W H Y ?

War! What is it good for? - Copyright to who cares?

Did war on Earth begin when the first cell of life divided itself into two new, but supposedly equal, parts?

Amoebae form a group of the single-celled organisms called Protozoa or Protista. Protozoa means 'first animals' ...the term Protista – 'first creatures' – is preferred nowadays... They include... the half-dozen species that live in the human mouth and digestive system, one of which is the cause of amoebic dysentery... The amoeba reproduces itself by dividing into two equal parts.

...when two tribes go to war...

If war on Earth did begin when the first cell of life divided *into two equal parts*, does this mean that humans are genetically conditioned to continue this battle to exist on the same planet until one cell manages to prove it is the best; the more superior; the winner?

Winning isn't everything – it's the only thing!

Or are humans destined to *continue this battle* forever?

...scientists accept the theory that plants and animals descended from a common ancestor... All living cells of today have come from ancestor cells which existed billions of years ago... Cells produce by dividing. Since new cells can arise only from existing cells, all life is continuous.

...for man no rest and no ending. He must go on, conquest beyond conquest...

...we're humans. I don't think we're ever going to be nice to each other.

Can you imagine a man not wanting to fight? It isn't normal.

I say that war is necessary and beneficial since it is one of the conditions of existence for humanity. War confronts us everywhere, not only between different peoples but also in family and private life. It appears as one of the principle elements of progress and every step forward that humanity has yet made has been attended by bloodshed. People have talked, and still talk, about disarmament, but disarmament is impossible, and even if it were possible we ought to reject it. Only an armed nation is powerful and great. I am convinced that a general disarmament throughout the world would involve something like a moral decadence which would show itself in general debility and would hinder the progress of humanity. The warlike nations have always been strong and flourishing. The art of war has led to the development of all the other arts. History bears witness to it. So in Athens and in Rome, commerce, industry, and literature never attained such a development as when those cities were masters of the then known world by force of arms. - Quote 9

Whatever may be said at the various Peace Congresses against war and against duelling will be in vain. Above all arbitrations, all arrangements, and all legislations, there will always be man's honour, which has always demanded the duel, and the interests of nations which will always demand war.

...most... princes have more delight in warlike matters and feats of chivalry... than in the good feats of peace, and employ much more study how by right or by wrong to enlarge their dominions, than how well and peaceable to rule and govern that they have already.

...empire builders can relate to others only in terms of a power struggle... The rise to power... [enables] empire builders to fulfill an unconscious desire to isolate themselves from a... hostile and competitive... world...

...intimidation is necessary if one is to survive... - THEATRE of HATE

Hey everybody! Let's be a superpower... I'm so bored so we'll start a war! ...So give me a gun... I want to kill someone! - LET'S GET NAKED

Peace on Earth (if we fight for it)... Those who rabbit on about world peace ignore the fact (and it is a fact) that war is part of the human condition – always has been and always will be. It started back at the dawn of mankind when Cain killed his brother Abel out of jealousy; it has continued one way or another, to a greater or lesser degree, ever since; and it will continue to do so until the Lord Jesus Christ returns. - 1997

Is it right to assume today, because of the continued existence of war, that the majority of humans agree with the statements above? Certainly it is easier to agree with Quote 9, for example, when the writer has conveniently left out the fact that many people suffered, be they conquered societies, slaves or citizens of ancient Athens and Rome, and that both civilisations eventually collapsed.

To me it is a symbol of the first importance that... the Roman people with its proud inscriptions, the people before whom Gauls, Greeks, Parthians, Syrians afar trembled, lived in appalling misery in the many-storied lodging-houses of dark suburbs, accepting with indifference or even with a sort of sporting interest the consequences of the military expansion: that many famous old-noble families, descendants of the men who defeated the Celts and the Samnites, lost their ancestral homes through standing apart from the wild rush of speculation and were reduced to renting wretched apartments...

A point raised by Quote 9 is that the word WAR can mean more than just a battle between two armies. Indeed, it can be defined in three ways:

1. strife (especially between countries) involving military, naval, or air attacks; the period of this. 2. open hostility between persons. 3. strong efforts to combat crime, disease, poverty, etc.

If these types of wars were rearranged in their order of relevance to individuals, the one most people experience today would be #2.

Competition begins in the home. Rivalry between siblings is originally for the favor and affection of parents, to become first in the parents' eyes. Competition continues in school grades, for popularity among one's peers, for athletic superiority... Evidence indicates... that even in nudist colonies "pecking orders" emerge. Even without the protection or intimidation of clothing, some people manage to get one-up on others.

At this fork in the road, old Adam keeps his grip firm on the wheel. Self-interest, as always, makes the worst-case analysis: there will never be enough to go around. All must continue, therefore, the war against all.

...the story of life on Earth. The tale begins... in the wild, where a single law prevails – the law of survival... When night falls in Africa... bitter rivalry is aroused.

For all animals life is a battle – and man is no exception... Long ago, deep in prehistory, early man discovered that rocks, spears, bows and arrows were just as handy for eliminating rivals and inconvenient neighbours as for bringing in the next meal. It was the invention of war – a pastime to which man applied himself with a gusto still with us today... His earliest combat briefing can be found in Genesis: 'Replenish the earth, and subdue it; and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth.' Well, man has done his best to obey to the letter when it comes to making war – but it would be interesting to have the animals' viewpoint...

War, in a sense, is an essential part of nature, evident in the wild as predator and prey battle for the survival of their species – but some species seem to take this essential battle more seriously than others.

This is most dramatically seen in the phenomenon of 'killer' and 'sensitive' strains of *P. aurelia*. Certain strains, known as killers, contain kappa particles in their cytoplasm which release toxins into the water which cause members of other 'sensitive' strains to die in a few hours... Sensitives can, however, be mated to killers without harm, provided certain precautions are taken. If the pair remain together for a few minutes only, the two continue as before, killer and sensitive, but as a result of mating they acquire the same genetic make-up as far as the nuclei are concerned. If, however, the pair remain together for longer, for example half an hour, some cytoplasm is exchanged in addition to the nuclei and then both become killers... It is the kappa particles which... are responsible for the effect... They contain DNA and if destroyed by high temperatures or X-rays, killers are turned into sensitives.

...When the winged males and females swarm out of the nests every insectivorous creature is their enemy. Birds, small mammals, lizards, toads and even some sensible opportunists among humans have a feast... The termites' arch-enemies are, however, ants; a permanent state of war exists between the two insects. Termite soldiers are really specialised ant fighters. Some have powerful jaws which can snap an ant in two. Others have no jaws but instead the head is drawn into a spout-like snout from which an intensely sticky liquid can be squirted that effectively gums up any ant it touches. In spite of their seemingly effective armament, however, no termites are a match for ants in open battle, and they rely on the massive defences of their nests for their continued existence.

...The sight of a colony of army ants on the march is surely one of the great wonders of nature, and the resemblance of such a column to a human army is striking. In addition to the main body of small workers, larger, huge-jawed workers flank the main columns and continually scout ahead, laying scent trails to mark the way for the main body. Quite often, the press of the column is so great that new columns may split off, so that any slow-moving prey is often surrounded and engulfed... Even man will not always escape unscathed if he is foolish enough to let his curiosity or bravado mislead him into thinking the ants would not dare attack him. There are many stories of the intrepid white hunter's adventures with army ants, although these often grossly exaggerate the ants' intelligence and ferocity. Sometimes, in fleeing from the advance of the ants, it has been impossible to rescue horses or other live stock, and these if unable to flee themselves rarely survive. A tethered horse will simply be eaten alive and left a skeleton... Army ants feed by simply cutting up and rending the victim on the spot, carrying the pieces back to the temporary nest... Very large amounts of food are needed by an army ant colony.

...Asps... Males indulge in a ritual battle, while the females watch. First, the males attempt to intimidate each other by rearing up in an S-shape, then, if neither retreats, they chase each other and try to coil round each other's bodies. They never attempt to bite and neither is ever harmed.

...Gibbons probably mate for life and they are very aggressive to other gibbons. Each morning some, usually the females, begin calling, uttering the 'great-call' which is used as an advertisement. This attracts the groups towards each other and they often meet at the boundaries of their territories. The males leap about uttering the 'conflict-call', a series of hoots, and eventually one male may chase another, forcing him back into his own territory, then rapidly retreating. Very occasionally there is a fight and the two males scratch and bite each other. After an hour or so the conflicts die down and the groups wander back into their territories to feed.

...The macaques are the most numerous and widespread of the Old World monkeys... When two macaque troops meet, there is always some kind of conflict. Normally, if two troops' home ranges overlap, the time-tables of daily movement are geared so they do not meet, but if the smaller troop is unwary and fails to see the bigger troop coming, they will probably be attacked. Subordinate males generally begin the fight, which can last up to twenty minutes and result in scratches and bruises, rarely anything more serious.

...The asses live in troops... In autumn and winter, troops may band together into herds two or three hundred strong. Such a concentration is possible in the winter as it is then that the desert plants flourish. In summer, the population spreads out and waterholes become very important in determining the distribution of troops... Very wary animals, wild asses cannot be approached easily, and they keep well away from human habitation even when suffering from thirst... Man has been the wild ass's main enemy, as its flesh and hide are much sought after by the inhabitants of desert areas. The introduction of firearms must have been a major factor in the decline of the ass, as wariness would no longer ensure its safety. Apart from man, wolves are their principal enemy. A troop of asses has little to fear, but a solitary animal falls an easy prey.

...Jousting rams... Full-grown and healthy big-horn will have little to fear from anything except man... Rams begin breeding when 4 years old. Their necks become thicker and during the mating season they lose much of their fear of man. During November and December, jousting takes place, not only between rams but between ewes. If an encounter comes to blows the two may fight with their forelegs, kicking and pawing at each other, before indulging in the spectacular, bone-jarring tournaments. The two contestants turn away from each other and, having retreated some distance, turn back and charge. The last few yards may be covered on hind-legs alone, then just before the collision, heads are lowered and the full force of two 8/900lb bodies is taken on the foreheads. The impact is terrific and the contestants may be dazed, standing nose to nose, eyes glazed for half a minute. Then they carefully back away and repeat the course. The combats may go on for hours with no decisive result; the contestants merely wandering away from each other. Sometimes there are 'battles-royal', free-for-all fights with a dozen or so rams taking part. These may go on all day, with individuals retiring for a time while they recuperate. These conflicts seem pointless, especially the 'battles-royal', and if fighting is an expression of competition between males, as is usually assumed, it is strange that ewes should also batter each other. The fights between male bighorns cannot be related directly to breeding because they do not form harems. There is no competition for females, who are promiscuous, mating with any male. It seems likely that the fighting is mainly a manifestation of aggressive behaviour and a general excitement and emotional stress that builds up during the breeding season... These fights seldom lead to serious injuries and afterwards the winner makes no further attacks.

Instead the two graze together and every now and then the winner starts what is called an appeasement ceremony by presenting his neck for the other to lick, sometimes going down on his knees for this. Probably a better explanation is that it is a sign of friendliness.

...The power of an elephant in defence can be gauged by the several stories told of a bull elephant meeting a train on a railway and charging the engine head on... the elephant charged the engine repeatedly, doing itself great injury yet persisting in the attack. Another feature of elephant defence is the close co-operation between members of a herd. Hunters have reported seeing a shot elephant being helped away by two others ranged either side of it, keeping it upright on its feet. On one occasion the herd combined to drag the carcass of one of their fellows throughout the night, in an abortive attempt at rescue... Such large and powerful animals have few enemies.

...The natural enemy of... many... whales, is the killer whale, a 30ft dolphin with the reputation of being the world's most ferocious animal... Belugas and other whales have been reported as becoming petrified with fear on seeing killer whales. Although killer whales wreak havoc amongst the schools of slow-moving belugas, the damage they have done is small compared with the efforts of whalers.

...In the scientific field chickens have been responsible for one of the biggest advances in our knowledge of animal behaviour. In 1922 the idea of a peck order was first published. It was discovered by observation of the common or farmyard domestic hen. Briefly, it amounts to this: if a dozen hens new to each other are put into an enclosure, they will separate into couples and start to fight. One of each couple will triumph over the other, either because she is stronger than her opponent or because her opponent refuses to fight. She will be dominant, the other will be subordinate. Then the dominants will face each other in couples, from which half will emerge once more as dominants, the other half as subordinates. In the end a hierarchy will have been established which can be expressed as follows. If we identify the hens by the letters A to L there will be the boss hen (A) which can peck all the others and they will not peck back. The next in succession (B) will be able to peck all except A... and so it will go down the line, until the lowest in the hierarchy (L)... which gets pecked by all the others. Any hen can change her position in the hierarchy by winning a fight with a superior hen, but without such a challenge the positions in the hierarchy are accepted by all. This is a simplified version but the principle is there, and subsequent research in a large number of animal species has confirmed it.

He was an astute observer and his experiments... led him to the idea of a 'balance in nature' where there is a continual 'war of all against all'.

The *balance in nature* helps to keep the population of plant and animal species in check. If, however, the population of one species explodes or becomes extinct, this can have an adverse effect on every other member of the food-chain which includes that species.

THE END OF THE DINOSAURS... The climate became colder and old tropical plants were replaced by new plants. The plant-eating dinosaurs could not eat the new plants and gradually died. As the plant-eaters disappeared, the flesh-eating dinosaurs found it more and more difficult to find food and they, too, began to disappear.

The probable reason for their extinction is that they were unable to adapt themselves to the changing environmental conditions... But they must never be considered as failures; they ruled the earth for over 100 million years, which is 100 times longer than man has been in existence! ...Until the advent of man, nature was in balance.

In this century, an exploding human population has become the single greatest threat to life on Earth... The wild has become a battleground, where conservationists wage a war against time and indifference... No alarm bell sounds when a species is lost – an estimated six every hour – but with each extinction the foundation of life grows weaker... Not since the demise of the dinosaurs... has the world witnessed such a dying off. The world of our making is hostile to wild things, yet we expect the wilderness to welcome us.

Sometimes humans at war have used other animals to assist them. Horses, camels and elephants have carried or pulled humans and their equipment, as have dogs, which have also been used as soldiers.

Mastiffs are the one breed used in war, other than for rescue work, as sentinels or for light transport work. The Romans used them for attacking the ranks of their enemies, and in the Middle Ages they were used against mounted knights. The mastiff, itself wearing a small coat of armour, was equipped with a cauldron of flaming sulphur and resin fastened to its back. From this a vicious iron spike projected forward over the dog's head. Added to these were the dog's great weight and fearsome jaws. It was a formidable combination to let loose among heavily encumbered cavalry...

Some people say that humans are the only animal which 'kills for fun' – as if this is a form of behaviour that also separates us from, or places us above, other animal species – but such people obviously haven't had much to do with domestic cats or members of the mustelidae family.

...the weasel and mink, often hunt just for the joy of killing.

