all container glass and operates the major recycling scheme. Last year, ACI recycled 9500 tonnes of glass, about 30% of the total in circulation. ACI[s] recycling manager... says the Penrose furnaces could handle much more and the company aims to collect over 10,000 tonnes this year. It is a financially fragile scheme engineered to match the price of raw materials. At the moment, it breaks even. [The manager] says... "There's always a cost attached to recycling. It just depends where you stand morally." • *Steel*... *STEEL CAN RECYCLING*... is a financial dud... [SCR's] national recycling co-ordinator... says the scheme makes "embarrassing" losses[but] won't reveal the figure. However... the scheme is here to stay, because they are obliged to recycle the cans they put on the market. S[CR] is the national management office for a recycling scheme initiated by members of the Steel Can Association of... [NZ. B]etween 10% and 15% of the three million steel cans used every year... are returned for recycling. Around 255 tonnes of steel cans are collected every month. These are sold to BHP/N[Z] Steel's Glenbrook mill where they are melted down to become, among other things, hot rolled coils or galvanised roofing... [T]here is a good market for recycled steel and Glenbrook could take double the amount currently supplied. With so few councils running kerbside recycling schemes, it's hard to increase the amount collected. SIMS PACIFIC METALS deals in scrap metal and collects around 200,000 tonnes of steel, old whiteware and car bodies which are sold to Pacific Steel in Otahuhu to be melted down and made into a range of steel items... [The company's] operations manager... says the supply of scrap is dwindling as dealers stockpile for export. As a result, S[PM] has to import scrap to meet orders. [The manager] says the company makes a profit, but it is becoming harder to do so. • *Plastic* MILK CORPORATION'S RAP (Return All Plastics) scheme is plagued by problems. It recycles most of the country's plastics through the scheme run in 400 schools. The scheme runs at a huge loss, only one grade of plastic has a market and the situation is likely to get worse. Of around 1300 tonnes collected every year, just 800 tonnes can be recycled. The rest is landfilled or stockpiled. The 800 tonnes is made up of two grades of plastic sent to A[US] for processing. However, A[US] has just announced it won't take one of those grades, just seven months after it refused to take any more mixed plastics. Corporation[s] food division general manager... says the market is saturated. "The A[US]n recycling scheme, just like our own, is getting stronger. Their tonnages, just like ours, are increasing. So I guess they're looking after their own backyard, before they worry about other peoples." The scheme cost the corporation \$1.75 million over three years because the collection costs far outstrip the price paid for plastic. And the price of virgin plastic material has nose-dived. [The manager] says they never expected to make money on the scheme and it's a bill they're prepared to pay. They... want school children to see them as a responsible company. "We are educating the customers of the future." Even so, [the manager] concedes recycling is probably not the right solution for the country's waste management problems. "...but I think at the moment it's a lot better than nothing." C[HH] has had a rough time with plastics. It was forced to shut its recycling plant after losing \$1m a year. The company is now negotiating to sell the plant. CHH is still recycling plastics from Waitakere City and Intermilk. Some is recycled for their own use, the rest is exported to China. The company is still losing on the deal. Plastic recyclers are pinning their hopes on a scheme being developed by NEXUS Packaging Systems to use a layer of recycled plastic in multi-layered Coke and Pepsi bottles. The scheme is revolutionary, as recycled plastic is not normally allowed in food or drink packaging. Nexus[s] technical manager... says... the process will just use carbonated drink bottles, but they hope to eventually use other plastics as well. • *Aluminium* COMALCO N[Z] LIMITED is taking a closer look at how to make its aluminium can recycling scheme pay. [Comalco's p]romotions officer... says the scheme had significant losses over the past four years. Initially, losses were in start-up costs, but the period of grace is over and the scheme must now at least break even. "For recycling to work as a long term option, it has to break even. No one can keep putting money into something that isn't profitable." Last year, Comalco collected 96 million cans. The number is dropping as other scrap metal dealers compete. N[Z] used 430 million cans last year. Around 47% of those were returned. Comalco's cans are processed at Inmetal Trading in Penrose and bundled into 25kg bales for shipment overseas, primarily to A[US] and Japan. Comalco has a remelt furnace in Sydney, where they are made into can stock again and sold to can makers. In Japan, the cans are remelted and used for car parts. N[Z] doesn't use enough aluminium cans to support a local remelt plant. • *Organic* RESOURCE RECOVERY is one of the main recyclers of garden refuse, and[its] director... says they can't work fast enough. The company processes 30 tonnes a day through its operation at Waitakere's Concourse transfer station and the Rosedale landfill. Out of that, it produces 800 cubic metres of compost each week... [I]t's taken three years to build up the business, now breaking even. Contractors pick up material which is put through a mulching machine. The blend is then piled in long rows and left to aerate for anything between 60 days to 6 months before it becomes compost ready for sale... "People are beginning to understand that recycling is important and accepting that it must happen"... • *Oil*: The biggest problem facing DOMINION OIL and its re-refined oil is lack of customer interest. The plant works at just 65% capacity, producing 6 million litres a year. [The t]echnical manager... says they are battling consumer perception that re-refined oil is inferior when the process is sophisticated and the price is similar to virgin oil prices. The other problem is that world virgin oil prices are very low. And refining plants overseas are subsidised making their final product cheaper... [Dominion Oil has] lobbied the Government for some concessions, but without success. The end result is that the process... only just... runs at a profit... *How we dispose of our rubbish* Most Auckland rubbish is dumped in landfills, the most common form of disposal around the world. At the moment, it is believed the most economical way to get rid of our waste. The Auckland landfills are: • *GREENMOUNT in East Tamaki*... [the] region's largest... taking 50% of Auckland's rubbish... Methane gas produced is used to generate electricity. It is the only site capable of taking hazardous waste. The site is

destined to become a golf course. • **ROSEDALE in Browns Bay...** receives around 16% of Auckland's refuse... Methane gas produced is also used for electricity generation... It is expected to reach capacity by the year 2000. • **WHITFORD...** • **HUNUA GORGE...** takes around 5500 tonnes of refuse a year. It is expected to last another 14 years. • **SNELLS BEACH:** ...First valley due to reach capacity in 12 months. Another two valleys are available to fill, [if] the... Rodney District Council... gets approval. • **HELENSVILLE:** ...Due to close in 12 months. • **REDDALE...** Has capacity to take 50% of Auckland's rubbish over the next 30 years. **OLD TIPS:** Many of the 120 in the Auckland region are thought to be leaking chemicals and gas. Councils have given the ARC a priority list of 26 old sites in need of attention, some 70 years old. All will be investigated and treated if necessary. **BALEFILLS:** They differ from a landfill – refuse is baled before being stacked on site. Waitakere is the only council operating one. It is due to close at the end of the year. The council is negotiating an extension. Gas is flared off but the council has called for proposals to use it. - 1993

Auckland primary school children will soon be learning that rubbish in dumps is not just a waste of space. Mercury Energy is developing school kits which explain how the company is generating electricity for 9000 homes from rubbish from landfills – and reducing greenhouse gas emissions at the same time. The school kits, being developed by professional educators, will link in with Auckland City Council's new recycling programme to show that smart thinking can turn rubbish into a resource – and help the environment. Mercury Energy pioneered the landfill gas generation in **N[Z]** which runs on the gas produced by decomposing rubbish. Rubbish is sealed in landfills like the filling in a pie. Wells drilled through the pie crust allow vacuum pumps to suck the gas out of the landfill, which is then dried and filtered before being fed to gas engine generator sets.

...To help raise money for the Cancer Society's Daffodil Day Appeal, **C[HH] Pulp & Paper – Fibre Recycling** co-ordinated the collection of old telephone books to be recycled. People were encouraged to bring their old telephone books into National Bank branches and from there the books were collected and shipped via rail wagons to the Penrose Paper Mill where they were converted into corrugating medium. "The response from the... public was fantastic," explained... Fibre Recycling's Christchurch Sales Representative. "In the past it has not been economical to recycle telephone books because of the collection and transport costs involved, but thanks to a special freight rate and support of many volunteers the project became possible." In total over 134,000 books (approximately 134 tonnes) were collected... includ[ing] telephone books from all over the world... [-] some dating back as far as 1956. A significant amount of money was raised... and plans are already underway for next year's collection.

...Daily, **[User]s** dispose of about 160 million tons of garbage – often sending it to China. Another] method of dealing with the enormous garbage disposal problem has been to build expensive waste incinerators, sometimes using the heat to generate electricity. Unfortunately, [while] the waste disposal problem is solved, an enormous air pollution problem is created... Every 100 tons of trash produces 30 tons of ash, which contains heavy metals and therefore qualifies as hazardous waste. But incineration could be minimized or avoided entirely by aggressive recycling... Recycling also reduces the amount of trash in landfills and generates no pollution; it... decreases the need to mine or harvest raw materials, thereby helping to save the environment... Over [75%] of the **U[Ss']** municipal solid waste is recyclable material. However, implementing recycling on a national scale is difficult. The problem is that some industries refuse to use secondary materials[, and t]here is little economic incentive for recycling... [But the] recycling of waste plastics, which account for about 40[%] of landfill trash, can yield a high-quality fuel oil to reduce the need for petroleum imports. In order to reduce the amount of garbage, our economy, based as it is on overconsumption and waste, would have to be overhauled... Manufacturers should be discouraged from making durable goods that don't last or that waste energy, and encouraged to use recycled materials whenever possible... In addition[, the]... system might be improved by... banning certain unrecyclable plastics and throwaway products...

SOME DAY, [a 60-year-old from] Yorkshire... might be mentioned in the same breath as Edison or Marconi. But for now the amateur inventor is relishing the mystified gasps... [being] elicited for his invention of Starlite, a new plastic that appears to be all but destructible. In one of the first displays of Starlite's heat-dispersing abilities... the shell of an egg... [was] slathered... with a thin coat of Starlite before... a welding torch [was turned] on it. The egg remained uncooked and even cool to touch. Pieces of Starlite have withstood temperatures of several thousand degrees and pulses from a laser. Its composition remains a secret, but [the inventor] insists it contains no exotic materials, and is easily produced. [The inventor] hit upon the formula in 1986, but the world began to take notice only after Britain's Atomic Weapons Establishment conducted tests in 1990. Scientists reported that a piece of Starlite a quarter of a millimetre thick survived simulated nuclear flashes that would have penetrated five-millimetre-thick-stainless steel. Now everybody from a Japanese bank-vault manufacturer to America's NASA is interested. Among Starlite applications envisioned... [is] a new heat shield for the space shuttle.

...[an expert tells us that an MIT forecaster erred in expecting the nose cones of re-entry vehicles to be made of heat-absorbing plastics, and came up with one of the most blatantly wrong forecasts, in expecting houses to be made of plastics. In 1964 the forecaster wrote: "For all but special buildings, the use of stone and brick will largely have disappeared by 1984, and happily we shall have passed out of the grey concrete age." One difficulty was that plastics became expensive. A more interesting snag in the forecast about the disappearance of concrete is the recent discovery that cement can be made stronger by squeezing it, to eliminate cavities. Cement looks like becoming a cheap, low-energy substitute for plastics; ballpoint pens, phonograph records and even springs have recently been made from cement, at Oxford University. Applied to concrete, the discovery will create much tougher and lighter structures. Another 1964 forecast was that humans are likely, in future wars, to stand helplessly by as a struggle rages between robot armies and navies, and air and rocket forces. That forecaster has become vehement about the misuse of engineering in general. "The best jobs for young graduates are all in weaponry," that forecaster says now, and has written *The Engineer's Conscience*, calling for the redirection of technology towards humane ends. His own concerns have shifted away from militaristic robots towards mechanical crutches for the disabled and remote-controlled mining equipment. And that may be why his prediction of domestic robots by 1984 was also wrong. Perhaps domestic robots did not materialise because that forecaster and others in the field were not fanatical enough about their idea of helping the homemaker to share the leisure that high technology could bring. Robots appeared first on the factory floor'.

...**'ROBOTS HAVE** long been stuck on the factory floor, welding car bodies and lifting heavy steel bars. Now they're breaking loose. Service robots, already at work in nuclear plants, are embarking on myriad new activities: taking care of the handicapped and elderly, cleaning offices and hotel rooms, guarding commercial buildings. In laboratories worldwide, hundreds of robots perform such intricate tasks as measuring and mixing minute quantities of chemicals, medications and DNA. The US navy is starting to deploy tethered undersea robotic devices with cutter-arms that snip mines' mooring cables. Other fields open for service robots include support in building and maintaining offshore oil platforms, assembling space stations, preparing fast food, sorting packages for posting and inspecting high-tension electric cables. As with almost any new technology, the major innovators are university labs and small firms – such as Transition's Research Corp. of Connecticut. Its founder is the "father" of industrial robotics and a driving force behind service robots. "The more stultifying, demeaning and downright dangerous human activities will be taken over literally by a new slave class," the founder says. A visitor to Transition's lab may be greeted by a squat, 1m-tall vacuum-cleaner robot rolling past the founder's office. Designed to clean supermarkets, factories and airports, it will sell for about \$30,000 – economical for a business the size of a small shopping mall. Transition's ultimate robot will be a \$77,000 household helper – assuming the company can raise \$33 million to develop it. This high-tech butler would prepare meals, clean, cut grass, even fix appliances. A snag: the lab hasn't worked out how to teach it to make beds. If researchers can get robots to see clearly and to understand where they are, it could make possible seeing-eye robots']...

THERE ARE ROBOTS that can see, hear and even talk. Now **A[US]n** engineers have created one that can smell. The electronic nose has been developed at the School of Microelectronic Engineering at Griffith University, Brisbane, and the Department of Electrical and Computer Systems Engineering at Monash University in Melbourne... Griffith University predicts the robots will revolutionise everything from polishing floors and

distributing office mail to finding victims trapped under earthquake rubble. Smells... can be detected and identified by coating electric sensors with other chemicals that react to that odour... Sniffing robots could deliver goods from a warehouse loading dock after a programmed "leader" robot had laid scented trails to various destinations. A series of simpler robot drones would collect goods and follow the trails like ants.

...ROBOTS THAT SLITHER like snakes and creep like caterpillars could one day help [us] by wriggling into places... [we cannot reach. A] professor of mechanical engineering at the California Institute of Technology in Pasadena, has developed such a multijointed device. Take exploratory surgery, for instance. The human intestine is between seven and eight metres long, and endoscopes can normally explore only 1.5 metres from each end. [The Pasadena] team built a robot about 17 millimetres in diameter and 25 centimetres long that uses airbags attached to each section to travel along tubes. The bags can be directed to fill or empty, creating traction on the tube's walls at key moments. Researchers have tested a prototype in a pig's intestine. [The professor] envisages snakelike robots... wriggling into the chest to help fit pacemakers... slithering into earthquake-damaged buildings to seek survivors... or... worming into toxic dumps to take samples...

Annually, Americans generate nearly 600 million tons of hazardous waste and wastewater, requiring up to \$80 billion for disposal and treatment. During 1990, the U[S] spent over \$100 billion, about 2[%] of its gross domestic product, on environmental cleanup. Over 1,000 sites on the U.S. Environmental Protection Agency's national priority list have been slated for cleanup... a number that is likely to double before this century is out... The disposal of mounting piles of waste generated by modern society remains one of the most perverse problems we face in the upcoming years... Landfills in most major cities are overflowing, and few new spaces are available... to put the trash. As the number of dump sites dwindles, the garbage continues to mount, while the growing population keeps on generating waste. Much of the garbage is composed of nonbiodegradable materials, like plastic, and remains in the environment for a long time. Most of the waste is trucked to already overflowing landfills and buried under conditions that do not allow it to deteriorate properly. Because of the high cost of the disposal of toxic wastes on land, coastal metropolitan areas worldwide dump municipal and industrial wastes directly into the sea. Much of the waste that washes to shore... [-] often resulting in beach closings in many parts of the world... [-] comes from... accidental spills by garbage barges, and lack of winds to disperse the flotsam. - 1995

Orange foam has oozed out of the old Devonport landfill site, issuing for several days from a [hu]manhole on a walkway beside mangroves at Ngataranga Park... The 3m-long pile looked like sponge but blew into the air like sawdust, irritating the eyes... said [a local resident], who pioneered a campaign which led to the closure of the landfill 2 1/2 years ago... An A[RC] pollution officer... said: "It looks pretty weird." ...Pollution experts from the A[RC]... and the region's leachate management contractors, Envirowaste Services Ltd, removed the foam... Envirowaste... said it was caused by a pin-hole leak in a leachate removal system's pump station, with the frothing caused by air being sucked into the leachate.

...Pollution experts are still trying to find the cause of a leak from the old Devonport landfill where orange foam is oozing through a containment wall. The problem has settled since last week... but there is still enough oozing to require daily mopping up... The A[RC] says the leachate is "not particularly nasty" but is keen to see the leak contained and stopped from reaching the harbour... The tip was contained and capped when it closed. Its liquid wastes are pumped into the North Shore sewage system.

...[a] Ngaruawahia pharmacist felt uneasy after discovering the volume of contaminants leaching from a tip in the river upstream from the town's water supply. After 10 years... [the pharmacist] lodged his protest against the Horotiu tip the best way [it knew how - the pharmacist] left town... "We're now on tank water supply. I did not want to subject my kids to drinking water from a river that contained leachate." [The pharmacist] is one of many people... who want the Horotiu tip closed when it comes under scrutiny later this year in a resource management consent hearing. [The] Turangawaewae Trust Board manager... said the marae did not want children swimming in leachate and demands the pollution stops. The tip was opened in 1985 by the Hamilton City Council to take rubbish from the city. But now it is becoming a regional dump, with garbage from Thames and Te Awamutu... [and m]anagement say rubbish coming from as far afield as Tauranga and Te Kuiti is likely... In 1994-95, the Horotiu site was taking almost 72,000 tonnes of refuse a year... The tip's riverside location was fortuitous for Perry[Waste Services], the contracting firm that manages the tip. An arm of the firm takes out sand from beside the river. The holes left are replaced by rubbish. But the landfill is regarded by some as a blight on the landscape and a typical example of the wider pollution cloud hanging over the Waikato River... The river rises from Lake Taupo and travels 330km to the Tasman Sea. It is the most intensively used water resource in N[Z], providing... hydro power... drinking water for 19 communities and 300 irrigation systems. There are 2700 permits for the discharge of wastes into the river, mostly dairy shed effluent. Nine communities, including Hamilton and Ngaruawahia, unload treated sewage into the river. [Challenge] Wood Panels, the Wairakei and Ohaaki geothermal power stations, Kinleith Pulp and Paper Mill, the Hautapu and Te Rapa dairy processing plants, Affco's Horotiu meatworks, the Huntly Thermal Power Station, Waikato Woolscourers and Waikato By-Products are major industrial plants that also discharge into the Waikato. The Horotiu landfill never had a water right. When it first opened, no discharge into the river was predicted. Clay linings in the bottom of the tip are supposed to keep all liquid in. Although everyone accepts the tip is leaching some waste into the river, debate rages on the volume... A 1995 Works Consultancy report estimates 19,433,000 litres of leachate a year is lost from the Horotiu landfill. But Perry Waste Service[s] general manager... insisted no leachate has been found downstream from the tip. Perry's has taken steps to improve the control of leachate. The clay liner was thicker, a rubber membrane would be put over the clay as new sections of the tip are commissioned and a pipeline had been constructed to pump leachate to a treatment station in Hamilton. "There would be 30 to 40 tips along the Waikato which have no linings," [the manager volunteers]. The city council remains committed to Horotiu... [and] expects it to operate for many years. "The Horotiu landfill is well engineered and monitored and has a reputation as one of the best landfills of its type in the country[," said the council's general manager, who also] said it could be argued a landfill well away from a river poses as much of an environmental risk. "...it is better [for leachate to] find its way into a river and quickly dilute than contaminate surrounding groundwater for an extended period." The biggest obstacle to the Horotiu landfill is probably Waste Management NZ... [T]he company was taking a keen interest in the Horotiu resource consent and would make a submission. [Waste Management's general manager] said its Redvale tip was established... in line with stringent resource management requirements and it was in the company's "commercial interests" to ensure other refuse operators were up to the same standard. "I believe they should shut it down and be forced to find another location... Waikato has a great range of old quarries which can be used as landfills,"...

Auckland could be generating more domestic and commercial rubbish... [by] the turn of the century... than the region's landfill companies can dispose of under existing operating conditions[- a]lthough waste companies are not saying so publicly... The quantity of waste dumped in the region climbed to 821,000 tonnes... [(of which) 501,000 tonnes or 5.9 tonnes per million dollars of [GDP] for the period... [was] commercial and industrial waste[)]... during the 1995-1996 financial year, a 13[%] increase over the previous year... [L]evels have climbed steadily... since 1992-1993, when about 530,000 tonnes of waste was buried... The good news is that waste minimisation and recycling appear to be making an impact on waste levels... Based on information available to the A[RC], 370,660 tonnes of material was recycled or composted... The Auckland City Council kerbside recycling scheme, celebrating its first anniversary next week, has resulted in more than 7000 tonnes of plastic, glass and cans being collected across the city's 120,000 households. The city council estimated that 60[%] of the... households are taking part in the kerbside scheme and believes the rate is "excellent" by world standards. But the council wants to improve on the number over the next year.

...The Auckland City domestic recycling scheme will celebrate its first birthday with a \$30,000 thank-you for users. Cards bearing a message from [the] mayor... printed on recycled paper, should arrive in 120,000 of the city's letter boxes at the cost of 25 cents each. But do not put them in the blue recycling bins, as paper is not collected. The waste minimisation unit manager for the city... said the... birthday promotion

followed an evaluation of the scheme which found that most users thought it operated well and was cost effective at \$6.40 a household a year... Those [households] who do not use the scheme would not be left out of the birthday celebration; the card doubled as a promotion for the scheme and has the bin info-line phone number on it... [A]lthough a high number of people used the scheme the council wanted more people to participate.

...A survey by the... [ARC estimates that m]ore than 9.65 million tonnes of... waste – about 10 tonnes a person – were generated in Auckland last year... [A]bout 9.5 million tonnes of the total was water-borne industrial trade wastes. This contained the equivalent of 13,390 tonnes of hazardous materials... The water-borne waste is treated in the region's sewage plants while 110,605 tonnes of other hazardous contaminants are put into landfills and 5392 tonnes are incinerated. Hazardous wastes are materials which have the potential to degrade the environment or pose a health risk to humans. A 1990 survey found only 45,000 tonnes of hazardous wastes were generated a year in the region. The latest survey, for the 1995 year, found about 8000 Auckland businesses produced hazardous wastes while 55 were involved in its collection, treatment or transport. The most common types of hazardous wastes dealt with... were from food manufacturing... Greenpeace said the survey results showed there was an urgent need for the Government to act on waste reduction measures before Auckland became a toxic time bomb... [and] the survey underestimated the amount of hazardous wastes generated, because it did not include stormwater discharges or emissions of air pollutants. Greenpeace... urge[d] the Government to bring in a polluter-pays hazard tax aimed at those who generate hazardous or eco-toxic waste... "It is Aucklanders, not the polluters, who are paying the cost of this toxic pollution with their health, polluted harbours and beaches, tainted air and poisoned lands."

...International traders are illegally exporting hazardous wastes into India... Greenpeace has said, "Every Indian port is a floodgate standing open and the world's waste traders know it. India is receiving the worst waste of the wasteful nations on the planet – the effluent of the affluent,"... The traders were defying a ban imposed by a New Delhi court in April on the import of toxic wastes for recycling, reprocessing or dumping in India... [D]ata for the last two years showed that India was unable to monitor and control its borders against the influx of toxic wastes, despite the Government claiming it had the situation under control... [In local news, t]oxic waste in the sediment of waterways needs to be monitored and charted so dangerous chemicals can be screened out in future, say scientists. Not all dumped chemicals are necessarily bad, but those that are can have a long-term effect... Identifying the bad ones has become a major project for a[n]... ecotoxicologist with the... Hamilton... [branch of the] National Institute of Water and Atmospheric Research... For the past 10 weeks [the Hamiltonian] has been working with... an ecotoxicologist from Wright State University in Ohio, who has previously worked on similar projects in Spain and Portugal. Together they have developed a method of making toxicity tests in the field, rather than having to take mud samples to a laboratory to check. [The USer], who returns to the U[S] this week, said... "Some of the worst contamination comes from the run-off from city streets... When you get concentrations of people and machinery... zinc, lead, cadmium and copper... are... the sort of toxic run-off you get. It all goes into the waterways and then settles into the mud where it gradually builds up." But in most... countries it was not the present activity that was the problem because much of today's industrial waste was taken care of properly. Rather, the danger was from the toxic waste dumped in the past when there were few laws and almost no understanding of the long-term problems from such material. "Some of our biggest headaches in the U[S] come from trying to clean up these old dump sites... In N[Z] the problem is not as bad as elsewhere in the world... You have fewer people, and a lot of water running through the country and around it... You also have more to protect here. The environment is so high-quality and pristine, and it would be wrong to have it contaminated."

...Clean, green image a load of rubbish THE environmental management and reporting standards of many N[Z] companies... often fail to meet the levels required... overseas[, says]... one of the authors of the Resource Management Act and... now the director of the environmental consulting unit for leading accounting firm KPMG... [- which] sponsors the Environmental Report Award, presented annually to the company that presents the best report on the environmental aspects of its business. This year, the award was won for the second time in a row by Auckland's water supply and waste-water treatment company Watcare Services – which... was the only N[Z] company to produce a full environmental report.

...As early as in 1986... it was estimated that humans took for their own use '25[%] of the photosynthetic product of the earth as a whole (land and sea), and 40[%] of the photosynthetic product on land'... A rule of thumb... is that each ton of final product, eventually to become garbage in many cases, is preceded by five tons of waste generated during manufacturing, and by twenty tons of it during initial resource extraction... During both the [extraction] and the manufacturing, toxic metals are scattered far and wide... In the mid-1980s, Britain and France were using sea dumping for nearly twenty million tons of industrial waste yearly, despite severe lack of knowledge about the environmental effects of the eighty thousand chemicals synthesized industrially... China generates five hundred million tons a year of industrial waste, dumping most of it just outside its cities.

...600 million Chinese – mostly peasants and young students – do not brush their teeth, according to the China Toothpaste Association. China's 1.2 billion people buy an average of fewer than two tubes of toothpaste a year, compared to an average of at least five tubes needed to keep basic oral hygiene.

...All around the world, people are voting with their feet – for China. Officials in China said the country was now making four billion pairs of shoes a year... "...so roughly 80[%] of the world's population wear Chinese-made shoes,"... China accounted for 40[%] of the world's annual shoe output, exporting mainly to Europe and the U[S]. By the way, in]... 1992... a small German company, Foron, develop[ed] the first CFC-free refrigerator technology – dubbed "greenfreeze"... After Greenpeace took the refrigerator to China, three of the four largest makers there... converted to greenfreeze. Yet a switch to greenfreeze technology was dismissed as impossible by every major expert in 1992.

...If you are an asthma sufferer your freezer could be your best friend. Freezing your pillow once a month will kill the house-dust mites that trigger attacks... [T]he practice of putting pillows, and children's soft toys, in the freezer is common in Scandinavian countries where they are more aware of allergies... The mites inhabit nooks and crannies all over the world and... excrete microscopic pellets which get into the inner cavities of the lungs and set up an immunological reaction in people with a predisposition to asthma. Some people are also allergic to the mites themselves but mostly it is the excreta that cause the problem... [The] International Study of Asthma and Allergies in Childhood... found high rates of [house mites] in Wellington homes, as well as in coastal A[US], where asthma incidence is high. The important thing is to get rid of them and... a member of the [study's NZ] team... suggests that washing bed linen in water hotter than 55 deg C will do this. But [a spokesperson for] Unilever disputes the necessity of using hot water. [The spokesperson] says it is more important to remove the dead skin cells that lodge in bedding and provide the mites' food source, and to wash away their faecal matter. This can be done, [the spokesperson] maintains, by regular cold-water washes. - 1996

[‘AN allergy to the faeces of dust mites is the number one trigger for asthma attacks in NZ – it affects about 80% of people with asthma. Since asthma affects 15 to 20% of the NZ population, finding an effective way to control dust mites – the tiny creatures that live in dust – would greatly improve the health of NZers. New research by the Building Research Association of NZ in conjunction with the Asthma Foundation, the Wellington School of Medicine and Victoria University, is leading the world in discovering how to control dust mites. Since the early 80s it has been known that dust mites can't survive in environments below 65% humidity. But the average humidity in many parts of NZ is about 80%. To make matters worse, the BRANZ research has shown that dehumidifiers and vacuum cleaners are not very effective at reaching inside the dust mites' favourite places of habitation – carpets, mattresses, pillows and bedding. These crucial dust-mite reservoirs have their own private micro-climates which keep remarkably constant high temperatures, no matter what the room humidity is. ● ‘Asthma is not giving up its secrets easily. A global study of childhood asthma and allergies involving more than 700,000 children in 155 centres across 56 countries has netted results that present medical thinking is at a loss to explain. Researchers are finding striking differences in the prevalence of asthma in different countries. NZ, with its high incidence (after Britain, NZ is the second wheeziest

nation in the world), is of special interest to the international research team. Other top scorers are AUS and Ireland, followed by North, Central and South American countries. Countries like those in Eastern Europe and Indonesia, Greece, China, India and Ethiopia are relatively asthma-free. A previous theory that genetics played a major role in global asthma patterns has been discarded by the study. While genetics is still important on an individual basis (an asthma sufferer still needs the right genetics for the expression of the disease), there is no correlation between genetic types and occurrence. Hong Kong has a prevalence rate five times higher than Guangzhou. "Two places very close geographically and whose peoples have a similar genetic background." European people who had migrated to AUS showed marked differences from those in Europe. So the evidence suggests that environmental factors, whatever they are, are more powerful than genetic makeup. Some researchers believe that some types of respiratory infections in childhood may be protective and other types of infection may predispose you towards asthma. For example, there is an inverse relationship between tuberculosis rates and asthma prevalence.']

...It was once said, entirely seriously, that cigars soothed asthma, coughs, bronchitis, hay fever and shortness of breath. Allegedly these pungent cheroots gave "immediate relief" and, when used daily, produced a "complete cure." How could this be? The explanation given at the time: "The contraction of the air tubes, which causes tightness of chest and difficulty of breathing, is at once lessened by inhaling the medicinal smoke." Doctors, surely, objected? Well, not especially. The Cigars de Joy, they said, "have been successfully tested and recommended by the medical profession for many years. They are perfectly harmless, and can be smoked by... children, and the most delicate patients, and they are pleasant to use, and contain no substance capable of deranging the system." This is one cure that has, thankfully, not stood the test of time. But ideas of progress should not let pride get the better of us. Asthma still presents an acute paradox. The more we learn about it, the less able we seem to prevent and control it... [A] leading asthma researcher from Southampton, has written that "our knowledge of the underlying mechanisms of asthma has been revolutionised by advances in molecular medicine." Perhaps. But the figures tell a different story. Not one life has been saved by such success. In adults and the elderly, related admissions to hospital and deaths have continued to rise sharply since the 1950s... On June 24, 1994, 50 bolts of lightning struck the ground around London. An hour or so later more than 600 people turned up in 12 casualty departments with acute asthma attacks. Needless to say, no one knows why... But... asthma... is... a disease of the rich. If you travel to rural Ethiopia... it's hard to discover anybody wheezing... The explanation seems to be... [that] in... Britain... and... America[, for]... instance... the... average house... produces about 0.9kg of dirt each month. And millions of dust mites are crawling around your bed waiting to feed off the 0.4kg of skin you shed every year.

...Asthmatics should... cover bed mattresses to reduce exposure to dust mites, according to a major medical study... Foam and cotton mattresses showed higher levels... of dust-mite allergen[s]... than water beds. "Because large numbers of children in our... 16-month study... use these mattresses, public health interventions that aim to reduce exposure to inner-sprung mattresses are important,"... a British medical journal... said. Allergen levels were lower in beds with a layer of foam rubber on top of mattresses or with plastic or rubber sheets. Wool underlays were a major risk. Allergen levels increased with the number of children per household. Cats, dogs or birds made little difference. The study said the home environment might need modifying. This included avoiding high-risk mattresses... reducing bed humidity... "and perhaps the most important strategy, removing carpets."

...The bedbugs are biting – big time. Our homes play host to... dust mites, an asthma sufferer's health enemy number one[– NZ and AUSn]... data shows that exposure to allergens of house dust mites and cats is the main reason for the onset of asthma... But researchers are putting their heads together to cull the staggering army of unwelcome house guests. Scientists from around the world met in Wellington at the weekend to work on a battle plan. A leading... asthma researcher... said the bedroom was the ultimate war zone. "We spend a third of our lives there and most of that time... we have our heads stuck in a pillow." Pillows alone harboured millions of mites which were readily inhaled... The tiny bugs... go about their business completely undetected by most. "There's a desperate need to raise the profile of this whole problem. This is a silent biological pollution disaster,"... To attack the mites, people should lower humidity, regularly wash bedding and get rid of carpets where mites tended to live. Alternatively, frequent vacuuming would cut allergen levels, but actual mite numbers would stay high as they clung to fibres... The carpet industry, important to the country's economy, was looking at mite deterrents. [□ It has been suggested that asthma sufferers remove carpets – but 'if you've ever lived in an apartment building or multi level house with hard wood flooring, you'll understand the value of carpet. Every movement within your house and the neighbours above, beside or below you will be greatly magnified if there's nothing to absorb the noise. And as the trend towards apartment style living in NZ has increased so too has the country undergone a carpet revival. Apart from its ability to add peace, carpet will of course enhance the aesthetics']...

THE noise-absorption and aesthetic qualities of carpet are obvious, but wall-to-wall carpet is also an efficient, cost-effective way to increase the comfort and well-being of building inhabitants. Carpets – particularly on a good-quality underlay – will keep the warmth in heated buildings in winter and the heat out of air-conditioned buildings in summer. Wools of N[Z] has found that carpets with thicker pile understandably have better insulation characteristics. As carpet flattens and wears the insulation effectiveness is reduced. Carpet that is made with a pile fibre that is resilient and resists compression (such as N[Z] wool), is a good choice... Another benefit of wool carpet is that wool assists in stabilising the relative humidity in buildings. Scientific studies have shown that wool fibres actually absorb or release moisture during periods of high or low atmospheric humidity. It is not always practical or desirable to install carpet in all areas of a building... [The] general manager of Hills Floorings Ltd, one of the country's largest carpet retailers... suggests cork tiles as an alternative in areas such as bathrooms and kitchens. While not as good an insulator as carpet, cork tiles are usually 6mm thick and coated with four coats of polyurethane. This is not only easy to maintain but provides a warm and comfortable alternative to harder ceramic tiles. Carpet has an important role to play in the total insulation of a home or building.

...A revolutionary new insulation product developed by a N[Z] company is described as a breakthrough in thermal technology. The new material, Thermobond 100 Series, has been developed over eight years by Waco Coatings and Chemicals. Interest in the new product is coming from around the globe... Among the companies evaluating Thermobond is the Boeing Company, which is assessing the savings in weight and volume over fibreglass-type insulation. Boeing now uses a 7.5cm cavity of fibreglass insulation in its aircraft with the insulation material weighing up to seven tonnes. Using Thermobond, the insulation cavity could be reduced to around 2cm, with the insulation weighing less than a tonne. But it's not just aircraft that can benefit from Thermobond's outstanding thermal and acoustic properties. Typical applications of Thermobond include insulation of homes, water tanks, exhaust pipes, steam pipes, cars, boats, and even pizza delivery boxes... A network of 38 franchised Thermobond applicators is now being developed by the company around the country... Application of Thermobond is by brush, spray or trowel and it will adhere to wood, metal or plastic... The cost is around \$6.50 a sq m and application time is the same as spray painting... It is dry to touch within hours and hard in 21 hours. It can be sanded and painted. Application can be external or internal. "Thermobond is odourless, free of ozone-depleting CFCs, cannot be infested by vermin, and does not require fastening or gluing. It contains no dangerous chemicals and will not aggravate respiratory and other health problems. In the event of a fire, Thermobond will not release dangerous fumes," says... [the] Thermobond sales manager...

HEATER manufacturers are under constant pressure to reduce the running costs of heating or to increase efficiency for environmental reasons. At the same time the insulation industry continues to improve its performance and joinery companies make doors and windows which exclude draughts. This has a flow-on impact on ventilation and comfort levels in the home. Home owners often find that their heating systems are over-efficient for the room they are located in and would like to be able to "move" some of that heat into their bedroom. The Auckland-based distributor of Manrose duct-fan systems, Securi-Max Ltd, now has a range of cost-effective packages to enable home owners to transfer excess heat to remote areas of the home. The system capitalises on the fact that hot air rises and, if undistributed, is held in a pocket under the ceiling. The temperature near ceiling level can be as high as 35 deg C, while the temperature at seated level is a more comfortable level. The Manrose heat-transfer system

can be manually switched on to gently move the over-hot layer of air to a remote room. Alternatively an optional wall-mounted thermostat keeps the air at a pre-set comfort level. As air is removed from the heated room, other air is drawn naturally from adjacent rooms, hence warm, dry air is being circulated throughout the home. Depending on the kit purchased, the system can transfer heat to from one to three rooms.

...HEAT pump is the generic name... given to home or residential air conditioning, which heat as well as cool. They use the same technology as a domestic refrigerator and produce heat by “transferring” it from one area to another. However, whereas a fridge transfers heat from inside its cold compartment to the outside, a heat pump can transfer heat both into and out of the home. In this way it produces nearly three times more heat than a normal electric heater. It also increases the heating power available from a standard wall socket. A normal electric heater can produce a maximum of 2.4kW from a wall socket – a heat pump produces about 7.0kW. This is still paid for at the 2.4kW price – hence... 4 or 5kW of “free home heating.” Heat pumps are available in many options... Prices can be from... \$3000 installed for a small split system to \$10,000 or more for a fully-ducted central heating system... Overseas experience has shown that... installing one improves the resale value of any home... A heat pump is effectively five appliances in one... [-] a heater for winter, a cooler for summer, a circulating fan for autumn and spring, a dehumidifier and an air filter. This means year-round comfort and reduced mould and condensation. This is beneficial for most occupants but especially... asthmatics and those with respiratory conditions... The same technology is now also used to heat water... Carrier Air Conditioning... has developed a hot water pump that can be installed into existing or new hot water systems. The unit costs... \$2000 installed but can save... 50[%] in water-heating costs.

...[‘HOT WATER FROM THIN AIR Imagine a 24 hour day continuous hot water supply that only needs as little as one quarter of the energy of a conventional water heater, and provides hot water much faster than an equivalent electric system. By reversing the heat pump principle the Quantum System draws heat directly from nature’s elements – and all the electricity it needs is enough to run its pump. What’s more, Quantum is simple, compact, clean and reliable. Quantum has no elements and needs no specific wiring.’ It’s ‘extraordinary. They’re creating hot water by extracting heat literally out of thin air.’]

...REMEMBER the sudden warmth when you step from the shade into the rays of the sun on a winter’s morning? Feel it every day when you walk through the front door into your home, by making a move to radiant floor heating. This is a system which uses warm water to heat up the entire house. A manufacturer of the system, Florad Underfloor Heating NZ Ltd, claims it is more efficient than other heating methods. Radiant heating systems, it says, make rooms warm by heating the walls, floors and furniture, not the air. That translates into health and cost advantages. The elimination of dampness from the floors, removes the environment in which dust mites, mildew and other bugs thrive. Sinus passages get it easy with a radiant floor system – convection-based air-heating methods... quickly dry out the eyes, nose and throat. Heating the air means moving it but the movement of air causes greater heat losses, requiring the costly heating of more air. [Furthermore, t]he dust circulates, making dust allergies worse. The Florad system uses a series of pipes underfoot. Water heated to about 45 deg C is pumped through the pipes, transferring heat to the floor as it goes. Just about any method can be used to heat the water to that temperature – gas, electricity, diesel, heat pump, solid fuel burners, or wetback. Florad designs and engineers each system to suit the regional climatic conditions. This ensures that there is enough tube in the floor and that the water temperatures required will not be too high. For new homes the pipes can be planted in the concrete foundations. With existing homes they can be fitted to the underside of a wooden floor which can then be left bare or covered. The key to a wooden floor-heating system is foil-faced insulation under the heating tubes. The foil reflects the radiant wave back through the floor, increasing the efficiency of the system by 50[%]. What you get is a heating system you can feel safe with – no hot spots that could harm children. Nor are there... wall-hung radiators or vents to get in the way of furniture. Florad says it has the only floor-heating system approved by the Building Research Association... The BRANZ mark shows that the system has passed rigorous independent testing. There is a 20-year guarantee... [■ BRANZ has yet to comment on recent reports stating h]ealth officials are concerned that a marked increase in cases of potentially fatal lead poisoning points to a growing ignorance about the illness. The Waikato Medical Officer of Health... said 13 cases of the poisoning – a notifiable illness – were reported last year. That was a “marked jump” from the previous year... The large increase indicated that people were not aware of the danger associated with lead-based paint.

...Lead found in a popular brand of children’s paint is up to 70 times above the safe legal limit, the Ministry of Health says. The Maries oil or water colour paints, sold in lead tubes, have been on the market for several years and sold widely through at least two major retail chains. The ministry confirmed yesterday that it had tested the paints only after someone noticed they were being promoted in back-to-school publicity campaigns. Ordering a recall of the paints would be difficult as they had been in use so long, the ministry said. Importers and distributors had agreed, however, to voluntarily withdraw the products from sale. The ministry’s senior adviser in health protection... said paint tubes made of lead had been used for about 40 years. Most brands were expensive... and sales were targeted at artists and other specialist users[, but] Maries... paints were cheap and highly likely to be used by children. Those aged under six, including unborn infants, were particularly sensitive to exposure to lead... “Small amounts... can cause hyperactivity... learning and behaviour disorders, impaired hearing and delayed mental development.” People who found Maries paints in their home should throw them out because of the risk of lead poisoning... They could be disposed of with the household rubbish... [T]he ministry would test other brands of paint stored in lead tubes to ensure they complied with legal limits.

...Health officials are concerned not only about what is on our plates, but what sort of plates we use. Fresh warnings have been sent out to tableware importers about ceramic goods with dangerous lead levels which may leach from poor glazing... Lead is often used in ceramics to enhance colours and glazing. New types and designs of imported ceramics were tested before being allowed on our shelves and scored against acceptable lead levels. Ceramic goods from countries such as A[US], Canada, Japan, Britain and the U[S] were exempt from testing, although the policy was under review... [after] consignments of Chinese tableware, totalling about 100,000 pieces[, were]... rejected in past weeks after failing border surveillance checks... The Public Health national coordinator of imported products... said potentially dangerous ceramics were being picked up about every [3] months. Most... were arriving from Asia, although Italian goods had come under close scrutiny since a consignment was rejected this year... [S]ome... Italian ceramics had imperfections in the glazing, called pinholes. Acidic type food... could eat into the glazing and bring the lead out... The other danger was that food particles could lodge in... pinholes and bacteria would contaminate other foods... [Incidentally, Mattel has been] forced to recall its popular motorised Cabbage Patch Snacktime Kids’ Doll because of its tendency to chomp on children’s hair and not let go.

...The Ministry of Consumer Affairs has welcomed the maker’s recall of a N[Z]-made wooden child’s rattle, Dumbbell. It has parts that could choke children... [In related news,] Plunket is warning parents to beware of old baby equipment after news of a second infant being admitted to hospital when a spring on a baby-bouncer broke... and gouged his head. In a letter in the parenting magazine *Little Treasures*, [the Auckland infant’s] mother said only luck prevented a serious injury. Her letter coincides with the admission to Waikato Hospital on Monday of a Tokoroa baby... after a bouncer spring became embedded in her head... Her family... had modified the bouncer, and that may have caused the accident... [The] Auckland mother... bought her bouncer secondhand. It was at least seven years old. A nurse specialist for Plunket... urged parents to have older equipment checked for safety. “The issue goes beyond bouncers. It is the buying of secondhand furniture, like car seats and cot mattresses.” [The nurse] urged parents to buy new articles if possible, because the safety of older products could not be guaranteed. For example, second owners of bouncers would not know if a previous owner had exceeded the recommended maximum weight. Bouncers did not enhance a baby’s development and infants in them should be supervised at all times... “There is a temptation to stick them in and then go and get a whole bunch of stuff done.”

...The Ministry of Consumer Affairs lacks the resources to adequately address child safety issues, says Safekids. A spokes[person] for the child safety agency said yesterday that the ministry was so stretched it failed to give some issues the importance they deserved. On the first day of

Kidsafe Week, [the spokesperson] said the high child injury rate from accidents involving supermarket trolleys was one issue the ministry had not addressed. [The spokesperson] did, however, welcome the ministry's move... to organise a forum next month to discuss child product safety issues. The general manager of the ministry... said the ministry could not be funded to cover every safety issue. The ministry had given other matters priority over supermarket trolley safety. The... debate over mandatory versus voluntary standards for strollers... and the... issue of introducing child-proof cigarette lighters... were considered to be more important, [the manager said. ● 'The latest show on at Waitakere College is sure to fire the sympathies of its audience. *The Match Girls* takes a step back into British history, to the first successful strike by unskilled workers. Their claims of "white slavery" and "phossy jaw" – teeth and jawbones rotten from working with the phosphorus used to make matches – brought the strikers widespread publicity. The 1888 strike brought the girls better wages and encouraged other workers to act to improve their conditions.'

...*Question*: What is the origin of the matchstick and how did safety matches come to be? *Answer*: An alchemist discovered phosphorous – the chemical needed to create flame – in 1669, but it was not until 1680 that an English physicist named Robert Boyle devised a small piece of paper coated with phosphorous. Boyle had a small splinter of wood with sulphur on it. When the wood was drawn through the paper it burst into flames. In 1830, a French chemist called Charles Sauria created an "odourless match", but they made people sick with a condition called "possy jaw". In 1855, safety matches were patented by Johan Edvard Lundstrom of Sweden. Lundstrom put red phosphorous on the sandpaper outside the box and the other ingredients on the match head, solving the smell problem. In 1889, Joshua Pusey invented the matchbook. American company the Diamond Match Company bought it for \$4000 in 1896. But matches were still poisonous and by 1910 there was a worldwide push to ban the use of them. Diamond invented the first non-poisonous match made out of sesquisulfide of phosphorous. On January 11, 1911 they released the patent at the request of US President William H Taft.'

... 'An electric blanket has been blamed for a house fire in Kelston. Firefighters from Avondale, Glen Eden and Titirangi had to battle through thick black smoke to reach the blaze in the back bedroom of the house on Archibald Rd. No one was in the house and the fire was quickly extinguished. A recent Fire Service campaign revealed that one in 5 electric blankets were unsafe. A Titirangi Station officer says blankets should be tested annually, used flat without creases, secured firmly and stored rolled up. They should be cleaned according to the manufacturer's instructions, leads should be uncoiled and children should always be supervised when the blanket is turned on. "Electric blankets are a common cause of avoidable house fires easily prevented by taking these precautions," the officer said, adding that fumes from a burning mattress can be fatal.' By the way, 'Air NZ has advised customers holding mugs from domestic flights not to put them into the microwave, after 3 melted yesterday. The mugs are labelled microwave-safe and 1.2 million have been given out.'

...a few days ago] **The Warehouse... recalled the Lilo 3m by 3m Hyper tent as it had faulty stitching and poles... [Y]esterday... the retail chain... recalled the Power Supply brand of double plug adaptors, as they had a mechanical fault... The Warehouse warned those who had bought the products not to use them, but to return them for a full refund... It also recalled Field of Flowers 25cm gold taper candles after incidents of the flame suddenly increasing in size... [In international news, 12] people... were killed... yesterday when a series of explosions in a fireworks market set off an intense fire in Ecuador's largest city, Guayaquil... Among the dead were a three-month-old boy and a three-year-old girl.**

... '[An indoor fireworks display ignited a wooden stage yesterday at an overcrowded dance club in Brazil, setting off a blaze that killed at least six people and injured 340 others. Fire officials in the city of Belo Horizonte said the club had no working fire extinguishers and no emergency exit. 1500 people were inside, double its capacity. The flames spread rapidly, and panicking club-goers tried to escape through the roof. But part of it collapsed on to others inside.'

... 'a fireworks display turned to tragedy when fireworks struck a high-voltage cable which crashed onto a crowd enjoying a festival killing 35 people. The 10,000-volt cable slashed through about 1500 people celebrating the 456th anniversary of Peru's second city, Arequipa. Charred bodies lay next to a burning pile where the cable hit one of the city's bridges. Witnesses and rescue workers said many people under the bridge continued celebrating after the tragedy, assuming the noise came from the fireworks and the crowd above. Adding to the panic in Arequipa there was a tremor measuring 4.0 on the Richter scale.'

... 'At least 80 people died and more than 200 were injured in a blaze sparked by an explosion in a fireworks store in a historic district of the Peruvian capital Lima. Charred bodies were piled on debris-strewn streets in the popular shopping area as firefighters battled the inferno on Saturday night (Peruvian time). At least three buildings were destroyed. Peru's President has declared two days of national mourning. Radio reports said people trapped on rooftops called in vain for help. "I tried to help, but unfortunately lots of people stayed to try to save their belongings and died," said a tearful merchant. Lima's fire chief said 440 firefighters fought the blaze, which was the worst the fire chief had seen in 40 years. Firefighters said temperatures inside the buildings could have reached 600 degrees.'

... 'Thousands of children in the Philippines are forced to work in dangerous, squalid conditions making firecrackers for New Year celebrations. It is illegal for youths aged under 15 to work, but children as young as 4 are being maimed or killed by explosions in makeshift backyard factories. The pyrotechnics business in the Philippines is still largely a cottage industry. Although the Government legalised the making of firecrackers in 1992 in an attempt to control and tax the industry, many "factories" are unlicensed. More importantly, there is no quality control and knowledge of safety procedures. Traditionally, Filipinos let off millions of firecrackers on New Year's Eve to herald a prosperous New Year and ward off evil spirits. Casualties from improper use are high. Last Christmas the Department of Health recorded 611 injuries, some the result of stray bullets fired into the air by police and security guards.'

... a 'Mexican security guard had just dragged two people from the wreckage of a mammoth fireworks explosion when a second blast catapulted him into the asphalt 6m away. The series of explosions – at least three – tore through a busy area of street stalls and shops near a downtown bus station in Celaya yesterday, killing 56 people and injuring 348. Many were rescuers like the 21-year-old guard, who rushed to help the victims. The blast is thought to have started in the back of a candy-store where fireworks were sold, then more explosions were set off, possibly from gas tanks in nearby restaurants or other firework stashes.'

... 'A fireworks explosion that devastated a school fete and killed an 11-year-old girl was described by witnesses as "like an atomic bomb blast." Chunks of metal the size of cellphones were found 600m away and thousands of smaller pieces landed as far as 2km from the school grounds. Holy Spirit Primary School student Dominique Baxendell died, two people were critically injured and seven others suffered shrapnel wounds in the explosion that rocked the north Brisbane suburb of Bray Park on Saturday night. The fireworks sponsor, a father in his 30s with children at the school, had part of his right leg blown off when the display toppled over and sprayed shrapnel over a crowd of 2000. Police took hundreds of witness accounts in the school hall and guarded the site overnight before a team of 20 scientific and dog squad officers arrived early yesterday to begin mapping the spread of the shrapnel. State Emergency Services volunteers arrived to scour the school's grounds for pieces of shrapnel. Police have called on residents to search their yards for the metal, which is needed to piece together what went wrong. The school was expected to reopen today, but classes might be held elsewhere while investigations continued.'

... 'An explosion in a Dutch fireworks warehouse has killed at least 20 people, including two fire officers, and injured more than 300 others. Many of the victims had been drawn out of their homes in Enschede to watch fireworks set off by an earlier, smaller explosion. They died when a huge red fireball hurled a blast wave across the town. Late yesterday emergency workers were sifting through rubble in a residential area that resembled a war zone, strewn with the blackened, twisted hulks of cars and piles of bricks where neat homes once stood. "People are shocked, confused," said a spokesperson for the town of 145,000. The tragic chain of events began when a fire outside a warehouse owned by the S.E. Fireworks company spread to the storage area, which held about 100 tonnes of fireworks, touching off the explosions. It was not clear if the fire was linked to other recent blazes in Enschede that officials suspect were arson. The blast, which was heard in nearby towns, gouged huge gashes in apartment buildings and shattered windows. Slabs of concrete blocked roads, and a brewery was set on fire. 2000 people were evacuated from the area, which is sealed off. It wasn't known last night when they would

be allowed to return. Police sealed off a 700m radius around the blast centre and asked shopkeepers to help prevent any threat of looting. The State Secretary at the Dutch Interior Ministry praised the help German emergency services provided and said it was too early to determine the cause of the disaster. Television reports said Enschede residents were asking how authorities had allowed the fireworks warehouse to be located in the middle of a residential area.'

...Firefighters had to] **douse trailers full of fireworks at a... warehouse in... Tennessee, after an explosion... killed four people and injured... several others. Witness[es]... said the explosion had... strewn hundreds of live shells over several blocks... blasted [a guy] out of a church basement... and... blown out... windows in a car dealership...** [1.5 miles away. Incidentally, t]he chore of cleaning windows may soon be history. Japanese scientists are close to fulfilling the dream of all householders – a self-cleaning windowpane. A special coating on the glass stops dirt sticking to it. The modified surface no longer mists over, even when humidity is high. The... coating which gives glass this astonishing characteristic is titanium dioxide. A thin film of the substance seals the pane. If ultraviolet rays fall on the glass, the coating begins to work. The surface then bonds with both water and oil. Neither of the fluids forms drops, but spreads evenly. The result is that every rain shower then effortlessly washes dirt particles down the pane.

...['Self-cleaning glass is no longer an impossible dream following Pilkington NZ's unveiling of the world's first self-cleaning glass, Pilkington Activ Self-Cleaning Glass – which uses the forces of nature to keep the glass free from organic dirt, delivering the practical benefit of less cleaning and more leisure time to do the things you want to do, as well as the environmental benefit of eliminating the need to use detergents and bucket-loads of water in window washing. "Anyone who has spent a weekend cleaning windows with a messy squeegee and bucket in hand will know what a laborious, time-consuming task it is – it's on almost everyone's most hated chores list," said Pilkington NZ's general manager. "In addition to its self-cleaning properties, Pilkington Activ can be further processed to offer all the benefits of a safety glass, whilst eliminating the occupational hazard of balancing on ladders when cleaning hard-to-reach windows." Pilkington Activ's self-cleaning action is continuous and will last the life of the window. "It's not that you'll never have to clean your windows again – windows will still need to be cleaned on the inside and hosed down on the outside during dry weather spells – but the frequency and amount of time cleaning windows will decrease significantly." Pilkington Activ can also be incorporated into Insulated Glass Units to provide energy efficiency.'

...'*Choosing efficient windows* Up to 40% of a home's energy is lost through the windows. Improving energy performance of the window system reduces heating and cooling costs, creating a more comfortable home and reducing energy consumption. To help people choose the most efficient windows, the Window Association of NZ has launched a Window Efficiency Rating System (WERS). Government supported, it uses a simple 5-star system to indicate how various window frame and glass options will perform. WERS advises on the best windows to use for keeping houses warm in winter and cool in summer, and for minimising fading damage. WERS uses computer simulation, based on real data gathered in scientific testing, to reflect changes in performance in the key areas of heating, cooling and fading. The calculations are made using software developed by BRANZ. WERS covers different frame materials – aluminium, timber, PVC etc – and different glazing types such as single or double-glazing and tinted glass. WERS applies to any glazed exterior joinery in the home, such as windows and glass doors. The average house has 20 windows and doors. Generally, locally made glazing products perform well because they are designed for NZ conditions. However, pure performance is only part of the story. Positioning for the sun, management of heat and cold, noise, condensation and cost factors also need to be considered. Understanding the performance trade-off and cost ramifications of different frame types and glass and glazing options helps make an informed decision which will best suit the specific circumstances. Purchasers can ask the supplier for the WERS star rating for the different options. A Rating Certificate and a schedule outlining the star rating for each window type will be issued on request. It will set out a licence number and the star rating for cooling, heating and fading. The certificate will include a brief description of the makeup of the window or door.')

...The idea of creating a pull-down-and-roll-up insect screen for windows or doors solves several problems posed by conventional screens. According to Rollo Screen NZ Ltd, there is no need to unhook or peel back its screen to open or close the window. The screen simply rolls away and when in use it is almost unnoticeable... The Italian-designed product is made from materials such as ultra-violet-resistant carbon fibre, aluminium and PVC... [While on the topic of insect screens, early] last year... scientists from Harvard and Johns Hopkins University confirmed fears that global warming could result in fatal, mosquito-borne diseases spreading to countries such as N[Z].

...A report for the Ministry of Health by an A[US]n doctor said a mosquito invasion was inevitable, unless the Government spent between \$1[million] and \$2 million a year to prevent them from entering the country... Auckland was at the greatest risk, with the high turnover of air and port cargo, large numbers of travellers and a growing population that included many Polynesians... The report said the expenditure should be regarded as a necessary insurance policy. Exotic mosquitoes had cost other countries millions... in health costs and damage to tourism. It called the present mosquito surveillance programme rudimentary and non-audited, noted a general lack of expertise, and said the lack of inspections for ocean-going yachts was a "glaring deficiency." It [also said NZ] authorities were not complying fully with the International Health Regulations to which they were a signatory... [The] head of the Queensland Institute of Medical Research mosquito control laboratory... has a reputation for accurately predicting mosquito developments. In 1980 his institute predicted... dengue fever would enter A[US] and it arrived the next year. In 1988 the virus-carrying Asian tiger mosquito entered A[US] in imported tyres after [the doctor]... warned that tighter border control was needed over such tyres.

...Indian scientists say they have isolated a fungus found in rice paddies that could be used to fight malaria and other mosquito-borne diseases... the Malaria Research Centre in the southern territory of Goa, says the fungus, named MRC-367, can kill mosquito larvae in three hours. "It causes 100[%] mortality,"... Tests are being conducted to make sure the fungus is safe for non-targeted organisms like fish before studies are conducted.

...Office workers walking over London Bridge on Monday were unaware of one of nature's wonders taking place in the waters below. Millions of tiny sea bass swam upstream in a sight not seen since the Industrial Revolution, according to environmental experts. This commercially important fish species was once common in the Thames, but pollution and sewage killed off stocks. It has only returned recently because of a clean-up campaign... The fish will probably swim as far as Teddington in West London and stay in the river until autumn. Then they will swim back to the Thames Estuary and out to sea... [In local news, a] Waikato farmer and his sharemilker have been fined a total of \$9500 for discharging raw effluent into a tributary of the Rotohouhou Stream... [The pair] pleaded guilty to charges levelled by Environment Waikato.

...A discharge of food-processing waste... into a Wiri creek from a Bluebird Foods factory [has]resulted in the company being fined \$5000... [plus court] costs of more than \$2500... Bluebird... pleaded guilty to discharging the waste into a tributary of the Puhinui Stream[, which]... flows into the Manukau Harbour. The offence, which occurred in December last year, was dealt with... in the Auckland District Court after the Auckland Regional Council decided to prosecute. In May last year, after vegetable oil flowed into the tributary... council officers asked the company to take action to prevent waste entering the stormwater system. Officers inspected the site in September and saw no evidence of contingency plans or equipment to prevent such spills happening again. The council wrote to the company in October asking that improvements be carried out.

...['Challenge Concrete and Infrastructure has been fined \$29,000 for a series of toxic discharges into the Papakura stream which flows into the Manukau Harbour. All signs of aquatic life were extinguished in the stream after the Challenge subsidiary, Humes Pipeline Systems, polluted it to such an extent that investigating officers could not find even the bodies of dead fish or eels. A tributary of Hayes Creek at Papakura was found to be completely lifeless and sterile after highly alkaline wastewater drained into it throughout the last two years. In the Auckland District Court, a judge said the events were easily foreseeable and easily preventable, and the prosecution should be a warning to all businesses. A pollution control officer said yesterday that although it was pleased with the outcome, the case – which was, in his opinion, one of the worse in the 1000 complaints received annually in Auckland – had taken six months of his time, adding that his division was over-worked and understaffed. "Auckland has 14,000 businesses which could potentially pollute the

environment but there are only nine pollution control officers – we are up against it.” Pollution control officers visited the Hayes Creek site three times, between February and August last year, after a consultant working on a nearby site reported finding the stream heavily discoloured with what appeared to be concrete sediment. On the first visit, the officers found concrete wastewater from Humes’ settling pond system had been deliberately diverted from the recycling ponds into the stormwater system. The ARC said this was because the process was not coping with the amount of waste being produced on the site. “The second offence involved a break in a wastewater pipe, discharging waste into the ground and stormwater drain. The company had no detection or prevention system for such an incident. ARC officers revisited the site at the request of the company, having been assured that the stormwater system was blocked off allowing no material to leave the site. However, ARC staff found that concrete was being waterblasted off pipes, and stormwater drains were ineffectively blocked with sand-filled rice bags.” In June last year, Firth Industries – another division of Challenge Concrete and Infrastructure – was fined \$27,000 for discharging wastewater into the Henderson Creek in May and July of the previous year. Firth was also prosecuted five years ago for illegal discharges from a site in Takanini. The chief financial officer for Challenge Building said yesterday the company regretted what had happened at Papakura. Asked if three prosecutions of Challenge concrete companies in five years was an acceptable record, it said Challenge took environmental issues seriously and had taken steps to ensure there were no further problems. ■’] **Greenpeace and Tasman Pulp and Paper are back at loggerheads over discharges from the company’s Kawerau mill into the polluted Tarawera River in the eastern Bay of Plenty.** Greenpeace activists began erecting signs early yesterday along the banks of the river and at the mouth at Matata warning against eating fish... because the water contained cancer-causing dioxin... The Tasman community relations manager... said it was becoming increasingly difficult for Greenpeace to substantiate its wild claims with facts[, but Greenpeace]... said the... conclusions were from International Association for the Registration of Cancer scientists evaluating carcinogenic risks to humans.

...Residents living near the Tarawera River hope a hearing starting today will finally see the end to pollution that has turned its water from “gin clear to black liquor.” [Challenge’s]Tasman Pulp and Paper [mill and CHH’s Kawerau Tissue] mill... want resource consent to continue discharging about 260,000 cu m of treated effluent each day into the river, including organochlorines that can cause cancer. By comparison, Auckland’s Mangere sewage treatment works receives 300,000 cu m of waste a day. Greenpeace has likened the contamination to the effect of a leaking nuclear power plant... Since the Resource Management Act was passed six years ago, the mills have continued discharging into the river under special exemptions. The hearing of the applications, filed two years ago, has been delayed while the council completed its draft Tarawera River plan containing policies for its management. Council staff have recommended granting consents with conditions aimed at reducing the impact of the discharges and reducing the toxicity of the discharges within 15 years... The river at the Tasman mill is... black, with flecks of foam, and stays that way until it meets the sea... [An old local, who lives] near the river, [and whose family has] for nearly half a century spearheaded a fight to have it cleaned up... remembers the river differently. When... a boy, [the local] swam in the river, and in a lake nearby. His whanau ate eel and morara (carp) and whitebait were plentiful... But while others share their views, the hearing has attracted only 14 submissions. A campaigner against the pollution for 17 years... said local campaigners had dropped by the wayside. “I don’t think it’s because they’re happy with the consultation process. I think it’s because they don’t see any commitment and don’t get any satisfaction.” Tasman’s community relations manager... said the low number of submissions was “a reflection of how things have changed.” Opponents had based their arguments on rhetoric and philosophy. This week, [the manager] claimed, the facts would be laid before the council.

...The cover of th[e]... 1997 TASMAN PULP AND PAPER COMPANY LIMITED ENVIRONMENTAL REPORT... consists of kraft (chemical) pulp, produced by using residual Radiata Pine from managed plantation forests, and bleached using Tasman’s ECF (elemental chlorine free) process. By 1998 all of Tasman’s bleached pulp and paper will be produced using this... process... *Environmental Review [of] Achievements 1987 – 1997*: ENVIRONMENTAL CAPITAL EXPENDITURE: \$70.1 million PLUS Annual Ongoing Cost of Environmental Control: \$8.0 million... * Bleaching gas emissions virtually eliminated... [(Total Air Emissions 3,344 t/day Comprising: Water Vapour 89.786% CO2 10.17% Particulate 0.04% TRS 0.004%)]... * River discharge colour reduced by 60% * Odour emissions reduced by more than 95%... * Dioxin (toxin equivalent) in effluent reduced by 95% from levels already regarded internationally as below measurement levels. * Water use reduced by 27% over the last three years to an average of 150 million litres a day... [* Other chemicals used are] Dyes 13.7kg/day Fillers 640kg/day Retention Aids 220kg/day Sulphuric Acid 16t/day Caustic Soda 14t/day Sodium Chlorate 1t/day Salt 55t/day Burnt Lime 1.6t/day Lime Rock 41t/day Sodium Sulphate/Carbonate 21t/day... Tasman’s solid waste management plan... covers... disposal of hazardous wastes, and operation of the primary solid lagoon in the area adjacent to the waste water treatment plant. Tasman operates its own landfill, where in early 1996 it commenced a programme to recover recyclable material for use by other parties. The 1996 acquisition of a solid waste compactor at a cost of \$478,000 has assisted in maximising landfill utilisation and efficiency... Work is proceeding on integrating environmental requirements into Tasman’s existing management systems, including the widely applied quality system, ISO 9002... Recent audits have included systems consistent with those required by the international ISO 14001 environmental management system standard... Information about Tasman’s environmental policies and performance is willingly provided to customers wishing to ensure compliance with their own environmental policies, and Tasman is committed to consultation with community groups, environmental regulators and its own employees, who now largely work in a structure of self-managed teams... Tasman’s Environmental Department, which has a dedicated manager reporting directly to the Director of Operations, has a team of 10 people committed to environmental monitoring, ongoing improvement projects and maintaining a high level of awareness and understanding of international trends and developments... Approximately 1200 people are employed by Tasman at its Kawerau mill, which is one of N[Z]’s largest industrial sites. A further 130 people are employed at offices in Sydney and Auckland, and at the company’s Mt Maunganui warehouse and shipping operation. Tasman’s... significance is reflected in a 1995 update of a 1993 study of Tasman’s national and regional economic impact, carried out by the University of Waikato. The 1995 study showed that with an employment multiplier of 5.87... [–] the Tasman operation generated 4.87 jobs nationally for each employee at its Kawerau mill... [–] Tasman, as a one-company sector, ranked sixth overall in a listing on N[Z]’s most valuable employment sectors, and third in a listing of non-agricultural sectors. The study also showed that... for each dollar paid to a Tasman employee, an income of \$2.50 was generated in the pay packets of every other working N[Z]er. Tasman’s Kawerau mill produces for sale two product lines. One of these is... chemical woodpulp, which is... sold in a variety of bleached and unbleached grades, mainly in Australasia but also in North America. The other product line is newsprint, and a range of paper grades related to it. Tasman produces all of N[Z]’s newsprint and telephone directory paper requirements and supplies approximately 30% of the AUS[n] market, the balance of production being exported throughout Asia and the South Pacific. In its 1996/97 financial year Tasman produced for market 399,000 tonnes of newsprint, directory paper and enhanced paper grades, and 151,000 tonnes of Kraft pulp. The planned production figures for the 1997/98 financial year are 408,000 tonnes and 213,000 tonnes of paper and pulp respectively... Tasman’s application for a permit to take water from and discharge into the Tarawera River [is at present being] heard by a panel of commissioners along with applications for the adjacent C[HH] Tissue mill and by the Crown for geothermal discharges.

...Tasman Pulp and Paper put its case bluntly to the Bay of Plenty Regional Council yesterday: its Kawerau mill would face shutdowns if forced to meet new environmental standards... [S]ome standards proposed by Environment BOP... were unreasonable... [for a mill that] produces about 1[%] of the world’s paper... and contributes nearly 1[%] to the NZ] economy. But it also discharges about 160,000 cu m of industrial waste into the [Tarawera River] a day, about 10[%] of its flow... Environmentalists call the river the Black Drain... The managing director... said Tasman’s turnover of about \$570 million and after-tax profit of... \$32 million would fall well short of the target return of its owner... Challenge, by a good margin for the year... [But the] colour issue had a high profile and the company had “aggressive plans” to make further reductions at high cost.

...Improvements planned by Tasman... for its Kawerau mill will not eliminate potentially harmful organochlorines from discharges, says Greenpeace... While Tasman proposed switching to a production process known as elemental chlorine free next year, reducing its organochlorine output, the chemicals would still be produced... A [Greenpeace spokesperson]... said Tasman should adopt a totally chlorine free (TCF) process. Tasman is not convinced, adopting a similar stance to Environment B[OP] staff who conclude there is no environmental justification for converting to TCF. A regional council witness... of the Institute of Environmental Science and Research, said it was safe to eat eels from the Tarawera. A person consuming a 31g slither of eel every day for a lifetime would not exceed the tolerable intake of dioxin. [Incidentally, 'the NZ-born head of inorganic chemistry at Carnegie Mellon University in Pittsburgh, has won the US President's Green Chemistry Challenge Award – the highest US award for environmentally friendly science – after 20 years spent trying to replace chlorine agents with the "greener" hydrogen peroxide. The professor and colleagues developed catalysts which help the process. Hydrogen peroxide, which scientists worldwide would ideally like to see all pulp and paper mills use for bleaching, can work without a catalyst but is extremely energy intensive. Using a catalyst, bleaching pulp with hydrogen peroxide has the potential to shorten the process from six hours to one and reduce the temperature needed from 90°C to 50, making it environmentally more friendly and economically viable through big savings in energy costs. The team should be ready to conduct pilot programmes at NZ pulp and paper mills in two years.']

...The Ministry for the Environment yesterday released a preliminary list of toxic wastes to be given top priority for treatment or phasing out... In the top 12... on the list of 50 wastes identified were: aluminium wastes which contain dioxins and heavy metals; timber treatment wastes which contain organochlorines and heavy metals; chlorinated pulp mill sludges which contain dioxins and organochlorines; lead paint; ...benzene; waste oils and sludges containing organochlorines; unidentified military wastes; mine tailings containing arsenic and other heavy metals; incinerator ashes containing dioxins and other heavy metals; ...electroplating sludges containing heavy metals[: ...persistent pollutants containing dioxins and organochlorines; ...and unspecified waste pesticides and chemicals... The list... compiled by the Hazardous Waste Advisory Group, made up of representatives of the ministry, industry, environment groups and local councils... was... just the beginning of a process of identifying the risk criteria of various toxic wastes and establishing the technologies to deal with them. "...wastes on the list are... difficult to deal with,"... said... [the] manager of pollution and risk management at the ministry... [T]he Greenpeace representative on the group, has urged the Government to fund a phase-out of toxic chemicals[, but the manager]... said it was not just up to central government to deal with the issue, "it is also industry's problem."

...Help to deal with unwanted agricultural chemicals stored by seven local bodies in Auckland is on the way. A project manager should be appointed in the next two weeks to oversee the safe management of[the] chemicals... Between 20 and 25 tonnes were collected in the A[RC]'s area, while a further 30 tonnes... are also being stored around Auckland. A further 35 tonnes of chemicals remain stored in the areas where they were collected... [A] consortium formed by the seven local bodies had received a \$158,000 grant from the Ministry for the Environment to cover the cost of identification, repackaging and management of the chemicals... A Greenpeace spokes[person]... said that because there was no national hazardous wastes facilities Auckland had become the de facto storage place. Regional councils had taken on the burden of what to do with the chemicals by collecting them, but several had found the storage facilities they were using were unsuitable... Greenpeace is pushing for more research into disposal methods other than incineration. It opposes exporting them which was one suggestion.

...The Government will develop national rules for disposing of hazardous waste. The Minister for the Environment... said yesterday that the decision followed concerns that local authorities were having difficulties dealing with hazardous substances. [The minister] told an international conference on solid waste in Wellington that [the ministry] was "increasingly alarmed about the potential these wastes have for causing serious environmental harm." The evidence was that standards varied among regions and it was time a national regulatory framework was set up. [The minister said 98%] of hazardous wastes in Auckland went straight into the sewer systems, which had resulted in damage. "If it damages the pipe, imagine what it does when it emerges into the environment." Anecdotal evidence was given of "regulatory flight" between regions – such as Auckland waste from the drycleaning chemical carbon tetrachloride being shipped to Wellington because Auckland landfills would no longer accept it. Old pesticides, oil products and other hazardous substances were leaching into aquifers in Napier, Wellington and elsewhere... This would be the first time national standards had been developed under the Resource Management Act, which generally leaves environmental standards up to regional authorities. [The minister] said the regulations would "obviously" have an effect on both industry and local authorities. Industry would have greater certainty about what they could discharge and where. Greenpeace said the Government would need to set the regulations following best overseas practice, rather than the "lowest common denominator" used in legislation last year on hazardous substances.