Hunting dogs hunt systematically as a pack... [D]ogs are long distance runners. Their speed is not impressive, but they are persevering... and... have great staying power... Gazelles... take flight when they see a hunting pack half a mile away, although the dogs can easily run them down despite this start... The quarry is worn down more quickly by the dogs snapping chunks of flesh out of its flanks, so it soon becomes weak from loss of blood, and the pack descends on it and eats it alive. First to be eaten are the entrails, which are rich in vitamins and other essentials, but eventually there is little left except the skull. Wildebeeste do not run from the hunting dog packs. The bulls move forward and try to repel the dogs by charging them, but the dogs avoid these attacks and dodge round the bulls to where the calves and cows are huddled... Not only do such large animals as wildebeeste fall prey to hunting dogs, even lions have been attacked and killed... While in a pack, the hunting dogs need fear nothing except man... They will kill more than they need, merely, it seems, for the sake of killing... Cape hunting dogs co-operate in hunting and rearing their young, and it is tempting to compare the social life of these dogs with our own. It might be possible that the hunting dogs are leading the same sort of life as our ancestors did when they lived as hunters in small family units. It may have been the organisation of baby-sitters while the main party went out hunting that allowed our pre-human ancestors to break from the baboon-like scavenging way of life, and become hunters. It would have been possible to take the children out to collect berries or birds' eggs, but they would have hampered a hunting expedition. A division of labour like this, with individuals carrying out different duties, is the hallmark of a society whether it be of men, hunting dogs or honeybees... In one way the hunting dog society, for all its ferocity in the hunt, is one stage nearer to perfection than ours. All hunting dogs are equal. There is no rank, as is found amongst wolves, each adult is qualified to perform every job whether it be hunting, feeding the pups or guarding them, and at the kill every dog gets its fair share. [In comparison, 'lion cubs get no special treatment. They must fight for every scrap. Adults seize the best of the spoils.' ('Mongoose adults let their offspring eat first when drought threatens their lives', but desert mice 'abandon their young to predators in order to save themselves.')

...‘Sometimes it takes the great Dustbuster of fate to clear the room of bullies and bad habits. Freak cyclones helped destroy Kublai Khan’s brutal Mongolian empire, for example, while the Black Death of the 14th century capsized the medieval theocracy and gave the Renaissance a chance to shine. Among a troop of savanna baboons in Kenya, a terrible outbreak of tuberculosis 20 years ago selectively killed off the biggest, nastiest and most despotic males, setting the stage for a social and behavioural transformation. In a study appearing in the journal *PloS Biology*, researchers describe the extensive temperamental and tonal shift that occurred in a troop of 62 baboons when its most belligerent members vanished from the scene. The victims were all dominant adult males that had been strong and snarly enough to fight with a neighbouring troop over a tourist lodge garbage dump, and were exposed there to meat tainted with bovine tuberculosis, which soon killed them. Left behind in the troop, designated the Forest Troop, were the 50 per cent of males that had been too subordinate to try dump brawling, as well as all the females and their young. With the change in demographics came a cultural swing toward pacifism, a relaxing of the usually parlous baboon hierarchy, and a willingness to use affection and mutual grooming rather than threats, swipes and bites to foster a patriotic spirit. Remarkably, the Forest Troop has maintained its genial style over two decades, even though the male survivors of the epidemic have since died or disappeared and been replaced by males from the outside. The persistence of communal comity suggests that the resident baboons must somehow be instructing the immigrants in the unusual customs of the tribe. “We don’t yet understand the mechanism of transmittal,” said a professor of biology and neurology at Stanford, “but the jerky new guys are obviously learning, ‘We don’t do things like that around here.’” The professor, who is renowned for his study of the physiology of stress, said that the Forest Troop baboons probably felt as good as they acted. Hormone samples from the monkeys showed far less evidence of stress in even the lowest-ranking individuals, when contrasted with baboons living in more rancorous societies. The researchers were able to compare the behaviour and physiology of the contemporary Forest Troop primates with two control groups: a similar-sized baboon congregation living nearby, called the Talek Troop, and the Forest Troop itself through the era that might be called Before Alpha Die-off, or BAD. The new work demonstrates that humans hold no patent on multiculturalism. As research indicates, many social animals learn from one another and cultivate regional variants in skills, conventions and fashions. Some chimpanzees crack open their nuts with a stone hammer on a stone anvil; others prefer wood hammers on wood anvils. The chimpanzees of the Tai forest rain-dance; those of the Gombe tickle themselves. But in the baboon study, the culture being conveyed is less a specific behaviour than a global code of conduct. “You can more accurately describe it as the social ethos of the group,” said a professor of evolutionary and developmental psychology at the University of St Andrews in Scotland. “It’s an attitude that’s being transmitted.” The report also offers real-world proof of a principle first demonstrated in captive populations of monkeys that with the right upbringing, diplomacy is infectious. A Doctor from Emory University in Atlanta has shown that if normally pugilistic rhesus monkeys are reared with the more conciliatory stumptailed monkeys, the rhesus monkeys learn the value of tolerance, peacemaking and mutual hip-hugging. The Doctor, who wrote an essay to accompany the new baboon study, said: “The good news for humans is that it looks like peaceful conditions, once established, can be maintained. And if baboons can do it, why not us? The bad news is that you might have to first knock out all the most aggressive males to get there.”]

...The killer whale... has a very bad reputation for ferocity which is probably unjustified... The killer whale probably has no real enemies. A few are killed by man, usually irate whalers. They are not a very valuable catch... Divers who have met killer whales have not been molested and several killer whales have been kept in oceanaria. All have been unaggressive or even hand-tame. One story goes of a fisherman of Long Island, New York, who threw a harpoon at a killer whale. The whale pulled free and followed the boat and its terrified occupants to shallow water, but it made no attempt to harm them despite such severe provocation. - THE INTERNATIONAL WILDLIFE ENCYCLOPEDIA

On guard – the surprising watchdog of the oceans Do dolphins really save other mammals from shark attacks? This week’s report on a pod of dolphins that surrounded a group of swimmers near Whangarei and shielded them from a great white prompted a visit to the internet search engine to find out if it is common behaviour. Yes, says... internet free encyclopedia Wikipedia... “Occasionally, dolphins have rescued an injured diver by raising them to the surface, a behaviour they also show towards injured members of their own species.” The website of Port Stephens, in New South Wales... claims... [t]here are few sharks in the Port... mainly because of a shark fishing operation but also because local dolphins are good protectors. “Most people agree that dolphins know how to see off sharks, mainly by ganging up on them.” There is certainly evidence that dolphins can be brutal attackers... [P]orpoises washing up on Scottish shores... looked unscathed but examinations revealed their internal organs had been minced. “The cause of their internal injuries was a mystery for several years,”... An amateur dolphin watcher, armed with a video recorder, solved the mystery when he saw bottlenose dolphins... attacking porpoises. They attacked with rapid blows of their beak and tail.

In a tradition that dates back to[our] founding Father... every May 10th local residents gather to drive snakes into the centre of town and whack them to snake heaven... “Woo hoo! The greatest day of the year!” ...“Whacking Day oh Whacking Day our hallowed snake skull cracking day We’ll break their backs gouge out their eyes Their evil hearts we’ll pulverize...” ...“...but I hate it! Is there something wrong with me?” “Yes honey... it’s part of our... nature. Inside every man is a struggle... that cannot be resolved...” ...“Dad, please... I beg you, don’t lower yourself to the level of the mob.” “Well... maybe if I’m part of that mob I can help steer it in wise directions?...”

It has been common for most humans to assume that they are a superior species of animal. The fact that they have proven themselves to be the best at war could be given as a confirmation of human superiority. However, because KILLING appears to be a primitive and animalistic character trait, it seems that this behaviour only makes us equal to other animal species.

“Okay, [dad], I made a terrible mistake... and now I’ve got to weasel out of it.” ...“...boy, weaselling out of things is important to learn. It’s what separates us from the animals – except the weasel.”

Some people believe that humans will only prove they are a superior species of animal once they have ceased to be war-like (or violent) – i.e., once they have overcome their ancestral urges. Such people regard violence to be an abnormal character trait for humans to possess.

AS A SPECIES, THE HUMAN RACE HAS GIVEN ITSELF A BAD PRESS. We have called ourselves killer apes, with natures forged in the searing heat of a violent Pleistocene past, and depicted ourselves as moral and ecological terrorists loosed upon a kinder, gentler natural world. Anything nice about us we are wont to dismiss as a recent invention called civilization. Anything nasty we attribute to evolved “human nature.” Yet modern biology no longer supports this jaundiced view. It is tentatively concluding that human[s]... have instincts – yes, instincts – to be kind.

I want to get away from these people who think it’s normal to kill.

...what is most astonishing is that the people do not rise against their governments, either in the monarchies or the republics. The most astonishing thing is that society as a whole is not revolted by the very word “war”.

Tomorrow a war may begin, and men, driven like cattle to the slaughter, will go where they are sent and perish unprotestingly, and destroy other men without even asking themselves why they do it. And not only will they feel no remorse about it, they will even swagger and be proud of the

gewgaws they are allowed to wear for their skill in killing people, and they will exalt those unhappy or wicked men who placed them in such a position, and erect monuments to them. The people of liberal Europe rejoice that they are allowed to write all sorts of nonsense in booklets and to say what comes into their heads at dinners, meetings, and in parliaments; and it seems to them that they are quite free – as oxen feeding in the market-garden of a slaughterhouse imagine they are quite free.

If you think it, say it.

...just cause I'm talking doesn't mean I know what I'm talking about...

Crikey... I'm talking a lot of shit today!

You're thinking about something, my dear, and that makes you forget to talk.

Unfortunately, many humans seem convinced that they possess the ability to talk and think at the same time. This would be less of a problem if they had the knowledge to back up their ideas, or took the time afterwards to think about what they had said and heard – which might cause them to correct their opinion in future – but most merely repeat commonly used statements, as if their being common means such statements are true, and never try to think deeply about these statements or anything else that should be considered important.

War has nothing to do with common sense...

Throughout human history there have been certain individuals who were known to have thought deeply about important issues. Such people are called philosophers ('war isn't about who's right, it's about who's left'), and the ones considered most authoritative tried to overcome the prevalent illusion – that violent conflict is necessary – by teaching that a different, better, more peaceful way of life is possible.

Consider the enormous influence of authority on the human mind... Authority is the evidence on which the mass of mankind believe everything which they are said to know except facts of which their own senses have taken cognizance. It is the evidence on which even the wisest receive all those truths of science, or facts in history or in life, of which they have not personally examined the proofs...

His great desire to work, his wise intuition... and his serene authority reveal... a person of exceptional quality... His theoretical work, his practical work as an inventor... designer and author... place him at a much higher level than those who preceded him.

2500 years ago one of the philosophers is supposed to have said: 'If the world were in order there would be no need of me to change it.'

The reasonable man adapts himself to the conditions that surround him. The unreasonable man adapts the surrounding conditions to himself... All progress depends on the unreasonable man.

Human society has progressed in many ways during the past 2500 years. It is no longer necessary to burn wood to cook, keep warm or see at night; hot and cold water comes straight from taps inside houses, and sewage is taken away by underground pipes to be treated before any part of it is returned to the environment; humans can talk to and see people on the other side of the world in an instant, have stood on the moon, etc. But many of the problems that inspired the 2500-year-old comment are still around, humans have created new problems and many people alive today haven't benefited from the progress.

I would like to live to regret my words but twenty years from now, I am positive, the less developed world will be as hungry, as relatively undeveloped, and as desperately poor, as today. And this, despite the fact that we know the world has enough resources – technical, scientific and material – to eliminate poverty, disease and early death, for the whole human race. - 1964

Today, in spite of and in part because of a vast outpouring of scientific knowledge, we find ourselves and our world confronted by a depressing array of problems most of which are of man's own making... such... as the following: poverty – malnutrition – overpopulation – unemployment and underemployment – physical and mental illness – educational and cultural deprivation – denial of civil liberties – soul-destroying work and leisure – separation and divorce – delinquency and crime – alcohol and drug addiction – urban blight and sprawl – rural squalor – pollution and environmental deterioration – guerilla activity and insurrection – nuclear confrontation.

The record of human history does not suggest that mathematical or artistic genius has produced more successful... populations.

Since the end of... 1945, there have been more than 150 military conflicts... Despite the emergence of... "the global village", life has not been made safer by the increased speed of travel, the spread of communications, or the extension of trading relations and economic activity. Indeed, quite the reverse is true. Today it may take less time to fly from London to Sydney than it took to travel from London to Aberdeen 150 years ago, but the world is also a more dangerous place for the many people who live in it.

When ancient philosophers talked, wrote and tried to improve society they weren't interested in technology. It was the behaviour and beliefs of the people that concerned them. But if people have been talking and writing about these things for more than 2500 years, WHY is it necessary to contribute more?

More words count less. - TAO TE CHING

The previous question is easy to answer: it's *necessary* because all the talking and writing has so far failed to do what the words were intended to. One reason for that failure is because ideals become practice if the majority believe them but, as was inferred previously (refer to page 7, line 65), the common ideal isn't necessarily the correct or best one. An example of this is the widely held belief that there is no certainty when it comes to ideals (or opinions).

In a dialogue with Socrates, Protagoras said, "Truth is relative. It is only a matter of opinion." Socrates then asked, "Do you mean that truth is mere subjective opinion?" Protagoras replied, "Exactly. What is true for you is true for you, and what is true for me is true for me. Thus truth is subjective." Socrates then asked, "Do you really mean that my opinion is true by virtue of its being my opinion?" Protagoras said, "Indeed I do."

Socrates then said, “My opinion is that truth is absolute, not subjective, and that you, Protagoras, are absolutely in error. Since this is my opinion, you must grant that it is true according to your philosophy.” Protagoras then admitted, “You are quite correct, Socrates.”

Many years ago a wise old codger told me, among other things: “...as you trudge the pathway of life you will find that six out of 10 people are as thick as two short planks; three out of 10 know how many beans make six and one out of 10 knows the Truth and what life is really all about.” (For those who at this point mouth Pilate’s age-old question: “What is truth?” all I can say is that for those who don’t know, no amount of explanation will bring any enlightenment. On the other hand, for those who do, no explanation is needed at all.)

Sadly, many people – and most governments – still use Protagoras’ argument to convince themselves that their ideals or beliefs can be right when authoritative reasoning says they are wrong.

A man with a conviction is a hard man to change. Tell him you disagree and he turns away. Show him facts and figures and he questions your sources. Appeal to logic and he fails to see your point.

Progress depends... on a willingness on the part of the mass of mankind – and we all, in nine-tenths of our nature, belong to the mass – to recognize genuine superiority, and to submit themselves to its influence. But the condition of recognizing genuine superiority is a contempt for unfounded pretensions to it.

Over the past 200 or so years English speaking people have, collectively, dictated the direction of *our world* (i.e., human society) more than any other culture or language group. It is entirely appropriate to use the word DICTATED because DICTATOR means ‘a domineering person with supreme authority in any sphere’ (*world*: ‘all that concerns or all people who belong to a sphere of activity’) and, in most instances, an English person (or a group of English people) has physically forced other cultures to accept its lead. One motivation for English people to do this was clearly a belief in their *genuine superiority*. This *unfounded pretension* must be considered partly to blame for their over-all failure to create a better society, not only for themselves but everyone they have influenced, as must their language – because the English word AUTHORITY can mean, strange as it may seem, two contrasting things.

authority... 1. the power or right to enforce obedience... (esp. in *pl.*) a body having authority... 2. personal influence arising from knowledge... a testimony based on this... an expert.