...N[Z and AUS]n scientists have come up with a simple, relatively cheap process to destroy deadly [hu]man-made chemicals in soil. The process announced... yesterday by the Minister for the Environment... could mean a more cost-efficient clean-up of organochlorines from numerous sites in N[Z] poisoned by timber treatment chemicals and pesticides... The unique one-step yet chemically complex process... known as thermal desorption and yet to be scaled up to full commercial operation... involves loading contaminated soil into a kiln, applying indirect... moderate... heat and some additives, including lime... What comes out is water, carbon and inorganic chloride as well as a soil which can be reused... All gaseous emissions from the process are washed and filtered and other particulate material is captured and recycled through the process. The technique could be delivered either by smaller scale mobile plant handling one to two tonnes of contaminated soil an hour, a relocatable plant in several shipping containers handling 5 to 10 tonnes an hour or a fixed plant handling from 20 to 40 tonnes an hour. There is competing technology available worldwide including high temperature incineration in the U[S] and Europe and methods involving the destruction of organochlorines in liquid form but all are expensive. [The minister] said... while the development made the ministry delighted and optimistic there had to be caution about tackling such an expensive and difficult task as cleaning up N[Z's more]... than 8000... contaminated sites... about 800 being the legacy of old timber-mill practices... To achieve economics of scale clean-ups would have to be carried out in a coordinated way. Issues of liability also had to be considered. At the announcement yesterday the Associate Minister for the Environment... launched a public consultation phase of the Government's study into organochlorine pollution... One aim of the study is to put N[Z]'s clean, green image to scrutiny to see if it can be verified.

...N[Z]'s clean green image is a sham... says a report... Speaking at the launch of the report, the... [PM] said that all N[Z]ers stood tall when the world talked positively and enthusiastically about their beautiful "clean, green" country. "The world judges us by images of crisp, clean air, green and productive farmland, dazzling white mountain peaks, sparkling lakes, tall pine plantations and remote native forest tracks..." ...But behind the picture-perfect scenery lurks an uglier reality... [T]he foul truth is that N[Z]ers are world leaders in polluting the environment... The [report] was the result of five years' work and... was a timely warning that N[Z]ers could not take the environment for granted... Entitled The State of N[Z]'s Environment, the report] paints a picture of Kiwis as gas-guzzling motorists and rubbish bin-filling homemakers... N[Z] has the highest rate of motor vehicle ownership in the world, with nearly 70 people out of every 100 driving an environment-fouling vehicle. The average Kiwi's annual energy consumption is the equivalent of more than three tonnes of oil per person, compared with a global average of one tonne. In 1993 each N[Z]er pumped into the atmosphere 8.7 tonnes of... [CO₂] – compared with a world average of 3.9 tonnes per person... [The average NZer also] generates about 145,000 litres of sewage a year and nearly 900kg of landfill waste... Most solid waste – about 2.5 million tonnes a year – goes into landfills.

...NZ landfills... are a national disgrace and need urgent attention from the Government, says Greenpeace. Reacting to the 1995 landfill census, released on Friday by the Ministry for the Environment, the environmental group said that the 327 landfills surveyed were far from clean and green... • 87[%] of landfills have no leachate (general contaminant) collection systems. • 96[%] do not have a properly engineered lining system. • 65[%] have no liner to contain wastes. • 52[%] of landfill operators burn waste (likely to cause toxic emissions), with 27[%] of this being

intentional. • 82[%] of landfill staff are not trained in hazardous waste identification procedures. • 20[%] of landfills accept hazardous waste in a completely uncontrolled manner. • 79[%] have no hazardous waste manifest or reporting system... A [Greenpeace spokesperson]... cited a paper by a ministry official... circulated to the ministry's advisory group on hazardous waste, of which [the spokesperson] is a member. In the paper, [the ministry official says NZ]'s landfill management "presents unacceptable risks to the environment" and is "generally well below international best practice."

...The [landfill]... serving Hamilton and several Waikato towns contains a highly toxic brew but does not threaten groundwater or the nearby Waikato River, says an environmental scientist. [The] senior consultant with the Institute of Environmental Science and Research... reported on leachate at the Horotiu tip to a Waikato Regional Council committee hearing an application from the dump owner, Hamilton City Council, for new resource consents. The level of some organochlorine pesticides, including dieldrin, chlordane and DDT, in the landfill exceeded international freshwater guidelines. Dieldrin exceeded water quality criteria for the protection of aquatic life by a factor of 44. [However, the scientist] said the level of polychlorinated biphenyls (PCB) was not likely to have any environmental effect.

...Residents near a contaminated Northland landfill want the site closed and its potentially lethal contents removed. The residents of Waipu... say they were shocked by the discovery of ...PCBs... from shredded car waste or floc mud... at a... private... dump near the area's water supply... But a report commissioned by Sims Pacific Metals, says it is safe to people and the environment.

...Auckland-based EnviroWaste Services Ltd has announced plans to investigate establishing a regional landfill site near Te Kauwhata. It unveiled its plans to residents at a special meeting on Friday. The site was chosen from more than 50 locations after an 18-month selection process.

...Details of a \$223 million scheme to turn the mothballed... Meremere power station... into a rubbish-burning power plant [have been] set out in a 700-page resource consent application filed with Environment Waikato. Nga Puawaitanga (Meremere) Ltd – a joint venture company formed by Auckland-based Olivine N[Z] and Meremere hapu Ngati Naho – is touting its project as an environmentally friendly alternative to dumping waste in landfills... Plans for a high-tech waste incineration plant... include the building of up to four vitrification units to turn hazardous waste into glass products... Councils are being asked to pay \$200 a tonne for a 40-year right to dump rubbish at Meremere[, a few kilometres north of Te Kauwhata.

...the 'scheme's promoter is out to shatter the myths about recycling. In his opinion, those of us who separate out the paper and the plastic for the recycling bin and make a point of buying recycled writing paper have been wasting out time, albeit with good intentions. Unless there is a definite market for the plastic (and for much of it there isn't), the only products worth recycling in the conventional manner are aluminium and metals. Instead, the promoter favours burning waste in a purpose-built power station. Incineration of the Auckland and Waikato regions' garbage could on its own achieve NZ's required contribution to the Rio de Janeiro earth treaty by cutting emissions of global warming gases from rubbish dumps. The promoter has been knocked back several times in his plan to generate 210MW, but within a fortnight it should be known whether the managing director of Olivine NZ has finally succeeded with the company's bid to re-fire the old Meremere power station and progressively convert it from burning coal to burning garbage. "Rubbish dumps produce methane, fluorocarbons, chlorocarbon, aromatic hydrocarbons – all poisonous and all gases with global warming potential. If you burn the fuel and recover the energy, that's the best form of recycling you can do because garbage is a biomass fuel, apart from the 10% that is plastic. A rubbish tip in itself is an incinerator. When you put garbage in you are incinerating at a low temperature because oxidation is burning, but you're not getting the benefit of the energy. And when the tip runs out of oxygen it just reduces what is left of the garbage, making methane and other poisonous gases and leachates." The promoter cites the Barrys Point tip in Takapuna as an example of the environmental problems landfills can cause as toxic sludge seeps out. In comparison, the Olivine incineration process completely combusts all carbon. Acid gases are neutralised, heavy metals and acids are melted into glass products, ash is used either for concrete, road base or high-quality cement. "Burying garbage is an escape, a time bomb for future generations to clean up. We've got thousands of hectares of old rubbish tips and new ones in the making. That land is stuffed for 500 years. After the year 2005 it will be illegal in Germany to landfill anything with more than 5% carbon in it. At the moment it's 10%. A good incineration leaves no hydrocarbons, no carbon monoxide, only carbon dioxide. Good incineration means sufficient heat and sufficient time to burn the gases. We keep the gases in the incinerators for 8 seconds at more than 1100 deg C. Hopefully there will be something better one day, but at the moment incineration is the only clean and responsible way of getting rid of garbage. Recycling paper is the very worst thing you can do for the environment unless you recycle the energy in the paper. You have to use chlorines to bleach it and a lot of energy in producing the recycled paper, between 1.2MW and 1.4MW per tonne. When you make a tonne of paper from a tree you use about 1.8MW but 0.6MW of that comes from the liquors in the wood, which you extract in the process of pulping and bleaching the pulps. That liquor is then burned to generate power. That means you use a net 1.2MW and you can get that 1.2MW back by burning the used paper in a power station. You then have energy in balance from a tonne of paper made from a tree. Plus the paper maker has to plant a tree to make sure it's got a stock wood for his future production. When you recycle it, there's no liquor, because that's been taken out the first time, and you don't get the energy from burning. So you have to assume that the whole 1.4MW comes from the worst form of electricity generation, fossil fuel. And if you leave the paper to rot all you're doing is making methane."]

...Would-be electricity generation company Olivine N[Z] has had its prospectus cleared by the Securities Commission. Promotion of the prospectus was put on hold after the ECNZ subsidiary DesignPower withdrew consent for the use of a report in the prospectus about Olivine's proposed garbage-to-electricity technology. The report said Olivine's development strategy was "sound and well-considered." However, DesignPower said approval for the statement to be used was provided by one of its employees acting without authority. An amendment to the report will be issued with the prospectus... The prospectus seeks both institutional and private funding for the venture. A spokes[person] for Olivine says the company... will also issue an investment statement designed to inform smaller investors about the opportunity. That statement, issued under new securities regulations introduced [last week], will be designed to give an overview of the opportunity to investors, without their having to read the longer prospectus. Any investment in the Olivine project would[, however,] still be governed by the full prospectus.

...Olivine N[Z] is banking on an \$80 million injection of ratepayer money to fire up its waste incineration power plant in Meremere. The company is approaching North Island district and city councils offering them free tipping rights in return for shares in the business... [However, Greenpeace NZ] has issued an "information pack" outlining... concerns about... [Olivine]'s proposal... It has been sent to fund managers who might be considering investing in Olivine's... share issue. The pack purports to contain a briefing by accounting firm Coopers and Lybrand on the economics of incineration, a summary of information about... incineration pricing, a "commentary" on Olivine's prospectus claims, and a discussion on the competitiveness of Meremere as a coal-fired power station. The information is drawn from sources already in the public domain. But it is also biased. Greenpeace is opposed to the Meremere project. It believes it will have detrimental effects. Its "information pack" contains selective reports to support this position... It snidely points to an auditor's report showing the financial forecasts relate to events that have not yet occurred and are "therefore speculative in nature." ...The Olivine proposal might well be environmentally flaky. It might also be financially marginal. But those assessments should be made by impartial professionals. If Greenpeace was concerned about Olivine's plans it should have called in the experts. It should have commissioned independent assessments on the financial forecasts, the technology and environmental aspects. That is what Olivine had to do before getting its prospectus registered with the Securities Commission. Organisations like Greenpeace have an important role to play in making sure businesses meet social obligations. But the report on Olivine is unprofessional. It should be consigned to the recycling bin.

...Recycling is often not the most efficient way of dealing with rubbish, says... a resource management consultant whose clients include Olivine... Whenever we make something useful we produce byproducts we do not want. If we saw a piece of timber... we generate a small pile of sawdust, which we let blow away, or sweep into a pile and put out with the rubbish. Major manufacturers of wood products have long recognised that large

amounts of sawdust are costly to dispose of, and such costs affect the final cost of the price paid by the consumer. Gradually, under competitive pressures, sawmillers began to realise that sawdust was a potential source of energy when burned as a fuel, and... could even be incorporated into a range of wood-based products. Almost all industrial sawdust is now transformed into valuable products, or used as a fuel to reduce production costs. As manufacturers have learned this lesson their products have become more efficient. Early motor cars were heavy and guzzled fuel. Modern cars are light, more fuel-efficient, and considerably more affordable. Early disc drives stored only kilobytes of information, cost tens of thousands of dollars, and were delivered in truckloads. A modern computer hard-drive stores gigabytes of information, costs a few score dollars, and weighs a few ounces. However, once these same products leave the factory door the discipline of the competitive market ceases to operate. Consumers buy their packets of biscuits, or tins of soft drink, and... after they eat the biscuits and drink the soft drink... throw the package and container away. The[se had]... represented the most efficient means of containing and protecting the products from damage and contamination. But once used they become unwanted rubbish. Some groups advocate recycling as a major solution. In practice recycling is not cost-effective for most materials and products. If such inefficient recycling is subsidised the end result is frequently a glut on the market and prices collapse even further. Others argue that such waste should be eliminated by the producers of the original goods. Because such wrappers and containers become waste it is easy to assume... the packaging and containers are wasteful in their own right. However, [much]... of the waste stream is the product itself. Waste washing machines, cars, computers, and tractor tyres cannot be removed by any campaign against excess packaging. So when deep-green environmentalists charge through supermarkets abusing customers for buying packaged goods they may promote their own feelings of moral superiority but... are not contributing anything useful to solving the “waste” problem... N[Z] statistics reveal that many of our businesses use more energy and other inputs than our competitors overseas. This is not because N[Z]ers are an inherently wasteful, or even sinful, lot. Rather it reflects the fact that most of our managers and owners grew up in an environment which protected them from vigorous competition. Hence they could afford to be wasteful and yet continue to survive. The viable solution to dealing with the problem of waste products is to extend the philosophy of the production manager beyond the point where the customer has used the product. We need production engineers and entrepreneurs to deal with the contemporary waste streams in the same way as those early sawmillers dealt with their piles of sawdust. The question should be not “How do we get rid of this waste?” but “How do we profitably transform it into useful products of value to customers?” The present solution – which is no solution – is to cart our waste off to rubbish dumps which we have now renamed landfills, as if we had a problem of surplus holes in the land needing to be filled. But 2 tonnes of our rubbish contains as much energy as 1 tonne of coal and we now have the technology to turn such wastes (including sewage sludge) into electricity and other useful products without polluting the air, water or soil. N[Z] desperately needs new sources of electrical power. Our rubbish is mostly sunlight trapped in paper products. Most of the rest can be recovered as cement, building aggregate, metals or other products... Dumping this material into a hole in the ground and leaving it to rot is a mindless way to deal with material which is waste only in the eye of the cost-plus beholder. Surely it is time to... regard our waste as a valued feedstock for well-managed processing plants which can generate useful products and electric power... [T]he overseas trend is to build modern, clean incineration plants while closing down landfills. Many landfills are being excavated and processed through these new facilities. Germany, France, Japan and many other countries are prohibiting and closing down landfills after the turn of the century because superior environmental standards are being met by modern waste-to-energy facilities.

...Why Meremere waste-burning proposition is not a good idea... At first glance the idea of burning N[Z]’s waste has superficial appeal. The problem is that... the smoke contains cancer-causing pollutants. And, like cigarettes, adding a filter does not guarantee purity... Olivine recently conceded that the \$30 a tonne figure it has been touting as the cost of disposing of municipal solid waste does not include waste handling and collection costs. The *Herald* has cited a figure... of around \$200 a tonne... based on a... 1990 [ARC report which] found that waste incineration was a prohibitive option at \$157 a tonne for an incinerator burning 300,000 tonnes a year, and \$282 a tonne for one burning 100,000 tonnes annually. In contrast, a 1993 Ministry for the Environment study of waste disposal in Northland put the cost of recycling at... \$7.40 a tonne and landfilling at... \$12 a tonne... [A] study of waste management options in Europe[also] concluded that recycling, composting and landfilling were better options – financially and environmentally – than incineration... The energy equation [further f]avours recycling. Research shows that three to five times more energy is saved by recycling waste than is generated if that waste was burned. Nor does recycling generate the large quantities – up to 25[%] of the original waste stream – of toxic ash which incineration does... Last month Lebanese authorities closed the[ir] last waste incinerator... Yet in N[Z] there are still five incinerators in the main centres burning hazardous wastes such as PVC from hospitals, as well as Dow Elanco’s, which burns toxic pesticide wastes in New Plymouth. However, the Meremere plant will dwarf those incinerators... The performance of Olivine technology overseas is a source of concern. In the U[S], the North-West Air Pollution Authority has listed 27 permit violations by an incinerator in Bellington, including exceeding its allowable stack emission rate, fugitive emissions and failing to complete required tests... [US] experience shows that up to 85[%] of municipal waste is reusable or recyclable. In A[US], Canberra has set a goal of zero waste by 2010 and is already making progress towards that.

...[a spokesperson for] Greenpeace, argues that... “...the smoke generated contains cancer-causing pollutants.” Olivine “supercinerators” produce no smoke so the simile is meaningless. [The spokesperson] then continues with the claim that Olivine’s supercinerators produce cancer-forming dioxins. The natural level of dioxin in the air around the Meremere site is about 18 femtograms a cubic metre, to which the Olivine supercinerators will “add” about two femtograms a cubic metre. Because the ambient level can vary from day to day by more than two femtograms a cubic metre it will be impossible for any measurement to reveal whether the supercinerators are operating or not. The ambient dioxin level around Auckland is probably about 100 femtograms a cubic metre. If any Auckland members of Greenpeace are genuinely worried about dioxins they should all move to Meremere... [The spokesperson] then claims... Olivine’s offer to councils now proves that its waste treatment costs must be around \$200 a tonne. Given that Olivine is offering free tipping for 40 years in return for an investment in the project, [Greenpeace’s] calculations must be truly arcane... Sales of cement and concrete products made from furnace ash... [and] a host of [other] valuable by-products, including... 20,000 tonnes of ferrous metals a year... exceed the revenues from “tipping fees.” ...[plus it] will... vitrify hazardous wastes and toxic chemicals which are being landfilled, illegally dumped or haphazardly stored. Olivine will also recycle a whole power station... Hence costing comparisons with antique stand-alone incineration plants in Europe are meaningless, as are references to long outdated reports from accounting firms on the other side of the world. What is the point of telling *Herald* readers that some clapped-out incinerator in Beirut has been closed? Probably all the incinerators in our schools should be closed, too. These plants have as much similarity to Olivine as a Tiger Moth has to a Boeing 747. The Bellingham plant that Greenpeace criticises is actually the experimental site in which the Olivine technology was developed for a host of applications over many years. Experimental plants do have their bad days – that is why they are experimental. But Greenpeace has never tried to solve a problem, which is why it shows little understanding of the process. The Olivine plant in Nova Scotia has been running for 11 years under local authority ownership and has set new standards and maintained an impeccable track record. Yes, the coal-fired power station will generate... an additional 1.4 million tonnes of carbon dioxide annually... But the rubbish burned in the supercinerators would otherwise go to landfills where the carbon in rubbish is turned into methane which is 60 times more potent as a greenhouse gas... The Ministry for the Environment has pointed out that N[Z] has a methane problem, not a... [CO2 problem. NZ]’s landfills are generating... 500 million cubic metres of landfill gas a year, of which 55[%] is methane or other toxic gases such as hydrogen sulphide, furans and dioxins. But who is measuring them? Tall chimneys should be built on these landfills to disperse these gases and allow compulsory testing of the emissions. The people of Hamilton... and elsewhere are now fully aware that landfills generate leachates and other hazards which pose an unknowable threat to future generations. Unlike an Olivine plant, no one can turn them off when they malfunction or

need an upgrade. Greenpeace presents its case as a choice between recycling and incineration. Olivine will take rubbish which has already been through standard recycling and is otherwise destined for the tip. The Auckland Regional Services Trust has proposed a massive landfill on the site adjoining Meremere. So local authorities must now choose between a huge... landfill, and the Olivine technology park with its superincinerators, high-tech vitrifiers, bio-treatments and future high-tech ramjets burning biomass to generate power. The... choice ...ought... to be a simple one.

...Olivine N[Z] says it is continuing to negotiate with North Island authorities to take a share in its proposal to modify the coal-fired Meremere power station... [Y]esterday... Olivine... said... interest in the project had increased after an Environment Waikato report that Hamilton's Horotiu landfill must close by 2003... – 29 years earlier than the Hamilton City Council wanted. The Waikato Regional Council hearings committee... also cut the amount of refuse that could be dumped each year from 220,000 tonnes to 160,000... That means several North Island councils might have to find a new place to dump waste. However... councils spoken to by the... *Herald* suggest the project is too risky to warrant investment of ratepayer money...

North Island local authorities are about sign up to provide \$64 million of funding for the... power station. In exchange... they will get rights lasting 40 years to dump... rubbish... at the plant... conditional on the plant securing strict resource consents. Nga Pua Waitanga Meremere, an associate of Olivine N[Z], is expected to announce this week that it has firm commitments of interest from councils willing to pay \$200 per tonne for the right to dump 320,000 tonnes of rubbish a year at the plant... [A] director of Olivine, [said]... his company had so far received expressions of interest by councils willing to pay to dump 700,000 tonnes annually. "It appears the offer will be well oversubscribed,"... [The director won't] name the councils, saying it might prejudice negotiations. Nga Pua has to compete for the rubbish-disposal dollar with landfill operators. The... *Herald* was unable to find any councils who would confirm they had signed up for the project. However, a number said they were seriously considering the offer. An information memorandum issued by Nga Pua shows the... authorities will have to pay 5[%] of the rights payment immediately, with 45[%] payable when the plant is given Resource Management Act consent and the final 50[%] to be paid when the first of the waste-burning furnaces is commissioned. The sale of dumping rights is just part of a complicated \$100 m... capital-raising exercise by Nga Pua. That is in addition to a \$9 m... capital-raising exercise being carried out by Olivine... In May, Nga Pua signed a contract to buy the mothballed Meremere plant from the Electricity Corporation for \$17.2 m... A \$1 m... non-refundable deposit was paid at the time and further \$1 m... refundable deposits are payable every six months until the... consents come through. Once the consents are given, the balance of the purchase price falls due. Part of the Nga Pua offer includes the issuing of 10 ordinary shares at... \$120,000 each to meet the next E[CNZ] payment and... the company had secured funding for that payment. Other... plans include the issuing of 80 ordinary shares in Nga Pua to institutional shareholders at \$300,000 each... The development has been criticised by environmental groups in part because Olivine will restart the coal-fired plant while it builds the rubbish-powered burners. There are concerns the plant will discharge dioxins and other pollutants, though reports commissioned by Olivine find to the contrary.

...The Minister for the Environment... has rejected a call for a special inquiry into Olivine[']s... plans... Eight environmental groups, including Greenpeace and Friends of the Earth, had asked the minister to use his powers under the Resource Management Act[, but the minister]... said the concerns could be adequately dealt with through the resource consent process under way. Environment Waikato and the Waikato District Council have advertised the Olivine proposal and objectors have until December 18 to make submissions. The Hauraki District Council voted against committing money to the scheme. Meanwhile, a scientist who has found three native forest fungi with an amazing ability to gobble up toxic substances does not want the technology locked away with patents. The three forms of white-rot might be a clean, green way to solve a serious environmental problem, said... [the] leader of a research programme which screened the trio from more than 500 native fungi... Some of the native fungi have an appetite for pollutants, such as pentachlorophenol (PCP) which is used in timber treatment.

...[You have probably read the headlines and heard the views on talkback radio as various individuals and groups attempt to place the blame of problem buildings on kiln-dried, chemical-free framing timber. The development of chemical-free timber was no accident. It was researched by BRANZ, Forest Research, Consulting Engineers, Territorial Authorities and the Timber Industry itself. This group examined buildings around NZ (some were up to 80 years old) and showed that untreated pine framing performed as well as H1 treated pine framing. In AUS, chemical-free radiata pine has been used for the past 50 years without any problems. So why are some people calling for the return of what they call "treated" timber for framing? And what do they think "treated" means? Lots of people seem confused so here is a simple explanation that may help clear things up. There are two distinct types of hazards that affect pine – borer and fungi. H1 treated timber is specifically designed for resistance to common borer only. If the timber is at risk from decay, higher levels of treatment such as H3, H4 and H5 must be used. H1 treatment, which was commonly used with wet framing, has a very low specified level of boron. It leaches out in wet conditions, and although it may be mildly fungicidal to some brown rot fungi, there are other brown rot fungi that tolerate H1 at this level. It is not a broad spectrum fungicide and was not intended to be. The case history of weathertightness failures is heavy with the high repair costs for damage to H1 timber. The only proven way to prevent fungal attack comes from protection against moisture, which applies equally to both chemical-free and H1! Untreated pine framing offers more than adequate protection against borer as long as it is high temperature kiln dried, dressed and stays dry. High temperature kiln drying makes timber unpalatable for insects and in particular anobium, better known as borer. Insect larvae can only attack the cellulose and starch if the timber has a very high moisture content. High temperature kiln drying permanently lowers the moisture content and allows the timber to dry faster even if exposed to weather during construction. Also, the eggs need surface texture to hang on to. Dressed timber does not provide suitable egg laying sites. So, if chemical-free pine resists borer, why was H1 treatment against borer ever introduced? The answer in a word – ignorance. The NZ Building Industry was quickly changing over to pine – native timbers were prone to borer attack – and it was generally and incorrectly assumed that kiln dried pine would be equally prone to borer attack. There was no evidence that this was the case but the result was that H1 became mandatory through regulation.'

... 'A working group has been set up to lobby central government on the Litter Act and getting harsher litter laws, and to lobby the packaging industry about its excessive use of branding. It costs West Auckland ratepayers \$600,000 a year to have the Waitakere City Council remove litter from the streets. The council is the first in Auckland to conduct analysis of this kind, in an attempt to reduce the amount of waste and money spent on its collection. Litter dropped on the streets was counted out and classified by a team of workers from the independent company Waste Not. Worldwide fast food chain McDonald's topped the 12% fast food category with 6.4% of all litter collected bearing its brand – a total cost to ratepayers of \$38,400. The council has started working with McDonald's and other food chains to find solutions for reducing the amount of waste they contribute. Cigarette packets account for 5.1% of litter generated (note: butts take 5 years to decompose) – costing ratepayers \$30,600 a year. With the government getting back most of the tax from cigarette sales, the council's solid waste business unit manager questions why local authorities should be expected to spend hundreds of thousands of dollars cleaning up after smokers. "It's unfair if you don't smoke or eat fast food. Basically, we're subsidising people smoking cigarettes and eating takeaways." In litter bins pizza boxes are a problem, as it only takes one box to jam up a whole bin. Pizza boxes are also a problem for the Auckland City Council, which has had to install larger bins with specially manufactured lids to cope. Auckland City spends about \$1m on litter per year. Household rubbish like plastic bags, food and packaging make up 43% of roadside litter. Dairies and service stations are the second largest source of litter contributing 40% to the total.'

... 'THE Waitakere City Council wants burger chain McDonald's to pay for part of the \$600,000 annual bill for cleaning up litter from Waitakere City streets. That follows a council survey showing the company's burger wrappers account for more than half of the litter generated by fast food chains in the city. The council's solid waste manager says McDonald's has not been asked for a specific amount of money. "We have suggested to McDonald's that they should be contributing to the cost of litter pick up for as long as they continue to produce packaging that's so readily disposable in a takeaway form."

McDonald's communications manager says the council has not asked them to pay for the clean-up, but they have received a letter from the council about the litter problem and the cost to the council. "All our franchises have a contract with us to pick up litter within a block of where they are situated." The communications manager says the company funds educational kits for schools, produced by the NZ Packaging Council, that deal with waste disposal and environmental issues. The council manager says: "Our laws are inadequate in comparison to other countries. An individual can be fined \$100 and businesses up to \$500. If you start hitting them as hard as you do with people who drink and drive, you are going to see some people changing their attitude.""]

...Litter bugs in Palmerston North may find themselves parting with more than just the wrapping on... takeaways. The council has decided to use the Litter Act 1979 to exact instant \$100 fines, instead of using its by-law, which meant lengthy and costly court action. A litter control officer can fine someone seen dropping rubbish, or in the belief the offence had occurred. People who see someone dumping rubbish from a vehicle can note the registration number and advise the council[, which] had noticed more rubbish on the streets after an increase in the number of fast food outlets.

...Auckland City Council... would save... \$900,000 and complaints from residents over growing rubbish piles in suburban streets... if... [it closed t]he lid... on... [it]s troublesome inorganic rubbish collection. The... push to axe the annual pick-up follows claims that people outside city boundaries took advantage of this year's collection to dispose of unwanted junk. Council officials estimate that tonnages in some wards jumped by 75[%] this year, with much of the waste from major building works and new residential construction. Delays in some wards this year had garbage piled up on footpaths for weeks. In a report to councillors considering next year's budget, [the person]... who manages resource recovery for the council... noted that as householders had mobile garbage bins or "wheelie bins" they could get rid of most domestic rubbish. The onus of disposing of larger items rested on individuals, rather than on all ratepayers. "There are a multitude of commercial operators in this industry sector to cater for such a user-pays service." Though [the council's resource recovery manager] recommended scrapping the inorganic collection, [it]... also wanted the council staff to investigate other ways of dumping. In a separate move, the council may increase the charge for additional bins by 30[%]. Extra bins cost \$140 but a report to the budget committee recommends a charge of \$185 to reflect costs and discourage excessive dumping.

...Manukau City is getting rid of "wheelie" rubbish bins because they have been found to be generating twice as much rubbish as the conventional bins and bags... [A] small number of residents were abusing the wheelie bin system by putting garden waste in them, at the expense of ratepayers' money. The conventional bins and bags system was fairer and... from October 1 next year the council will offer free collection of refuse in bags and cans in a bid to reduce what it calls excessive solid waste generation... The council has adopted a waste management plan that aims to reduce rubbish being generated by 20[%] before the year 2014. It said it would fund community-based programmes and initiatives which encourage businesses to reuse and recycle rubbish. Each programme would be evaluated and, if successful, could be set up citywide... A... councillor... said residents who wanted to continue using the wheelie bins might make private arrangements with the company operating them.

...Manukau City is quickly running out of room for its rubbish and urgent planning has begun to cut refuse generation. Based on calculations on waste production levels over the past three years, council officers fear the city's two landfill sites... will reach capacity in eight years... Council staff... want to slash the amount of garden waste householders put in their bins. Up to 25[%] of domestic rubbish is organic... Council research shows that more than 210,000 tonnes of rubbish is produced in Manukau each year. About 60,000 tonnes comes from households and the rest from commercial properties and industry... Commercial and industrial waste production in the wider Auckland region has increased by 13[%] to 501,000 tonnes over the past two years.

...Waitakere City Council is to weigh rubbish produced by residents and charge them accordingly in a trial designed to cut down on waste. The city intends selecting a sample of households for the "charge-by-weight" trial which will use a high technology system. The normal collection will be retained until the council makes decisions about rubbish services by December. The "eco-city" wants to slash the amount of waste it... generate[s].

...Six smelly sacks of rubbish that have haunted Otahuhu's business district for a week show that Auckland City Council's recent restructuring is not working... Someone dumped the plastic sacks beside a shop's wheelie bin... says the Otahuhu Business Association director... The bin contractor would not take them because they were not official council bags and therefore [it] would not be paid to remove them. [The director], who is a Tamaki Community Board member, said the rubbish had been rotting in the humid street while [the association] tried to persuade the council to remove it. Before council restructuring a month ago, such problems could have been easily sorted in an hour by the resident council services representative. But now countless phone calls were needed to contact the officer responsible, who had been relocated to a centralised office...

Late last year I wrote a column lamenting the passing of one of our national treasures, the local rubbish dump, a place at which, for the hire of a trailer and the fee of a few bucks, one could quickly, easily and cheaply dispose of the accumulated family junk of the past few months. This prompted a number of letters, some well meaning; others, I suspect, derisory, advising that what you do, idiot, is hoard the stuff in some unseen place, like around behind the woodshed. Then, when the council advertises its annual inorganic collection, you whip it all up to the roadside and one morning when you wake up, presto, it's all gone. Just like that. Clean as a whistle. And free. Unfortunately, it's not at all like that... My return to this subject was sparked by a photograph in the *Herald* recently showing ranks of inorganic rubbish slumped forlornly on a suburban footpath, like passengers waiting for a bus that's already gone. More recently still, one of our local papers ran a report quoting the North Shore City Council's refuse and recycling manager... as saying professional scavengers have been among those scouring the inorganic piles on the streets. Well, fancy that! You call that news? I could have told you that years ago. But it's not the pros who are the problem – they know what they're looking for and that's what they take; it's the amateurs, hordes of them – they have no idea what they're looking for but they take it all the same, or half of it. The other half they biff on to your front lawn, the road or someone else's by-now-dishevelled pile. I have no objection to other people helping themselves to my rubbish. It's just the way they go about it. While we were brought up to respect other people's property (not that you'd notice, these days) there's nothing in the book about unwanted property. They attack it with the frenzy of starving seagulls spying a dead fish in the sand, tearing it to shreds until only the bones are left and then disgorging the over-stuffed bits anywhere along the beach. And it's no use trying to fool them by sticking your rubbish out under the cover of darkness the night before the collection officially begins – it could be days, sometimes weeks, before that big truck rumbles by. Because I had to go out in the afternoon I put my last lot out early on a Sunday morning the day before the collection period officially began... Even at that early stage the advance party of pros was on patrol, utes, vans and trailers crawling menacingly along both sides of the road, practised eyes peeled for a Stradivarius or a Steinway among the lesser spoils. In no time the main body was moving in; big, cigarette-smoking mums in equally big station wagons, disgorging urchins on Fagin-like missions. But I was ready for them. This year, I had decided, I would make it easier for giver and receiver. Remotely salvageable disposable assets were neatly arrayed in one lot, among them five typewriters of tappier times and a VCR... I had just placed the VCR prominently in position and was retreating down the driveway when I heard urgent footfalls descending on me. "ey mate... that video go?" "If it did," I replied tartly, "it wouldn't be out there." You could tell [the scavenger] didn't like smart-alec responses. [The scavenger] turned on his heel and disappeared. So, I noticed a few minutes later, had the video, along with the electric typewriter. The two portables proved, as they say in the retail trade, harder to move... though by day's end they were perplexing new owners elsewhere... Customer response to the two remaining typewriters, relics from newspaper offices of the 50s, was disheartening. From their increasingly battered demeanour it was obvious that passing fowssickers had given them more than an inquisitorial tap or two. Then, on the day before the collection truck finally arrived, two youths happened by and uplifted them – high above their heads before dashing them on to the footpath many times. But, like pre-war cars, 50s typewriters are made of sterner stuff than juvenile morality: although the innards were smashed

to a million bits, the casings remained intact. I did not witness this display of witless wantonness, but my seven-year-old grandson did. And although [my grandson] later expressed astonishment I suspect that, as is the wont of small boys, [my grandson] might have secretly found it pretty cool. Now, several months on, after the lawnmower has picked up most of the stray keys and springs from the typewriters, I keep worrying about my grandson – that after [it] gets to be a big boy [it]’ll be able to go around at inorganic collection time and smash all those discarded PCs into a trillion pieces.

...[I am dismayed to read in a leaflet, recently distributed to all Waitakere City householders, the request that anyone seen “scavenging” be reported to the council. I find it extraordinary that a council, which advocates its citizens “reduce, reuse and recycle”, would then demonise those who do what it suggests. One would imagine that a council, sincerely advocating policies of conservation and environmental care, would be encouraging members of the public to avail themselves of any “rubbish” that could be put to use. Such an enlightened council would be pleased that this was happening and appreciative of the fact that the reuse of materials and goods means reduced volumes in landfills and reduced demand on the planet’s resources. That would seem an appropriate approach from a council professing to be a clean and green “eco-city”. Instead of that, we have a council which promotes the disgusting “spy-on-your-neighbour” tactics of totalitarian regimes. I find the hypocrisy disturbing and would like to know who decided that “scavengers” should be reported?]

...[Scavengers setting their eyes on this week’s round of inorganic rubbish could be deterred from rummaging in it – because fellow citizens may do them in for stealing. In addition to explaining what “We will NOT COLLECT” (any bagged rubbish, garden waste, commercial and farming waste, bricks and broken concrete, glass and small loose items, oil and paint, fibrolite/asbestos, car bodies and tyres, builders waste and anything that cannot be lifted by two people), plus asking that doors be removed from stoves/refrigerators (or place the appliances face down) for safety reasons and metal items be sorted from other inorganic rubbish to assist in recycling, the inorganic rubbish collection brochure lays out the law with these sentences: “Anyone who witnesses people illegally dumping or scavenging inorganic rubbish may record the date, time, and vehicle registration details. To report illegal dumping or scavenging contact Waitakere City Council on 839-0400.” The brochure is sent to all households seven days before their inorganic rubbish collection, which happens in different streets for 50 weeks of the year. Scavenging can be dangerous, and makes rubbish collectors’ work-load tough, the council’s waste minimisation officer says. Not all scavengers will be sought after: “It depends what they are scavenging.” People smashing up a television on someone’s front lawn and taking the insides out is an example of dangerous scavenging. Not only does it pose a safety threat to pedestrians, it also shows lack of respect for others’ property. As yet there have been no reported cases to the police of scavengers stealing from the inorganic collections’, or people illegally dumping rubbish.]

...[Widespread illegal rubbish dumping throughout Auckland City is likely to force the council to reinstate an inorganic waste collection it axed to save money. The removal of tonnes of rubbish is costing the council \$10,000 a month. No one has been prosecuted and health inspectors are worried that the refuse is a health and safety hazard... [A] senior councillor... called the collection a core council responsibility... The policy u-turn is calculated to cost \$1.6 million, with the collection accompanied by a campaign promoting recycling... [□ A NZ]-born recycling consultant [i]s in Auckland talking to local councils about Canberra’s goal of becoming the first city in the world with a waste-free society. It aims to reduce waste generation, recover resources and, eventually, halt the flow of rubbish to landfills... By intercepting rubbish at the landfill face and at transfer stations Revolve... [(a community employment and recycling enterprise)]... stocks its depots with reusable building materials, plastic goods, parts for electrical appliances, suitcases – anything for which there is a demand... [The consultant] said the Canberra experience should happen in N[Z] – and in Auckland in particular... All that was needed was support and an enclosed area with some sheds. If waste generators provided reusable materials goals of saving landfill space and creating jobs could be achieved. [The consultant] was hosted by the Zero Waste N[Z] organisation.

...[Looking into bins, [a]... waste management consultant for Waste Not Auckland... doesn’t see rubbish, [it] sees energy, resources, money and jobs... When you regularly look into bins, as I do, it soon becomes apparent that what we regard as waste is in fact a valuable resource... [A recent] article... said our practice of landfilling was “no solution,” and I couldn’t agree with [the article’s author] more. Where our paths diverge is in his support of incineration. Hardly a better step. At least with landfill there is a future opportunity to mine the resources, as is happening in the U[S]. Incineration is being touted as the waste disposal solution for the 21st century allowing us to “consume as much as we want and could afford, without suffering from environmental guilt.” Given the Earth’s finite resources, not a philosophy my generation should promote. Regardless of our consumption patterns, would not the best system be the reuse and recycling of these waste materials? ...[the article] argues that in practice recycling is not cost effective for most materials. Yet this is not surprising for a number of reasons. In a society where user-pays is the norm, waste management practices are heavily subsidised by councils, while recyclers, who by diverting material from landfill directly save councils money, receive no assistance. I would like to know how many landfilling/incineration operations there would be if a council offered entrepreneurs \$20 a tonne to take waste from the kerbside. The Auckland landfill rate is approximately \$60 a tonne, and is set to rise. At a reduced cost per tonne recyclers can now utilise material to produce top-quality products, such as the compost made by The Living Earth Company. In Kaitia, a community has shown that recycling, even in a remote area, costs less than landfilling. An increase in recycling would also bring an increase in low-entry-level jobs into the local community, those that have been lost over the past 40 years, and money directly into local communities. Operations such as Urban Ore in America have thrived off waste. They employ 23 fulltime and 8 part-time staff, with a turnover of \$US1.4 million, by diverting 6000 tonnes... Before there are accusations that I am another “deep-green environmentalist promoting my own feeling of moral superiority,” I am... [I] like *Steptoe and Son*, and my Yorkshire-born grandfather, [who believed] that “where there’s muck there’s brass,” and that doesn’t mean throwing it in a furnace. • [The Christchurch City Council has begun a recycling enterprise similar to Canberra’s Revolve programme.]

...[Voluntary consents to reduce waste are not working and new strategies are needed, says [NZ’s] Associate Minister for the Environment... The ministry has completed its first National Waste Data Report in line with the ...g[overn]ment’s waste-reduction policy... The... report showed there was a serious information gap in the waste area. “We know far too little about what waste there is and where it comes from. We have to do more to ensure that adequate information is collected in a useable way,”... The ministry was working on draft legislation which would require companies to report their environmental impacts.

...[PDL Plastics takes pride in being environmentally conscious. “We’ve always maintained an interest in, and taken responsibility for, environmental issues,” says the company’s chief executive officer, [who]... chaired the Plastics Institute of N[Z] action group when it initiated a system in the late 1980’s of marking different types of plastic mouldings with recycling codes. This enabled products to be separated for recycling or for other re-use applications. Today the company continues this practice, type-coding products to improve the viability of local collection services... [A]ll scrap and waste within the PDL Plastics plant is recovered and re-used... [s]crap which cannot be used by PDL Plastics on site is recovered by a local recycling company[.]... often being manufactured into low-specification products such as garden centre buckets and pot plant holders.

...[London’s *Sunday Times* report[s] that... oilseed rape plants... have [been] genetically engineered... so that they grow plastic polymers in their leaves and seeds. The [US] chemical manufacturer, Monsanto, will attempt to boost the content of the plant’s plastic so it can be made into various household items such as plastic bags and bottles. The new type of “natural” plastic is also biodegradable, so that once buried, it converts into harmless carbon dioxide and water within six months. Farmers could be growing the plastic plant crops within ten years...]

[THE YEAR 1909 saw the arrival in the manufacturing world of a material that would change our lives: plastic. Today it is difficult to imagine a world without plastic products, and that’s the problem – we’re being buried in the stuff. The documentary *Planet Plastic – The 4th Kingdom* (Discovery, 10pm, Saturday) reveals that Americans alone throw away 10 million tonnes of the stuff every year and that only 5% of it is recyclable. Scientists are now

working hard to find ways in which a product designed to endure can be made biodegradable. Good luck, we say.' By the way, 'roadside recycling collections will start in Manukau City next April. A Manukau City councillor said residents created about 2kg of waste each day. This figure compares with 0.9kg in Sydney and 1.5kg in Brisbane. The councillor said while the service was a good step toward reducing the city's waste stream, the council should continue to look for new ways to discourage waste production. Last November, the council reversed a decision to introduce user-pays rubbish collection, a move the mayor said "destroyed" Manukau's efforts to reduce waste. The scheme offered residents year-long contracts as an alternative to paying \$1 a bag for rubbish removal. Tenders for the new recycling service have been called for and Manukau expects the successful bid to be announced in three months. A one-off sum has been included in Manukau's annual plan for start-up costs, such as new bins, and a public education programme. Manukau City's senior policy analyst will not say how much money has been provided for fear of showing the city's hand to potential tenders. Rates will pay for ongoing costs. The service will operate alongside normal rubbish collections and offers residents a weekly collection for some plastics, aluminium cans, paper, cardboard and glass'...

Fed up with sifting through dead cats and dirty nappies, Glass Recyclers of N[Z] has removed its bottle banks from Auckland. But Paper Reclaim Ltd plans to modify and reintroduce about half of the 100 bins to raise funds for schools and community groups. The bins will be locked.

...a... mountain of waste paper [is] awaiting recycling at A[US]'s largest paper recycling mill in Sydney... Over the past year, prices for recycled paper, plastic and bottles have fallen so heavily that A[US] has been forced into paying Indonesia to accept some of its [recyclables]...

Recycling: is it worth all the hassle? ...For [an] environmental economist... there is more to recycling than the realities of budgets, cost-effectiveness, profits and losses. [The economist] comes from the U[S] where... more adults regularly participate in recycling than vote... Recycling... may make only a modest contribution towards an environmentally sustainable future and it is not the most pressing of environmental issues. [Howeve]r, it is important because many people care about leaving a livable world for their descendants. Apart from making green purchases and cutting car travel, it is the easiest activity they can do each day and then say they have helped the environment. [The USer], who holds a doctorate from Harvard and is now research professor at the Global Development and Environment Institute at Tufts University in Massachusetts, was in Auckland last week hosted by the Packaging Industry Advisory Council. [The USer] asks why we recycle when the activity is profitable only for people involved in scavenging in [Last World] countries and a handful of specialised businesses... But [the USer] says recycling is important even in the absence of a crisis caused by a lack of landfills or an immediate opportunity for profit... A strong case for recycling rests on its benefits in resource use and manufacturing... "Using less stuff in the first place is even better for the environment than recycling." ...● About 29[%] of packaging consumed in N[Z] is recycled. The average weight of packaging per unit of goods has decreased by about 24[%] over the past 10 years.

...The Minister of Finance... yesterday patted the Papakura District Council on the back during the opening of a new joint-venture project in the city... sa[ying] the \$2.5 million... refuse transfer and recycling station... was a shining example of cooperation between a local authority and a private company... The new facility is expected to process 12,500 tonnes of refuse in its first year... The council used its expertise to get the necessary consents, which it then onsold to Waste Management NZ Ltd, which built the plant and will operate it... Waste Management [also] plans to make trial rail runs of rubbish before Christmas and should have a service from Thames to Auckland operating in six months... [R]ail was a cheap option over long distances and was used to move waste extensively in Europe, particularly in Holland... [The company i]s working with Trans Rail to test a railway wagon converted to allow a truck driver to load or unload a 10-tonned container of compacted waste directly onto or off it.

...More quarry trucks 'inevitable' Auckland's quarries are fast running out of rock to meet the voracious demands of expanding roads, ports and construction projects... The biggest, Auckland Airport's second runway, will absorb two million tonnes – equivalent to the annual output of Winstone[Aggregate]'s Mt Wellington quarry, the largest in the country. Roads and motorways need "several million tonnes" in the next five years. The Britomart scheme, the America's Cup Viaduct Basin development, the Fergusson Wharf expansion and housing growth also will be big users of aggregate... Quarries supplying almost 50[%] of aggregate... are expected to be depleted by the year 2000, forcing firms to use rock sources south of the Bombay Hills. The greater distances involved in trucking quarried material is expected to add to congestion and the cost of infrastructure projects. These are the conclusions of a University of Auckland study... Commissioned by Winstone Aggregates, a [Challenge] subsidiary... the study estimates that twice as many big trucks may be needed to move... quarried material 40km along the Southern Motorway when existing operations close... A Winstone manager believes authorities and the community should review quarry restrictions... [because] using "appropriate regional resources" would help to relieve the burden on roads and save on transport costs... But an Auckland City councillor... said higher costs imposed by trucking aggregate long distances "may be the price we have to pay." [The councillor] supports Three Kings residents in their fight against the 35-year expansion of Winstone's local quarry. [The councillor] feels the time has passed when dusty, noisy quarries could operate in the suburbs. "I don't think they're a good marriage." ...[the] president of a Three Kings group fighting the 15ha quarry, questions whether Winstone wants a relaxation of its Resource Management Act obligations or 24-hour blasting rights. [The president also] says the company's plan... [for the pit] to be mined 57m deeper... will create a suburban open-cast mine. "We would much prefer for the company to close its quarry by the year 2000 and start the millennium with a new recreation reserve." ...The company contends that scoria is an essential resource – about 40[%] of Auckland's scoria market is met from Three Kings – and that the quarry has been there as long as the suburb... (The Auckland Regional Council intends to build a plant beside the quarry to treat the water... to be pumped out of the pit... and feed it into the city's water supply.)

...A New Lynn [resident] has come up with an idea... [that] could help to fill the gap as Auckland's quarries run out of rock... [The idea – which] occurred to him at 2 o'clock one morning – is to turn plastic milk containers from kerbside collections into plastic flakes... [E]ngineering tests showed that the flakes have a permeability similar to that of course sand or fine gravel and stand the weight of a heavy load... [I]f they were contained in material that was tough and would not rot, they could take the place of quarried scoria or gravel as free-draining material. In 2 1/2 years the idea has won a Waitakere City Council ecology award and has grown into a patented product called Flomat. The flakes form a quilted mat 2m by 1m wrapped in a polypropylene fabric... [and are already] used between walls and clay banks as part of the drainage system. It had taken "a lot of talking" to persuade conservative builders to try something different from scoria... but the converts were enthusiastic about the savings in trucking of gravel and disposing of excavated clay... [A] cubic metre of mat weighed 32kg compared with 1.2 tonnes for a cubic metre of metal. The fact that more mats could be carried in a truckload was attracting interest from forestry operators for use as an alternative to metal for temporary roading and from farmers for their stock-holding areas... [A] Henderson factory... produc[es] the plastic flakes and imports the mat covers from the U[S]. Flomat's inventor said there was an endless supply of plastic waste in Auckland [and] business had grown to the extent that a council that previously had no market for two-thirds of its plastic could now sell twice as much as it collected.

...[Waste plastic is being used by a Papakura businessperson to make "hard-as-concrete" paving stones. His experience with plastic began when a tail-light on his car broke and the businessperson couldn't find anyone to repair it. From building up a successful business specialising in tail-light repairs, the businessperson turned to fixing damaged plastic milk trays previously thrown away at the rate of about 30,000 a year. But while most containers could be fixed, plenty were still beyond repair. "Suddenly I had a yard cluttered with these crates. That's when I started granulating and grinding the plastic." The businessperson then hit on the idea of mixing the grindings with cement and sand. "I thought, 'This is too simple and obvious. Why hasn't anybody else thought of it?'" The businessperson spent hours on the Internet trying to find out if anyone else had the same idea, but could find no evidence and now has

international patents protecting the Plascrete product made at his Enviropas premises. The paving stones, in a variety of colours, are being launched on the market this week. At about 1.8kg, they are lighter than normal paving stones of the same size, which weigh about 3.4kg. The plastic pavers are sold in six-packs for about \$8, and 39 of the triangular stones are needed to cover a square metre. The pavers, which can be cut with a hand-saw, are designed for pedestrian walkways and are the first products using the manufacturing process. In time the businessperson hopes to make heavier pavers suitable for traffic, as well as other building products. "The whole plastics game is about repairing, reusing and recycling. Even these pavers can be recycled."

... 'A milk company is helping customers to stay warm this winter by recycling plastic and fibreboard milk containers into fire logs. "Just another log on the fire, except it's like no other. For a start it was sold and delivered by a Dunedin milky." In a unique recycling loop the milky also collects the beginnings of more logs, picking up empties and returning them to Dunedin's milk plant. They're ground into small chips then added to a special recipe of coal fines and recycled paper. While plastic on a fire is normally a no-no the hot-rocks, as they're called, were designed by the old Department of Science and Industrial Research for their clean-burning qualities. "As far as we're aware the particular process that we're operating is unique to Dunedin, to NZ and possibly even the world. The rocks sell for about 33 cents each and will burn for between 2 and 7 hours." The hot-rocks plant was officially opened this week.'

... a New Yorker's 'customers are being hassled about the backyard decks the contractor has built for them out of recycled plastic. They've even asked him to stop using them for referrals. Their complaint? The decks are too popular. "These people just became overwhelmed by people knocking on their door or calling them up." Artificial timber – made of recycled plastic or a blend of plastic and scrap wood – is chipping away at the dominance of real wood in the \$2.2b annual market for decks. The industry's top producers, US Plastic Lumber Corp and Trex Company – who together have 80% of the artificial lumber decking market – have about 4% of the US deck market and now are targeting national parks, railroads and local government. While their market share may be small, it's enough to generate stock gains for US Plastic and Trex that far exceed those of big forestry companies. Artificial lumber has a big advantage, contractors say: it lasts for decades. Treated wood needs replacing much sooner because of cracking and rotting. The disadvantage is price. Artificial-lumber decks can cost twice that of wood. However, advocates say consumers recoup the higher price in as little as three years once the maintenance costs for wood are included. The threat of market-share loss has prompted at least one lumber-treatment company to battle back. Two years ago the 4th-largest lumber company in the US began distributing Deck-Cap, a wood board partly covered in vinyl. "We are absolutely concerned about alternative products to wood," says the lumber company's vice-president. Lumber companies should be concerned. Artificial boards cover the surface of the 3000 sq m viewing platform for the Old Faithful geyser at Wyoming's Yellowstone National Park. The three-year-old platform supports 2.5 million visitors a year in temperatures ranging from almost 38 degrees to well below freezing. "We've never replaced a single board," says the chief of maintenance at the world's oldest national park.'

... Victoria University's school of biology and physiology is substituting plastic for glass in one of its laboratories to boost safety and reduce breakage costs. Glass will be restricted to experiments involving direct flame... [The] senior physiology lecturer... said the user-friendly lightness of plastic equipment and that it was recyclable made it ideal... [Incidentally,] Auckland-based ACI Glass has suspended its sand mining at Parengarenga harbour in the Far North after environmental concerns raised by local Maori. A Ngati Kuri Trust Board member... said about 100 people attended a hui on Tuesday at Te Hapua Marae after a threat by Maori last week to blockade the entrance to the harbour. Ngati Kuri said the sandspit had been changed by underwater suction dredging of the sea bed. A new coastal inlet had been created, widening the harbour mouth and eroding the foreshore. The Ministry of Commerce said this week that ACI had mined silica sand in the Parengarenga area since 1922.

... An independent report has cleared... ACI NZ Glass Manufacturers... of causing erosion to... the Parengarenga Harbour entrance... [and foreshore during decades of sand] mining activity. The environmental report was responding to concerns by the local... tribe.

... ['Plans to dredge huge amounts of sand from the seabed off Leigh, north of Auckland, have raised fears for the marine reserve around Goat Island. An application by Kaipara Excavators to suction dredge 2 million cu. m of sand over 480 sq km is believed to be the largest proposal of its kind in NZ. The proposed area extends to within 1.5km of the marine reserve. An Auckland University marine ecology lecturer, whose research programme is based at Goat Island, said dredging would kill shellfish beds, starfish and crabs – reducing available food for snapper and crayfish that lived in the reserve. "This affects the reserve's integrity. You don't want something making a big mess at the edge of it." The 20 objectors to the application include the Department of Conservation. But the applicants have already overcome one hurdle with coastal Maori just north of Leigh, who have relaxed their stance about the issue. The Ngatiwai Trust Board chairperson, a vocal campaigner for the preservation of Pakiri Beach, said it was taking a pragmatic approach – perhaps because it has been retained by the applicants as a cultural consultant – though the chairperson said it was only receiving "a bit of petrol money and some koha (gifts)" from the company. The sand was inevitably going to be needed for the expansion of Auckland, and taking it from offshore was better than from the beach']...

Not even a grain is too small to escape the labyrinth of bureaucracy... [T]he forms have been completed, the officials have investigated and at last the... Museum of N[Z]... has approval under the Resource Management Act to display a piece of the great outdoors indoors. Subject only to negotiating a suitable protocol with the local tribe, museum staff can proceed to a west coast beach north of Auckland and remove some sand. To be precise, six buckets full. And the strangest part of the story is the museum's insistence that it obtain a resource consent from the A[RC] despite being told it did not need one... "We told them not to be so silly..." said the council's environmental officer... "...We try to employ the principle that if it's minor and not going to have an impact then don't worry about it, but they insisted... because they were a public body and didn't want anyone attacking them for doing something illegal..." Asked for his view on the sand consent application, the council coastal resources manager... said: "It would be fair to say it is the most minor activity that we have processed a consent for." A consent might be needed for a trailer load of sand but only because "the council likes to know what people are doing." The black sand was needed to pad out a Treaty of Waitangi exhibition.

... BHP N[Z] Steel officials brought an uncertain message at the weekend to Taharoa, an isolated settlement on Waikato's west coast and site of an ironsand mining operation... [BHP's] chief executive, and... [its] primary operations manager, said they had secured the future of the ironsand mining operation at least until 2004 by clinching a further five-year contract with Japanese steel mills – but with annual tonnage cut from 1.1 million to 700,000 tonnes. If BHP is to retain the present level of mining operations it must now find new markets for ironsand in Korea and China before existing contracts expire in March 1999. BHP faces the same dilemma with its Glenbrook steel plant which faces falling demand for its steel at home and abroad. At Taharoa, however... [(j)unique in the BHP empire as the only worksite with a set number of employees – 50 – written into the existing contract)]... the crumbling global demand for ironsand hardly rated on the list of concerns... The community was much more worried about the appalling quality of tap water in the town, the sinking levels of Lake Taharoa, environmental oversights on everything from scrap waste to whitebait, and impressing on BHP the need for respect for traditional burial sites. "Twenty years ago they tried to sell our water to Saudi Arabia... Now we can't even drink it." A trial shipment of 55,000 tonnes of ironsand to China, being loaded next week, may secure a much-needed new customer... China faces an annual shortage of 100 million tonnes of iron ore by the year 2000... By the end of the century, annual demand for iron ore will be 350 million tonnes, with domestic supply at 230 million to 250 million tonnes... [In related news, t]he world's major aluminium producers are expecting to restart mothballed smelters in the next few years as the price of the base metal climbs and stockpiles drop... Last week, Montreal-based Alcan Aluminium, the second-largest aluminium producer in the world, said it will increase output from its Kitimat smelter in northwestern British Columbia to 100[% from 92%] now, a rise of about 22,000 tons a year... The company also said it might reopen further idle capacity in Canada, the U[K] and the U[S]. It has 134,000 tons a year of idle capacity around the world excluding Kitimat... Other major producers, though, are less willing to suggest they will resume idle capacity... The... largest... producer[, the]... Aluminium Co of America (Alcoa)[,

has]... 450,000... tons a year of idle capacity... Reynolds Metals Co, another leading American producer[has]... 209,000... and Pechiney of France... 125,000... Consumption of aluminium this year could be as much as 18.8 million tons[up 5%, and]... demand... is expected to... [rise a further 3%] next year... The... London Metal Exchange... said the stockpiles were now at 620,475 tons, a drop of 330,800 tons... since the beginning of the year.

...Since 1919, when an A[US]n-dominated triumvirate, the British Phosphate Commissioners, began mining the... tiny South Pacific island of Nauru... more than 100 million tons of premium-grade phosphate – the product of centuries of seabird droppings – have been gouged from its central plateau for use as fertiliser in... Britain[NZ and AUS]. The exports bought Nauru's 7,000 citizens a good life: one of the world's highest per capita GNPs, free education and health services, no income tax. It is one of the few island nations in the region that has never needed foreign aid. But phosphate – the nation's sole export – has been both blessing and curse: when deposits are exhausted at the turn of the century, roughly three-quarters of Nauru will have been mined out. The only arable land available will be a coastal fringe less than 400m wide; the biggest employer will be gone; alternative industries like fishing are so far nonexistent. Says... the South Pacific Trade Commission: "It was good while it lasted, but unless they can live off the investment, there's nothing in the future for them really." Four years ago, Nauru won \$A107 million compensation from A[US] for environmental damage. The government is also believed to have invested another \$A700 million of past royalty payments. Some of those investments – including an ill-fated loan to a Melbourne football club and a short-lived musical in London's West End – have been disasters. As were the loss of funds handled by one A[US]n law firm and problems at the Bank of Nauru. Besides troubled investments, deficits previously masked by phosphate income have been increasing... [Once.] falling numbers threatened their community. Underpopulation is no longer a problem, but other threats remain. The 21 sq.km republic... is now torn by political instability – four presidents since November and another election this weekend... As well, Nauru has some of the worst characteristics of small-town politics – family rivalries and old feuds.

...Nauru, the tiny coral island in the Pacific whose environmental destruction supported N[Z] agriculture for decades, is rapidly facing hard times as its rich phosphate reserves reach their end... Already, Nauru's latest budget has slashed... public spending by 41[%], halved]... the deficit to \$A24 million... clamped down on public employment, and cut salaries and overtime. Import duties have been increased, and other licences and fees have been increased or introduced... [The]Finance Minister... told Parliament the nation had assets of about \$A1.26 billion... in 1991: by last year, after deducting public debts, these had plummeted to \$A423 million. "An era of comfort and extravagance has come to a severe halt," said [an AUS]n Agency for International Development economist... "The difficulty for the Government is that... [the] 10,400... people in Nauru are accustomed to the delivery of free or cheap services and may find it difficult to accept the need to pay." The need to work after years of living on phosphate royalties may present other difficulties... "Workplace skills are poor, with little economic incentive in the past for Nauruans to participate actively in the workforce." Nauru is a product of colonial history. The British discovered phosphate in the island's central plateau in 1899, and began mining it seven years later, splitting the proceeds with the German administrators. During the First World War the island was occupied by A[US], and remained a trust territory until 1968. Its only wealth... was stripped from the island and poured across the farms of N[Z, AUS] and Britain as superphosphate. Deep gullies now lace the interior of an island whose 34km of coastline embraces just 21 sq km of land. Nauru won back part of the wealth that was lost before independence with a settlement in the International Court of Justice, under which A[US] agreed to a \$A57 million lump sum payment and \$A2.5 million a year for 20 years. But the future is darkening... There are few options. Despite some stopovers by package tours heading for Guam, tourism's prospects are limited. And while there are no taxes on the island, the development of Nauru as an off-shore finance centre appears unlikely. Now the tough options are being faced. Land rehabilitation has been identified as a key priority to boost cultural, social and political development, and to diversify the options through the creation of alternative industries... Nauru also badly needs new housing, but... the island was unlikely to be able to both finance these demands and maintain present standards of living... It is, says the... [new] President... – elected... after claims of massive squandering of the Lilliputian republic's wealth by [the]former President... – a new era of frugality.

...futuristic new materials – some of which are already in use... – will be stronger, more durable and less polluting than their predecessors. And this stuff could very well define the coming age, just as stone, bronze and iron defined their respective eras. To many, the "Materials Age" would make a fine sobriquet for modern times. In the past, new materials were developed "by guess, by God or by good luck," says... [the] adjunct chemical director of the Physical Sciences Research Division of Lucent Technologies... But now scientists are taking at least the luck and guesswork out of the creative process by discovering the complex protocols of construction behind atoms, molecules, crystals and even living tissue. "Engineers will no longer be limited by what materials exist," predicts... a materials scientist at Northwestern University in Evanston, Ill. "They will be able to design according to the materials they would like to have." The invention of new materials involves a new paradigm of discovery... Materials designers now rely on scientific understanding and sophisticated computer modelling to perform their modern alchemy of turning the common elements of the Periodic Table into the gold of new materials. For the past dozen years or so, [the materials scientist has tried to]... develop an affordable steel alloy that is twice as strong as any available today [so] only half as much of it will be required to build a car, for example. Such a steel would be a boon to the environment, since just half the mining and energy consumption would be needed to harvest the steel, and fleets of lighter vehicles would consume less fuel. [The materials scientist] and his colleagues have not yet perfected this type of doubly-strong steel, but his forays into the Periodic Table have yielded specialty alloys that are strong and less apt to fail than previous alloys... [His] most ambitious project to date is known as Terminator 3: a smart steel composite, inspired by the fictional material depicted in the movie *Terminator 2*, that is self-healing and biomimetic – meaning that it emulates certain types of biological materials. In the film, the robotic villain is made of a metal that can take on any form, including that of specific persons, and can reassemble itself even after being blown to bits.

...Beware the rise of the robots... THE robots are coming and there's nowhere to hide. Computers are developing so quickly that a race of intelligent androids more awesome than... Terminator may enslave the world and treat their human creators as little more than pets. This is not the paranoid delusion of a science-fiction dreamer, but the considered opinion of... a world authority on robotic research and professor of cybernetics at Reading University in the [U]K... According to [the professor], within the next few decades research into artificial intelligence will create computerised robots that could outperform humans in every intellectual capacity. In his laboratory and other centres in the U[S] and Japan... advances in computers are already laying the foundations for new "life-forms" that could take control of the planet. "It is because of our intelligence that we are in the driving seat on Earth... When machines become more intelligent... they will take over control... In contemplating the next millennium and our future, we should prepare ourselves now for a society in which a more intelligent life-form than ourselves will exist." Will they treat us just as we treat animals? "We can't rely on intelligent robots being nice and generous when we are not nice and generous to life forms less intelligent than ourselves,"... If computers are the next step of evolution, they may also follow the law of survival of the fittest. It is a scenario predicted... in 2001: *A Space Odyssey*, where the computer HAL kills all but one of the crew of its space ship to protect itself... A machine as clever as HAL or as brutal as the T-1000 Terminator will not be created by 2001. But by the end of the decade, the Japanese will have developed machines as intelligent as a cat and... there is no fundamental barrier to creating ever more sophisticated robots with the ability to improve on their own design. Cyber-intelligence may have no limits... [The professor] believes there is nothing mystical about human intelligence that cannot be encoded in the circuits of a robot: "There are those who say humans have a magic ingredient that keeps us ahead, but I don't believe it." His vision of the rise of artificial intelligence is supported by... [the] head of research and development at BT Laboratories. In 10 years, computers will be 1000 times more powerful than today, [the head] says; a million times greater in 20 years, and a billion times by 2030. "Machines of such power and capability will evolve human characteristics of adaptability... and personality,"... Such views are not, however, shared by other eminent scientists... [A] leading mathematical theorist at Oxford University, says [the professor]'s nightmare is improbable. "It is based on the view that all

our brains do is compute. What is involved in intelligence is quite different from computation. Whatever intelligence is, it involves consciousness or awareness... The danger is that people will think that something like this is true, when it is not. It is a dangerous trend in society for people to believe computers can replace us." Time will tell, however. At the end of last year, [the professor] was the first scientist in the world to succeed in getting one robot to programme another over the Internet. "The experiment showed that machines can learn, like humans, by communicating what they themselves have learnt,"... [H]is research team have also created miniature robots that learn from one another and even exhibit new behaviour – such as "flocking" around a leader – that... had not [been] programmed into them. So far they do not seem threatening. [The professor] calls them "the seven dwarfs"... [The professor] does not want to "overreact" by calling a halt to robotic research, but intends to warn the world of what is going on: "There is a lot of frightening stuff out there that nobody is telling us about." [The professor] believes developments in artificial intelligence should be policed by an international body as an insurance against malign influences. "We cannot and should not rely on computers forming such a body for us,"... Fear of technological progress has a long history... [T]he idea of being threatened by clever "beings" created by humans goes back to the golem of Jewish tradition, a story about a [hu]man made of clay... [The] rector of the Royal College of Art, London, sa[ys]... "All the anxieties people felt during the industrial revolution about loss of control we are now feeling in the information age."

...[LITTLE Hachibe, whose name is the Japanese equivalent of Rover or Bowser, has been with its human family for five months, and in that time their lives have been transformed. "My husband bought him and, at first, Mother and I weren't sure," says the 54-year-old wife. "But we're a family of grown-ups, with no children at home any more, and these days Hachibe's all we talk about." While the wife does the house-work and her 82-year-old mother sits in front of the television, little Hachibe ambles around their small apartment, playing with his pink ball and only occasionally walking into things. "When Hachibe's tired it curls up and goes to sleep, and sometimes it comes up to see what we're doing. When my mother calls out, 'Hey, Hachikins!' it hears, and moves his head so prettily. I know I shouldn't, but sometimes, when we've been eating together, I put a bit of food in his mouth." But Hachibe has no mouth, no digestive system and no orifices. His ears are tiny microphones concealed inside his sleek silver head. His paws are articulated plastic, and his eyes are tiny video cameras which glow behind a curved perspex screen. Hachibe is an Aibo or Artificial Intelligence robot, a computerised dog released, in limited numbers and at enormous expense, by the Sony Corporation. Hachibe has no fur, no smell and no warmth but for the wife, who had a traumatic experience with a hamster as a child, this is his great attraction. "I hate dogs and cats," the wife admits, as the little bundle of joy head-butts the wall. "I can't stand being near any live, furry animal. So we don't think of him as a robot. This is a real dog." If you like your pets cool and metallic, you too can purchase an Aibo – for the first time, through the company's Website (www.world.sony.com/aibo). Sony is accepting orders from Europe, the US and Japan for the second generation of robot pets. Even at Euro 2400 (about \$NZ4700) each, the 10,000 units for sale are likely to be ordered several times over, and there is little doubt where most will end up. When the first 5000 Aibo went on sale last year, they sold out in the US in four days. In Tokyo, they were cleaned out in 20 minutes. The Aibo is just the visible tip of a potentially enormous new field of personal robots – robots designed to assist, entertain, communicate with and even love humans. The leading researchers, the designers and the keenest consumers of this technology are in Japan, the global centre of robot civilisation. Robots in their more functional forms are in use all over the world, from the giant industrial limbs which assemble cars to the Nasa planetary rover which collected samples from the surface of Mars. Japan still has a higher ratio of industrial robots to humans than any other country, although since its economy began to decline, the lead has been slipping. But nowhere is there greater interest in what may soon become the most interesting and lucrative area of robotics research – human and animal-like robots capable of interacting directly with people and expressing something very like emotion. The first walking humanoid robot, the Wabot, which could move one leg every 45 seconds, lurched out of Tokyo's Waseda University in 1974. Ten years later the piano-playing Wabot 2 made robotic and musical history by performing Bach's Air on a G-String with the NHK Symphony Orchestra. As the robot sat at the keyboard, his circuitry and memory chips occupied an entire room at the back of the concert hall. As the new model Aibo was tottering through his paces for the press, the latest in robotic innovation was on display on the other side of Tokyo at the International Robot Exhibition. There were vigilant guard robots, looking like benign daleks without the death rays, "welfare" robots – moving platforms with arms which can fetch and carry household objects or scoop up food from a plate and lift it to the mouth – aimed at the elderly or disabled, and industrious cleaner robots, which scrub and Hoover.'

... 'Electrolux appliance dealers are set to clean up with a robot carpet-cleaner.' [I]t's unlikely to be on sale for at least a year but no one can deny it's a brilliant idea to have a robot do your housework... CHATTERING appliances are growing in popularity. A robot which detects dirt and vacuums it up – created by university scientists in Georgia – tells anyone obstructing its path: "It anybody there? I'm cleaning up a mess." Weight-conscious Americans are also buying a slimming gadget, activated by the opening of fridge or pantry doors, which gives a stern warning: "Watch it, fatso."

...WATCHES that squeal warnings if their owners absent-mindedly leave their credit cards in shops – or if their cameras, for instance, are stolen – are being developed in Britain. [The i]nventor... is perfecting them in partnership with electronics experts at Southampton University. The watches have transducers that exchange signals with others built into the cards, cameras, or other valued possessions. If a return signal is not received, because the linked transducer is out of range, the alarm is activated. Another security aspect... is personal protection. A different type of screeching alarm goes off, at the touch of a button, if the wearer is mugged. The watch will also spout an evil-smelling spray on the assailants...

IF necessity is the mother of invention, do we really need a flying car... or a doggie nappy... which comes in various shapes and sizes and costs about \$6.35 each...? These were just some issues creators and dreamers grappled with at their annual Invention Convention in Pasadena, California. [A] [San Diego resident... has been inventing things for decades in his spare time, but the 67-year-old inventor of the "cafly" flying car does not expect to get rich quickly. "Usually 90[%] of inventors die poor... It's the next guy, who has the money to commercialise the invention, who becomes... rich..." The "cafly" is an egg-shaped two-seater with wings on top that flap like a lethargic bird and a top speed of 130 km/h. The wings would eliminate the need for stoplights, allowing the car to soar over busy junctions and traffic jams... [The 67-year-old] hopes to revolutionise the motor industry but his car has yet to make its maiden flight. A simpler... invention [of his] is the "pop-up," a device allowing a movie-goer to eat popcorn with one hand while draping the other around his girlfriend. "I do this for the same reason people... smoke... drink... and... play football... Inventing things is my sickness." His book, *An Inventor's Life*, discusses other ideas such as bathing only in warm water. [It] suffers from skin cancer, many of his family have died of cancer and... believes one cause of the disease is taking hot showers and baths. One of his aunts who washed only in warm water lived cancer-free... A Korean company is trying to attract distributors for its range of products, which includes... mineral-enhanced underwear. The "pio power underwear" is said to raise your spirits by relieving stress and steadying your nerves. If you are not happy with the idea of imbibing minerals through your underwear, they can also be found in special socks, soap and bedsheets. Does it work? Just ask your celestial wristwatch. [An i]nventor and astrologer... of Los Angeles explains: "If you wanted to know the outcome of a job interview you would stop your watch and you will get a horoscope that will give you your yes or no." [The astrologer] needs a company to make the chip that will make his watch tick then a manufacturer to build it. Meanwhile, [the astrologer] will read your stars in person for around \$140 an hour. [Another] Californian... reckons that her indelible cosmetics have the potential to become a household name. Her lipstick lasts 24 hours and requires a special remover. [Another stand was for] the inventor of the disposable erection enhancing band, an adjustable plastic ring that enables a [guy] to achieve a bigger, longer-lasting erection by keeping blood from leaving the penis... [I]t comes in just three sizes – large, extra-large and extra-extra-large.

...There is a story that economics lecturers used to tell their students to demonstrate the vast superiority of free markets over communism. It concerned a bolt factory, somewhere in the Soviet Union, where they used central planning rather than the profit motive to allocate resources. At first the factory's production target was set by Moscow in terms of quantities – so many million bolts a month. The plant managers were savvy

enough to realise that the easiest way to meet this target was to produce very small bolts and this they did – many more... than were needed and, of course, not enough medium and larger-sized bolts. Frustrated, the central planners changed the target to tonnes – so many hundred tonnes of bolts a month. The manager's response was to switch production to making a small number of huge bolts... the easiest way of meeting the target... Modern history has thrown up two ironies in connection with this story. The first – and it is rather tragic, like so much of Russian history – is that the communist economy turned out to be held together by rather more than the edicts of central planners, so that when these informal networks and relationships were torn apart by the capitalist revolution of the 1990s the economy basically collapsed and is yet to recover. The follies of the bolt factory don't look so bad, in retrospect. The second irony is shared – or suffered – in a few countries, notably N[Z] and Canada, which have adopted an extreme anti-inflation monetary policy. The irony is that [NZ's] 1989 Reserve Bank Act – a centrepiece of our own “free” market revolution – can be seen as an example of crudest, Kremlin-style central planning with its obsessive focus on keeping a particular measure of the consumers price index within a very narrow arbitrary band. As with the bolt factory, the danger in setting such a strict target is not that it won't be met, but that it will be – at the expense of other, worthy goals not written in to the contract which can therefore be distorted with impunity.

...A N[Z] company says its new cleaning agent will revolutionise auto parts washing in workshops and garages. Stocks AutoQuip says the biological agent in SmartWasher is safe, healthy and environmentally friendly... It has been cleared by OSH... and... has been used in industrial applications in N[Z] for the past four years... [A] Stocks AutoQuip executive, said microscopic enzymes digest all organic compounds, including oil and grease, and turn them into harmless [CO2]... The enzymes, nicknamed Ozzys, are contained in the cleansing fluid, known as OzzyJuice... Auto parts washed with OzzyJuice are cleaned in the same time as [traditional] systems, with any metal residue captured in the system's filter. The OzzyJuice is returned fully cleansed to the washing bath to be re-used indefinitely. A new filter is required each month and the OzzyJuice needs topping up every eight weeks or so as it is depleted by the cleansing action... The company says SmartWasher is just as efficient as traditional products – even better with varnish – and costs about the same to run in the longterm. It says engine reconditioners can even leave seals on parts because SmartWasher does not harm them, this saving time... [It also] doesn't aggravate... dermatitis... SmartWasher is designed and produced in the U[S]... Most existing cleaning products in garages contain solvents...

Solvents, from paint thinners to nail polish and industrial fuels, can cause brain damage and must be treated carefully, two U[S] experts have warned... Effects on the brain could be subtle and difficult to detect, ranging from difficulty remembering to personality changes, listlessness, irritability or depression. Nerve damage in the limbs could show up as intermittent tingling, numbness and muscle weakness... “An estimated 49 million metric tonnes of solvents are produced a year in America alone and more than 9.8 million people experience daily solvent exposure,” they said... Such chemicals... can be inhaled or can get into the body through the skin... Treatment is limited but patients whose moods had been affected could sometimes be helped with therapy and psychiatric medication... [□ IRD staff “are] all a bit tense,”... [after the NZ tax department's] managers... ordered painfully cheap toilet paper for... the Wellington service centre region. The department's Palmerston North staff said the new paper was hard and nasty to use. Its poor absorbency meant people had to use more to do the job – which negated the attempt at savings.

...[in] 1594 Sir John Harrington, an Elizabethan poet, invent[ed] the flush lavatory – installing one at his country home near Bath and just one other at Richmond Palace at the command of Queen Elizabeth I. Consequently, some people say they're going to use ‘the John’ when heading off to do a #1 or #2 in the device which one selection panel recently judged to be our species' ‘greatest invention’. While on the topic of flush toilets, ‘don't buy expensive loo deodorisers. Instead, keep a box of matches on the cistern and strike one after you flush – any trace of odour will vanish when you blow out the match. To remove odours in the kitchen, leave a saucer of vinegar to evaporate overnight and take any lingering smells with it.’]

...kitchens of the future... look... good: Never again will you run out of chocolate icecream. In the future, your fridge has a programmed inventory of staple items. When these foods run out, the fridge sends a message to the supermarket requesting more. A package arrives on your doorstep and your bank account is automatically debited... Should you get a little too enthusiastic with the frozen deserts, your fridge is programmed to keep track of consumption and tell you that you've had enough carbohydrates for the week. The thought of being disciplined by your fridge is unnerving; sounds a little too sci-fi. But it's closer to reality than you might think. The major trend in appliance manufacturing is in “intelligent” machines. Prototypes incorporating some of the aforementioned functions already exist... In the future your fridge... your oven... your lights and so on... will all be... run from a central computer. In the US, it's possible to automate your whole home. A combination of touchscreens... hand-held remotes and wall-mounted keyboards control lighting, temperature, the curtains and blinds, security and entertainment systems. The rooms are full of receptors that react to climate changes or a human presence, turning appliances on and off to achieve optimum comfort and efficiency levels. Says [the] jex-rocket scientist... who runs an automation design and installation company from Phoenix, Arizona; “Kitchen appliances will most likely remain fairly similar but will have a ‘smart’ chip... [which] will automatically share information with the other appliances in the home. So, for instance, when the phone rings it tells the TV to lower its volume so you can hear... [The ex-rocket scientist] predicts there will be a touch screen located in the kitchen that allows you to control your entire home from the kitchen. There will also be a television screen that allows you to check on the kids playing in their room or to see who's at the front door without abandoning the pots on the boil. In such a digital palace you can run a bath from the office, make breakfast from bed, even control how regularly your plants are watered and how fast your garden fountains tinkle... [The ex-rocket scientist] estimates that within 15 years every North American household will have at least some automation... However at the moment home automation remains the preserve of the wealthy – it costs about \$20 a square foot of totally automated house. For instance[, the Microsoft billionaire's] new \$80 million home on the shores of Lake Washington... is completely computer controlled. British Telecom researchers forecast that within 10 years, domestic robots – the equivalent of an automated dog that acts as security, cleans and does other household tasks – will become widely available in Europe. They already exist in Japan... AUTOMATION, robotics, smart chips – conjure up a futuristic vision in stainless steel complete with talking food processors; but some cuisine-oriented fortune tellers have quite different ideas. For various reasons they believe we'll be longing for an old-fashioned kitchen... To deal with condensation and eliminate the need for an extractor fan... a professor of architectural technology at Auckland University, has... [designed a] future kitchen... that... is built from natural wood because... “it absorbs moisture far better than shiny plastics or metals”. Every kitchen will have space for recycling bins. As for the stove top, individual appliances are much more energy efficient than a large hob, [the p]rofessor... says and predicts a series of smaller devices as a replacement. And the bad news is: We'll be doing our own dishes too. Well, some of us will... [The] head of department of Consumer Technology at Massey University is an advocate of the modern, minimalist kitchen[, but will] stick with his steam cleaning micro-dishwasher... [H]is colleagues' kitchen of the future is on wheels. It can be folded away to become little more than a benchtop during the week, or expanded with tables, shelves and seating for those “ceremonial” meals. You can also plug in accessories, such as a pizza oven or electric wok.

...[‘The latest in news, views and clues Ever wonder why your vacuum cleaner is so noisy? It's because people like it that way, according to an overseas survey, which polled consumers, asking them if they would buy a quiet vacuum cleaner. The answer was a firm “no”. The reason? They thought if the cleaner didn't make a lot of noise, it wouldn't do a good job. And apparently they feel the same way about lawn mowers, hair dryers and other gadgets. Noise equals power. In fact, manufacturers could make quieter, and just as powerful, models. FOR A GREAT floor cleaner, pour a couple of capfuls of eucalyptus oil into a bucket of hot water. The oil leaves floors with a clean sheen, has antiseptic properties and smells fresh’]...

We were watching a story on television regarding hay fever – one cause given was flowers indoors. “You see,” said MM. “I told you I had trouble breathing at night. It's those damn flowers you've got all over the place.” I had to point out that the flowers in question were made of silk.

...[‘an apartment tenant in Singapore has been fined \$14,000 after her flowerpot fell 22 stories and killed a five-year-old girl.’]

...The company's biggest sellers, however, are cube urns with a sandstone finish for prettying up the decor in high-rise apartment blocks. Coliseum Contractors in Mt Roskill reports a similar trend. "Our biggest sellers at the moment are special pots – mostly cube size – for special areas... They go outside cafes. Or rich people with nice houses buy them for placing around the swimming pool. Some of them are so big they have to be made up in panels and glued on site." ...A marble statue in the backyard? Until recently, N[Z]ers shuddered at the thought. Now, we think it's not such a bad idea after all. As long as it's not naked... Garden Statues and Ornaments in Tauranga... has manufactured statues for 17 years... "When we first started people wouldn't dream of having them. They thought statues were for graveyards. It's because we haven't been brought up with them. We're not like the Italians, who are surrounded by them all the time." [Garden Statues'] best seller is the goddess Diana – fully dressed... [The company's] version of Michelangelo's *David* comes with a fig leaf – or without. Even though we now accept the notion of a 1.5m Greek god lurking by the clothes-line, marble deities are still not "everyday sellers." "But N[Z]ers are getting better all the time," says [the company's founder, who] started making concrete gnomes, animals and miniature Venus de Milos in his own backyard. [The founder] was manufacturing 2000 gnomes pushing barrows, wielding picks and carrying rakes each year. Now [his business] no longer produces gnomes and his home is far too small for his mushrooming business[, which has]... 10 people working on a wide range of garden ornaments... RIGHT now there is a lot of customer interest in classical Roman columns venerably draped in vines or rambling roses. The older and more ruined they look, the better. "People ask us to make columns and break the ends off... There are some very wild imaginations out there." ...A silicon rubber mould is... made... from classical statues manufactured in Italy... reproductions are [normally] cast in a mix of white cement and crushed marble. Each statue can... also be bronzed, silvered... painted bright yellow... bright red[, or]... tinged in brown, black or green to give it an aged look. ■ 'A lack of money is holding up completion of a \$100,000 statue for Ericsson Stadium of the NZ athletics legend who was the first person to encourage cardiac patients to jog and has trained 17 Olympic gold medallists around the world. "There's a lot of work involved and the materials are really expensive," says the Waitakere sculptor who did a couple of test runs with smaller statues before embarking on the two metre version. The statue is still a clay mould and has to go through a few processes before it is cast in bronze. A fundraiser says they had hoped to unveil the statue next summer but funds are slow coming in. "We believe that NZ sporting icons should be honoured. Despite pioneering athletics and single-handedly starting the jogging movement, our model's been unrecognised."

...*'There's no business like gnome business* Everyone knows garden gnomes are naff, yet 2000 of them have invaded Bagatelle, a charming 18th-century estate in the Bois de Boulogne near Paris. Gnomes? Yes, everywhere – gnomes on the balconies, gnomes on the balustrades, gnomes on the parterre, gnomes on the lawns. "It is not a question of spoiling a historic site with kitsch, rather of initiating a dialogue between this type of sculpture and its site," says the organiser of the exhibition. "It is the context which transforms a gnome into a garden gnome." To prove his point, the organiser has invited some very superior gnomes to his show – antique gnomes who would utterly deny kinship with the plastic, red-capped species. Take Morgante, for example, a 1565 Medici court dwarf in marble who hails from the Boboli gardens in Florence. Few people would have a problem with these gnomes – in fact, Britons would hardly call them gnomes at all. But purely as a matter of semantics they are wrong. The "quaint manikins" disparagingly called gnomes across the Channel were first sold in Germany as Gnomengiguren, which simply meant "miniature figures." The first person to import gnomes into England was Sir Charles Isham, who created a rock garden at Lamport Hall peopled with porcelain figures Sir Charles had brought from Germany, where in the 1890s they were sold as table ornaments. Gnomes in their thousands are still imported from Germany. There is a Gnome Reserve in Devon (with 1000 small residents) that attracts 25,000 visitors a year, and an International Gnome Club based in California with its own Internet site. Thus the popularity of the genus cannot be denied – but neither can the scorn with which it is viewed by people of so-called good taste. For years, gnomes have been banned from the Chelsea Flower Show – it is claimed that their bright colouring renders them vulgar. But could there be a more arcane reason? After all, Sir Charles was a spiritualist and believed in fairies. So could these grinning figures evoke in us a subliminal fear of the supernatural?

The Garden Gnomes Liberation Front has struck again, kidnapping 20 of the cheerful little characters from a Paris park. A grim-faced watchperson at the Bagatelle estate admitted that an anonymous statement from the Paris branch of the front claimed responsibility: "We want to deridiculise garden gnomes, return them to their natural environment by releasing them in the forests that they should never have left. We demand the immediate closure of this odious exhibition and the unconditional freeing of the garden gnomes still being held." The liberation front has periodically stolen gnomes from domestic gardens and left them in local forests. Police have sometimes recovered the gnomes, returning them to their owners, but the kidnappers have not been arrested.'

...*It's not easy being GREEN* [The shopkeeper] cradles a plastic bottle as if it's the holy grail. It's nothing more than biodegradable liquid cleaner concentrate. But [the shopkeeper is a guy] with a mission. His environmentally friendly household and garden products are precious to him... And now [the shopkeeper] wants bitumen-hardened Aucklanders to like them too. That's why [the shopkeeper] has brought a range of 400 environmental products to the Big Smoke – from his home on a small communal-type farm in Northland. [The shopkeeper] left Auckland more than 12 years ago to work as an event organiser and fund-raiser in Whangarei[, organising]... the first national buskers festival and a mid-winter Christmas for the winterless north – with snow trucked in from Mt Ruapehu. Three years ago, [the event organiser] changed direction, setting up Fairground Ethical Traders with his school teacher wife... It began as a mail-order company selling environmental products from a small warehouse dug beneath their Matapouri Bay house. They specialise... in organic products – ...85[% of which are sourced from within NZ –] ...reaching out to like-minded people around the country, plus a few extra-keen customers abroad. Sometimes they packed 30 to 40 boxes a day for the rural delivery post[al service] to collect from the gate. Now... [they] have opened the Eco Store in Freemans Bay, where they hope to grow their business by combining mail order with a green shopping experience. "Most of us in the [First] World have houses full of poisons... We are creating a toxic nightmare, because we always want faster, cleaner and brighter. Research from America shows that domestic households have taken over from industry and agriculture as the greatest polluters..." Aucklanders, however, are a far cry from a group of like-minded eco-families in the north. And the sloppiness of our city ways have surprised the couple. "There is so much complacency here – even among our own family and friends," says [the wife]. "I'm shocked. They use horrible dish washing liquids that smell like an Olympic swimming pool. I'm amazed at the lack of awareness." Nevertheless, Aucklanders are finding their way to the couple's newly-opened shop, in a building that once housed... the Freemans Bay Boat Club... [The couple's] metamorphosis into shopkeepers is taking time. They are used to a warehouse environment. Now they have a till and eftpos machine. But enthusiasm for their product continues to shine through... [The husband] displays a flame thrower that kills weeds... There are hemp and wool socks, toothbrushes with natural bristles, organic food stuffs, organic... insecticides... paint... and... shampoos...

"Before you go out burgling tonight, dear, don't forget to shampoo your hair." ...DANDRUFF may soon be more than an unsightly annoyance to criminals. It could result in them being nabbed – sometimes for crimes committed years earlier. A system perfected by [a] British pathologist... enables forensic scientists to identify DNA in just one speck – with the chances of two people having identical dandruff being... one in 1 billion.

...[dandruff can 'usually be effectively controlled with the use of sulfur-containing ointment and shampoo. Most individuals with seborrheic dermatitis tend to have an oily skin, but the causal relationship between the oil glands and the skin disorder is still unclear.' By the way, 'hairdressing first became a profession in Greece, and its practitioners were prosperous enough to form an industry. Greek guys cut and curled their hair on reaching the condition known as ephebe (18 years of age), while Greek gals wore their long locks drawn back simply into a Psyche knot. Simplicity in coiffures persisted until the 14th cent., when variety became the fashion keynote and hair styles varied from the long curls of the nobility to the close-cropped haircut first introduced by Charles IV of France. To compensate for his short stature, Louis XVI introduced the towering curled wig, a hairdressing trend which produced the high rolled pompadour and the extreme styles popular among the court of Louis XVI, coiffures sporting miniature ships and coaches. The French Revolution reversed this trend. However, the turn of the 20th century saw a revival of the pompadour exaggerated by the use of artificial padding, but by the early 1900s gals began to bob their hair, thus inaugurating the modern preference for naturalness and simplicity in hairdressing – until the 1960s. The early

Marcel wave, named for the French hairdresser who invented it, 1872, was produced by applying a heated grooved iron. Charles Nessler invented the permanent wave process in Germany in 1905, using chemical and electric heat. The current cold-wave process has so simplified the art of hairdressing that more than 50 million home permanents, using packaged kits, are had each year in the US. Hairdressing salons have suffered little loss of business as the cutting and arranging of the hair, wigs and hairpieces have become increasingly dictated by fashion.'

...*'Choice of brush makes power of a difference* Use of a certain kind of power toothbrush each day could keep the dental hygienist at bay. People who wake up in a cold sweat at the thought of dental assistants with sharp instruments hacking away at plaque on their teeth, or those simply interested in the most efficient method of daily dental care, should use a power toothbrush with rotational/oscillation action, according to a new report announced at a symposium in Boston at the weekend. The finding comes from the oral-health wing of the Cochrane Collaboration, an international non-profit organisation that reviews data from healthcare studies. Rotational oscillation toothbrushes – those that rotate in one direction and then the other – removed up to 11% more plaque and reduced bleeding of the gums by up to 17% more than manual or other power toothbrushes. A senior director of the Council on Scientific Affairs for the American Dental Association said the findings, if they prove accurate, could be useful in helping dentists make recommendations to their patients. "That still doesn't mean that everyone should abandon the toothbrush that they're currently using. Someone using the simplest manual toothbrush with good knowledge of how to brush and conscientious brushing can do just as well as somebody using a power toothbrush, regardless of the design."

...*'Pain-free lasers could one day replace the dentist's drill.* A US dental expert has developed a laser that can zap infected tissue inside the tooth rather than having to drill and fill. The procedure does not damage the healthy nerve, and patients do not even need a local anaesthetic unless the tooth is really painful. The expert, of the Centre for Advanced Dentistry, in Fullerton, California, says the procedure also reduces the likelihood of root canal work in later life. The expert says most of the dental work done on adults is necessary only because of treatment during childhood. "Adult dentistry wouldn't exist if we routinely used lasers," says the expert, who has used the laser method to treat nearly 600 patients and claims a success rate of almost 100%. The erbium laser used emits light with a wavelength which is mainly absorbed by water. Decayed material has an extremely high water content, so that most of the laser's energy is absorbed by the infected tissue, which is vaporised. If necessary, an antibiotic paste can be inserted through a hole made by a more powerful laser and the tooth sealed. A Harley St dental surgeon in London said: "I personally would not use lasers. In the first place, the equipment required is incredibly costly, which would make it very expensive for the patient. Also, I don't think they have been tried and tested enough, and they take too long."

...a *'West Auckland Dental Centre is committed to total long-term patient care, using the latest dental technology to provide diagnosis and treatment that is faster, more accurate, and more comfortable for patients. The diagnostic laser has been shown to be 75% more accurate than X-rays and manual probes in detecting cavities. When X-rays are required, the centre uses digital radiography, which provides more immediate and accurate diagnosis while exposing patients to 90% less radiation than conventional X-rays. Intra-oral cameras enable both dentists and patients to see exactly what is inside the mouth. The image captured by the camera is magnified and projected on a screen to give a clear view of the teeth from any angle. For more difficult cases, dentists at the centre can use an operating microscope to enhance visibility when they are engaged in a delicate procedure. Air abrasion can be used instead of the drill in many cases. This modern technique is less invasive than drilling and often does not require injections. At the Lincoln Rd centre, founded in 1957, it is used whenever possible. The centre includes a new teeth whitening clinic, where the LaserBrite teeth whitening system is used. Never before has teeth whitening been such a comfortable experience. Patients spend only one hour in this pleasant treatment clinic and have had some fantastic whitening results.'*

...product[s] **claiming to brighten and whiten teeth without visiting a dentist can in fact damage teeth, says a report in the *Consumer* magazine. All of the whiteners contain a bleach, usually peroxide-based...** Hydrogen peroxide can demineralise a tooth's surface, roughening it, which in turn can lead to further staining. It also can severely damage some dental work... **Problems that can arise from regular use... include temporary damage to soft tissue (such as gums and the tongue), damage to tooth pulp, as well as irreversible cell changes or enhancement of the effects of carcinogens.** In N[Z], the Ministry of Health classifies tooth whiteners as cosmetics which means producers are not required to list their ingredients.

...Skin contains lots of things that you can't see from the outside, like sweat glands, hair follicles and nerve endings[, but it]... is our single largest body organ. The whole thing weighs as much as four kilos... The thickest skin is on the soles of our feet – up to 10 millimetres – while the thinnest is the skin of our eyelids – a m[m] or less... Skin might seem kind of soft... but it's the body's first line of defence against all sorts of infectious nasties like bacteria... and fungi. Skin has some bacteria of its own which can help stop these others taking hold. Plus skin cells are always shedding and replacing themselves to give us the best protection they can... [But we can help] skin by being careful about what goes on to it and into it... You need to put time and care in every day to give your skin its best chance. Find a cleansing, nourishing and protection programme that suits your lifestyle and your skin... Use good quality, natural products... Be careful what you wash with. It's not going to do your skin any good to scrub it off in strips... A toner will help keep your skin's surface cool and refreshed... Summer swims in salt water or chlorine can dry skin out, so get yourself into a fresh water shower if you've been at the pool or the beach. Follow with a natural moisturiser all over... [This] helps restore the skin's natural balance... It's estimated that as much as 80[%] of skin damage occurs on the inside, so it makes sense to begin your skin care with what you put into your body... Regular care and a balanced lifestyle will help your skin to do its job better. But there may still be changes in your skin, like pimples, blemishes, dry patches and oily spots. Just covering them up isn't the same as curing the problem. Use covering cosmetics that... also do your skin some good... [- e.g.] Blackmore's Treatment Cover Stick... Summer's an important time to take special care of... skin. The more sunburns you have, the more likely you are to get skin cancer... The message is clear: keep your skin out of the sun... Your face is the most exposed part of your body. But slap sunscreen on to every other part the sun gets to... [U]se high SPF sunscreens and head for the shade... Remember to wear sunglasses...

[*'Use sunglasses, children told* Children should be taught to slip, slop, slap and slide to avoid serious eye conditions such as cataracts later in life. The Optometrists Association AUS president said prolonged exposure to the sun could cause conditions such as cataracts, growths on the eyes, loss of central vision and even cancer. People's eyes didn't fully develop until the age of 30, and prolonged early exposure to UV rays almost doubled the need for corrective cataract surgery later in life. More than 120,000 cataract operations were performed in AUS each year 'at a cost of \$A378 million'...

A User's 17-year career chasing the sun on the professional tennis circuit brought her 18 Grand Slam singles titles, made her a multimillionaire and left her with damaged eyes. "And I'm not alone," the 45-year-old who retired from playing in 1989 says in the current edition of *Florida Tennis*, urging today's competitors to avoid the mistake of playing without protecting their eyes against ultraviolet radiation. The player idolised by generations of players who copied her baseline style, has pterygiums – cataract-like growths – in both eyes. "This problem is the nasty little secret tour players don't talk about much. But lots of them suffer from moderate to serious eye damage. I'm fortunate that mine haven't moved over my pupils, requiring surgical removal." In related news], a physics lecturer at Oxford University, [has]devised a pair of self-adjusting, fluid-filled spectacles. The glasses consist of an inert silicon oil sandwiched between two lenses made of thin polyester film. They can be adjusted to correct a person's vision simply by varying the amount of fluid in each lens with a syringe. [The lecturer's] aim is to produce spectacles for as little as \$3 a pair that would not need to be fitted by an optician.

...[*'If you're looking at the world through \$2 sunglasses, you are doing your eyes – and your wallet – no harm. While some fork out hundreds of dollars for designer sunnies, cheap versions are often just as good, says a Wellington optometrist. A recent survey by *Consumer Magazine* showed even \$2 glasses blocked the harmful effects of ultraviolet light. But buyers should be vigilant about ensuring lenses offered UV protection. Unlike AUS, NZ does not have a sunglass standard for wholesalers or retailers. The NZ Association of Optometrists wants that changed to stop substandard AUSn sunglasses being*

dumped here. Despite all the brands in the *Consumer* survey passing the UV test, the Wellington optometrist said there had been cases of dodgy sunglasses being sold in NZ. And while cost need not be a major consideration when looking for sunglasses, there are several other factors to be aware of. Contrary to popular belief, dark lenses do not offer more protection. Lenses which are too dark may obscure vision and be dangerous to wear while driving.']

...Sunglasses have four major purposes: 1. Protection of the eyes from harmful radiation, namely ultraviolet. 2... To assist in the process of adapting to different light levels... 3. To ensure clearer vision... 4... To provide comfortable vision by reducing glare... Glare comes from visible light and can cause discomfort (frowning, headaches, tired red eyes), temporary loss of ability to see, and some long-term effects on certain conditions involving the back of the eye. Studies have shown that night vision is detrimentally affected subsequent to exposure to intense glare if sun protection is not worn. Children with healthy eyes have very transparent media. That is to say the cornea, aqueous humour, crystalline lens and vitreous are all new and clear so transmit light very efficiently to the back of the eye. This increases the potential for damage to the retina from harmful radiation. Much of the effect of exposure to ultraviolet radiation is cumulative and it may take twenty or thirty years for a problem to appear. However, the damage process begins when children first begin to play outside. It is common to see adults wearing sunglasses on the beach but rare for children. This is understandable considering most young children are not good at caring for their possessions and breakage, scratching and loss will be higher than for adults. The wholesalers of sunglasses appear to have reduced their profit margins in children's sunglasses, perhaps in appreciation of the higher incidence of replacements. The prices charged for children's sunglasses are not usually high. As an alternative to sunglasses a good peaked hat will serve well at eliminating glare and ultraviolet radiation coming from above. However, this will not block out reflected light such as comes from a light sandy beach, water or snow. [● A reader asks: 'How much heat is lost through the head when a person is not wearing a hat?' As much as 40 to 50% of total body heat, depending on how hard the heart is working to circulate blood to the head.]

...in winter there 'has always been a trade-off between staying warm and looking your best – until now. Thermal underwear is taking off down under. Forget the "passion killers" your grandmother wore. We are talking about little lacy numbers that are as hot as they look – teddies, camisoles, body suits and French knickers that hug your body in a cosy cocoon. Damart – one of Europe's leading mail order lingerie labels – has more than 82 different styles, including a range for guys, gloves, socks and specialist garments. Its extraordinary success is attributed to the unique fabric used in the manufacture of all its garments – thermolactyl. "It is made from weaving spun PVC. The final fabric itself is no thicker than ordinary cotton and is just as soft." But that is where the similarity ends. Whereas cotton absorbs moisture, thermolactyl does not. Instead, it allows perspiration to evaporate. This is essential to warmth as moisture will quickly conduct any heat away from the body. "Thermolactyl allows people to wear lightweight clothes, move freely and yet still be as warm. We do not go for the big advertising hype. Our customers do most of our advertising for us." One famous customer had no qualms about revealing how it stayed looking slim and smart in the chilliest of weather. "I am a walking ad for Damart," Princess Di once told shivering crowds who had gathered in bitter winds to welcome her on to a new housing estate in London']...

LONDON – Soldiers of the British Army's prestigious Household Division are in uproar over a proposal to replace their shining metal breastplates with imitation plastic ones. The... proposed break with tradition follows a suggestion last week that the... Canadian bearskin hats which have been worn since 1815... by several British regiments be replaced by synthetic versions. That suggestion was made by the Minister of State for Defence Procurement, [who is] a staunch defender of animal rights... Traditionalists say the synthetic versions look electrified when affected by static electricity and resemble drowned rats when it rains. Cost is apparently the reason for the second proposal. The imitation breast-plates are reportedly half as expensive as the metal versions, which cost about £1000... □ [British soldiers are]... not alone in having expensive sartorial tastes. [A Hollywood movie star (r:p1734, ln7) splashed out \$150 on a pair of gloves in Toronto. But[after] feeling pangs of pity... gave them to a vagrant who was freezing outside the shop. The [vagrant] promptly swapped them in the store for others costing \$30 – and accepted the balance of \$120.

...A classified advertisement in a Japanese friends-wanted magazine sought [gals] to "exchange tips on becoming more beautiful." The person who placed the ad was a [guy. While that case] may be considered the extreme, a whole industry has sprung up in Japan catering to [guys'] vanity... Shape-Up House, an Osaka-based beauty parlour operator, opened its first [guy]-only Dandy House in Tokyo in September 1995 and now has six such places to meet growing demand... Customers spend on average \$NZ6000 for three months of pampering, with the most popular services being hair removal and weight-reducing massage. Japan's top cosmetics maker Shiseido is in on the act, too, launching its Geraid line late last year. It estimates the [guys'] cosmetic market has grown 70[%] in the past 10 years to more than Y200 billion. One Shiseido product has been an extremely hot item, an eyebrow-designing kit... that includes a tiny comb, scissors, tweezers and an eyebrow pencil, [which posted] twice the sales the company expected. A survey done by Shiseido before the launch of the eyebrow product found that the second wave of baby boomers, born between 1971 and 1974, "have a strong tendency towards narcissism." In the survey... 57.6[%] of guys]... in their early 20s... said the main purpose for wanting to look beautiful was for personal satisfaction, far higher than the 16[%] who said they wanted to attract girls... The survey showed that 65[%] had dyed their hair, 43[%] had long hair, 24[%] had a pierced ear and 11.5[%] cultivated a suntan in their pursuit of... "a wild appearance and a beautiful body." ...To enhance beauty, 85[%] used face cleansing foams, 54[%] were devoted to deodorant spray, 32[%] used mud masks and 17[%] were obsessed with trimming "excessive" hair. But far from being an obsession of the young, their fathers also worry about their appearances, says a marketing official at Fuji Spinning Co Ltd. Sales of the company's "shape-up underwear" for [guys], introduced two years ago, posted a four-fold jump last year. Sales grew among young [guys] and spread unexpectedly to the older generation worried about fat bellies and falling buttocks.

...Grots – that N[Z] schoolboy colloquialism for underwear – is an accurate description, if the results of a survey into Kiwis' knicker-changing habits are to be believed. Holey smalls, sagging undies, discoloured delicates and lingerie that has lingered so long its elastic is but a memory – it seems most N[Z]ers are averse to emptying the knicker draw until its contents are examined and certified dead by the underwear police. Research conducted by [an] underwear manufacturer... reveals that 63[%] of NZ]ers do not renew their underwear until even its use as a rag is questionable... [The manufacturer] estimates that about five million pairs of underpants are sold each year, equating to not quite two new pairs per person. A straw poll confirmed the awful truth: people are happy to wear underwear so riddled with holes it can be used as a sieve. Never mind – similar research in A[US] shows an identical if-you-can-wear-it, don't-change-it attitude. But at least Down Under we beat the Brits. Surveys may show we are slow to update our undies, but British [guys] are often loathe to change theirs from day to day... [In related news, the] vice-president of the Italian family business that has 30[%] of the world's fine [guy]swear market and annual revenues approaching \$1 billion... flew into Auckland yesterday for a quick tour of... the first Southern Hemisphere boutique to sell only... [their] clothes... and seemed pleased with the displays of \$130 polo shirts, \$1650 double-breasted jackets and \$395 bathrobes... [T]he Queen St store... got in ahead of frontrunners Sydney and Melbourne because of... [the franchise partner's] "forward thinking and readiness to break through in [guyswear]." The vice-president said guys] should have as much fun shopping as... [gals, and: "Gals want their guys] to look good. [Gals] like nice accessories such as handbags or belts and aren't [guys] their best accessories?"

...Be sexy, start smelling... You're out on the pull. At a party or on the dance floor, sheathed in designer wear, looking for that significant other. You have checked for radicchio stuck between the teeth, scrubbed at that stain and washed and powdered yourself to meet operating-room standards of sterility. We spend a fortune eliminating body odour, but are we making a terrible mistake? The news from the research labs is that the right sort of body odours can trigger desire more effectively than a bottle of costly scent... We are talking pheromones here – chemicals, the slightest whiff of which sends most mammals and insects into a sexual frenzy. However, scientific wisdom has always held that humans are not susceptible to crude stimulus-response mechanisms. What is more, say today's experts, we do not have the sense organ needed to respond to pheromones. Animals detect them with a special organ in the nose that is different from the one that detects ordinary smells. Called the veromonal

nasal organ (VNO) it consists of two small pits with tiny openings in their centres about... [0.1mm] wide. But although we develop one as a foetus, it then atrophies... Like the appendix or the tail, our VNO is something we can now do without. But our lofty eminence may be about to take a tumble. A... group of [US] researchers claims to have discovered the VNO in... adult... humans, raising the possibility that we may be responding to chemical messengers... [Researchers from] the University of Utah... Pennsylvania University and... the University of Colorado... examined subjects who virtually all had VNO pits – about 1cm up the nostril... [A]nd there seem to be clear gender differences – [guys'] VNOs respond vigorously to steroids from the skin of a [gal] and vice versa. Not everyone is convinced. For a start, [the head Utah researcher] has a vested interest in our VNOs, having raised \$12 million to exploit his discovery. His company is already selling “his and hers” pheromone perfumes. What’s more, no one has repeated the work yet. And even [his Utah] team has not been able to show that nerves from the human VNO actually go into the brain. But, as [the head researcher] points out, there is good reason for this: “We know a lot about the rat’s VNO, but studying the human one is hard because not many people are willing to have dyes that trace nerve cells injected into their brains, then have their heads cut off so you can take sections to see where the dyes went.” But if we are not affected by pheromones, it’s hard to explain why we produce them all the time all over the body... [W]ater sweat comes from one set of glands (eccrine) and gets mixed with tiny amounts of fatty material from two other types of glands (sebaceous and apocrine), both found around hair follicles. It is surely significant that in puberty we sprout hair in precisely those areas that fill with blood... The warmer they get, the more easily the... [sweat evaporates. So it] seems that we have two sets of chemical detectors in our noses. As well as the one that responds to newly-baked bread there is another that is triggered off by the waste products produced by millions of bacteria that chomp at fat deposits on your skin. Precisely the material you have been scrubbing off and trying to disguise. - 1997

IF SOME wicked witch could transport us back to the 1920s, our noses would tell us when we had got there. Suddenly we would meet the smell that the 20th century has managed to suppress: the rank, stale stink of the human body[‘perfumes and incense have been associated with humans throughout our recorded history – in ancient times they were primarily used in religious ceremonies and when embalming the dead, though the Egyptians soaked fragrant woods and resins in water and oil, and then rubbed their bodies with the liquid’; ‘alcoholic perfumes for applying to the body as “scent” were unknown during Elizabethan times, and the use of perfume was confined to fragrant powders and water’; ‘in England, aromatics were carried inside lockets, which gals wore around their necks and held to their noses when they were outdoors’ to gain some relief from ‘the odors of houses and streets’]. Cleanliness was the great, unnoticed achievement of the century. For the first half, people simply didn’t wash. Well, not by the standards of the second half. Daily showers? No, a weekly bath night, more likely, and often the whole family wallowed, one after the other, in the same tubful of water. Clean underwear every morning? Not a show. Housewives held a washday every Monday, and it was such a brutal and wearying job that clean clothes on Tuesday morning had to last all week. People had tricks, though, for looking fresh. [Guys’] shirts came with detachable collars held in place by collar studs. Pernickety [guys] could change their collars daily or every few days... I once had the privilege of working for a year in a Tibetan refugee camp. None of us in the camp bathed or showered, even in 40 deg C heat. And nobody cared or noticed because a kind of providence designed humans so that if nobody bathes nobody stinks: we are so used to our own smell that we become inured to the stink of others. So it’s bad luck to become the first person who takes up regular bathing. But not washing can be even worse luck. Once doctors realised that they were killing [gals] in childbirth by not washing their own hands, they themselves were bound to scrub up and to sterilise their own saws, scalpels and forceps. Hospitals became another source for the spread of cleanliness. Florence Nightingale had shown how lives could be saved by scrapping and scrubbing away the muck in military hospitals, and by the 1930s the lessons of Crimea had spread to N[Z] classrooms, where our own missionaries of cleanliness were almost as imperious as Miss Nightingale had been. Teachers held competitions for the cleanest fingernails. Dental nurses visited classrooms... I remember one nurse publicly berating a boy who had grown a line of bright viridian-green scum along his upper gum... We 7-year-olds knew how close to destitute the boy’s family was. So we understood, when [it] told the nurse that his mother said toothbrushes wore away teeth, that the real message was: “We can’t afford toothbrushes.” [‘The standard of dental health in NZ was once among the poorest in the world. It was found to be so bad among young recruits called up for service in WWI, that the school dental service was established in the early 1920s by the Department of Education and later transferred to the Department of Health.’]Three hundred years beforehand, Francis Bacon had declared that cleanliness was next to godliness. For centuries cleanliness remained only a pretty idea until the 20th century when Lever, Colgate and Procter & Gamble discovered that cleanliness could also be immensely profitable, to themselves. We ought to be able to measure with what a fury we N[Z]ers took up washing. By rights the *Year Book* ought to record how every decade soap production had doubled, quadrupled or whatever. Instead the *Year Book* says nothing. Statistics N[Z] claims not to know. And at the Manufacturers’ Federation, the [person] who ought to know says [it] doesn’t – probably... because the 19 soap factories we had in 1891... have now shrivelled to Levers and to Colgate, neither of which wants the other to know how much it makes. So we only know that two companies overwhelmed 19 – and that the winning two called in brilliant writers of advertisements to crush their enemies. Lifebuoy soap, glaring pink and reeking of the laboratory, launched one of the all-time great advertising slogans: “Lifebuoy stops BO.” Within days, BO (short for body odour) was absorbed into the language. And every day the advertisements pierced us with fear: “Have I got BO?” Nor was the advertisement dishonest. Washing does get rid of smells. Sunlight laundry soap – or Solvol sandsoap, for that matter – would have done as well. But no. The... ads had welded BO and Lifebuoy together: you couldn’t get rid of one without the other. A Lux product, soap flakes, probably had the greatest impact on the century. Soap flakes forced us into changing our underwear every day. “Join the Lux change-daily girls,” said the advertisement, and there stood a young [gal] wearing a skimpy nightdress and washing her knickers (pronounced longdzer-ray) in the handbasin before hanging them on a towel rail and going to bed. Next morning, and every morning of every day, [the young gal] would slither into slightly damp underwear, confident that her odourless knickers would not let down her over-all personal freshness. The soap companies and the writers of advertisements may have strutted and gloated to see how they had changed the world simply by selling soap and growing rich. If so, they overlooked the real revolutionaries... [R]eally it was electricians who made us clean. Cold water is a hateful substance. Nobody lingers in it, luxuriously lathering the gunk out of every fold in the skin. But until the 1940s it was tedious and troublesome to make hot water. A boiler in the kitchen would do the job. But the firebox had to be cleaned out daily and a new fire started. By the 1930s califonts... were common. Inside a califont a column of coal-gas flame played on a corkscrew waterpipe. Into the top end flowed cold water. Out the other end dribbled hot. The terrible disadvantage, though, was that califonts often started with an explosion that rattled windows and sent children running in terror. By the 1940s electric hot-water cylinders were standard and the daily bath or, increasingly, the daily shower were established. In the 1950s young people returned from long working holidays in England aghast with news of bathless Britain: houses row on row and not a bath between them, only municipal slipper-baths used by sullen and smelly Poms and amazed A[US]ns, Canadians and N[Z]ers.

...*Soap magnate leaves lots of suds...* William Hesketh Lever had a brilliant idea in the 19th century, and it made him one of the world’s largest fortunes. Before [Lever] came on the scene, soap was made from rendered animal fat called tallow. Lever began making better soap from easier-to-handle vegetable oils, including palm oil from Africa... Sunlight and Pears soaps were his creation and [Lever] sold them everywhere. When [Lever] died in 1925, as the first Viscount Leverhulme, his business was worth £60 million... [–] or... £1.6 billion... in today’s money. His grandson Philip, the third viscount, died a year ago without an heir and now the family mansion, Thornton Manor, and the treasures within it, are poised under the auctioneer’s hammer... Not on offer is the splendid art collection housed in the Lady Lever Art Gallery, which... grace[s] Port Sunlight, a model town with leafy streets and gardens, which the first viscount built for his employees... The viscount made up his title... from the surnames of himself and his wife, Eliza Hulme. His fame and fortune live on as Unilever, the company which last year had worldwide sales of \$US43 b[il]. Editor’s note:

'Soap was first discovered in the Middle Ages – when it was found to mix with both water and fatty dirt. Water alone does not loosen or remove oily or greasy coatings, but soap – especially when used in association with warm or hot water – divides the fats into droplets (*emulsifying action*) and breaks up carbon compounds into fine pieces (*dispersing action*).’ ‘Soap also reduces the surface tension of water by 2/3rds, thus causing more thorough wetting’.]

...What is Ha-Ra? ...Ha-Ra[is]... the Chemical Free Fibre Cleaning Technology... system which cleans better, faster and cheaper! ...Ha-Ra is an amazing invention, a complete cleaning system which Protect[s] Yourself and the Environment... The only solution you need to clean with is: water!

...It is surprising how few people know anything about the origin of dry-cleaning, the methods used and the progress made since the secret was first discovered. France was the original home of the so-called dry-cleaning (which by the way is not an entirely dry process). A rather romantic accident about 100 years ago was responsible for its beginning. According to the story, during the course of a lovers' quarrel, a lamp was upset on a tapestry tablecloth. Although it appeared at first that damage had been done to the valuable table covering by the liquid spilled from the lamp, it was soon found that the appearance of the cloth had greatly improved when compared with surrounding parts that had not come in contact with the liquid. This discovery gave birth to the idea that the same liquid might effectively clean... other fabrics and textiles. The average person does not stop to think what happens between the time the frock or suit is handed in and picked up by the owner so in order to satisfy our curiosity a visit was paid to a city dry-cleaner's. The first thing to strike one is the absence of any chemical smell and the bowls of spring flowers around the office, where the cleaning is actually done... The manager... explained the technical side of the dry-cleaning... Garments are brought in two or three times a day from depots in the city and suburbs. A search is made through pockets and it is amazing the collection found by the end of the day. Letters, note money as well as coins, butter coupons, car and radio licences, photographs and even nuts and bolts. If the clothes have been picked up from a house by a driver in the course of a laundry delivery, the belongings found are returned... to the person concerned that day. Otherwise they are sent back to the depot with the garments when cleaned. The first thing done by the sorter is to remove the docket pinned on at the depot and find out which day the garment has been promised for return or if it [is] a particularly urgent job. The docket is filed and a ticket is put on by a metal stamping machine. The colours of the tickets vary each day so that later on, when the garment comes to be pressed, the operator can tell at a glance... which to give priority... The room is lit with fluorescent lighting and, although used in many places of business nowadays, it is even more important here, as it shows up spots and stains more clearly than ordinary electricity. After details of the stain have been noted, the garments are then weighed and tied into bundles not exceeding 250lbs. The reason for this is that the load in the cleaning machine is limited to this amount. After this the clothes are sorted into bins, light and dark clothes being divided, so that in the cleaning process only clothing of the same colouring is done. Grubby clothes, such as raincoats, are kept apart from others and cleaned separately. The actual dry-cleaning process is rather wonderful to watch. Because of modern scientific developments none of the solvent fluid is wasted. While the cleaning is going on, the fluid is being converted back both as liquid and vapour to new solvent that can be used time and time again. The clothes to be dry-cleaned are put into the machine... The attendant of the machine sets the time... the cleaning will take (it varies for different things) on the automatic clock face, closes the door and the machine does the rest. In the trade, this part of the cleaning is known as "washing" and the clothes are turned over and over in a bath of cleaning fluid which is pumped continuously through at 400 gallons per minute. In this case trichloroethylene is used and, as well as removing soil, it revives colour. After the wash is completed, the machine is speeded up to 1000 revolutions per minute, creating sufficient centrifugal force to throw most of the solvent out of the garments. When the clothes are taken out at the end of the 25 minutes, they feel dry but there is still about 20[%] solvent remaining. So the next part of the cycle is to put the garments into another machine known as a Syntho Saver, in which circulating warm air takes out in the form of vapour every remaining trace of the solvent liquid. It is at this stage too that moisture in the form of perspiration is removed. I asked... how it was that there were no overpowering fumes while the machines were operating. [The manager] took me to inspect two huge grey tanks at the other end of the room and said that the fumes are conveyed in pipes into these tanks, the interior of which is like a huge gas mask containing large particles of charcoal that absorb and neutralise them. While this is going on, steam is applied to the air in the "gas mask" tank and by sublimation the vapour is converted into solvent again. We followed the cleaned clothes into the pressing room. Before a frock or suit is free of stain, and should any mark remain, such as rust, which is not taken out by the ordinary cleaning, it is treated by various chemicals. One of the interesting things about cleaning is the steam gun, which also removes obstinate stains... After "spotting" as this is termed, the clothes are put into a machine that circulates hot air for rapid drying. Many a housewife would envy the wonderful shoulder pressers – the "puff irons"... Incidentally, [the manager] explained that steam heat is not as hot as a household iron and cannot scorch even the most delicate fabric.

...Self-cleaning materials could soon make scrubbing out coffee stains as redundant as the horse and cart. The new science of "nanotechnology" is developing self-cleaning materials ranging from clothes to kitchentops, using tiny structures the size of a few nanometres, or billionths of a metre. The techniques rearrange the atoms in traditional materials to stop liquids getting through. In NZ, the Kathmandu sports stores plans to launch shirts, shorts and trousers made of self-cleaning "nano-care" material in October. The associate director of the Institute of Nanoscale Technology at the University of Technology in Sydney... told a conference on nanotechnology and advanced materials in Wellington this week that the techniques would revolutionise many consumer products. "It's a technology that can be incorporated into almost anything that we use..." [the] institute is building a model "nanohouse" that will incorporate self-cleaning benches, fridge pipes coated with material that will not heat the surrounding air, and windows made of transparent glass that you can see through but which blocks out heat in the middle of the day. The trick lies in using nano-sized particles that are smaller than the wavelength of visible light, which is around 500 nanometres... Traditional sunscreens, for example, were white because they incorporated large blocks of zinc oxide, which absorbs ultraviolet light. New transparent sunscreens used the same zinc oxide, but in such tiny 10-nanometre particles that they scatter the light while still absorbing it. The tiny particles are made in "ball mills", using large metal balls to literally crush material into a microscopic powder... [In another development, a] University of California chemist has invented odourless sports socks... [In addition to meaning there will be] NO more stinky socks[. the chemist]... hopes to develop the technique into odour-free diapers and hospital gowns that ward off deadly bacteria and viruses.

...● I have just had my grand-daughter to stay while her mum was in hospital having Number Three. My daughter left disposable nappies for Miss Under Two and, having read a lot of opinions about these nappies, let me tell you they are marvellous – better than sliced bread. No leaks, no washing, no trying to get them dry in the rain. In fact no worries at all. *Happy Nanny, Walton* ● I agree with EF DE of Hamilton's letter... about all the negative responses to people using cloth nappies. I know – I'm one of the minority of young mothers who do use [them]... I'm a 26-year-old mother of a two-year-old boy and my husband and I are expecting our second baby next April. My friends think I'm crazy for using cloth nappies. I do use disposables when we go out and one at night, as our son sleeps through the night. We watched a programme while I was pregnant with our son which said to keep a baby in disposables full-time for a year costs \$1200. As I'm a full-time mum, we are on a limited income and I would rather spend the money elsewhere... [I say] to EF DE's daughter... [d]on't worry about people thinking you are mad. Do what you think is best for your baby. H[owever, h]ave you tried shopping at the Baby Factory, K-Mart or Mitre 10 for a nappy bucket with a lid? Good luck. *KH, Waipawa*...

Finally a solution for maternity wear! PreggyBand is an insert that buttons on to your own clothes, allowing them to expand and fit through pregnancy... enabl[ing] you to retain your existing wardrobe... A... single pack is \$26.95 a... double... \$39.95... Look and feel great in your own style.

...Gangster-style swagger recipe for back pains Low-slung pants and a gangster-style walk may look cool, but they are exposing teenagers to hip and back injuries... "Walking around with their legs wide out to their side because they have to hold their trousers up tends to influence back

pain,” says the Waikato chair[person] of the N[Z] Society of Physiotherapists... The walk, which [the chairperson] describes as a swagger, is a nationwide trend among teenage [boys] wearing low-slung baggy pants that expose acres of boxer shorts. It causes a lot of rotating in the lower back, and an abnormal swaying motion “to keep everything up”... Teenagers also tend to slouch when they walk with a swagger. The overall walk affects teenagers from the shoulder blades to the lower spine... It will not cause injuries by itself, but teenagers going through a growth spurt risk back problems if they walk with a wide-leg swagger. [The chairperson]’s advice to teenagers is to try to keep good posture...

[A NZ fashion designer] is excited about a dead [guy]’s ties. So much so that when they came up for auction [the Auckland] bought the lot: 1000. They’re not woven from the woolly bellies of exotic creatures, nor are they the most exquisite things you’ve ever seen. Some are downright ugly. Yet, [the Auckland, who forms] one half of the World design duo, had to have them because they represent the fetish aspect of fashion. “They’re pointless [– apart from pointing towards the wearer’s face or crotch, depending on your point-of-view!] They stick around your neck and they look silly. But they’re one of the few things that [guys] can get obsessed about. There’s a lot of fetishes that [gals] can get. Guys don’t wear nail polish and they don’t do lipstick.” ...As the ties are mostly [N]Z... and A[US]n-made with a brief foray into American culture, they illustrate the mood of the nation from the 1940s to the 1980s. For instance, the swirled paisley and “Muldoon” ties of the 70s depict a groovy, positive era, whereas those from the 40s and 50s show a bolder, more beautiful and classical period... These thin scraps of mostly unworn fabric waiting to be knotted around... throats are on show on the mezzanine level of World’s High St premises... and are on sale from between \$20 to \$30 each... [The bald Auckland] will keep a few of the collection... – without even knowing how to knot one properly. “I’m hoping a lawyer will come in and show me.”

...Get rid of unwanted hair permanently, effectively, painlessly! With the highly advanced IGIA hair removal system. One of the most effective hair removal systems ever... Simply hold the hair in the electronic tweezers. The tweezers emit a radio frequency in the form of a dry heat which goes down the hair to the root and the papilla, stopping the hair growth cycle. In just 30 seconds to 1 minute the hair will slide out... Sometimes up to 3 applications are necessary, because occasionally more than one hair grows in each follicle and some hairs can be stubborn. If the hair grows back within a year after 3 applications, return for a full refund... Only \$17980... Includes special cleansing gel and after treatment cream.

...Now you can afford to remove unwanted body hair – permanently! With the affordable, new, permanent hair remover from... Sonique – one of the most effective hair removers available... Why waste time waxing, shaving or plucking again and again when you can remove hair once and for all? ...Sonique employs radio signals to kill hair at the roots... and you won’t feel a thing... Only \$99...

Is embarrassing facial and body hair ruining your life? Unwanted facial or body hair is an embarrassing fact of life for many [gals]. Now, the CACI Clinic’s advanced new *PermaLase* treatment means you don’t have to just put up with the problem. Medically-developed, *PermaLase* is the quick and virtually painfree way to remove unwanted facial or body hair – and restore your self-confidence. Hair that is treated effectively during the... cost-effective *PermaLase* programme will not return. Studies show an average hair loss of 50-70% after two... treatments.

...imagine... no more awkward shaving, painful waxing, or messy creams Depilux is a new method of hair removal that’s clean, quick and effective! Simply smooth Depilux... DEPILATORY CREAM... onto your skin while in the bath or shower and leave for a few minutes before rinsing away. Each hair is painlessly removed right from the root so you can enjoy baby-soft, ultra-smooth skin for even longer... Depilux... dissolves each hair... [but] is so gentle you can use it on your face or bikini line and, even better, the hair that grows back will gradually become softer and finer... See and feel the difference – for weeks on end! ...Only \$29... each \$26... each for 2 or more... No other hair removal method is this easy.

...‘epil-stop plus’ ...is a new improved hair removal formulae that contains Vitamin E to leave your skin feeling soft and smooth. A painless alternative to electrolysis and a convenient alternative to shaving and plucking. ‘epil-stop’ penetrates deep down to the hair follicle and prevents the hair from growing – for weeks! ...Only \$69... Includes... ‘epil-stop Growth Spray Inhibitor’, reusable spatula applicator and instructions... [in which] two fat... g[als]... prance, dance and try to entice me into buying the AirCore – the pot that cooks... dinner while I’m out on the town.

...[introducing an] amazing new bakeware... unlike anything you’ve seen before, it will turn your ideas about baking inside out! IT’S INCREDIBLE, IT’S FLEXIBLE! Never again will you have to battle a baking mould that won’t let go of your freshly baked cake. With Llorente you simply flex the tray and your baking pops out, perfect, in one piece! ...It’s absolutely indestructible... GENUINE NON-STICK! (All the way through) Llorente needs absolutely no greasing... [– so] you won’t need to add fattening oil or butter to your recipes... [–] and won’t... rust, dent... chip or flake. Best of all it’s not a coating so Llorente will never lose its non-stick qualities... And since food doesn’t stick, clean up is a breeze... Just rinse or wipe clean, or pop in the dishwasher... Llorente is not just for cakes. Now you can prepare pizza, lasagne, meatloaf, quiche and delicious specialty dishes. Plus... you can make wonderful cold dishes... COOKS EVENLY! There are no hot spots, so your baking cooks evenly with no burnt edges... [– u]nlike traditional pans that absorb heat, causing food to be overcooked and underdone... The baking trays are made of 100% pure food-grade silicon, which doesn’t hold the heat, [so] it stops cooking as soon as it leaves the oven... “...one thing that [we] noticed that made a difference was that the pan couldn’t burn you. We took it out of the oven and you could touch it right away...” ...Metal pans can rust, dent, and the non-stick surface can scratch and flake... Glass pans can shatter... [Since Llorente]’s not rubber it won’t melt. That’s why it’s earned the Good Housekeeping seal [of approval]... By now you can all see why Llorente cookware is *the* hottest product in Europe... Retailers throughout Europe are raving about it. “[The]Llorente product-line is revolutionary. People love it. We never have returns. People come back over and over to buy it for themselves and their friends.” ...SPACE SAVING! You can fit 25 of these revolutionary baking moulds in an average sized cutlery drawer – simply roll up or fold, saving valuable space! ...Choose from... seven great styles... All moulds are available in 3 colours... Only \$3995 each... Buy your Llorente moulds one at a time or put together your own 3 piece set or 6 piece set and take advantage of the special prices... Select any 3 – pay only \$9985... Select any 6 – pay only \$17970... plus buy 3 or more and receive a free recipe book... Try your Llorente cookware risk-free for a full 30 days. If you don’t love the way it looks and cooks, simply return it for a full refund of the purchase price... DURABLE! Heat proof up to 220°C... microwave and freezer safe. They can be put in the oven or microwave straight from the freezer.

...THE GADGETS WE OWN... Today... 80.0... % of N[Z] households own... a... Microwave... [(compared with 37].6%... 10 years ago[)]; 80.3% own]... a... Combination fridge/freezer... [(69.8%)]... a third... own... a... Dishwasher... [(18.6%); 65.4% own]... a... Clothes drier... (...55.7%]; 79.3% own]... a... Video recorder... [(42.7%)] and... 32.9... % of... households... [have a computer (9.6%). Surveys] say... plenty about our changing lifestyles. Cellphones and pay-TV were nowhere to be found in the [corresponding] survey a decade ago. Now, around 20% of households have one or both, while the prevalence of black and white television sets is no longer recorded in the publicly issued tables... 96.3% now have a]... Colour TV... Likewise, the quiet demise of the open fire can be observed. In 1988, more than 33% of houses still had one, whereas only 20% have them today.

...Is condensation driving you up the wall? Create a dry healthy home with a Dry-Matic ventilation unit... Continuous, filtered fresh air... Recycles lost heat... ● Childproof caps are a great innovation and do a great job but could I make a plea to manufacturers to spare a thought for those who suffer from arthritis and similar afflictions. Increasingly caps on household cleaners are getting larger and more difficult to remove...

THE UVtec franchising operation has targeted one of the sore points for N[Z] homeowners – the effect of the sun’s ultraviolet rays on their fixtures and furnishings... “There are other options for protecting furniture, carpets and artwork, but these involve keeping curtains closed all day, tinting windows which affects light in the room, and applying film. The UVtec liquid is invisible and bonds to the surface of the glass – you won’t even know it is there.” ...UVtec’s clear liquid is applied to the inside of ordinary window glass... 98[%] of UV rays are blocked by the... product.

...Millions of people who suffer from sick-building syndrome could be cured if ultraviolet lights were installed in office ventilation systems... 70[%] of people in the West now work in air-conditioned offices, and... [u]p to 80[%] of office workers are thought to suffer from ...related illnesses.

...Office workers who festoon their desks with potted plants in the hope that it will cure sick building syndrome are wasting their time. A[n AUS]n researcher... says plants have no measurable effect on removing airborne chemicals that are blamed for the syndrome, which causes people to feel tired, irritable and unwell... One of the biggest culprits for sick building syndrome is formaldehyde, a toxic compound that is widely used in pressed wood products such as plywood and some foam insulation. Formaldehyde can irritate the eyes, skin and throat, aggravate asthma and trigger hay fever. At levels as low as 50 parts per billion... it is thought to cause nausea, dizziness and tiredness. The W[HO]'s safety standard for this chemical is 82 ppb. [The AUSn researcher] set up five rooms in which [were] placed five plants every two days until there were 20 plants in each. With up to 10 plants in the room, formaldehyde levels were unchanged. With 20 plants, the levels reduced slightly, from 856 ppb to 761 ppb.

...['plants in office or shop environments may turn yellow and down due to light, water and air-con problems – but the solution is the NZ ARTIFICIAL PLANT SHOP: a special shop for realistic Palms, Ficus and other big or small trees, foliages and potted plants']...

The versatility of vinyl... Think vinyl and you may cast your mind back a few years to some of the cheap and nasty flooring options found in areas like the kitchen and bathroom. Home owners today however are looking for more fashionable choices in their flooring selections. No other floor covering category offers the selection, styling, and ease of maintenance as a vinyl floor! Thanks to some great advancements in styling and technology, vinyl floors have been changed forever. Modern technology has literally revolutionised the vinyl flooring market with manufacturing processes that produce vinyl that resembles the look and textures of real ceramic, stone and wood grain patterns. They have changed the way vinyl floors are made and these amazing replicas have such incredible realism it is difficult for most people to tell whether it's the real thing or not. Today's vinyl floors are extremely durable and long lasting, but like any floorcovering they still need regular maintenance to stay looking like new.

...“Never Paint Again” has been the promise made to users of Masada Twin-wall claddings since 1985 and now many thousands of proud home owners across N[Z] enjoy the long-term benefits of cladding with Masada's low-maintenance exterior vinyl weatherboards and soffitline. When re-cladding, Masada can usually be fixed over the top of existing claddings, thus transforming an old home in a matter of a few days, to one that will never need painting again and that will stay looking good for decades. Satisfied users have found that Masada Twin-wall Vinyl weatherboards provide the answer for an exterior cladding which is unaffected by the sun and salt-spray of N[Z]'s harsh maritime environment and won't warp, split or rot. As well as the appealing classic rusticated design, Masada Twin-wall vinyl weatherboards offer practical benefits, including increased levels of thermal insulation. The weatherboards are capable of being fixed vertically or diagonally as well as horizontally or bent around a radius for such purposes as curved decking balustrades, or for under bay windows. [■ Another alternative to timber or fibre-cement weatherboards, and Masada's primary competitor, is 'Marley Clad – a tough impact resistant PVC construction that is easy to work with, will never rot, rust or need painting'.]

...THE SMART CHOICE... IN WEATHERBOARDS... [Marley's] *Pallside* is a solid weatherboard that combines the traditional values of weatherboards with modern technology. Designed and manufactured in N[Z] specifically to withstand the rigours of N[Z]'s harsh environment, *Pallside* is a low-maintenance, cost effective weatherboard that offers stylish looks without the need for painting. That's right, no more painting, just select the colour and profile and sit back and relax. *Pallside* is used mainly for new homes but can be used to re-clad an existing building, to breathe new life into the tired, old exterior of your home... •Doesn't rot or absorb water so increased durability... • Smart looks • ...25-yr Guarantee

...A range of polycarbonate roof sheeting has completed more than five years of exposure at the Building Research Association's test site in Wellington. The 20 imported sheets were fixed at angles of 45deg on weathering racks on the edge of Cook Strait in 1992 to test their life expectancy... Some look as good as the day they were put up, others have yellowed and developed haze on the surface caused by micro-cracking, which reduces its impact strength. Among the conclusions: “The greater the roof pitch, the longer the life of the polycarbonate... The part of the sheet that is closest to horizontal weathers the fastest. A good surface protective coating on the side facing the sun is necessary for good durability. Protective layers of acrylic coating appear to weather better than surfaces that incorporate only ultraviolet light absorbers. Less condensation occurs in the channels of coloured twin-wall sheeting than clear sheeting. We recommend that the top of the supporting timber (for example, purlins) directly under the polycarbonate sheet be painted white at installation – also for all other glazing sheeting, including fibreglass, PVC and acrylic. This helps to prevent localised heating of the sheet and premature breakdown.” PVC wall claddings Branz has had on the exposure site since 1990 have shown noticeably reduced impact strength. “However, after three to five years the loss of impact strength has levelled off and, in the case of the worst-performing cladding, has even improved slightly.” The association tests a range of building materials as part of ongoing research and also for paying clients. Some materials have been up for 20 years. They are tested for the impact of such things as ultra-violet light, moisture, corrosion and salt in a maritime environment. Branz uses sites in Queensland to test the effects of extreme heat[– ‘plastics expand on hot days’ –] while cold weather is simulated in freezers. Weathering can be accelerated in laboratories, but the results are checked long-term outdoors.

...A smart type of plastic which automatically “heals” itself like human skin when cracked or broken has been developed... The substance, containing embedded microcapsules filled with a special healing agent, could mark a revolution in materials for systems that cannot easily be repaired once in use. Examples include the components of spacecraft and space stations, satellites... motors, artificial organs and bridge supports.

...The west Indian state of Maharashtra is set to place a total ban on plastic shopping bags, with violators facing a maximum five-year sentence. Officials said the beaches and drains in the state capital, Bombay, were being choked with millions of plastic carry bags discarded after use.

...South Africa is to ban the use of plastic bags in a bid to rid the country of [them]. The ban on the bags, handed out free to shoppers at all major stores, will be phased in over the coming months... The prohibition is the brainchild of [the]Environmental Affairs Minister... who has campaigned for months to rid the country of the [non-]biodegradable bags, which [it] refers to as “the country's national flower”... [In related news, AUSn] companies are moving off-shore because of hazardous substances and new organisms legislation similar to legislation proposed in N[Z], says a local] plastics industry leader. The new chief executive of the Plastics Institute (PINZ)... says the HSNO legislation... is a “real can of worms.” If it is introduced in its present form it will have a “drastic effect on any manufacturing industry with an imported content... In essence what it means is that anybody bringing any substance into the country, as opposed to a finished product, is required to notify that substance and have the substance, the method of treatment, labelling, packaging and a whole host of other elements, approved by... the Environmental Risk Management Authority... At the moment... ERMA... has something like 120,000 separate notifications in front of it, and it's going to be a bureaucratic nightmare.” ...[but] the biggest risk is that N[Z] will get the same situation as occurred in A[US]... where companies found it too difficult, too time consuming and expensive, and left... Firms competing in world markets have to be very nimble to stay competitive... and they cannot do that if... bogged down in bureaucracy. The industry is also being hurt by the low value of the N[Z] dollar, which is compounded by the fact that raw material prices, even in US dollar terms, have virtually doubled in the last six months. That has been caused by a shortage of materials arising from the doubling in the cost of polymers used in the plastics industry because of oil industry manoeuvrings. “The whole thing has snowballed a bit of late and our members are certainly having to approach their customers with price increases... Having said that, the industry is in good heart despite the problems. Everyone is very busy and... we keep hoping that it will get better.” The plastic industry, [the executive] says, has a commitment to environmental protection and product development. Several sophisticated new products have been developed in a joint venture with Auckland University and at least one of those is now coming on-stream. The industry is a significant exporter, and in the last calendar year earned N[Z] more than \$300 million...

Tyres may be made of plastic in future Tyre companies have tried all types of alternatives but nothing works quite as well as rubber – for now. However, the search continues for better materials and rubber may well be replaced by new types of plastic compounds in the tyres of the future.

Firestone and its parent Bridgestone, are among those researching composite plastic rubber materials that will perform better under stress and will be easier to recycle than existing rubber tyres... The ability to maintain elasticity at high temperatures is crucial because heat is a real enemy to current tyres, hardening the rubber and increasing wear. The new plastic compounds stay elastic even up to 180 degrees centigrade. But Firestone says more testing is required and it could be several years before a non-rubber tyre is available at a competitive price.

...Overseas sources say th[at] sharing of componentry... [(Mazda's] 1998 323 four-door sedan and five-door hatchback share body panels apart from the obvious differences at the rear[)]... has been instrumental in reducing development and production costs... [- but r]ecycling cars may not help car-makers to recycle money. Costs are starting to outweigh the value of the material retrieved, according to reports... which say there is a slump in demand for steels, plastics and other materials... [But Mercedes-Benz - which] made much three years ago of the use of renewable raw materials, such as the tropical plant sisal, in its E-class[- has now] gone further with the new S-Class... Wood, cotton, wool, cellulose, flax, sisal and coconut have found their way into components. Using the natural ingredients meant a weight saving of... 23kg over conventional materials. The rear parcel shelf is 40[%] cellulose. The backing for door panels is flax and sisal bonded with polyurethane instead of epoxy resin. An insulating mat is made of felt, basalt wood, carbon fibres and cotton. For the first time Mercedes-Benz has used eucalyptus in the wood trim... It's more plentiful than walnut and mahogany. Cheaper too... □ ['Ford made a chassis out of a plastic produced from corn starch during WW2.' Yet most post-war manufacturers stuck with using steel - although increasingly]... a fibreglass body [is being adopted so vehicles are lighter and]won't be troubled by rust...

SCIENTISTS IN America are... produci[ng]... glass that is stronger than steel. By hooking a stereo speaker to a sample of glass... a research student at Alfred University in New York state, found that vibrations from the speaker made the glass structure vibrate. After immersing panes of glass in molten chemicals to give them extra strength, [the student] and colleagues used a sonic-wave generator to bombard the panes with sound waves. Too much power from the generator caused the glass to shatter, but pitched at the right level, the waves helped speed up the process in which the chemicals close the microscopic cracks that weaken glass. The result was a "super glass" five times stronger than normal glass. Glass bottles could be almost as light as plastic, windows could be half as thick and less distorted, while car windscreens could become three times stronger than safety glass... [Incidentally, r]estrictions on more creative building designs may be a thing of the past with a west Auckland company leading the way in laser technology. Avondale's Stainless Technology has acquired the only three dimensional laser cutter in the southern hemisphere. The \$1 million laser is one of only 12 in the world. The others are in use in Europe and the U[S]. The c[ompany]... has imported the laser primarily to strengthen the manufacturing and metal production base in N[Z], but... hopes the building sector will take advantage of the opportunities it offers. Stainless Technology designs and supplies food processing and packaging machinery to businesses around the world. [90%] of their work is exported... [T]he laser is capable of cutting any material... "...architects... are no longer constrained by the limitations of conventional cutters... For example the cutter can cut a steel pipe into any shape imaginable which is not possible with conventional cutters."

...Steel mills tend not to feature too often as travel destinations, but... one... in Kakogawa, 60km west of Osaka[, is an exception to the rule]. Kakogawa is one of those pleasant coastal cities that casual travellers invariably race through by bullet train after seeing the historic castle at nearby Himeji and on their way to the neon-lit pleasures of bustling Osaka. In the competition for tourists' attention there is little in Kakogawa's history that makes the major guide books, and the impression is that there are few... reason[s] to spend any time in this low-lying city when historic Kyoto is so close. Yet Kakogawa, with a population of 250,000, has long been a destination for N[Z]ers. It has had a sister-city relationship with Waitakere since May 1992 and there has been a consistent and fruitful exchange of students, teachers, sports groups and pleasantries between the two... [As is] befitting a city which has a relationship with the Auckland region's most self-professed eco-city, Kakogawa has a proud record in conservation and eco-consciousness. The huge Kobe Steel site, occupying six million square metres of shorefront, is a case in point. Surrounded by lush greenery and with broad boulevards lined by immaculately trimmed topiary, some parts of Kakogawa Works (as it is commonly known) could easily be mistaken for a holiday resort if it weren't for the huge blast furnace, pelletising plant, coke ovens and enormous hot-strip mill that takes at least 15 minutes to walk its full length... [The head of] the environmental control and plant safety section, is understandably proud of what his team has achieved since the plate mill began operation in 1968. [The head] produces graphs to illustrate the steady decline in energy consumption rates, now reduced by a quarter of its 1974 level, and how carbon dioxide and carbon monoxide are recycled into the power supply of the factory. Kakogawa not only creates its own power but sells its excess to local private companies. The nitrogen gas used to cool the coke is also recycled, and sophisticated dust-collecting systems have reduced dust and soot to imperceptible levels. Most impressive to the lay visitor... is the plant's water recycling: 97[%] of the 3000 cu m used every day is treated, filtered, cooled and returned to the environment... 100[%] of all limestone used is recycled, [and]a permanent oil fence floats just out from the docks to contain accidental spillage... This is steel mill as responsible corporate citizen... Noise levels are reduced by covers over cooling towers and silencers on exhaust ducts (which makes the cold-strip mill look more like Paris' Pompidou Centre than a steel plant), and computers monitor levels of dust, noise, water quality and effluent. The avenues outside the hellfire furnaces and gargantuan machinery of steel production are quiet and peaceful. Oddly enough, as I look up birds wing through clear skies towards puffy clouds. It's probably a good day for windsurfing, I think.

...Public health authorities in Whangarei have been alerted to the cases of nine Kaitia people suffering illnesses suspected of being linked to toxic chemical emissions... [from] the Japanese-owned Kaitia mill... The number of cases reported has... doubled since early [last month], when the medical conditions of four people were notified... At the same time, a draft report on testing of chimney stack gases being released from the Juken Nissho triboard mill shows "detectable amounts" of isocyanates and related chemicals are coming from the mill chimney. The Northland Regional Council is now seeking expert opinions on whether the amount of chemicals in the mill's discharges can cause ill-health effects for people at ground level nearby... Specialised stack emission testing, as well as ongoing air sample monitoring, was undertaken at the mill after the... council became aware the plant was using a chemical substance in its triboard production process that it did not have consent to use under its air-discharge permit... The mill's consent covers only formaldehyde and total aldehyde amounts which can be discharged... into the surrounding air... [Its] monitoring manager... said the council's report was now being interpreted and reviewed because the type of specialised emission being carried out had not been done before and work was needed to evaluate and establish what the results meant. Meanwhile, a Kaitia couple who have lived near the mill for six years and... are among the nine cases... have been told by a specialist from Auckland that their conditions have been caused by... "multiple chemical poisoning," [with one of the chemicals being] ...methylene diphenyl di-isocyanate... The couple, who... have had... breathing problems, rashes and persistent headaches... for the past six months, are waiting for a written report from their specialist before passing it on to health authorities. The[y]... are also seeking a High Court judicial review of a decision by the Far North District Council earlier this year to allow the mill land use consent to build a multimillion-dollar extension to its operations without publicly notifying the company's application. They say full public consultation was never carried out before consent was granted. No date has been set for a hearing. An air-discharge permit hearing for the mill extensions, needed before the expanded plant can become operational, is... to be held by the regional council in Kaitia late next month.