From the above dictionary reference we learn *authority* can come via violence (through threats and force) or peacefully (through knowledge and example).

...why have the times stayed the same...

If *human society* has predominantly *stayed the same*, this may be because authoritative reasoning has somehow been kept from the masses or the authors were unable to reach the masses with their message; or, alternatively, all reasoning has so far failed to be authoritative enough to convince the masses that they are wrong. Perhaps the greatest philosophers were aware of this?

Of all man’s miseries, the bitterest is this, to know so much and to be impotent to act.

That quote also came from 2500 years ago, but it could have been written during the so-called 20th century in reference to Albert Einstein.

E = MC² made Albert Einstein the most famous scientist in history... Knowing that it wouldn’t be long before Hitler’s physicists worked out the same equation... Einstein... wr[o]te to the American President... When the bomb was used, not on the Nazis, but on the Japanese... Einstein... w[as] horrified. Einstein, who spent his final years campaigning for peace between nations, described the letter to... Roosevelt as his life’s only mistake.

I recently discussed with an intelligent and well-disposed man the threat of another war, which in my opinion would seriously endanger the existence of mankind... Thereupon my visitor, very calmly and coolly, said to me: “Why are you so deeply opposed to the disappearance of the human race?” I am sure that as little as a century ago no one would have so lightly made a statement of this kind. It is the statement of a... painful solitude and isolation from which so many people are suffering in these days... Innumerable voices have been asserting for some time now that human society is passing through a crisis, that its stability has been gravely shattered... Is there a way out? ...Modern anthropology has taught us, through comparative investigation of so-called primitive cultures, that the social behaviour of human beings may differ greatly, depending upon prevailing cultural patterns and the types of organization which predominate in society. It is on this that those who are striving to improve the lot of man ground their hopes: human beings are *not* condemned, because of their biological constitution, to annihilate each other or to be at the mercy of a cruel, self-inflicted fate... The importance of securing international peace was recognised by the really great men of former generations. But the technical advances of our times have turned this ethical postulate into a matter of life and death for civilised mankind today, and made the taking of an active part in the solution of the problem of peace a moral duty which no conscientious man can shirk... A permanent peace can not be prepared by threats but only by the honest attempt to create mutual trust. One should think that the wish to create a decent form of life on this planet and to avert the danger of unspeakable destruction would tame the passions of responsible men... But today the rude passions of man reign in our world, more unrestrained than ever before. - Einstein

If there’s one thing that I can’t explain... with all the ways of communicating... it’s why the world has to have so much pain... I hear it everyday on the radio somebody shoots some guy he don’t even know...

Why must... people keep on killing and fighting... we don’t want... wars we don’t need... violence we just want what’s right... peace... - Bad Brains

Perhaps *all the talking and writing has so far failed* to improve the behaviour or beliefs of the majority and make the world a better place for all members of our species because the words were ahead of their time once but are not completely relevant now due to the technological changes of recent years?

“She was right, peace is the way[.]” said Spock. Captain Kirk replied,] “She was right, but at the wrong time.”

When Einstein was writing over 40 years ago nuclear destruction was becoming the primary fear, but even Einstein could not have imagined the state of human society at the end of the 20th century. Today nuclear explosions, be they bombs or power plants, are of less concern. The primary fear now is a non-

nuclear destruction of our entire eco-system. The need to improve the *behaviour and beliefs* of the majority is as important today as it ever was, if not moreso – since the *rude passions of man* seem to be even more unrestrained now than when Einstein lived.

All of us need to learn to live at peace in this world, to work out a new mode of thinking, for conditions today are quite different from what they were even three or four decades ago.

...these are the days when anything goes...

If in nature animals and plants do battle with each other *for the survival of their species*, which species has humanity fought most? During the last few thousand years the battle for the continued existence of humans has been fought against other humans. Lately it appears that the side fighting for humanity's extinction has become bored or dissatisfied with fighting other humans and is now trying to fight nature.

Nature started the fight for survival... now she wants to quit... because she's losing? ...Well maybe she should have thought of that when she was besetting us with droughts and floods...

The most unbelievable fact is that no serious effort is made to avert what looks like a final decree of fate. While in our private life nobody except a mad person would remain passive in view of a threat to our total existence, those who are in charge of public affairs do practically nothing, and those who have entrusted their fate to them let them continue to do nothing. How is it possible that the strongest of all instincts, that for survival, seems to have ceased to motivate us?

The aim of the first part of this thesis (FUTURE SOCIETY?) is to show why humans are still at war, be it with other humans or nature, in order to identify what needs to be done to permanently bring their wars to an end – thereby completing the mission of those people who have tried to do so previously.

Anyone who examines culture today, who looks on it long and unblinkingly, can hardly stave off a feeling of hopelessness, a fear that all may be utterly lost; the blight, blank misery, the poverty of joy bear in on such a person like a dreaded tomorrow. Even if we do not harp on the prospect of nuclear holocaust, which serves as an infernal cup into which we pour our deadliest terrors, we cannot dispel the overwhelming sense that nothing but power – the desire to grab, consolidate and exercise it – now motivates our leaders and our cultural elite, so that when they govern, write, create or speak they do so untouched by... the “old verities”: compassion, ancestral wisdom, love and reverence for the earth... Though... power has become so cagey, so uncommonly adept at absorbing anything that challenges it, we can nonetheless preserve the memory of a fabled past, storing it away against the time when humanity sickens with its long affair with power and casts about for something nobler, grander, and infinitely more lovely. On such a day this book, together with hundreds like it, may prove its worth, may justify the time, expense and efforts of its authors.

We care a lot about the army navy air force and marines... about your guns about the wars you're fighting gee that looks like fun We care a lot about... Transformers cause there's more than meets the eye... We care... cause we're out to save the world... Well, it's a dirty job but someone's gotta do it... - INTRODUCE YOURSELF

The endeavour *of those people* has made this thesis easier to write. Quotes from such people and many others will be used throughout the thesis, but in many instances no attempt has been made to refer to a quote's origin. This is a deliberate act and there are a number of reasons for doing so – one being an aim to not directly name or give credit to any living person, including the thesis' editor. If time and resources had allowed it, the entire thesis could have been created by using a collage of quotes from books, newspapers, songs, television programmes, etc.

The pool of informed opinion about this... is infinite; so what to include in a book of this nature and what to leave out are balanced on a fulcrum of subjective editorial policy.

References will be given where they are relevant (i.e., letting the reader know that a quote comes from Albert Einstein is important – but which of his books, and which page, the quote is sourced from is unimportant). Although many quotes have no reference some come from sources whose title has been provided elsewhere in the thesis. Thorough references are generally only needed so copyrights can be observed (which is something that will be discussed elsewhere in the thesis) and by the conservative academic world – which often appears to be more interested in what has been said in the past than the present.

University departments are still lagging behind in field after field, caught in older mechanistic paradigms drawn from an earlier era, mainly the... dawn of modern industrial life...

Acceptance by the *academic world* may help this thesis to be successful but the editor believes such can be achieved without thorough references. Most readers don't bother checking references and, if someone doubts the truth of a quote, seeing that quote in its original setting isn't going to convince them otherwise. Another reason for providing thorough references is so people can check a quote's context (i.e., when quotes are removed from their original text they can be used to imply support for a meaning not originally intended). For this reason readers should not assume that the editor agrees with what is said in any quote – anything printed in dark lettering; or printed in light lettering but is enclosed by a pair of single inverted commas (i.e., 'x to y'), which indicates the enclosed phrase has been inserted within a quote, or between quotes, that it doesn't share the same reference with (e.g., page 6, lines 68-70 + page 7, lines 1-27), or the reference details were unknown/uncertain.

A final and most bitter satire involving future war is *Tomorrow's Yesterday*... It is a savage attack on business methods (advertising in particular)... and mankind's stupidity. The main substance of the book concerns a film made in 1932 but showing various (mainly futuristic) eras of mankind being visited by a future race of telepathic beings evolved over three million years from cats. They view an advertising campaign of about 1930, then the hypocrisy of the 1960s where an unfaithful husband berates his son who is participating in the current vogue of companionate (i.e., temporary) marriages, then the outbreak of war in 1997.

At the end of the 20th century (circa 1997) humans were engaged in so many wars that it wouldn't be possible – and would be overly repetitive – to discuss all of them. However, in order to achieve its aim this thesis will attempt to cover each of the major wars and most of the minor wars – which have all been grouped into the 3 most contentious topics.

MONEY

World War I, international conflict, 1914-8, involving most important nations of the world, and precipitated by the assassination of the Austrian heir-presumptive... by... a Serbian nationalist, at Sarajevo, June 28, 1914. International distrust accumulated in the 19th cent. had led to numerous earlier crises and to formation of the... *Triple Alliance*... of Germany, Austria-Hungary, and Italy against... the... *Triple Entente*... [of] France, Russia, and Great Britain... Belated unification of Germany under Prussian military leadership during the Franco-Prussian War, 1870-1, her annexation of Alsace-Lorraine from France, and her sudden emergence as a major military, naval, commercial, and colonial power had shaken the balance of power in Europe. France wanted revenge, Great Britain feared for her commercial survival and colonial empire, and Russia was worried that her expansion toward Turkey's Black Sea straits, begun in the long Russo-Turkish Wars, might be cut off by Germany's "urge toward the east"; hence these countries increasingly opposed German ambitions. Meanwhile, within Austria-Hungary the existence of large minorities, notably Magyars and Czechs, who craved national independence, created strong internal tensions; and... the continued existence of large Italian minorities under Austro-Hungarian rule after the unification of Italy, 1870, had caused friction between the two countries in spite of their participation in the Triple Alliance. Also, the emergence in the Balkans of Slavic states, whose independence from Turkey had been achieved largely through Russian assistance, made for irritation between Russia and Austria-Hungary, and large Slavic minorities in the Dual Monarchy looked to... Russia for eventual liberation... Amid these tensions grew up an exalted nationalism, militarism, international rivalry for markets following the economic depression of 1872-96, and consequent rival imperialisms. It was against this background that, following the assassination of the archduke, Austria issued her ultimatum to Serbia, July 23, demanding among other things suppression of all anti-Austrian activities. Russia then assured Serbia of support in case of war with Austria. Serbia's reply, July 25, unsatisfactory to Austria, prompted Austria's declaration of war on Serbia, July 28, and Russia's mobilization, July 30. Germany, committed to support of Austria, declared war on Russia, Aug. 1, and convinced that France, now mobilizing, would assist Russia, Germany declared war on France as well, Aug. 3. The German invasion of Belgium, Aug. 3, following Belgium's refusal to allow German troops to cross her territory to France prompted Great Britain to declare war on Germany, Aug. 4. Japan, allied with Great Britain since 1902, also declared war on Germany, Aug. 23. Russia declared war against Turkey, Nov. 2; and Italy, remaining initially neutral, finally denounced the Triple Alliance and declared war on Austria-Hungary, May 23, 1915... [R]esponding to Russian appeals... the British and French... opened the Gallipoli Campaign against Turkey in the Dardanelles... hoping thus to capture Constantinople, open supply routes to Russia, and bring Greece and Bulgaria into the war on the Allied [(Triple Entente)]side... With no end of the war in sight, casualties tremendous, and discontent and mutiny spreading through the armies, demands for a negotiated peace as urged by[the] U.S... increased. However, failure of the Central Powers ...t[o] make any specific proposals, and the reorganization of the British and French governments... along with the reorganizations of the... French... and... German military [commands]... prolonged the struggle... Although it took a heavy toll of Allied shipping, the[German] practice of sinking neutral ships (including the unarmed passenger ship *Lusitania*... on which numerous Americans lost their lives)... [had] prompted a temporary restriction of submarine activity... [because of the danger it might lead] to... war with the U.S... [Eventually, however,] Germany started unlimited submarine warfare (Feb. 1, 1917) to force[the] surrender of Britain before the expected American participation in the war could count... resulting, as expected, in the American declaration of war on Germany (Apr. 6, 1917)... and it was evident by the end of 1917, when U.S. men and arms were pouring into Europe, that the German gamble had failed... Tremendous in destruction, W[W]I left casualties of almost 10 million killed and 20 million wounded, with direct financial costs of around \$180 billion. The war and the peace settlements... revolutionized the map of Europe. Although the... League of Nations... [was] established... to secure peace for the future, problems created by the war multiplied, and only 21 years after the armistice of Nov. 1918 the Continent was aflame with... *World War II*... 1939-45, involving most major nations of the world. In some respects a continuation of W[W]I, but resulting also from problems created by... the international economic crisis of 1927-37... Notable... were the failure of the Allies after W[W]I either to conciliate or to completely crush Germany; the discontents of Italian, Japanese, Hungarian, and other national groups; the rapid disintegration of Allied unity, begun by the Russian Revolution and establishment of Communism in Russia, and continued by the withdrawal of the U.S. into isolationism... The war casualties... [included t]ens of millions of civilians... Allied forces lost 7 or 8 million men... Germany alone lost c.3,250,000 men. - THE NEW UNIVERSITY ONE-VOLUME ENCYCLOPEDIA

WWII is described as *a continuation of WWI*. Yet, both were merely a series of campaigns fought within the longer-running war over money (or wealth).

...people all over the world are dying in the war... [over] economics... - BALL OF CONFUSION

The *war over money* (or economics) has involved armed and unarmed conflicts between or within countries. Money hasn't been the only cause of wars but it is doubtful if there has been one for centuries in which money didn't play a role.

It is possible to understand the Greeks without mentioning their economic relations; the Romans, on the other hand, can *only* be understood through these. Chaeronea and Leipzig were the last battles fought about an idea. In the First Punic War and in [modern wars] economic motives are no longer to be overlooked.

The city of world power. The remarkable though largely unplanned territorial expansion of Rome between 375 and 275 brought lasting economic gain. With control of all of peninsular Italy, Rome established colonies on some of the conquered territories and elsewhere assigned lands to individual Roman citizens. The nearly 60,000 holdings distributed before the middle of the 3rd century helped to solve the pressure of Rome's land-hungry population; nevertheless, by c. 250 the city's population had grown to almost 100,000. The booty from conquests also helped to defray the costs of such public works as the building of temples and roads and the improvement of the city's water supply. By the early 3rd century, two aqueducts carried fresh water into the city. In 264 Rome was drawn into a war with Carthage, the great Phoenician emporium in North Africa. After more than a century of conflict, Rome emerged as the strongest power in the Mediterranean; but the acquisition of an empire, which, for the most part, had not been the conscious desire of the Roman people, brought new social and economic problems to the city itself. During the Second Punic War (218-201) large areas of the peninsula were devastated by invading troops from Carthage, led by the famous general Hannibal; much land was abandoned and many peasants sought refuge in Rome. The growing requirements of a standing army depopulated the countryside and

concentrated veterans in the city. The Roman nobility, prohibited by law and by custom from investing in commerce or industry, profited from the economic distress of the peasantry by buying up large tracts of land in central and southern Italy. Slaves, whom Rome's wars in the Mediterranean made available in large numbers, were introduced into Italy as farm labourers and herdsmen, causing further dislocation among the free peasantry. In general, the Roman economy lagged well behind the political development of both city and empire.

The quote on page 11, line 51, implies that Greek wars weren't influenced by money. However, in Plato's *Republic*, Socrates has the following conversation:

"Then I dare say even the land which was sufficient to support the first population will be now insufficient and too small?" "Yes," he said. "Then if we are to have enough for pasture and ploughland, we must take a slice from our neighbours' territory. And they will want to do the same to ours, if they also overpass the bounds of necessity and plunge into reckless pursuit of wealth?" "Yes, that must happen, Socrates," he said. "Then shall we go to war at that point, Glaucon, or what will happen?" "We shall go to war," he said.

Sophocles, in 441 B.C., wrote, "It is money that sacks cities and drives men forth from hearth and home; warps and seduces native innocence, and breeds a habit of dishonesty."

The type of conflict Socrates referred to has been repeated in every century since his lifetime – although the instigators of aggression have often disguised their true motives by proclaiming good intentions (e.g., to civilise an apparently uncivilised people).

One of the grievances that the Red Indians had against the white men was that they had driven away or exterminated the bison... To the Indians, wanton killing of bison was the equivalent of cattle-rustling for the white man, and also punishable by death. Wars broke out as the Indians saw both their territory and their livelihood disappearing. Some enlightened men sought to safeguard both, but many others claimed the extermination of bison was the only way of 'civilising' the Indians (always a good excuse for land-grabbing). Without the bison, the Indian culture died. For centuries their economy had been based on the bison but as has often happened, technological advance has failed to bring happiness.

What will happen when the buffalo are all slaughtered? ...It will be the end of living, and the beginning of survival. - Brother Eagle, Sister Sky

Money is a necessary commodity for survival in the modern world.

Money is seen as the key to survival. It turns helpless, infantile rage into usable strength and power.

In primitive societies and in the subhuman animal kingdom, survival belongs to the strongest and... swiftest. In modern civilized society, the means of survival – food, clothing, and shelter – are purchased with money. Over a period of several thousand years, money has become a substitute for strength and speed. People no longer compete directly with each other for the game to feed their families, but indirectly for the money to buy food.

Furthermore, the people selling the food usually do so to make a profit.

When it comes to making a *profit*, the best time to do so is supposedly during a war, and it is often said that 'the way to end a depression is to start a war.'

...the arms manufacturers tell me... war is money... the more people we kill in this war the more the economy will prosper...

"Alright, here's your last question. What was the cause of the [US]Civil War?" "Actually, there were numerous causes. Aside from the obvious schism between abolitionists and anti-abolitionists, economic factors, both domestic and international, played a significant..." "Just say slavery."

The Federal government has been the biggest customer of U.S. industry since 1941. The Cold War made it possible to substitute government purchase of armaments for the investment not forthcoming from the private sector. When the Kennedy administration took office in 1961, investment and the demand for capital goods were not sustaining growth in the U.S. economy. The Kennedy tax cut did not produce the desired surge of investment... Arms procurement, it turned out, could also serve to stimulate economic growth, or at least to keep the economy going. Both capital goods and armaments create employment without putting products into the market to absorb the wages they pay. Those wages generate additional demand and, therefore, additional jobs in consumer-goods industries and, by this "multiplier" effect, keep the system growing... Military procurement has kept the system running by taking a sufficient percentage of its output off the market and – in plain language – burying it in the ground.

Today, the industry with the greatest worldwide financial turnover is officially said to be 'armaments (second place goes to drugs; third to oil' – although other sources say 'oil is the biggest industry in the world' and 'coffee is second to oil').

One has to realise that the powerful industrial groups concerned in the manufacture of arms are doing their best in all countries to prevent the peaceful settlement of international disputes... - Einstein

...take the profit out of war we don't need it any more...

Historically, the money war has been depicted by struggles between rich and poor people – or, in 20th century-speak, between the right and the left.

We are assured again and again that politics comes in two basic styles – "right-wing" or "left-wing" – with something in between dubbed, with vivid originality, the "centre." Yet commentators who employ these words seem often to have quite woolly ideas about what they mean by them. - 1997

The so-called *right* is associated with the rich, West or capitalism; the so-called *left* with the poor, the East or communism. Such references give the impression that the capitalist and communist systems are on opposing sides. Propaganda from within both systems has been responsible for that impression.

East/West rivalry In the propaganda war between the superpowers... a permanent climate of mistrust and misunderstanding... [has been] created... Television and the written word have helped to bring home such violations of human rights as the crushing of the independent trade union movement, Solidarity, in Poland (1981). For their part, the citizens of the Soviet Union have been shown pictures of the unemployed in the West, images of an apparently uncaring society which has reduced many of its citizens to a poverty-stricken, marginal group. It is not altogether surprising that both East and West feel they have a moral duty, as well as a strategic interest, to extend their interest in the world. They want to export their values, if necessary by force...

On the air the ministry broadcasts... we're living wonderful lives... we know... it's only propaganda... - DO YOU BELIEVE IN THE WESTWORLD

There is, however, some theoretical truth in the belief that capitalism and communism *are on opposing sides*.

capitalism, an economic system in which profit on invested capital is the primary incentive for production and distribution. It is based on the private ownership of property. In theory, it supports free enterprise, or the right of any individual lawfully to establish and operate an enterprise, and to take for himself what rewards he can reap in competition with others... Opposition to capitalism is found in one form or other among socialists, communists, syndicalists, and certain fascists, all of whom advocate state regulation of capital... *communism*, the body of doctrines and practices associated with the belief that in a social group all property should be owned in common[('everything would be state owned')]... Modern communist-socialist thought generally stems from the 18th- and 19th-cent. thinkers who believed in the natural equality and perfectibility of man...

Marx believed that the Communist revolution would be the final revolution because it is the perfect answer to all social contradictions.

Communism embraces a revolutionary ideology based on the overthrow of the capitalist system, and, in theory at least, on the notion of constant progress towards the perfect stateless society.

In theory communism works.

In practice it hasn't worked. The main reason for this is because, while most of the citizens in communist countries wanted something that was the opposite of capitalism, they got 'what we call state capitalist operations.'

The basis for this claim is that... the similarities between communism and capitalism are greater than their differences... It makes no appreciable difference who owns the means of production if the production process itself is based on the assumption that its development need not be hindered by thoughts of limits to growth... Ecologists argue that discussion about the respective merits of communism and capitalism is rather like rearranging the deckchairs on the Titanic: they point out that industrialism suffers from the contradiction of undermining the very context in which it is possible, by unsustainably consuming a finite stock of resources in a world that does not have a limitless capacity to absorb the waste produced by the industrial process.

The development of modern society in both the Soviet Union and the United States is now following the same course... giving rise in both countries to managerial groups that are similar in social character. We must therefore acknowledge that there is no qualitative difference in the structure of the two societies.

During 1989 and 1990 the world saw the collapse of a raft of... regimes in Eastern Europe. In Peking, demonstrations in Tien An Men Square were suppressed by force, while in the Soviet Union nationalist uprisings, anti-communist demonstrations and mass strikes against economic deprivation became the norm – and are continuing. Albania has been no exception. Western politicians and the big business media howled with glee. They shouted: This is the end of communism! Hurrah! It shows that capitalism is best! Actually it showed nothing of the sort! Because *all* the regimes that were claimed to be 'communist' or socialist *had already a long time back restored capitalism!* This assertion may astonish some who are kept in ignorance of the history of [commun]ism and the working class. *But it is a fact nevertheless...* Actually, communism as a system did not exist in any of the countries concerned. For a ruling party to be a Communist Party, even a genuine one, does not at all mean that the country is 'communist'. Communism as a socio-economic system is simply the abolition of classes. That is what the theory of Marx and Lenin teaches. - What Went Wrong in Russia & China

...Marxist theory holds that socialism is simply a later stage of capitalist development and would grow out of the process of capitalist production and accumulation. In fact, the new vulnerabilities of industrialism itself now have produced an even greater irony: that the fierce and supposedly fundamental debate between Marxism and capitalism of the nineteenth and early-twentieth centuries has turned out to be a surface argument. Both systems are systems of industrialism, dedicated to maximizing material production and narrowly conceived technological 'progress'; both short-change the considerations of ecological tolerances and the fundamental needs of human beings that go beyond material sufficiency to needs for philosophical meaning and concerns of the spirit.

Marx saw the capitalists as parasites living at the cost of the workers.

Unfortunately, 20th century communism – which in Russia was actually a form of socialism (or, alternatively, Leninism, Stalinism, etc.), and in China can more accurately be termed Maoism – has proven to be capitalism's equal when it comes to *living at the cost of the workers*.

The division of the industrial world by the Cold War has concealed the progress of the centrally planned economy... In isolation from world trade, the Communist regime went on with the building of... heavy infrastructure protected from competition by longer-established industries outside. The people – under severe political discipline, assured of shelter and sustenance, and waiting in long queues for access to goods widely available in other industrial countries – continued patiently to render their involuntary contribution to capital formation... [in anticipation of] the fruits that were owing to three generations of sacrifice.

Both the "left" and the "right" are plundering the freedom of the individual... The terms derive... from the seating arrangements of post-revolutionary French parliaments, one of the more venal and violent ruling bodies anywhere, anytime.

I ask myself should I put my finger to the left? ...I ask myself should I put my finger to the right? ...doesn't really matter where I put my finger... it's always been the same it's just a complicated game...

The managing of economic systems may be *complicated*, but showing the division of money within a society is easy – and can even be depicted graphically:

It would be honest to admit that the above graph was not derived from the input of factual data. However, if researchers were to waste time and resources obtaining the relevant statistics, upon plotting them they would end up with a similar result. Such data could also be presented in the following way:

According to the graphs, people with zero wisdom aren't wealthy. The justification for this suggestion is that, although there may be the occasional exception, most examples either don't understand the meaning of wealth, quickly lose what wealth they acquire or must have someone manage it for them (which only makes them wealthy in an abstract manner – and the financial manager could steal their wealth). Furthermore, the graphs imply that wise people aren't wealthy either – though not necessarily for the same reasons as people with zero wisdom – while people who have average wisdom (point or box A) can be poor, the wealthiest people in the world or anywhere between. What is average wisdom? It is hard to define and might not even exist – which may be why people are only labelled as being either wise or unwise (or more often one than the other). In that case, the majority – when considering all living humans – are unwise and poor (although this is merely a reflection of the way things have been historically).

In the capitalist system competition drives the way...

In general, and constitutionally in any democracy, the desires of the majority are what gives society its direction. Thus it may be poor people's desires that currently drive the world.

They denounce, and rightly, the injustices of capitalism; but they do not always realise that capitalism is maintained, not only by capitalists, but by those who, like some of themselves, would be capitalists if they could, and that the injustices survive, not merely because the rich exploit the poor, but because, in their hearts, too many of the poor admire the rich. They know and complain that they are tyrannized over by the power of money. But they do not yet see that what makes money the tyrant of society is largely their own reverence for it.

In the market economies, especially, whole new categories of experience were entering the measure of well-being... People in these societies who did not share fully in the rising abundance remained bound to them by the expectation that they might soon have their share also. Economic growth offset disparity in income because it brought new participants into the celebration.

I don't know if I'd like being rich... but I'd sure like to try.

The dream of rising from rags to riches is as much a part of the American heritage [(and 'no society has ever encouraged its people to dream so extravagantly and with such expectation as America has over the last 50 years')]as is baseball and apple pie.

...factory town... youth... All we ever wanted was everything all we ever got was... darkness... oh to be the cream...

If one is poor, for example, one is likely to place a higher value on money than if one is rich... The lure of money is the motivation for a large part of human behaviour... Millions of people apparently worship money. Even more dream about having millions of dollars and fantasize about the things they would do with it. It is probably safe to say that money is as much a preoccupation with most people as sex... A number of studies have even stressed the similarity of the very rich... and the very poor. Both groups tend to live off unearned income, have a disdain for hard work... Another similarity between the very rich and the very poor is their immunity to the necessity of making choices and assuming the responsibility that goes with such choices.

It seems like the majority of poor people support the type of society we currently have as long as there is a chance for them to become rich also.

...every man is for himself Wealth is for the one that wants it Paradise if you can earn it...

Pragmatic values predominate, with the individual free to seek his own self-interest, as he defines it, in the marketplace. Hence the future is not determined by tradition nor achieved through organized plan, but rather as a consequence of relatively autonomous units in the system pursuing their own practical ends.

An alternative view to lines 37-8 on the previous page is that the wealthiest people are the ones who currently dictate which direction human society takes.

Lifestyles of rich measure our economy - 1996

The destinies even of this world-economy are now decided in a few places, the ‘money-markets’ of the world.

The wealth and power of British-run Hong Kong is breathtaking.

The Hong Kong city-state is dominated by the centralized power of a small financial oligarchy.

In Hong Kong money is the world and the world is money.

Money makes the world go round.

...if there was no money then gravity would cease to exist and everything would float off into the atmosphere, so money is definitely the most important thing in the world!

***Love once made the world go round; now it's money...* [T]oday money is the overwhelming driving force for world leaders and political wannabes as romance, revolution, high-minded strategy and the rest fade into the background. Economic self-interest has always been central to the organisation of societies and the advancement of individuals. But the defining characteristic of the post-modern political era is the absolute domination of money as the organising principle of human and international relations. - 1997**

Regardless of who is responsible for the current preoccupation with wealth – be it financial or material – the situation has been compounded by the fact that, whereas wealth was traditionally gained only by killing, stealing or exploiting, or by inheriting wealth from somebody who had profited through any of those activities in the past, today people can also become wealthy by luck.

You don't have to work – just be damn lucky!

The main problem with thinking of wealth in terms of *luck* is that it presents rich people with an excuse to believe nothing can be done to help the poor – because for some to be lucky it necessarily follows that others must be unlucky.

“...Luck comes in cycles,” he explains... [He] has won Lotto, not once but twice... [His] good luck could be put down to karma... “No, I don't think that's it,” he says. “After all, criminals have won it, too. I mean the odds against winning are enormous. With things like Lotto it's just chance... Personally, I think the luckiest thing I've ever had was being born to my parents...”

Somehow... there always seems to be... this situation in which people are segregated into... class[es]... and it's all a matter of luck which one you happen to be born into, isn't it...