...A contaminated Avondale paint factory site may not be cleaned up for years if resource consents can't be fast-tracked... Funding apportioned to the cleanup may be reallocated if not spent on the project this financial year, [a Dulux spokesperson] says. "I'm not saying it will never be carried out but we would have to wait until the company decided to spend the money in this area again." [Avondale Community]Board members commended Dulux for its openness about the cleanup. "They should be fully commended for their voluntary approach - a lot of companies would not be so responsible,"... Dulux wants to remove 15,000 tonnes of rubble and soil contaminated with heavy metals and solvents brought on to the

site in the early 1980s. The multi-million dollar operation would see 20 trucks a day over a four month period taking the material to a licensed landfill.

...AN industrial-sized conscience will cost a former Avondale company millions of dollars to remove contaminated landfill from its Rosebank Rd site... over an 18-week period. Twenty truckloads of landfill a day will be taken to a licensed tip in the cleanup of the 1.5 hectare site backing on to the Waitemata Harbour. The paint company is... asking the Avondale Community Board to put traffic lights on Rosebank Rd to give the trucks easy and safe access to the motorway. [An e]nvironmental consultant... says strict guidelines to prevent accidental contamination... [of] ground water or... the harbour... during the cleanup will... be enforced allowing only a small area of landfill to be exposed at any time. Dulux[s] communications manager... says the fill was already contaminated when used to level the site in the early 1980s, when regulations were more relaxed. The site is set to be broken up and sold... and they don't want repercussions of any future development stirring up the contaminated soil.

...10 sites are being cleaned of contaminated soil at any one time, but Dulux's is one of the biggest. [A c]ontamination control leader... says companies do not have to disclose whether their soil is unclean. "That's one of the failings of the Resource Management Act as the company or their consultants don't have to tell us anything... We have to keep our ears to the ground." ...the attitude behind cleanups is refreshing, given the often cavalier attitudes of international companies in the past. "When a company comes and asks how we would like things to be carried out and who should be spoken to such as residents and iwi, it is pretty impressive." ...companies face prosecution if they try to use contaminated landfill.

...Landfills linked to birth defects... [Pregnant people] living near landfills run a greater risk of giving birth to deformed babies than those who live elsewhere, a British study has shown. It found that 80[%] of the British population live within 2km of a landfill and babies... in those areas have 5[%] more neural tube defects such as spina bifida, 7[%] more genital defects in boys and 8[%] more abdominal wall defects. The [mothers] have a 1[%] increased risk overall of having a baby with birth defects. There is also a 5[%] increased risk that the baby will be of very low birthweight (less than 1500g) and 4[%] that it will be of low birthweight (less than 2500g). The risks are higher near landfills for hazardous waste, where [pregnant people] have a 7[%] chance of giving birth to a baby with a birth defect. The risk of a heart or genital defect goes up to 11[%]. On the other hand, the abdominal wall defect risk drops to 3[%] near hazardous waste sites... The British Government's deputy chief medical officer... said the research's results could be skewed by several factors but it could not be discounted. Even so... the Government would not give any new advice to pregnant [people]. In an editorial, the... *British Medical Journal*... said exposure to landfill waste could harm the foetus but more research was needed. The Auckland medical officer of health... said a review of Auckland landfill sites two years ago raised no concerns about health effects but there was a shortage of information about them... N[Z]'s low number of [annual] births... could make it difficult to quantify risks from landfills... Of the four landfills in Greater Auckland – Greenmount, Redvale, Rosedale and Whitford – only Greenmount is licensed to take hazardous waste.

...*'Hazmobile' swallows... hazardous waste.* The... Auckland Region Hazardous Waste Programme[s]... Hazmobile has hit the road and judging from its first outings Aucklanders want more of it... Designed to make it easy for householders to dispose of their hazardous wastes without a trip to the local transfer station, the Hazmobile was a big hit on the North Shore in September (supported by the ARC and North Shore City Council). The Hazmobile was in Albany [first]... and in Takapuna the following Saturday... 1,000 people took the opportunity to get rid of their old car batteries, tins of paint, oil and other chemicals. Hazmobile staff collected more than 5000 litres of oil, 320 car batteries and countless tins of paint over the two days... The Hazmobile rolls into Papakura in November and Pukekohe in December. It is scheduled to be in Auckland City... early [next year]...

Do you have any unwanted agricultural chemicals sitting in the shed? The next ARC collection round for agricultural chemicals will be at the end of February. Call Enviroline on 0800 80 60 40 to register for a free pick-up. This is a free service only for rural residents.

...Regional councils planning to export a stockpile of deadly farm chemicals to Europe for destruction are ignoring locally based safe disposal technology[, according to]... the Minister for the Environment... Six regional councils are on the verge of announcing they will export 120 tonnes of the unwanted dangerous chemicals to France or the Netherlands for incineration, contrary to the spirit of the international Basle Convention on the transport of hazardous waste. The councils claim that sending the chemicals is the most environmentally responsible option available until treatment facilities are available in N[Z]. But one of the disposal tenderers, the A[US]n-based defence engineering and technology company ADI Ltd, says it could set up two plants in N[Z] within eight weeks. The treatment, described as world-leading Anzac technology, was developed with the help of N[Z] scientists and taxpayers. However, the councils complain that they have given up waiting for the Government to propose a national solution to the problem. The chemicals, which include the pesticides DDT and dieldrin, have been built up since 1992. [The minister] dismissed the complaint, saying the Government had done everything it could to help them... [A]s well as helping to fund the new technology, the Government had offered to contribute towards the continued storage of the chemicals and support a resource consent application for the plants. Greenpeace[s] toxics campaigner... said that given the councils had their chemicals and the Government had a huge number of contaminated sites to clean up, it was a pity the two sides could not work together. A spokes[person] for the six-council consortium... said: "I would have thought people would be congratulating us, not continually seeming to be negative to what we are doing. At the end of the day most of these chemicals have come into the country. Anyone think about that?"

...Auckland City is to stop using chemical herbicides. Councillors decided yesterday to phase out the spraying of roadside weeds, a decision that will add nearly \$1.25 million to the... [annual] budget. The decision, at a rates committee meeting, is in line with promises made by many councillors during last year's elections. Anti-chemical spray groups welcomed the news, saying it marks the end of a 10-year battle to stop the council using toxic sprays along public footpaths. Instead of chemicals the council will use steam, weed-trimmers and thermal air weed destruction measures. In the Auckland region only the North Shore City Council has a similar policy. The Mayor of Auckland supports the phase-out but does not believe the spending level will be enough to achieve the spray-free goal... For the past few years the council has been using a mix of herbicides and steam to destroy weeds. Chemical control still dominates, but in the past six or seven years the volume of herbicides used in weed control on roadsides and in parks and reserves has reduced 75[%]. In another development, the Auckland City Council... could impose user-pays charges... for household rubbish, saving itself \$10 million a year. The council hopes to reduce the city's rubbish pile by highlighting refuge costs in rates bills and linking the charge to the amount of waste a household throws out. Under the proposed scheme, which could be introduced next July, homes that switched to smaller, 120-litre wheelie rubbish bins would pay \$88 a year for collection. Those who stuck with 240-litre bins would be charged \$175. The scheme still needs to be approved by the full council... The user-pays concept goes against the wishes of most submitters to the council's draft waste management plan. About 400 submitters said they opposed the idea, while 175 supported it. While the wheelie-bin scheme has been criticised in the past, it received overwhelming support from the submitters, who believed it was a hygienic, animal-proof and tidy way to collect rubbish... The... \$1.70 a week... charge for a 120-litre bin... compares with... \$2.60 charged by the North Shore City Council. Auckland City produces 380,000 tonnes of rubbish a year, about a quarter of it coming from households.

...Nine appeals have been filed to try to stop a planned dump in the northern Waikato... ear-marked to take some of Auckland's annual million-tonne mountain of rubbish. Appeals against the \$25 million project... near Meremere, have been received from local iwi and Northern District Federated Farmers as well as neighbours and environmental groups. Environment Waikato and the Waikato District Council gave approval... last year to EnviroWaste Services and Northern Disposal Systems to dump... 30 million cu m of solid waste in the 87ha landfill over the next 25 years... N[DS] is owned by Auckland ratepayers through Infrastructure Auckland... Opening the... landfill will keep... EnviroWaste... in the Auckland market... [once its] Auckland landfills at East Tamaki and North Shore [reach] capacity... Hamilton faces a critical shortage of dump facilities in

five years, when its Horotiu landfill has been ordered to be closed because of adverse environmental effects and its proximity to the Waikato River. Most of the 620 submissions on the Hampton Downs plan were against it, citing concerns about smell, health and environmental effects. The site is just 500m from the Waikato River... But engineers say silt and sandstone at the site will stop fluids leaking into the river... [O]pening... the dump... would help keep the Auckland waste market competitive... However... Auckland would eventually have to look at reducing waste.

...One million tonnes of solid waste. That's a mountain of rubbish in anyone's terms. And it's the nightmare all of us within the Auckland region will face... if we don't do something to reduce the amount of waste we generate... The cost of rubbish disposal in the... region is expected to jump by at least 50% – perhaps as much as 100% – within the next five years. The problem stems from the fact that... roughly 90% of... all the waste... ends up in landfills, and... two of the region's four current landfills close by 2003. So what are the alternatives to paying these higher charges? One possible alternative is for all the region's councils to competitively tender our combined solid waste, thereby bring[ing] down the total cost. Another... is for the councils to work together to build a third landfill within the region[... which is]... not as simple as it sounds. A third alternative is to transport our waste outside our region to a less populated area. Plans for a new landfill... at Hampton Downs... have just begun... but the cost of transporting our waste there rather than to our own region's landfills will of course be far higher. Fortunately there is a simple solution to the solid waste problem, and that's to reduce the amount of rubbish we send to landfills. The Government has made it clear that this is not just an option, it's a necessity. They've signalled that a landfill tax, similar to that imposed in the United Kingdom, may be introduced... Disturbingly... recent waste analysis of a random sample from the Waitakere City kerbside rubbish collection revealed that more than... 20% of bag contents could have been recycled through the kerbside recycling collections. • 14.4% was recyclable paper • 1.5% was recyclable... plastic • 2.6% was recyclable glass bottles and jars • 1.9% was recyclable steel and aluminium cans... If recyclable materials are separated at the source – that is, put in the recycling bins rather than rubbish bags – residents would not only help the City achieve its... goal of reducing the amount of solid waste that goes to landfill by 40% by 2001... but would also save themselves money... “Education is critical if we're going to develop long-term sustainable solutions to the problem,” says [a coordinator] of Waitakere City's new Waste Minimisation Learning Centre... Existing programmes, such as the You Prevent Waste campaign, provide a good starting point for public education but because attitudes about waste are formed at an early age, solid waste management also needs to be stressed in the school system. The Learning Centre's approach is to make learning about rubbish and recycling a fun experience and very “hands on” for children... “Most of the children have no idea what happens to their rubbish,”... Although the Learning Centre has only been open for less than a year, more than 1300 children – as well as visitors from other parts of the world, including a South Korean television crew – have already been through its waste minimisation programme. The programme includes donning hard hats for a tour of Waitakere City's Recycling and Refuse Transfer Station, conveniently located on the same site... Demand for tours... has been so great that the centre is now open for three days each week. When it first opened... the centre was only open one day a week. A grant from the Zero Waste N[Z] Trust enabled a second day to be added in July. A further sponsorship... has... [now come] from the waste company Onyx... – but [the] coordinator... warns that this arrangement can only continue as long as funds are available.

...This week, Auckland City... stopped recycling huge amounts of plastic... – anything Grade 5 and 6 is now being dumped in landfills... although these products are completely recyclable... – ...then advertise[d they're] sponsoring a conference “to help promote sustainable business practices...”

...World leaders of a burgeoning coalition of industrialists and ecologists will descend on Kaitia... next month for [NZ]'s second annual Zero Waste conference... [G]uests from the US, Britain and A[US] are keen to come here to study a bold campaign to turn N[Z] into a waste-free society by 2015, reusing everything that would now be dumped in landfills. Although it might sound wishful thinking, 26 district and city councils making up [33% of NZ]'s local authorities have already joined the cause, qualifying for \$25,000 grants from the Zero Waste trust. The trust, which also finances community projects and has given away almost \$1 million, is heavily backed by the Tindall Foundation but receives some money from the Ministry for the Environment and private donors. [The] Environment Minister... is expected during the three-day conference to issue a public discussion paper on waste minimisation, from a working party convened by her ministry and Local Government NZ. The paper will canvass the possibility of national landfill levies, such as are already imposed by Christchurch City Council to finance a sophisticated recycling operation. Christchurch's Recovery Materials Foundation, which receives \$4 to \$5 for every tonne of dumped rubbish, is researching ways of turning ground waste glass and plastics into local industries rather than exporting them as raw commodities. Zero Waste[s] director... said many people were eyeing N[Z] as a potential world leader in sustainability because it was rich in ideas yet small enough to accommodate new technologies and practices... Topping the bill [at the conference] will be... a former managing director of Japan's Mitsubishi Electric Corporation[who now] chairs Future 500, a group of big U[S] firms at the sharp edge of a sustainable development revolution. The 65-year-old executive... decided to help set his company on the path to sustainability, relying on knowledge rather than raw materials, after falling asleep at the wheel of his car and driving over a cliff. Reflecting in hospital on his brush with death, [the executive] concluded that the global business community was similarly driving towards a cliff, its eyes closed.

...*Humans driving Earth bankrupt*... The consumption of... [today's] people is exceeding the rate at which Earth can replenish itself. Research published yesterday in the Proceedings of the National Academy of Sciences says a failure to rein in humanity's overuse of natural resources could send the planet into “ecological bankruptcy”. The... lead author of the study and a programme director at Redefining Progress... [–] a non-profit group concerned with environmental conservation and its economics... [–] said Earth's resources were “like a pile of money anyone can grab while they all close their eyes, but then it's gone”... [D]emand for resources had soared during the past 40 years to a level where it would take the planet 1.2 years to regenerate what people removed each year... [40 years ago,] demand was 70[%] of the planet's regenerative capacity. “If we don't live within the budget of nature, sustainability becomes futile,”... The study measured the “ecological footprint” of human activities... then used Government data and various estimates to determine how much land would be required to meet human demand for those actions[– e.g., the]... team found that [3 years ago], each person consumed an average of 2.3 hectares. The global average was lower than in industrialised countries such as the U[S] and Britain, where [the figures were] 9.6ha and 5.3ha respectively... Even though the findings revealed that human use of resources was far outstripping Earth's supply, it stopped short of determining how long the process could continue without detrimental consequences. “Like any responsible business that keeps track of spending and income to protect financial assets, we need ecological accounts to protect our natural assets,”...

[A] professional British muckraker who makes a decent living going through rubbish, specialises in stealing waste. Dressed in overalls and a fluorescent jacket, [it] drives around London emptying bins and plastic bags into the back of his van. Addresses of prominent people and firms are targeted and the rubbish is collected according to precise timings, mainly at night. To avoid detection after a series of scrapes with the law, [the muckraker] even recycles old rubbish so householders and office staff are not left wondering where it all went. [The muckraker claims to be] a social necessity, not a menace. Nor does [the muckraker accept it] is breaking the law; the culprits are individuals... and firms carelessly disposing of confidential documents. [The muckraker], aged 36, has been diagnosed as suffering from a very severe form of obsessive-compulsive disorder. As well as filling the family home with papers, his daily routine involves repeated checks of doors, locks, lights and other possessions. The illness is thought to have started in his early teens after an older brother died in a car crash. A[t] the age of 14 [it] became known as the “bag boy,” carrying around half a dozen bags stuffed with papers and books. [BB] started a law course at University College, London, but unexpectedly failed his exams in 1986. [BB didn't] tell his parents and for eight months pretended [it] was a lawyer until they found out. After a further stab at joining the legal profession, [BB] started work for a cleaning company and then launched his own cleaning firm. That set him off down the road that led him

to being named as the source of... leaked Downing St memos that have rocked the British Government. His contempt for the lawyers who refused to embrace him as one of their own and growing interest in rubbish saw him raiding the bins of solicitors and barristers. [BB] took the waste home to sift through the dregs of everyday life in search of notes, letters, credit card details and bank statements of the rich and famous. [BB] initially dealt directly with newspapers but, after feeling [it] had been ripped off, struck up a relationship with [a] British publicist... who could use his formidable contacts to supply the documents and guarantee payment... A News International invoice shows [BB] was paid £3375... at the end of April last year for stories on... the former lover of the late... Princess of Wales... and allegations of ballot-rigging in Hackney, east London. Another invoice, from Mirror Group Newspapers, detailed £1435 paid... last year ranging from £15 for a tale about [a] British TV presenter... to £400 for a story about ex-Spice Girl G[inger]. BB accepts commissions, regularly visiting addresses that newspapers and others such as private investigators want targeted... [BB] was fined £20 in London last November on five counts of "stealing documentary waste." The court heard [BB] had been seen loading rubbish into his van outside a firm of London solicitors... When [BB] was searched in Marylebone police station officers discovered a £2500 cheque from News International. A search of his home uncovered at least 200,000 documents in his shed... [In local news, t]he letters concerning Onyx taking papers intended for Paperchase are timely. It appears it is happening in all areas. Having seen this, I phoned Paperchase. They replied they had a long list of complaints about this matter but were having difficulty stopping it. When phoned, Onyx replied – guess it is a paper war, and they (Paperchase) are probably taking our paper. For those of us who support Paperchase because of its charitable work, this theft is despicable.

...a new product designed by [a] Green Bay resident... aims to reduce... wastage by helping people stack and secure their old papers until they are ready for recycling. The Vermiche Paper Stacker is a powder-coated frame that can be attached to the wall of the garage or inside a cupboard, wherever it's convenient. Its unique tie-off system also allows you to use string, twine or thin strapping to make compact bundles ready for kerbside collection... Manufactured in Auckland, Vermiche Paper Stackers are being sold as a fundraiser at Waitakere City primary and intermediate schools. Retailing for \$22, the product is... not available in retail outlets... Thousands of tonnes of paper are wasted each year – most of it screwed up and thrown in the bin with other household rubbish.

...When the do-gooder lefties gang up with the know-best righties, it's time to be very afraid. Take Auckland's rubbish. Or should I say, please take the city's rubbish, because the council no longer wants to. Our leaders have decided that the 380,000 tonnes of waste that city businesses and households put out in their wheelie bins each year is too much. By June 2003 they want this figure halved. By June 2010 they want us putting out just 20[%] of what we now toss away. How will this miracle occur? Like all true believers, their plan of action is doctrinaire. The popular 240-litre bins are out; half-sized 120-litre bins are in, no matter the size of your family or business. They're even going to use video cameras to spy on the contents of bins to ensure you put out only acceptable rubbish. For the master plan, even food scraps were to be forbidden. "Kitchen and garden waste is not collected kerbside, so don't put this in the wheelie bin," said promotional material issued last year. This was echoed in a council brochure giving six simple steps to recycling. It advised, under the heading "Garden and kitchen waste" to "please don't put this in your wheelie bin." The policy seems to have softened. This month, after a *Herald* story referring to the ban, city officials said food scraps were permissible but not garden rubbish. I'm not too fussed by the ban on big bins. I already compost and need to put mine out only every two or three weeks. But I don't have a tribe of consuming teenagers to clean up after, or a flow of disposable nappies to contend with. Friends who do, however, are very agitated. And I can see their point. What are they supposed to do with the rubbish that doesn't fit in the little bin? Wave a wand and hope it goes away? This is the problem facing Mt Roskill Primary School... For in this brave new world, every unit is treated the same, be it a Freemans Bay pensioner, a school or large factory. Come July, each will be allowed to put out one small bin full of "domestic" rubbish and not one cigarette butt more. At present... [the] school gets one large bin as of right and pays the council to have a further seven emptied. These bins are placed around the playground for kiddy litter: yoghurt containers, clingwrap, lunch scraps and the like. Soon the school will be allowed to put out just one little bin. Staff and pupils already recycle waste paper, but some items don't qualify. [A local councillor who is] a critic of this "big stick" approach to recycling, asks if the school is supposed to send the rubbish home in schoolbags? The reality is, [the principal] will have to call in a private contractor – which will not reduce the rubbish mountain one jot. To me, replacing 150,000 perfectly good bins with little ones is more like creating a new rubbish mountain, not reducing one. The council fudges the embarrassing question of what to do with the redundant big bins by claiming they are "gifting" them to us for garden waste disposal. In other words, they've dumped them in our backyards. My bet is an awful lot of other stuff will get dumped in backyards and frontyards and grass berms as well, cluttering up neighbourhoods until an inorganic collection takes place.

...Wheelie bins turn out to be rubbish... The Auckland City Council has started a huge hunt for faults in a \$2 million batch of its new wheelie bins and has frozen payments to the manufacturer. Councillors were dismayed when they learned that as many as 90[%] of 60,000 bins brought from an Otahuhu manufacturer failed council specifications... This number would cost \$2 million to replace in full. [A councillor] said the disclosure of the flaws by officers... came on top of a string of problems in bringing in the \$104.2 million system of red-top wheelie bins... "The bins have only been taken out to the letter box 10 times and already the wheels are falling off,"... Apart from failing wheels, ill-fitting lids and blurred logos, the bins had thin walls that an expert predicted would not withstand harsh ultraviolet light. But [Auckland's m]ayor... said last night that [it] knew of faults to a varying degree only on 411 bins given to residents in the west. [The mayor] said the reports of flaws were being treated seriously, although they were small compared with the 146,000 bins in use. Faults had been reported only in suburbs that received... bins made by Otahuhu company Sulo-Simapas. No problems were reported with the rest of the bins, which were from... Germany... and... A[US. The]... manufacturer would repair faults but accelerated ageing tests would be carried out to indicate durability. Until this information was available, the council would withhold \$1.5 million still owing for bins, in addition to a \$250,000 performance bond. [The mayor] said performance clauses in the contract meant the council was not exposed to financial loss if a number of bins proved faulty. The Otahuhu company had a \$2.5 million contract to supply 75,000 bins but it had to bring in 15,000 made in A[US] to fill the order in time... The council had bought the bins from the manufacturer for about \$33 each to sell to its three rubbish collection contractors. Before buying, contractors needed assurances the bins would last the life of their seven-year collection contracts... [B]oth Sulo-Simapas and the western city collection contractor did not return the *Herald's* calls... [On a positive note, the chairperso]n of the council works committee... said the smaller wheelie bins had encouraged recycling. The council introduced the bins two months ago with the aim of halving the amount of domestic waste going to landfills by 2005. Progress figures showed waste taken to landfills in the two months had dropped 34.5[%]... from 18,019 tonnes to 11,810 tonnes. Residents had also recycled 77[%] more glass, 57[%] more plastics and 4.8[%] more cans. Paper and cardboard recycling was up 23.8[%]. In related news, the... finger has been pointed at Waitakere landlords for rubbish left to rot in city streets since the... new user-pays collection started last week. While... 90[%] of households managed to put their refuse out in the new prepaid bags, pockets of the city resembled mini-rubbish dumps yesterday. The Waitakere City Council had warned residents that their rubbish would not be collected unless it was in an official \$1 bag... [But the council said it] had been... difficult getting the message through to tenants, despite a leaflet drop and a free bag delivered to every letterbox... The new system has a flat fee of \$30 plus \$1 for every bag, as against the previous \$125 charge.

...Waitakere's clean image goes down the dumps... [The] Waitakere City Council Works and Services Committee reported this month that far from achieving its annual target of a 1[%] reduction in street litter, over the last six months there has been a 10.9[%] increase. The council started a user-pays rubbish bag scheme... [by] claiming it would reduce the amount of rubbish being created and encourage recycling. However it seems that instead of people putting out less rubbish, it is turning up in other, illegal areas. At the moment, there are no fines for dumping household rubbish in litter bins or in private skips but after the latest figures, the council is looking at introducing these and increasing fines for other litter dumping

offences. Random waste audits, already in place to identify and target the main culprits, have shown that the majority of rubbish is from the commercial sector. As a result, the report states that there will be discussions with local shopkeepers to work out ways to reduce this. Another initiative to prevent dumping is a gradual replacement of current litter bins with a different sort making it difficult to leave shopping bags of rubbish in them. The council is hoping that as people get used to the new by bag system, they will dump less into public rubbish bins.

...THE Waitakere City Council has ordered two independent refuse collectors to stop collecting rubbish in the city. It has revoked the licence of Metropolitan Waste Ltd and is prosecuting it for unauthorised use of the council's logo on green rubbish bags sold in... supermarkets. The council has also ordered Waste Management Ltd, which doesn't have a licence, to stop its wheeler bin pickups in the city for failing to comply with council bylaws. Both companies say they will defy the orders. Metropolitan Waste... says the council's ban is a "standover tactic to protect their user pays revenue. To have a true user pays system there must be competition,"... Metropolitan Waste gets its money from selling green rubbish bags 5 cents cheaper than the council's grey bags, which are collected by official city contractor Onyx. The council is taking Metropolitan Waste to court for misleading and deceptive conduct and infringement of copyright"... [The managing director] says his company "made a mistake" by photocopying its licence, which includes a city council logo, on to the rubbish bags. "We have since corrected the mistake and offered to make a \$5000 donation to a charity of the council's choice but it's been rejected by the council,"... [By the way,] I have recently been shocked to discover that this "clean, green, eco city", as promoted ad infinitum by the mayor and... council, now requires us to dump all types of rubbish at the Refuse Station, organic and inorganic alike, in one huge, evil-smelling conglomeration, with no separation of garden waste for composting. Why is this? Until now, I was under the impression that all garden waste was composted, and sold to the public, since we have been taking it there for several years, paying the fees, and off-loading into the area set aside for garden waste. But not so any more... Is this what Waitakere Eco City calls recycling?

...Waitakere City councillors are looking at a scheme which could see pressure taken off landfills by recycling the city's huge proportion of organic waste... [F]ood and garden[waste] would be turned into compost at a privately run operation at the city's refuse and recycling station...

The volume of waste West Aucklanders send to landfills could be halved by a composting plant under consideration by the Waitakere City Council. Garden and food scraps would be collected and taken to a fully enclosed composting facility... They needed far less land than open-air composting operations and were odour free... [T]he council had resource consent for an enclosed plant that could convert up to 14,000 tonnes of raw materials a year to compost. Just over half Waitakere's annual 20,000 tonnes of domestic refuse was kitchen or garden waste which could be recycled and sold locally. The proposal follows limited enthusiasm for the self-styled eco-city's efforts to reduce its waste mountain by encouraging home composting. The council subsidises the cost of compost bins, but only 70 residents in the past year have picked up the subsidy... The privately owned and operated facility, which would be sited at the city's refuse station... could also take organic waste from business and industry... Councillors are approaching the scheme cautiously, mindful of the recycling venture with EcoPlan Ltd, which collapsed [two years ago] with debts of around \$1.4 million. Over \$5 million of ratepayers' money was poured in without proper authority... Waitakere's solid waste manager... said officials were negotiating with preferred bidders for a scheme involving no extra disposal and collection costs to ratepayers. "It's a win-win situation, with the element of risk to the council very much reduced. They simply take green waste off us and we provide an area of land." ...If the scheme wins approval, the most likely plant is a vertical composting unit manufactured in N[Z]... The region's only large-scale composting operation is Living Earth's open-air facility at Pikes Pt, Onehunga, which takes garden waste from six refuse transfer stations. Waitakere sends about 8000 tonnes of green waste mulch a year to a Tuakau "land farming" operation... Separate organic collection has already been tried by the North Shore City Council, without much success. Shore residents complained of difficulty separating kitchen refuse from other waste. [However, the Waitakere City Council's] works and services chair[perso]n... says they may succeed where the North Shore has failed.

...WEST Aucklanders could be forced to separate food scraps from household rubbish within three years. The Waitakere City Council has applied to the Auckland Regional Council for an air discharge resource consent to trial food waste separation in a bid to reduce the amount of rubbish going to landfill. The... proposed trial – similar to one in Christchurch [(which, however, hasn't prevented the city's council from searching Canterbury for somewhere to site a 'super-dump'), but unlike the]... proposal... Auckland City councillors heard... today... from a 9-year-old boy... [whose] idea... to reduce inorganic waste on city streets... [involves] a council web-site where people could list and exchange unwanted items... – ...would see a select group of residents separating food waste from other rubbish and putting it in a specially provided bin to be collected regularly by the council for mulching in its \$2 million composting machine. The council's manager of solid waste... says the scheme could become compulsory for all residents if the trials are successful. But the ARC air quality manager... says the consent could take as long as three years to process.

...Waitakere City Council will not make separation of food scraps compulsory. The *Western Leader* ran a front page article last week saying that residents could be forced to separate waste. This was based on an incorrect assumption. The council says that if any scheme is implemented, it will be entirely voluntary... The *Western Leader* apologises for any confusion its original article may have caused... [Incidentally, i]n a few weeks, the heir to one of the world's greatest fortunes... will set sail across the Pacific in the *Plastiki*, a boat made from plastic bottles and recycled waste. The aim of the venture is to focus attention on the Great Pacific Garbage Patch, a rubbish-covered region of ocean, several hundred kilometres in diameter. The patch, north-west of Hawaii, was discovered in 1999 by researchers who found that its waters contained tens of thousands of pieces of plastic per square kilometre... The plastic, most of it swept from coastal cities in Asia and California, is trapped indefinitely in the region by the North Pacific Gyre, a vortex of currents that circulate clockwise around the ocean. Scientists estimate that there is six times more plastic than plankton by weight in the patch and this is having disastrous ecological consequences. Fish and seabirds mistake plastic for food and choke to death; 'jellyfish absorb it into their bodies'. Plastics also absorb pollutants including PCBs... and pesticides, bringing poisons into the food chain.

...Floating rubbish traps have been installed in three Waitakere City streams to protect waterways from litter and debris. The floating mesh baskets are in place in the Opanuku, Oratia and Rewarewa streams. Booms have also been added to deflect floating litter into the baskets. "The floating litter traps are effective and well suited to tidal areas because they are fitted with flaps that close when the tide turns, trapping debris so it doesn't escape back up-stream," says... [the] general manager of Waitakere City Council's Eco Water Business Unit. "Debris will be cleared once a week initially, but we will be monitoring it to achieve the best balance. The amount of debris collected at each clearing will also be measured." [The] Deputy Mayor... hopes the litter trap programme will heighten public awareness of the amount of rubbish finding its way into Waitakere City waterways... Auckland City has also installed four rubbish traps in their streams, including the Whau River on the Waitakere City border... In A[US], floating rubbish traps have been used for a number of years with great success. In Sydney the traps have captured between 24-71 kg of rubbish per hectare in each catchment. In Melbourne, 15 traps in the Yarra and Maribymong rivers are collecting about 100 cu m of debris and litter a year.

...Japan suffocating under weight of its rubbish... Japan, renowned worldwide for its tidy cities, is awash with garbage. Disposal sites are overflowing. Illegal dumping is on the rise... Greenpeace has dubbed Tokyo the dioxin capital of the world. Alarmed by an ever-increasing volume of trash and the rapidly vanishing space available to dispose of it, Japanese sanitation officials say the country could eventually drown in its own waste. "In 30 years there won't be any place left in this city for garbage, no matter how much we burn," said... a spokes[perso]n for Tokyo's sanitation department. The Organisation of Economic Cooperation and Development says the average person in Japan produces about a kilogram of garbage a day – half the amount Americans toss out and about the same as green-minded Germans. The problem is a lack of space. Much of Japan is too mountainous for habitation, and the plains and coasts where most of the 120 million Japanese live are already notoriously crowded. To save room, the country burns most of its garbage – about 75[%] compared with about 20[%] in the U[S] and Germany. Tokyo alone has 17 factory-

sized incinerators burning trash around the clock. Even so, available disposal space shrank by about a fifth in the past decade. And while most Japanese understand the need for new dumps, no one wants one next door. In Hinode, a small community in the hilly outskirts of western Tokyo, riot police were deployed to enforce a court order expropriating a small grove of cypress trees to make way for the expansion of an 18ha dump. The property had been bought by residents worried that the site was polluting their air and water with dioxins... The operator of the Hinode dump considers it safe, but disclosed environmental data only after a long legal skirmish. “Nobody really understands the risks,” said... an environmental activist. “Who’s going to take responsibility when the unthinkable happens?” An increasing amount of garbage that is not burned or buried is being shipped overseas – an illegal, but cheaper, solution. In the most glaring example, the president of a commercial waste-removal service was arrested in May for shipping 2000 tonnes of used syringes and soiled diapers to the Philippines in containers marked “paper for recycling.”

...*Dump deaths* At least 37 people were killed and more than 60 missing yesterday when a huge garbage dump collapsed and buried a cluster of shanties in the Philippine capital, Manila. More than 90 people were injured as the... rubbish mountain... buried more than 100 houses, mostly shanties. Survivors said they heard a rumbling sound followed by an avalanche of mud and garbage which swamped their wooden houses after one side of the 15m high dumpsite caved in following days of heavy rains.

...*Globe-trotting ash returns for burial*... Almost 2400 tonnes of burned garbage from Philadelphia, part of the gigantic load of ash that roamed the globe for 10 years, has been tucked into a Pennsylvania landfill over the past six weeks. The 128th and final shipment of incinerator ash was dumped yesterday at Mountain View Reclamation landfill... all that remained of the 15,000-tonne Khian Sea cargo that wandered the globe in search of a dump site... “They should have kept it in Philadelphia,” said [a 61-year-old]... who lives 2.5km from the landfill. The ash was left without a home in 1985 because Philadelphia’s landfill had no space left. The following year, a subcontractor sent the Khian Sea with the ash to the Bahamas, but the Government would not allow the ship to dock. For a year, the ship sailed the Caribbean but was turned away by... Bermuda, the Dominican Republic, Honduras, Guinea-Bissau and the Netherlands Antilles – sometimes at gunpoint, said crew members. Environmental groups warned the countries that the ash might contain toxic materials. Federal and state regulators in the U[S] said it had minute amounts of toxic metals such as lead and cadmium. On New Year’s Eve 1987, the ship anchored off Gonaives, Haiti, with a contract to use the ash as topsoil fertiliser. But after weeks of protest, the permits were revoked and the Khian Sea was ordered to leave with the remaining 10,977 tonnes... Most of the ash was... eventually... dumped in the Atlantic and Indian Oceans... resulting in prison terms for two shipping company executives... Eastern Environmental Services took on the... [portion of ash that had spent the intervening] years on a beach in Haiti... and sailed it to Florida... on a... barge... two years ago. The Pennsylvania Department of Environmental Protection finally agreed to dispose of it, with the first truckload arriving on June 27.

“Go ahead, try... [my] smell-a-scope... You’ll find that every heavenly body has its own particular scent. Here, I’ll point it at Jupiter.” “...smells like strawberries.” “Exactly. And now, Saturn.” “...pine needles... this is great... as long as you don’t make me smell Uranus.” “...I’m sorry Fry, but astronomers renamed Uranus in 2620 to end that stupid joke once and for all.” “Oh, what’s it called now?” “Urectum. Here, let me locate it for you.” “...no, no, I think I’ll just smell around a bit over here... [Pooh! What’s that?]” “...remarkable! A stench so foul it’s right off the... monitor. I dare say Fry may have discovered the smelliest object in the known Universe.” “...I think it’s moving.” “Umm, perhaps the computer can calculate its projectory. My God! Whatever it is, it’s heading straight for us, with enough force to reduce this entire city to a stinky crater. We have less than 72 hours.” “...So this thing’s going to destroy the whole city? What the heck is it?” “Ah, just as I thought. The answer lies in this movie I found on the Internet[called *THE GREAT GARBAGE CRISIS OF 2000*].” “New York City, the year 2000 – the most wasteful society in the history of the galaxy, and it was running out of places to bury its never-ending output of garbage. The landfills were full; New Jersey was full. And so, under cover of darkness, the city put its garbage out to sea on the world’s largest barge. The repulsive barge circled the oceans for 50 years but no country would accept it... Finally, in 2052, the city used its mob connections to obtain a rocket, and launched the garbage into outer space. Some experts claim the ball might return to Earth some day, but their concerns were dismissed as depressing.” “Wow, you got that off the Internet? In my day the Internet was only used to download pornography.” “...So that’s the situation. Due to the short-sightedness of Old New York, New New York is going to be destroyed by a giant ball of garbage.” “Fry, what the hell were you people thinking back then? How could you just throw your garbage away?” “Hey... give me a break... what do you do with it?” “We recycle everything... Nothing just gets thrown away.” “The future is disgusting!” “Typical 20th century attitude.” “Hey, you have no right to criticise the 20th century. We gave the world the light bulb... and... the steam boat...” “Those things were from the 19th century.” “Yeah? Well they probably just copied us.” “...If we could build an object the exact size, density and consistency of the garbage ball, it might just knock the ball away without smashing it to bits.” “But where can we find a substance the exact density and consistency of garbage?” “Alas, I don’t know.” “...what about garbage?” “Good lord! A second ball of garbage. That might just work.” “But garbage isn’t something you just find lying in the streets of Manhattan. This city’s been garbage-free for 500 years.” “Well, then it’s time to make some more.” “Make garbage, but how?” “Stand back and watch the master...” “...If my calculations are correct, this garbage ball will knock the other ball directly into the Sun... It worked!” “...And so, on behalf of the entire city, I thank you... Fry, we owe you a tremendous debt... Were it not for your 20th century garbage-making skills, we’d all be buried under 20th century garbage.” “Should we really be celebrating? I mean, what if the second garbage ball returns to Earth like the first one did?” “...who cares? That won’t be for hundreds of years.” “Exactly! It’s none of our concern.” “That’s the 20th century spirit!” - FUTURAMA

If all manufacturing became united under one ministry, that ministry would be able to classify every product as being either ESSENTIAL or NON-ESSENTIAL, then cease making all non-essential products (some products might have to be classified as temporarily-essential because they are still needed initially but have the potential to become non-essential in future; other products might be temporarily-non-essential because existing stocks mean that no more need to be manufactured for a long time) – thereby reducing the ministry’s use of human labour, raw materials and energy. Use of those three resources can be further reduced by standardising manufacturing as much as possible (including, wherever practical, using the same components when making various complex products – which should ultimately mean that many parts of complex products will be interchangeable).

Products also ought to be standardised worldwide – which means that they will be compatible worldwide. Although worldwide compatibility won’t normally serve a useful purpose, it would be valuable whenever emergency supplies have to be sent from one district to another. Furthermore, although it would be ideal if every district could manufacture all of its own material requirements (thereby reducing transportation between districts or states), some products – large machinery in particular – might never be used in enough volume to warrant having each district produce them fulltime. Therefore, some or all districts will need to have a factory (or a number of factories) which produces a specialised finished product (or a range of related specialised products) on behalf of one or more neighbouring districts – or every district within a state; or every other district in the world. The receiving districts would each provide raw materials used in making the final product, or produce one or more components of the final product; or trade different unrelated components or completed products (there should be no justification for districts to have trade disputes with each other – e.g., over the relative value of different products – but, if ever there is, the state government would be responsible for resolving the situation). Unfortunately, because few Last World districts currently have much in the way of sophisticated, large-scale production facilities, the practice of moving large volumes of raw materials from Last World regions to the First, to be processed then returned to the Last World (including districts which can’t provide raw materials, or compensate the manufacturing district in any other manner) will have to be maintained – except that the returned goods no longer need to include items which may be called JUNK!

If everything society produces is being managed by one ministry, and the worldwide population can be stabilised, it should eventually be possible to reach a *perfect equilibrium between production and consumption* – a situation where the range and volume of products manufactured alters little from week to week, year to year, maybe even century to century. While the production level of a particular essential product remains below the volume required, different factories could continue to make different designs of that product, but the Manufacturing Ministry should identify the best design – by comparing factors such as: easiest and safest to make and use, most durable – and phase out the others as its capacity to produce the favoured design increases (some factories making less-favoured designs might be able to convert to making favoured designs; if increased production of the favoured design can only be achieved by building one or more new factories, such construction ought to be delayed until the less-favoured factories near the end of their productive lives).

Factories – especially highly-automated ones – are relatively easy to run non-stop, but the Manufacturing Ministry should aim to eventually have as few factories as possible do so (i.e., it ought to be considered preferable for a district to have two identical factories both operating for 12 hours/day than one operating non-stop – because, although it requires more resources to build two factories than one, routine maintenance can be performed during the 12 non-operational hours; non-operational time can be used to make up for time lost whenever a production line breaks down unexpectedly; one factory can operate non-stop in the event that the other is disabled for an extended period of time; a district's productive capacity can easily and quickly be increased if, for example, it has to temporarily cover for the production of another district – r:p1865, lns63-4).

If the Manufacturing Ministry was also responsible for handling all of the wastes it produces – and economic cost was no longer an issue – it could adopt reuse and recycling practices wherever possible (a product should be reused until it becomes non-reusable due to damage or other reasons, then be recycled), and proper waste management practices elsewhere. The aim should be to eventually have *zero-waste* at all points of production, but until that has been achieved – or if it can't be achieved – productive waste must be treated to render it harmless before being released into the environment, or be stockpiled until a safe method of treatment or reuse is found. Unless the current processes for making plastics create more waste (toxic or non-toxic) than mining, wastes produced while collecting raw materials can be minimised by substituting plastics for glass (if sand needs to be used – to make glass or for whatever reason – it should come from effectively limitless sources like the Sahara) and metals. Preferably, plastics should be sourced from plant polymers; but, until plant-based plastics are more common, it is more efficient to turn petroleum into a plastic product which can be used indefinitely than burn it once in a car engine or heater (r:p2169, lns13-4).

The Manufacturing Ministry would have to make products required by other ministries and by householders (other ministries would have to justify the products they require the Manufacturing Ministry to make for them, and the Manufacturing Ministry would have to convince other ministries of the necessity of every household product it makes). Any wastes produced by another ministry (while using the products manufactured for it by the Manufacturing Ministry, or during any other process) would have to be treated properly at the point of use – with the relevant ministry being responsible for implementing that treatment – or be collected and returned to the Manufacturing Ministry to treat. The Manufacturing Ministry would manage any quarries or other forms of raw material gathering operation. However, rather than have that ministry manage forests and other plant-growing operations (e.g. those providing the raw materials needed to make fabrics and plastics – although plastics, in particular, could be sourced from waste plant products, including weeds and fallen tree leaves; efforts ought to be made to identify the plant species which provide the most cellulose or other base ingredients used in plastic-making, of the best quality, in the shortest amount of time – consider bamboo – or require the least input of other resources, which might depend on local soils and climates), the Food Ministry could manage them on its behalf – thereby eliminating duplication of effort (and, if the Food Ministry is responsible for managing forests, it could utilise some forest floors to, for example, produce mushrooms or other shade-loving crops). The Food Ministry may need to use paper bags, cardboard or biodegradable plastics to package certain processed foods (e.g., flour), but the Manufacturing Ministry should still be responsible for making them for the Food Ministry – from the raw materials the Food Ministry produces – rather than have the Food Ministry produce its own packaging (after all, other ministries might need to use paper bags, cardboard or biodegradable plastic).

The Manufacturing Ministry would be responsible for making any machinery used by the Food Ministry in growing and processing foods, as it would also be responsible for producing medical equipment (machinery, bandages, etc.) for the Health Ministry – although the Health Ministry could be responsible for manufacturing medicines (from raw materials provided by the Manufacturing Ministry or the Food Ministry).

The Housing Ministry could still be responsible for constructing buildings – but, because the Manufacturing Ministry should be responsible for making building materials, it would be sensible for that ministry to manage construction through to completion (after all, other ministries will also require buildings to be constructed on their behalf). The Manufacturing Ministry can also be responsible for the maintenance and repair of buildings (and their interior fittings) – although each ministry should be responsible for the cleanliness of the interiors and exteriors of the buildings it manages (with the exception of the Housing Ministry, which would not normally be expected to keep the interior of houses or apartments clean – r:p2022, lns25 + lns68-9).

One means of keeping manufacturing to a minimum is to make products which are expected to have a long life-time, and this applies to buildings as much as anything else made by society – if not moreso. Most of the houses built in NZ since the arrival of the Europeans have been made from wood. Some are now over 100 years old (r:p1959, lns24), and they could last a lot longer yet – 'the first capital of Japan was Nara in 710 AD, which has the oldest temple complex in Japan and the oldest wooden building in the world.' However, few of the wooden houses built in NZ before WW1 are still standing. Fire or natural disasters claimed some, others were condemned (due to disrepair; rotting or wood-eating-insect-infested frames), but most would have been pulled down before their useful life had expired – often because the land-owner could make more profit out of building a new house (or multiple houses) on the section. The remainder of NZ's houses are mostly made from brick or concrete products, although they normally still use wood for interior framing (steel framing has been introduced recently). These houses should last much longer than wooden ones (if the continued use of stone housing in other parts of the world is anything to go by – and they aren't damaged by an earthquake or other forms of land movement – they could last thousands of years).

NZ may not need to build any more houses for its own requirements for a while (r:p2022, lns37-42), which means NZ's redundant builders – and those from countries in a similar situation (especially those with lots of stone or brick houses which need little or no work to keep them habitable) – could be sent (along with building materials – r:p2022, lns42-5) to parts of the world where large-scale new housing projects are needed. Alternatively, these builders could construct prefabricated houses, then ship them to other parts of the world. In NZ's case, wood would have to be the main construction material – because it is a raw resource that NZ currently has an abundance of, extracting and processing it has less impact on the environment than clay or concrete-based materials and, although it might be possible to construct prefabricated housing out of concrete-based products, their weight means they aren't as easy to transport). Eventually, however, the Manufacturing Ministry should look at using plastics as the major construction material used in all buildings.

Plastics are considered a threat to the environment because most types 'take about 500 years to break down' – but, if used sensibly, this could be a valuable characteristic. The main problem with current construction plastics is that while having the potential to effectively last indefinitely – especially when buried in landfills – they become brittle after being exposed to the Sun for a decade or two (though that might not apply to 'UV-treated high-density polyethylene' or to fibreglass – 'plastic containing glass in fibrous form, used as a structural material: e.g., for boat-hulls'). However, it should be possible to develop a UV-resistant (r:p2196, lns23) – and expansion-resistant (r:p2196, lns45) – construction plastic that can be produced from plant-sourced (i.e., renewable) raw materials. Until such a plastic is available – assuming one hasn't already been patented (plus existing fibreglass materials are unsuitable) – houses could have plastic shells whose exterior walls are covered with fibre-cement or *carbon fibre*. The advantages of UV-resistant plastic housing are so numerous that they surely outweigh any disadvantages. Examples of the advantages are: • Plastic houses have the potential to last much longer than brick or concrete ones, whose walls ultimately crumble beyond repair. They are resistant to insect attacks ('AUSn termites whose ancestors arrived in logs used for power poles are a problem for homeowners in parts of NZ'), and even natural disasters – such as earthquakes or storms – should have less effect on

plastic housing than those constructed using traditional materials (i.e., a plastic house can be floodproof and is unlikely to break apart when shaken by the earth, or be blown apart by strong winds – although, because they would be lightweight, they will need to be well secured to the ground, especially in exposed locations, or where tornadoes, hurricanes, etc., are frequent, unless they are tethered to allow them to float above floodwaters; a safety bonus is that plastic windows ought to be unbreakable). Such houses could have a life-time that is measured in tens of thousands of years, and maybe even millions of years (theoretically, each house could be inhabited by successive generations of humans for as long as Earth continues to support life!). • Plastic houses would, presumably, have better insulating and sound-proofing (be it between interior rooms, or the interior and exterior) qualities than wood, brick, or other types of housing (if these qualities aren't inherent in plastic, it should be relatively easy to develop a construction plastic which has better insulating and sound-proofing qualities). • Plastic housing would be easier to keep clean and maintain than other housing, and won't ever have to be decorated (e.g., painted or wallpapered). In addition, it should be easy to produce plastic in a range of colours, so even if neighbouring houses are identical in design, their exteriors don't have to look exactly the same (but the same aesthetic reasoning doesn't need to be applied to the interiors). • Plastic housing can be made out of a mould (thereby minimising the need for joins – and eliminating cracks that may let water plus ants or other small insects enter the building). Moulded houses can be made in a factory, which means their construction isn't delayed by wet or stormy weather (note that NZ builders sometimes face delays because the factory which put together their pre-nailed trusses got the specifications wrong). They would also be relatively easy to move from their point of construction to point of use – and later be moved to another location, if necessary (e.g., when land movements due to earthquakes or other natural disasters render a residential area inhabitable; if one district's population undergoes a decrease as another district's population is increasing).

If the worldwide population can be stabilised, and houses can be made out of a UV-resistant plastic, by the time all – or the majority – of houses worldwide have been made out of such plastic, demand for new housing should be so minimal that only one district (or just a few worldwide) would need to have a house-making factory. Furthermore, if the design of standard houses remains constant in future, and the major components of this factory's machinery – and that of any other factory – are all made out of a long-lasting material, it might only be necessary to replace moveable parts (i.e., the same factories and most of their machinery could be used indefinitely). In addition, there would be little or no need to employ any people as architects (the same goes for designers after the best design of every product has been identified).

The standard, two-bedroomed house design (r:p2024, ln7) ought to be single-storeyed, but there may be some instances where this is impractical (e.g., although roofs and exterior walls can be heated, districts which experience heavy snow-falls in winter might need to have A-frame or chalet houses – as are common in Switzerland; some districts might need to utilise a mixture of both standard and A-frame housing). However, a house-making factory should be able to produce both design types, and any other kind of prefab building, simply by changing the mould used.

The roofs of standard houses could be flat – although a partial slope (be it from one side of the house to the opposite side; or to the left and right sides of a central ridge; or on each side of a central apex), or a domed roof, would assist the removal of rainwater. However, regardless of whether or not a house is standard or A-frame, it should only be necessary to have ceilings in addition to the underside of their roofs if they are the only means of dampening the noise of rain landing on the roof (regardless of whether or not the house has a ceiling, there ought to be enough internal headroom to allow the tallest people to stand upright comfortably – but if house roofs slope *from one side of the house*, the living space area can be located on the higher side, and the bedroom space – where people are less likely to be standing up for long periods – on the lower side). Assuming that the noise of rain hitting the roof can be dampened without requiring a ceiling, houses could be formed from two moulds – one consisting of the roof and outer walls, the other consisting of the base and internal walls (including, perhaps, kitchen benches, cupboard frames and other permanent internal fixtures, such as the bathtub – thereby minimising the amount of fixtures that need to be replaced due to *wear and tear*) – which are then joined together (if necessary, the bottom mould could include a ceiling). Incidentally, moulds could also be used in the construction of larger, multi-storey buildings, including schools and apartment blocks (i.e., individual apartments or classrooms could be constructed in single units, which are then joined together to form blocks), but only if the stability of the completed structure isn't compromised – in comparison to traditional apartment blocks. Blocks of prefab apartments might be stable and earthquake resistant if they are held together by a strong plastic (or steel/plastic composite) external frame.

A standard two-bedroom house can be symmetrical (be it square shaped or circular) – which should make it easier to produce and handle their moulded frames – because each bedroom would occupy one quarter of the house (the spare bedroom doesn't need to be as large as the family bedroom, so part of the second quarter space could contain a walk-in wardrobe/closet – which is accessible from both bedrooms, thereby also providing a direct route from one bedroom to the other), with the lounge/dining area occupying a third quarter, and the kitchen/bathroom/toilet (plus a hallway between the front, main bedroom, bathroom, toilet and kitchen doors) occupying the remaining quarter (thus allowing all plumbing to be located in one quarter – which not only minimises the amount of piping required, but also the distance hot water has to travel through pipes). Alternatively, if houses are circular the two bedrooms could occupy one side of the building, the general living area (i.e., lounge, dining-room and kitchen) the other side, and the bathroom/toilet could be located centrally (with the backs of the kitchen sink and bathroom sinks being separated by an interior wall).

It is not normally necessary for a house to have more than one toilet – because, most of the time, no one in the house will be using a toilet. However, the value of having two toilets for the few occasions when two or more people want to use one at the same time (like in the morning – r:p1976, ln22) would seem – especially to people who are busting to go to the toilet but otherwise would have to wait their turn – to outweigh the material costs and labour expended in providing two toilets per house (but apartments definitely only need one toilet each). The toilets could be aligned side-by-side – to minimise the amount of piping needed to carry sewage – but be partitioned, with one toilet being accessed via its own door while the other is accessed via the bathroom. Alternatively, houses might have one toilet and keep a bedpan in the bathroom. It isn't necessary for houses to have both a bath and a shower but, because houses should definitely have a bath (especially for cleaning children) and constructing a combination bath/shower is relatively easy, that's what each house could have. Apartments, though, only need a shower box (thereby minimising the amount of space that is devoted to their bathroom/toilet area).

Household fittings (e.g., furnishings, utensils) ought to belong to each house – or apartment – which means, if ever a tenant has to move from one residence to another, the only things that it has to take apart from itself are personal items (e.g., clothing, towels and flannels, bedding – excluding bed bases, unless a base was made specially to fit a very tall person). Furthermore, unless a tenant has a disability which means its residence needs some basic, reversible modifications (e.g., extra hand-rails – note that all homes ought to have access ramps instead of front steps, while other buildings can have both), the range of fixtures and fittings should be uniform from house to house – although any house that has more than four inhabitants would, in addition to having more than four beds (r:p2024, ln12), need to have more than four chairs, dining utensils (e.g., cutlery, plates, cups), etc; but apartments may only ever need to have two of everything in the way of dining equipment (and only one double bed – which could covert into a lounge suite). If an apartment accommodates a couple, and that couple is catering for guests, those guests can bring their own utensils; with the same applying to house-guests – unless the Manufacturing Ministry decides to provide enough utensils for each apartment and house to prepare two meals without having to wash dishes in-between (so there will be enough utensils for dinner-guests). Each house needs a lounge suite, which guests or the children can sit on while dining (and might convert into an extra double bed – the other double beds being the parents' and the one in the spare room, which might fold up to form a desk?) – rather than have them bring their own chairs (although, if every dining chair was foldable and made from a light-weight material, they would be easy to carry from house to house). Dining tables can be expandable and, if they could be folded away against a wall, that would be a useful as a space-saving measure. Each residence needs to have a fridge – although those used by apartments ought to be smaller than those used by houses – but, eventually (i.e., when the Food Ministry is delivering weekly allowances of fresh foods to each residence – r:p2089, ln6), there should be no justification for residences to

have freezers (which means that ice cream and similar foods, including frozen white sauces – r:p2087, ln17 – will become rare, if not extinct). Apart from being little more than an energy-guzzling piece of convenience equipment, residential freezers affect the nutritional quality of foods.

The water in each cell contains the minerals which give flavour and goodness to food; if frozen slowly... large uneven... ice crystals... are formed in the cells of food... which break through the cells; on thawing, the goodness and flavour drain away... Microwave is a method of cooking and heating food... [‘Much prized for its cleanliness and speed in cooking and defrosting, it has gained great popularity. Manufacturers have met all government safety and health requirements, but scientists have no definite data on possible radiation damage from prolonged use.’] The energy used is the same as that which carries t[v] from the transmitter to the receiver but is at a higher frequency. The waves disturb the molecules or particles of food and agitate them, thus causing friction which has the effect of cooking the whole of the food, whereas in the conventional method of cooking, heat penetrates the food only by conduction from the outside. Food being cooked by microwave needs no fat or water and is placed in a glass, earthenware, plastic or paper container before being put in the oven. Metal is not used as the microwaves are reflected by it... [One design of] cooker combines forced air convection and microwave, either of which can be used separately, but... are normally used simultaneously thereby giving the advantages of both systems: speed, colouration and texture of food. Traditional metal cooking pans may also be used without fear of damage to the cooker. *Induction cookers*... are solid top plates made of vitroceraic material which provide heat only when pans are put on them and... stop the heat immediately the pans are removed. A generator creates a two-way magnetic field at the level of the top. When a utensil with a magnetic base is placed on the top a current passes directly to the pan. This means that a far more efficient use is made of the energy than with conventional cooking equipment... Tests indicate more than 50% energy saving. If a pan of water is to be brought to the boil there is no delay in waiting for the top to heat up; the transmission of heat through the pan is immediate. When shallow frying, cold oil and the food can be put into the pan together without affecting the quality of the food as the speed of heat is so rapid... Since the ceramic top is not magnetic but merely a tray to stand the pots and pans on, it never heats up... [Apart from being safe and having a] faster cooking time... [i]nduction tops have a number of [other] advantages over ranges using conventional sources: ...flexib[ility], controllability... easy maintenance, hygienic... improved working environment (less heat in the kitchen). However, induction tops are expensive and special cooking utensils are required... Stainless steel, enamelled ware... and... iron... are suitable... Any non-magnetic material does not work and aluminium and copper are unsuitable... [unless they are] specially adapted copper pans... Copper equipment is expensive, but it is first-class for cooking... The disadvantages of copper are that it tarnishes easily and looks dirty... [Aluminium equipment is] also... expensive, but one advantage is that the pans do not tarnish... A disadvantage is that in the manufacture of aluminium, which is a soft metal, other metals are added to make pans stronger. As a result certain foods can become discoloured; [e.g.], care should be taken when making white sauces and... soups. A wooden spoon should be used for mixing; then there should be no discolouration. The use of metal whisks or spoons must be avoided. Water boiled in aluminium pans is unsuitable for tea-making as it gives the tea an unpleasant colour... An ever-increasing variety of kitchen utensils... are available... [in a n]on-stick metal... [U]se plastic or wooden spatulas or spoons when using non-stick pans so that contact is not made to the surface with metal... [E]xtra care is needed when cleaning non-stick surfaces... *Wooden cutting boards* are an important item of kitchen equipment which should be kept in use on all table surfaces to protect the table and the edges of cutting knives... Heavy chopping should not occur on boards as this causes splintering... Wooden cutting boards will warp... and... are porous... therefore retain taste, smell, bacteria, grease and dirt... They expand and contract when washed and allow small particles of food to become trapped... The cut and scoured surface also allows food particles and bacteria to become embedded... Cutting boards are also made of hard rubber and rubber compounds... These are hygienic because they are solid, in one piece and should not warp, crack or absorb flavours. They are cleaned by scrubbing with hot water and then drying... Dishwashing machines take over an arduous job... For hygienic washing up the generally recognised requirements are a good supply of hot water at a temperature of 60°C for general cleansing followed by a sterilising rinse at a temperature of 82°C for at least one minute. Alternatively low-temperature equipment is available which sterilises by means of a chemical, sodium hypochlorite (bleach).

Dishwashing machines are needed by hospital catering kitchens but not in households containing able-bodied tenants. Even though it is more hygienic to wash dishes by machine than by hand, washing by hand isn’t unhygienic if performed properly; and even when a house has a dishwashing machine, it still needs to have other dishwashing equipment (e.g., a sink, brushes, pot-scourers, sponge-cloths, towels, cleansing liquid), because some dishes still have to be pre-washed to remove the worst dirt, and other dishes can’t be cleaned properly by a machine at all – so dishwashing machines merely duplicate the work performed by equipment that a household can’t do without (whereas they can do without a dishwashing machine). For a similar reason, the Manufacturing Ministry shouldn’t be able to justify producing both a microwave oven and conventional oven for each household – unless they are a combined unit. Every kitchen needs a hob, and because hot water can be boiled in a pot on the hob, the Manufacturing Ministry can cease to produce electric jugs.

Vacuum-cleaners can be classified as an unessential household item because, as long as a house has a mop and bucket, broom and dustpan, vacuums are only needed to clean carpets – but carpet can also be classified as an unessential item. If a householder doesn’t like walking on a bare floor (be it wooden or plastic), it can wear socks or slippers (or shoes); if a parent doesn’t want its baby to crawl on a bare floor, it can lay down a blanket (or rug).

Blinds should be preferred to cover windows because they are more versatile and easier to clean than curtains – and, although curtains have better thermal properties, windows can be double-glazed. It shouldn’t be necessary to tint-windows (either with a permanent tint, or a film that darkens as sunlight intensifies) because, although sunlight can fade the colour of interior fabrics, that isn’t a huge problem (and the few fabrics existing in future housing – those covering the lounge suite and beds – can be pale-coloured to start with). However, it may be possible to produce double-glazed windows which enable residents to change the amount of light coming through from 100% to 0%, removing the need for blinds or curtains.

If *house roofs slope*, the higher side could be that which most often faces the Sun, and have vertically longer windows to take advantage of the wall’s height (in which case, to assist with privacy, the bottom of the windows could be about chest-high on an average-sized adult). Vertically long windows should mean that skylights aren’t necessary on the higher side of the house (however, the windows could extend across part or all of the roof – including, perhaps, an emergency exit onto the roof), and maximisation of natural light isn’t normally an issue for bedrooms.

Beds should all have mattresses (that aren’t water-filled) – which are covered in a waterproof fabric (or a plastic bag) to protect them from moisture and dirt – but householders could be given a choice between having blankets or a duvet as their upper bed-cover (which, like sheets, don’t need to be dyed).

Even in a house which has more than one young child (except, perhaps, houses that have more than three youngsters), it shouldn’t be necessary to do a load of washing (clothes and bedding) everyday. Therefore, rather than supply every house with a clothes-washing machine, groups of houses can share a launderette (as could apartment blocks) – which has both automatic clothes-washing machines (preferably, they would only use cold water – or at least a set warm temperature) and dryers (although each house ought to have its own clothes-line, which means dryers will only need to be used on wet days). Each house would, however, need to have a clothes-basket that is fitted with wheels – to make transporting laundry easier (although a householder may wash by hand in a sink or the bathtub if it prefers). If problems are caused because everyone always wants to use a launderette (or laundromat) at the same time, a rostered booking system might have to be adopted – which won’t be too hard to organise (especially since the launderettes can stay open at all hours). The Manufacturing Ministry would be responsible for cleaning and maintaining these launderettes (including restocking washing detergents – but not fabric softener, and any other product that is unnecessary or unhealthy for the machines) – and will also have to be responsible for maintaining household equipment (if an oven, for example, is faulty and can’t be repaired on the spot, it should immediately be swapped for a working oven – which

would remain in the house even after the original oven has been repaired). These launderettes might not be of much help to houses containing babies, but those houses could temporarily be provided with a clothes-washing machine (and maybe even a clothes-dryer) – or, as an alternative, a nappy-cleaning service (i.e., someone visits the house daily, or every second day, supplies clean nappies and collects soiled nappies, which are taken to be cleaned in bulk). Unless they are biodegradable, the Manufacturing Ministry would cease to produce disposable nappies. In addition to extra clothes-washing machines (and dryers), the ministry could store products such as prams (or push-chairs) and cribs, to be lent out whenever a couple has a baby – then be returned when the product is no longer required, or has to be swapped for a larger size.

Clothes-lines can be totally or semi-removable (i.e., the lines could be pulled in and out from a box attached to an exterior wall and hook up to a fence or post; the lines could open out like an umbrella from a post which can be put into, and removed from, a hole in the ground). Access to the clothesline at the back end of the house should be via the lounge (through french or sliding glass-doors). Cavity sliders can be used for internal doors – or at least wherever it is awkward to have a hinged door – but they don't need to be automatic. Likewise, houses can do without many other forms of automation (e.g., automatic blinds, lighting systems) – and residents can also cope without having robots to clean, cook, and answer the front-door, etc. (unless they are disabled, in which case another human ought to be employed as their home-help).

While money is still being utilised, householders would need to continue purchasing household cleaning products (containers can include a deposit to encourage their return to the Manufacturing Ministry), but eventually such products (and things like light-bulbs) should be delivered to each household on, for example, a monthly basis – each house could receive a sufficient supply of the range of household products to last until the next month; householders could order their monthly delivery before the delivery date; or households could leave empty containers and used material products (e.g., old spongecloths, brushes, light-bulbs) outside their house prior to delivery day so that the delivery person is able to see what items each household needs. The first of those three household delivery options would seem to be the easiest to organise (householders would have to ration their use of products until the end of the delivery period; or householders could go to the nearest Manufacturing Ministry warehouse if they run out of a product between deliveries). Alternatively, instead of having the Manufacturing Ministry deliver to households, householders visit their nearest warehouse whenever it suits them, swapping empty containers or used products for full containers, etc. If the process of supplying such products was linked to a computer programme, the ministry would be able to keep a tab on the amount of product that each household is using – so households which are consuming more than average can be warned that they must reduce their consumption or risk being refused extra supplies the next time they run out of something.

Householders ought to clean empty containers (and recyclables) before returning them – but some reusable containers would also have to be sterilised before being refilled. If containers were all identical, the process of reusing them would be simplified. However, if different sized, shaped or coloured containers were matched to specific contents, users would be able to easily identify the products they want (therefore containers might not need to be labelled – although information on their contents could be embossed into the containers); while it should be possible to mechanically sort returned containers into each size, shape or colour at a central collection and sterilisation facility (Auckland City Council's recyclable waste is separated into plastics, paper, metals, etc., by 'Visy's' large robotic sorter), before each type of container is returned to the factory which produced its original contents.

Many of the household cleaning products currently produced are unnecessary. One liquid suitable for washing dishes and general cleaning, another for extra-hard cleaning jobs (e.g., oven cleaning; polishing – though future housing is unlikely to have anything that needs to be polished) in unison with a scouring cloth, and one for sanitising (or disinfecting) floors and toilets, ought to be sufficient – although the latter two cleaners might be covered by one 'All-Purpose Cleaner'. As for toilets, it isn't necessary to produce bleached, coloured, embossed or non-absorbent toilet-paper (note that if toilets were like some used in Japan – i.e., with water jets, as opposed to having a separate bidet – the requirement for toilet paper might be reduced)! Toilet-paper can be used for handkerchiefs. Paper towels (e.g., for use in kitchens) are unessential – producing reusable cloth towels or sponges is more efficient (though less hygienic if not cleaned properly) than producing paper towels.

In addition to having regular dental checkups and consuming a proper diet, people will need to be provided with tooth-care products such as dental-floss, toothpaste and toothbrushes (but electronic toothbrushes are an unnecessary use of resources – r:p2191, lns12-3; furthermore, because normally only the bristles need replacing, toothbrushes ought to have replaceable heads – at least one brand already does this – with each handle, perhaps, lasting for the lifetime of its user). Proper dental care and a proper diet should help to prevent bad-breath – but mouthwashes could be provided to anyone who needs them.

If a *general cleaning* liquid is mild enough, it could also be suitable for cleaning humans – thereby eliminating the need to also provide soaps specifically for washing hands, etc. (preferably, such a cleansing liquid should be hypo-allergenic – if not, the Manufacturing Ministry would still have to produce hypo-allergenic cleansers to supply, possibly via the Health Ministry, people with overly sensitive skin) – including the hair of people who have something against just using water (if someone needs a special shampoo – e.g., to treat severe dandruff – it should be supplied via the Health Ministry). There is no justification for producing hair dyes, sprays and accessories (e.g., bands, clips and, perhaps, ties – string, old shoe-laces or the hair itself can perform that task), or even hair dryers – people who don't like to dry their hair by more natural means should shave it short or completely off (although they would be removing their head's natural protection from sunlight and cold). Furthermore, if the Manufacturing Ministry provides each household with a suitable pair of scissors, there wouldn't need to be any hairdressers (people should also shave their hair if they don't trust themselves or an acquaintance to cut it).

Each household could be given an option between having an electric shaver or a hand-held razor and shaving cream (if the equipment is properly cleaned after each use, sharing such equipment shouldn't lead to health problems). Gals shouldn't feel like they need to shave their legs, etc., but if a gal has a genetic condition which causes it to grow embarrassing facial hair, the hairs could be removed by a more permanent process when it has a health check-up. By the way, gals could receive a supply of sanitary products (and have the choice of tampons, pads, or a mix of both) when having their health check-ups.

Deodorants are another product that ought to only be supplied via the Health Ministry to people with special problems (and they should only neutralise the offending smell, not add a new one) – but, in many cases, an altered diet might be a simpler solution; or always carrying a flannel in order to wash after performing strenuous activities. Perfumes (excluding, perhaps, toilet air-fresheners), make-up and jewellery (if all of the jewellery currently in existence was melted down, the Manufacturing Ministry would be able to cease mining for gold, silver, etc., *for a long time* – if not forever) are some of the other products that a truly intelligent society wouldn't devote labour, material resources and energy to producing. The same goes for ornaments and other purely decorative products – including Christmas decorations (society doesn't have to force people to stop celebrating Christmas – just stop producing related items; and telling lies to children!) – plus mindless celebratory products (e.g., fireworks).

The practice of giving presents to children mostly serves the purpose of conditioning them into having personal belongings, and becoming present-buyers (i.e., consumers) themselves. If parents want to honour a child's birthday, they can arrange to have friends and family visit – but the visitors should only bring a plate of food. If adults want to give something to children, or other adults that they care about, they should give their love – or at least their attention.

...my [partner does]n't give me presents I know that... [my partner] only... has to give me love... - The Beatles

The Manufacturing Ministry would be responsible for ensuring that each person has the things that it NEEDS, and people shouldn't want to give others things that they don't need (note that in a moneyless society, people definitely won't need purses or wallets). Something that people need – and is often gifted to others on their birthday – is clothing. Each citizen would have to receive a supply of clothing at least once a year, and an easy way for the Manufacturing Ministry to spread out the distribution of clothing is to match delivery dates to birth dates. Each suburb could have a warehouse where

people go on their birthday, or shortly before, to be measured for their annual clothing supply. Each person might, for example, be allowed a new pair of trousers and a jersey, a couple of tee-shirts, underpants and pairs of socks each year (ideally, all made from plant-based fabrics; note that 'everyone in the US has Teflon particles in their bloodstream – causing "teflon flu" – from clothing, cookware' and other products). A range of basic, practical, sensible (e.g., no ties) and mostly unisex patterns (which might vary depending on the climate of each district – some districts may need to provide both thermal and standard underwear – or the preference of each district's inhabitants) could be offered in each item, in a selection of colours (using natural dyes – e.g., 'if boiled, the campeachy tree's wood produces red colouring matter on contact with acids, violet on contact with alkali') – but no future clothing should need to be ironed (so the Manufacturing Ministry won't need to produce irons or ironing boards). Although each person ought to just settle for whatever is immediately available in its size, if a person's choices of pattern and colour aren't immediately available, the relevant items could be sourced from another suburb or be made up by the clothing factory – the person would either return to the warehouse when notified that its supply of clothes is ready, or the clothing could be delivered to the person's home. Instead of having designer labels, clothing can be tagged with their user's name for easy identification.

The amount of each clothing product that people are allowed annually would depend on what the product's average life expectancy is (i.e., if the average life of a pair of socks is four months, each person will get three pairs annually). However, amounts could also be related to what each person already has. If the Manufacturing Ministry decides that each person should, at any one time, possess no more than, for example, eight tee-shirts, underpants and pairs of socks (thus allowing people to wear a clean pair each day of each week), three trousers and jerseys (one to wear, one spare and one in the wash), each adult ought to effectively start out with the maximum amount, and only receive more the next year if any products have become unwearable due to overuse or damage (an exception to the rule will be when someone becomes pregnant – i.e., mothers-to-be may need to receive a range of suitable maternity clothing, which can be swapped for larger sizes as their girth increases or have adjustable girths). The set amount of clothing could be managed voluntarily; or each person might be required to produce worn-out or damaged products (the Manufacturing Ministry can provide a repair service for minor damage – which means it doesn't need to provide clothes-mending products to each household) in order to receive replacements. Some products (those which the Manufacturing Ministry decides each person only needs to have one of at any time) may just need to be supplied once a decade or human lifetime – a light, hooded raincoat; a heavy winter coat; a sunhat and sunglasses (suntan lotion could be provided as a household product, along with products such as mosquito repellents – if a district deems such products necessary); an umbrella; swimsuit; a pair of sturdy, all-weather boots (replacements for all of the products can be provided when they become unwearable and have been returned to a local warehouse). People would also need a pair of light shoes (e.g., made out of canvas and PVC), but they might not last more than a year – in which case they should be provided annually (and people may need to have at least two pairs at any one time). Pointy-toed shoes, stilettos and other absurd, or dangerous, designs of foot apparel shouldn't be manufactured (slippers also aren't necessary – people ought to wear socks or go bare foot when indoors). The Manufacturing Ministry might also produce wind-up watches to be supplied on request (note that it ought to be possible for watches to be passed from generation to generation) – but, as long as each house has an alarm-clock, and clocks are located strategically around workplaces and in public spaces, individuals shouldn't need to have a personal watch (the only requirement may be for people who work outdoors – in which case, a watch can be supplied by the relevant ministry as part of the workers' equipment). Incidentally, each workplace needs a first-aid kit – either each workplace would make one person responsible for checking that a kit is fully stocked (such a worker should be a trained first-aid, or the senior first-aid on duty); or the Manufacturing Ministry – or the Health Ministry – could employ people to visit workplaces to restock their kits (note that each household also needs a first-aid kit, which householders could gain supplies for – including, perhaps, 'spray bandage' – either via Manufacturing Ministry deliveries or from the Health Ministry during annual health checks).