...there is one other essential ingredient involved in becoming rich. That is luck. No matter how intelligent, hardworking, unscrupulous, or ingenious a person is, an element of luck is almost always involved in making a fortune. The person is at the right place with the right product or the right technology at the right time to capitalize on the right opportunity... In these instances, it often appears to the recipient as if the money has appeared almost by magic, making the person feel as if he or she has a favored position in the eyes of fate or some higher authority. To test this illusion, the individual often seems driven to find out whether the money can be disposed of faster... Humans seem to adjust to almost anything if given enough time, but rapid change creates chaos for many. People who suddenly acquire a lot of money often make drastic changes in their life-style... Obviously, those who are poor and stay poor have no luck at all, or if they do, it is bad luck.

However, via suing, people can even become wealthy through having *bad luck* or by being careless! Not surprisingly, there is much more written about how to become rich than about how to become or remain poor.

THIS BOOK COULD BE WORTH A MILLION DOLLARS TO YOU... READ YOURSELF INTO A FORTUNE

***Making Money Made Simple*, released in Australia early in 1987, jumped to the bestseller list and stayed put for 19 months... He wants the book to become “the [definitive] book of finance. I want it to be in every home.”**

The secret to becoming a millionaire is simply using the right words! You are 17 words or less away from a fortune! I'll reveal all the ‘magic’ words you'll ever need in my new book.

...open up the rich world of books for our children...

[A s]even-year-old... learned some cold hard facts about cash... [during] a programme to promote economics education... The Colwill Primary School pupil was making “lots of money” running a bookstore at a school market yesterday but couldn't bank it because she had left her bank book at home.

...Transforming the primary source of wealth from the business of making things to the business of thinking up things has meant a drastic reduction in how long it takes to get rich. If you woke up one morning with an idea of how to build a better steel mill, you couldn't become a zillionaire overnight... But if you had an idea of how to sell books over the Internet, all you'd need is start-up money... It took Andrew Carnegie three decades to become a centimillionaire by making steel. It took [someone else] three years by starting Amazon.com. - 1997

It is often said that ‘the rich are getting richer while the poor are getting poorer.’ Though the last part of that saying may be debatable – some people might argue that the generalisation does not hold true for a large enough percentage of *the poor* to be valid – there should be no need to dispute the first part.

The gap between... the have-nots... the haves... and the have-lots has widened.

...[Money is the seed of money, and the first guinea is sometimes more difficult to acquire than the second million.]

...[THERE IS AN OLD SAYING TO THE EFFECT THAT IF A PERSON HAS a hundred dollars and makes a million, that is incredible; but if a person has a hundred million dollars and makes a million, that is inevitable. And, despite increasing taxes, controls, and other barriers imposed by government agencies, the number of millionaires continues to grow to the point where one wit recently remarked, "Soon millionaires will be a dime a dozen." Still, the odds against someone who is poor or middle class becoming rich are much greater than those against the rich getting richer. Rather than putting themselves to work, the rich put their money to work for them. Naturally, the more money they have working for them, the more they are likely to get back in return. If one has enough capital to start with, it is possible to make a lot of money with no effort, no intelligence, no business know-how, and virtually no risk. Since money generates money, it is theoretically possible for a person to develop a never-ending supply of dollars. A Howard Hughes or a J. Paul Getty, for example, could invest \$100 million in eight percent tax-exempt bonds. The interest on this investment would produce \$8 million a year spendable income, without ever touching the principal. Conceivably, this income could go on forever. Those who are already rich have capital at their disposal, and it does not lower their standard of living or restrict their self-indulgence to invest part of it in some money-making venture. For the poor it is harder. People who are hungry have difficulty transcending their present discomfort. It is unrealistic for them to think in terms of doing with even less than they have and investing the difference in the hope of making a profit several years hence. In the ghetto, survival is a day-to-day reality. Tomorrow may never come. Five years from now is forever. Individuals who have become rich after starting with nothing but a dream are unusual']...

Many New Zealanders are worth... nothing... or less than nothing. Financially that is. That is one of the findings of a comprehensive survey... [O]nly 51 per cent had a positive net worth (assets less liabilities), 35[%] just broke even and 14[%] owed more than they owned... A POOR man's rich list would be one way of describing it. A poor man's poverty list might be even better. Unlike the other, much-heralded rich list, there are no names with this one. There are too many of us, for one thing... While the numbers may not be happy reading for 49% of all Kiwis... things were not as bad as they seemed. While only 16% of N[Z]ers may own three-quarters of all the money, the situation was more extreme in the United States and Britain. Up to 80% of Britain's net worth is held by between 5% and 10% of the population. [Incidentally, last year it was 'reported that the gap between rich and poor is growing faster in Britain than in any country except NZ'.]

...A... report shows that Australia and Britain [(the United Kingdom)] have the biggest gap between rich and poor in the western world, the gap being twice as bad as that in Ethiopia... "The United Kingdom, unfortunately, has an exceptionally high degree of inequality," said the United Nations Development Programme, which published the report.

...The number of millionaires in Britain has doubled in the past five years, taking membership of the £1 million... club past the 100,000 mark. Almost 200 people became millionaires every week on average over that period... It means that one in 500 people can now claim to be a millionaire.

...[Previous to the 1970s 'wealth in Britain was measured in £100,000s', while in the US – where the rate of millionaires 'per 100,000 persons was 205 in 1982' – it was recently said that: 'a million dollars isn't what it used to be; you need \$5 million to feel comfortable today'.]

...For the second year in a row, two Americans... have topped *Forbes* magazine's ranking of the world's billionaires. The... founder of software giant Microsoft Corp [is on top]... *Forbes* also said that there are at least 447 families or individuals in the world with a net worth of at least \$1 billion, up from 388 last year... The U[S] is home to one-third of the world's billionaires with 149. There are now 41 Japanese billionaire fortunes and 82 non-Japanese Asian billionaire fortunes, including 20 from Hong Kong. Other countries with billionaires include Germany with 52, Mexico with 15, France with 14, Switzerland with 12, Malaysia with 11, Indonesia with 10, Thailand with 10, Philippines with nine and Canada with seven.

...*Forbes* said the net worth of the 40-year-old... Microsoft Corp co-founder... has jumped to a staggering \$US18.5 billion... up almost \$4 billion in just one year. The sharemarket's bull run had much to do with the big gain in the fortunes of those who made the *Forbes* list... [M]ore than half of those who made the list were not born wealthy – 217 were self-made millionaires... The magazine found that 30 of its 400 richest Americans never attended college. And the 63 people on the list who did not have a college degree had a much higher average net worth than the college graduates on the list. - 1996

Welcome to the United States, the land of milk and money...

The company's share price has increased more than 50-fold in a decade, making hundreds of Microsoft staff millionaires.

...*Making a fortune in America has never been easier...* The biggest trend in the U[S] economy for the past 20 years has been the decline of manufacturing and a corresponding shift to high technology, retailing, finance and entertainment... It took a mere \$100 million to make the first *Forbes* 400 list of richest Americans by 1982. By last year, the price of admission had risen to \$415 million... Before we succumb completely to irrational exuberance... we should look at a difficult issue: the fact that the New Economy is leaving lots of Americans [(USers)] behind. Despite heartwarming success stories like the millionaire secretaries created at Home Depot, the top 1[%] of the population continues to own about a third of the nation's wealth, the next 9[%] own a third and the remaining 90[%] have to make do with a third... This isn't bleeding heart stuff – it's just a fact.

...THE Pacific Rim now accounts for about a quarter of the world's billionaires... Of the top 100, only six are from Japan... [and of] the 10 richest Asians, only two are Japanese... although that may reflect the fact that Japan's wealth is created by huge corporations rather than by entrepreneurs... The family of [the] President... of Indonesia jumped to ninth on the annual ranking... published yesterday – up from 93rd last year – with a combined wealth estimated at \$US6.3 billion... The... world's richest man... the Sultan of Brunei... worth an estimated \$US30 billion and whose tiny Borneo sultanate sits on vast oil reserves, again topped the list of Asia's 100 wealthiest families...

The sultan is regarded as the richest man in the world with an estimated fortune of \$US40 billion...

For those a tad out of touch... the richest businessman in the history of the universe... flogs computer software... [and fifth place goes to his] Microsoft co-founder... *Forbes* magazine puts the computer whiz top of its annual list of the 200 wealthiest billionaires... for the third year in a row... The 41-year-old bespectacled tycoon's net worth has doubled to \$US36.4 billion... [His] fortune is second to that of the Sultan of Brunei, but the magazine excludes monarchs and dictators from its annual lists because their wealth derives more from political heritage than economic effort. Those who inherit money rather than actively make or manage it are also excluded. For the record, however, *Forbes* estimates the sultan is worth \$US38 billion, more than [the King of] Saudi Arabia's... \$US20 billion... and the Queen [of Britain], whom it says is worth \$US16 billion when the Royal Collection and crown jewels are counted and \$US350 million without. - 1997

Two months after the above article was published another one stated that the '*Forbes* list of "Technology's Richest 100" for 1997 estimated the Microsoft executive's wealth at \$US38.66 billion', then, a week later, '*Forbes* magazine's list of the 400 richest Americans said his net worth was \$39.8 billion, an increase of \$400 million a week compared to 1996'. While the Microsoft co-founder's wealth – which is 'worth over 10 times NZ's top 200 richest people put together' – appears to be changing rapidly, the official order of the world's richest of the rich has remained relatively unchanged since the beginning of the final decade of the 20th century.

The Queen is the fourth richest person in the world... Her personal wealth has been estimated at \$[NZ]18.9 billion. Only the Sultan of Brunei \$43.8 billion[or approximately \$US26 billion at the time), the] King... of Saudi Arabia \$31.5 billion and... [a US] chocolate family \$21.9 billion are said to be better off. The Queen's vast fortune had increased by \$3.84 billion in the past 12 months. - 1989

THE KING REALIZES PAYING TAXES IS DIFFICULT, AND HE WANTS YOU TO KNOW HE FEELS YOUR PAIN... HE KNOWS TIMES ARE HARD AND MONEY IS VERY SHORT... SO THIS YEAR HE WON'T BE TAKING YOUR MONEY... WHAT *WILL* HE BE TAKING?
...YOUR HOME - HAGAR THE HORRIBLE

Kings, after all, are simply anointed robbers.

"It's so nice to be rich and cultured and better than other people." "How true." ... "A toast... here's to all the wealth, fame and fanfare that goes with royalty."

The Firm, as the royal family is known to many, is thinking of privatising... The financial restructuring of the crown is one of a series of "modernising" changes which, it emerged this week, is being considered by a hitherto unknown body calling itself the Way Forward Group. The group is really the unofficial royal board of directors: the Queen, her immediate family and her senior advisers... The total cost of maintaining the royal family is about £55 million... a year. This comes from various sources: the Queen's private assets, various Government departments... and the Civil List, an annual parliamentary vote of taxpayers' money, this year totalling £8.9 million... The idea... is that the family would give up all taxpayers' money, but instead take back the revenue from the Crown Estate... The Crown Estate is huge, ranging from Scottish moorland to some of London's most prime real estate, such as Regent Street. Since 1710, revenue from the estate has gone to Treasury. This year... the assets are worth more than £2.2 billion and earned £94.6 million. Even taxed at the top rate, the exchange looks a good deal for the family. So good, some observers say, that there's no way the Treasury would agree... There's a difference of opinion over abolishing the Civil List. Some don't like losing Parliament's only real opportunity to scrutinise royal finances. - 1996

The Queen is to open her account books for the first time for members of Parliament to see how she spends the £20.4 million... she receives from public funds... By opening her books, the monarch wanted to show that the royal family is not making a profit on taxpayers' money, and is not exempt from payment of local taxes and home repair costs... the *Times* reported yesterday.

...After picking up between \$[NZ]36 million to \$48 million in her divorce settlement and benefiting from her father's estate when he died... PRINCESS Diana... now... shares the 916th richest spot... according to a new survey of Britain's 1000 richest people... which describes itself as "the definitive guide to Britain's wealth." [Her former husband, the] Prince of Wales does not make the list because most of his wealth is counted under his mother. "He will pick up quite a considerable amount of wealth from the Queen... [but] will not really control much until he becomes king," said a spokesman... His personal wealth amounted to \$11.7 million last year... Top of the list is [a] financier... on \$7.22 billion... The list features 16 other billionaires... - 1997

The Queen is set to join Britain's growing band of dot.com millionaires only four months after investing £100,000... in an internet company. The *Sunday Telegraph* says her shares in getmapping.com may be worth £1.2 million when the company, which is producing an aerial map of Britain, floats next month... Meanwhile, Britain's super-rich are getting richer, according to a list... published by the *Sunday Times*. The collective wealth of the top 1000 has reached almost £146 billion, up 27[%]...

At 27, he's worth £600m, he's single and on every girl's shopping list - TOP TEN BACHELORS

He's got fame and fortune. She'll do almost anything for money. Together they're the perfect couple. - Pretty Woman

...for the love of money a woman will sell her precious body...

What is that song now? ...money can't buy me love... trouble is it can. Money can buy you anything, anything you like... love, respect, loyalty...

It is said that for money you can have everything, but you cannot. You can buy food, but not appetite; medicine, but not health; knowledge, but not wisdom; glitter, but not beauty; fun, but not joy; acquaintances, but not friends; leisure, but not peace.

A man who feels unattractive and unlovable may feel that beautiful women would find him desirable if he were rich. But if he becomes rich and women do flock to him, he is likely to feel they are really attracted to his money and not to him.

HAVE you seen today's *National Enquirer*?" [asks the New York billionaire]... "Well, I just happen to have one here. Wanna take a look?" He bounces round his vast desk and slaps the magazine down in front of me... [then] jabs his finger at a double-page feature, [The New York Billionaire] And His Women... He is proud of his conquests and the[property] tycoon does not tire of telling how the world's most beautiful women are falling at his feet... There are lots of photographs of him with various beauties... Beneath the pictures is the "amazing story of how even if... [he] was not a billionaire thousands of women would *still* fancy him!" ..."Gosh," I say to him. "Have you read this?" ...[I show him the article about how t]he Bank of England has agreed to help the Sultan of Brunei to locate... [an estimated \$NZ]43 billion... of state funds that are thought to have disappeared when his brother... was finance minister.

...For sale: trove of 10,000 items ranging from priceless jewels to unused... hardwood toilet seats. Current owner forced to sell due to family dispute over £500,000-a-day... spending habit... They are the assets of the Prince's company Amedeo Development, which [has]collapsed... with debts of £4 billion. The world's most exclusive garage sale, worth an estimated £2 billion... was forced by a falling-out between [the]Prince... and his brother, the Sultan of Brunei, until recently the richest man in the world. An international lawsuit was launched... by the Sultan against his brother for allegedly embezzling up to £2 billion from the oil-rich state's coffers and squandering around £28 billion.

...Four or five N[Z]ers have been barred from leaving Brunei after being caught up in a billion-dollar feud involving alleged embezzlement from the Sultan of Brunei. They are part of a group of 13 foreigners, including British and Australian citizens, who have been told not to leave while "visa irregularities" are investigated. The group all work for a company called Global Evergreen that was set up by the Brunei Government to investigate the alleged disappearance of \$31.2 billion from the Sultan, one of the world's richest men. The [NZ]Ministry of Foreign Affairs and Trade... told the *Herald* that... [a]ll of the N[Z]ers were employed by the company, which had been engaged to investigate problems caused by the collapse of the Amedeo Group, which belonged to... a brother of the Sultan.

...The youngest brother of the Sultan of Brunei allegedly paid £21m for £5m worth of flats over the old Playboy club. The Prince allegedly laid out the money so he could keep his hoard of prostitutes secreted away from the public eye. Other revelations... include... stories of huge sex parties where [the Prince] would fly 50 high-class prostitutes to Brunei from Europe. He was also alleged to have given the girls lavish gifts like jewel-encrusted watches and erotic pens fashioned from white gold.

Lawyers for the Sultan of Brunei and his brothers argued yesterday that they were protected by sovereign immunity from a lawsuit filed by six women accusing them of sexual coercion... [A] 26-year-old... University graduate, claims she and six other women were tricked into going to Brunei last year for what they were told were modelling jobs. When they arrived their passports and airline tickets were confiscated and they were tested for sexually transmitted diseases. They were expected to engage in sex acts and act like prostitutes for a group of wealthy, influential men. [The 26-year-old] said she was held captive for 32 days.

...The latest adventures of N[Z]'s warrior princess include catching the eye of one of the world's richest men. It seems [a New York]billionaire... wants to add [the]actress... to his many acquisitions. The 51-year-old property investor, worth a cool \$2.5 billion, propositioned the star... But the twice-married [billionaire] was rebuffed and took his brush-off like a gentleman... said... [the] 29-year-old Aucklander, acclaimed as a feminist icon by *Ms* magazine... She... [is already engaged to the] American... executive producer of... [her] hit show... - 1997

[An American s]upermodel... says she was once offered \$8 million to sleep with an Arab sheik... [The American supermole says] she turned it down.

When she was a heart-stopping beauty of 19, billionaire Howard Hughes offered [her] one million dollars to marry him and the deal was she wouldn't have to sleep with him... [S]he refused... Love was more important she told a friend... When her third husband... was killed in a plane crash... [the widowed actress – who 'is to voice an animated character in the new series, *God, The Devil And Bob*, playing God's girlfriend' –] went after... the husband of her best friend... Less than three years later, while filming *Cleopatra in Rome*, [she started an affair]... with her Mark Antony, a little-known actor... It was an affair that would end her [4th] marriage... and begin... [a 5th. Eventually, however, Mark Antony's] two-fisted drinking caught up with him – he died broke at 58... [He] told... he'd spent about thirty million dollars on her...

It seems you're never too old to learn from your mistakes. The eight-times-married [former Cleopatra – who is 'estimated to be worth \$575m' –]is now adamant you'll never see her walking down the aisle again... "Marriage can be a very selfish institution..." - 1997

If marriage is potentially *a very selfish institution*, surely the institution which permits the existence of billionaires is that way permanently?

I have so much money that I don't have to think about it.

...more more more more money more more more more everything more things than you have time for... than you can use...

The desire to accumulate extreme wealth is irrational. Beyond a certain point, added wealth cannot increase the opulence of one's style of living or increase one's happiness... Howard Hughes made more than a billion dollars in his life-time and J. Paul Getty made several billion... If one spent a thousand dollars an hour, twenty-four hours a day, three hundred and sixty-five days a year, it would take over a hundred years to get rid of a billion dollars. What is the drive that made them continue to pursue money when they already had more than they could ever count, let alone spend? Surely not happiness, since both of them apparently became more and more unhappy as their wealth increased... Hughes... became more aloof and suspicious, and it would seem that his wealth created an ever-increasing barrier between himself and other people... [A]s one accumulates more and more money, the money controls the person rather than vice versa. The wealthy person may easily become chained by money and possessions and thus lose the freedom to function independently... [A]ffluence is perceived as limitless and such a superabundance of money eliminates any need for control or conservation... The fallacy of trying to achieve happiness through money has been expressed as well by Benjamin Franklin as by anyone. "Money," he observed, "never made a man happy yet nor will it. There is nothing in its nature to produce happiness. The more a man has, the more he wants. Instead of its filling a vacuum, it makes one." ...The relationship between money and happiness has been debated for centuries. Phrases like, "The best things in life are free," "Money can't buy happiness,"... have been bantered about for so long and so often that they have all but been accepted as true. Recent evidence, however, indicates they may contain more myth than reality. For example... the Global Survey on Human Needs and Satisfaction "...hoped that somewhere in the world a nation would be found whose people are poor but happy. We didn't find such a place." ...The studies... do not show that money actually *buys* happiness, although they suggest that the lack of money may in many cases contribute to unhappiness. People whose needs are unfulfilled, whether due to lack of money or anything else, are going to be dissatisfied. Within certain limits, it is also likely that most people are happier with money than without it... Most people express a desire for both money and happiness... Of the two, money is probably easier to come by... since there are no truly happy neurotics, but there are rich ones! ...There is no evidence, however, which indicates that, beyond a certain level, happiness increases proportionately to an increase in wealth... [One millionaire] claimed the happiest day of his life was when he turned his back on his Rolls-Royce and his Bel Air mansion and drove off into the sunset in a Volkswagen.

Despite the apparent unhappiness of the world's richest, most young people still seem to associate happiness with money.

In a study by... San Francisco State College... students were asked to ascribe personality characteristics to a hypothetical man. Half of the subjects were told the man was poor, the other half that he was rich. In every other respect the man was described identically to the two groups. "The average ratings attributed to the rich man were vastly superior to those projected on the poor man... the hypothetical rich man was seen as relatively healthy, happy, and well-adjusted, while the hypothetical poor man was seen as maladjusted and unhappy."

In fairy tales like *Cinderella* and *Sleeping Beauty*, the ending, "And they lived happily ever after," implies not only that the happy couple are deeply in love but also very wealthy... Like the king, the person with money is endowed with great power. By waving a handful of money in the air, an otherwise insignificant man can command others to wait on him and to satisfy his every need and whim – shine his shoes, clean his clothes, pour his wine. In short, to treat him like a king.

It isn't hard to understand why most people would associate being treated *like a king* with happiness. However, it should be hard to understand why anyone would associate wealth with being wise!

If I were a rich man... I... Wouldn't have to work hard... The most important men in town will come to fawn on me. They will ask me to advise them, like a Solomon, the wise... And it won't make one bit of difference if I answer right or wrong. When you're rich they think you really know.

The "How to turn a dollar into two" seminar... (or one million into two million.) - wealthy & wise

If you ever wanted to be rich, successful or influential, then we suggest you pay attention... They didn't get where they are today by sleeping in...early to bed and early to rise makes a man healthy, wealthy and wise.

Make money; if you can, make money honestly; if not, by whatever means you can...

Is it wrong to cheat in order to win a million dollar[s]...?

To have money is to be virtuous, honest, beautiful, and witty. And to be without money is to be ugly and boring and stupid and useless.

I found that money was like a sixth sense without which you could not make the most of the other five.

Money is power. Every good man and woman ought to strive for power... I say, get rich, get rich!

When travelling on life's rich journey, it's not always possible to anticipate the troubles that lie ahead. Best then that you travel in a Range Rover. The four wheel drive that is synonymous with luxury and refinement. A vehicle with which power and respectability are standard features.

Is there an instinctual drive to amass wealth? There appears to be no possible doubt about this... [I]ndeed, a person in whom it is completely lacking will in our society be considered abnormal.

In 1802, looking in satisfaction on the ascendance of Britain, then in the vanguard of the industrial revolution, Sir Humphry Davy astutely observed: "The unequal division of property and labour, the difference of rank and condition amongst Mankind, are the sources of power in civilized life, its moving causes and even its very soul."

The development of money is, therefore, a part of the evolution of human society comparable in importance with the domestication of animals, the cultivation of land, and the harnessing of power. - A History of Money

Money, wrote the socialist playwright Bernard Shaw, is "the most important thing in the world; and all sound and successful personal and national morality should have this fact for a basis."

"The universal regard for money is the one hopeful fact in our civilization... [T]he two things (money and life) are inseparable: money is the counter that enables life to be distributed socially: it is life..." What is here described as civilization, then, is the stage of a Culture at which tradition and personality have lost their immediate effectiveness, and every idea, to be actualized, has to be put into terms of money... For it will become manifest that, from this moment on, all great conflicts of world-outlook, of politics, of art, of science, of feeling, will be under the influence of the same contrary factor. What is the hallmark of a politic of Civilization today, in contrast to a politic of Culture yesterday? It is, for the Classical rhetoric, and for the Western journalism, both serving that abstract which represents the power of Civilization – *money*. - The Decline of the West

It is the nature of privilege and tyranny to be unconscious of themselves, and to protest, when challenged, that their horns and hooves are not dangerous, as in the past, but useful and handsome decorations, which no self-respecting society would dream of dispensing with. But they are the enemies, nevertheless, both of individual culture and of social amenity. They create a spirit of domination and servility, which produces callousness in those who profit by them, and resentment in those who do not, and suspicion and contention in both... A nation is not civilized because a handful of its members are successful in acquiring large sums of money and in persuading their fellows that a catastrophe will occur if they do not acquire it, any more than Dahomey was civilized because its king had a golden stool and an army of slaves, or Judea because Solomon possessed a thousand wives and imported apes and peacocks, and surrounded the worship of Moloch and Ashtaroah with an impressive ritual. What matters to a society is less what it owns than what it is and how it uses its possessions. It is civilized in so far as its conduct is guided by a just appreciation of spiritual ends, in so far as it uses its material resources to promote the dignity and refinement of the individual human beings who compose it. Violent contrasts of wealth and power, and an indiscriminating devotion to institutions by which such contrasts are maintained and heightened, do not promote the attainment of such ends, but thwart it. They are therefore, a mark, not of civilization, but of barbarism, like the gold rings in the noses of savage monarchs, or the diamonds on their wives and the chains on their slaves. Since it is obviously such contrasts which determine the grounds upon which social struggles take place, and marshal the combatants who engage in them, they are a malady to be cured and a problem which demands solution.

There is much that kindles our anger. How could it be otherwise: the brutalization of nature, the destruction of human community, the squalor of public life, the often excruciating loneliness of personal life. And most of all, the lost opportunities that could turn life on our planet from its present stark prospect of destruction into one of beauty, joy, truth, and love. We have been told by the powers-that-be and by their paid scribes that these things are not for people, surely not ordinary people... We have to "prove" that we are good enough by enduring pain and privation and fear – which they generously make available to us – so that we can achieve the good life, the good life being riches and power (their kind) and fame. But even then, not for all, for only a few can get that far. That is their vision of life. It is a rotten vision.

Thus far the argument here has been that the character traits engendered by our socioeconomic system, i.e., by our way of living, are pathogenic and eventually produce a sick person and, thus, a sick society. - TO HAVE OR TO BE?

...obsession with money, as witness the long and unhappy life of Howard Hughes, reduces a man to the gibbering sycophancy of a frightened ape.

Within the span of a few centuries the focus of interest shifted from the inner world to the outer world... All but one of the (seven deadly) sins, sloth, was transformed into a positive virtue. Greed, avarice, envy, gluttony, luxury, and pride were the driving forces of the new economy... Unbounded power was harnessed to equally unbounded appetites.

Money, perhaps more than any other cultural reality, typifies our distressed condition, in that money *is* power, the power to convert fantasy into fact, wish into fulfilment, and money has become nothing but power; we have expunged every other meaning, extinguishing their bright radiance with pudgy fingers that prefer the dark. We stand in desperate need of a memorial to money, a testament that treasures its marvellous past, a past dismissed by modern economics because... we cannot deliver the earth's wealth as a legacy to our children, having consumed and squandered it within the space of a few short generations... - Money and the Soul of the World

In Hong Kong... your life or death depends on the size of your wedge... Show us your money, you've got a life... If life was as simple as that I would have died years ago.

Money's not the only thing that makes the world go round.

IF "IT'S A MAD WORLD. MAD AS BEDLAM," AS CHARLES DICKENS wrote, at least part of that madness has to do with money... [Y]et to many it is the most prized possession in the world... To most people... the lure of money seems to be a natural phenomenon... They have become so indoctrinated with the idea that having money is important, that they no longer question why... Despite evidence everywhere to the contrary, millions of people seem to think that money is the panacea that will solve most of their problems. And if a little bit of money doesn't do the trick, they consider that more money will... While they may not be aware of what it is they truly want from life, they feel sure that money will provide it for them... [as] lack of money is perceived to be the basis of all their troubles... "[Psychiatric patients] show far less resistance in relating hatred for their parents or in disclosing sexual perversities than in discussing their money status or transactions. It is as if they equated money with their inmost being." *...the same liberated couple that casually goes to bed on the first date might feel extremely uncomfortable talking about dividing expenses for dinner or the movie they attend...* Secrecy about money matters leads to many kinds of confused and neurotic interactions between people... Hypocrisy about money is therefore inevitable... You may wonder why you spend money freely on luxuries and resist buying tomatoes because they are three cents a pound higher than they were the day before... "Crazy" money habits and money neuroses rarely disappear with age... ['HERE'S a simple question: would you mow your own lawn to save the \$25 you might pay someone else to do it? Now, a second question: would you mow your neighbour's lawn for \$25? If you answered yes to the first question (and most people do) and no to the second question (again, most people do), then you have violated a simple premise of prevailing economic theory, which assumes human beings are self-interested and will do what is economically rational. But, as everyone knows – everyone except economists, that is – human behaviour does not conform to immutable laws.'] The magic of money is such that few people react to it with logic or reason... The magical power of money has multiplied over the last twenty-five hundred to three thousand years. As more and more people have come under its spell, the quality and quantity of its magic have increased. The myths and rituals have become more complex, and the money priesthood has expanded to include bankers, legislators, accountants, lawyers, stockbrokers, economists, and financiers... Many of the meanings associated with money are symbolic and closely intertwined with other needs and values. If having money makes a person feel important or superior, it has more impact on the person's life than if its only value is in the goods it will buy. For many persons, money is a status symbol. One of the benefits of having money in our society is that it raises one's value in the eyes of many people... The bank manager is likely to fawn over the large depositor and ignore the person with a small savings account... Conspicuous consumption – whether it be of clothes, jewelry, automobiles, furnishings for the home, or food and drink – is an attempt to flaunt one's wealth in the face of others as a means of trying to prove one's superiority. Oddly enough, it is sometimes successful... It matters little whether money is obtained through hard work, inheritance, fraud or corruption, or a lucky ticket on the Irish Sweepstakes. When it comes to status, the question is not how, but how much... To some people, money means power. It is... used to buy importance, domination, control. The need for power is a compelling drive. It is usually associated with aggressiveness and a determination to win at all costs. It is often the key ingredient in "greatness." Politicians, generals, labor leaders, and business executives are usually driven by a need for power... Being able to control other people like puppets makes [them] feel powerful by comparison and assuages the fear of being helpless and frustrated themselves... The equation of money with power can be traced back to ancient times... *Power-oriented people never get enough power and they never get enough money. Like many who have never had enough to eat, they become greedy...* Studies of self-made wealthy men... show an extremely high incidence of parental death and parental divorce, which resulted in a high degree of insecurity early in life. Many of these men, as young boys, apparently set out to amass so much money that they would never be left stranded again... Compulsive savers [believe]... that "Time is money." And time not spent in making money is time wasted... They engage in a chronic, continuous struggle against circumstances, against others, and against themselves. They don't know how to relax and enjoy life... The more money they acquire, the more they worry about losing it. And the more they worry about it, the less they are able to enjoy it... Focusing their attention almost exclusively on finances makes these people dull and boring. They... are not much fun to be around. They are rarely at ease with other people, partly because they are suspicious that others are trying to do them out of their money... Some skimp on nourishment and neglect their personal health because of the cost... For the compulsive saver, good health is less important than money... They are so busy *getting the things worth having* that they don't have time to *become the things worth being*... While some people become rich because of their greed, more are destined to remain poor... because of it. The lure of instant riches is an opiate that dulls reasoning and common sense... Billions of dollars change hands every year because dishonest salesmen appeal to the greed and gullibility of millions of people who eagerly hand over their money in the hope of "turning an easy buck." - Money Madness

...I have shown the dumb dumbs the perils of greed.