If someone needs to have specialised clothing because of their work, or their work makes their clothes particularly dirty, the relevant ministry would have to order such clothes from the Manufacturing Ministry – and be responsible for cleaning them. Children's clothing would also need special consideration, because children can grow out of clothing before the clothing becomes worn-out. An option is that a child could be fitted with slightly bigger than expected clothing, then swap all of its clothing at the time when they are too small. Because this means that clothing which is still wearable will be returned to the Manufacturing Ministry, children would have to receive a mixture of new and used clothes (although they needn't be given used underwear and socks). Whatever clothing children receive, it should be sufficient for them to wear to school (they would also need to be supplied with a school bag, lunch box and drink container – but these things ought to last a lifetime, which means adults shouldn't need to be re-supplied with such products when starting work).

Products currently sitting in shops and warehouses that have traditionally been sold to both businesses and the general public, but which have been classified as essential to the operations of a particular ministry (including the Manufacturing Ministry), can be forwarded to the relevant ministry (e.g., the Housing Ministry ought to receive all of the decorating materials in existence – which should help to reduce, if not completely eliminate, acts of mindless graffiti) – or be shared if more than one ministry uses them – to be distributed within each ministry (be it within a district or between districts), or stored until required (products used periodically by various ministries could be stored by the Manufacturing Ministry and be loaned out). Of the remaining products, some will be useful to householders who own equipment which has been classified as non-essential, and therefore is no longer being made. Such products can be shifted within districts so that the same things are all stored in one warehouse (because they are no longer being used for their original purposes, shops – and department stores in particular – can be designated as warehouse space; note that if shopping plazas aren't required for warehousing, they would need to eventually be converted for use by a ministry or as recreational facilities – or, if they can't be utilised, be demolished so the space can be rebuilt on and used productively) – or a number of adjacent warehouses (depending on the volume to be stored and the size of each warehouse) – and householders could find out where whatever they want is being held, then go there to purchase it. Products which haven't been sold out by the time money ceases to be used by a district could then be divided evenly between the people who have been purchasing them (in one go if the remaining volume is low enough; or else at regular intervals until all the stock is gone). All remaining products – those which can be classified as being USELESS – ought to be divided into things which have been made from recyclable materials (then be recycled, or be stored until being recycled) and things which can't be reused or recycled in any way (which should be stored until a means of reusing or recycling them has been devised – although any householders who want to use some of these products could be allowed to go and collect whatever they want).

The amount of rubbish that each household produces would gradually decrease until they have nothing to dispose of except for the food scraps and containers (and biodegradable food packaging) collected by the Food Ministry, and the empty containers or used household products which are collected by the Manufacturing Ministry (i.e., there would be no need to regularly send trucks around every residential street to collect rubbish bags or to empty rubbish bins, and occasionally collect inorganic waste). Until this eventuates, the Manufacturing Ministry could situate groups of bins (one each for plastics, metals, glass, etc.) in strategic places around each suburb so that householders can be responsible for sorting (after being cleaned) their waste and depositing it into the relevant bin – rather than have the Manufacturing Ministry be responsible for trying to sort waste after it has been collected from households. Collecting rubbish by this means would take a lot less time (instead of emptying them weekly, it might be possible to empty them every few days, or daily – depending on how common the bins are, and how large they are, it might only take a day to fill some of them). The Manufacturing Ministry should also start, or continue, to dig up landfills and deal with their contents (and the contents of uncovered rubbish dumps) in an environmentally-safe manner – i.e., recycling as much as possible, then incinerating (assuming gaseous by-products are filtered so any atmospheric emissions are non-toxic) the remainder to produce energy and ash (assuming it contains no toxins; toxic ash that can't be converted into a harmless product may have to be safely reburied) to be used elsewhere. Obviously, landfills which have been built over (e.g., Auckland's Western Springs College is built on a landfill) should only be dug up when the buildings above them are due to be replaced, or if the landfill is collapsing or causing health problems through leaching of liquids or gases.

ENERGY

In the decade from 1965 to 1975, U.S. energy usage rose an average of about 4.5[%] per year; at this rate energy usage doubles every 16 years. Now suppose that during the decade 1975-85 energy conservation measures save enough wasted energy... [- by, for example, providing better insulation and more efficient heating and cooling systems in residences and office buildings[; increasing] efficiency in household appliances[; changing]... freight-hauling... and... [other] transportation patterns (e.g., increased use of car pools, mass transit)[; improving the]... gas mileage of automobile engines... [and the] efficiency of industrial processes... - ...so that the demand in 1985 is only 75[%] of what was projected for that year. That 25[%] saving would stretch out the doubling time to 23 years. But the critical point is that the demand would still double. And double again. So energy conservation in the conventional sense of the term only buys time; it does not avoid the fundamental problem of endlessly rising demand... Of course, it is possible to reduce the growth rate of energy demand - to make it zero or even negative. Such a reduction of the energy growth rate has been seriously proposed (e.g., by the Ford Foundation Energy Policy Project in 1974)... Consider the possibility of restructuring various sectors of society to be more frugal in their use of energy. (The word frugal is used here to connote not austerity but using resources sparingly and wisely.) Here are some of the kinds of measures that could lead toward an energy-frugal society: 1. Reduce agriculture's dependence on fossil fuel derivatives... place... farming... closer to consumers; reduce processing and energy-wasteful packaging of food. 2. Reduce industrial consumption of energy by producing more durable, repairable goods (eliminating planned obsolescence), by designing for materials recycling, by altering production processes so that waste heat and materials from one process becomes inputs to another; change the product mix of the economy to include less energy-consumptive materials and services; ...produce goods closer to raw materials sources and to users... 3. Reduce personal energy requirements by... reduc[ing] transportation needs from residence to place of work, by increasing dependence on communication instead of transportation... by curbing consumption of energy-intensive goods and services, and by stimulating community-based recreation instead of long-distance travel. 4. Redesign communities to be more self-sufficient and better suited to the environment and ecology, while using sophisticated technology to support highly civilized living conditions, not primitive privation... A glance at this list emphasizes the drastic changes in consumption habits, industrial structure, social institutions, personal values, and national goals that are implied by real energy frugality. These steps are very different from the earlier list of "energy-saving" or "conservation" measures, which assume that essentially the same goods and services are to be provided as exist today and the same appetites catered to, with only the elimination of unnecessary energy expenditures. - 1976

...a growth in efficiency should not be too difficult to achieve. The use of abundant resources has made us very wasteful: there is, in a sense, plenty of slack in the system that could be taken up. We can see this by looking at some of the things we have come to accept as everyday, without questioning their efficiency. A homely example is the electric light bulb. Of the power that goes into it... 5% is manifested in the form of light; the remaining 95% is wasted in the form of heat. When heating is anyway required, this is not so important - other than that electricity is a wasteful way of heating; at other times it is pure waste and, even, additional electricity may be required for cooling if the heat has to be extracted after it is produced. Fluorescent lamps, on the other hand, can be 30% efficient, and it should be possible to achieve perhaps 50% without stretching the technology too much. Thus a tenfold increase might be possible if we really put our minds to it. Similarly, if we examine the system serving the electric lamp, we find a loss of 5% or over in the transmission system, and 60-70% conversion loss at the power station, which makes approximately twice as much waste heat as it does electricity. To this one must add the loss entailed in getting fuel to the power station, plus the capital cost in terms of the steel, concrete and copper used in the station and its grid system. We find that our home lighting is, at best, somewhat under 1% efficient. Let us take another example, in case electricity is a special instance: the family automobile will do, as it is a common object on which a lot of design work has been lavished over the past few decades. To start with, of course, the engine is only 20-25% efficient, even if in peak tune. This is only part of the story, however: the average car weighs about ten times as much as its occupant, so only 10% of the energy used moves the occupant... Add to this the fact that under modern traffic conditions much of the energy is wasted in braking: compounding it with the fact that road distances are quite a bit more than straight-line distances; make allowance for the fact that many journeys are made necessary by an unrealistic separation between work and living areas; and one comes out with a figure of about 0.5% efficiency for the automobile. Home heating is another area we could examine. Here the efficiency is really zero, for all the heat put into homes leaks out again within a few hours. Thus home insulation can be a very effective investment in efficiency... [In the past, some people] have dreamed of being immortal, or at least of living for a very long time: now we know that ageing is a process that is perhaps retardable, and in the past few centuries we have doubled the [average length of human lives. Some people] have also dreamed of 'perpetual motion', or the creation of energy... ['Once started, a *perpetual motion machine* should run forever without any additional energy being supplied to it from an outside source. This *ideal* - but only theoretically possible - machine could supply energy to run other pieces of equipment. The planets and natural satellites, such as the moon, seem to travel about their central bodies perpetually, for they move in the near-vacuum of space and undergo little or no friction. The main friction-like forces on satellites are those made by space debris - which might sometime end the perpetual motion of these bodies. One of the many proposed perpetual motion machines uses a wheel with mallets attached to its outside that fall out as they head downwards and fall in as they head upwards. Another has three springs - one of which is supported by two upright rods, the other two have metal spheres at their lower ends. This system is started by introducing energy into sphere A; that is, it is set to vibrating up and down. Eventually sphere B will vibrate and A will come to rest. This process will repeat itself for quite some time. Then why will it fail in perpetual motion? There will always be some air friction; and even in a vacuum, there will also be the internal friction and heat loss of the molecules in the springs themselves. In short, friction and heat loss are the two ever-present conquerors of perfect use of energy and thus of perpetual motion.' However,] **presumably at one time energy was created, and if our science develops far enough to understand the process, it may well be possible to duplicate it...** [Presently, t]here are three thermodynamic laws, which state that (a) energy can neither be created nor destroyed, (b) there is a continual running down of the system from high concentrations of energy to a more average distribution, this process being irreversible, and (c) entropy - that is, a state of disorder - decreases at very low temperatures. The laws are empirical; that is, they are derived from observation and there is perhaps no good theoretical base for them... [But] so far nobody has been able to contravene them... [T]he Earth continuously receives a large amount of energy from the Sun. This causes the natural cycling of water from the atmosphere to the seas and back again, and also the planetary wind systems. Together, these agencies have been responsible for the less than random arrangement of different elements in the crust. Added to this there has been the effort of living things in concentrating material by way of carbonates, coal and oil deposits and oxygen. Thus, although it is true to say that there is a trend to entropy in the sense that the total system is running down, the flow is not linear but turbulent. In rather the same way that some of the water in a fast-flowing and eddying stream will be going the 'wrong' way, some of the processes operating do not tend to entropy but result in

accumulations of energy and less than randomly distributed materials. The power to effect this comes from the total system, so there is no overall gain, and the laws are conserved. The same kind of effect is observable in a refrigerator: it uses power and on balance it does more warming up than cooling down if one measures both the amount of heat removed from the cabinet and that rejected at the back. In the thermodynamic model of the world we can distinguish between the main flow and the eddies in a similar manner, and again we find that always the amount of energy used up in making some kind of differential is greater than that which can be released by running that differential down. The interesting thing about this is that, whereas all natural cycles are powered by the main flow, or are at least so close to it that time out of flow is insignificant, most of our industrial processes are powered by releasing power in the eddies. Thus food production is powered by the Sun *via* green plants, the food is eaten and the energy run to waste in, on average, less than a year. The fuel used to power industry has been in circulation for several million years, however, and the same applies for most materials used by industry as well. This is the main problem facing our civilisation at the present time, for we are running down these accretions of energy and material at a far faster rate than they are accumulating. We have, in a sense, become parasitic on the mineral resources of the planet, and these have a far shorter expected lifetime than [hu]mankind's, or at least shorter than [hu]mankind's need be if we can find some other way of doing things. There are three options open: we must get back much closer to the mainstream of energy flow from the Sun, which is, after all, very much greater than our present needs even if we consider only the minuscule fraction that falls on our planet[('a widely quoted figure is that the solar energy falling on 20 million sq. kms of desert is 400 times present world energy production'; another source says that the amount of solar energy 'reaching the earth after due account has been taken of surface averaging and atmospheric losses is 170W/m²')] or we must try to duplicate the reactions of the Sun here, or at least get some kind of atomic reaction using a fuel that is neither scarce nor productive of dangerous wastes; or, finally, we must find some way of circumventing the laws of thermodynamics. Surprisingly, all three may be possible. The total energy input from the Sun is vast and from our point of view inexhaustible. Given the technology we could use this until our civilisation died of old age, or until we ceased to exist in our present form. Direct solar radiation could be augmented by use of wind or wave power, as these are in effect concentrations of solar energy. Tidal energy could be used up to a point, although here we would be using gravitational energy, mainly from the Earth-Moon couple. At present the technology does not exist for these sources in any developed form, and when it does it is likely to cover large areas of ground (unless we get it up into space). However, the possibility is there and the main outlines of the technology are already known. Thermonuclear energy from hydrogen fusion – duplicating the reactions of the Sun – is the present main hope. So far progress has been disappointingly slow. This is not because the reaction cannot be initiated; it already has, in hydrogen bombs. The problem is that it cannot be scaled down to a useful size. There is at present no known way of getting energy out of a small enough reacting mass to be contained in a power station. Laser technology may point the way here as this can give the intense heat needed to fuse atoms of deuterium or tritium. In a sense we have to do a good deal better than the Sun regarding the rate of energy release from a given mass. A roomful of Sun would give less heat than a candle at a steady rate of output: the Sun is hot only because it is so big and every square kilometre of surface is the only outlet for over one hundred and fifty thousand cubic kilometres of reacting gas. Should it be possible to build a device which uses hydrogen from seawater as its fuel, then our energy problems are solved... The third possibility... is perhaps the most interesting. Firstly there is no such thing as an unbreakable scientific law. By their very nature scientific propositions cannot be proved in the absolute sense, they can only be disproved or not disproved, as the case may be. Usually they last for a while and are then overthrown or, more commonly, absorbed in a more embracing theory. The laws, furthermore... describe what is observed to happen and say nothing of what might be made to happen with the use of a little [bit of] wit and imagination. Many of [humanity]'s artefacts are in fact new: for example, it is highly probable that a uranium fusion reaction moderated by graphite has never existed in the Universe before. If we examine our thermodynamic laws we will find that they are in fact self-contradictory. Either we must accept that energy (and that means matter, too) cannot be created or destroyed, or we can accept the fact that the Universe is in the process of running down from some state, which by reverse extrapolation must have been more 'wound up' than it is now. Ultimately our extrapolation must bring us to the creation of the Universe, which breaks the first law. If we postulate some cyclic Universe, which periodically runs down and then winds up again, we break the second law. It is a pretty safe bet that matter was at one time created – and could still be being created someplace in the Universe today, for all we know. We can be fairly certain that it is being destroyed in some fashion in black holes, or, if not destroyed, then at least dropped through into another dimension rather as a stone may be dropped through the surface of water. The true function of a black hole may, in fact, be not much different from the hole in one's kitchen sink: all we have to do now is to find the tap and we have in effect an open system once more. Thus, the next stage after fusion power might well be the *creation* of power. Similarly one could hazard a guess and say that all processes are reversible if only one knew how. There is some evidence that a gravitational field could be used to effect a selection between 'hot' and 'cold' atoms of a gas, thus performing the function of 'Maxwell's Demons' postulated over a hundred years ago to 'wind-up' a run-down thermodynamic system so that it could provide an energy gradient once again... Ideas about methane are not new. Dalton did experiments on the gas in the early part of the last century, and cow-dung gasworks are in operation in India.

...In factories, there are vast opportunities for increased use of heat exchangers or recuperators to recapture waste heat from boiler smokestacks, hot metal castings or ingots, slag heaps or incinerators. Local on-site electric power generation is economic in many locations because of the possibilities for utilizing both the heat and the electric power. Much of this low-grade waste heat could be put into economic use in winter; [e.g.], in adjacent greenhouses... Organic wastes such as sewage or animal manure that [c]ould... be recycled... damage a stream or lake if the quantity being dumped is excessive. Organic material normally decays by an oxidation process via the agency of aerobic (air breathing) microorganisms. This uses up the oxygen in the stream. If the amount of waste is too great, all the oxygen dissolved in the water will be exhausted, thus killing the aerobic bacteria and all fish or other air-breathing animals. At this point the waste begins to accumulate on the bottom of the stream or lake where it continues to decay slowly, with the help of anaerobic bacteria. The decay products consist mainly of carbon, tars, and hydrocarbons, such as methane. If left long enough, the result is peat or, ultimately, coal, petroleum, or natural gas... Taking into account our existing knowledge of reserves, rates of discovery and rates of substitution, it is almost certain that one can rule out the possibility of a critical shortage of any mineral resource prior to 2025, with the exceptions... [of] natural gas, petroleum, and (unless a viable breeder system is developed) uranium. All are used for the production of energy – the latter being a partial substitute for fossil fuels... [W]astes can also result in contamination of, or damage to, the land surface or the coastal waters. However, nothing now known would touch the devastation of a major nuclear reactor melt-down... This fortunately has not yet happened, but even the slight possibility causes many people to worry about the plutonium breeder concept. Conceivably, tens of thousands of square miles of land and water would be contaminated by highly radioactive and toxic materials, including plutonium. Any region thus contaminated would have to be totally evacuated and quarantined, lest the dangerous materials be spread even further by wind, flood, or wandering animals. If the ocean itself were contaminated by radioactive wastes, the consequences would be permanent. There would be no conceivable method of restoring it to purity... A major commitment to nuclear power now means that our descendants for many generations will have to live with a legacy of hazards that are truly frightening, at least in terms of their potential. One of these is the need for permanent storage of the dangerous waste products, many of which have an effective half-life of thousands of years.['The US Department of Energy assured the public in recent hearings that it is only "the first thousand years of the disposal period that are critical". This year – the year that a publication entitled *Nuclear Disaster in the Urals* described an official government cover-up of the disastrous explosion of nuclear wastes at Kyshtym, in the USSR, in 1957, where thousands were killed and injured and an entire region was destroyed – the 72 licensed reactors in the US will produce between 8,000 and 14,000 cubic feet of wastes'.] Most scientists now agree that, because of geological and seismological changes in the Earth's crust, there is no such thing as a

permanently safe method of disposal by burial or dumping in the oceans. According to [one] biologist-writer... it would require a kind of “nuclear priesthood” to watch over permanently and prevent the escape of these wastes. Such a priesthood is not *ipso facto* out of the question, but it is no light commitment to impose on our descendants. A[safer source of energy is the Sun]... Solar collectors on the surface of the Earth... [generally] encompass... photovoltaic solar cells which convert sunlight directly into electricity. After two decades of intensive development by Bell Laboratories and other research groups, the best existing solar cell utilizes ultrapure silicon crystals, grown in a vacuum[and formed into ‘slabs. The crystal has p-type and n-type semiconductor junctions near the surface. Sunlight falling on the silicon crystal surface displaces the electrons from the atoms. Since the junction tends to transport electrons across it in one direction only, an electric current will then flow. Under ideal conditions, nine square feet of silicon crystal in a solar cell will produce 100 watts of electric power. The present solar cells only use 10% of the solar energy striking their surface’ but solar cells have] a **theoretical maximum conversion efficiency of 18%**. [‘The history of solar engineering may conveniently be grouped into three periods. There was the pre-20th century phase, which one can think of as “the age of the great inventors.” Archimedes is reputed to have used mirrors to burn enemy ships attacking Syracuse, and Leonardo began work on a 4-mile-wide mirror for peaceful uses of solar energy. Many ingenious one-of-a-kind devices were built in the 19th century. A solar steam engine, for example, was presented to Napoleon III and its inventor, Augustin Mouchot, demonstrated a giant, multipurpose solar machine at the Paris Exposition Universelle of 1878. But it soon became clear that coal was a far more convenient form of energy. By the time the 20th century dawned, what one may call the “age of pragmatism” had clearly set in. The most ambitious solar engineering project on record appears to have been a 55 hp water pump, built at Meadi in Egypt and powered by 1230m³ of parabolic trough-shaped solar concentrators. This system was supposed to pay for itself in four years but, owing to the outbreak of WW1, it fell into disuse after operating for barely a year. From then on, solar energy usage was confined to domestic hot-water production in those places where it was found to be economically viable. Renewed interest in solar energy was generated suddenly in 1974. Owing to the Arab oil crisis, crash programs were introduced all over the First World in order to reduce oil consumption, and one product of these programs was the commencement of a systematic study of all potential methods for utilizing solar energy. The “age of solar engineering” as a recognized discipline in its own right, had begun’]... **There are, of course, a vast number of [energy] devices based on... electromagnetic[s]... Electric motors and generators are both based on the fundamental discoveries of Michael Faraday (1791-1867) that if a conductor such as a wire moves “through” a magnetic field (or, equivalently, if a magnet is physically moved past a conducting element) an electric current will be excited in the conductor. Moreover, if a current is passed through a conducting wire or coil of wire, a magnetic field is produced. Interestingly enough, the magnetic field that is required by an electric generator [(which “does not “make” electricity – electricity is already present in all matter, and generators merely make the electrons move: although one must not think that electrons move smoothly through a wire, as water moves through a pipe; rather, the movement is a series of impacts, in which one electron moves into a nearby atom, pushing another out and displacing another from the next atom, and so on’)] can be produced internally by an electromagnet utilizing part of the electricity output of the generator itself. Thus electric conductors are the only basic elements actually needed to make a motor, generator or magnet. Until recently copper was almost exclusively used for all electric purposes. Silver and gold are as good or better in terms of intrinsic conductivity, but the two precious metals are much scarcer... [A]luminium is also a fairly good conductor... Since it is significantly cheaper, aluminium has recently begun to replace copper for a number of applications... However... [a]luminium wiring is a little less satisfactory than copper... because it tends to heat up more in case of an overload... Thus aluminium is not likely to replace all copper wire in the foreseeable future. But several new competitors for both aluminium and copper are coming on the scene. One rather surprising alternative is metallic sodium, which is an excellent conductor at room temperature but even better than copper for carrying large currents at ultra-low temperatures because of its unusually low intrinsic magneto-resistance. Of course, the metallic sodium must not be exposed directly to air or water (it reacts violently to moisture), but this can be accomplished by encasing a sodium conductor in a plastic sheath and then armoring the whole cable. Superconductors are another old scientific dream, that is gradually approaching realization and commercial viability. A superconductor is a material which when cooled to a low enough temperature loses *all* its electrical resistance. A superconducting loop can literally carry a current for an indefinite period with no dissipation. It has long been hoped that it may be possible to synthesize an organic superconductor that will operate at room temperature, but no significant progress in this direction has occurred for several years. To date, the best superconductors are alloys of metals: niobium, zirconium, vanadium, titanium, and various rare earths. All these become superconducting... in the range of 18-20°K, which is about -350F. To maintain this temperature requires the use of liquid helium as a refrigerant – nothing else will do – plus very high-quality vacuum insulation. Yet the savings for a major electric transmission line in energy not lost as heat can probably justify the cost of such an elaborate conductor. At this point, all that seems to remain in the way of practical application is the manufacturing capability and a customer. - 1979**

Electricity’s most sterling virtue is that it is totally clean for the user. It is extremely easy to control, and with the advance of the solid-state art it will become even easier. It is highly versatile, being convertible to heat with 100[%] efficiency and to or from mechanical energy with an efficiency of 70[%] for small motors today and close to 100[%] for large motors and generators. B[ut]... the efficiency even of small electric motors is likely to approach 100[%], partly as the result of developments in strong permanent magnets and partly because there is likely to be a substantial shift from alternating to direct current (DC)... In a power grid with many generators, it is far easier to switch individual sources on and off line with DC than with alternating current[(AC)], because there is no need with DC to match the phases of alternating voltages... Already some of the high-voltage transmission lines operate on DC, because such lines can carry more power with fewer losses... Electricity has just two disadvantages: it is difficult to store cheaply, and it can be transmitted easily only on high-voltage lines, above the ground and visible. Automotive lead-acid storage batteries are as cheap as mass production and the cost of materials will allow, yet their cost for storing an hour’s worth of energy coming off the power line is over two thousand times as much as the utility company charges for that energy. Multiple recharges can’t even come close to bringing that factor down below about three... It may just be possible to develop superstrong materials during the next century. We’ve known for years that carbon and certain metals could be very strong when they were in the form of tiny, ordered crystals. However, we’ve never been able to preserve the same order and the same strength in pieces of material larger than microscopic size. The strongest large-sized objects in use today are the cables of suspension bridges, and we don’t know how to make them much stronger now than we could fifty years ago. It is tantalizing that the ultimate theoretical limits of strength are about one hundred times greater. If we had such material, a wire no thicker than a needle could suspend the weight of an automobile. In practical applications, it could be used in the building of suspension bridges several miles in length... and perhaps less fortunately, taller skyscrapers. The most generally useful application of superstrong materials would probably be to the building of flywheels for storing energy. Such flywheels, spinning so fast that they would store more energy in their motion than we carry now in the form of gasoline, would power electric cars of high performance. Those cars would be totally nonpolluting and – unlike any electric car that’s now possible – would never require battery replacement... Ever since gasoline prices began their upward spiral we’ve all hoped that someone would invent a practical, high-performance electric car. Unfortunately, it just won’t be possible until something much better than a lead-acid battery is developed... There are newer types of battery under development, but they all use expensive materials like nickel or zinc, and they store only two or three times more energy than the old lead-acid type... They’ll be used mainly [in] commuter vehicles that can be plugged in for re-charging each night... [Alternatively, we could end up with] “changing stations” where batteries would be mechanically removed from cars and replaced by freshly charged units, but that seems an awkward solution to a problem... For the larger electric power grid there are other ways of storing energy, and that’s good, because electricity demand varies within each 24 hours. Typically, a power grid has to supply twice as many kilowatts in peak hours as

it does in the middle of the night. At present, peak fluctuations are handled by starting relatively inefficient diesel-electric generators and, where hydroelectric power is available, by opening the inlet water valves to turbogenerators that are already spinning at full speed with zero current output. Some experiments are being made with "pumped storage," the technique of pumping water up to a high-altitude reservoir during times of low electric power demand, then running the motor pumps in reverse as turbogenerators to put the energy back into the power grid when the demand peaks. That is a good, reliable, low-technology method of storing energy, but I doubt that it will find wide use... because of the inherent ugliness of reservoirs that fill and empty within a matter of hours... As a medium for transporting and storing energy, pure liquid hydrogen gets a top rating for effectiveness and near-zero environmental impact. It contains a great deal of energy per kilogram, and it burns with oxygen to give only... pure warm water... as a product. Burned in air, it does form ammoniacal compounds with nitrogen, but only in tiny amounts compared to the similar compounds that result from burning gasoline... To prevent hydrogen's boiling away as a vapor, it must be kept very cold – just a few degrees above absolute zero... The Boeing Corporation, after a detailed study, found that liquid hydrogen was the only fuel so light and so powerful that it could drive a supersonic airliner across the whole Pacific Ocean... and [also] found that the thick insulation needed around hydrogen fuel tanks could be accommodated in a wide-bodied jet, but not in any smaller supersonic plane. Hydrogen could easily fuel any slow aircraft. Before engineers and scientists had acquired experience with large quantities of liquid hydrogen, they were fearful of its explosive properties. [‘To longer memories, hydrogen recalls the flaming catastrophe of the airship *Hindenburg*. In pipelines, however, hydrogen presents no hazard not already managed in piping natural gas. A 200km pipeline in Germany has been moving 4000 billion cubic feet of hydrogen per year since the 1930s without mishap’ and, [after several years of working with it in laboratories and in rocketry, [engineers and scientists have] concluded that it's less dangerous than gasoline or jet fuel. In the crash of a hydrogen-fuelled aircraft, the hydrogen would tend to rise very quickly because of its light weight. Though it would certainly burn, the flames and heat would be high in the air. Ordinary jet fuel stays on the ground as a liquid, soaks the clothing of crash victims, and burns them... Liquid hydrogen could become the fuel for surface vehicles as well as for aircraft... The hydrogen would react with the oxygen of the air in a fuel cell to transform its energy into electricity. Fuel cells were engineered for the Apollo program of the 1960s, and their efficiency can reach 80[%]. The electricity put out by the fuel cell would drive electric motors at each wheel of the vehicle, and we would have the perfect combination of high performance, long range, quiet operation, and complete freedom from pollution. It will be some years before you can buy a tankful of liquid hydrogen at your neighborhood gas station, but there's an interim technology already in use on an experimental basis. In Stuttgart, Germany, city buses are being run on hydrogen fuel, with the hydrogen absorbed on fine metallic grains filling a pressure tank. In the event of a crash, the worst that can happen is that the powder spills out in the street, and releases its hydrogen too slowly for a serious fire to feed on it. Liquid hydrogen may well be the preferred medium for transporting and storing energy in [future], but liquefying it will always require complicated refrigeration machinery. There is likely to be at least as much demand for a synthetic fuel that can be stored and handled at ordinary temperatures as easily as gasoline. Two hydrogen molecules can be pacified by linking their four atoms to the four chemical bonds of carbon to make methane, the main constituent of natural gas. Methane can be liquefied and stored at moderate pressure at a temperature that can be maintained with equipment not much more complicated than a household refrigerator. These days it's shipped as "Liquid natural gas"... The same chemical game can be played further by adding pairs of hydrogen atoms along with single carbon atoms, to form ethane... propane... and butane... Propane and butane are even easier to store than methane, because they become liquids at moderate pressure at ordinary "room" temperature. Butane liquefies so easily that it can be found in cheap plastic cigarette lighters. Propane requires at least a thin steel shell to contain it, but it is so easily handled that it has been in routine use for many decades as "bottled gas." One can anchor hydrogen atoms to nitrogen as well as to carbon, and the result is ammonia... familiar to us in watered-down form as a household cleaning agent. Ammonia works fine in fuel cells, where its hydrogen reacts with atmospheric oxygen and its nitrogen escapes to mingle harmlessly with the air... but ammonia is less attractive as a fuel for vehicles because it has to carry along the dead weight of the nitrogen; as a result it has only about half the energy per kilogram that methane or gasoline contain, and only a fifth as much as there is in liquid hydrogen. Talking of energy content, don't be so gullible as to believe irresponsible statements that alcohol can easily be substituted for gasoline. Alcohol has so little energy per gallon that its price would have to be less than half that of gasoline before it would be a good buy at the pump... [‘Since it is far more practical to produce electric power in very large central generating stations than in many small local generating stations, a single station often produces electricity for a large area. This necessitates a method of distribution with minimum loss of power in the transmission process.’] It is likely that increased electric power transmission will occur through using thicker conductors on existing lines, and by "low-profile" towers hidden by trees in flat country. Lines under water could be economical, but not those underground, except for short-distance, low-power cable runs as in residential neighborhoods. By contrast, ammonia or synthetic hydrocarbons can be transported by pipeline, with almost no environmental impact, at a cost only a fifth to a third that of transmitting equal electric energy on overhead lines. My guess is that pipeline transportation of such liquid fuels will be the most practical, economical, acceptable method for sending energy over long distances in [future], but that electric lines will still carry a great deal of the total energy transmitted, because a large electric power grid can respond instantaneously to sudden heavy demands occurring anywhere within it... During [WW2] Germany developed a practical though expensive method for producing liquid fuels from coal. This and other methods of liquefying coal are being studied again, and within some decades it is probable that a good deal of fuel oil for use in central power stations will be obtained this way. As with coal gasification, about a third of the energy content of the coal gets dumped as waste heat, but sulfur, an undesirable pollutant, is removed safely as a solid. With further refinement and more loss of energy, it's possible to extract diesel oil and even an equivalent of gasoline from such fuel oils, and we may have to... There's so much more fossil energy in the ground in the form of coal than of oil that coal gasification and liquefaction will almost certainly be large-scale activities long after cheap, natural crude oil is just a distant memory. We'll probably shift during the next century from a fossil-dominated energy economy to a healthier reliance on long-term resources. In my guess, from 50... to 95[%] of the energy used on Earth in 2081 will be from such self-renewing or near-infinite resources. You've probably heard quite a lot about several of them: nuclear fission and fusion, breeder reactors, and perhaps ocean thermal power; you've probably heard less about a newcomer to the field of long-term energy resources: satellite solar power... Satellite Solar Power (SPS)... was invented in the late 1960s by... a research firm. A power satellite is a large array of solar cells or of turbogenerators, located in synchronous ([24]-hour) orbit above a fixed point on the equator. The satellite receives full-time solar energy, converts it to low-density microwaves, and then relays it to a ground station where it is rectified to DC current with an efficiency of about 90[%]... For energy density equal to sunlight, the microwave antennas... use only about 1/36 as much land area as ground-based solar cells producing the same average power. The antenna is a mesh structure, intercepting the microwaves but allowing rain and sunlight to pass through it, so if it is raised above ground level on posts, the land below it can be used... In orbit we don't care how much area is needed for the solar cell array, because it's not in competition with land area... In a two-year study completed in 1980, the U[S] Department of Energy found "no unacceptable environmental effects" from [SPS]. However, many experiments remain to be done before [SPS] can be certified safe. The low-density microwaves may have some yet-unsuspected biological effect on birds, or may alter the ionosphere in ways that disagree with calculations made so far. If [SPS] turns out to be acceptable on all grounds other than the environmental effects of microwaves on birds or insects, there may still be a way to use it safely. One can float the antennas above biological life and above the weather in the stratosphere where the winds are usually mild (one needs to avoid the special combinations of latitude and altitude where the jet stream sometimes penetrates). A balloon-borne antenna could feed continuous electric power through its tether cable to a moored ship and from there by undersea cable to shore... You may be surprised that I don't list ground-based solar power as a viable option, but... [because] of interruptions by nighttime and clouds, and lower illumination near sunrise and sunset, a solar cell at

the Earth's surface puts out power, averaged over a year, that is only a sixth as much as its output at high noon on a clear day... The U[S] is a relatively sunlit nation of low population density, a particularly favorable place for solar energy. Yet... [if] we add together... all... sources... of solar energy... [- w]indpower, tidepower, photosynthesis, and hydroelectric power... [-] for the entire continental U[S], including damming every stream for hydro power and burning every forest, and throw[ing] in geothermal power for good measure, the most energy we could get is... only 1.5 watts per sq... m... The total annual amount of sunlight reaching ground level, if converted to usable energy needs at the fairly high efficiency of 15[%] would be 33 watts per sq... m... In 1971[- when] the average U[S] energy use was 0.3 watts per sq... m[- a]... committee of the American Physical Society did a careful review for the federal government for the cost required to satisfy just 1[% of US] electricity needs in the year 2000 from solar-electric cells... The committee concluded that... ground-based solar electricity could never supply more than about 5[%] of the nation's electricity needs, because above that level one would have to solve the problem of cheap storage of electric energy – something we don't have a clue how to do in the vast amounts that would be necessary... The continuous sunlight of synchronous orbit makes storage unnecessary... For more than three decades we've dreamed and hoped that we could obtain nuclear energy the same way the sun does: by fusing hydrogen nuclei together to make helium. That reaction is a copious source of energy, and it doesn't produce penetrating radioactive particles. There are several ways it might be done: by confining an intense, hot cloud of heavy-hydrogen ions and electrons in a very strong magnetic field, by "zapping" a microsphere of glass containing hydrogen with a powerful laser beam, or perhaps by using some version of a mass-driver to smash together two glass hemispheres of liquid hydrogen at such a speed that the collision would heat the hydrogen to the fusion temperature. At least in the case of the first two alternatives, it has turned out that the technical challenge is so difficult that we may not be able to meet it head-on. Instead, we may be forced to work with a less clean reaction, that of deuterium with tritium. Those are heavy, rare isotopes of hydrogen, and they react to produce helium and a neutron. It appears, rather unfortunately, that the most economical version of fusion may be to use that neutron to breed plutonium or uranium, and then burn the fissionable isotope in an ordinary reactor. That raises all the difficulties and fears associated with reactor safety... For some years there's been intense controversy over a pilot-plant "fast-breeder" reactor, which was built to transmute the commonly occurring isotope U238 into the fissionable isotope P239... The controversy has raged because fast breeder reactors are much trickier and more dangerous than ordinary fission reactors, and because P239 is a suitable material for making atomic bombs... There seems to be a way to avoid both problems by breeding from the element thorium [- which, together with other 'naturally occurring radioactive materials such as uranium, is believed to be largely responsible for the heating of the earth's core and for volcanic heat' -] in an ordinary "slow" reactor (the fast/slow distinction refers both to the average speed of the neutrons in the reactor and to the speed with which it could go from a safe to an unsafe condition). Canadian scientists have developed the CANDU reactor, which uses slow neutrons to breed fissionable U233 from the commonly occurring isotope Th232... If the thorium is kept mixed with nonfissionable U238, as it can be without degrading the operation of the reactor, the resulting nuclear material couldn't be used to make a bomb without very elaborate, large-scale laboratory equipment. It has been estimated that if even 5[%] of the available thorium can be burned in reactors of the CANDU variety, we will have enough energy available to run our civilization at fifteen times its present energy-use rate for 30,000 years... (some optimists think 50[%] can be achieved)... [T]he commercial CANDU reactor operated by Ontario Hydro Power Company has run with no difficulties for more than five years, so nuclear power certainly seems capable of giving all the energy we need... I'm not strongly biased against nuclear power, but I'll be happier if we can find a good alternative to it, because it's an inherently messy solution to a problem. As long as nuclear radiation is involved in any system, it has the basic drawback that the "off" switch doesn't really mean "off." Radioactivity remains... [P]ublic opinion polls such as that... in the [New York] Times of April 10, 1979, showed a sharp rise since 1977 in opposition to nuclear power, with 56[%] opposed and only 38[%] still willing to have a plant close to their town... [SPS] has at least one great advantage over any form of nuclear energy, for should it subsequently turn out to have been a wrong choice, it can simply be turned off, leaving no radioactive wastes. The various likely sources of primary energy... are sharply different in the waste heat they will dump into the biosphere. [SPS] is the most benign, because for each kilowatt on the power line here on Earth, it would put a total of 1,100 watts into the environment (the 1,000 that are useful, plus about 100 watts of waste-heat at the antenna). Any type of nuclear reactor... must go through the "thermal bottleneck" to deliver power, so nuclear puts 2,500 watts into the biosphere for each 1,000 on the power line. Coal-burning is about the same, except that if the coal is gasified or liquefied the figure becomes worse: about 3,800 watts. - 1981

If power plants are built in space during the twenty-first century... their energy will be beamed down to earth... [by] lasers... Unlike other energy forms, the laser spreads only slightly, so an energy-enriched laser beam could be collected in a relatively small area. Also, lasers are totally self-contained; they don't wander and they don't create radiation or other unwanted side effects. Finally, even a massive laser presence in the atmosphere shouldn't ruin radio and television signals, which a microwave beam from space could easily do. This laser space plant could use the power it gleams from the sun to power a massive laser gun, which could then create a beam of virtually limitless force. Since the laser light beams are packed tightly together, incredible power can be concentrated in a beam over a brief time span. A laser could deliver at least ten times more power than any other wave in a given period of time... A huge solar-powered grid could be placed in orbit between the earth and sun. If covered with solar cells or plastics that conduct electrical currents, such a grid could generate huge amounts of electricity... Another energy possibility involves building giant mirrors in space that reflect sunlight to solar collection sites on our planet's surface. These huge power stations could be located in the centre of deserts and other unpopular areas... However, isolated rural ranchers and farmers will make use of tiny water-wheel plants that use small amounts of moving water to generate a usable current. This will be a new development in the hydroelectric field. These torque units will enable rural areas to generate electricity from even the most sluggish streams... By the turn of the century, enzyme products will be used in plastics... and fuels. Genetically engineered enzymes will be built up from simple hydrogen, oxygen, and carbon and fashioned into virtually any desired molecule. The future for this energy source appears almost limitless... The poorly conceived and designed nuclear power plant that was once touted as the answer to our energy woes by virtually every major utility is almost certainly the biggest technological boondoggle ever perpetuated on the public... By the turn of the century, most of the problem-plagued nuclear power plants already built will be shut down. Most will grind to a stop on their own because of broken pipes, leaks, or assorted fuel problems. The rest will be closed by economic necessity. They will be expensive white elephants, unable to generate enough power to outweigh related mechanical difficulties... Breeder power plant reactors, which make their own fuel, may very well be regarded more favorably in the near future. The world needs fuel almost as much as it needs energy... Breeder reactors are... closed systems... – those processes that feed off themselves or that link smoothly with other needs... American physicists anticipate that by 1992, the first successful fusion reactor system will be demonstrated at the Plasma Physics Laboratory of Princeton University... The percentage of U.S. electricity supplied by fusion nuclear power plants may not be overwhelming by 2050, but the impact of this source... could become significant since, theoretically, 9[%] of America's electricity needs could be supplied by only two fusion power plants. The extraordinary amounts of power each fusion plant will be able to produce suggest the importance of the new technology. Fusion will most likely become the dominant form of large-scale electrical power generation in the twenty-first century... Geothermal energy will never be more than a secondary energy form, but improved understanding of geothermal engineering should increase its use. Hawaii and the Pacific Northwest plan to take advantage of favorable local conditions to generate most of their energy from underground streams... Hawaii is pioneering the use of tidal shifts for power generation in America... Experts project that tidal power could eventually provide up to 5[%] of America's energy, as much as 25[%] in areas like Louisiana and southern Texas... Houston and Galveston lie at or near sea level. Both are industrial cities that use immense quantities of

water. These two factors will combine to put large parts of both cities underwater within fifty years if civil leaders are not careful. Simply stated, southeastern Texas is sinking because it is pulling too much water out of the deep underground. The cavities created by depleted water supplies pull surface land masses downward. Over the past fifty years, some 1,300 square miles of coastal land have subsided by more than a foot... Bangkok parallels Venice in many respects. Once a city of canals, it is no longer. The waterways have been filled in for roads and construction sites, destroying the natural drainage of Bangkok's marshy land. The problem has been compounded by the unrestrained pumping of drinking water.

...Aucklanders may tap into the Waikato River in the future as a source of their water. A pilot study at Mercer has shown that high-quality, drinkable water can be produced consistently from the lower Waikato. [In related news, 'the fate of the Whakapapa Stream and the Wanganui River looks like another example of myopic planning, says the chairperson of the National Conservation Council. With large proportions of their waters diverted eastward for the Tongariro power scheme, the Whakapapa is reduced to pools of water and the level of the Wanganui is drastically lowered.'

...recently, 'industrial research scientists discovered a superconductor called copper bismuth that worked at much warmer temperatures. It still needs to be cooled but not as much. Now they've put it into their first commercial product, a magnet attached to a machine used in physics research in Lower Hutt. Manufacturing companies say it's a huge technological advance. "It's maybe two quantum leaps. We couldn't really under-rate the giant step we've taken here." As superconductor technology evolves, scientists say it will allow perfect transmission of power through superconducting wires. And, at the moment, one of the most advanced substances in the world for superconducting electricity is this NZ one.'

...scientists predict that by 1994 they will be able to] **create compounds that can carry electricity without resistance at ordinary temperatures. Called room-temperature superconductors, these materials can save more than 15[%] of American energy production without requiring any new plants to be built... Room-temperature superconductors [will] also have applications in appliances and computers. - 1982**

Superconductivity has found many specialist applications, but scarcely in heavy engineering, except in such pioneering ventures as particle accelerators... If, as seems fairly likely, superconductors can be used in heavy engineering, high-tension cables will go underground and pylons may disappear... The first big industrial application for superconductors is expected to be a matter of boosting electricity production in power stations, by the principle called magneto-hydrodynamics... Conversion efficiencies should rise to between 45 and 48[%]... 'Conversion efficiency' in a power station means the proportion of the energy input that becomes converted into electricity. In this context, 'magneto-hydrodynamics', or MHD for short, is a matter of topping up the output by taking hot, electrically charged gases, produced by burning the fuel, and passing them through magnetic fields, so generating supplementary electricity... The first power station topped up by MHD is coming into operation in the Soviet Union in 1984... A demonstration fuel-cell power station became operational in New York in 1982... The advantages of fuel cells includes their quietness, potential high efficiency and possible role in decentralising power generation at a time when the main trend is towards very big power stations and expensive power distribution systems. They have potential in [Last World] countries, where methane, for example, generated from vegetable waste, could run fuel cells in villages. But energy strategy on a grand scale also favours fuel cells... Weather and the unavoidable nights make it unthinkable to use solar energy on a large scale, while the old problem of cheap electricity storage remains intractable... [Yet, even if the old problem can be solved,] I do not believe, for advanced areas, in houses heated by solar energy... Solar heat, however, seems to have a future... in the [Last World] countries of the tropics... (solar cookers, boilers and water distillation units)... At the peak rate of oil formation, during the Cretaceous geological period, nature added 5,000 tons a year to the preserved stocks of petroleum. That's barely enough to wet the bottom of the tanks of one supertanker. If we're going to use the oil, instead of saving it for future generations, why do we burn it instead of making valuable chemicals from it? If we're going to burn it, should not the... countries that cannot easily turn to other sources of energy have first call? The oil is a treasure beyond price because it is a finite source of cheap energy, and the market place cannot cope with that sort of paradox... [W]ell-informed friends from the [Last] World insist that they must have nuclear electricity, for any hope of even modest prosperity for their peoples. Spurn nuclear power[in the First World], by all means, if you live above a coal field... but geological history has distributed oil and coal very inequitably around the world, and nuclear energy could help to restore the balance. That remains the dream of many people, and the Director-General of the World Health Organisation recently endorsed a declaration by the International Atomic Energy Agency that nuclear power 'is a technology whose hazardous effects are well understood and controlled.' ...But... [how] do you safely bury copious radioactive wastes, and what do you do with derelict but still 'hot' reactors when their useful life is over, are questions not yet answered to everyone's satisfaction... About 10[%] of the world's electricity now comes from nuclear power plants, which seems a 'substantial contribution'... though... much of [the future nuclear power will] be from a new generation of power reactors... Fast breeders conserve uranium supplies, so they would be the next logical step in the use of fission energy. Beyond that, the difficult quest is for unlimited energy from nuclear fusion, which could 'burn' atoms from sea water...

As a source of energy, the potential of the oceans is staggering, even for the supply of non-renewable forms of energy... If nuclear fission has any long-term future, uranium and thorium in seawater could in principle 'sustain the estimated 21st-century level of power production for some million years', [while the]... lithium and deuterium from the sea, if used in thermo-nuclear fusion, could 'sustain the power level for the remainder of the life of the solar system'. The tidal power plant successfully operating at the mouth of the Rance River in northern France is a small token of the renewable and non-polluting modes of energy production from the sea, waiting to be harnessed. Useful tidal energy will be restricted to favoured places where the tidal range is very large, but low-pressure water turbines of the kind developed for this purpose might also tap the energy of ocean currents - for example, from the Gulf Stream where it passes Miami... Wave energy is more widely available on exposed coasts, and experiments to tap it are under way in Britain, the U[S] and Japan. In theory the most prodigious energy-content of the oceans takes the form of differences in salinity between different layers of water, but the technology needed to extract useful energy supplies does not yet exist. On the other hand the temperature difference between warm surface water and cold deep-lying water, amounting to 20° to 25° C in the tropical oceans, can certainly be exploited as... the French first demonstrated three-quarters of a century ago, and as experimental and pilot plants of the 1980's are reconfirming. Because it brings deep, nutrient-rich water to the surface, 'ocean thermal energy conversion', or OTEC, will lend itself to integration with aquaculture... Rivalling the urban sector as a claimant on cropland is the fast-growing global energy sector... Hydroelectric dams often inundate vast stretches of rich bottomland; electric generating plants can cover hundreds of hectares. More often than not, oil refineries and storage tanks are built on prime farmland along rivers and coastal plains. Strip-mining of coal and the diversion of irrigation water to the energy sector both tend to reduce the cultivated area... The *Climate Regulator* is a system, or assortment of systems, for managing or generally improving climatic conditions over substantial parts of the Earth. Existing concepts range from family-scale greenhouses in which people can live comfortably in a frigid climate, to global proposals for controlling the amount of carbon dioxide in the atmosphere, or for increasing the supply of sunlight by flying huge mirrors in space. Intermediate in scale are air-conditioned cities inside giant domes, and schemes for wringing moisture out of the desert air by promoting an updraft... perhaps by painting the desert black, perhaps by setting up huge chimneys. Meteorological nuisances like hurricanes, tornadoes and fogs might be suppressed locally. Although the term *Climate Regulator* may imply playing games with the air in particular, I would extend it to include large-scale manipulation of the water cycle, a theme that goes back to ancient Mesopotamia. One contemporary example is the project for towing Antarctic icebergs to A[US] or Saudi Arabia; another is the controversial Soviet scheme for diverting the great rivers of Siberia. And the... proposed... Ganges Water Machine... might rescue much of India and Bangladesh from the tyranny

of fickle monsoons by using hydro-electric power from Nepal to run a system which stores water underground during floods and pumps it up again for irrigation in the dry season. (That could be set up, by the way, for the cost of two aircraft carriers.) - 1983

The... director of the United Nations Environmental Program, has said, "People throughout the world are contaminating water much faster than they are conserving it. Eventually, the growing scarcity of fresh water could lead to international conflict." In [Last World] nations, one fifth of all urban residents and 70[%] of all rural dwellers drink contaminated water, [the director] says. Moreover, about 25,000 people die daily from water-related diseases. But there is an even more ominous threat than the prospect of a water-based international conflict: The natural environment can take just so much abuse, just so much imbalance. When pollution gets too far along, we may pass the point of no return. Then, we may well be facing a natural cataclysm... So the state of our water supplies is one of the keys to our very existence in the near future.

...[*In some countries one of the most dangerous things you can do is drink the water.*] By law, water authorities are required to provide a supply of clean, wholesome water – that is, water free from: suspended matter, odour and taste; all bacteria which are likely to cause disease; mineral matter injurious to health. [From the point of view of chemical analysis, it must dissolve soap, reveal no traces of lead, leave no more than 0.50 dry residue per litre after evaporation, contain less than 3 mg organic matter, less than 1 mg ammonia, less than 10 mg nitrates, contain no trace of albuminoids or nitrites, and contain at least 8-12 mg dissolved oxygen per litre. Drinking water often contains too high a proportion of calcium salt and is called *hard* (such water prevents the satisfactory cooking of vegetables). All this explains the remark: "Pure water is a myth."]Water is obtained from rainfall which is collected in the following ways: natural lakes, rivers, artificial reservoirs, underground lakes, wells, springs. Water is collected... and is then given several cleansing processes before being piped to the consumer... The Water Board's stopcock is situated beyond the boundary of the proprietor's premises. Another stopcock should be fitted just inside the boundary to enable the consumer to turn off the water in an emergency... There are usually other stopcocks throughout the premises enabling water supplies at different points to be cut off. If the ball-valves fail to function, the water would flow out through the overflow pipe... The entire supply sometimes comes direct from the main, and may be considered drinkable... [However, where] the main supply has to be pumped by the water authority (not relying on gravity) then fluctuations in pressure at peak times – breakfast, lunch, dinner – will occur. Therefore the water authorit[ies generally] require cold water cisterns to be fitted... [A] cold water cistern... [also provides] an emergency water supply should the main supply be turned off, or lowered... In the average house there is usually a day's supply in the cistern, provided the water is carefully used... *Disadvantages* Stored water should always be considered suspect as it may become contaminated even though covered... It must be above the level of all taps; the higher the cistern is placed, the greater the pressure of water when supplied to the taps... The washers for modern taps are of two sizes and replacements are normally a composite material similar to rubber... A modern cistern is usually made of galvanised steel or plastic... The cistern should be insulated with fire resisting material like fibreglass... Flushing cisterns should be so designed that they will discharge 2 gallons of water in 5 seconds... *Methods of heating water...* *Storage heaters* Water is heated by the fuel and stored in a container designed for the purpose and suitably insulated. Water in large quantities may then be drawn off as required. *Instantaneous heaters...* Water is heated and supplied direct to the fitting on demand, therefore cutting down heat loss... Any fitting which discharges water from it should have a drain or waste pipe which has a diameter of not less than the size of the outlet. Each fitting... must be fitted with a water seal (trap), when connected to a drainage system, to prevent unpleasant smells rising from the pipe into the room... Blockage occurs most frequently because of misuse, such as depositing liquid grease, tea leaves and other waste products in the sink... Modern plastic traps... are very smooth and reduce danger of blockage... Lag all pipes... [to prevent] pipes bursting... when... frozen... water expands... In... electricity generating stations... magnets may be moved by turbines driven either by steam pressure or by water power... The most common electricity supply system now in use is A.C... Electricity is carried by cables called the grid and transformed [– by transformers, which are 'electrical devices that use the principle of induction to increase (step up) or decrease (step down) the voltage of an alternating current' –]at local substations. The consumer takes the supply of electricity from the substation. Electricity must have a complete circuit from the source of supply through the load, eg an appliance back to the source of supply or it will cease to flow... All substances allow electricity to pass through them. Those which allow electricity to flow freely are known as *conductors*, eg metals, carbon, tap water, damp earth... Anyone who has received an electric shock will know that the human body also conducts electricity... Those which do not allow electricity to flow freely are known as *insulators*, eg glass, porcelain, wood, rubber... - 1984

Plants and especially trees are our most precious renewable resource, providing fuel, food, textiles, cosmetics and almost anything else that human ingenuity might devise. By biomass fermentation, 'all required liquid fuel could be obtained from 17[%] of the UK's land area' and 'all gas from 15[%]' (quoting a p[ro]fessor... of King's College, London, [who gave] evidence at the Windscale Enquiry of 1977). The manufacture of fuel alcohol on a large scale has already been shown to be possible, for instance in Brazil, where part of the coffee crop is diverted in this way in order to lessen dependence on imported fuel (though unfortunately in this case it only runs cars for the rich)... According to [the same p]rofessor... in May 1984, all of the world's economically extractable coal, oil and gas only ha[d] an energy output equal to that of the trees now growing in the world... It is well within the range of our ingenuity to produce... [energy from renewable plant] resources which would be cheap and... ecologically sound. - 1985

When nuclear-power reactors first became operational 35 years ago, the problems of dismantlement seemed trivial compared to the benefits scientists said would flow from these sources of infinite power. Engineers boasted that the first-generation plants would churn out inexpensive electricity for about 30 years. But design and equipment failures at some of the reactors forced their shutdown less than two years after they were put into operation. Accidents such as the ones at Lucens in Switzerland, Three Mile Island in America and, more recently, Chernobyl... dramatically aborted the working lives of these plants and posed awesome problems of securing or dismantling them. As well, growing public reaction to the potential perils of nuclear energy restricted how the industry could handle its old plants and where to dispose of radioactive waste. Today, the nuclear industry is facing a universal problem: what to do with a mounting inventory of obsolete nuclear-power plants. In Europe, over a dozen facilities... are already standing idle near populous centres... Experts tell us that an estimated 300 nuclear facilities will be obsolete by the year 2010. In any other industry, getting rid of an old plant is a relatively simple matter. But decommissioning a nuclear plant poses safety, technological and economic problems never encountered before. Even several decades after the uranium fuel elements have been removed, the reactor core is still "hot" enough to cause radiation sickness in anyone directly exposed to the rays for more than... 15 minutes at a time. What can be done with a retired nuclear facility? At present there are three options. The first – and by far the option of choice – is "mothballing" for a period ranging from a decade up to a century... Next came decontamination of equipment and buildings – tonnes of steel and concrete – outside the contamination structure. "Most of this was surface contamination that could be washed away by high-pressure steams and chemical solutions,"... Then the turbine and electric engines were removed intact and sold to conventional power plants, while most of the steel components, including piping and joints, were sold for recycling... The third option for decommissioning... is complete and immediate – meaning within the first decade after shutdown – dismantling, usually until nothing is left but, as nuclear engineers call it, a "greenfield." The biggest test for "greenfield" dismantlement began in 1984 at the Shippingport plant, America's first commercial nuclear reactor built primarily to generate electricity. When the plant began operations in December 1957, it was with an unusual condition: the government operators of the reactor agreed to return the land to a radiologically safe condition by 1994. Thus, complete and immediate dismantlement was the best option the engineers could exercise when the plant was shut down in October 1982... In America... the burial ground best suited for the materials from Shippingport was a site in Washington

state in the west, involving a trip of more than 7000 kilometres across at least seven states. The Shippingport engineers decided to remove the huge, highly radioactive main pressure vessel in one piece and transport it to the state of Washington via an ocean-going barge. The pressure vessel is a cylinder about ten metres tall and three metres wide, surrounded by an even larger one-metre-thick Neutron shield filled with water. The radioactive water will be drained, processed to remove the radioactivity, and replaced with a material similar to concrete. Next, the team will build a steel tower over the vessel, on which they will put a giant crane. In mid-1989, the crane will lift the cylinder from its bed and place it on to a crawler vehicle. The crawler will inch over specially constructed roads to... nearby Ohio River. From Ohio, the barge will travel down the Mississippi to the Gulf of Mexico, through the Panama Canal, up America's west coast to Washington, and finally up the Columbia River to a landing area. Then it will be driven to the site, placed in a ten-metre-deep pit and buried until natural decay reduces its radioactivity to safe levels. The total distance of this incredible trip will be nearly 14,000 kilometres! Since dismantling of commercial plants started three years ago, a major new problem has arisen: where to dispose of the increasing amount of radioactive bits, pieces and parts? Since 1983, there has been a worldwide moratorium on sea dumping... This restriction has put land burial at a premium. In Sweden, for example, public pressure has prompted the government to put its low- and intermediate-level nuclear waste into underground caves that have been blasted into granite rock 50 metres below the Baltic Sea. Material from... the relatively small Niederaichbach nuclear-power plant[... which] was shut down in July 1974... will be buried in a retired iron mine in West Germany. In France, nuclear waste is compacted, packaged in concrete and buried in concrete-lined bunkers covered by metres of soil. And in Britain, intermediate-level waste is stored in concrete silos with 1.8-metre-thick walls. Even so, all these disposal sites must be monitored 24 hours a day until the risk of spillage is gone and there is no longer any evidence of harmful radiation – possibly hundreds of years. The same is true for the high-level waste that comes mainly from the reactor core, which will give off potentially lethal rays for up to a thousand years. Most of it is now stored at nuclear and reprocessing plants where it can be monitored round the clock. Final disposal will probably be in deep granite caverns or watertight salt or iron mines located far from population centres. But where...? ...“So far, no final decision has been made.” Lastly, who pays for the \$400,000 a year that it takes to monitor and maintain a mothballed plant? What about the estimated... \$230 million it will cost to dismantle a nuclear plant of small to modest size? Who picks up the formidable bills for packaging, shipping, storing and monitoring the dumps? Experts estimate that these expenses could run anywhere from [10%] of the original cost of each plant to 30[%] or more. The estimated costs are being incorporated into electricity bills. Thus, one way or another, the consumer will have to pay... - 1988

Energy policy is still driven by the short term profit motive... Most of Northland's power is generated in the National grid south of Auckland[– including power from 'the 120 MW-capacity Rangipo hydro-electric station, which is built completely underground and was commissioned in' 1983, thereby completing 'the fourth and final stage of the Tongariro Power Development Scheme and becoming the country's second underground station, after Manapouri (the largest hydro-generating station in NZ at 700 MW – Lake Manapouri is regarded by many as the most beautiful of NZ's lakes, and at 433 m deep it is the deepest in NZ, so when the original power scheme provided for the raising of the lake artificially by 11 m, there was a public outcry, which resulted in the construction in a huge human-made cavern 213 m below the lake, hewn out of solid rock, into which the water of the lake plunges down vertical penstocks to turbines, and then on through a 10 km tailrace tunnel to Deep Cove in Doubtful Sound'; unfortunately, 'thousands of migrating eels also plunge down the penstocks – a fatal deviation from the lake's natural outlet')]. Electricity charges are very expensive and some Northland homes are still not electrified... Marsden A [power station] runs on oil, a by-product from the Marsden Point Oil Refinery. It supplies electricity for Northland only at peak-load and times of breakdown. Marsden B, even bigger and more complex has never been put into action in the ten years of its existence... Right now Maui gas is being... converted to synthetic petrol at Motonui and the surplus flared off... Instead of keeping the gas until the best use can be made of it, an agreement signed in 1973 means that all gas will be gone by 2008... The major reason for the existence of these plants was to create employment in provincial areas like Northland and Taranaki and to move towards self-sufficiency in energy. In fact: ...When they were completed, most of the local workers were made redundant[... and NZ]... is still dependent on imported oil... Large energy companies control energy sources. They are not interested in developing technologies for conservation and renewable fuel and power resources. One reason for this is that it is difficult to “own” the wind, sun or the waves. It is easier to “own” land, minerals and machinery. - 1989

Water is... a vital component in the cooling process at the eight thermal stations Electricorp owns. But Electricorp Production must apply for the right to use water along with any other use of natural resources. In some cases, it may be necessary to impose limits on the amount of water that can be diverted or discharged. This may be to protect the environments of rare species or because a number of users are competing for the same resource. However, if limits are too severe they may reduce Electricorp's ability to generate electricity from N[Z]'s only renewable resource. If this does happen, [the state-owned-enterprise] must place more reliance on its thermal stations which burn coal or gas... [Because] Electricorp cannot satisfy all the demands for electricity from hydro generation alone, it carries out ongoing research into ways of reducing harmful emissions from its thermal stations. And there's an element of recycling involved. The ash, which has cement-like properties, can be sold for use in road construction. At Electricorp's newest power station, Ohaaki, the waste products from geothermal steam are reinjected back into the steam fields. This major experiment is being pioneered in N[Z] and if successful will be used here and around the world. Other major research is under way into alternative electricity generation such as wave and wind power, coal gasification and other forms of fuel.

...Greens usually base their energy strategy around renewable sources... It is worth noting, however, that... technology associated with renewable energy sources (windmills, barrages) is often highly complex and, in the case of the production of solar cells, polluting... [We can, therefore,] see that the issue of alternative energy sources provides us with yet another specific example of the ambivalence with which Greens... view the role of technology... Renewable energy sources are argued to be desirable because they are in principle unlimited... [But producing] fantastic quantities of ...renewable... energy... encourages frippery and helps to turn wants into needs (do we need kiwi fruits? – but, then, do we need tea?)... Likewise... patterns of trade [may] lend up being notoriously wasteful... [Already,] tomatoes (for example) are grown on the island of Guernsey, exported, and then sometimes shipped back for consumption... [When considering] the Green argument for reduced trade we find the central notions of reduced consumption (if you can't produce it, think about doing without it first, and only trading for it second), and a theory of need that hopes to sustain the view that in many instances the trade to which we have become accustomed is an unwarranted indulgence... This [theory] also affects the Green position on travel: one of the characteristics of the Green sustainable society is that people would travel less... In the first place this is because Greens consider present travel practices to be wasteful of resources... Secondly, and more importantly, Greens argue for reduced mobility as a part of their hopes for generating supportive, satisfying relationships in their decentralized, self-reliant communities. From this point of view, travel involves dislocation of the ties that hold such communities together, and so endangers the emergence of the 'sense of loyalty and involvement'... that, for Greens, will be one of the prime benefits of decentralized communitarian life. The sustainable society is substantially about living 'in place' and developing an intimacy with it and the people who live there; travel, on this reading, is too expansive and too centrifugal an occupation.

...[the wife of the famed Texas oil-well firefighter] asked him that evening, “Haven't you had enough? Haven't you... put out enough fires? Don't you think you ought to quit completely and take it easy? Relax? Travel?” “Travel?” [her husband] said. “You know... that reminds me... I've never been to China. That's a place I'd like to see... They got these wells blowin' like crazy over in China and they're gonna need help over there bad...” [That evening the husband had returned from his most difficult challenge in a career that included putting out the Gassi Touil fire]... WHEN THE CAR came within 500 metres of the burning gas well, the roar was so loud it set the floorboards thrumming... The bonnet began dancing on its hinges,

and the windscreen, peppered by driven sand, threatened to pop loose from its seals. Even with the windows wound up, you had to shout to make yourself heard, though at that moment none of the four [occupants of] the car was saying a thing. In front of them were the twisted remains of a drilling rig jutting from the sand, blown into grotesque shapes like the wreck of a spaceship on the moon. At the centre, raging from the wellhead, was a column of fire that roared like a fleet of jet engines... The manager of North African operations for Phillips Petroleum was driving... Two French oil-and-gas experts sat in the back seat... both were sweating profusely. Their trepidation was understandable. They had been... at Gassi Touil, a remote desert outpost in Algeria... on November 3, 1961, when the well blew out with such force that it exploded the safety devices and sent a 33-centimetre-thick column of gas into the air. Almost immediately the call had gone out to Houston... [to get] the famed Texas oil-well firefighter... [However, the Texan] was on his way to fight a blowout in Mexico, and... sent his two assistants... to Algeria. For a week, [the two assistants] fought to control the well. Then a sandstorm swept in, charging the air with static electricity that ignited a small fire on some nearby machinery. The flames quickly spread to the derrick, sending every rig hand running for his life. There was a blinding flash and a noise like thunder as the gas exploded and a flame that would become known as The Devil's Cigarette Lighter rocketed skyward. With 8.5 million cubic metres of gas going up in smoke each day, this was the most violent conflagration yet recorded in petroleum history. When [the Texan] heard what had happened, [it] rushed to Gassi Touil... THE FIRST THING needed at Gassi Touil was water: not to put out the fire – [the Texan] would do that with explosives – but to cool down the surrounding desert and provide continuous soaking for [the Texan and his crew] when they made their final assault on the well. Oil-company geologists located an area with water only a few kilometres away, deep beneath the desert. Wells were dug and the water was piped overland to three polyethylene-lined reservoirs, each the size of a football field. For days, [the Texan] surveyed the area, measuring, calculating and sketching... [The Texan] ordered eight brand-new bulldozers, tonnes of pipe in various diameters, large quantities of sheet metal and welding equipment, and 900 kilos of solidified nitroglycerin delivered by a French army unit. All this preparation involved over \$4-million worth of equipment, which took months to assemble. Meanwhile, the drilling camp of 30... had grown to a town of 300. The reservoirs were now full. Beside them stood giant pumps, ready to force water through the lines snaking their way to the well. Mechanics... were fitting an 18-metre-long steel boom onto the back of a bulldozer. A hook would be attached to the end of the boom... to pull the wreck of the drilling rig away from the wellhead – the area had to be free of debris... This part of the job went smoothly... At 3 a.m. on May 28, 1962, the crew [controlling] the hoses advanced and began spraying the area. They cooled it for six hours while [the Texan] finished packing 340 kilos of... nitro... into a huge drum. A dry, nonexplosive chemical was poured around the charge in order to knock out any small ground fires that might start as a result of the explosion – fires that might reignite the well. In the morning, [the Texan] mounted the explosives on the hook. As... the bulldozer... [was] reversed... towards the wellhead... [it] was bucking and shaking from the well's noise. The boom was swinging to and fro with enough nitro dangling off its end to reduce a 25-storey building to rubble. The fire was so hot the charge could go off at any time without an electrical impulse. [The Texan] directed the boom close to the base of the flame. Then... gave the signal to detonate... the device went off with such a mighty blast that the bulldozer jumped 30 centimetres off the ground. Through the enormous cloud of dust, filled with rocks and shrapnel and pieces of water hose... they could see that The Devil's Cigarette Lighter... was finally out... [B]ut there was no time to relax. It would be another week before the well was capped, stopping the escape of gas. Defeating [the Gassi Touil fire brought the Texan] international acclaim. Geologists predicted that if [the Texan] hadn't killed the well fire, it would have burned for another hundred years. *Life* magazine did a story about [the Texan]... In 1969, John Wayne starred in a movie, *Hellfighters*, that was based on [the Texan]'s life... IT WAS ON A stifling summer night in 1921, on a weed-choked vacant lot, that [the Texan, then a] six-year-old... saw his first oil-well fire. [The six-year-old] was with a dozen older boys [it] had followed when they raced past his house... shouting and pointing at the sky, east of town, that pulsed orange and crimson through the trees. It was very late, and [the six-year-old knew it]d get a hiding for leaving the house, but... kept right on running. On the lot, [the six-year-old] and the other boys fell silent for a time, watching the sky. "What is it?" [the six-year-old finally] asked. "An oil-well fire," an older boy said. "My dad says there ain't nothin' on this earth more dangerous." "What will they do about it?" ... "Sometimes they just let 'em burn." "My dad had a friend who tried to put one out," another boy said. "[My dad's friend] got burned up. My dad says you make a lot of money fighting oil fires, but ain't a [one] who's done it ever died a natural death." [The six-year-old] stared at the eastern sky and tried to imagine the kind of [person] who would battle a fire like that. "I bet I could get it out, someday," ... "Sure you could," scoffed one of the boys. "If a pig had wings, it could fly." ...For... years, [the Texan] fought wild wells from the equator to the Arctic Circle. [The Texan] had fought with an air pack on his back in Alaska at 55 degrees below zero; and... had fought poison-gas wells spewing deadly hydrogen sulphide. The exposure to extremes of heat and cold, from the weather as well as the fires, had taken its toll. The skin on his face and hands was creased and blotchy, and... [the Texan underwent] numerous operations for skin cancer. Constant proximity to gas and distillate had left the tissue round his eyes puffy and red. As well, despite taking precautions to protect his ears, the noise from the wells had permanently damaged his hearing... [Red's] most difficult challenge, and best-known case, came on July 8, 1988, when at the age of 73 [the Texan] landed in Scotland to fight a blaze that had erupted at the Occidental Petroleum's Piper Alpha production platform in the North Sea. There had been 226 [workers] on the Piper Alpha platform, 200 kilometres northeast of Aberdeen... when... came the piercing, paralysing scream of escaping gas – the sound of a thousand nightmares. Within seconds, a spark hit the gas, and the first explosion knocked out communications facilities. Steel beams and pieces of equipment hurtled through the air as more explosions tore through Piper Alpha. The platform trembled and convulsed. Inside the crew's quarters, which were nearly 30 metres above the water, some 100 [workers] were trapped. The survivors... were those... who were able to jump into the water – itself a perilous choice. Even in summer, the North Sea is so cold that a [person] loses consciousness in half an hour or less. And jumping into water from a great height is like plunging from a rooftop onto concrete. The [workers] who jumped would surely have died had Piper Alpha been alone in that part of the sea. But close by... were the... supply and support vessels... Also nearby was the *Tharos*, a huge multipurpose built vessel carrying firefighting equipment... Suddenly, another enormous explosion rocked the platform, and there was nothing but a wall of fire from the top of the structure to the sea. The *Tharos* sprayed more than 150,000 litres of water per minute on Piper Alpha, but it was like spitting on a burning barn... Two-and-a-half hours later, the giant steel legs buckled, the entire structure tilted nearly 45 degrees, and the accommodation module... dropped into the waves like a pat of butter sliding down a canted frying pan... No-one still [i]n it – or in the flaming water below – was left alive... [The Texan] met with his [crew] in a room below the *Tharos's* deck... [The *Tharos* was a vessel the Texan] had helped design... It was a near duplicate of the *Phillips SS*, the first semisubmersible firefighting support vessel, which had been [the Texan]'s idea – his solution to the problem of reaching an off-shore-platform emergency quickly. On board there was a hospital, a pollution-dispersal system and a diving station... If it were up to him, there would be a... [sister ship] in every body of water where [people] drilled for oil and gas... While they worked, they would keep records of everything they uncovered, so that if the platform fell into the sea, they could return with a team of divers and control the wells with a sub-sea kill. If that happened, it could take months, or even years to complete the job... *The whole world is watching this one... to see what we can do...* [the Texan thought. His crew] worked for weeks, 15 to 16 hours a day, clearing debris, making their way towards the burning wells... But, as press helicopters circled above Piper Alpha... some were questioning his chances of victory... Then one day, the wind blew right and [the Texan] was able to direct water just where [the Texan] wanted it. The fire went out... [The Texan] flew home to... Texas. It was a time of mixed emotions. [The Texan] felt satisfaction because of his team's success; but at the same time [the Texan] was filled with sorrow for the [workers] on the platform who had died.