I think only a dumb person would think money makes them smart.

It is unfair to use the word DUMB in the above context because doing so includes people who are simply 'unable to speak' as targets of criticism. The word UNINTELLIGENT is much more appropriate.

A successful assault on the strongholds of capitalism demands a prolonged effort of intelligence and resolution.

Making money is an intellectual pursuit... One does not have to be superintelligent to make money, but... it is necessary to be knowledgeable. Ignorance is not bliss when it comes to making money.

Ignorance is not bliss when it comes to identifying INTELLIGENCE either. For this reason, people try to measure intelligence – with intelligence quotients (IQs) being the most common method.

PRETTY women and handsome men have more in common than mere beauty. They are more likely to have higher IQs, according to scientists who have linked intelligence with beauty.

The majority of *pretty women and handsome men* probably received a lot more attention as children (e.g., from peers and teachers) and, therefore, developed a greater amount of self-confidence, which caused them to perform better in IQ tests! If the scientists are correct, wealthy people would also be expected to have higher IQs because, generally, having more money increases self-confidence (although some wealthy people don't exercise their own brain, which could tend to cause a degree of mental retardation).

If the notion that pretty women are intelligent is combined with a previous suggestion that pretty women like wealth (refer to page 17, line 42), it follows that people with high IQs should either be wealthy or aspire to become so – although one 'American who is said to have an IQ that is too high to measure, works in a low-paid, unskilled position'. However, even if a link between intelligence and wealth can be proven, it won't disprove the notion that wealth and wisdom don't mix (r:p14, lns29-30; p18, lns68-9) – because having a high IQ isn't the same thing as being wise!

A... GORGEOUS supermodel [(r:p18, lns16)]... whom American teenage girls want to run for president... adores the attention that comes with being beautiful, smart and famous... She has... bought... a charming, four-bedroom, Spanish-style house... for \$1.8 million in Brentwood, one of Hollywood's smartest areas... The budding actress, with a genius level IQ of 165... has built upon her natural talent to manage her \$7-million-a-year... conglomerate... [and] regards herself as more of a spokeswoman now... "A woman's face is her armour... If you wear the right amount of make-up you can survive anything..." says the woman who once remarked she "doesn't think make-up is rocket science or a cure for cancer"... However[, just]... when we were about to give [her] the heady title of thinking man's supermodel, she reveals the reason she has not married... her baby's dad... yet is because her numerologist told her not to walk down the aisle until November, which is her lucky month... "Nothing in my life has come by chance,"... says the woman who... [at] 16... had been a straight-A pupil... until a local photographer foresaw her potential.

I NEVER had to study too hard to pass most exams at school or university. I had a good memory for facts which generally counterbalanced the long nights of drinking and gossiping that university life entails. Which is not to say I am a genius. While I can pick out a tune or phrase of language fairly easily, I cannot read a road map... fill out a tax form with any success and find it almost impossible to figure out the time in another country when making an international call, despite having all the information at hand. Armed with the knowledge of my smarts and my idiocies, I was eager to see how I might fare in an intelligence test administered by Mensa N[Z], a regional branch of the... international society aimed at "identifying and fostering human intelligence for the benefit of humanity..." – all in a determinedly non-political, religious or racial way. The organisation has only one qualification for membership: a score in the top 2[%] of the population on a standardised intelligence test... My score was 93[%] – an IQ of 135 – meaning I missed out by 5[%] on joining Mensa... Intelligence testing is controversial, as is the exact nature of intelligence, but to test for it, you can't swot and you can't memorise answers. There are more than 100 different intelligence tests in the world and all experts have a different definition of genius, or even intelligence. Generally they agree that high intelligence means a better capacity to reason, process information and solve problems, or to combine seemingly unrelated facts to form new ideas...

There's high IQ and there's common sense... I would not want to suggest that a member of the international high-IQ society Mensa might be less than intelligent. So let me tell you a story instead... We had received, earlier in the week, a press release soliciting publicity about this weekend's annual gathering of the group whose sole membership requirement is a score in the top 2[%] of a recognised intelligence test. I'd left a message at the number included and a woman rang back yesterday... I told her I was interested in the group's conference and wondered if any of the members might have an interesting yarn to tell – might offer, in short, what we journalists call an "angle." ... "I'm not sure that we want our organisation to be written about from an angle," she said... enunciating the last word as though it were the name of a contagious disease. I tried to explain that a story beginning "Mensa N[Z] is holding its 1997 national gathering..." would be less likely to make the paper than one about a member with an unusual background. "Say," I stammered, casting about for an illustrative example, "you had a member who had failed School Certificate." "Oh, there wouldn't be anyone like that," she said. I grasped the edge of my desk to steady myself and wondered whether any of these recognised intelligence tests included questions calling for lateral thinking. "I am sure there wouldn't be... But if there were, *that* would be an angle." She said she'd think it over and call me back. As yet there has been no word. But a colleague who took one look at the press release went to the heart of the matter. "It says here they're having a car rally on the Saturday," he said. "Maybe we could follow them and see how many get lost." ... [Another] story came to mind... The... mechanic... [of] the Russian-born American biochemist and science fiction writer... who was... by any reckoning one of the century's most brilliant minds... put to him one of those posers which, to our chagrin, we all occasionally fall for... "I've tried that one on everybody who's come in today," said the mechanic, "But I knew for sure that I'd get you – because you're so damn smart."

"Quit butting in, please. Your IQ is a mere 155 while mine is a muscular 170! I am... much smarter than you..." "You should all do as I say. My IQ is 199..." "Big deal. My IQ is 280." "[That must make you t]he world's smartest man."

The size of the brain is not necessarily related to intelligence... Intelligence... tests are intended to assess the level of intellectual functioning of the respondent, in order to locate mental defectives, to assign students to appropriate levels in school, and to aid in selection of persons for certain jobs. The Army Alpha (developed in W[W]I), the... Wechsler-Bellevue... and the... Stanford-Binet... are widely used intelligence tests.

Believing that bright or dull schoolchildren were simply advanced or retarded in their mental growth, Binet devised a 'mental-age' scale which described a student's performance in relation to the average performance of students of the same physical age.

...a test was considered to measure mental ability at a specific age if two thirds to three quarters of children that age could pass it.

Intelligence tests have provoked a great deal of controversy about what kinds of mental abilities constitute intelligence and whether the IQ adequately represents these abilities, with debate centring on cultural bias in test construction and standardization procedures... On the theoretical assumption of a normal distribution for intelligence, tests designed for its measurement have been constructed in such a way that IQ scores will approximate the normal distribution. Thus, with the mean IQ arbitrarily set at 100 and the standard deviation at 15, about 50 percent of the world's population should have IQ scores between 90 and 110. About 68 percent of all people are expected to have scores between 85 and 115 (one standard deviation above and below the mean). Another 14 percent should score between 70 and 84, with an equal number scoring between 116 and 130. Only 2 percent are expected to obtain scores below 70, with another 2 percent earning higher scores than 130. In practice, however, the

distributions derived from large samples of individuals do not conform to these expectations. The theoretical distribution rests partially on the assumption that the level of general intelligence attained by any individual is genetically determined (has a hereditary basis). There is a growing body of evidence that this is not wholly the case; e.g., one's experiences after birth (indeed, into adult life) appear to play a large part in determining one's eventual intellectual status, especially when intelligence is represented by a single global score such as IQ.

It has been common to associate certain levels of IQ with labels. For example, at the upper end, the label "gifted" is sometimes assigned to people with IQs over a certain point, such as 130... Labeling schemes like these, however, have pitfalls and are in some ways dangerous. First, the labels assume that conventional intelligence tests provide sufficient information to classify someone as either gifted, on the one hand, or mentally retarded, on the other. But most authorities would agree that this assumption is almost certainly false. Conventional intelligence tests are useful in providing information about some people some of the time, but the information they provide is about a fairly narrow range of abilities... Most psychologists and other authorities recognize that social as well as strictly intellectual skills are important in classifying a person... Second, giftedness is generally recognized as more than just a degree of intelligence, even broadly defined... To measure giftedness merely in terms of a single test score would be... a trivialization of the concept... Third, a given test score can mean different things to different people. An IQ score for a person who has grown up in a ghetto home and gone to an inadequate school does not have the same meaning as the same IQ score for someone who has grown up in an upper-middle-class suburban environment and gone to a well-endowed school. An IQ score also does not mean the same thing for a person whose first language is not English but who takes a test in English, as it does for a native English-speaker. Another factor is that some people are "test-anxious" and may do poorly on almost any standardized test. Based on these and similar drawbacks, it has come to be believed generally that scores have to be interpreted carefully on an individual basis. Psychologists now believe that IQ represents only a part of intelligence, and intelligence is only one factor in both retardation and giftedness. Earlier rigid concepts in the field of intelligence measurement, which led to labeling, have had undesirable effects. The growth of a more recent concept, the malleability of intelligence, has also served to discredit labeling.

DO HEREDITY and environment have an influence on intellectual development? French researchers... have analysed the IQs of 38 adopted children, and the social level of the adoptive and natural parents. Their first observation is no surprise: ...the... average IQ was 111.60 for children with adoptive parents from upwardly mobile social groups, and 99.95 for those with parents having no professional qualifications. But whatever the child's environment, biological origin will affect intellectual performance. Children born to students or executives had an average IQ of 113.55, whereas those with socially disadvantaged parents had an average of 98.

Although biologists can point to the twenty-first chromosome as the basis of mental retardation in Down syndrome, they can't tell us why one normally developing child has an IQ of 90 and his sibling has an IQ of 150... Many will confess their own IQ at the slightest provocation, and many who do not know their IQ often wish they did. IQ is a term that is widely used and often misconstrued by a great many people. It is frequently regarded as some kind of innate, fixed endowment, like a baritone voice, big ears, or "your father's family's nose." It sometimes comes as a shock to find that IQs vary over age, can be modified by experience, and depend to some extent on which test is being administered and under what circumstances. - CHILD PSYCHOLOGY A CONTEMPORARY VIEWPOINT Third Edition

ON THE face of it, members of the younger generation, given over to video parlours, junk food, meaningless Internet chat groups, and listening to banal trance music, might be... considered to be intellectually inferior to their forbears... One might think so, and one might be right. But much of the talk of today's dumbing down of popular culture has overlooked one crucial sign: Each new generation is getting better at IQ tests. In every one of 20 countries for which there are data, today's young test-takers are outshining – often by stunning margins – their predecessors. The implications of these findings, which scholars are only now waking up to... [– 13] years after... a maverick seeker of IQ data from Otago University... first published... his findings... in *Psychological Bulletin* [–] ...have left intelligence experts perplexed. Yet few doubt their importance.

...For researchers trying to understand how much of someone's... IQ is the result of genes – and how much is the result of parental influence and everything else from the outside world – identical twins separated at birth are more valuable than an unrestricted grant. Identical twins have 100[%] of their genes in common. Separated at infancy, usually through adoption, they are assumed to have 0[%] of their environment in common. But American researchers... [at] the University of Pittsburgh... have... reported on an experiment that suggests that the "no shared environment" assumption is flawed. Twins who have never been in the same place since they popped into the delivery room did share the womb, argue the scientists... Now the Pittsburgh team has re-analysed 212 studies of IQ and genetic inheritance spanning 70 years. The... effect of the uterine environment accounts for 20[%] of the IQ similarities between twins and 5[%] of the similarities between other siblings. - 1997

Intelligence tests are also carried out on other animals but these have sometimes proven to give false results.

Gibbons are often said to be the least intelligent of apes, but recent tests have shown that they may be as intelligent as chimpanzees. The reason for the gibbons' supposed lack of intelligence was that they were not so adept at problem-solving tests as other apes... Gibbons were apparently unable to solve these problems, but it seems that they were unfairly set... [During the tests, f]ood such as a banana is placed out of reach beyond the bars of the apes' cage. A piece of string is tied to the banana and led to the bars... The strings ran along the ground and gibbons had difficulty grasping them. If, however, the strings are raised, the gibbons, being adapted for hanging on to branches or vines, could take hold of them. This is a point of great importance in designing tests of an animal's intelligence. It has to be able to carry out the necessary movements. For example, it would be no good expecting a dog to pull a suspended string with its paws. Using the improved tests it was found that gibbons could solve the problems as well as other apes... Gorillas are at least as intelligent as chimpanzees, less volatile in temperament and more patient and methodical. This stands them in good stead in the performance of intelligence tests, but they tend not to do well in tests involving manipulation. This makes sense, as they do not make use of natural objects as 'tools' in the wild as chimpanzees do.

Tool using always used to be considered a hall-mark of the human species... [N]ow we have to redefine man, redefine tool or include chimpanzees with human.

Intelligence is exhibited in the way a creature presents itself behaviourally, mentally and – when possible – orally. A plant can grow but can't think, so doesn't know it exists. An insect has a brain but is driven by instinct. Most animals, including young humans, have a limited ability to plan specific actions, which derive from instinct, and can be taught to perform various tasks by punishing or rewarding them – but few, if any, would understand the significance of those tasks (i.e., why they were taught; why they were punished).

Animal intelligence Most, if not all, animals can learn. Even an earthworm can be taught to avoid electric shocks... [I]ntelligence, or learned behaviour, in addition to instinct, is present in lower animals as well as man... All of the physical characteristics of man show that he is an animal. He has gone through many stages of development as other animals have done. The animals most like man are the *anthropoid* (meaning “like man”) apes. But even these apes do not have what man does – the abilities to think, reason, believe, and choose a course of action at will. These abilities... separate *human beings* from all other forms of life.