...Floating oil, released either by accidental spillage or by illegal tanker cleaning, is one of the most devastating forms of marine pollution. Although major oil spills that threaten coasts receive much publicity, those on the open oceans often go unreported... Much of our knowledge of the

forces that drive the oceans, of their geography and of the myriad forms of life that inhabit their depths is relatively recent, and even today there are major areas of uncertainty and ignorance. One hundred and twenty years ago, those who sailed the oceans knew next to nothing of the vast mountain ranges below them: the Mid-Ocean Ridge, for example, was not discovered until 1872. It was not until the 1960s, when transistors replaced vacuum tubes, that oceanographers were able to study deep ocean cataracts and currents. As our knowledge of the oceans increases, so many widely accepted theories turn out to be myths. Until the early 1980s, it was generally assumed that conditions on the seabed of the deep oceans – at depths of 4,800 m... below sea level – were utterly calm. However, researchers at the Woods Hole Oceanographic Institute in the US have now discovered that far from being calm, the deep oceans experience violent underwater storms which scour the sea floor, transporting large volumes of silt and sediment from one area to another. Because of their size, and the vast quantities of water they contain, the world's oceans have long been regarded as having an almost infinite capacity to absorb wastes, the assumption being that the wastes are rapidly diluted and dispersed to levels where they pose no threat to the environment or human health. In many areas, the reverse is proving to be true. Inshore currents often trap wastes along the shoreline, where they may accumulate in sediments. In others, wastes are swept offshore only to be carried to other coastal areas, a problem that is particularly acute in seas such as the Baltic and the Mediterranean, which are almost completely surrounded by land. Moreover, as pollutants are taken up by marine organisms, so they accumulate in the food chain, often reaching toxic levels... As a result, vast stretches of coastal waters have been rendered all but lifeless through pollution, threatening wildlife and destroying fisheries. Several seas are now in critical condition. The Baltic is one of the most polluted seas in the world. Wastes from factories, farms and private households have turned 100,000 [sq.]km... of the sea into an ecological wasteland, devoid of life below depths of 80 m... The damage is particularly severe in the narrow straits between Denmark and Sweden and in the bay off Gdansk, where thousands of tonnes of phenols, oil, lead, zinc and other pollutants are carried into the sea by Poland's main river, the Vistula... The Mediterranean, like the Baltic, is virtually an enclosed sea, and is almost as sick. Because of its high rates of evaporation and its very slow-moving waters (it takes a hundred years for the sea's waters to renew themselves as they flow through the Straits of Gibraltar), pollutants tend to accumulate without degrading. But it is not only enclosed seas that are now under threat. The North Sea is also showing signs of biological collapse. Worst affected are the coastal areas of Holland, West Germany and Denmark. Here, strong inshore currents have trapped tonnes of pollutants carried into the sea by the major rivers of northern Europe – the Elbe, Rhine, Meuse and Scheldt – causing them to accumulate to dangerously high levels in the Wadden Sea and the German Bight. Adding to this fatal burden are pollutants driven across the North Sea from Britain by westerly winds... Even coastal areas as yet unaffected by industrialization have not escaped the effects of pollution. Ninety-eight per cent of the PCBs in the sea enter the ocean via the atmosphere, borne up into the air through evaporation and often transported thousands of kilometres by the wind. Even the high Arctic and other remote regions are now contaminated... The health of the great inland seas of the world is in many cases even worse than that of the oceans. In the Soviet Union, the over-extraction of water for irrigation is causing the Aral Sea – once the fourth largest lake in the world – to disappear. The area of the Aral shrunk by 40[%] between 1960 and 1989... Salt from the dried-out bed of the Aral has been blown as far away as the Arctic. [Earlier this year], an agreement was signed between the USSR and the U[N] Environment Programme for international action to save the Aral Sea. But, with the Soviet economy in crisis, the massive sums of money required to stop the further devastation of the region are unlikely to be forthcoming... In 1980, in a characteristically unrealistic gesture, the UN General Assembly proclaimed that the 'International Drinking Water Supply and Sanitation Decade' had begun, with the aim of "Clean Water and Adequate Sanitation for all by 1990". Needless to say, the UN's grandiose plans have largely come to nought. Only a tiny fraction of the \$300 billion which the project was to have cost was spent on water schemes around the world... Even if more of this money had been spent it is debatable what good this would have done the world's poor. Most foreign aid for water projects is spent on buying unsuitable and expensive equipment made by the country which has given the funds. In 1970, a \$3.5 million sewerage system was built in Accra, Ghana. Designed by foreign consultants and supported by foreign aid, the system was excessively elaborate and too expensive to use, and by 1977 only 171 houses had been connected... In the [Last] World, particularly in urban areas, the discharge of raw sewage to waterways is the rule rather than the exception. The bacteria, viruses and parasites in untreated human waste make it the world's most dangerous environmental pollutant. Typhoid, cholera, amoebic dysentery, polio and hepatitis are all transmitted in human excreta. Nearly two billion people in the [Last] World are exposed to these diseases by drinking contaminated water, and every day an average of 25,000 people die from them. Four out of five deaths of children in developing countries are due to water-related diseases... The main threat to water quality in industrialized countries undoubtedly stems from chemical pollution. Industrial discharges, the run-off from land treated with agricultural chemicals, leakages from landfill sites, and accidental spillages of chemicals have all combined to render many drinking water sources increasingly unfit to drink. Twenty million Europeans obtain their drinking water from the Rhine, which is heavily contaminated with chemical wastes... In spite of the most up-to-date treatment of water supplies, more and more chemicals are being found in drinking water from the Rhine. The head of the Dutch waterworks in the Rhine treatment area has admitted that just about every substance present in untreated water can also be found in drinking water. Many rivers in the eastern US are so polluted by industrial chemicals that they can no longer serve as sources of drinking water. The water of other less polluted rivers has to be treated at great cost, but this has not stopped nearly 130 dangerous chemicals being detected in US drinking water. Only 14 of these contaminants are regularly monitored. Not only do water treatment processes fail to remove hazardous chemicals, but they also pose health risks themselves. The chlorination of water supplies kills most harmful germs but the chlorine can react with various organic pollutants to form chlorinated hydrocarbons, several of which are suspected of causing cancer. In the US, increased cancer rates have been found among people supplied with... polluted and chlorinated water. Many German treatment plants now use ozone instead of chlorine as a disinfectant. Groundwater, which provides drinking water for many millions of people around the world, including a half of the US population, are also becoming polluted with industrial and agricultural chemicals.

...['Industrial plants which use large amounts of water usually construct water-supply systems for their own use. Smaller water-supply systems sometimes rely on natural springs or wells (either free-flowing artesian wells or pumped wells). The earliest sources of water were lakes, streams, springs, and wells. Aqueducts and other closed systems for supplying water by gravity were constructed by the ancient Romans and some are still in use. The earliest use of pumps for water supply was at the London Bridge waterworks, built in 1572. The first American pumping plant was at Bethlehem, Pa., c.1760, but the first municipal waterworks was set up in Boston, 1652. Modern water-supply systems, particularly those of large cities, are of great complexity – they usually consist of chains of reservoirs, sometimes located hundreds of miles from the area supplied, which are interconnected by underground aqueducts (large pumping stations transmit water through the aqueducts and provide water pressure for distribution through large mains to the individual user')]...

Later cities in many parts of the world rarely reached the standard of water supply of... Samos and Athens in ancient Greece... being mostly reliant upon local wells or rivers... [instead of] covered or underground aqueducts with settling basins, and the aqueducts of the Romans are justly famous although the use of lead pipes was not perhaps quite so clever... In environmental terms, the city represents a wholesale transformation of the local environment... The nucleation of people in the city inevitably brought a concentration of wastes which themselves altered the environment of the city and its surroundings. Noise was an immediate effect, to the point where Julius Caesar prohibited all wheeled vehicles from entering Rome between sunrise and two hours before sunset; this law, however, fell into disuse in the third century AD. Possibly more significant is the contamination of the air caused by the effluents from its energy sources: again in Rome, citizens coming back from the country commented upon the smoke and dust which obscured the sun and caused them to lose their tan. In medieval London, the smoke caused by fires burning coal (known as sea-coal...) high in soot and sulphur residues caused problems as early as the last quarter of the thirteenth century. By the second half of the

sixteenth century it became so serious that Queen Elizabeth prohibited the use of sea-coal in brewhouses within a mile of the Court; later, in 1627 the smoke from alum works was said to be the cause of tainting the pastures near the city and even of poisoning the fish in the Thames. Waste water likewise became more contaminated as cities grew. Sewers might have been built from ancient times, but they generally discharged to the nearest watercourse and in time the by-products of all those manufactures which were attracted to the city also ran off into the common drain. In some cities, night soil was collected from pits or directly from privies and sold for fertilizer, but elsewhere the rivers or the sea were the sites of the biological transformation of ordure back to simpler molecules. The solid wastes created by an urban population would require disposal as well but a simple pit outside the built-up area would likely suffice; it could be built upon easily when full, and disjecta per person were no doubt a great deal lower than those of today's western populations and more like the thrifty dwellers of [Last] World cities. The decomposition of the human body itself might also change land use patterns near the city, since the dead might not be buried within the city either because it was a sacred place or because they were crowded out by more active land developers. In all events, the pre-industrial city[']s... environmental impact was... much smaller than those of the nineteenth and twentieth centuries... simply because each citizen had access to lower quantities of energy than fossil-fuel-using successors... Like the control of fire and the invention of agriculture, industrialization represents a turning point in the history of [hu]man-nature relations. An essential economic characteristic of the period since AD 1800 has been the manufacture of goods in a factory and by a machine, for sale outside the neighbourhood concerned. As a result, the structure of environmental relations over most parts of the world has been changed by the use of coal, oil and natural gas... Energy use per head in an industrial world can usefully be compared with past times. Hunter-gatherers can only tap solar energy and nearly all of this comes in the form of food and fire. Their energy throughput as food is perhaps 2000 kcal per head per day... Even without access to fossil fuels, agriculturalists nevertheless use draught animals, construct irrigation channels, use wind and water power and may produce surpluses: they can be responsible for throughputs of 10-20,000 kcal per head per day... Calculations suggest that in the early phases of industrialization, the members of such societies average a throughput of 70,000 kcal per head per day... and that members of today's full industrialized societies are at the level of 120,000 kcal per head per day... The elite selected to engage in space travel are supported, it seems, by 2,740,000 kcal per head per day... Since 1945, the energy of the atomic nucleus has been added to the repertory of energy sources available to [hu]mankind... The discovery of radioactivity is credited to the French scientist Becquerel in 1896, and thereafter significant developments on the practical side included the isolation of polonium and radium from pitchblende by the Curies, and demonstrations of the fission of heavy nuclei by Rutherford, Bohr and others in the 1930s... ['The first nuclear reactor (then called an *atomic pile*) began to operate on December 2, 1942, at the University of Chicago.'] The early development of civilian nuclear power as a source of electricity took place under the impetus of... the belief that it would be very cheap since the energy from 1kg of uranium-235 was equivalent to 2500 t of coal... ['There is a wide variety of coal types, from black anthracite (almost pure carbon) through bituminous coal to lignite, a soft brown coal of later formation and with lower calorific value. Layers of coal near the surface are mined by opencast methods; deeper layers are mined by sinking shafts and digging the coal layers by machine, leaving pillars to support the ground above. Both methods have severe social problems'. In] the USA in the 1970s there were 262 urban areas that were in jeopardy from [coal]mining subsidence: depressions, pits, troughs, cracks, compression bulges, sinkholes and small ponds were all recorded... The formation of these features may take place more than 50 years after mining has stopped... [Where mining continues, there] is... likely to be considerable active management of regional water resources in order to produce the large quantities of water needed for dust control and coal washing where open pits are used: a consumption of 17 litres per tonne coal mined is representative for the USA; underground mining uses 63-120 l/tonne, plus 33 l/tonne for surface waste disposal. If coal is gasified then another 6-36 x 10[00000] litres of water per million cubic metres of gas are required and a coal-fired power plant may also require 1.86 litres per kWh of electricity generated. Such a plant also has numerous effluents... Oil refineries are major industrial installations... and as such may interact strongly with the environment, not least in the changes of land use needed to provide sites. Since proximity to deep water is usually required, coastal wetlands are often modified for this purpose. Once in operation, the refinery demands water for cooling and chemical processes, of the order of 195 litres of water per barrel of oil processed, and in turn emits wastes to the air and to the out-going water... Oil and gas may be burned to produce electricity... in which case there are further demands for cooling water... If we imagine an early stage when *Homo sapiens* used water only for drinking, then each adult would require an average of 2.25 litres per day... [During] our own time... residential use of an individual is... a minimum need of 90 l/day for drinking, cooking, washing and sillage. This is the order of consumption in the households of Karachi, for instance. In London it is 263 l/day, in the USA 635 l/day. Modern agriculture, too, raises the demand for water... In the food industry the unit consumption is correspondingly higher because of the multiplicity of processes which need water. A tonne of bread produced industrially consumes 2100-4200 litres of water; in the UK 1000 [litres] of beer has been needed... 10000 litres of water for its production, and in the USA the same quantity of beer has needed 15200 litres of water: American beer is either cleaner or weaker than its British counterpart, we may suppose. A tonne of steel may need 8000-12000 litres of water at the steel mill, and a single automobile some 38000 litres while at the factory... All these data are for the 1960s and the magnitudes are now probably lower because of improved efficiency, but... [i]ncreasing knowledge of scientific hygiene leads to raised requirements for clean water... [T]his usually means industrially based treatment, with filtration to remove sediment and organic matter, aeration, sterilization with ozone or chlorine to kill micro-organisms, and possibly further chemical treatment to adjust the pH. All this may well necessitate the use of energy, not only in constructing the facilities but in pumping the water between source, storage, treatment and use. In [Last World] nations such water treatment is less common, with various diseases... being a common result... To bring clean water to all users is a major task... [I]n Tanzania it means getting it to 20 million rural inhabitants. These schemes will in some places compete with agriculture for water resources which are in limited supply... Since the 1960s attempts have been made to increase the number of condensation nuclei in clouds by scattering substances such as silver iodide from aircraft: it has been claimed that one gram of silver iodide can produce 250 x 10[00 cu.] m of rain. [However, t]he statistical problems of interpreting the results are considerable (would it have rained anyway?) and the legal difficulties are a paradise for lawyers who are called in to arbitrate (whose rain is it?)... [Subsequently,] weather modification seems unlikely to be as important a resource as ground and surface water, and so environmental modification is... more productive...

The practice of using our seas as international dumping grounds must be stopped. HRH The Prince [of Wales] said, when opening the North Sea Conference in 1987, that the North Sea is 'not a bottomless pit for all our waste and it makes no sense to test it to destruction'. Britain was a willing signatory to an agreement to stop dumping toxic materials harmful to the marine environment in the North Sea by December 1989. Well into 1990 the T[ory] government is shown to be full of broken promises and confirms Britain's reputation as the 'dirt... of Europe'. Britain is the only North Sea state to continue polluting the seas in this way. An international monitoring commission must have powers to deal with pollution, whether it be on land or sea or in the air, and any penalties must be severe enough to ensure that it is not financially worth while to pollute. Too often it is cheaper to pay fines than invest in alternatives. In 1987 reported incidents of river pollution in Britain numbered 23,253, of which 1,402 were categorized as 'serious'. Yet only 288 prosecutions were made, and many of those convicted were given conditional discharges or small fines. Considering that the river authorities themselves were responsible for over one fifth of these incidents, it is no surprise that industrial polluters fail to take the new Green Bill seriously... Successive governments' neglect of [Britain's] water systems means that to bring drinking and bathing water quality up to minimum EEC standards would cost approximately £39 billion. 'Liquid Costs', an environmental report on water written by... Leeds University, concludes that only 30[%] of the £18.6 b... of government money earmarked for capital spending by the ten new water companies will be used on environmental improvements. The remainder is needed for government neglect. If EEC standards are to be complied with, water bills for consumers will have to soar. Under the government's privatization scheme, the report concludes, river pollution will become worse because the

government has relaxed the controls on sewage discharge to make ownership of shares in the industry more attractive. This report was suppressed until the Water Privatization Bill was on the statute book. While the... government has made noises about the level of pollution and damage to the eco-system, it has been busy cutting funding in those very areas seeking to promote better understanding of the biosphere. Government spending on environmental research was £161.2 m... for the year 1988-89, contrasted with a defence budget of £19,215 m... Spending by the energy-efficiency office was slashed by £6 m... in the year 1987-88 from a high of £24.5 m... in 1986. The Select Committee on Energy in July 1989 said, 'The government's cutting of the Energy Efficiency Office's budget shows misplaced complacency... it indicated a misjudgement both of the evidence and the analysis of this issue.' Her Majesty's Inspectorate of Pollution set up in April 1987, supposedly at the heart of the government's commitment to all things 'green', has been a dismal failure. The director, Brian Ponsford, who committed suicide in December 1989, had written a damning report of the Inspectorate's activities. Lack of money and staff and low morale had meant that monitoring undertaken by the Inspectorate was woefully inadequate. Britain had [32] full-time anti-pollution police, while Holland had 1,000 staff and the U[S] Environmental Protection Agency 20,000 staff for air pollution alone... The privatization of the electricity industry means maximizing profit by maximizing consumption rather than by promoting energy conservation, which is essential if we are to combat the greenhouse effect and to preserve fossil fuels for future generations. If this or any other previous administration had poured the money used for research into the nuclear industry into the promotion of energy conservation and alternative renewable energy resources, we would today be well on the way to having a safe, clean renewable energy supply. Britain is one of the largest importers of other people's toxic waste and plans to build more incinerators. In 1986 it disposed of... 1,580,000 tonnes of toxic waste, and in 1988 saw the importation of over 100,000 tonnes of dangerous waste on the grounds that the UK has the advanced technology to deal with it. The truth is that British laws are more relaxed than those of the country's counterparts and... profit is more important than either health or safety. However, when faced with public pressure, angry environmentalists and tightening controls, some companies have sought to export their hazardous cargoes to [Last World] countries where... the... high cost of toxic-waste disposal... (approximately... £20 per tonne in Africa... compared with... £750 per tonne... in [First World] countries...) make the [Last] World an attractive dump. When [Last World] countries pressed the [First World] countries to stop dumping waste on their territories, the [First World] refused to agree. Indeed, the U[S] objected to a clause in the UN Environment Programme that required exported waste to be handled just as safely in the receiving country as in the exporting country. This led Greenpeace... to say, 'The Basle Convention was not drafted in the spirit of compromise. The demands of [Last World] countries for protection from the international waste trade have been largely ignored. [First World] countries had the power to stop waste exports to the [Last] World; instead they opted to legalize them.' It makes no global sense at all to transport toxic waste over long distances, so that the chance of accident during transportation becomes greater... it is far better and more sensible to transport the technology capable of dealing with toxic substances until we are in a position not to produce the dangerous chemicals in the first place... British Nuclear Fuels Limited (BNFL) actively seeks contracts for reprocessing nuclear waste from abroad and maintains that these are vital for its business and Britain's balance of payments. At present most spent fuel from abroad and the UK goes to Sellafield, where it is stored under water to await reprocessing and the extraction of plutonium. The spent rods inevitably corrode and contaminate the water with radiation. In 1988... a radio interview with... BNFL... went something like this: PK: "[...]Do you think it morally wrong to import dangerous substances from abroad, like nuclear waste, which poses a threat to the health of people?]" BNFL: "[...]It is not right to call it nuclear waste. It is spent fuel, a valuable commodity, and by your continued insinuations you are ruining a multi-million-pound industry, which profits the people of this country." PK: "[...]You are therefore prepared to put profits before the health and safety of the people." This is... a draft letter to the then UK Energy Secretary... [from the then chairperson of the] Central Electricity Generating Board (CEGB)... 'We are under attack from environmentalists and our critics for storing Magnox fuel in water. The attack is difficult to answer because it is basically correct...' BNFL was reported recently to have told workers to stop fathering [kids] because of the risk of cancer... [Britain's PM, the Iron Maiden,] proclaims that nuclear power is the only solution to the greenhouse effect, deftly plucking us from the fire and into the radioactive frying pan... Only a minority of countries have nuclear power stations and in all but France and the countries of Eastern Europe nuclear power generates only a fraction of the energy required (in Britain, despite [the PM]'s advocacy, a mere 7[%])... Every stage of the atomic cycle, from mining the uranium to transportation and reprocessing, from the operation of the Chernobyls and Harrisburgs of this world to the unsolved problem of what to do with ever-growing quantities of waste, is fraught with difficulties... The USA hasn't seen the construction of a new nuclear power station since the 1976 Three Mile Island accident. Austria, Sweden and a host of European countries are phasing out their nuclear power programmes, while even France and the USSR are seriously questioning their commitment to this source of poisoned power... Fast-breeder reactors, which... can generate up to seventy times more energy than conventional power plants, may be seen as another nuclear way forward. But breeders are difficult and dangerous sources of energy, as they operate at very high temperatures, use highly volatile sodium as a cooling agent and contain 4-5 tonnes of plutonium... Fusion is heralded as a new source of electricity too cheap to be metered, just as fission used to be, but it is both technically a distant prospect and has its own risks. Although the risks of catastrophic meltdown or explosive nuclear reaction would not apply, fusion would produce large quantities of waste... Their life may be much shorter than that of fission reactors; [20] years has been mentioned. Neutron bombardment in the reactor would induce radioactivity in some materials that have very long lives. The niobium which is necessary to contain corrosive lithium has a radioactive half-life of 29,000 years. Permanent waste storage would be needed for these substances... [T]he former chair[person] of the... CEGB[-] ...an enthusiastic exponent of the nuclear dream[- has] stated, 'The chance of it [fusion] being commercial is zero.'

...Of the 103 chemical elements present on our planet, only 20 are actually made use of by animals and plants. Of the rest, most are damaging to living organisms... All living creatures are exposed to background radiation, some of it emanating from outer space and some from radioactive substances... which occur in rocks, soil and seawater. Radiation is measured in becquerels, one becquerel being equivalent to one atomic disintegration per second. On average, a human receives... 60,000 becquerels from natural sources. The radiation comes from outside the body as well as from natural radioactive substances, such as radioactive potassium, taken in with food. Such exposure cannot be prevented, although it can sometimes be reduced... Plants and animals have little choice but to live with natural background radiation, and... have protective mechanisms to combat the damage it does. But if such radiation is unavoidably part of life, that does not signify that additional amounts from [hu]man-made sources are harmless. The evidence is that a small addition to the natural levels will cause an increase in disease - and that, in some cases, even background levels can cause cancers and genetic damage. Yet, over the past 40 years, as a result of human activity, ecosystems have become increasingly polluted with radiation-emitting substances. After more than 1,000 nuclear weapons were tested by exploding them in the atmosphere, the fallout of radiation covered the Earth in a fine radioactive dust, containing highly carcinogenic plutonium, a few grains of which, taken into the lungs, can significantly increase the chances of lung cancer. Plutonium will remain an environmental hazard for tens of thousands of years... To fuel nuclear power stations, now the major source of electricity in some countries, notably France, uranium must be mined... To obtain the uranium to run one nuclear reactor for one year requires 100,000 tonnes of rock to be brought up to the surface, most of which gets dumped... on the surface... 90[%] of the original radioactivity in the rock remains in the tailings. The number of reactors that need fuelling is increasing every year, and thus the mountains of tailings increase day by day. Nuclear power plants, meanwhile, produce an extremely dangerous cocktail of radioactive substances... [S]plitting... the atom increases the original radioactivity in... uranium a million times... To date, there is little agreement of the best way to dispose of such waste. Proposals vary from sending it by rocket out to space to burying it deep in the ground. The large quantities of low-level waste produced in operating nuclear installations are meanwhile discharged into the environment within limits set by governments - even though the evidence that they are damaging the environment is now overwhelming. Accidents have occurred at nuclear

installations with depressing regularity, frequently releasing radioactive substances into the environment. The most devastating accident to date took place in April 1986, when a reactor at Chernobyl in the Ukraine exploded. [‘The Soviets tried to hush the incident up while young army conscripts were brought in to help clear up. With no special protective clothing available they had to improvise. The level of radioactivity was so great that each conscript was allowed to work for a single two minute period. They had to rush in and rush out.’] Hundreds of thousands of people had to be evacuated. Four years [la]ter... people were still being moved. Levels of radiation... 400 km... from Chernobyl are still between 8 and 25 times more than the background average. - 1990

...in December 1990... [came] the news... that radium from the earth’s crust has been brought to the surface in decades of oil drilling, causing widespread radioactive contamination of the... world’s... oil fields, and through them of its water, drainage systems, and soil... [H]ow many executives in high places would continue to love fossil fuels if in the price of oil and gas and coal there would be included the staggering costs of environmental degradation their products unleash on the planet and its inhabitants, including people? ...Similarly... [it] is doubtful if utilities and/or consumers of electricity would care to pay for the thousands of years of disposal costs of nuclear waste... As the hidden costs of nuclear and fossil fuels come into the light, the perceived costs of conservation and of solar power will come down dramatically. Their costs would also come down absolutely because of the much greater research and development that would be put into solar energy and conservation. But even more than that, it becomes clear that not just one major energy source will be the “silver bullet” on which the economy must run. A variety of renewable energy sources, adapted to different regions, with a different mix in each region, would then come into focus and sharply influence the way economists, business[people], labor leaders, and politicians would think about the priorities and the efficiencies of successful production.

...In the present crisis, there is blame enough to go around. The world market has no mechanism for establishing the true scarcity value of the dwindling petroleum reserve... The political stampede away from nuclear energy has gone to increase the opaquing of the infrared window of the planetary greenhouse. The planetary catastrophe invited by continued increase in the combustion of fossil fuels compels re-examination of the nuclear alternative... So urgent is the situation, as long as the concentration of carbon dioxide in the atmosphere continues to rise, that even the free-lunch alternatives – wind, tide, geothermy, and the rest – must be re-examined. By the time the UNCED conference convenes[in Rio de Janeiro later this year], the world may be ready to respond to rational counsel. That will mean stretching the time horizon of public investment in research and development beyond that by which the members of the world’s business and political communities now live. [Editor’s note: ‘The value of a fuel – any combustible material used as a source of heat – is determined by the ratio of the heat released (measured in calories or B.T.U.s) to the fuel weight. The more common fuels consist largely of some form of carbon or hydrocarbon. Combustion occurs through an exothermic reaction involving the rapid union of the carbon and hydrogen in the fuel with oxygen, releasing energy in the form of heat. Petroleum is the chief liquid fuel while coal is the most important solid fuel, but also used are other carbonaceous material such as vegetable waste, straw, peat and wood’.]

...wood, for 2 billion [Last World people, still] supplies substantially all of the energy available to them external to their bodies[– it] cooks their food and warms their homes... – [while] most of the world’s households... still [live] a kilometer or more distant from their water sources... Early in the history of agricultural civilization, people engaged falling water to turn millstones and the wind to do the work of oars... The water wheel and the sail exchange motion in one direction for motion in another[(‘water wheels – which were an important source of power until the turbine was introduced at the beginning of the 19th century – convert the energy of moving water into rotary motion; the three types used – the overshot, undershot, and breast – may reach efficiencies of 85%, 35% and 75%’ respectively)]... It was an entirely different kind of energy exchange that started industrial civilization. The steam engine transformed the energy of heat to the energy of motion. James Watt invented the term horsepower to describe the superhuman power of his steam engine to do work... After Watt, people learned to transform the energy of heat not into motion but into electricity, and then into radiant energy, and then into chemical bonds, and back again and across the circle from one form of energy to another at will. By the middle of this century, energy-transforming machines had taken over the toil of human beings in the [First World] countries. These machines summon enormous power to do work. They lift and move, hammer and squeeze things in masses, with forces and at velocities that no number of people and beasts could together manage. With a command of energy on this scale, people have been making materials that enlarge and diversify their command and use of such energy. Thus, to increase the working temperature of gas turbines, and so the efficiency with which they transform heat to motion, they make the turbine buckets of a ceramic reinforced by single-crystal inorganic whiskers or fibers. These “composite” materials retain tensile strength at high temperature better than any metal against the immense centrifugal force exerted by the spinning of the turbine. Employing another class of ceramic, the semiconductors, people have learned to make energy and information interchangeable... Machines that interchange energy and information are now doing the work of human nervous systems as well as of human muscles. - 1992

One of the basic tenets of our reigning belief system is that unlike animals, human beings can choose. And, by making choices, they can become architects of their destiny. Put another way, this proposition states that all of us individually and, more importantly, collectively, may be capable of envisioning, designing, putting in place and, above all, controlling what, in the broadest anthropological sense, we call “culture.” Yet, if we subject this “rosy outlook” to a careful consideration... first we begin to wonder, then to doubt. Let us take a case of our culture “in action”: the case of nuclear fusion. Way back in the 1940’s, physicists... began to ponder the notion of using... the same reaction that powers the sun, to generate power on earth. In 1951, one early fusion “prophet” predicted a fusion power plant within five years. Seven years later... the director of the new US Government fusion energy programme insisted that a full-scale fusion energy reactor was almost a certainty... providing that “enough ingenuity and hard work” were brought to bear on the problem. [The director] also added: “luck.” [Although ‘scientists at Los Alamos, N. M., produced a controlled thermonuclear fusion reaction for a few microseconds in 1960’, b]y 1971, his successor less sanguinely foresaw an operating demonstration fusion plant only[by] 1995. Today, after forty years and the expenditure of some \$20 billion by the U[S] and a few other countries, no one seems close to making electricity from tiny [hu]man-made suns. However... this is hardly going to halt in its tracks the juggernaut set in motion by human hope. Only half a year ago, a special advisory committee suggested... it was only necessary... to hike... steeply... the fusion budget in order to build a demonstration plant by... the year 2025, and to have one commercial reactor fully operative by 2050! The juggernaut relentlessly proceeds down its track in spite of any naysaying to the contrary. One physicist at the... University of Maryland [sai]d: “Fusion is thirty years away, and always will be... Except now it seems to be sixty years away.” Is this an example of humankind in control of its destiny? ...I would like to add that one gigantic barrier to the development of fusion power, at least in the modalities considered through science or hope, to be feasible, is its environmental effect. For we have not been fully informed that the process is not as “clean” as advertised. And that, in turn, raises another question in the context of my thesis: “How can we become masters of our fate if those purporting to be in command of our culture, and to control it, hide the truth?” A hum]an’s judgement is only as good as the valid information that supports it... [T]he widely touted fusion process... spew[s] out neutrons which... can turn almost any material radioactive. This problem has so far been considered unsolvable by the “crowned heads” of fusion. Yet, for nearly twenty years, a brilliant Yugoslav-born physicist and inventor... has been developing a new “migma” process to achieve non-radioactive fusion, otherwise known as “aneutronic energy”... “Migma”, which uses NON-radioactive deuterium as a fuel (available in nearly UNlimited quantities from sea water[; it]... is interesting to note that Deuterium, or ‘Heavy Hydrogen’, is what powers the ‘H’ Bomb[– a] pound of this fuel at less than a hundred dollars... will produce the power of \$75,000 worth of fossil fuels[– but the]... proposed methods of producing cheap deuterium now have already become details of the suppressed past...), does NOT produce radioactive waste[,] can be converted DIRECTLY into electricity (without

energy-wasting steam turbines), and can be constructed small enough to power a house or large enough to power a city... The only trouble is that, after performing four experiments at a cost of \$17 million... to increasingly demonstrate the potential of the new system... his Advanced Physics Corporation have... been unable to find support and funding necessary for a fifth crucial experiment that bids fair to establish what is known as “proof of principle.” In comparison to the staggeringly huge amounts of money allocated over the years to fusion, those required for this fifth stage are minuscule: \$3.5 million. Nevertheless, applications for this paltry amount have been turned down by the US Energy Department on the basis of “peer reviews” in which various scientists, hiding behind a cloak of anonymity, maintained... the four former experiments were “scientifically flawed.” ...despite the fact that members of [APC]’s Board of Directors and Scientific Advisory Board bear nationally recognized names, including those of two Nobel Laureates in physics... [I]t seems that establishmentarian “powers that be” have not seen fit to back a promising new overture that would cost figuratively, if not virtually, no more than “pennies”... [A] high-ranking scientist at the Princeton Plasma Physics Laboratory has said: “The top two inches of Lake Erie contain 1.6 times more energy than all the world’s oil supplies.” Why, then, have our national leaders continued to insist that a full-scale effort be made to locate more of what is colloquially known as “Black Gold?” Why haven’t they sought to unlock the power hidden in water with keys other than the “fusion key?” Do we humans presently dominate our culture in that respect, or does the “King Oil” aspect of it dominate us? Can water be made into fuel? The question is no longer rhetorical. Fuel from water is a fact... it has sprung from the inspiration of a Bulgarian-born [US]n inventor... whose travails I have followed for... six years. [The Bulgarian]’s story is one of struggle, and survival, the story of an innovator and his conception, one still considered by many moguls of science as pure fantasy, yet courted by many entrepreneurs of dubious ethics as a potential bonanza. It is the story of a machine able to crack water into its two constituents... and to burn both of them together safely with out risk of explosion, a result almost universally considered impossible. It is also the story of the flame produced by that burning, a flame with properties so remarkable that they are confounding scientists in the laboratories of many countries... [(t)he flame burns through bricks with a speed impossible to reproduce with hand-held oxy-acetylene welders and reduces them to very dense and hard lumps of glass; and]... when... applied to the tip of a tungsten rod, there is intense light and the dimensions and mass of the metal are reduced by what appears to be vaporisation[– t]he temperature for the vaporisation of tungsten is supposedly 5900°C)]... To do... that story... full justice, to get all the intricacies of it, the genius of it, the politics of it and its “politics of science”, would demand a whole book. What can be asked here is the overall question: “Why are those responsible for our energy future not investigating the new avenue opened up by [the Bulgarian]...?” ...Migma WORKS, already producing at least three watts of power for every watt put in... A few years ago, Carr was advertising his model A-X1 energy system that produced 15,000 watts from an input of only 5000 watts... In “Return of the Dove”... Carr is mentioned having... started a company which dealt with “free energy”. Supposedly, certain aspects of his “free energy” device were incorporated in his “Amusement Device” patent (2,912,244)... It took... [an inventor from] Blacksburg, Virginia... six years of legal hassles to get his “free energy” motor patented... Patent... # 4,151,431... [is his] motor... in which the power is generated by magnets alone... Professional sceptics were stumped, a generation or two ago, by an invention in Utah. Incredulously, people witnessed a working “free energy” device... [Scientists] mailed impressive credentials ahead to open the inventor’s workshop door, then strode into examine his tabletop apparatus from all angles, poking it and interrogating him in their search for evidence of fraud. Scientists were allowed to dismantle everything except a delicate two-ounce component, the Radiant Energy detector. When the unit was put back together, they ended up witnessing – but not all believing their eyes – as the self-contained unit converted some unknown energy into useable power, and ran continually for days at a time. Without any moving parts, the device produced a strange cold form of electricity which lit incandescent bulbs, heated a flat iron and ran a motor. The inventor – T. Henry Moray, D.Sc., of Salt Lake City – in the late 1920’s was a confident 33 year old engineer with a young family and a gift to give humanity. The gift was his Radiant Energy invention, which as [Henry] saw it converted power from the cosmos – from rays which, on their eternally-launched flights through space, constantly pierce the earth from all directions... “Energy can be obtained by oscillatory means in harmony with the vibrations of the universe... the Moray Radiant Energy Device is a high-speed electron oscillating device.” [Henry] also said that those vibrations continually surged onto the earth like waves onto a seashore... [Henry said his device could generate power] in the middle of the Sahara Desert or in the deepest mine... The power... would come in so strongly during the day that it would burn out [the] detector... Despite his self-confidence, there were hints that [Henry] might be stopped from mass producing his device. His family was harassed by mysterious threats. “Your husband’s life is not worth a plugged nickel unless [it] co-operates on Radiant Energy”, an anonymous caller told [Mrs] Moray over the telephone. Their home was repeatedly broken into when the family was away, as if in warnings of worse to come... Since the device seemed to go against current “laws” of physics, professional doubters went to ludicrous lengths in attempts to dismiss it as a hoax. Moray’s sons remember the family laughing about a visitor who saw the device working in Moray’s basement. [The visitor] insisted that “Mrs Moray was secretly powering it; [the wife] must have been pacing back and forth on a carpet upstairs and generating static electricity!” Would-be debunkers, sabotage and lack of funding were only some of the obstacles in the way of further developing the invention. Because of betrayals, Henry... eventually distrusted people outside his family and... guarded his technical secrets closely – even to the point of losing a potential business deal... [Ironically,] Henry offered his Radiant Energy discovery to the... [US Government during a 1925 meeting] with... Senator Reed Smoot... Free of cost. According to... the book... The Sea of Energy – In Which the Earth Floats... the senator thanked Moray but replied that the government would decline such an offer. Why? “On the grounds that the government was not competing with public utilities.” Undeterred, Henry spent countless hours in his basement working on solid state physics with what [it] called the Moray Valve as a detector for radio frequencies. According to his records, early in the 1930’s [Henry] made a radio which was no bigger than a wristwatch. Parts of Henry’s invention was his pioneering use of semi-conductors. Moray’s first germanium solid-state device (a transistor) was sent to the US Patent Office in 1927, and was rejected on the basis that it would not work without a heated cathode. Heated cathodes were commonly used in vacuum tubes of that time. This means that Henry... was so far ahead of his time in semi-conductor technology that the patent office had not heard of it, and so the bureaucrats decreed that what [Henry] had was impossible. Of course society later learned that cold cathodes are most definitely possible. But when the transistor was officially invented 20 years later, no credit was given to... Moray. The second generation of Moray’s radio valve not only picked up radio waves, it also detected a small amount of power. Launched by these experiments with semi-conductors, [Henry] followed a trail of discovery which led to his powerful energy converter. By 1939, a unit weighing less than 55 pounds, including its wooden case, converted 50,000 watts of power – enough to run a small factory. [Henry] tested it 90 miles from the nearest radio station, at a desolate area now known as the U.S. Army Dugway proving ground, and the device still worked. Witnesses to his experiments included engineers and curiosity-seekers from other countries as well as local visitors from Utah Power and Light, the Secretary of State’s office in Utah and other officials. As far as this author can discover, no one refuted... Moray’s claim that his Radiant Energy device did run motors, light bulbs and a radio. The invention had unusual characteristics. Photographers exclaimed over the intensity of the light from the bulbs – remarkably more bright than... 150-watt bulbs normally shone... Despite death threats, Henry... repeatedly worked on his strange electric generator in front of creditable witnesses. The only threat which stopped him from demonstrations came in the form of advice from his patent attorneys in Washington DC – under patent laws [Henry] could have lost his rights to a patent if [it] showed his invention to just anyone. The US Patent Office itself was not much help either. That agency rejected seven patent applications for his Radiant Energy Device... In one attempt by intruders to break into the Moray house in 1931... someone... shot the Morays’ watchdog... Violence in Henry’s lab... also shocked the family. A[n assistant]... who had been sent by the Rural Electrical Administration to work in Moray’s lab went crazy with a sledge hammer... one day. The [assistant] destroyed the Radiant Energy machine... What type of person would hammer an important invention into useless pieces – destroy a device which took years to perfect and which contained expensive almost-

irreplaceable parts? [One of Henry's sons] describes the saboteur as "a double agent trying to force Dr Moray to co-operate with the US Department of Agriculture's R[EA] and a communist government"... From then on, trouble multiplied. Henry... refused to co-operate further with the REA... His family later discovered that more than a dozen of Henry's original patent applications had disappeared from the U.S. Patent Office, although the file jackets remained there. "The contents and applications themselves are gone... Watergate was not the first great coverup and act of duplicity," [Henry's son later] wrote. Who stole the... patent applications? ...the question will probably remain unanswered. Over half a century after... Moray's discovery, his sons are still waiting for an investor who will fund the expensive development of the Moray device; engineering problems still have to be solved. Some researchers believed that... Moray's secrets died with him and that the family and associates would not be able to replicate his device even if they had funding... This incident is only one example of difficulties facing independent inventors of unorthodox energy devices... Federal employees worked with a vengeance when instructed to destroy the work of scientist Wilhelm Reich, MD, at his lab... in the state of Maine. Their 1956 court injunction said that construction materials in... Reich's boxlike "orgone accumulator" could be salvaged, but the workers slashed the Celotex panels into useless junk. Down the coast in New York, Reich's associates... were forced to load the literature in the Orgone Institute stock room into a large truck. The freight truck dumped the papers at a Lower Manhattan incinerator, for an FDA-ordered book burning. The American Civil Liberties Union stepped in when it was too late, with a press release saying that the court order was a violation of free speech because only one of the torched books could be considered... to promote or explain the controversial orgone accumulator. (Orgone... – energy of the organism... – ...is the name Reich gave to a life force which [Reich] discovered to be within and around all living organisms, including the earth... It is not a biological radiation, not electromagnetic, and an Oslo radiologist confirmed that no standard nuclear radiation was present... Instead, it corresponded more to the Hindu concept of prana or to the Chinese concept of chi...). The... press release said, in part, "It is a serious challenge to freedom of the press, principles of free thought on which our democratic government is based, for an agency of government to take advantage of such a dragnet injunction to thwart the dissemination of knowledge, however eccentric or unpopular that knowledge may be." ...No major newspaper used the press release. Furthermore, six scientists and educators sent all major papers in England a letter of protest about the book-burning and Reich's sentencing. All the papers remained silent on the topic. What was the suppression of Reich's scientific work really about? It was apparently about more than just the FDA's responsibility to protect supposedly gullible consumers from spending money on devices which the FDA decreed as useless... Some observers wonder if his free-energy invention played a part in the squashing of his scientific writings and the obliteration of his reputation. Reich claimed that h[is invention] could power an electric motor with concentrated atmospheric energy. Did economic interests want to crush that possibility? Or... [d]id mechanistic-minded people, in positions of power, fear being shown that they and the earth itself and the universe are filled with streamings of a vibrant, pulsating unpredictable life force? Reich's experiments indicated that this living force could actually be measured in terms such as heat or movement, and that it is present in varying degrees depending on sickness or health of the organism. And that this life-giving substratum is bothered by high-voltage power grids and is in effect irritated into a frenzy by unnatural levels of nuclear radioactivity... [(m)measurements inside the accumulators would swing strangely... after atomic testing[])... Reich's biographers hint that squashing of writings about a dynamic atmospheric force in the 1950's was related to the fact that the atomic power industry was emerging at that time; it would not do for the public to debate whether atomic fission and its byproducts turns life force in the environment into a destructive presence which Reich called Deadly Orgone Radiation. Nor would the atomic power industry want people to connect droughts and anomalous weather with atmospheric DOR... A third possibility is that the unprecedented opposition came from the orthodox medical community. The orgone accumulator... was a simple medical-treatment box which concentrated the previously-unknown energy by a certain layering of absorbent organic and reflective inorganic materials. Experiments showed an anomalous rise in temperature inside the box, and even Albert Einstein had experienced this phenomenon under Reich's tutoring. Although Reich himself never claimed... the accumulator cured cancer, patients of a number of physicians reported that they were helped with various conditions by sitting in an accumulator or being treated with a smaller accumulator called a shooter... While confined to his bed a couple of days, an Edinburgh professor doodled up a method of using ocean wave action to produce an amazing amount of electric energy. Large pods shaped something like a duck simply bobbed up and down in a pumping action that used 90% of the waves' energy. Scale models actually functioned perfectly and indicated that larger units should produce hundreds of kilowatts... Not one to stay at the vapourware level of ideas, [an Austrian named Viktor]Schauberger picked up his tools and built hardware. From watercourses to agricultural implements, his constructions attracted praise from users. Then [Viktor] turned to extracting electrical energy directly from the flow of water and air. "They contain all the power we need." Hitler had heard of the... [Austri]an through an industrialist. After Germany took over Austria in 1938, word came to Schauburger that [it] would be hired to plan log flotation structures in Bavaria, Bohemia and North Austria, and that furthermore [Viktor] could use a professor's lab... in Nuremberg for his research. Viktor... sent for his son[, who] had studied physics in university and was said to find that some of his father's concepts were foreign to the way [it] had been taught to think. However, [the son]'s scepticism crumbled during the experiments they conducted. [The son] contributed useful techniques himself, and the duo were soon extracting 50,000 volts from fine jets of water at low pressures. A physicist from a nearby technical college came; his first action was to search for hidden wires. When [the physicist] could find none, [it] lost his temper and asked... where [the duo] had hidden the electrical leads. Eventually [the physicist] had to admit that there was no trick involved; the experiment was valid. However, [the physicist] could not explain such a high charge from water. After... W[W2] interrupted their experiments, and [the son] had been drafted, Viktor was ordered to undergo a physical examination supposedly related to his forthcoming pension. However, says [his]biographer... "it looked like an engineering and architectural association was behind this demand for a check-up." Viktor... unsuspectingly showed up, but was whisked to another clinic... in... the mental hospital... Registering almost a hundred patents, [Nikola Tesla] is the inventor of... basic developments in high voltage, electric motors, oscillators etc. Almost everything that touches our lives in the 20th century has been brought out to the world by Tesla... arguably the greatest inventive genius... at least as far back as Leonardo. What a shame and an indictment of our educational institutions that his name enlists barely a mention here and there in the hallways of learning. When pressed, our vaunted electrical engineers, who in fact owe their livelihood to Tesla, will tell you... Tesla invented alternating current and "the Tesla coil"... the poly-phase alternating current system of power generation... which they play around with every so often when they have to. But they will probably not be able to tell you anything about his other... basic patents... Or his invention of the radio (well before Marconi) [and] x-rays... Or his ability to fetch electricity from the ambient atmosphere... and his experiments with transmitting electricity around the globe to virtually anywhere... ['By this discovery Tesla proved the Earth could be used as a conductor and would be as responsive as a tuning fork to electrical vibrations of a certain frequency.' 'It has been reported by various writers that during his power transmission experiments in Colorado, Tesla succeeded in lighting up a bank of 200 50-watt incandescent lamps wirelessly, 26 miles from his station. In his own writings, however, no such claim was ever made, nor is there other evidence that Tesla did so. What Tesla actually wrote was that, by use of the magnifying transmitter, it had passed a current around the globe sufficient to light 200 incandescent lamps'.] *Towards the close of 1898[1 (Tesla) undertook] a systematic research, carried on for a number of years with the object of perfecting a method of transmission of electrical energy through the natural medium, [which]led me to recognize three important necessities: First, [I needed]to develop a transmitter of great power; second, to perfect means for individualizing and isolating the energy transmitted; and third, to ascertain the laws of propagation of currents through the earth and the atmosphere... It was on the third of July... when I obtained the first decisive experimental evidence of a truth of overwhelming importance for the advancement of humanity... Impossible as it seemed, this planet, despite its vast extent, behaved like a conductor of limited dimensions. The tremendous significance of this fact in the transmission of energy by my system had already become quite clear to me. Not only was it practicable to send telegraphic messages to any distance*

without wires, as I recognized long ago, but also to impress upon the entire globe the faint modulations of the human voice, far more still, to transmit power, in unlimited amounts, to any terrestrial distance and almost without any loss. With these stupendous possibilities in sight, with the experimental evidence before me that their realization was henceforth merely a question of expert knowledge, patience and skill, I attacked vigorously the development of my magnifying transmitter, now, however, not so much with the original intention of producing one of great power, as with the object of learning how to construct the best one. This is, essentially, a circuit of very high self-induction and small resistance which in its arrangement, mode of excitation and action, may be said to be the dimetrical opposite of a transmitting circuit typical of telegraphy by Hertzian or electromagnetic radiations. It is difficult to form an adequate idea of the marvelous power of this unique appliance, by the aid of which the globe will be transformed. The electromagnetic radiations being reduced to an insignificant quantity, and proper conditions of resonance maintained, the circuit acts like an immense pendulum, storing indefinitely the energy of the primary exciting impulses and impressions upon the earth and its conducting atmosphere uniform harmonic oscillations of intensities which, as actual tests have shown, may be pushed so far as to surpass those attained in the natural displays of static electricity... Much has already been done towards making my system commercially available, in the transmission of energy in small amounts for specific purposes, as well as on an industrial scale... The Canadian Niagara Power Company have offered me a splendid inducement, and next to achieving success for the sake of the art, it will give me the greatest satisfaction to make their concession financially profitable to them. In this first power plant, which I have been designing for a long time, I propose to distribute ten thousand horse-power under a tension of one hundred million volts, which I am now able to produce and handle with safety. This energy will be collected all over the globe preferably in small amounts, ranging from a fraction of one to a few horse-power. One of its chief uses will be the illumination of isolated houses. It takes very little power to light a dwelling with vacuum tubes operated by high-frequency currents and in each instance a terminal a little above the roof will be sufficient. Another valuable application will be the driving of clocks and other such apparatus. These clocks will be exceedingly simple, will require absolutely no attention and will indicate rigorously correct time... There are innumerable devices of all kinds which are either now employed or can be supplied, and by operating them in this manner I may be able to offer a great convenience to the whole world with a plant of not more than ten thousand horse-power. The introduction of this system will give opportunities for invention and manufacture such as have never presented themselves before. Knowing the far-reaching importance of this first attempt and its effect upon future development, I shall proceed slowly and carefully... But I am hopeful that these great realizations are not far off, and I know that... the great truth accidentally revealed and experimentally confirmed is... that this planet, with all its appalling immensity, is to electric currents virtually no more than a small metal ball... and... that... the energy of a waterfall... can be transmitted to any... point of the globe... – on sea, or land, or high in the air...! - 1994

An energy crisis of immense proportions looms ahead if alternative sources of energy are not found and exploited before petroleum begins to run out. Nuclear energy is one of the... solutions to the world's chronic energy problems... However, the safety of the plants must be ensured and nuclear wastes have to be managed properly... if nuclear energy is to be considered a viable alternative energy source. Much research has been done on fusion energy... but... [u]nless a major breakthrough is made soon and the technology is rapidly commercialized, fusion would not figure significantly as an energy source in the near future... The potential for geothermal energy is enormous, and that of the U.S. alone is about 10 times the heat energy of all its coal deposits... In... areas without natural geysers, geothermal energy can be extracted from fractured, hot, dry rock, in a method whereby water is injected into deep wells and steam is recovered. Unfortunately, overproduction of steam fields such as The Geysers in California... the largest geothermal electrical generating plant in the world, could rapidly deplete this... natural resource. The geopressed energy deposits beneath the Gulf Coast off Texas and Louisiana are a hybrid of geothermal energy and fossil fuel in reservoirs of hot gas-charged seawater. The deposits were formed millions of years ago when seawater was trapped in porous beds of sandstone between impermeable clay layers. Heat building up from below was captured in the seawater along with methane from decaying organic matter. As more sediments piled on, the hot gas-charged seawater became highly pressurized. Wells drilled into this formation... not only tap geothermal energy but also natural gas, providing an energy potential equal to about one-third that of all coal deposits in the U[S]... Another successful energy alternative is solar energy... The sunlight striking the Earth is equivalent to about 15,000 times the world's present energy supply... The manufacture of solar cells... with an optimum efficiency of about 20[%]... is very expensive, however, making large-scale use uneconomical. But less efficient solar cells can be manufactured in mass quantities at greatly reduced prices. A more successful means of converting sunlight into electricity are vast arrays of solar collectors combined in solar farms... Sunlight is focused into a powerful narrow beam by banks of heliostatic mirrors that automatically track the sun as it travels across the sky. The light beam is directed onto a central receiving station, where the intensified light heats a boiler and superheated steam drives a turbine generator. At present, however, solar power stations cannot compete economically with conventional fossil fuel generating plants. But this could change as fossil fuels become scarce and expensive. Commercial and residential buildings can utilize solar energy to supplement conventional water heaters and furnaces... The Sun Belt states of the Southwest, which receive a generous supply of sunlight, can take full advantage of this type of solar energy... In windy locations, such as seacoasts, where the offshore and onshore wind currents are reliable, utilities construct large windmills to generate electricity... About 90[%] of the U.S. wind power potential lies in 12 north-central and western states. The wind also drives ocean waves, which could be harnessed... Trapping tidewaters in enclosed bays is a means of generating electricity from the power of falling water. [‘Also some natural WATERFALLS can be used as sources of water power for hydroelectric generators. The power plant at the base of Niagara Falls is an example of this type of installation.’] Another important use of falling water is hydroelectric dams. However, hydroelectric projects are expensive, and the most accessible sites [in the US] have either been exploited or deemed unacceptable due to the necessary flooding of large tracts of valuable land. A little-known energy source [utilises the fact that ‘if a long strip of zinc and a similar strip of copper are pressed together at both ends to form two junctions, some of the electrons will leave the zinc and go over to the copper. The copper will acquire a small negative charge due to the excess electrons, and the zinc will acquire a slight positive charge due to the loss of electrons. Therefore, any additional loss of electrons by the zinc quickly becomes impossible because of zinc’s positive-charged attraction for electrons and copper’s negative-charge repulsion of electrons. In 1821 Thomas Seeback discovered that heat altered an atom’s ability to gain or lose electrons. Seeback heated one copper-zinc junction and cooled the other. More electrons were lost by the zinc and gained by the copper at the hot junction than at the cold. The hot end of the copper then had more electrons than the cold end. Since electrons repel one another, some flowed down the copper strip to the cold end. But cold copper can’t hold as many electrons as hot copper and some electrons went back to the zinc strip. The resulting thermocouple can generate electric current indefinitely as long as the temperature difference between the junctions is maintained. By using hot and cold gases instead of wires, a thermoelectric generator was being developed in the 1970s which would generate electricity without moving parts.’ Then there is ocean thermal-energy conversion... OTEC... plants also produce fresh water as a by-product – another valuable resource... [Incidentally,] British scientists have discovered... that... [the] seeds... of the Moringa tree, native to northern India, can render water safe to drink in an hour, according to... the University of Leicester. The crushed seeds adhere to bacteria and viruses, allowing them to be easily filtered off... [The discovery will have] immense value in the [Last W]orld, the *Times* reported.

...In the future... who[ever] controls the water may control the world. [The NZ Herald] looks at the growing global water bomb and its devastating consequences. THE World Bank has seen the future and it’s very, very dry. As the U[S] counts the rising death toll of a searing summer, as Spanish regions clash over what to do in seven weeks’ time when their drinking water may run dry after a two-year drought, and as tinder-dry Britain finds it is leaking a third of its water supplies, the world’s most cautious economists are helpfully chiming in... [T]he World Bank... vice-president... says the wars of the next century will... be fought over... water... 40[%] of the world lives in the 250 river basins whose water is

competed for by more than one nation... all of whom want to extract as much water as possible... Because water is no respecter of national boundaries, the potential for insecurity is great. Botswana, Bulgaria, Cambodia, the Congo, Gambia, the Sudan, Syria and many other countries receive 75[%] or more of their fresh water from the river flows of upstream neighbours who are often hostile... Eighty countries... now have shortages that threaten health and economies; 40[%] of the world... has no access to clean water or sanitation; and as industrial, agricultural and individual demands escalate everywhere the situation is deteriorating... ['Communism's filthy legacy means that the waters of the Vistula are too polluted for industrial use, Warsaw having no sewage treatment; 90% of wells in the Czech countryside are contaminated; and Romania's border-crossing emissions pushed tens of thousands of Bulgarians into antigovernment demonstrations in 1987.' Moreover, the situation] is being worsened as tensions grow everywhere between the three sectors of society that traditionally compete for water... World demand for water is doubling every 21 years. Supply can't remotely keep pace with demand as populations soar and cities explode... *Ultimate Security*, is... [a book written by] a fellow of Green College, Oxford, and consultant to the World Bank... It says Egypt's water supply per person is expected to shrink by 30[%], Nigeria's by 40[%], Kenya's by 50[%] in under a decade. By 2025... the amount of water available to each person in the Middle East and North Africa will have dropped by 80[%] in a single lifetime... The problem, the FAO says, is not "climatic drought." Rainfall stays roughly the same. Today's problem is self-induced... Growing populations need more food which demands more water to grow it. But less marked (and ignored in the bank's analysis) is the fact that new high-yielding crop varieties – subsidised and pushed vigorously by governments, industry and world bodies as the most efficient way to feed people – demand much more water per se... THE figures are startling: according to the FAO, the average 15,000 c m of water needed to irrigate 1ha of high-yielding modern rice is enough for 100 nomads and 450 cattle for three years, or 100 rural families for three years, or 100 urban families for two years. The same amount can supply 100 luxury hotel guests for just 55 days... The bank wants \$NZ909 billion to be invested in sanitation and water schemes in the next decade, and says it will up its lending in this area to about 25[%] of its loans. It makes economic sense: the price of not investing in health and sanitation is huge. Ten weeks of cholera caused by contaminated water in Peru recently cost about \$1.5 billion – three times the amount invested in the country's water supply in the whole of the 1980s. Because it could not afford to clean up the pollution of its water supplies, Shanghai spent \$454 million recently moving its intake 40km upstream. In Britain, water companies say it will cost \$136 billion to meet European Union water quality standards – the price of not investing in pollution prevention earlier. "It's good to see the bank taking water seriously," says... WaterAid, the British charity which claims 80[%] of all deaths in the [Last W]orld are now water-related... "But money is not enough – the approach is vital. Time and again the poorest are bypassed by inappropriate water and sanitation investments. The [Last W]orld is littered with failed water projects..."

...A garden in the South Pole is set to cheer up scientists wintering there while improving their diet and recycling waste. San Francisco space researchers have worked out a prototype for the experiment in which several hundred [US] scientists wintering at the Pole this year will grow salad greens, tomatoes, wheat and potatoes in artificial light, using water produced by the purification of sewage. The 15 sq m growing space will be little bigger than a backyard glasshouse. If successful... Nasa... intended to apply the programme to making space missions cheaper... "If they can make the thing work on Earth, clearly they have overcome some of the problems they will meet attempting similar things in space." Managing and watching the growth of plants in the sunless and relatively sterile environment of the Antarctic winter would boost the morale of scientists as well as providing them with more varied... food. Flights to the southern continent were few in winter and the cost of bringing fresh food in was high.

...['First came the stone age, then the iron age, now it's the sewage' 'Disposal of the organic waste products of people and industry is very important in both urban and rural areas (raw sewage can be a threat to public health if not disposed of quickly and satisfactorily). As the population of a community increases, problems of sewage disposal also increase.'] Auckland's main Wastewater Treatment plant... now serves a section of the city with a population of 700,000 – in 25 years the same area will be pressing one million... Urgent decisions need to be made about... [t]he plant... to cope with[that] growth... Something... also... needs to be done about its odours, its effects on the Manukau Harbour and the sludge it produces... Overall, [Auckland's sewage] is about 99% water – the problem is the 1% of impurities. It... includes nutrients which cause algal growth when they end up in the harbour in sufficient quantities... pathogens (disease-causing bacteria and viruses)... solids such as grit, wood and plastic... organic matter, oil, grease... - 1995

...Christmas w[as]... particularly grim for some workers for the sewerage company Thames Water. They... [were] organised into a crack squad of "fatbusters," according to the *Sunday Telegraph*... Their task w[as]... to don protective suits and wade through sewers scratching turkey and goose fat poured down domestic kitchen sinks on Christmas Day from the sewer walls. "It is not a pleasant job but someone has to do it,"... Thames Water e[stimates that] more than 100 tonnes of fat... go down the sink [each year and, before Christmas,] were urging cooks to pour fat into a tin, let it go hard, then throw it in a bin. [In local news, 'Wellington pumps 100 million litres of untreated effluent into the ocean every day – and will continue to do so until the city's new sewage treatment plant becomes operational in the year 2000.']

...A bid to protect a volcanic crater... has prompted a last-minute revision of plans to upgrade the main Auckland sewage treatment plant. Watercare Services Ltd has bowed to pressure from environmental, geological and other groups and changed tack on its plan for rehabilitating the sludge lagoons at its Mangere plant. It intends ceasing to use the lagoons but before this week had proposed to fill in most of their 35ha to create a grassed recreation area. It also planned to protect the remnant of the [volcanic] cone in the centre of the lagoons – culturally significant to Maori – by surrounding it with a lake. The revised plan is to return the area of the lagoons, which fill a volcanic crater, to its natural state as part of the Manukau Harbour shore. Watercare's 11 planning applications for the \$360 million upgrade of the Mangere plant will go under the microscope of a resource management commission of the Auckland Regional Council, the Manukau City Council and the Minister of Conservation next week... The Mangere Lagoon crater has been used for sewage sludge stabilisation since the 1960s. The remnant of the tip of the volcano's scoria cone stood only an estimated 8m above the lagoon, even before it was quarried. A regional council natural heritage officer... says in her report to the commissioners that the Mangere Lagoon is considered the "best representative example of its type remaining in the Auckland volcanic field..." ...But the revised scheme is also likely to be controversial because the one it replaces was the option favoured by a majority of 712 residents near the Mangere plant who responded to a Watercare circular. People fear that if it is returned to its natural state, the Mangere Lagoon will become a smelly mudflat, trapping seaweed and harbour debris. [However, the ARC officer] says that if it is properly restored it is unlikely to be a problem.

...Local residents will endure another summer of foul smells from the polluted Orakei Basin. Auckland City councillors yesterday agreed on a plan to improve water quality in the basin but will not meet again until March ['97] to allocate funds for the project during the council's budget rounds. Signs were put up [last] February warning people against swimming and waterskiing in the basin because of high pollution levels. Diluted raw sewage pours into the basin when combined stormwater and sewage pipes... from both the Meadowbank and Waiaatarua catchments... overflow after heavy rain... [causing] silt build-up and high nutrient levels which encourage algal growth and add to the odour. A resident and member of the Orakei Basin Protection Group, said the... air around it was so bad that clean silverware went black in a week... Separating sewage and stormwater systems to stop sewage overflowing into the basin is already underway. Stormwater treatment ponds will be built in the Orakei creek to filter silt, and an automatic sluice gate in the railway embankment will allow higher water levels. Erosion control, some dredging, and improved cesspit cleaning operations will also contribute to a safer waterway. The Orakei Basin project manager... could not say how long the estimated \$16.9 million project would take but hoped it would be finished by 2001 when the separation of sewage and stormwater systems was due

to be complete. The council would also impose building regulations governing surface water run-off and explore whether regulations needed to be imposed on the Winstone Quarry which accounts for 10 to 15[%] of the sediments carried into the basin through the Waiaatarua tunnel.

...Pollution levels caused by the recent heavy rain washing sewage into the Waitemata Harbour warrant public health warnings... An Auckland Healthcare official... said water samples taken from beaches across Auckland – from Kohimarama to Pt Chevalier – showed... swimmers ran a high risk of contracting health problems such as vomiting and diarrhoea, ear and eye infections and possibly hepatitis A... Pollution levels, measured by the account of the human gut organism *Enterococci* in the water, are about twice the acceptable level for swimming... But most die-hard winter swimmers... probably know not to swim for 48 hours after rain, [the official] said... Consistent rain over the past two months meant the ground was not soaking up water, instead it was flowing into the city's inadequate stormwater drains, flooding the sewage system and polluting the harbour.

...The Nelson Regional Sewerage Authority is defending a delay in notifying the public after the largest major sewage spill... [–] an estimated two million litres... [–] into the Waimea Inlet this year. The public is be[late]ly be[ing] warned not to swim at Tahunanui Beach or to take shellfish from the estuary... [but] a warning could not have been issued earlier, as the full extent of the spillage had not been determined... [In related news, the Auckland] City Council... has adopted a 20-year plan which provides for a \$350 million sewer separation programme to minimise outflows... says[its] works and services committee chair[person]... The city... is spending \$22.8 m... [–] almost one third of its drainage maintenance budget... [–] this financial year, and plans to spend \$25 m... next year. That amount will increase each year to 2011. His comments followed an episode last Monday when raw sewage flowed into the harbour around Princess Wharf and Queens Wharf, startling tourists and prompting a complaint from Fullers[Ferry Services]... Sewage outflows into the harbour are not acceptable, says [the chairperson], but the problem cannot be addressed immediately.

...Visitors often envy Aucklanders for being able to choose a beach to match their mood – that is within 30 minutes drive of downtown city. For example, on the west coast there are the wild rugged surf beaches of Muriwai and Piha while the northernmost of the North Shore's eastern bays is gentle and serene Long Bay. What they have in common is their popularity; Muriwai and Long Bay each have just over a million visitors a year while Piha can have 20,000 visitors on a sunny day. Such high use, assaults by storms and close proximity to generators of pollution, bring problems in keeping Auckland's beaches in good shape and health. Efforts to replace sand washed away at beaches have cost ratepayers more than \$200,000 at Orewa and \$2.2 million at Mission Bay in Auckland's eastern suburbs. But the price of basking in clean sand is small bikkies compared with that facing Aucklanders if they are to have healthy Waitemata Harbour beaches all year round. Forty years after the city fathers decided to stop pumping raw sewage into the Waitemata and instead send it to treatment plants at Mangere on the Manukau Harbour, human waste is still discharged albeit unintentionally at various places on the city's waterfront... [from] century-old drains that carry both sewage and stormwater runoff for 15[%] of the city... By cleaning up three major catchments, the council aims to halve the number of stormwater overflows containing sewage in 10 years, and stop the lot in 30 years. The estimated cost is \$380 million. [Until then, s]tormwater drains will continue to feed heavy metals and poisons to the marine food chain in tidal areas. While the plumbing is being fixed, public health protection officials have a stack of warning signs at the ready to be nailed up at beaches anywhere on the isthmus... But sampling is not done on rainy days and it takes 48 hours to get test results. The council reports that last summer's samples met median Ministry of Health guidelines for swimming and that water quality was "very good" in terms of the guidelines. However, samples at some beaches on one of two days of the summer indicated levels of bacterial contamination well above the recognised standard.

...Seven years after first being called in by the A[RC] for expert advice on urban stormwater... [the] environmental engineer, who started stormwater control programmes in severely polluted Atlantic coast areas of the U[S – including]... Chesapeake Bay, one of the most polluted estuaries in the world... [– and now] works for the Delaware Department of Natural Resources and Environmental Control... said Auckland had made big progress dealing with a problem common to all urban areas... On his fourth visit to the Auckland region, [the engineer] can now inspect stormwater treatment ponds and wetlands and see what our local bodies are doing about the problem... "You are well ahead of most states in the U[S], but you are not ahead where there are serious problems like Chesapeake Bay or Puget Sound." ...Runoff pollution is widespread. Scientists have found contaminated shellfish and other tiny marine animals in Auckland estuarine sediments. And the bill for cleaning up polluted waterways is sizeable – about \$100 million says the A[RC]... Twenty years ago drainage systems relied on removing rain from roads and other surfaces as quickly as possible. The focus was now on building systems which mimicked the natural world's drainage patterns. [The engineer] said stormwater programmes in the U[S] were moving towards total catchment control, where only land use appropriate to catchment was permitted.

...A pilot study centred on four areas on the... fringes [of Auckland] is finding that at least half of... drinking water... supplies collected from householders' roofs are showing evidence of animal faeces. Droppings from... possums, cats and birds can lead to diarrhoea illnesses... The project is considered small... [– only] 25 homes in Muriwai, Clevedon, Waiheke Island and Kumeu were being checked... [–] but indicative and it is hoped that a larger study involving Auckland University will go ahead next year. It is estimated that 15[%], or 100,000 people, in the region gather their water off the roof. "The water that hits the roof is pretty pure but once it hits the roof it can be contaminated by lead-based paint, dust and faecal matter,"... [the] principal investigator in the Auckland Healthcare public health protection team... said. "...Lead-based paints... and nails with lead heads... is the biggest [problem] on the bach-type places such as Muriwai." ...people with such water supplies should be scrubbing their roofs at least every six months, disconnecting downpipes before doing so. Chlorination of supply was also an option and filters did help... [The investigator] said some people had been drinking the water for years with no apparent ill effects but some illnesses could be carried and passed on to others.

...The U[N] human settlement conference has heard a gloomy prophecy that most cities in the [Last W]orld will face extreme water shortages by the year 2010. More than one and a half billion people will face environments that threaten life and health by 2025 unless a revolution in urban problem-solving takes place, the U[N] said... Habitat II, the last major U[N] conference this century, seeks to address the deep-seated urban ills of poverty, homelessness, and social and environmental decay. But participating countries have yet to agree on how to treat these problems. The U[S] stood out against demands that housing be given the status of human right... The European Union backed the developing countries' demands, but Habitat officials said the U[S] and some other developed states were wary of seeing housing as a distinct human right for fear of incurring legal obligations to the world's homeless. The U[N]... listed Cairo, Lagos, Dhaka, Beijing, Calcutta and Sao Paulo among the developing cities facing the greatest water problems, but said [First World] cities such as Houston, Los Angeles, Warsaw, Cardiff and Tel Aviv also encountered severe shortages... [■ A Waikato]-based water filtration manufacturing company... [that] employs 12 people... has won two \$15 million contracts to clean up the water in two Chinese cities. Works Filter Systems will design, build and operate plants in... Wuxi and in Shenyang. The company's porous ceramic dual media filtration system design won last year's Rutherford Award for energy efficiency, innovation, environmental friendliness and commercial potential.

...[The Waikato River is one of NZ's most important and utilised rivers, draining 5% of the land area. Clear, blue water leaving Lake Taupo changes to a more turbid, darker green-brown in the lower river due to: geothermal inflows in the upper river (e.g., chloride, lithium, arsenic – the arsenic levels downstream of Wairakei geothermal power station exceed drinking water guidelines); tributary inflows, especially from peatlands; waste inflows and runoff (the faecal indicators of bacteria in the river between Cambridge and Huntly exceed limits for bathing); and hydro lakes which increase residence time of water increasing algal biomass and temperature.' However, the] feelings of Aucklanders worried about the purity of the Waikato River as a potential drinking-water source are unlikely to be considered in resource consent decisions crucial to the development of the new water supply. A... public... resource consent hearing... for... a treatment plant and a 38km pipeline... begins on Monday at Tuakau[, and]... is expected to run over 13 days... Water quality has been one of the hot topics in submissions to the Waikato Regional Council[, but in]... an unusual move before a resource

consent hearing Waikato Regional Council staff scrutinising the applications have been unable to make a recommendation. The officers have left the decision-making to the hearing committee... On the basis of the officers' report... [-] that the water quality of the river is relatively high by world standards, adding there is evidence of improvement in recent years... [-] the committee will have to decide whether to decline or approve the applications or perhaps defer them until Tainui's [Waitangi Tribunal] claim on the Waikato River is settled... Maori objections look likely to be the biggest hurdle for the scheme, [which]... the Waikato staff... have concluded... can be managed to have only minor environmental effects... The hearing comes as Auckland's [eleven] water supply lakes are more than 95[%] full holding about 95 million tonnes of water but as consumption has jumped to an average daily use... of over 317,000 cu m... from a system which can deliver up to 346,000 cu m of water a day. Watercare Services puts the consumption jump down to population and industrial growth... When Watercare 13 months ago announced its plans for the \$155 million pipeline scheme to boost Auckland's water supply... it said independent experts from Thames Water, a British company, had confirmed that the water could be treated to a standard better than the N[Z] standard. Thames said the reported concentrations of pesticides... PCBs... and dioxins were low or below the detection limit and no problems were envisaged... Watercare... [-] Auckland's publicly-owned water company... [-] says the new water source is needed to cope with population growth and to meet the increase in the drought security standard from 1-in-50-years to 1-in-200 sought by its local authority customers after the 1994 drought during which a \$73 million emergency Waikato pipeline was considered.

...Hidden water supplies in the Hunua Ranges have been discounted by Watercare Services, says an environmentalist... [who] told the panel considering the bulk water supply company's Waikato River pipeline project yesterday that [it] believed Watercare had significantly under-stated the water yield from its four Hunua storage dams. Water stored in the surrounding hills – which replenish the dams – had not been included in Watercare's assessment of the existing water supply... Watercare's lake-level forecasts lacked credibility in 1994 and [the environmentalist] was still concerned "by its forecasts today." [The] director of Friends of the Earth... said that in 1994 hydrologists had looked at the Hunua dams' replenishment from the surrounding geological strata[, and] had estimated that a similar amount of water "may be available to recharge the dams as was held in the dams when they were full." ...an Alliance activist, said that Watercare had not considered dual reticulation schemes for both drinking water and non-potable water. High quality waste water from the Mangere treatment plant could be separately reticulated and [the activist] believed that two-thirds of all industrial, commercial and domestic requirements could come from non-potable water. This... scheme could be built in stages over almost 100 years, enabling Auckland's existing bulk water supply to meet future needs without the Waikato pipeline... [But Watercare says it] has no second thoughts about its... pipeline project in spite of water supply lakes overflowing from [recent] rain and... Waitakere City Council, the only Auckland council opposing the pipeline... saying water use could be reduced by more than 40[%] over the next 10 years by the introduction of water-efficient appliances... The deputy mayor of Waitakere... said: "Our focus is on our ratepayers' pockets as well as the environment. We never opposed planning for a pipeline but we believe that kind of insurance policy is not necessary now." ...a spokes[person] for Watercare... said the 39c a tonne unit charge for water paid for by the company's council customers would rise by 2[%] a year for 10 years to pay for the pipeline... [By the way, c]ooling water from an expanded Otahuhu thermal power station poses little risk of environmental contamination, according to scientists hired by the scheme's backers. Contact Energy Ltd's advisers told a resource consent hearing yesterday that the discharge from the... new, \$250 million, 360-megawatt "combined cycle"... South Auckland station into the Tamaki River would raise the temperature by no more than 3 deg C outside the mixing zone extended 200m either side of the outfall. An environmental researcher... said... fish... in the Tamaki River and Otara Creek were adapted to the wide-ranging natural fluctuations in water temperature. Another researcher from the same consultancy... said the potential environmental risk from discharges of biocides – chemicals used to kill algae and other unwanted organisms in the cooling towers – would be extremely small. Techniques were available if necessary... to neutralise or treat the biocides before discharge...

N[Z] will face power shortages within five years, according to an independent report... The study, by academics and engineering consultants, has identified a big gap between supply and demand from 2001 based on present construction and power use patterns – and sooner if we have a dry year... The report, Electricity Supply and Demand to 2015... is an update of two works but for the first time takes into account the 1175MW capacity of proposed power stations as well as existing capacity of 7185MW... [- although the] publication of the report yesterday coincided with an announcement that a major hydro power project has been postponed indefinitely. Contact Energy said it had shelved plans to put another dam on the Clutha River. The chief executive... said the project for a 50m dam and a 320MW power station was not viable. About \$22 million had been spent on investigations and buying land to flood... The ensuing shortages could mean a repeat, possibly more dramatically, of the 1992 power crisis when homes were forced to ration power and street lighting was cut. On a greater scale, future shortages could lead to blackouts... The vulnerability of N[Z]'s electricity system to the forces of nature was exposed during yesterday's storms... [when] bolts of lightning hit the national grid on the lines leading into Auckland's western suburbs. All power was cut to areas near Trans Power's Henderson substation and all parts north. Customers of four power companies were limited to cold drinks, fruit and cereal for breakfast... The fierce storm produced a freak occurrence when two high-voltage transmission lines leading to the substation from different locations were zapped either simultaneously or within seconds of each other. Trans Power's acting general manager of operations... said the supply system was designed to cope with lightning strikes, but two strikes at the same time was a rare occurrence. Compounding the problem, the lines were leading into N[Z]'s biggest population centre during the morning demand peak. Power surges raced along both 220,000-volt lines but within a split second safety mechanisms came into action and prevented serious damage... Each transmission line has equipment at either end monitoring the current, the speed at which electricity is flowing. Henderson-bound power in from the south, comes through Auckland's biggest substation, at Otahuhu, or alternatively along a second line from the switchyard outside Huntly power station. When lightning hits a line there is a flash but a circuit breaker prevents the surge going beyond the line's end. An auto-reclose device then allows the power to flow normally again. Consumers might notice their lights flicker... But [on this occasion] Trans Power was unable to keep power flowing beyond Henderson... [P]ower was gradually restored... 12 minutes later... Because of the size of the load that was lost in the cut – about 420MW – it was necessary to restore power in stages... In other parts of the North Island local power line networks suffered similar damage, causing power cuts in Bay of Plenty, Waikato, King Country and Taranaki... In the US, an icy storm that glazed the north-west stranded holiday travellers... and... forced... shoppers to try on their clothes by candlelight... Ice-covered trees splintered or toppled onto power lines, leaving about 185,000 homes and businesses in Oregon and Washington state without electricity.

...A tree that had grown too close to a transmission line... triggered a power cut that affected two million homes and businesses in 15 western states this month, investigators said yesterday. The Western Systems Co-ordinating Council, an electricity energy group, said the July 2 cut began when electricity from a 345,000-volt transmission line jumped to the nearby tree, causing a short-circuit... It caused scattered power cuts lasting from a few minutes to several hours across an area stretching from southern California to Canada and as far east as Texas... [- although it only affected] less than 10[%] of the customers served by the 88 members of the council... [However, it] raised concerns in the industry about the integrity of the transmission system... The council said the tree that had grown too close to the... line that spans the 376km between the Jim Bridger generating plant near Rock Springs, Wyoming, and the Kinport substation in south-eastern Idaho... had been removed... Meanwhile, [a]... power failure across Malaysia... stranded train passengers, snarled traffic, shut down shopping malls and forced the country's most popular soccer match... [- t]he final of the Football Association tournament between Kedah and Sarawak states... [-] to be abandoned... The national power company, Tenaga Nasional, said the electricity supply went out almost simultaneously in all 11 states in peninsular Malaysia two hours before nightfall. The news agency Bernama quoted the Minister of Energy... as saying the cut was caused by a fault at the Baka power station, about 350km north-east of Kuala Lumpur. Power was restored to most of the country by early morning... [but, as a precaution,] Malaysia will request

Singapore to provide some power... A similar blackout occurred in September 1992 when lightning damaged a power station on the national grid, blacking out nine Malaysian states for 12 hours... [This time, a]irports functioned normally, using their own power sources.

...A total loss of power to Auckland Airport was the most serious of three separate power cuts in Auckland yesterday that left nearly 20,000 Mercury Energy customers without electricity. Safety was not jeopardised at the airport during the one-hour cut, said... a spokes[person] for the Airways Corporation... The tower automatically switched over to a battery-powered electricity supply system... allowing aircraft movements to remain on the controllers' computer screens throughout the power cut. A bird strike at a Mangere substation was believed to be responsible... Middlemore Hospital was [also] forced to use its emergency generator while the Mangere substation was repaired... In the two other incidents, about 100 homes in Papatoetoe lost supply for up to an hour after a truck hit a power pole, and a contractor digging through a cable left 80 or so homes in Bucklands Beach without power for up to two hours. [In international news, 'a contractor who inadvertently dug through a cable outside the head office of a major US airline shut down its computer, affecting all of the airline's operations across the country']

...A serious nuclear accident took place at Greenham Common more than 30 years ago, the Campaign for Nuclear Disarmament said yesterday... [A]t least 150,000... lives were put at risk as radioactive fall-out from the former U[S] military air base settled across west Berkshire and north Wiltshire, but the incident was hushed up by the British and U[S] authorities... CND says the accident occurred when a B-47 bomber flying at 7000-8000ft got into engine trouble and was forced to jettison its wing-tip fuel tanks. The tanks were supposed to land on an emergency drop zone within the airfield. Instead, one fell on a hanger on the air base, causing a huge fire... The other landed 30m behind a parked B-47 equipped with nuclear weapons, which was also engulfed in flames, creating a fine uranium and plutonium powder. Firefighters trapped some of the powder using spray foam, but a residue remained after the foam was removed and was then blown up to 15km away across surrounding countryside... The campaigners' allegations were denied by the Ministry of Defence [last night, but]... CND said it had seen a copy of the confidential report into the accident and conducted its own 12-month investigation... [A CND spokesperson]... said: "The Government has lied to Parliament and said there has never been an accident involving a nuclear weapon in the UK which resulted in nuclear contamination." In addition to local residents, thousands of people had served at the base, attended international airshows there or protested against the siting of Cruise missiles during the 80s...

TWENTY years ago a small group of anti-nuclear activists organised "Campaign Half Million." They set themselves the ambitious target of collecting half a million signatures to a petition asking the Government to reject the possibility of nuclear power for N[Z]. In 1976 that number of signatures represented one-sixth of the population. A national network was set up. Petitioners stood in shopping malls, outside school gates, near bus stops and on the windswept steps of the museum to offer people the opportunity to "Say No to Nuclear Power." They didn't get their half million signatures – they got 333,087. But the Government got the message and N[Z] has exploited other means of power generation... Other countries are not so lucky. There are 430 commercial nuclear reactors throughout the world. They produce about 17[%] of the total global electricity – much less than predictions made 50 years ago... The industry's steady decline over the past 20 years can be attributed to the higher costs of nuclear power compared with that generated by other means, and the failure of scientists to come up with a solution to the problem of disposal of the increasing amounts of radioactive waste. Despite these facts and the undoubted effects of the loss of credibility after the Chernobyl disaster, 36 new nuclear power plants are still under construction, half of them in Asia... France... is the only European country where a new reactor is being built. It is described as the "inherently safe" model of the "next generation" of nuclear reactors... Called the "European Pressurised Water Reactor" it is said by its promoters to have a 10 to 100 times smaller risk of a core meltdown than the present pressurised water reactors. But its costs are... at least 15[%] higher. The date for its start-up is 2005. In Britain a lengthy and often bitter debate on the industry's future ended last December with the cancellation of two proposed new stations. Sweden, which [like France] generates half of its electricity in nuclear reactors, is now deciding whether to phase out nuclear power by 2010 – which it voted to do in a referendum in 1980. The date for the phase-out was based on the estimated working life of power stations in use at that time... Russia has official plans to build up to 10 reactors by 2005, but such is their cost that industry officials predict only two will go ahead. The downturn of the nuclear industry is particularly notable in the U[S] where, after a boom in the construction of plants, none has been built in the last 23 years. Complacency about the safe operation of existing plants and the adequacy of regulations was rocked by a recent *Time* magazine article outlining shortcuts that were being taken at an older plant called Millstone Unit 1 in Connecticut. There, safety precautions governing the cool-down period – before spent fuel rods could be removed and the plant refuelled – were being ignored, saving the company money and two weeks of "downtime" for each refuelling. In Japan, which has 50 nuclear reactors and four more under construction, public confidence was shaken when sodium coolant leaked from a fast breeder reactor at Monju in December. In 1992 the official forecast for Japan's energy needs was for the construction of 40 more reactors but changed economic circumstances make this highly unlikely. REACTORS are under construction in China at Daya Bay, close to Hong Kong, India and North Korea where the U[S] has promised the Government \$400 million worth of fuel oil and two reactors in exchange for a pledge not to develop nuclear weapons. Vietnam, Thailand and the Philippines have expressed interest in nuclear power, and in Indonesia negotiations are said to be under way for the construction of a plant. The average operational life of a nuclear power plant is 50 years, after which it must be "decommissioned." ...In a paper titled *Nuclear Power World Status Report 1996*, Greenpeace points out that no full-size reactor has yet been dismantled anywhere in the world. "Although some countries are planning to remove the entire structure... leaving a flat empty space, others have suggested leaving the building where it stands, covering it in concrete or possibly burying it under a mound of earth. The Yankee Rowe reactor in Western Massachusetts... which cost more than \$US186 million to build in 1961, was closed in 1991. To fully dismantle the plant will cost about \$US370 million..." ...The 10 most dangerous nuclear power plants in the world, according to a recent report issued by the U[S] Department of Energy, are in Eastern Europe; of these, Chernobyl is considered the worst. Yet the Ukraine continues to depend on electricity from the two reactors in the crippled plant which are still working. Their operation is highly controversial. The Ukrainian Government is seeking enormous amounts of aid which will enable it to close the plant by the year 2000 and the request is being considered by the G7 countries.

...Twenty years ago... the most important scientist of his generation... formulated the "Gaia" hypothesis: that Earth's life-friendly environment has been shaped, and is kept stable, by the living species that depend upon it. The concept was soon hijacked by Greens and New-Agers who use it as a mere metaphor of Mother Earth, but the theory itself is strictly scientific... So it is not surprising that [the scientist] backs nuclear power... It is... 10 years since the Number 4 reactor at Chernobyl exploded... starting a fire that burned in the reactor for nine days and spewed 200 times the combined radiation from the Hiroshima and Nagasaki atomic bombs into the atmosphere. Stand by for a torrent of outrage about the dangers of nuclear power. Some of the outrage is justified. It is outrageous that 15 other reactors of the same unreliable RBMK type are still operating in Russia, Ukraine and Lithuania, including two right on the Chernobyl site. It is outrageous that 12 other Russian reactors of another flawed design, the older generation VVERs, remain in operation in Russia, Armenia (that one is located on an earthquake fault), Slovakia and Bulgaria. After that, however, the outrage slides into the gulf of ignorance about risk perception, and about the difference between local and global risks. The local damage from the Chernobyl calamity was severe. Even 10 years later hardly anybody enters the "Zone of Alienation" around Chernobyl except the people running the remaining reactors (and they do not stay overnight). In the large "Purple Zone" around Chernobyl, where the soil is contaminated but the residents have returned, there are two million children – and Unicef reports a 38[%] increase in the number of children suffering malignant tumours and bone disorders. But does this mean... nuclear power poses unacceptable risks? Only if you believe that other means of generating power have no consequences for people's health. You also have to ignore the global environmental effects of burning coal, which is still nuclear power's main rival... Estimates of the deaths directly caused by radioactive contamination from Chernobyl vary widely, but...

there have been at least 6000. That is close to the number of people who die *each year* from coal-mining accidents and miners' diseases such as emphysema. This is where risk perception distorts the equation. The miners' deaths are an annual event, so they are discounted. A single nuclear accident of comparable scale, once in the 40-year history of nuclear power generation, gets far more attention. Moreover, miners' deaths mostly happen within relatively isolated mining communities, whereas a nuclear accident strikes at the public. And the wider health consequences of burning megatonnes of coal... (...power stations... burned 2.3 billion tons of coal in 1970, 5.2 billion in 1990)... for electricity, in terms of pumping pollutants and carcinogens into the atmosphere, are so hard to trace, in terms of any individual illness, that they are simply ignored. But the *global* consequences of favouring coal over nuclear power are what really frighten [the scientist, who]... was deeply pessimistic about the short-term future of humanity... [w]hen I drove down to the West of England to see him recently... "Why do the Greens all fret about nuclear power? ...It could actually be a boon in every sense of the word. The worst thing that could happen with nuclear power is that it would kill some people – which sounds a terrible thing to say, but it would relieve the pressures on the planet. Whereas burning coal... has the danger of... kill[ing us all]." His]... point is that... Earth shifts between three stable temperature regimes in this geological epoch. Most of the time, it is in a relatively cool, glacial regime with average global temperature about 10 deg C. For brief periods during the inter-glacials, it warms to... 15 deg. (The present inter-glacial began... 10,000 years ago.) But it can also run away to a hot stable state about 25 deg, and stay there for a long time. The worst time at which to be pumping huge amounts of carbon dioxide into the atmosphere is during an unstable inter-glacial period like the present. It is not clear how much is needed to trigger a runaway effect, but we really do not want to find out... The real tragedy of Chernobyl is that it has made people hypersensitive to the risks of nuclear power while they remain blind to the graver risks of "conventional" coal-fired power stations... If this goes on, we are in deep trouble.

...A top minister said yesterday that Ukraine was reviewing how to deal with the cracking "tomb" around the Chernobyl ruined fourth reactor... after a chain reaction was observed there last week. The comments, by the Minister for the Environment... were the first admission that the increased readings of neutron activity 10 years after the reactor exploded amounted to a limited nuclear chain reaction inside the structure. But [the minister] said the data was insufficient to determine whether it posed a real threat... "What we are observing shows that we must remove as much fuel as possible to rule out the development of chain reactions inside the devastated reactor." ...meters last week showed neutron radiation dozens of times normal levels inside the concrete and steel covering hurriedly erected after the April 1986 fire and explosion... A project drawn up three years ago to build a new sarcophagus has made no progress and is to be discussed at a Group of Seven meeting in Paris next month... [G7] countries have pledged more than \$US3 billion... to help Ukraine to keep its promise to close the two working Chernobyl reactors by the year 2000.

...The Chernobyl disaster involved such ludicrous disregard for safety that we might harbour hopes of its never being repeated: 'no matter what you did with the reactor an explosion was impossible', the operators are reported to have thought. It did, however, kill thirty people quickly, with up to forty thousand premature deaths to follow according to an official Soviet report, or half a million or more according to... [unofficial reports]; and there could be still more energetic reactor explosions... Nevertheless, [until] the explosion... in 1986, civilian nuclear power had a remarkably fine record, making it a much more environmentally friendly source of energy than coal or hydro-electricity. The partial core meltdown at Three Mile Island seven years earlier had released hardly any radiation to the surroundings. Even the fire at Windscale in 1957 had led to no fatalities in the short term, and although in the long term up to one hundred additional deaths from cancer may conceivably have resulted, any large coal-burning power station beats this total... [But s]ites geographically suitable for prolonged underground storage [of radioactive waste] have proved very hard to find, while above-ground storage has a deplorable history: between 1945 and 1973 over four hundred thousand gallons of radioactive waste leaked from tanks at Hanford, the main US storage center. The US D[OE] estimates that the States will have accumulated fifty thousand tons of 'spent fuel' by the year 2000... And... the radioactivity from Chernobyl 'was puny compared with the colossal exudation of much longer lived radionuclides from reactions that the former Soviet Union used, and Russia still uses, to produce plutonium for bombs', the world's biggest environmental release occurring over decades at Toms-7 in central Siberia, which poured out 'about a billion curies of high-level waste, or 20 Chernobyls' worth'... while in the Urals... many cities... had become utterly unfit for human habitation... In 1992, British Nuclear Fuels had detected 2,400 [computer] errors, about 100 of which could have 'placed a demand upon the safety systems' (to quote the project manager's careful words), in an early version of software to control its huge new nuclear fuel reprocessing plant at Sellafield. When a computer program contains more than a couple of thousand lines of code, finding all its faults can be near impossible.

...Auckland-based Advanced Windpower Ltd plans to build a prototype wind-powered electricity-generating turbine at Waikaretu, in the Waikato. The executive director... said that resource management consent had been received to build the \$1 million machine on private land. The 22m tall machine, which will have blades seven metres in diameter, is expected to be built by October. Advanced Windpower had gained global rights to the diffuser augmented wind turbine from the U[S]-based Northrop Grumman Corporation, which had decided to concentrate on its core defence activities. The prototype machine... will be a small-scale version of a commercial model, which would have blades with a diameter of 22m. The... machine uses an expansion chamber behind the blades to create a pocket of low pressure and thereby draw more high pressure wind across the blades. The prototype aimed to prove the degree to which the diffuser augmented the wind flow... [C]omputer simulation and testing of the design using wind tunnels had indicated Advanced Windpower could sell electricity at 3.45c a kilowatt hour, significantly below the cost of most other electricity generators... Counties Power had agreed to handle the power generated... - 1996

The DAWT system was developed as an alternative energy system to fossil fuels during the oil crisis in the 1970s. However, Grumman dropped the project after eight years investigation because it could not find cost-effective construction material. The company... [that] developed... Apollo 11... was also sidetracked when it secured major defence contracts from the US government. Instead of using high cost steel to build the DAWT, Advanced Windpower will build it with high tensile ferro-cement. Advanced Windpower[s] managing director... said the... system had the capacity to revolutionise wind electricity generation and claimed it could be 50% cheaper than conventional wind power... The... DAWT... can suck in twice as much air as most other turbines and produce five times the energy of a conventional one... "Current predictions are showing annual energy outputs in excess of 12 million kilowatt hours per annum for a single (full size) machine are possible,"... The final DAWT would be around 18 storeys high and be capable of producing power for 1500 homes. It had cost about \$5 million to reach the demonstration stage, funded by 80 private investors... N[Z]'s first wind farm near Martinborough in south Wairarapa, began producing electricity for 1500 homes last June.

...[the Te Uku land mobile telecommunications base station was commissioned on Dec. 6, 1973, using batteries. Within ten months a locally designed windmill generator was keeping the batteries charged.' Yet it was another twelve years before NZ's first wind farm opened. Now] Tararua Windpower has permission to build a large wind farm at the north end of the Tararua Ranges near Palmerston North. According to... [the] research manager at ECNZ, average wind speeds in many areas exceed 36 km/h, and it's feasible... to generate more than 20[% of NZ]'s power needs from wind.

...A BATTLE is developing near Wellington, with residents of a coastal settlement set to take on electricity generating giant ECNZ, which wants to build a wind farm... [that] would meet the electricity needs of 8% of the Wellington region... Makara is a popular recreational spot about 20km from Wellington and residents are worried up to 80 turbines each 100m-high will be noisy and "ugly blots" on the landscape... "It's outrageous. These turbines could be as high as the BNZ building in downtown Wellington – that's a 30-storey building," said [the] Makara Guardians president[, who believed]... some of the turbines could be as close as 300m from some of the 100 houses at Makara. "We accept renewable energy is a good thing but it should not be done at the expense of defiling a unique and beautiful spot... We [also] do not want to be a testing ground for wind

farms in the rest of N[Z] when it could easily be viewed as a national disaster in future years,”... But ECNZ... assured Makara residents they would be listened to. ECNZ had not determined the number of turbines or what size they would be... Research by the Energy Efficiency and Conservation Agency shows that 30[% of NZ]’s energy needs could be met by wind – about the same amount that is generated at present by fossil fuels... [● A] Dutch company is moving to build the world’s biggest wind power station, in the North Sea off the east English port of Harwich. WindMaster Nederland BV, based in the small town of Lelystad, east of Amsterdam, won a contract to sell power from the 30MW station last April. It is now seeking contractors for the scheme, which will be developed privately... Power from the Harwich scheme will be bought by the Non-Fossil Purchasing Agency, owned by Britain’s 12 regional electricity companies... WindMaster, which started modestly in the early 1970s, is now a major player, accounting for 20[%] of installed wind power capacity in the Netherlands. The company offers turbines ranging from a 300kW machine with a 28m rotor, best suited to sites where wind speeds are slower, to a 750kW turbine with a rotor diameter of 48m. WindMaster’s latest project, which at \$13 million was also the biggest in the company’s history, was completed in August and involved the erection of 18 750kW turbines near Lelystad. Other schemes have been completed or are planned in France, Ireland and Costa Rica. In the U[S], projects with a combined capacity of 60MW are being researched... *Wind Power Monthly*, says the Dutch have the most well-thought-out future energy policies of all the European countries... [T]he Netherlands has the third-biggest wind-power generation capacity in Europe – 323MW, against 1675MW for Germany and 927MW for Denmark. In fourth place is Britain, with 285MW... India... [has] 825MW... Worldwide wind-power capacity totals 6457MW... It is unlikely that wind power will ever seriously challenge more conventional sources of electricity... While environmentalists embrace wind power for its cleanliness, they have expressed concern at the visual intrusiveness of the giant turbines. Building stations offshore... sidesteps that objection and at the same time offers access to the best winds... As offshore installations will be built where the sea is shallow, they should pose no significant danger to shipping.

...*Wind power* is becoming a viable industry in N[Z]... *Wave power* is plentiful but techniques to harness it are expensive. The potential is greatest around the southern end of the South Island where the average offshore wave energy is around 90 kilowatts per metre of wavefront. But plants are at risk of being destroyed in storms and maintenance costs are high... *Tidal power*, with a barrage across an estuary using tidal flow to turn turbines, has limited potential in N[Z] because of our low tidal range – 1.7 to two metres compared with the five to eight metres needed for it to be cost-effective. Environmentalists say it also poses a threat to wildlife and estuary ecosystems... *Solar power* is among the most promising developments, and N[Z] is ideally suited to exploit this because of our many clear days... In remote areas, a growing number of farmers... are turning to photovoltaics... [because they] face high charges from ECNZ to install power lines... [-] \$25,000 to supply power to [one] new Wairarapa farmhouse[(the owners) decided to... install... a 13-metre-high wind turbine and four photovoltaic solar modules to provide back-up power on windless days[– this], combined with a system of storage batteries, meets all their energy needs[; and the] cost of maintenance is around \$500 a year, compared with \$1400 to buy mains electricity[)]... Other uses include lighthouses, navigation buoys and telecommunication systems[(the ‘NZ Post Office’s Kakatarahae installation in the Coromandel Ranges became NZ’s first solar-powered telecommunications station when it began service in Dec. 1976; Te Uku was fitted with solar collectors in May, 1977’)]. PV-driven emergency telephones have been on our motorways since 1989.

...Sunshine means more to [one ex-pat] than most people. Back home in A[US] the sun powers his water heating and when [the ex-pat] travels it makes his laptop work through a newly developed solar electric panel... [Born in Invercargill, the ex-pat now] lives northwest of Melbourne in the shady, forested Central Highlands. The area gets less sunshine than his birthplace but solar power heats two-thirds of the home’s water. A steam engine provides the rest of the water heating and steam for the radiators... But it is a desire to investigate wind power developments which has brought him [back to NZ]. The publisher and editor of the 25-year-old self-sufficiency and alternative energy magazine *Earth Garden* says N[Z] leads the Southern Hemisphere in the use of wind power. [The ex-pat believes that NZ is] lucky in that about 75[%] of its electricity was produced by hydro plants. With the addition of wind power, combined with solar heating, the country could generate all its power from renewable sources. “N[Z] receives three times its total electricity requirements hitting the coastline as wind power. If you harnessed only 8.5[%] of the wind energy hitting the country then it would be the first country in the world to be completely powered by renewable resources...” The problem was a lack of political will. “In general, A[US and NZ] are run by... politicians who think the bigger the smokestack the better.” ...[however, at] the end of last month, EnergyA[US] started a huge wind turbine in N[SW] to generate 600kW of power... [Recently published figures show that last year the world’s windmill power production increased by 26[%] on 1995, while nuclear energy output rose less than 1[%]. Solar energy also rose, after a drop in the price of photovoltaic batteries enabled more than 400,000 households in [Last World] countries to install solar systems.

...The total solar energy falling on the roof of a house in a year is about 20 to 30 times the amount of energy required by that household. The question is not whether we have enough energy, but how do we get it into a usable form? Space and water heating use about two thirds of a household’s energy needs. Ideally solar space heating should be dealt with at the time the house is designed. Appropriate materials and design can get the best use of the sun for winter heating without cooking the inhabitants in summer. Some of these can be fitted to existing houses. The use of relatively large north-facing windows, with shades to allow low angle winter sun into the house while eliminating high-angle summer sun, is an example... Solar water heating can almost always be installed in new and existing houses... If all NZ houses had solar water heaters the energy input would be equivalent to one more Clyde-sized dam... There are about 10 different sorts of solar water heaters available on the market. The typical heater is a flat-plate collector on which solar energy is collected on a blackened flat plate and conducted to water flowing in tubes attached to the plate. The water either circulates of its own accord in a thermosyphon or is forced around by a small pump. Three to 4 sq m of collector area will provide most of the energy required to heat the water for a typical family home... Even in quite dull weather the collector will make some contribution to the water heating and many have surface coatings designed to enhance their dull-weather performance... It is generally not convenient or economic to try to obtain the whole of one’s hot-water supply from the sun – this would require too large a collector and cylinder. Typically, the solar collector will be sized to provide 50 to 70[%] of the household requirement and the rest will come from the back-up electric element... Some solar collectors come as a package, with the hot-water cylinder sitting on the roof above the collector panels, while others have only the panels mounted on the roof. Some systems have the collectors incorporated into the roof structure. Depending on size of the collector and the associated water storage the cost can range from \$2000 to \$5000... The direct production of electricity from sunlight can be done with photovoltaic cells, but the capital cost for a suburban household is \$25,000 to \$40,000. Developments in the technology will reduce the cost significantly in the next 15 to 20 years. By then the typical household may well have a roof covered with, or even made from, photovoltaic panels. These will produce electricity continuously in sunny conditions, with the excess to household needs being fed to the grid.

...Synergex Systems NZ Ltd has a new... solar hot-water... range from Solahart... The Black Chrome 12, launched... last month, has a 12-year warranty. To compliment the model, a system of slim-line solar panels means tanks can be installed inside the premises rather than on the roof. Called Streamline, is it quick to install with dual pumping connections... Solahart has [also] developed the Sorcerer hot-water storage cylinder, and claims it is up to five times more efficient than ordinary gas or electric systems. Easily installed, it has 250-litre and 315-litre cylinder options... Another way to use the sun to heat water is by heat pump, where the heat energy in the air is used and concentrated into hot water.

...ELECTRICITY plus heat. If [a Whangarei-based inventor] has his way, the world will soon be able to produce both more cheaply and cleanly. His brainchild is the Heliostat, a solar energy machine radically different to previous models, which has attracted the interest of ECNZ... [-] his... former employer... [-] and Montana Wines... The latest Heliostat model is working at Montana Wines’ Blenheim winery, with Montana providing land and the use of its engineers to evaluate the project. [The winery’s] manager... said the Heliostat had huge potential, especially as a future

source of hot water for winery business such as tank washing... The company set up a solar power testing site for an older Heliostat model at its Gisborne winery... a year ago. Assistance was provided by ECNZ and Gisborne's Eastland Energy... The machine uses flat mirrors to concentrate sunshine on to a strip of photovoltaic cells. Some of the electricity generated is then used to pump liquid across the solar panels, to cool them and collect heat. This improves the cells' efficiency... mak[ing] the energy produced by the Heliostat potentially cheaper than other solar forms... The average cost of producing a kilowatt of electricity for existing solar energy was between \$25,000 and \$35,000. But... the Heliostat would be able to produce the same amount for between \$15,000 and \$20,000. As a bonus, it would also generate 10kW of heat... If positive test results turn in to commercial success, the Heliostat could be used for water pumping, desalination and filtration, stand-alone electrical generation for remote areas, and heating swimming pools and hot water cylinders. It could supply electricity to the national grid or pump 10,000 litres of water an hour over a 10-metre head... [T]he project had enormous potential for use in [undeveloped] countries. While most of the [Last] World lacked the necessary infrastructure – or... money to develop one – for more traditional forms of power generation, what many impoverished nations didn't lack was sun.

...ONE RESOURCE AFRICA HAS IN ABUNDANCE is sunlight... [S]olar-powered cookers could help save Africa's forests... In some of the remoter regions of Eritrea some 23 hospitals and health centers use solar power systems... At Adi Qwala in central Eritrea, a town that has only five hours of electricity supply daily, solar panels now provide current 24 hours a day to the local health centre, which serves a catchment area for more than 100,000 people. The system produces enough electricity to power the hospital's lighting and air-conditioning and to refrigerate supplies of vaccines and blood. Constant energy also means that the operating theatre can work around-the-clock... When the world's top athletes arrive in Sydney for the 2000 Olympics, their living quarters will be powered by the sun. By then, 400 remote villages in the Philippines will be decked in solar panels built by the energy giant British Petroleum... Japan, which imports almost all its energy, has pledged that half of all new homes will be solar-powered by 2010. But while concern for the environment grows, industry analysts say the hard reality is that the world will rely on hydrocarbons... for most of its energy needs well into the next century. In most cases it is still too expensive to use energy that produces no harmful emissions. A massive structural change is needed before hydrocarbons could be superseded.

...I felt a wee bit smug for some 36 hours after Cyclone Fergus when we were the only house in our valley with lights and one of only a few with water. But much more important, our wind generator and solar panels and composting toilet are not polluting anyone's air or water, increasing the cancer rate, changing the climate or sending our sons to war to secure our access to oil. A recent *Herald* editorial suggested that if I... [- a] co-leader of the Green Party... [-] or Auckland University's new professor of architecture use renewable energy to run our homes or transport we are just exercising our personal consumer choice in a rather odd way and this is of no concern to anyone else. It was said that we used to think renewable energy and self-sufficiency were necessary because the Club of Rome report showed us the world was running out of resources. But there were some mistakes in the Club of Rome report and now we have even more oil than we thought we had in 1973. What's more, when resources do become depleted the market will produce price signals and make sure alternative fuels "far more efficient and pleasant than today's environmental Jeremiahs can imagine" will be ready to take over. It is time this pernicious nonsense was laid to rest. The Club of Rome has long been a whipping boy for those anxious to discredit the case of living within the limits of our planet. But how many of the detractors have even read its report, "The Limits to Growth"? It rightly saw that resource depletion, pollution, population growth and food supply are interconnected and that population and economic growth would eventually, and sooner rather than later, be limited by some combination of those factors... The real limit to fossil energy resources is not "running out" but the pollution from burning these fuels. The increasing reliance on fossil fuels to oil the wheels of our social machinery has impacts far uglier than the idyllic image of a sleek vehicle entering grand scenery on a lonely highway... The Ogoni people in Nigeria, their lands laid waste by an international oil giant and their protesters hanged, could also tell us of the real effects of our oil use. Less visible but eventually more life-threatening is the cautious consensus of hundreds of the world's scientists in the Intergovernmental Panel on Climate Change that human-induced climate change... has probably already begun. There are, of course, a few dissenting scientists who say there is nothing to worry about. Many of them are, or have been, employed by the oil and coal industries. There are others again who believe the panel is far too conservative and that the effects of global warming could be worse than predicted – for example if the warming of the tundra thaws frozen swamps and releases huge quantities of methane which will accelerate the warming... Renewable energy is claimed to be much more expensive than fossil energy. It is worth considering why: Oil is a mature technology[('the modern mineral oil industry dates from 1859, when a well was bored at Titusville in Pennsylvania')]. The research and development on drilling, processing and eventual burning has been done and is a sunk cost. The production, transport and marketing systems are in place. One can buy appliances ready to use it off the shelf. All these will eventually be true for renewables (with the market being in the hardware to produce and use the energy, not in the energy itself) but at present renewables are an emerging technology trying to compete with one that is fully established. Since we are going to need them eventually it would repay us to put some of the huge profits of the oil industry into developing the use of solar, wind and wood energy so that their cost comes down as soon as possible. Secondly, renewables have virtually no running costs, but that has to be balanced by high capital cost. Our society demands a very fast return on capital. Energy efficiency improvements which pay back their capital cost in two years typically do not proceed, yet a coal or nuclear power station which takes 14 years to pay back the capital investment gets built. A society that valued the future and used a lower discount rate would find renewables were often cheaper than oil. And then there are the subsidies. A database of all the geological records of oil and gas drilling is maintained at public expense for the oil and gas industry. If a wind farm wants detailed meteorological information it has to pay for it. N[Z] is facing the depletion of its largest energy resource, the Maui gas field. Gas provides a third of our primary energy. We are poised on the brink of deciding what should replace it. The default option is coal, of which we have plenty but which would double the carbon emissions of each unit of energy... Once a large-scale coal industry has developed to replace gas the transition to renewables will be retarded by many years and be accomplished only at the expense of loss of jobs and waste of infrastructure. The market cannot make the decision for us. It can help by making sure that prices reflect true costs, but in the end it is a social and political decision about what sort of future we want to have... And we will not get there by thinking energy decisions are a question of individual preferences which have no effect on anyone else.

...A[n A]uckland... research consultant in resource management and strategic planning... says market prices are better than Green politicians when it comes to guiding the world's energy developments... [The NZ Greens' co-leader] claims... it is "simplicistic to believe that the market has the answer to the depletion of energy resources" and... "decisions should be made now on renewable energy sources for the future." But such decisions are being made, and the market is making them. All around the world new energy sources are being developed and implemented... [The co-leader] defended the Club of Rome, though it predicted that the world would, by now, have run out of mercury, tin, zinc, oil, copper, lead and natural gas. How wrong do you have to be? The Club of Rome failed to recognise that all of these "natural" resources are human inventions and will run out of them only when we run out of the power to invent. There is no sign of that. The Club of Rome also predicted a combination of... [factors] would combine, "sooner rather than later" to destroy civilisation as we know it. [The co-leader] agrees. The facts do not. All resources, including energy, are now cheaper, which means more plentiful, than ever. The world's population has doubled since 1960 and yet 80[%] are better fed than ever. Hungry populations are hungry because they are poor, not because of any shortage of food. They are poor because they live under tyranny. There have been no famines in any democracy since the [end of WW2]. The poor and hungry need political reform. [The co-leader] blames the oil industry for executions in Nigeria which were ordered by tyrants. Politicians should not blame business for the murderous behaviour of politicians... We known how... to feed... the poor... – set them free... [and allow them] to get rich... The [rich societies] grow cleaner by the day because citizens demand it. The oil industry has helped. Imagine living in London in the 19th century when coal fires pea-souped the air and horse excrement

drowned the streets... Historically all replacements of one major resource by another have been driven by price changes. None was the result of political decisions. If we had listened to “expert opinion” (such as the Club of Rome) we would have got everything wrong. As [a] Nobel laureate economist... pointed out: “Industrial development would have been greatly retarded if 60 or 80 years ago the warnings of the conservationists about threatened exhaustion of the supply of coal had been heeded; and the internal combustion engine would never have revolutionised transport if its use had been limited to the known supplies of oil. The result would have been very detrimental if [experts had had] the power to enforce their views on policy.” [The co-leader] then argues that it is unfair to compare new renewable technologies with oil because oil is a mature industry and entry costs are high. The bronze industry was mature too – but iron replaced bronze. And steam replaced sail; fibre optics replaced copper and jets replaced propellers. So what is so special now? Energy fuels political fires. Politicians who would never interfere with the market for bread, steel – and even rugby on television – will leap to intervene in energy. Why is this? They are driven by fears of depletion, price manipulation by foreign devils, and dependency. Although no one really knows how much oil is below... Earth’s surface, today’s best guesses are that, at current rates of consumption, 650 years’ worth of oil remains for future generations... Should we be panicking... [when prices] have many years to send their signals, and we have many years to respond...? ...The *Washington Post*, normally so politically correct, [recently] said: “Leaving energy to the free market means leaving it to the roller-coaster of alternating shortages and gluts... [I]n the case of oil they are aggravated by the concentration of reserves in a place that... you can fairly describe as the world’s least stable.” Would the *Post* argue that the price of newsprint should also be controlled by the Government, or that the Government has a right to regulate the purchase and use of all commodities because they undergo “wild swings” in price? We tried that with wool and mutton... Rather than deal with all the other assertions of [the co-leader’s] tract it is worth quoting one of [the observations of the new professor of architecture at Auckland University], as recorded in the *Herald* interview which triggered this whole debate. [The professor] said: “The depletion of energy reserves... raises all sorts of questions. Like whether a market-led economy can be sustainable when it is based on profit and an ever-increasing use of resources?” This raises all sorts of questions. Like what is her alternative to the market-led economy? Does [the professor] prefer one led by a priesthood who claim more information than is contained in the price system as expressed by the workings of the democratic markets? Who are these remarkable people? Where have they acquired their special knowledge? If we give them the power to exercise their dominance over the millions who make up the market, how do we restrain them from exercising unlimited power over every aspect of our lives. The truly poor people of the world can help to provide the answers. And the devastated environments of the centrally planned economies have much to say.

...a consulting engineer in Auckland... doubts that markets will provide abundant new sources of energy. “All resources, including energy, are now cheaper,” writes [a research consultant in resource management and strategic planning]. In the 1960s and early 70s we were in a post-war development phase[when] prices were high... and we were [paying for] the last major capital intensive hydro schemes. In today’s more competitive climate (with the country’s power systems sold off at bargain-basement prices...) the whole lot is being run on a shoestring by a deliberately fragmented industry... Now we are looking to an economic recovery which will increase our energy demands considerably... [– yet r]enewable energy sources such as wind, solar and wave generation continue to be limited in the contribution they can make (there is vigorous opposition to a wind generation proposal at Pencarrow, for example, on visual amenity grounds.) ...[however, t]here is no such thing as unfettered private growth... “Free” enterprise will continue to be constrained by environmental legislation and public protest, as it should be in a free society... Conservation [– the antithesis of a free enterprise economy –] has been, and will continue to be, an important part of the energy equation... [Finally, the consultant believes centrally planned economies are even worse than free-enterprise economies. The consultant appears to be unaware that it isn’t central planning which is the problem – it’s the fact that the wrong people get to become central planners!] Events in the Soviet states have shown the dangers of nuclear energy in a politically unstable environment. From the viewpoint of long-term planning, is our political circus any better?

...Playing the new power game... With world energy demand expected to increase by up to 50[%] over the next 25 years, concern is growing at the ability of conventional power systems to deliver... “Coupled with this massive demand for energy... [– primarily from the] estimated two billion people around the world [who] still do not have access to electricity... the majority of [whom] live in rural and remote locations in... [Last World countries –] are major environmental concerns...” said a study of renewable energy by the A[US]n Department of Primary Industries and Energy... The study said that although high capital costs were a problem for some forms of renewable energy in [Last World] countries, and usually involved aid funding or concessional loans, widespread reforms in energy markets could allow renewables to compete on an increasingly even footing with conventional power generation. The potential is vast. The International Energy Agency says biomass... is already the fourth-largest source of energy in the world, providing about one-fifth of the [Last] World’s needs and 11[%] of total world energy demand. In some [Last World] countries, biomass may [already] be the largest source of energy, providing up to 38[%] of needs... A[US]n researchers say continuously running landfill-gas-fuelled generators can deliver more than 90[%] of installed capacity, with the added benefits of reducing odour and the emission of greenhouse gases... Similar gains are emerging from sewage gas – already generating electricity in Adelaide, Melbourne and Brisbane – and from sugar refining in Queensland, where power from cane residue could be worth up to \$A20 million... a year for the sugar industry... Already the nation is turning the sun, wind, rivers, sugar waste, rubbish tips and sewage into energy equivalent to 6[%] of AUS’s needs, while in[... the remote north-west of the continent vast tidal stretches could generate almost a tenth of the entire nation’s electricity. Waves pounding the Victorian coast hold the potential to pump more power into A[US]’s homes and industries... And near Musswellbrook, in N[SW]’s Hunter Valley, Hot Rock Energy A[US], a company set up by A[US]n National University researchers, is hunting corporate sponsors to build a pilot geothermal power station tapping heated rocks kilometres beneath the ground. According to the *ANU Reporter*, a 1994 federal study found there was enough... heat stored in A[US]n rocks to supply the country with power for at least the next 850 years. Electricity is generated by drilling bores up to 5km deep, connecting them with a network of small fissures and pumping cold water down the first bore. The water becomes superheated steam as it percolates through rocks as hot as 300 deg C, and drives turbines as it erupts from the second bore... [□ G]eothermal energy provides about [6% of NZ’s electricit]y... This source has the advantage of continuous supply. Wairakei and Ohaaki geothermal power stations in the central North Island operate round the clock every day... There are plenty of geothermal systems in N[Z], but only those between Lake Taupo and the Bay of Plenty, and the Ngawha field in Northland, are suitable for power generation because of their high temperatures. Fifteen geothermal fields in the central North Island could still be developed, but ownership of much of the land and its resources is awaiting investigation by the Waitangi tribunal.

...Mercury Energy yesterday made legal progress in its costly fight to fire up its \$80 million geothermal power station. The Auckland power company’s... 55MW... Poihipi plant north-west of Taupo has been idle for six months after a Maori sub-tribe claimed its operations would affect the Wairakei thermal field... which was a taonga (treasure)... But the tribe, Ngati Rauhoto... was knocked back in the Environmental Court yesterday... A request from Mercury for costs was reserved... [Mercur]y claims the starting delay is costing it \$1 million a month... [● A] fourth power station is planned for Taupo’s Tauhara geothermal field, where the scale of proposed development worries many residents. A company called Tauhara Geothermal Co-operative yesterday lodged a resource consent application with the Taupo District Council for a 33-megawatt station.

...Kaimai Energy has put its plans to test the Reporoa geothermal field south of Rotorua on hold, partly because of community opposition... [but two] power companies are [still] fighting thousands of Taupo residents and a regional council to build geothermal power stations... on the untapped Tauhara... field... near the town... [The] regional council, Environment Waikato, said at a joint resource consent committee meeting with Taupo District Council that neither company had properly addressed the issue of land slumping.

...The Ohaaki geothermal power field is subsiding at an unexpected and unprecedented rate, threatening to drown the local marae and historic gravesites under the Waikato River. Local Maori... have been in talks with the power station operator, Contact Energy, anxious about the marae's future. According to Contact, the 70-year-old meeting house, Tahumatua, may have to be moved... Alarm about Ohaaki, which began production only eight years ago, coincides with growing concern among some Bay of Plenty residents about the environmental consequences of the host of new geothermal stations planned or under construction. Subsidence occurs because steam and boiling water extracted to produce electricity cannot all be returned underground. Previously, subsidence at the Wairakei geothermal field, near Taupo, was known to be the greatest of any exploited underground reservoir in the world, including oil and gas fields. Now Ohaaki, 30km south of Rotorua has that dubious distinction and Contact Energy, already struggling to make a profit as a state-owned enterprise, is restricted to a 70MW capacity instead of the 104MW it was built for because river water was flooding its geothermal wells... Land at Waikareki subsided 13m in 36 years. Ohaaki was sinking at... double that rate by 1995 when a report was prepared for the Electricity Corporation (before Contact was created) by the Geological and Nuclear Sciences Institute... By 1995 low-lying areas normally dry in the summer were permanently flooded... The affected area is... 500m by 1km... If subsidence continues at its present rate it is predicted that by 2005 the area will have sunk... 7m, making it... permanently under water. A geophysicist... said: "The whole area that is sinking will continue to do so even if the... power station is shut down tomorrow. It is now irreversible and probably unstoppable."

...About 50km south of Rotorua is a small Maori settlement and a geothermal power station. The settlement bears the name Te Ohaaki-o-Ngatoroirangi – the gift of Ngatoroirangi, tohunga of the Arawa canoe... Edward Earle Vaile (1869-1956) whose 53,000-acre property Broadlands shared with Ohaaki a common boundary on the Waikato River, wrote in his book *Conquest of the Wilderness* that the Maori people there had "a wonderful great boiling pool with a beautiful lacework pattern around the edges – the most handsome pool in the whole thermal area. They had led the overflow into two useful baths in which the temperature can be controlled... They also have a 'champagne' pool (that is one which will effervesce when sand is thrown into it), numerous small cooking pools, and a beautiful sulphur cave." Test bores to ascertain the area's suitability for the generation of geothermal power were sunk between 1969 and 1981. The hot pools were drained dry. The bottom literally dropped out of one; all traces of another were wiped out by bulldozers. Ground surrounding the pools became unstable and dangerous and had to be fenced off. Today, vast amounts of carbon dioxide are released from the wells, much of it into the atmosphere along with thousands of tonnes of water vapour. All production wells have silencers, which are themselves noisy but only to anyone nearby... Many of the Ngati Tahu people who live at Ohaaki... are descended from those who, until the 1886 Tarawera eruption, lived in a sizeable village at Orakei Korako a few kilometres to the west. Great changes are said to have occurred in the [area's] hot springs after that eruption... As if [tha]t were not enough... the Waikato River [was dammed, flooding] two-thirds of the unique geothermal scenic area of Orakei Korako in 1961... When investigations were carried out into Ohaaki's viability as a geothermal field the [local Maori] jelders were uneasy. But when it was pointed out that a power station would provide tribal members with a livelihood and new skills they reluctantly accepted the scheme. Now, as a large part of the Ohaaki geothermal field rapidly sinks below the level of the Waikato River... [meaning that the] marae of Te Ohaaki-o-Ngatoroirangi may be as doomed to drown as was the ancient city of Atlantis[...], a new power station at Poihipi – west of the Wairakei geothermal field – has been given the approval to begin production. In the 1950s test bores were drilled at both Wairakei and Waiotapu. It was established that Waiotapu water was 40 deg C hotter than that at Wairakei but the ground had poor permeability. Wairakei was chosen... And then, when all the springs and geysers at Wairakei were destroyed, Waiotapu was declared a scenic reserve, thus saving it from the same fate... In the 1950s N[Z] had at least 240 active geysers. Today only about 55 remain... No springs, alkaline or otherwise, remain in their natural condition[at Wairakei]... A new geothermal field is due to go into production next month at Rotokawa, 10km south-west of Ohaaki. The area was acclaimed by the author Thorpe Taylor in 1882 as being the "choicest wonder of Wairakei." And "when the development of Wairakei makes it easier to access, it will be one of the main features of the district. It is already one of the most wonderful." [This year the area] was described as thus: "It looks like a nuclear bomb site! What appears to be either a landfill dump or car wrecker's yard is actually a huge plant of... rotting metal, a constant reminder of many decades of sulphur mining carried out in the area."

...With its multitude of tiny islands rising sharply from emerald waters, romantic boat rides and spectacular sunsets, Halong Bay naturally gets a "must not miss" rating from Vietnam's travel guide writers. No wonder, too, that the... cultural agency Unesco has this giant arena of natural beauty on its list of World Heritage sites. And yet a Government-run weekly recently described northern Vietnam's most popular tourist draw thus: "Mountains of dirt and rocks from... coal mines, some reaching over 200 metres in height, are casting clouds of dirt over residential areas of the region." That's no exaggeration, as... the general director of the state-owned coal monopoly, Vinacoal... [– which last year had] revenue... around \$US300 million[(but) because of cheap domestic prices and a policy of keeping uneconomical mines open to protect jobs... [– it employs] about... 70,000 employees[–] ...its profit was just \$US4 million[–] ...is ready to admit. "The damage done there is a consequence of many years of exploitation, to which the Government paid no attention." Indeed, forest cover in this coal-rich province of Quang Ninh has tumbled to... 15[% from 42%] in 1969, rivers are heavily polluted and 300,000 tonnes of coal slurry are spewed into the sea every year. According to the Mine Science and Technology Institute, the concentration of dust is 10 times higher than international standards, causing respiratory diseases among 80[%] of the province's rag-tag army of miners. At the Coc Sau open-cast mine in the town of Cam Pha, where a crater measuring 2.2km across has been gouged out of the... landscape, workers scramble with their hands for coal as mechanical diggers grind deafeningly beside them. Most cover their face with cloth masks, which are black [from dust] around the mouth and nose. "I am totally exhausted at the end of every day," says [a] 31-year-old... who has toiled at Coc Sau for the past five years. "Sometimes I just say to myself that I won't go back the next day." But [the 31-year-old] always does – to earn \$US60... a month. [Gals], who account for about a third of Coc Sau's 5300 workers, take home as little as \$US30 a month because they lack the strength to carry as much from the coal-face. In an unusually frank article last month, the official English-language daily *Vietnam News* asked whether the authorities really cared about the arduous lives of [Vietnamese people] working at mines... "Many workers die before they become eligible for the pension."

...Eighty-six people were killed and 12 seriously injured in an explosion in a privately run coalmine in central China, it was reported yesterday... The three owners of connected sets of mine workings fled with their families after the accident, fearful of reprisals, said the report quoting Chinese Government officials in the area. Most victims died while working in the mine. The cause of the huge underground blast is still being investigated... The blast follows a series of similar accidents in Chinese mines, which have together claimed well over 100 lives this year[and, last]... November, 114 people were killed in a coalmine explosion in the northern province of Shanxi.

...Chinese regulators blame bad management for a string of coalmine explosions that killed more than 200 people last month. Chinese authorities have appealed for greater attention to safety and warned that officials in charge of badly run mines may be prosecuted... [In local news, t]he Coal Producers' Federation said a coal ban would not fix the problem... of the smog... [that] s... smothered... Christchurch... 26 nights so far this winter.

...Coal could be banned from all Christchurch homes next year in a bold smog-busting drive to clean up the city's winter air-pollution problem. The Canterbury Regional Council planning committee... also decided open fires should be phased out by September 30, 2001, and enclosed burners phased out after 15 years' use or by September 2002, whichever is later. The full council will decide [in a fortnight] whether to approve the committee's recommendations. Christchurch has been the country's winter smog capital for years. This winter 33 nights were considered high-pollution nights because of smoke from house fires being trapped in clear, freezing air... and on one night the number of polluted particles per cubic metre of air was more than four times the healthy level. [Incidentally, '40% of Christchurch's smog is produced by just 10% of the city's houses.']

...Smog in this city is not just a nuisance, it kills, says the Clean Air Society. The... filthy Christchurch winter air was so bad, people were dying of respiratory ailments... At dusk on some nights, Christchurch is clogged in suffocating smog and from the [adjacent] Port Hills the city is barely visible through the haze, as dirty smoke from puffing chimneys destroys the clean night air... Christchurch was the third worst city in the world for this pollution from home fires. "Vancouver is worse and so is Logan in Utah. But forget Manchester, Birmingham or London. Christchurch is next on the list..." ...The... [s]ociety and Christchurch Polytech students are gearing up for a protest rally in... Cathedral Square... this month. They say Christchurch is known as the garden city, but if people don't stop polluting the atmosphere, it will become the smoggy city... But the problem is that Christchurch wakes up to the smog problem every winter and then forgets about it by the time the hot summer nor'westers start to blow.

...Christchurch residents are not worried about living in one of the most polluted cities in the world. A survey found only 17[%]... considered... air pollution... a problem over the past 12 months. The seventh annual residents' survey... showed barking dogs were the biggest nuisance in the... city. Residents also complained about traffic noise and backyard fires... [40%] of... the... 800... residents surveyed... said they were concerned about litter in the streets or shopping centres... [but 94%] were satisfied or very satisfied with Christchurch as a place to live, work and to spend spare time.

...Christchurch's blanket of smog is likely to linger for years even if council authorities decide to ban open fires and older woodburners... Christchurch has 15,500 open fires in regular use and 31,000 woodburners. They produce about 90% of the city's winter air pollution... Burning wood generates two-thirds of the pollution, particularly in woodburners... [T]his month the Canterbury Regional Council toughened its requirements on the emission rates from new woodburners. It raised the N[Z] standard, based on 5.5 grams of particulate per kilogram of fuel burned, to 3g. By the year 2000, Christchurch's standard rises further to 1.5g. But... [w]oodburners that have "clean air approval" at the old 5.5g rate can still be bought and installed, until the approval period for that model runs out – five years after it was originally tested. From now on, manufacturers submitting their models for approval will have to meet the 3g standard. About 24% of woodburners on the market already comply.

...IN these days of heightened environmental awareness many people are doing their best to ensure they play their part. So it may come as a shock to read that some authorities are targeting solid-fuel heating as a major contributor to air pollution – particularly in the colder weather. Before you cancel your firewood delivery, or rip out your fireplace, let us approach this rationally and sensibly. Solid-fuel heating is an umbrella for a vast array of heating appliances and fuels, from the open fireplace to the latest enclosed wood burner, and from the driest wood to the roughest coal... Before the late 1970s the most common solid-fuel appliances were a development of the open fire – a hearth, a grate and a venting system with little or no control over combustion, which resulted in little increased efficiencies. There were few – if any – requirements for clean air because there was no need to address the problem. Then along came the first truly efficient enclosed wood heater. This heralded a significant change in heating habits. For once the home owner could install a high-output appliance which would burn over night and heat the whole home. These early heaters sold in their thousands, and the owners were unreservedly enthusiastic about the product. Smoke levels seemed to be reduced, and servicing was cut to a minimum. The move towards a popular form of heating had begun. But the early technology brought with it a whole raft of problems which had yet to be solved. It was a significant improvement over the open fire, but its efficiency and performance meant that it was more sensitive to the type of fuel used... – wood for heating is the most environmentally acceptable option... but for maximum benefit, and minimum emissions it has to be... as dry as possible... [-] and to user operation. Over the years, research and development solved the problems with more sophisticated air systems, heat exchangers and fire-box linings which helped to meet or exceed the ever-changing clean-air legislation which was evolving as the state of the planet became a critical concern. Today's enclosed wood burners or high-efficiency fireplace inserts are a far cry from those of even five years ago, and they meet even the most stringent international clean-air standards even in problem areas like Christchurch when operated correctly... If... [open] fires, their sheet-steel counterparts, early enclosed wood stoves and pot bellies... were replaced by today's more sophisticated appliances the problem of pollution due to solid-fuel heating would be minimised if not eradicated.

...What form of home heating appliance should you choose – gas, electricity or solid fuel? Proponents of these different fuels put their cases... THE world's cleanest fossil fuel [– it 'doesn't produce ash, dust or smoke' –] natural gas is also easy to use, readily available and economical [('it requires little processing from the time it comes out of the ground until the time it is used in homes and businesses – having passed through an extensive network of steel and Polyethylene pipelines, which are buried to minimise disturbance to the environment and its visual natural beauty')], claims... the marketing manager for Enerco... "Natural gas provides large amounts of very controllable heat. Continuous-flow gas hot water heaters eliminate the heat losses of storage tanks. The supply of hot water is inexhaustible, and the high heating rate makes such appliances particularly popular for spa baths... It makes more sense to use up to 80[%] of the energy in natural gas by using it directly to heat water in your home, rather than wasting nearly 70[%] and increasing pollutants by converting (gas) energy to electricity... then heating your water... If you're cold and switch on the heater, you want to warm up as quickly as possible... Gas heaters are [also] convenient to use, can be portable or wall mounted and give you the same cosy feeling as an open fire without the hassle and heat loss. New flame effect fires look just like a wood-burning fire but are more environmentally sound." Flued gas heaters are usually larger appliances for heating bigger areas, while smaller capacity gas heaters are often not flued. Deciding which type of heater is most economical for household needs is often made more confusing by the different ratings and fuel efficiencies. Fuels are measured in different ways – gas by the megajoule (mj), electricity by the kilowatt hour (kW), coal by weight or the bag, and wood usually by the trailer-load which makes it difficult to compare heating values. However, if all energy values are converted to megajoules... (3.6mj equals 1kW)... a comparison can be made... [B]ased on 400mj, which is an average household's weekly winter power consumption, a flued gas heater cost \$4.33 to run in 1995, an unflued gas heater \$3.78 while an electric radiant heater cost \$9.44. These figures... are from the energy and resources division of the Ministry of Commerce... [A]n unflued gas heater converts 90[%] of the available energy to heat... "While new-technology heat pumps are more efficient than natural gas space heaters they are usually more expensive to buy, install and operate." ...Electricity THE Electricity Corporation wants to persuade people that electrical heaters are not as expensive to run as some may think. Its marketing information co-ordinator... claims that the latest technology and moves by a competitive electricity industry give electricity an edge over other home-heating options. [The co-ordinator] says that heat pumps are at the leading edge of heating technology when it comes to efficiency. According to the Heat Pump Association... heat pumps produce almost three times as much heat energy as the electrical energy they use. "It sounds miraculous... but it's proven technology." ...While in the summer they can be used to cool the home, in a temperate climate like N[Z]'s they are generally used for heating. Heat pumps are widely used in countries like A[US and the US]... Conventional electric storage or plug-in heaters are also likely to beat non-electrical heaters in most situations... "The best and cheapest option for each individual home rests on a complex combination of factors, including insulation, draughtiness, the number of appliances using each energy option, local electricity and gas prices, family type and lifestyle, and available sunlight." ...Gas heating can be cheaper than electricity in some situations, [the co-ordinator] admits. However, if the heater is the only appliance to use gas, "it can be an expensive option." Customers often pay a fixed charge which remains the same whether or not they actually use any gas... [T]here is, of course, a fixed charge for electricity too, but electricity is used over a greater range of appliances, so the cost of a fixed charge can be spread over a variety of uses... Solid fuels... [T]he Home Heating Association – which represents the solid-fuel industry – believes that further price increases for electricity will be introduced next summer. It claims that there are also concerns about the future availability and price of gas. Both coal and wood are readily available, but efficient utilisation is the key to economy here, it says. The best economy and efficiency is achieved if the whole home is kept warm and dry. What's more, a fully heated home is more healthy and livable so "heating capacity must be a major concern." The average home requires 12-15kW for adequate heating – that's six to eight two-bar electric heaters, the association claims... Other forms of heating... find it difficult to match the attributes of the solid-fuel heater "without making compromises which may not be so user friendly..."

...For many there are pleasant features about winter – from snow sport to roaring fires or the sound of rain on a tin roof. But for many elderly people winter is a time of bleakness and discomfort – caused by worsening illness, cost and even danger. A number of these problems revolve around the use of small electric heaters or open fires... [which] heat... only a small part of the house... Cold areas within the home quickly soak up the warmth provided by small output heaters, so while one room may be warm, the next may be as cold as ice... The N[Z] Home Heating Association says there are far better alternatives on the market... For best heating, and to reduce dampness – the cause of mildew, condensation and chills – the association says it's important for a home's structure to be as dry as possible, and to maintain a constant overall temperature to prevent moisture building up again as winter progresses... By maintaining a more even temperature throughout – even if there is just one person living in the house – sharp temperature drops... [that] can affect the body, making it prone to colds and flu... are avoided... The “trusty” open fireplace is a trap. Its efficiency is low, burning far more fuel than necessary. It takes more loading work and cleaning. The large fireplace opening causes cold drafts along with useful heat, so it becomes necessary to sit closer to the fire to feel warm. The association adds that... [s]ometimes it's not possible to react quickly to a falling log, or cinders, with potentially disastrous results... [By the way, t]he Christchurch School of Medicine, Christchurch Hospital and Christchurch Regional Council found that 29 deaths in the city a year might have been associated with air pollution[caused by open fires and other means of burning solid fuels, while]... 400,000 productivity days [are probably] lost by people feeling under the weather... The School of Medicine is carrying out [further] research... Dunedin, with so many coal fires, has also been testing its air... Wellington's notorious wind kept the capital clean most, but not all, of the time... Auckland had a different problem with pollution from car exhaust fumes.

...The Ministry of Commerce is taking an Auckland-based gas company to court following two house fires... The fires allegedly resulted from a failure to follow correct procedures during a mains pressure up-grade carried out by Enerco... “We're prosecuting to send a sign to utilities or gas companies to ensure they follow gas regulations and the safety of consumers is not put at risk.”

...Firefighters used a risky “wall of water” technique... to tame a gas fireball which raged for nearly five hours in a Hamilton street. Normal hose use proved useless against the 2000 degree-plus flames after a car crashed into a gas regulator station in Kahikatea Drive at 5.50 am yesterday, rupturing pipes and valves. The 15m fireball turned water to steam and the heat could be felt 50m away. Emergency services could not reach a valve to turn off the gas because the car was sitting on it. Gas workers gradually reduced the pressure from a nearby main to a point where firefighters [were able to] create... a wall of water shield... in front of them... [using] two hoses... and edge... forward to connect a tow truck cable to the car... The manoeuvre had been used only once before in N[Z] – at Manukau in 1990 when a girl was trapped under a crashed petrol tanker that ignited... Frantic firefighters initially feared at least one person was trapped in the... car... Police later determined no one was... They were following positive leads to identify the driver, who fled the scene. The Natural Gas communications manager... said there had been some vehicle collisions with stations since their installation 25 years ago, but never with serious results. The station reduces gas pressure from the main intermediate pipeline delivering gas to Hamilton, so it can be distributed to clients. Nearby service stations temporarily closed their CNG facilities to reduce demand. [Editor's note: 'Natural gas composed mostly of methane is the second most plentiful hydrocarbon energy source in the US. The country's present reserves of natural gas can withstand steep increases well into the next century. Electrical generating plants and motor vehicles could take advantage of this fuel; compressed natural gas mixed with hydrogen yields the cleanest-burning alternative fuel for powering motor vehicles. Switching to natural gas where possible would cut carbon dioxide emissions in half. Unfortunately, significant amounts of natural gas leak into the atmosphere during pipeline transmission and urban distribution, possibly contributing to greenhouse warming' ('in 1990 there were 194,100 miles of natural gas pipelines and 168,000 miles of petroleum pipelines in the US, which delivered 5.6 trillion cubic feet of natural gas and 11,378 billion barrels of petroleum respectively').]

...Dash for gas set to sweep Asia... Asia's... economies may be heading for a greener future if several multi-billion dollar pipeline projects aimed at supplying... power-provider natural gas come to fruition. But analysts warn that the region will have to wait for huge projects to bring gas from Russia and Central Asia. The attraction of gas for Asia is that it is both plentiful and clean... This means it is well-placed both to meet new energy demand, and to displace coal with all its associated pollution problems in the existing market... While this was still not as important an issue as in Europe, it was becoming more of a concern in Asia. The growth of gas use around the world has been spectacular. In the past 10 years global demand has risen by a third and consumption is... 60[%] of that of its big brother, oil... [G]as use increas[ed by 7.5% in the]... Asia Pacific region... in 1996 over the previous year to 235 billion cubic metres... But consumption could change out of recognition if plans to move natural gas by pipeline from the giant fields of Russia and... Turkmenistan go ahead... Russia's supplies are so large it cannot sell all the gas... in its traditional markets in Europe... The chair[perso]n of the world's largest gas company Russia's Gazprom... recently announced his company's intention... to develop gas fields in Irkutsk and Yakutia in Siberia and to link Siberian fields by pipeline with China, North and South Korea and “very likely” Japan. “We are aware that gas from the Middle East may start competing with Russian gas in the region in the next 10 to 15 years... But Gazprom expects the Russian gas to win the competition.” Senior officials from Turkmenistan and Japan recently reaffirmed plans to build a pipeline from the Turkmen gas fields to the Pacific and also eventually on to Japan. “If Turkmenistan's natural resources reach the Pacific... and the pipeline goes as far as Japan, there is no doubt this will have a positive effect on peace and stability in the Asian region,” [says the]... special councillor to the Japanese [PM]... The... Japan Gas Association... told a conference in June that East Asian demand will double from 140b cm a year now to around 300b cm a year by 2010. “On the one hand its utilisation as an electric power generation fuel is expected to rise... On the other hand, its employment in the manufacture of chemicals and fertilisers as well as a fuel for industrial purposes is anticipated to burgeon.” ...There are also other plans to build major pipelines from Turkmenistan through Afghanistan to Pakistan and India, as well as smaller scale projects, like a pipeline from Burma to Thailand already underway... [■ Yesterday's] blessing by local iwi heralded the start of Enerco's \$10 million North Harbour gas pipeline project. The 25km pipe will run from Taupaki to Albany and deliver gas to thousands of North Shore homes and businesses. The project will begin in October and is expected to take six months. A high-pressure gas pipeline across[Auckland's] Harbour Bridge is working at full capacity.

...[‘over-filled’] LPG cylinders have caused explosions in NZ – but nothing like the explosion allegedly caused by a leaking ‘gas pipeline that killed 10 campers in a remote part of the US’. In related news, it] is estimated that... in Britain... up to 70% of reservoir water is lost between the reservoir and the customer due to leaky pipes. The recently privatised water companies are all making massive profits but it seems these must be returned to the shareholders and the executive, rather than be used to fix the pipes.

...WHY do you think so much water is lost from cracked mains? Water pipes do not just shatter of their own accord, for the Victorians built well and solidly. No, the reason is the endless pounding from above by needlessly heavy lorries... [– although frozen water might have caused some of the damage? Speaking of frozen water,] Essex and Suffolk Water, which provides water to 1.4 million consumers... is in talks with a Scandinavian company to examine whether... it can tow giant icebergs from the Arctic circle to bring water to Britain's drought-stricken south... “It does sound a little fanciful but we have a duty to investigate all sources of supply,” said... [a spokesperson, who] admitted “getting the icebergs across the North Sea would probably be rather expensive because we would have to build plants on the coast to convert the ice back into water and then treat it.”

...Enormous deposits of ice-like crystals beneath the sea-bed could provide energy to power North America for over a century... “The inclination to dream about how many cities might be lighted with the stuff can prove irresistible,” says [a scientist from] Texas A and M University, who published his findings in the British scientific journal *Nature*. His university operates the research ship *Resolution*, which discovered the... methane hydrate crystals... [that] contain natural gas... below Blake Ridge off South Carolina on America's eastern seaboard – although they are thought to

be widespread elsewhere. The crystals – formed by the combination of methane and water under huge pressure at low temperatures – may well yield more energy than all the remaining oil reserves in the world. They act like cages, trapping neighbouring gas molecules which originate in organic sediment deposited over millions of years. Russian technologists have already succeeded in producing methane from gas hydrates in the Messoyakh field... At room temperature, the crystals – which resemble dirty, bluish-grey snowballs – smoke, pop and eventually disintegrate with a hiss as the gas escapes. This explosive property... may also unlock the mysteries of the Bermuda Triangle, the stretch of the Atlantic... close to the target area of the Resolution's drilling exercise... where... 1000 lives have been lost without trace in the past hundred years... [S]uggested solutions to the mystery have included disastrous mini-tornadoes and evil rays emitted from the underwater ruins of the lost city of Atlantis... [According to the crystal theory,] methane hydrate zones act as impermeable barriers to gas fields that accumulate beneath them. The crystals form a seal but, if it cracks in an earthquake or other disturbance, gas and decomposing hydrate rise through the water, causing surface eruptions. This, some believe, could produce a highly concentrated – but invisible – flammable bubble above the surface of the sea, endangering not just ships but low-flying aircraft as well... Ships have been lost in the triangle without issuing mayday calls or leaving bodies, wrecks or even oil slicks in the water.

...Parts of an oil slick from a sunken Russian tanker started washing ashore in northern Japan yesterday, threatening a possible environmental disaster for the Noto Peninsula. A Maritime Safety Agency spokes[person] told Reuters the 10km slick had broken into many parts and the first patch washed ashore on a beach at Echizen. Bad weather has dogged efforts to stop the oil spill since the 13,157-tonne Russian-registered Nakhodka, carrying 19,000 tonnes of heavy fuel oil, sank and broke in two during storms in the Sea of Japan last Thursday... It has been estimated that at least 3700 tonnes of oil had escaped from ruptured tanks in the ship's bow and more oil was leaking from tanks in the stern. The Noto Peninsula, about 350km west of Tokyo, is a rich fishing ground famed for its shrimp... snow crabs, abalone and... [gal] divers known as "Ama."

...The battle against one of Japan's worst oil spills grew more difficult yesterday as huge new slicks whipped by heavy winds quadrupled to 450km of coastline affected by the spill. And the top civil servant in charge of the clean-up... was seriously ill in hospital after losing both his feet and an arm when [the civil servant] fell in front of a speeding subway train yesterday. Police were mystified about how [the 50-year-old]... director of Japan's Marine Pollution and Waste Management Office, fell on to the tracks at central Tokyo's Awajicho Station... The shoreline threatened by the breakup of an ageing Russian tanker spanned six prefectures on the Sea of Japan, stretching from around Kyoto to the Noto Peninsula[, and oil is] continuing to spill from the tanker... said the Kyoto News Service... "It's worse than we expected," said one fisher[person] cleaning up the shores of Imagoura in Hyogo prefecture. "We have to scoop the oil by hand because the slick is like jelly and won't react to neutralising chemicals or absorbing mats," a Hyogo prefectural official said. Once-thriving fish markets were either shut or had only frozen or processed seafood on sale, a rare sight in Japan. In a mainly symbolic gesture, the Russian Government is sending a ship to help with the clean-up.

...The Russians have apologised to the Japanese for an oil spill from a sunken Russian tanker which has turned into a major ecological disaster. The Russian Ambassador to Japan... sa[id]: "This is a dreadful, regrettable thing. I apologise for such tremendous damage and destruction." Oil was still seeping from an inaccessible part of the tanker yesterday and adding to a group of oil slicks which has already fouled much of Japan's west coast... The rear section of the... Nakhodka, which sank about 150km off [Japan's] western coast... is thought to still hold three times the total amount that has spilled so far, said [a] coast guard spokes[person]... If all the remainder spilled out, it would be Japan's worst oil slick ever. Slicks have now affected... an 800km stretch of the western coastline... Japanese environment officials are calling for volunteers to clean up bird sanctuaries smeared with oil... "Oil slicks have already hit the shores of Kanmuriyima Island, [which]... is a summer nesting ground for 600,000 white-faced shearwater birds... We don't have the resources to clean up the slicks, so it's down to volunteers." ...[however, c]leanup operations... were cancelled today because of stormy weather... Waves up to 4m were whipping at the coast, and threatened to disturb the fragile, oil-laden bow portion of the ship, which has run aground on rocks off Mikuni. The bow split from the rest of the ship when it sank. Salvage experts plan to try to pump the oil out of the bow when the weather calms down. The four-day operation was originally scheduled to start today... [On a positive note, the] oil spill... has narrowly missed a string of 15 nuclear power plants at Wakasa Bay, the world's largest concentration of nuclear power generation...

A network of oil fences and favourable currents have prevented... Japan's... worst oil spill from reaching a string of nuclear plants along... the country's... northern coast... However, a new slick estimated at 20km long was spotted east of the main concentration of oil, possible heading for previously untouched areas. Officials are focusing their clean-up efforts on the waters near [the] nuclear power plants... The sea water is vital in keeping the reactors from overheating. While their intake pipes are set about 5m below the water level, the heavy oil... from the... 26-year-old... Russian tanker... has been gradually sinking as it becomes as thick as mud... Nuclear power plant officials say there is no danger of a meltdown even if oil gets into the intake pipes. The system can tolerate small amounts of oil and at worse they would have to suspend power generation.

...Nuclear. Now there's a word to set the blood boiling – even when it applies to power not weapons. N[ations], blessed with free-running rivers, coal and gas reserves, and with a tendency to live in the present (if not the past), find resisting the nuclear option a simple matter. However, taking the high ground against countries not so similarly blessed is disingenuous. It is because their options are limited that nuclear power is here to stay... Absence of natural resources is not the only reason for choosing the nuclear option. Concentrate oil reserves in politically unstable regions and expect nervousness. In Tokyo's eyes the 1990-91 Gulf War justified the decision in the wake of the 1973 oil shock to reduce Japanese dependence on Middle East oil... Japanese nuclear waste is being reprocessed – in France until Japan builds its own reprocessing facilities – and returned for reuse... The shipment of processed nuclear waste from France to Japan has brought the usual protest from anti-nuclear militants... Some of the N[ation's] reaction to the shipment's passing through the Pacific region smacks of the not-in-my-backyard mindset that France was charged with at the height of its nuclear testing. But in the interests of recycling nuclear waste it seems of greater value to encourage international assistance for Japan in its venture rather than taking a negative stance that can only be interpreted as accepting the alternative – waste dumping... In the late 1980s impoverished states in West Africa and the Pacific had become targets for private companies that had taken over the business as industrial countries faced a combination of growth in toxic, including radioactive, waste and a reduction in disposal space. Comparative costs made the business attractive. At the time, disposal cost the equivalent of about \$1500 a tonne in Europe compared with \$3.60 a tonne in Africa... Not all African states welcomed the new growth industry among their neighbours... And the publicity over the attempts to try to use poor states as dumping grounds for toxic waste encouraged regional agreements to counter such activities. Collapse of the Berlin Wall opened the curtain to disaster areas of untreated contaminated waste. In 1993 Russia's dumping of nuclear waste into the Sea of Japan drew attention to the disintegration of the former Soviet Union's nuclear-powered naval vessels. Co-operation in such matters provides the key: Japan came to Russia's assistance with a pledge to build a treatment facility for safer disposal of the waste.

...Britain[, which for]... years... has been using the water as a... [dump for its nuclear waste, says it']ll honour a ban on radioactive dumping at sea.

...A link between a French nuclear reprocessing plant and leukaemia in children has been found by a new study which is likely to reopen controversy over the safety of Britain's two reprocessing plants. One of them, Dounreay in Scotland, reprocesses spent nuclear fuel rods from Lucas Heights, near Sydney. The study... was carried out at La Hague... Nearby are a low-level radioactive waste depository, a nuclear power station and a navy dockyard where nuclear fuel is handled. The area is "one of the most densely nuclearised in the world,"... The... study... found children who visited local beaches at least once a month were almost three times as likely to develop leukaemia. Eating local fish and shellfish at least once a week showed a similar increased risk... La Hague, Dounreay and Sellafield in northern England are the world's only nuclear reprocessing plants operating on an industrial scale... Sellafield... handles more than 200 tonnes of nuclear fuel from Europe and Japan each year.

...A sharp increase in radioactive waste from Britain's Sellafield nuclear reprocessing plant has been detected in Norwegian waters, says Norway's Radiation Protection Board... [In another development, n]early 50 people living near the French town of Saint-Jean d'Ormont [have been] tested for contamination after radioactive traces were found in wild boar caught in the region. The tainted animals were... found to have three times the normal safety levels of cesium 137 and strontium. The discoveries have caused concern that the nuclear cloud released by the accident at Chernobyl in... 1986 could still be affecting the area. Radioactive mushrooms were discovered growing in France earlier this year.

...A Russian scientist has warned a Chernobyl-style disaster could happen just outside Moscow because his institute cannot afford to dispose of its large quantities of highly radioactive material... The environment minister... said recently that disposing of radioactive waste would cost Russia \$US700 billion. The country's 1996 [GDP] only came to about \$US400 billion. Meanwhile, Ukraine has made "great progress" in... the latest round of talks with... the G[7] countries... on how to shut down Chernobyl but no final decision has been taken on compensation for the loss of energy... For the record, the financial cost of the Chernobyl accident – the most expensive ever – is estimated at between \$283[billion] and \$358 billion.

...Ukraine said it needs to complete two new reactors to compensate for the lost electricity... [if it were] to close Chernobyl... The G7... had agreed to fund the reactors, but lately has been showing reluctance.

...Western diplomats, journalists, South Korean contractors and officials of an international consortium arrived in North Korea yesterday to witness the breaking of ground for a landmark nuclear project. The international community is due to build two 1000 megawatt light-water reactors in the communist state in return for Pyongyang's promise to freeze and eventually dismantle its suspected atomic weapons programme... Before... the Korean Peninsula Energy Development Organisation (KEDO)... puts the vital reactor cores in the new reactors to be built over the next seven to 10 years, the International Atomic Energy Agency must give North Korea a clean nuclear bill of health... [● Last week in Germany, m]asked militants fought with firebombs and slingshots to protest against nuclear power. Now, their cause may be triumphing throughout Europe – not as a result of their protests but because of the rising cost of producing nuclear energy. Western European countries have stopped building nuclear power plants... partly because of the panic over radioactive fallout from the... Chernobyl disaster. The panic fed a desire for top-level safety standards, and those standards can raise the cost of a plant to \$NZ3 billion... Germany has an unofficial moratorium until 2005. It also has the strongest anti-nuclear movement in Europe, as shown by[the] demonstrations... against a shipment of nuclear waste to a storage facility in the northern German town of Gorleben. [But t]hree years of Gorleben demonstrations have failed to pressure Germany into closing down its 19 atomic power plants, which produce a third of the country's electricity.

...Indonesia's Parliament has approved a law allowing state-owned and private companies to develop nuclear energy despite protests that the Government was ignoring safety issues. About 50 anti-nuclear activists... protested outside Parliament as 75 of Indonesia's 500 law-makers debated and approved the bill. They argue that earthquake-prone Indonesia is no place to build nuclear power stations... The... Research and Technology Minister... said the law was not aimed at legalising the construction of nuclear power plants but only at updating a 1964 atomic energy law, which had no provision for compensation in case of an accident. The new law sets the liability of a nuclear plant's operator at 450 billion rupiah (\$[NZ]27.65 million) including the compensation to victims of fallout. But the law is vague about the mechanism for subsequent generations to sue the operator for radiation-related genetic diseases. The Government has been promising to build at least 12 nuclear power plants across the country. The first is planned to be built by 2000 in the foothills of a dormant volcano in central Java... [D]emand for power in Java... [–] one of the most densely populated regions of the world... [– is] expected to grow six times by 2015... A feasibility study has been conducted by Mitsubishi Heavy Industries Ltd of Japan, Samsung Corp of South Korea and Westinghouse Electric Corp of the U[S]... In Canberra... the... Greens Senator... accused the Federal Government of being more intent on promoting uranium sales than protecting the interests of A[US]ns over Indonesia's nuclear plans. [The] Senator... said the prospect of nuclear power stations in Indonesia was one of the biggest environmental threats facing A[US] and the region. "We know that in the event of a major nuclear accident with one of these nuclear power stations the whole of north A[US] could be contaminated if it's in the monsoon season, but this Government is not going to complain about that on behalf of the A[US]n people..."

...A public inquiry organised by the Nuclear Issues Coalition in A[US] yesterday renewed calls to abolish the A[US]n uranium industry, citing its negative health, environmental, social, cultural and economic effects... [Incidentally, the US] House of Representatives yesterday passed a bill to build a temporary dump in Nevada for spent fuel from nuclear power plant reactors.

...Nuclear leaders in the U[S] yesterday spoke dreamily of the opportunities opening up in China... [The US] President... is poised to allow sales of nuclear technology to China and the Chinese are expected to spend[at least] \$US50 billion... until 2015 to meet their energy needs, making them by far the fastest growing nuclear market. "From a US perspective, the numbers are very big," said... [the] vice-president of the Nuclear Energy Institute, an industry organisation. "We think that you are not going to have that spread out over 50 countries. You are going to have a few big winners"... France, Russia and Canada have already clinched deals with China to build two nuclear power plants each but U[S] industry officials say their advanced technology will allow them to compete in the market despite the late start." Giants like Westinghouse and General Electric are barred from doing business in China under a 1985 law which prevents such exchanges until the Administration can certify to Congress that China is not helping countries develop nuclear weapons. China's nuclear cooperation with Iran and Pakistan had up until now prevented the Administration from making that determination... To secure certification, China reportedly agreed in talks last week in Beijing to end nuclear cooperation with Iran... [By the way, last week a] prominent Bulgarian brewery announced it has developed a new formula for "beer" that will filter out the harmful effects of radiation in humans... The Bulgarian daily *Troud* reported that the non-alcoholic brew is made of herbs and mineral water, and is said to neutralise strontium and uranium in those who drink it. Research on the beer was funded by Bulgaria's defence and health ministries, and the final product is targeted for workers at nuclear power plants.

...Workers in a Japanese nuclear fuel reprocessing plant were dusted with radioactive particles after a fire broke out at the facility north-east of Tokyo. The blaze was brought under control within 10 minutes.

...Radioactive particles collected after an explosion at Japan's nuclear reprocessing plant indicate that plutonium may have been released into the air... However, the level of radioactive particles found was below the limit set for areas outside the plant and did not pose a risk to the environment... The... explosion at the facility in Tokaimura, 160km north-east of Tokyo, was caused by a fire that was not properly extinguished 10 hours earlier. Radiation escaped, exposing 37 workers to minor levels. [The Japanese PM], who was not informed of the accident for several hours, formally apologised to the nation in Parliament for the lapses. Since the Tokaimura incident two other nuclear plants have either shut or cut back production because of maintenance checks that found flaws in their operations. The Tokaimura plant is Japan's only nuclear reprocessing facility... with the rest... [of the] spent nuclear fuel from Japan's 50 running commercial nuclear power plants... [being] reprocessed at French plants.

...Japan's most serious atomic energy accident could not have come [at a worse time] for the country's nuclear power industry. The incident early last week, in which a radiation leak contaminated 35 workers, was just one blow in what could turn into more than a bad luck week for an industry regarded as a cornerstone of energy-starved Japan's economic policy. Hours before the fire... the industry had already suffered a setback when local opposition elsewhere in Japan forced the scrapping of a planned nuclear power plant... [The] Citizens Nuclear Information Centre Secretary-General... expected the accident to have a significant psychological impact. "I think the accident is going to provide momentum to people calling for an end to Japan's plutonium energy policy." That is bad news for economic planners, as Japan hopes plutonium technology will allow it to wean itself off oil imports to the point where... it will be able to supply more than half of its energy needs. Nuclear planners were already reeling from the impact of a December 1995 accident... at Monju, a prototype plutonium fast-breeder reactor, which was the centrepiece of the plutonium strategy.

Although no radiation leaked... at Monju, the incident became a public relations disaster when the media revealed that the state-run Power Reactor and Nuclear Fuel Development Corporation (PNC), owner of both the Monju and the Tokaimura plants, tried to keep videotapes of a coolant accident secret. The shame and perception of betrayal of the public trust was so great that a PNC official at Monju committed suicide.

...A Science and Technology Agency panel looking into the cause of [Japan's] nuclear fuel reprocessing plant accident met yesterday to scrutinise the cover-up... The meeting is the fifth of its kind since a fire and subsequent explosion took place... at a bituminisation facility in the plant where low-level nuclear waste is solidified with asphalt for storage.

...Supporters and opponents of nuclear power were united in anger yesterday after a state-run firm said it had delayed reporting a new radiation leak after concealing Japan's worst nuclear mishap last month. The beleaguered... PNC... was ordered to halt operations at its Fugen reactor in western Japan after it emerged that it had waited 30 hours before reporting a radiation leak which occurred on Monday... It shut down the Fugen plant on Tuesday night... A Government spokes[person]... said the troubled state-run body "should be dismantled and start again from scratch, leaving no sanctuaries." [The spokesperson's] comments echoed those of the head of the Citizens Nuclear Information Centre, Japan's biggest anti-nuclear organisation. "Let's say 'sayonara'... to the PNC... we should be telling the firm to 'please go away,'... instead of saying 'clean up your act'...,"... [Japan's PM], who last week said revelations of PNC's earlier cover-up made him speechless... yesterday... was disgusted at the latest revelation. "I saw the date of the accident and the date the PNC reported. It's completely hopeless!" ...The Government has asked the police to press charges over the cover-up... If convicted, PNC officials would face a fine of up to 200,000 yen (\$2340) each and a jail term of up to six months.

...WHEN an explosion at a government nuclear fuel plant north of Tokyo recently exposed a large number of people to high levels of radiation, officials quickly covered up the accident and denied responsibility. Last week the Japanese public learnt just how dangerous their 52 nuclear plants have become. Investigators uncovered a web of lies, falsified reports and at least 11 other unreported nuclear accidents... [Then the public found out yesterday that an] estimated 100 litres of coolant water [has] leaked from a nuclear reactor in northern Japan...

PM angry at 30-year nuclear waste leak... A furious Japanese [PM]... said yesterday that it was unbelievable the country's state-run nuclear corporation turned a blind eye for 30 years to a low-level radiation leak from a storage plant... at Tokaimura... "....despite the fact that the company even received a verbal warning from the Science and Technology Agency in 1982,"... [The PM] also questioned the credibility of the... [a]gency, which oversees PNC operations... The radiation leaked from about 2000 drums, each containing 200 litres of low-level radioactive waste produced by uranium processing. The drums were in an open swimming pool-like pit exposed to rain which rusted some of the containers.

...The "No Swimming" signs beside Orakei Basin look as if they will stay for a few more years. The latest tests show that the basin remains a public health risk, almost 65 years after the first complaints of sewage contamination... [T]wo-thirds of sewers in the Auckland City Council area were laid before 1930... [O]nly one of 12 tests in the... basin last summer was within the Department of Health bathing guidelines... Enterococci bacteria... indicates sewage contamination... The department maximum is 104 enterococci... per 100ml, but the median reading was 4300... Tests of the four sites in November, February and March showed a low reading of 10 bacteria per 100ml at the sluice gates and a high of 59,000 in the Kelvin Rd arm of Orakei Creek... [I]t would be another two to three years before it would be known when swimming in the basin would be safe.

...Swimming at the outfall from a sewage treatment plant is more than four times safer than swimming at the Auckland Viaduct Basin... The... figures... issued... yesterday... have alarmed health officials... The high pollution is caused by three combined stormwater and sewage pipes that drain into the [Waitemata Harbour] around the basin... [T]he problem was exacerbated by fishing boats that discharge raw sewage in the vicinity... **With a... faecal pollution reading... of 104, 19 out of 1000 bathers could become sick with gastroenteritis... conjunctivitis and hepatitis A...* [The e]xpected reading from a large municipal sewage treatment plant [is] 1000... The... Viaduct Basin [was] 4600...

Tegal Foods Ltd has been fined a total of \$7500 after admitting it allowed chicken faeces and body parts to enter a Henderson stormwater system. Three charges of breaching the Resource Management Act... were... brought against Tegal by the Auckland Regional Council... The ARC's lawyer... said the stormwater drained into the Oratia Stream and thereby into the Henderson Creek and, eventually, the Waitemata Harbour. Tegal's lawyer... said the plant was in the middle of an upgrade at the time and, in hindsight, the first two... overflows were due to inadequate practices and facilities. But staff training and the building of a bund were among steps taken to improve yard procedures, and the third incident had resulted from a mechanical pump failure. [The lawyer] said there was no evidence of environmental harm. Tegal had plans for a \$6.5 million redevelopment of its inherited site which included a new purpose-built live-bird processing plant... The planned redevelopment would have to conform to Resource Management Act regulations... [Incidentally, plans] to clean up the polluted Viaduct Basin in downtown Auckland are on hold because of a legal battle. The disagreement between the Auckland City Council and Ports of Auckland means that clean-up work... may be delayed for months... Plans to redirect drains that feed into the basin into an area near Wynyard Wharf depend on the argument being resolved... The port company says the proposal simply shifts the stormwater pollution problem elsewhere. The company's group public affairs manager... said it would have to spend more on disposing of dredged material if stormwater outflow continued to be near wharves... The council's water and wastewater manager... said... an outfall at Wynyard Wharf... [would be] tidal and not prone to silting... [T]he proposal to improve Viaduct Basin water was part of \$16.2 million being spent on separating stormwater and sewage drains in central Auckland.

...[city traffic will be disrupted while t]win lines of stormwater pipes big enough for a person to walk through are being installed along Commerce St as part of [the] scheme to clean up the downtown area discharges to the Waitemata Harbour for the year 2000... [In related news, the] North Shore City Council has rejected the claims of a former council sewerage worker that its 40-year-old... sewerage and stormwater... system is in danger of collapse... The council's... deputy mayor... said... last night... "...We are working to replace it and we've spent about \$50 million on it since 1989." ...The accusations follow growing concern about beach pollution in the East Coast Bays... A residents action group, the North Shore Environmental Protection A[ssociation], is campaigning to ensure \$1 million earmarked for stormwater work is retained in the up-coming budget.

...Rebel councillors are fighting for more money to upgrade the North Shore's ageing sewerage system... A five-[member] group is expected to put pressure on the city council today... "We are not asking for an increase in total expenditure, just funds to accelerate the programme and do essential work,"... said... the lobby group's leader, who is the council's finance committee chair[person]... The council said it was spending \$2.5 million this year on sewerage and pumping station renewal works. In a statement, it said the sewerage system was not perfect but had been adequately designed to cope with expected population growth... A claim by... a former sewerage employee... that an overflow alarm in the Devonport area was turned off to conceal continual overflows had been investigated by the council. The statement said a continuously monitored alarm system was in operation and a telemetry alarm system, controlled by a central computer, was installed at every pumping station in the city... The biggest problem for the system continued to be stormwater infiltration, caused largely by illegal private connections and low gully traps.

...More than 30,000 North Shore properties will be checked as the city council cracks down on the illegal stormwater connections wreaking havoc on the city's sewerage system. Roof run-off pipes [are often] connected to the sewerage rather than the stormwater system... The council's water network manager... said the inspections, which would be carried out over the next year, would cost about two-thirds of the \$1 million allocated to improve stormwater and wastewater systems... [T]he checks were an ongoing process because people renovated or replaced piping and could do it incorrectly... Last year, pipe faults were found in 5.6[%] of the 19,470 properties inspected.

...Contamination of North Shore streams is so high that bathers risk illness and infection, says a damning new report. A survey by Auckland Healthcare officials shows that bacterial levels in eight main urban streams are at least 10 times higher than recommended under guidelines for

recreation and shellfish gathering. While the exact source of the contamination is unclear, officials suggest it is highly likely to be sewage. North Shore City Council last night slammed the report and claimed the contamination could have come from bird or animal droppings or soil bacteria. Council officials produced their own report by two leading water-quality scientists from Auckland University, who attacked the findings as "confused... haphazard... and inconclusive." ...The... scientists... said the report failed to prove ongoing sewage contamination... [T]he North Shore Environmental Protection Association... said the council was whitewashing the issue, because raw sewage regularly poured from overflow pipes into the streams... The council has approved a \$25,000 water-quality pilot study... which will begin next month... in Mairangi Bay...

Bacterial levels at five North Shore beaches exceed... guidelines... The Auckland Regional Council's guidelines specify bacterial levels in bathing water should be no higher than 119 enterococci/100ml... Samples were taken from 24 North Shore beaches on Monday... The beaches that failed the bathing water quality tests... and... [t]he results... were... Takapuna 486, Mairangi Bay 218, Murrays Bay 170, Long Bay 159 and Rothesay Bay 142.

...Warning signs have been erected at Milford and Mairangi Bay beaches after heavy rain caused sewage overflows at the weekend.

...An independent audit of the North Shore City Council sewage disposal system has exposed management deficiencies... [However, the audit, which] cost about \$20,000... found that techniques being used to rehabilitate sewerage were as good as anywhere in N[Z]... The... Council yesterday made a further move to clean up an image muddled by public health authorities' criticism of stream pollution. It called for a unified approach to the monitoring of streams and bathing water throughout the Auckland Region... The chair[person] of the city council's regulatory committee... said last night that environmental health had suffered from a lack of consensus between agencies. A joint approach was urgently needed.

...A public health official has accused the Auckland City Council of upgrading its sewerage system too slowly, after a mystery spill into Cocks Creek... The heavily polluted creek, which drains into the Waitemata Harbour from the Auckland suburb of Grey Lynn, ran bright orange with the spill for several hours on Tuesday... [The health official's accusation coincided with the ARC] taking its stormwater pollution message to the streets and airwaves as part of a \$60,000 advertising campaign[, which]... is aimed at discouraging people from pouring toxic substances on the ground or down stormwater drains... A council officer said the campaign had an immediate effect... – a person rang a hotline to complain about car-washing detergent flowing down a stormwater drain. Though the main component of stormwater pollution is road run-off from vehicles, a significant amount occurs because people do not understand that stormwater drains lead to the nearest waterway, rather than a sewage treatment plant. The council's resource quality section deals with about 1100 water pollution complaints each year... [However, an ARC] pollution control officer... said no... action would be taken over... [Tuesday's spill. The officer] was not sure what it was but thought it could be dye or paint from an industrial source. It was legitimately in the nearby sewer which had overflowed after rain... Sewage overflows into the creek were common after rain and were permitted... The drainage operations manager... said... last week... that... the council's... four-year, \$55 million project to separate... combined drains in[cluded] the Cocks Bay, Freemans Bay... catchments... Freemans Bay drains were being fixed first. Cocks Bay would have to wait until July next year at the earliest for its upgrading. [The health official], while recognising the council's efforts to fix the problem, said it had not given it high enough priority. "When Auckland City allowed substantial infill housing, they should have at that time started making sure the infrastructure could handle the increased loading." [The official also disputed the council's] assertion that yesterday's pollution followed rain, saying there had been no significant rain for several hours beforehand... [● ○]rganisms which cause food poisoning have been found in four Waiheke Island streams, opening more debate on whether a reticulated sewerage system is needed there. Residents of the Hauraki Gulf island now dispose of sewage from their own properties, using methods such as septic tanks and pits. A health official says evidence is mounting that the ground is not coping, with contaminants seeping into the environment... Local Auckland City Council politicians were reluctant to comment... However, a council project aiming to maintain the village atmosphere of the Oneroa settlement, the island's biggest, had decided there was surplus effluent which needed to be removed. The manager of Project Oneroa... said the public were being consulted over setting up an irrigation system to take it to forest areas or creating oxidation ponds. A proposal would go to the Auckland City Council next month, but public consensus and funding would be needed for changes to take place...

The Auckland City Council looks set to miss the boat for dealing with sewage problems on Waiheke Island... The draft budget for ...1998 allocates \$200,000 for solving sewage problems in the commercial area of Oneroa. But... [a] local councillor... says more than three times that amount may be needed just to build a service lane where pipes would be laid. The Minister of Health... has told the council that cost cannot be used to ignore a public health problem. As a result, senior engineers were sent to the island this week to assess the situation... [The minister's] attention has added urgency to a long-running discussion on what should be done... The council estimates it will cost up to \$3 million to build a reticulated system for Oneroa's commercial area alone. Servicing 40 businesses and 25 homes, that breaks down to about \$46,000 for each property. Who will pay the high capital cost is a sticky question for the... [c]ouncil, which this month narrowly rejected turning sewerage into a business and introducing user-pays financing. In a letter written in January but not released to the works committee until this month, [the minister] said... "A narrow interpretation of user pays must not hold up implementation of a sewage scheme for those parts of Waiheke... that need it,"... The chair[person] of the Waiheke Island community board... says the council has an obligation to Oneroa. "They are paying rates that would make your eyes water."

...A conventional sewerage system is planned for Oneroa Village... which may get rid of the offensive odour that has plagued the commercial area for decades. The Auckland City Council works and services committee passed a resolution yesterday to allow the design of a system which would cost around \$300,000. The Waiheke Community Board had opposed a conventional system in favour of a small bore system, which it said was cheaper and would do the same job... and it feared that the [alternative] decision would lead to more intensive commercial development against the wishes of most islanders... [But t]he decision was welcomed by the Oneroa Commercial Landowners Group... "Common sense has prevailed. We've finally put an end to the suffering of having to come face to face with the gross smell and odour for years,"... The... committee felt that the more expensive option would serve the community longer – between 30 and 50 years – before the system needed modernising. The small bore system was only a short-term solution... However, the... Waiheke Community Board... felt that the small bore system would last more than 25 years.

...[a] plan to force Oneroa residents to pay for Waiheke Island's first sewage system has struck 11th-hour trouble... Today an Auckland City Council committee is expected to recommend that Oneroa businesses pay about \$90,000 a year, and one-off connection costs of \$2000... Local businesses have complained of unfair treatment and say the costs should be shared by all Auckland ratepayers. They believe the council has underestimated the cost of the project... and say a decision should be delayed until their objections can be heard... Council staff estimate the scheme will cost \$685,000, but... an Oneroa commercial landowner, said that excluded land and a treatment plant. He said a realistic cost would be closer to \$3 million, and pointed out that islanders had paid rates for years as if they had full wastewater services... It is expected that residents at the western end of the island will be charged a special rate.

...A decision on the funding of the Oneroa sewerage system has been postponed for a month after deficiencies were revealed in a... [c]ouncil report... The committee agreed to the delay to allow more ratepayer consultation and financial analysis, and talks with Metrowater about its involvement... [But a]pproval for using the island's two septic tank sludge disposal sites expires on December 31. The owner of the larger capacity site intends closing it permanently. Businesses and home-owners could be faced with \$700 bills to have their tank sludge dumped on the mainland... An Oneroa commercial land-owner... said yesterday that the cost... would bankrupt commercial tenants and landlords... The alternative for some may be having their premises closed by officials if their tanks begin to malfunction. Domestic tanks need to be pumped out three-yearly on average

but restaurants need more frequent service. Bach-owners and tourists swell the island's population from 6500 to an estimated 30,000 during the summer holidays.

...Overflowing septic tanks have left about 30 homes in the Coromandel Peninsula settlement of Cooks Beach uninhabitable... Most of the homes were holiday houses... [In related news, a] combination of devices is tipped to cut... household water bills and soften the blow of... user charges for wastewater disposal. The devices will also make it possible for homes to be built on hundreds of sections not served by sewers and which Auckland councils previously considered too small to accommodate septic tanks. A Waiheke Island house fitted with wastewater reduction devices has already been allowed on a site smaller than that normally required for septic tank storage. Studies indicate the devices, which would cost the average house up to \$5000, could cut personal water use by 66[%]. Proven water savings from use of the improved plumbing fixtures and appliances have prompted the A[RC] to modify wastewater disposal system guidelines used in granting building permits. Most Auckland beach resorts without reticulated sewerage have poor soils for waste disposal by septic tank.

...A new sludge dump has been proposed to solve Waiheke Island's sewage problem, but it will not be usable for at least a year... [A local couple] want to run a sludge dump for the whole island, on 40ha in the centre of the island, south-east of Onetangi. However, the consent process is slow and expensive and before they go to the... ARC... they are seeking consent from nine neighbours and concerned parties. One of those groups is the Royal Forest and Bird Protection Society, which owns a neighbouring reserve.

...Authorities have taken emergency action to stem the sewage crisis on Waiheke Island... In an eleventh-hour decision, the Auckland City Council is using special powers under the Resource Management Act to use a quarry without resource consent... [But, because d]isposal of the sludge constituted an offensive trade under the Health Act... the council was seeking consent from Auckland Healthcare to use the site... It [hopes to] dump sludge at the council-owned site in Onetangi Rd from January 1. The... quarry was an interim measure until a long-term solution could be found... [In another development,] Waiheke High School has won approval to discharge... 58,000 litres of treated sewage a day over a 13ha site near Surfdale.

...The Ministry of Education is making a new attempt to fix the overloaded Waiheke High School sewage disposal system. The system, which handles effluent from the 400-pupil high school, a primary school, five houses, a creche and kindergarten has been the source of public health hazards after sewage "breakouts" and surface ponding in the past. The problem is symptomatic of Waiheke Island's increasing septic tank sewage disposal woes... The Ministry of Education has been served with an abatement notice by the A[RC] requiring the installation of an improved system or the termination of effluent disposal at the site, which would effectively shut down the schools. In response to the abatement notice the ministry applied for a resource consent from the ARC for modifications to the system but council staff recommended the application be refused because they were concerned how well the proposal would meet environmental concerns.

...Widespread sewage contamination in Mangawhai is bad for shellfish and puts public health at risk, says a Northland Regional Council survey. It says seepage from on-site sewage treatment and disposal systems appears to be a problem in most parts of Mangawhai Heads and the village.

...Many streams and creeks in the Wellington region are polluted and a health hazard, says the Hutt Valley Health medical officer...

Contractors laying cable television and telephone wires for Telecom... in Wellington... are causing thousands of dollars of damage to water, sewer and stormpipes... Some homeowners face being out of pocket because of the damage and Wellington City Council may consider legal action to try to recover the costs[... which included using]... underground TV cameras to find the damage... Council officials are angry at the "cowboy" attitude of the contractors who, the officials say, don't want to take the time or the expense to find out the location of existing pipes... "It's just hit and miss. They've had 180 strikes since October..." ...rather than digging trenches, workers were using a "thruster borer" to speed up the work. In one case, residents of a Wellington street were without water for about 10 hours after contractors hit a water main. The work[ers] turned off the main valve and left without telling city officials. Telecom said it was doing everything it could to minimise damage and disruption...

Telecom and Wellington City Council officers are finalising tough conditions for contractors... [which] include locating the underground services or using cameras to film the pipes before and after... [their jobs. Incidentally, a] clean green approach to drains... and... underground water systems... in Waitakere City has earned the council-owned Eco Works an ISO 14001 stamp of approval.

...The Mayor of Auckland... had a tale of caution for those who gathered to see him officially open a keenly awaited public toilet at Greenwoods Corner, in Royal Oak, yesterday. [The mayor] had been jogging in Western Springs several years ago when [the mayor] heard screams coming from a self-cleaning Exeloo toilet – the same make as the high-tech one... opened yesterday. "There was tremendous screaming and a mother was banging on the door. I prised it open and there was a completely washed child... so these toilets are not without their problems!" ...[By the way, t]he thousands of people who flocked to Bay of Plenty swimming spots yesterday enjoyed the region's finest water in seven years. So says Environment Bay of Plenty, which monitors 59 swimming spots at beaches, rivers and lakes for cleanliness.

...A \$17 million water upgrade in Tauranga, which could see an end to annual summer hosing restrictions, uses some of the most advanced technology in the world. The district's new, fully automatic Joyce Rd water treatment plant at Pyes Pa uses a system which filters water through tiny holes in plastic straws. Reported to be the largest microfiltration plant of its type internationally, it will be opened tomorrow by the Deputy P[M]. In further news from Tauranga, a]... Maori group frustrated by... years of... inaction on a cultural grievance is considering using explosives to sabotage a sewer pipeline... owned by the Western Bay of Plenty District Council... A kaumatua representing the group of residents of Matakana Island, in the Tauranga Harbour, has approached a former naval demolition expert to blow up the pipe, which crosses land they consider sacred and pumps sewage into the sea. The... demolition expert, who served in the Navy for seven years, was asked about five weeks ago to damage the facility – a request [it rejected. But the demolition expert] believes the plan is still alive, and... is speaking publicly to try to avoid someone being injured or killed in an amateur attempt... What scares him most is the involvement of kaumatua who have mana and, as such, have influence over others. A Matakana Island community spokes[perso]n... confirmed the intention to destroy the pipe. "We have had enough of butting our heads against the council. People have to know it is not an idle threat. The pipe will be destroyed if there is no satisfaction... We acknowledge the council has met us and listened to our concerns, but they always come back to the costs of what we want, which is to pump the sewage on to land where it will do some good as compost." ...[the spokesperson] was prepared to face the consequences if the pipe was destroyed by an explosion. "They can take me to jail, I don't care. We have tried every legal way to try to stop the pipe pumping sewage and I'm damn sick of it." ...[the] former Maori Affairs Department officer in Tauranga, said another person had come forward who had explosives experience and was willing to do the job.

...A sewer pipeline, which is the target of a possible bomb threat, has been the focus of intense debate between the Katikati community, the Western Bay of Plenty Council and Maori on Matakana Island for three years, including 27 meetings. Working parties have been set up to deal with the issue, and to find the best solution. The pipe was installed in 1978 and originally used to pump milk waste from a dairy factory in Katikati. The Katikati Wastewater Working Party decided last year, after looking at options, to stick with the continued disposal using the existing ocean outfall pipe, but with effluent treated to an extremely high standard that did not impact environmentally on the ocean. Reaction from the people of Matakana Island was swift and vocal. They said the decision was ill thought out and hadn't taken into consideration cultural issues that ran hand in hand with the environmental issues. At that time threats of "direct action" against the working party were made by the young people of the island. The Western Bay [of Plenty] council plans to upgrade the pipe including a scheme for treatment by aerated lagoons, surface flow wetland and ultra-violet disinfection, before the effluent is pumped out to sea. The estimated capital cost is \$1.95 million, with \$115,000 annually in operational and maintenance costs... Matakana residents have supported the treatment of Katikati's sewage but have always been opposed to the

pipeline.[The] Matakana Island Trust spokes[person]... said disposal of the sewage was Katikati's problem, not theirs and believed money had been the only consideration in the decision to continue using the pipeline... "We cannot change our mind at this late stage,"... the... Western Bay of Plenty Mayor... said[yesterday]. "Our resource consent for the pipe is running out..." ...[■ A] strong opponent of the \$360 million scheme to upgrade the Mangere sewage treatment plant has scrapped its appeal plans. The Papakura District Council had found it lacked sufficient appeal grounds to justify the cost of going to the Environment Court, the mayor... said yesterday. The council had already spent \$74,000 on legal fees and expert witnesses... His council supported upgrading the 37-year-old... sewage treatment plant but believed it could be done for about \$155 million and still meet the requirements of the Resource Management Act... [The mayor] said the Watercare scheme was too expensive for the region to bear... [and] would provide only minimal environmental improvements... Sewage treatment bills would more than treble over the next 10 years to pay for Watercare's upgrading plan, [the mayor] claimed. However, his figures were at odds with Watercare, which says there will be a 50[%] increase, excluding inflation... lifting the average household cost to \$6.51 a week. The publicly owned company also maintains its scheme, which it hopes to start building this year, will significantly improve the plant's environmental performance... The Papakura council... [- which] is refusing to pay a scheduled 22[%] increase in wastewater charges levied by... Watercare... [-] believed Watercare would struggle to comply with the enforcement order of the former Planning Tribunal (now the Environmental Court) requiring the plant's... containment of offensive odours.

...Unpleasant odours from North Shore's wastewater treatment plant will be cut by a \$4.8 million sludge dewatering facility opening tomorrow.

...Pollution creates a stink the world over, and there are big rewards for whoever can quell the smell. A[n A]uckland firm... High Tech Pure Air... has the stuff to do it with, and... says, "We're on the verge of breaking through big-time overseas." ...To create a smell a substance must be volatile, releasing molecules into the air. The High Tech anti-aroma product contains a monomer... that... has a positive charge which attaches to the negatively-charged target molecules, says company literature, and wraps its long tail around to encapsulate an offending odour. The result is "a spectacular odour knockdown." The smell has not been merely masked; the malodorous molecules have been chemically neutralised and the stink eliminated... A drive up the Northern Motorway past the North Shore sewage treatment plant where it is used, gives a fair indication of its effectiveness. That sudden wave of pungency as you pass the ponds is a thing of the past. The deodorising treatment is said to be specially beneficial at pig and poultry farms. Pigs develop a dry cough and other problems from breathing ammonia in their pens. The spray neutralises the fumes to the benefit of pigs and workers alike... The product has purified prawn-farm water in Thailand, making the prawns grow bigger, and allowed fish to breed again in areas polluted for a century... Its many applications include hospital, airline and household use. It is not yet in the supermarkets, but Amway and some chemists sell it... High Tech Pure Air spray... can [also] be made mildly anti-bacterial, but for it to be more so would halt the natural functioning of[a] cesspit or sewage farm.

...cleansing... effluent at... the... source [is an idea that] came to... the... managing director of Sydney company Atlantis Corporation... in bed... "We believe it's crazy that Sydney should have 9000km of tunnels, all full of effluent, so we asked ourselves what could we do. The first thing was to recognise the system was unsustainable and attacking the life of the planet. The alternatives are a mirror reversal of the way we're doing it..." ...[his] solution was to build a house which would sustain itself... [via a] roof garden... "If the government pays 50[%] of the cost of your roof garden it would be more economical, because they would not have to put sewers through the cities." ...Despite what [the director] insists is an entirely logical way of salvaging urban health... his company... [has] had to fight entrenched interests to get its message across. The company discovered the potential for lawsuits if a new idea was tried and failed, and this meant engineers and regulators were not prepared to take the risk. [The director] cited the example of the Sydney Olympics... for which Atlantis' technology was specified for stadium drainage. "The International Olympic Committee said you can't do that, go back to herringbone. They never questioned us, just said it was too risky." In the Atlantis Corporation system, stormwater and sewage water percolate and permeate through designed "biologically amended" soil mixes surrounding the system's drainage cells. This "biodigester" takes all the organic waste from a household, which became almost pure by infiltration and passing through these soils. "It separates the water from the solids almost instantly..." Atlantis Corporation has priced a household system at \$A450... [or] \$1000 fully installed...

A British company thinks it has devised a good answer to the siting of land-hungry sewage treatment plants – build them at sea. The president of Kaiaki Ltd... is in Auckland promoting his company's "starfish" scheme, which [it] says is a practical and cost-effective system that could suit this region. The idea is to incorporate all the best sewage treatment equipment in a concrete or steel box. The 10m-high, 90m by 90m structure would be submerged, up to 2km offshore, with only the staff quarters and communications room above the surface. The company has not yet installed any of these systems but is discussing them with one of Britain's privatised water companies and the European Commission for use off polluted coastal areas... This week [the president] discussed his company's scheme with officials of Auckland's... Watercare Services... [whose] upgrading of... the... Mangere sewage treatment and disposal plant is budgeted to cost \$360 million. [The president] said it would cost about \$520 million to build and install a starfish plant of similar capacity or several smaller ones around the region, possibly in the harbours... Watercare representatives said that as they had not evaluated the starfish for a specific application, they could not comment in detail[, but an]... Auckland environmentalist... said the starfish scheme... was... an extreme example of the "flush it and forget it syndrome" that could lead to less-strict monitoring because it was "out of sight, out of mind." ...It... would greatly increase the environmental risks in sewage treatment and disposal and could threaten fishing.

...AT 1110 sq km, the Manukau Harbour is the second largest harbour in the southern hemisphere. But Maori have watched their traditional fishing ground in this huge harbour being depleted by pollution. The D[O]C has described the harbour as the most threatened in the Auckland region. It suffers from extensive water pollution, with pollutants coming from the Auckland International Airport, farm runoff, domestic and industrial wastes, sewage pumping station overflows and from the Mangere sewage works... A report compiled by the... Huakina Development Trust... said pollution of the harbour first came to public attention in the 1950s and has steadily worsened... For 1000 years, the Manukau was the traditional fishery of the Waikato people. It was harvested, but with strict controls... Seafoods were traded with inland tribes for birds and berries. Dried shark was a particular Manukau delicacy, as were cockles and scallops. Logging around the harbour began in the 1830s. Mangrove swamps, important breeding grounds for fish, were reclaimed or used as rubbish dumps. Industrial development near the harbour began in earnest around 1847... Although a major pollution crackdown was launched in the late 1980s, the harbour is still struggling to recover. Maori still fish the harbour and it still supplies seafood to... Turangawaewae, the home of the Maori queen... [Now the] Manukau is finally getting the treatment it deserves. Watercare is playing its part to clean up the... [harbour and the surrounding foreshore. This is of major importance to the future of Auckland... The final five kilometres of the Southwestern Interceptor is currently under construction and this vital pipeline is scheduled to be connected to the Mangere Plant next year. Until the Southwestern Interceptor is completed raw sewage will overflow into the Manukau... whenever it rains heavily... [because the] existing Southern Interceptor... is operating beyond its design capacity and simply cannot cope... New, land-based, high quality treatment units will produce an effluent so clean that if all other flows into the Manukau... were of a similar high quality, swimming, fishing and shellfish gathering will be able to be enjoyed in all parts of a sparkling harbour... Future initiatives include the replanting of native coastal trees... and foreshore plants including sea grass and reeds, the creation of new mangrove areas... and the preservation of important historical and archaeological sites... Improvements include coastal walkways, viewing platforms, bird boxes and roosts and the creation of a new 25 hectare reserve. With the co-operation of all local industry and users of the Manukau, together we can all work to clean up the harbour.

...For two weekends recently raw sewage poured into the Manukau Harbour as sewer lines failed to cope with heavy downpours. The reason is that a much-needed and long-planned new trunk sewer (the south-western interceptor) is not yet complete. Watercare has been embroiled in a

legal dispute over the final section of the pipeline; 400m of the 12.5km proposed route crosses an area regarded by some Maori as waahi tapu. Environmental law is a mechanism for balancing competing interests... Getting the balance right however is never easy. No matter what precautions are taken some local residents will be implacably opposed to various projects. It is that balance between public and private interests which is increasingly under the spotlight in the sewer issue... Watercare said it had arranged a comprehensive archaeological survey of the strip... and had arranged for artefacts (if any) discovered on the site... [-] that for several decades... has either been farmed or used for grazing cattle, sheep and horses... [but today] is privately owned by a quarrying company which intends extracting scoria and basalt rock... [-] to be handed over to Maori. Last year local Maori blessed the project... Meanwhile, [four members]... from a Waikato Tainui iwi [- Ngati Te Ata -] went to the Environment Court objecting to the pipe passing through the strip... The court dismissed... [their] case. It held that Watercare had obtained all necessary consents under the Resource Management Act and saw no reason to stop the project... [But one of the four] appealed against the Environment Court decision. One ground of appeal was that “reasonableness” in European law is not the same as “reasonableness” in Maori law and the Environment Court applied the wrong legal test. The High Court has issued a declaratory judgment upholding Watercare’s right to proceed... But a deeper question remains: have our laws got the balance right? Do our environmental laws adequately protect personal interests while at the same time allowing much-needed public works to proceed in a timely and inexpensive fashion? Have we as a society allowed ourselves to be so “hog-tied” in legal red tape... that major projects take years to approve? Do the thousands of dollars frequently paid in fees for major project – often before the first spade of turf is turned – deliver a better project and provide value for money? ...Have we put the interests of litigants too high at the expense of the silent majority? ...Watercare estimates that a two-month delay while the appeal [i]s being processed will cost... ratepayers \$419,000 in extra construction costs after which the costs will accelerate further. In the meantime, of course, there is the ongoing threat to the Manukau Harbour...

The Environment Court has set November 26 as the start date for an appeal hearing on the planning approval granted last year for the... upgrading of the Mangere sewage treatment plant. Nine appeals have been lodged against the Watercare... scheme, including one from the environmental arm of the Tainui Maori Trust Board... Technical experts have argued over methods of achieving high-quality discharges and monitoring standards... [A] Sydney... lecturer and consultant in environmental virology and waste water treatment has advised the group challenging Watercare’s consent conditions[, called] the Manukau Appellants... [-] made up of Manukau and Waitakere City Councils... and [the] Mangere Bridge Residents and Ratepayers Association[– that despite]... the Mangere upgrade... one could expect a filter-feeding oyster to accumulate from 10 to 100 viruses over a normal week... [T]he plant’s proposed use of high-intensity ultra violet... light rays to disinfect effluent would give no more than an 80 to 90[%] virus kill, which would mean a discharge of about four million viruses a day. This made the plant a significant health risk all year round... Ironically, [the lecturer] said the plant’s maligned oxidation ponds, which are demolished in the upgrade, are an efficient killer of viruses and parasites. So, the upgraded plant would increase viruses and parasites being shed into the harbour. [The lecturer] recommended filtering to remove pathogens before UV disinfection. This method allowed water from effluent to be re-used for drinking. [The lecturer] had meetings in Auckland with Watercare’s adviser, [the]... vice-president of the Montgomery Watson waste treatment technology consultancy in the... [US. Hi]s studies showed water quality under UV irradiation could achieve target bug kill standards for unfiltered and filtered secondary waste. But [the adviser] acknowledged that bacteria and viruses reacted differently to UV... It is now agreed that Watercare will undertake a pilot study to determine processes so that a full-scale plant can achieve a 10,000-fold reduction in viruses from raw to treated effluent.

...A proposal to treat high sewage flows with chlorine at the Mangere plant has been dropped by Watercare... on the advice of overseas experts concerned about health risks. Chlorination was in Watercare’s plans... when A[RC] commissioners approved consents... But the method has been dropped during the settling of appeals against the project consents... Watercare had proposed to deal with storm flows occurring about 2[%] of the year. All wastewater up to 9 cu m a second would be [UV] irradiated... but flows above that, up to the maximum of 14 cu m a second, would be treated with chlorine.

...When the Mangere sewage treatment plant opened in 1960,[the then] Auckland mayor... – a health fanatic – was pictured with a drinking glass of treated effluent. The message: this water is fit to drink. The state-of-the-art plant has since become the main source of faecal coliform and other pathogens in the... Manukau Harbour and is the reason swimming and shellfish gathering is not recommended at beaches near the plant discharge. Nutrients discharged from the plant brought weeds, algae and plankton blooms to the harbour and, more important to many Mangere people, smells and midges. In 1993 the Environment Court ordered the plant to clean up its act, and the Waitangi Tribunal has condemned it for its effect on shellfish gathering... So, in... 2003, when the new-generation plant is supposed to be operating, public relations consultants may well suggest a new version of the old “water fit to drink” picture. Or arrange for Watercare chiefs to line up a plate of 10 raw oysters from the Oruarangi Channel near the plant’s discharge point. Such a show of faith would indeed dispel thoughts of Auckland history repeating itself.

...The Waikato River pipeline plan could be scrapped if Auckland tapped into treated effluent for some non-drinking water... [A]n environmental activist... called yesterday for the construction of a second network of pipes to recycle the effluent for toilets, irrigation and industrial purposes[, which it]... estimated... would cost between \$500 million to \$1 billion and could be built progressively over the next 73 years... Recycling could more than triple the 327,000 cu m a day yield of Auckland’s water system... This would [also] head off the risk to Auckland’s high drinking water standard from the addition of ...lower-quality treated... water from the Waikato River, which had 13 sewage effluent discharges upstream of the proposed water take at Tuakau... [But Watercare’s] lawyer... dismissed... the... suggestion yesterday. With such a large river so close to Auckland and with less than 1[%] of it wanted for the city, Watercare could not approve the proposal to “re-reticulate” the whole Auckland water system.

...The Hamilton City Council is on notice to stop the daily dumping of 40,000 cubic metres of treated sewage into the Waikato River. In a resource consent decision released yesterday, the Waikato Regional Council harshly criticised the city’s attitude over the discharge. It said the effluent emission was the “largest discharge of treated sewage to an inland waterway in N[Z].” The city was “posing significant risks of high potential... for which it must take responsibility.” ...[the regional council’s stance comes after] an... Environment Waikato scientist... [voiced concerns about the Waikato River’s source. The scientist is amazed that] Lake Taupo, the largest freshwater lake in the Southern Hemisphere, is not protected by a management plan to safeguard it from pollution... [In related news, the] Huakina Development Trust is crying foul over what it considers the selective disclosure of Waikato River pipeline costs. The trust, part of the Tainui Maori Trust Board, was paid about \$70,000 by Watercare Services for consultancy work. But Watercare refused to disclose details of firms paid almost \$3 million. The Auckland Regional Services Trust subsidiary claimed the information was “commercially sensitive.” The company revealed to the N[Z] Herald this week, following an official information request... that it had spent more than \$3m so far on finding a future water source for Auckland. Half went on analysing 96 identified options, and the rest on the resource consent application for the preferred one.

...Watercare... is lining up its attack on Tainui Maori and other Waikato pipeline objectors should their opposition lead to water restrictions in Auckland. The company’s chief executive... told the A[US]n Water and Wastewater Conference in Melbourne this week that with the Waikato River so close to Auckland, “you would think that the project would be greeted with open arms. Not so. Opposition from one council [Waitakere City], Maori iwi seeking control over the river, and some environmental groups has meant that the regulatory consent process has been long and costly. We are still to receive a decision from the authorities and, even if favourable, we know it will be appealed to the Environment Court... In the meantime we know that a very dry winter similar to 1993 would mean water restrictions in the following summer. You can be assured that should we have another shortage we are ready to place the blame on those who deserve it.”

...Watercare Services Ltd is being criticised over an apparent lack of progress in developing a water conservation strategy. The Mayor of Waitakere... says Auckland's bulk water company should be "front-ending" a region-wide strategy but appears to have made virtually no progress on its promise. "It should be one of their major programmes and it's clearly not,"... When Watercare announced in 1995 that it wanted to build a pipeline from the Waikato River... it also committed itself to drawing up a conservation plan... The company's board required that the strategy be implemented and its effect on water consumption be assessed before starting... the pipeline. It is understood the board faced senior staff opposition over the conservation strategy. A Watercare spokes[person]... said this week that it wanted its dams and other assets to suffice as long as possible, so it encouraged the public to use water carefully. It employed school programmes and newspaper advertisements. It had also reduced the amount of unaccounted-for water in its network from 4[%] a year ago to 2[%], mostly by fixing leaks. But it had no power to introduce water restrictions. Asked if these measures were the comprehensive conservation strategy announced in 1995, [the spokesperson] said they were a continuation of it. In an earlier interview, however, [the spokesperson had] said the company could provide no documents on the development of the strategy as "it hasn't got that far yet." [The spokesperson] also agreed that no detailed work had been done on a strategy as the first priority was to obtain consent for the pipeline... Waitakere City Council... opposed the pipeline[because it] favours sticking to Auckland water sources and having greater emphasis on conservation... The council's target is a 25[%] drop in water use in the city between 1992 and 2000 through measures including its controversial water pressure reduction, and promotion of alternatives, such as composting toilets and recycling of non-toilet wastewater. [The spokesperson], fending off the frequent criticism that Watercare wants to sell as much water as possible to maximise profits, said there was no reason for it to do so. It was legally prevented from paying a dividend to its owner... [T]he region's average daily water usage last month was 304,674 cu m...

Auckland City[']s water supply is drawing more from under Onehunga. Onehunga groundwater had supplied Auckland for a century and its present contribution was 800 cu m daily... It would now be capable of supplying 19,000 cu m daily... Watercare... said... the Onehunga contribution would be significant should El Nino reduce rainfall and restrictions be required before the next major water source was tapped.

...Auckland[']s water supply lakes are brimful, meaning that water restrictions over summer are unlikely... [Meanwhile, the] Waikato River water pipeline has passed another hurdle, with approval granted for its construction from the river to a Manukau reservoir. But any progress on 25km of trenchwork remains a long way off, with a series of appeals... lodged with the Environment Court. The latest decision covers resource consents for the pipeline route for stream crossings, roadworks, excavations and fill sites. The pipeline crosses 23 streams. Conditions require Watercare... to stop work if it uncovers archaeological evidence, including human remains. A[RC] approval would be needed before digging could resume.

...A High Court decision cleared the way for work to resume on a sewage pipeline through sacred Maori sites... [after the judge had] ruled... that an old, disputed Historic Places Trust authority allowing construction of the pipeline was valid... [- even though] the modification of significant archaeological sites in parts of the Matukuturua Stonefields near Wiri... could [mean that some sites are going] to be destroyed[, and the]... trust has argued that its 1978 authority "counts for nothing" in 1997... [The] judgment was sought by Watercare... after the Minister of Conservation... - who has called the stonefields one of N[Z]'s greatest archaeological treasures - told Parliament... that the Crown Law Office would take on the case. At the start of the hearing [the judge] refused an application by [a member] of Ngati Te Ata, whose ancestors lie in the stonefields, to join the case...

Opponents of Watercare Services' new South Auckland sewage pipeline launch a new legal battle today but are too late to stop earthworks on the Matukuturua stonefields. Watercare contractors last Thursday completed most of the bulldozer work needed in a 20m by 400m strip for the south-western interceptor to cross the stonefields... The same day, [a member] of Ngati Te Ata, filed an application in the High Court at Auckland for the work to be stopped until it hears her appeal against an Environment Court decision not to halt the project. The Huakina Development Trust, the environmental arm of the Tainui Maori Trust Board, said yesterday it was disgusted by Watercare's desecration of the waahi tapu (sacred site), N[Z]'s equivalent of the pyramids. The trust... said Watercare intended pumping excrement and industrial waste over "the remains of our tupuna [ancestors]. It's disgusting and despicable." Watercare's communications manager... said it was ironic that Maori opposed to the pipeline had urged the company to clean up the Manukau while frustrating a project which would help achieve that aim... [N]o sites of archaeological or cultural significance were unearthed by last week's removal of topsoil... Bypassing the stonefields would add \$15-19 million to the pipeline bill.

...Auckland once had about 8000ha of stonefields showing such signs of occupation as houses, terraces, walls, pavements and drainage systems. Less than 200ha remain, mostly in Manukau City. Most of the remnant stonefields are on private land but some can be seen at the Ambury Farm Park, on Browns Island (Motukorea) and around the base of Mt Wellington (Maungarei). "Because so many of the stonefields in the... region have been devastated, it is imperative to preserve what little remains today,"... says... a[n ARC] poster for schools[, which is meant] to raise awareness of one of the region's most significant historic landscapes... The poster had been devised more than a year ago as a heritage education project before the pipeline issue became controversial... A descendant of inhabitants of the area around the ancient... Matukuturua... stonefields is making a last-ditch stand to save the sacred site from destruction... [The] Ngati Te Ata[descendant] is seeking a[n]... urgent High Court... judicial review of approval granted 19 years ago for [the] sewage pipeline through the stonefields. [The descendant] is seeking the... review in a bid to stop the pipeline carrying human and industrial waste across the... stonefields, which contain the remains of her people's ancestors. [The descendant] has won an injunction preventing Watercare Services continuing work on the pipeline while an appeal to the Environment Court proceeds.

...Watercare Services faces an indefinite delay to its South Auckland sewage pipeline after the High Court extended a temporary halt to work on the project... For [one member] of Ngati Te Ata, it was another step in her battle against the company plan to put a sewage pipeline through the Matukuturua stonefields... [T]he counsel for the [Ngati Te Ata member], told the court that the bulldozing of 400m of pipeline route across the stonefields two weeks ago was severe, but it would not cause the same continuing insult or loss of mana as if it carried human and industrial waste. The stonefields were the sole remaining treasure of Ngati Te Ata, whose people once lived in the area in settlements of up to 5000 and tied their canoes directly under the pipeline route... It was unclear last night whether Watercare... would appeal against the judgment... [However, the company's counsel said the member of Ngati Te Ata] had the right to appeal but not to a stay. "It has been a huge public labour to get to this point, and it should not be stopped - not for a day, not for a week or a month."

...Watercare Services is going to the Court of Appeal in its bid to build a sewer across the Matukuturua stonefields in South Auckland. The company is appealing against... [a] judgement in the High Court at Auckland last month over the sacred Maori stonefields. [The High Court was] ruling on an appeal by... [a member of] Ngati Te Ata[, who]... had asked the Environment Court to stop the project[because her tribe considered it offensive. Incidentally, Watercare Services has launched a public advertising campaign in the hope of firming up support for its other major pipeline project.]

...We can't gamble on the weather for our water supply any longer... Each year the risk of another drought becomes... greater and we have an ever increasing population. That's a risk we can't afford to take... [- but] that's exactly what's happening. What we can rely on, however, is the Waikato River Future Water Source Project... the only option that offers a continuous and plentiful water supply to meet the demand predictions of 468,000 cubic metres a day by the year 2021... an extra 140,000 cubic metres a day... [above the volume] our existing dams are supplying. The Waikato River is also the only option that will ensure... a 1 in 200 year drought standard can be met. A standard that Aucklanders and local councils demanded after it was agreed that the previous 1 in 50 year drought standard was no longer acceptable for a modern and growing city. Looking at it another way, the... [pipeline] will mean that Aucklanders can count on an unrestricted water supply most of the time... People forget that even with the catchment lakes at their fullest, the existing system is still only capable of holding 290 days supply of water. So why haven't we

started building the... [pipeline] even though resource consents have been granted? We're waiting for final appeals to be heard, then after that it will take... two and a half years to construct... [the pipeline and treatment plant – that] will give Auckland a quality of water which meets the Drinking Water Standards for N[Z] and compares favourably with the world's best... Only then will Auckland have its drinking problem well and truly under control.

...[‘in 1995 1-in-4 NZers drank water that did not comply with NZ drinking water standards’ ...

Earlier this year, a) Ministry of Health survey... found 54[% of NZ's] population had safe water supplies... [Another survey estimated that e]very day each N[Z]er pours and flushes about 350 litres of water into sewage systems[– ‘approximately 30% of a household's total water use goes through the toilet; 25% through the bathroom; 25% through the kitchen and laundry; and the remaining 20% is used outside’ (most of which doesn't enter the sewage system) –] but when the water used to generate electricity is added the water use becomes 82,000 litres per person per day.

...Water is our most precious resource. Millions are dying because they can't get enough of it in a potable state or can't get it at all. And yet millions more people never give the fact that it is always there, at the turn of a tap, a second thought. [‘Water should be used wisely – and it is to your benefit to reduce your water consumption, particularly with the wastewater user charges which started in October’.]By saving water we also reduce the amount of chemicals and energy used in water and sewage treatment. • *Use your bucket* when you wash the car not a hose[– which ‘uses 150 litres per 5 minutes (on full)’]. • *Aerate your shower*. Low-flow shower heads reduce water use by 50% or more[(a standard shower uses ‘75lts per 5 minutes – a full bath, 200lts’)]. • *Brush off*. Use a glass of water when doing your teeth[‘rather than leaving the tap running, and put the plug in the sink’ when washing vegetables and utensils. • *Water plants* – ‘at night rather than during the day to reduce evaporation’ –] *with the rinse water from your washing machine*[(which uses ‘200lts per load). A dishwasher (single wash) uses 40lts. • *Fix dripping taps*. Dripping taps waste 10,000 to 250,000 litres per annum’]. The waste of water is a crying shame, please don't be a part of it. Do your bit every day, starting today! YOU CAN SAVE THE WORLD.

...a World Water Forum opened in the southern Moroccan city of Marrakesh[yesterday], gathering specialists, bankers, and senior officials from 50 countries... A senior UN official... said: “For most of the world, current patterns of water resource development and utilisation is not sustainable. Unless action is taken now, the situation will become increasingly serious in the future.” [The official], chief of the UN energy and natural resources department, said by 2025, “as much as two-thirds of the (world) population in the lower income categories could be facing moderate to severe water stress”. The... meeting coincided with UN World Water Day and will examine the outlook for world water supplies and ways of managing them... [A]ccording to a new UN report... [only] about 0.007% of the world's water is readily accessible for human use... It says water use had been growing at more than twice the rate of the population increase during this century... The... UNESCO Director-General... said in a statement that water would be one of the great challenges of the next century. “It will be necessary to show proof, in action, wisdom and vision, if we want to satisfy human needs and avoid the most precious of natural resources becoming an object of conflict,”... Morocco's Public Work's Minister... [also] told the forum that... in... the next decade, water would represent “the same value” as crude oil and be the source of conflicts...

Water rift hard to bridge in Israeli-PLO conflict... Peace with Israel was supposed to bring running water to [a Palestinian]'s West Bank home. [The Palestinian] gets 60 television channels piped into her house, but her tiny village is still dry. “We hope that some day we'll have running water,” [the Palestinian] said, balancing a bucket of well water on her head with one hand and holding her two-year-old daughter... by the other. “That's what they [the P[LO]] promised, but we haven't seen anything.” While politicians bicker about the status of Jerusalem and a future Palestinian state, experts on both sides say there will be no peace until the water problem is solved... About 130,000 religious Jews live on West Bank land... They make up less than 10[%] of the population, but use 80[%] of the water, according to Palestinian and independent assessments. “We need more water,” said... a[n Israeli] farmer at the Peza'el settlement in the Jordan Valley, one of the West Bank's driest... [The farmer] has enough water for only half his crops. Peza'el has started using drip irrigation to conserve water, but [the Israeli farmer] says it is on the verge of economic ruin because of a disastrously small grape harvest and the water shortage. Palestinians have little sympathy. While Peza'el pipes in drinking and irrigation water, villagers in Ain Arik drink and irrigate their fields with water taken manually from the village well... and collect rain in rooftop tanks for washing... Farmers gather the water from a mossy concrete pool that holds the green run-off. Village boys swim in it... More than half of West Bank Palestinian towns do not have water piped in, Palestinian officials said... In the dry summers, they buy water that is often polluted at exorbitant prices from green tractor trucks... “There is no single Israeli settlement without water, and they have good water and good pipes,” said... [the] director of the Palestinian Hydrology Group, a[n NGO] monitoring the water supply in the West Bank and Gaza. “This is increasing tensions between the two countries,”... The water dispute stems from disagreements over who should control Israel's water resources, which lie mainly under Palestinian land. Palestinians say land is inseparable from the water that lies beneath it. They say the water is theirs. But Israelis say they have a historical right to the water, which they have been tapping for decades. “It's going to be difficult,” said... a water expert who spent five years on the Israeli team negotiating the issue with the Palestinians. “Water resources don't always conform to political boundaries,” [the expert] said, adding that the sides would have to share. One of the difficulties, [the director] said, was getting the politicians to understand the problem. “There is a water shortage, and there is a large demand for water, and some Palestinian minister is talking about bringing 50 million tourists to Bethlehem. If each one of them goes to the bathroom once a day, they need three million cubic metres of water... That's just to flush the toilets. It's a disaster.” At the same time, both sides say that when talks on a permanent peace settlement finally roll around, it will be easier to solve the water problem than to find a solution for the status of Jerusalem and a future Palestinian state. They have already reached a temporary agreement giving Palestinians some extra water until a final agreement is worked out. But [the director] said it was not enough. “The Palestinian villagers cannot wait,”... The water shortage has created an economic crisis for Arab villages in Gaza and the West Bank, which now cultivate only 3[%] of their farmland, down from more than 25[%] 30 years ago... The well water is drying up slowly, and Palestinians depend on a new Israeli-Palestinian water committee to get permission to dig new wells. But that committee has not met since last February, and no new wells have been dug. “Water is not the dream any more. The approval to find water is the dream now... [In Gaza they] drink water unfit for human beings, and even in some areas like Khan Yunis, they drink water unfit for agriculture,” [the director] said, adding that it was polluted with chemicals and pesticides... [In local news, t]he Department of Conservation has raised the ire of Mingingui villagers who fear contamination of their water supply after the burial of... poison bait in the area... south-east of Rotorua. The village manager... said the pit the D[oC] dug to bury nine 80kg barrels of 1080 poison and nine of non-toxic pre-feed bait is only 35 to 38 paces from the creek which feeds the village's water supply bores.

...The Auckland Regional Council has applauded the fining of a water-drilling firm... The Kiwi Drilling Company and its director... have to pay \$45,000 for breaches of the Resource Management Act. The firm admitted 20 breaches relating to the drilling and construction of... unauthorised... and... substandard bores... [By the way, heavy rain has] seriously polluted the water supply in the Taranaki town of Opunake... forcing more than 3000 residents and holidaymakers to cope with muddy tap water for over 30 hours.

...[water – ‘Africa's life-blood’ – is volatile]: usually there is too little of it, as in droughts, or too much, as in floods. But even when rainfall is good and rivers are full, but not overflowing, millions of people live many kilometres from a reliable source of clean water, leaving them vulnerable to... water-borne diseases... [Herders] often have to water their flocks at muddy or polluted water holes... while... [villagers] spend much of their time hauling water to their homes... Dismayed by the back-breaking labor endured by the rural [gal-folk] and children in the traditional transport of water, [a] South African architect... and his brother... a civil engineer, reinvented the wheel to ease their burden... “All around us in the African

rural areas we could see the problems caused by the lack of clean, piped water... We could just imagine the agony for [gals] who have to carry open, unstable containers on their heads for long distances... [W]e believe we've come up with the ideal solution to one of Africa's age-old burdens." ...Their Q-Drum is a doughnut-shaped plastic drum that can be filled with water and rolled easily along the ground using rope passed through the middle of the container. To ensure low maintenance and durability, the... brothers opted for simplicity. Apart from the screw-top lid, the Q-Drum has no removable parts. Available in 50- and 70-liter sizes, it is made from low-density polyethylene and is virtually indestructible... During field tests... a drum that was used daily for more than 20 months travelled 12,000 kilometres, made 7 million revolutions and provided a family of 13 people with 120,000 liters of potable water. During that time, the Q-Drum had worn less than half a millimeter – giving the container a life-span of more than 10 years... The ingenuity of the... brothers shows that it is possible to teach an old wheel new tricks.

...The Waikumete reservoir in West Auckland is being upgraded as part of a project to strengthen the earthquake-resistance of the region's water system. Watercare Services is strengthening six of its 53 reservoirs after a survey found they did not meet present earthquake standards. A contract supervisor for the company... said from inside the empty, 22,000 cu m Waikumete reservoir that in an earthquake, water tended to "slosh around" in them, creating great stresses. The joint between the walls and base of this 1966 reservoir was no longer considered adequate. The solution was to cast and fix an 800mm by 400mm reinforced concrete "ring beam" around the base... In others, the wall-to-base joints are being strengthened by the fitting of numerous steel ties... The upgrading of the six reservoirs is expected to cost \$550,000.

...The extent of damage caused to the Opuha River dam project has shocked the Timaru district mayor[, who]... yesterday flew over the scene of the deluge near Fairlie. "Frankly, the damage to the dam is far greater than I expected. Had the river system been in flood and if the dam had broken quickly I'd hate to think what would have happened..." Surging waters tore away a third of the massive dam early yesterday, sending a violent wall of water towards the sea. The dam section tumbled soon after 1 am after heavy machines had been brought in to dig a channel to release floodwater built up behind the unfinished wall of compacted gravel... after... several days... of... heavy rain... Muddy water roared through the channel and through a pipe beneath the dam draining at 50 cubic metres a second, but the structure began to crumble and the huge volume of water in the lake cannoned forward... Civil Defence officials declared a state of emergency at 3.15 am and about 200 residents of the riverside settlements of Stratheona and Butlers Crossing... were evacuated. They were allowed back into their homes about 6 am after it was clear the torrent had passed its peak... [T]he irony of the situation was that if the dam had been full, the excess water would have flowed down the dam's spillway. On its wild ride through the river system the water punched out the approach to the Skipton Bridge... closing State Highway 79 between Geraldine and Fairlie and leaving engineers with a deep gash to repair. Floodwaters crossed the highway, veered through paddocks, and re-entered the river system... Downstream, the water wrecked a pump station for the Allandale water supply system, leaving 38 homes without water... Dam workers had been confident that the pipe beneath the dam would keep the level safe... The Opuha Dam Company chair[person]... who inspected the dam before it burst... had expected, at worst, the channel to deepen and widen, but was not prepared for the devastation... "The building of the dam and its integrity in the future will not, I repeat not, be affected by this major incident,"...

FARMERS facing a mammoth cleanup after the Opuha dam collapse... are planning to put a case to Cabinet in the hope of receiving immediate... help... Up to eight farms were severely affected by the flooding, and others have also lost stock and fencing. One farmer's stock wandered after [his property] lost 10km of fences. "[The farmer]'s got about half back, but [has] had to put them on his winter grazing... The stock's happy, but come the winter, that farmer is not going to have any winter feed." Funding was necessary to ease that type of situation... Details of insurance funding would be required soon. Meanwhile, the... Civil Defence Minister... has called for an urgent report on the collapse of the dam...

CIVIL Defence is to develop an emergency response plan for dam failures... A report called for by [the]Civil Defence Minister... has questioned the reassurances from dam company staff to Civil Defence authorities in the hours leading up to the [Opuha]dam collapse. The report showed the last assurance was given two hours before the collapse... "How can the dam engineers reconcile their repeated assurances to Civil Defence with the catastrophic failure of the dam only hours later? ...If a satisfactory answer is not found, we run the risk of repeating the experience elsewhere." ...About 18 million cubic metres of water escaped when the nearly completed \$32 million dam was breached... [In international news, t]wo workers were seriously injured when a dam collapsed and sent water from Sydney's Cooks River flooding into a construction area of the city-to-airport light rail tunnel. Twenty-one workers were in the tunnel at the time.

...[an AUS]n assessor has laid the blame for the breaching of... Opuha dam... on a double weather event... combin[ing] to cause... a one-in-20-year flood. [The]Perth-based consultant... commissioned by the Opuha Dam Company... said the double event was very rare. The... design had allowed for a one-in-10-year event... [Other] possible contributing factors for the dam failure include[d]: • Construction guideline warnings about overtopping the dam during a flood were not carried from design to construction. • The decision to close flood channels once the dam reached a certain height. • A possible flaw in the quality assurance system which did not challenge the absence of flood-mitigating works. • Only occasional visits to the dam site by designers familiar with all the concepts. • Modifications to the design during construction. • Lack of warning of rain/river flows.

...The main insurer of the... [Opuha dam has] refused to accept liability for damage because it believed there were faults in construction... The dam company... blamed the disaster on a "triple rain event" but the insurance company... disputed that[, though its]... engineering manager... would not comment on what... faults had been found... [T]he construction company building the dam, was disappointed with [the] decision. The general manager... intended to challenge the decision jointly with the dam company. [It believed the insurance] experts had made some errors.

...The Canterbury Regional Council is looking at whether [the construction] company involved in the Canterbury dam collapse... complied with its original resource consents... The council has been investigating the environmental impact of the collapse and said it was assessing whether new consents would be required to rebuild the dam... [- i]t would be rebuilt to withstand a 100-year flood during construction... [- the cost of which is] estimated to be between \$3.5 million and \$4.5 m... [Now for some news from overseas in brief, a] supertanker was ripped open by a shallow reef in Tokyo Bay yesterday, leaking an estimated 13,400 tonnes of crude oil, causing Japan's worst yet oil spill... The affected area is between Yokohama, Japan's biggest port, and metropolitan Tokyo. [Japan's P]M... declared... a national emergency[, and] warned that there was a threat of a big fire.

...Embarrassed Japanese Government officials said yesterday that an oil spill from a supertanker in Tokyo Bay, initially thought to be of record proportions, was just one-tenth the size previously estimated... The Panamanian-flagged Diamond Grace, carrying 257,000 tonnes of crude oil from the United Arab Emirates, scraped a well-known shallow reef in calm water in daylight. The resulting oil slick spread over an area about 5.5km long and 4.5km wide in the middle of Tokyo Bay. The tanker was last night heading for port and the leaks were reported to have stopped. [Earlier this year] the Russian tanker Nahodka leaked 5200 tonnes (about 36,400 barrels) of heavy fuel oil when it broke in two in the Sea of Japan.

...The waters look pristine again in the coves and inlets along the picturesque coast of the Sea of Japan... months after a Russian tanker broke apart and caused the country's worst oil spill. But fishers in Mikuni, a town of scenic rocky shores and white beaches... fear that the area's future is not so crystal clear. "We are in a dilemma... We don't think the water is 100[%] clean here but if we say this out loud, our fish won't sell." ...More than half of the... 276... members of [the local fishing] cooperative are a group of [gals] called "ama" who dive without breathing equipment for choice abalone (paua), sea urchins, and sea weeds. "Our fresh green seaweed catch was completely wiped out this year... But our catch of 'uni' [sea urchins...] was about one tonne[, which is about average." However]... nobody knew the long-term effects of the oil on marine life. "It takes three or four years for sea urchins to grow, and that really worries us..." [The cooperative] held out little hope of being fully compensated. Little progress has been made after several months of negotiations with agents of the London-based International Oil Pollution Compensation Fund (IOPC). "Unlike Japanese companies which readily pay damages for pollution cases, the IOPC is difficult to talk to... They don't go by concrete damages or

common sense. I hate giving the impression that we are playing into their hands, but we don't really expect them to pay damages beyond the... 20 million yen... for the... wiped-out seaweed catch." Mikuni town officials said the IOPC told them it could meet only about 22.5 billion yen (\$[NZ]300 million) of the 36 billion yen in total damage claims by nine prefectures affected by the spill... Compensation is likely to be complicated, and payment delayed, by disagreement among Russian and Japanese authorities about why the *Nahodka* capsized and broke in two. Russia says the tanker hit something, while Japan says a huge wave broke the aged ship in two... About 3700 kilolitres (23,273 barrels) of oil washed up on the shores of Mikuni and other parts of the coast. Some oil is still seeping from the stern section resting 2500m below the surface... [C]oatings of thick oil were still visible on the underside of rocks and in places where the thousands of volunteers who took part in a clean-up could not reach... The economic damage is not only to fishing. This ...[season], tourists visiting Fukui Prefecture's beaches numbered only 1.59 million people, down 600,000 from last year. [□ 'A retired headmaster has received a suspended jail term for negligence over the first outbreak six years ago of a killer germ now sweeping Japan. The court ruled that the former headmaster, aged 69, ignored warnings from the local health department that a well supplying water to his kindergarten was contaminated with the O-157 colon bacillus germ. O-157 food poisoning spread at the kindergarten leading to 319 people, including 149 children, being infected. Two children, aged four and six, later died from kidney complications.'