The chief food of earthworms is decaying plant matter although they sometimes eat small dead animals, such as other worms, and droppings. Some food is taken in with soil swallowed in burrowing, but vegetation lying on the ground near the mouth of the burrow is also important... Charles Darwin... showed that leaves, pine needles and even paper would be drawn in and used to line the upper parts of the burrows. In spite of the fact that worms are blind, the leaves and paper triangles with which he experimented were usually drawn in by their pointed ends. Clearly it is easier to draw in a leaf by the tip than by the edge, and Darwin reasoned that this behaviour showed rudimentary intelligence. Several biologists have since looked into this and it seems clear now that leaves are pulled down in the way which is mechanically most efficient, that is, by the tips. The worms reach from their burrows, grasp leaves at random, and pull. If the leaves meet with resistance they let go and try again. Success comes when they happen to grasp the tip of the leaf, and so they do this largely by simple trial-and-error and not by intelligent action. There is, however, more to it than this, for worms respond to some of the chemicals in the vegetable matter, showing a preference for the chemicals of the leaf tips rather than those of the bases and stalks.

...At one time the flea circus was a familiar item of entertainment in country fairs... It was customary for the proprietor of one of these circuses to keep human fleas and feed them on his own arm. A large part of his skill lay in constructing tiny devices such as tricycles and ‘chariots’ which could be propelled by fleas attached to them in such a way that the crawling of the insect caused them to move. Another very delicate operation was the tethering or harnessing of the fleas with very fine gold or silver wire. There was never any question of the fleas being taught or trained in any way, though of course this was always claimed as part of his expertise by their owner. Advantage was simply taken of the natural movements of the insect when restrained in various ways.

...Reports of army ants on the march, the regular columns, the division into ‘rank and file’ with ‘officer’ types flanking the main body have frequently led the more romantic writers into crediting ants with far greater intelligence than they really deserve. In fact, the apparent regulated orderliness and ‘intelligence’ displayed by army ants are the result of pure instinct – the fixed behaviour patterns they have evolved. The vast majority of the column are blind and are governed by an instinct merely to follow the ant in front, the column being guided by the soldier ants who precede the main column laying down scent trails. Yet even they are hardly seeking a path. Although best fitted to act as scouts and skirmishers, by reason of their size and armour, they take up their flanking positions merely because, being giants compared with the smaller workers, they are unable to find a footing amid the close-knit ranks of their brethren. So it is a case of the blind leading the blind. Food is found by smell, and if there are any obstacles to the line of march, the ants have to search blindly for a way round. If a circular obstacle is placed in the centre of a colony of army ants, they will troop endlessly around it... In Panama a column once became separated from the main army, described a circle by accidentally latching onto the end of its own column, and kept on marching round until the ants became weaker and weaker and eventually died.

...A 16th century antidote to poisoning was to drink the broth from donkey’s bones bruised and steeped in water. Doubtless this would produce the necessary vomiting. It was also held to be an antidote to scorpion poison. There was even the belief that anyone stung by a scorpion had only to look into a donkey’s ear to be cured – and we say a donkey is stupid!

...Whether called ass, donkey or mule, the animal is usually linked in our minds with stupidity. Many stories could be told to counter this... ‘One of our donkeys which had been severely beaten for misconduct by a member of our party, never forgot the circumstances, but, while ready to sniff and caress any of the others, would stand demurely whenever his old enemy was near, as if unconscious of his presence, until he was within reach of his heels, when a sharp sudden kick, with a look of more than ordinary asinine stolidity, was the certain result.’

...Other attributes of the mule are their intelligence and their proverbial stubbornness. Mules were extensively used by the armies in WWI for driving transport wagons and light artillery. British soldiers who had to handle them spoke of them sardonically as their long-faced friends because, they said, nothing could equal the obstinacy of a mule. If a mule decided not to do something you had almost to wait for the animal to change its mind, because it would not be driven. However, a mule’s obstinacy was not always blind, and there was one occasion when a transport column was moving along a road... when the British army was advancing rapidly on the western front. Suddenly the leading mules stopped... and all the rest followed suit. Their drivers were unable to make them take another step. Then, a hundred yards or so ahead of the transport column, a battery of field guns opened fire. The mules went forward of their own volition as soon as the firing ceased. It transpired that the battery had pulled into position during the night, and was so well camouflaged that the drivers of the mules had no idea of its presence. Yet the mules must have heard the guns being loaded, and had no intention of being under the muzzles of the guns as they went off.

...Before they were hunted bottle-nosed whales were fearless, and very inquisitive. Schools would swim up to boats to investigate them, and could not be driven away, even by firing guns. Now they have become very wary, their acute hearing warns them of approaching danger.

...At sea it has been noticed that bottlenose dolphins will avoid a boat that has been used for hunting them but will not be disturbed by other boats. The assumption is that they can recognize individual boats by the sounds they make.

...There are two basic types of animal behaviour: instinctive and trial and error learning. In addition the higher animals especially show to a varying degree a mental quality which almost defies definition. We call it intelligence... Almost all animal behaviour is instinctive but a few species also show a fair degree of intelligent behaviour... Mammals show more intelligence than any other class of animals, though many of them do not show very much of it. The most intelligent mammals are in the primates, the group which contains... man, the most intelligent animal which has ever lived on earth... The behaviour of the other primates teaches us a lot about our own behaviour. Although we are extremely intelligent we still have plenty of instincts, and the two kinds of behaviour are mixed up in almost everything that we do... We are more intelligent than our closest non-human relations, but the difference is much smaller than we often like to think.

Instincts are what a creature relies on when it doesn’t have time to consider its options – hesitation can mean death in the wilderness! Hesitation can also mean death in a society – but then so can the consequences of rash decision-making or *trial and error learning*.

Most of the species on Earth can be divided into two sets – animals that are SOCIAL or ANTI-SOCIAL. Another term that might be applicable for animals which are anti-social is PREDATORY (‘preying naturally upon others’). Social animals live as a group because instinct tells them this will increase their chances of survival – but, because societies also serve as time-saving systems, social creatures can afford to take time over their decisions (e.g., a hive will ‘consider messages from a number of scouts before deciding where the best flowers are’). Unfortunately, there is always the potential for differences of opinion to arise when two or more animals get together. For this reason, humans have placed a lot of emphasis on being able to recognise intelligence. However, intelligence isn’t something that can clearly be seen (i.e., it isn’t a material object; you can’t cut open a brain, point at something and say, “Look, there’s intelligence!”). Therefore, the first step has been to try defining it with words.

Intelligence is “innate, general cognitive ability”... “the aggregate or global capacity of the individual to act purposefully, to think rationally and to deal effectively with his environment”... “Manifest intelligence is nothing more than an accumulation of learned facts and skills... [I]nnate intellectual potential consists of tendencies to engage in activities conducive to learning, rather than inherited capacities as such”...

intelligence... 1. mental ability, the power of learning; quickness of understanding. 2. information, news; the collection of this, especially for military purposes; persons engaged in such collection[– e.g., the Central Intelligence Agency (CIA)].

A major problem with trying to define intelligence is that humans are limited in their perception of it – intelligence could be as infinite as the universe! Furthermore, because wisdom seems more elusive than intelligence, it should also be safe to assume that wisdom is harder to define than intelligence.

wisdom... quality of being wise: ability to make right use of knowledge... - CHAMBERS EVERYDAY PAPERBACK DICTIONARY

...experience and knowledge together with the power of applying them... - THE OXFORD REFERENCE DICTIONARY

Those two definitions don't show that having a high IQ isn't the same thing as being wise – indeed, both are similar in meaning to the first dictionary definition for INTELLIGENCE (r:ln5). However, the second definition of INTELLIGENCE has little or nothing in common with the meaning of WISDOM!

[There's 2] kinds of habits: habits which are skills or arts, and moral habits – habits of conduct... [U]nlike most of the habits that are skills or arts... it is more difficult to explain how good habits are to be distinguished from bad... [w]ith respect to moral habits... When these are good habits of mind, we call them intellectual virtues. The three that I wish... to consider are habits of insight or understanding, habits of knowing, and habits of sound judgment about ultimate matters, usually called wisdom. The Greek words for the... intellectual virtues are “*nous*,” “*episteme*,”... “*sophia*.”

The need to properly define things was acknowledged by the Ancient Greeks. One thing that they were keen to define was VIRTUE.

It seems to me then... that virtue is, in the words of the poet, ‘to rejoice in the fine and have power’, and I define it as desiring fine things and being able to acquire them. - The Meno, 77B

A *virtue* is ‘a good quality’ (e.g., patience). Therefore, at least by that definition, intelligence (or having a high IQ) is a virtue. Although the same logic can be applied to wisdom, it could also be argued that it takes many virtues to become wise – and, therefore, the more virtues a person has the wiser it must be.

I wanted one virtue and I find that you have a whole swarm of virtues to offer. - The Meno, 72A

If INTELLIGENCE is *one virtue* and WISDOM is *a whole swarm of virtues*, we can say that people are WISE if they know a lot about more than one subject; merely INTELLIGENT if they only know a lot about one subject.

An expert is a person who chooses to be ignorant about many things so that he may know all about one.

Unfortunately, people who only learn about one thing risk becoming detached from what is going on in other spheres of knowledge, which may render their knowledge obsolete or irrelevant – especially to other people. However, while an expert might be able to get away with choosing *to be ignorant about many things*, such a person is unlikely to achieve a high score on an IQ test. For this reason, simply knowing a lot about many subjects doesn't make a person wise – it is the choice of subjects that sets a wise person apart from people who are merely intelligent or unintelligent. Because it is impossible to know everything (the human brain doesn't have the capacity to store every piece of information available to it), wise people concentrate on learning about things that are important to humanity – whereas merely intelligent people tend to learn about things that are trivial or only important to themselves – and means that a wise person can have less information stored inside its head but still be more useful to society than an intelligent person. Ironically, wise people don't aim to set themselves apart from other members of their society, even though they actively seek knowledge that will do so!

Clever men, it has been remarked, are impressed by their difference from their fellows; wise men are conscious of their resemblance to them.

Wise people are better at identifying elementary or essential information than people who are merely intelligent – which means they are also more adept at deleting irrelevant or wrong information (especially when, like a computer, their brains become overloaded) – and are faster at adapting to new ideas.

I believe the research on which I base my conclusions is accurate, true and sound. As I broaden my knowledge, and as new research is unveiled, I will modify those opinions if necessary... Life and growth is change... I don't mind finding out if I'm wrong on something. I hate, however, to be wrong, because I live every principle I espouse.

Wise people aren't too concerned about being wrong when it comes to something trivial but, if unsure about something, they tend to avoid giving an opinion ('it is better to remain silent and be thought a fool than to open one's mouth and remove all doubt') – whereas merely intelligent people usually have an opinion about everything, don't mind sharing them and assume they are always right. Furthermore, merely intelligent people tend to dislike being wrong and take criticism badly – whereas wise people listen to criticism in an attempt to avoid making the same mistakes again; merely intelligent people tend to keep quiet about their mistakes in the hope that no one will find out – whereas wise people are more concerned about ensuring no one else repeats their mistakes; a wise person isn't likely to dwell on the mistakes or stupid statements of others – whereas merely intelligent people may make ‘mountains out of molehills.’

Another difference could be that if there is both a simple and a complicated way to do something, an intelligent person would be expected to choose the latter method in order to challenge itself and impress others – whereas a wise person would choose the simplest method in order to complete the task efficiently and with a minimum of fuss. (Incidentally, a previous quote – r:p9, lns4-7 – split people into three types, which could be labelled UNWISE, INTELLIGENT and WISE, thereby making INTELLIGENCE the equivalent of *average wisdom* – r:p14, lns21-31).

Unfortunately, while it is easy to suggest such differences, they would all have to be called unsubstantiated. A more accurate means of showing how INTELLIGENCE and WISDOM differ is to compare examples of humans who are acknowledged as being one or the other. Perhaps the best example of a highly regarded person who was merely intelligent is Aristotle.

Of the Greeks, Aristotle... had the most sustained influence upon western thought.

...in astronomy, his rejection of the idea of the plurality of planets... more than one in number... was a serious handicap to later thinking.

Many a sincere person will answer me: "Our attitude towards Negroes is the result of unfavourable experiences which we have had by living side by side with Negroes in this country. They are not our equals in intelligence, sense of responsibility, reliability." I am firmly convinced that whoever believes this suffers from a fatal misconception. Your ancestors dragged these black people from their homes by force; and in the white man's quest for wealth and an easy life they have been ruthlessly suppressed and exploited, degraded into slavery. The modern prejudice against Negroes is the result of the desire to maintain this unworthy condition. The ancient Greeks also had slaves. They were not Negroes but white men who had been taken captive in war. There could be no talk of racial differences. And yet Aristotle, one of the great Greek philosophers, declared slaves inferior beings who were justly subdued and deprived of their liberty. It is clear that he was enmeshed in a traditional prejudice from which, despite his extraordinary intellect, he could not free himself. - Einstein

The superior man is concerned with justice, the inferior man with profit. - The Great Philosophers

The features of Aristotle, familiar from busts and engravings, are handsome, indicating refinement and acuteness. An ancient tradition, possibly from an unfriendly source, says, however, that Aristotle had spindleshanks and small eyes and spoke with a lisp. In compensation for these physical defects, he was notably well dressed. His cloak and sandals were of the best quality, and he sported rings. Presumably, he was rich, with large family holdings at Stagirus.

...Aristotle was the son of the court physician to the king of Macedonia... He was the first person to study BIOLOGY... Alexander the Great gave Aristotle money to hire a thousand men to observe and collect specimens of animal life in Asia and Greece. Aristotle studied their observations and wrote... many books about biology. - YOUNG PEOPLE'S SCIENCE ENCYCLOPEDIA

The works credited to Aristotle are probably lecture notes, not intended for publication, but collected and edited and arranged in some order by other people, and first made generally available in about 60 BC, more than 250 years after he died.

It could be said, at least in regard to biology, that Aristotle got famous on other people's brains. The same thing can be said of America's richest person.

The real made-in-America product is not Microsoft but [its primary co-founder and chairman]. The brilliance and ingenuity of this man can be developed to that extent only in America. How many kids in the world are as smart as he?

...HE MAY BE THE WORLD'S MOST FAMOUS businessman or the smartest guy alive, but I have no respect for him.

Nerd who got rich on others' brains... At the age of 41 he is the world's richest man, with a personal fortune... bigger than the gross domestic product of around 100 countries... And yet there is... a reluctance to applaud his achievements. For the place which gave birth to the original enterprise culture, America has been surprisingly snuffy about his success... Americans expect something of their successful businessmen. They should be sharp-suited, immaculately groomed and, if not blessed with movie-star looks, at least trained in media techniques. [He], in contrast, dresses like one who only wears suits for special occasions, has a floppy, sub-1960s hairstyle – and dandruff to go with it – and speaks in a nasal whine... His image is of America's most famous nerd... More than this, for Americans struggling to make their first million – or their next dollar – he appears to be uninterested in his vast wealth. True, there is the vast, newly built, 45-room house on the shores of Lake Washington, with a garage to accommodate 26 cars – he has about 20 Ferraris. This is not, however, a man who worships wealth. Most of it he will not even leave to his children. Worst of all, perhaps, he is an intellectual. "American society to this day is reluctant to renounce anti-intellectualism because of its underlying promise that anyone, with the right dollops of luck and pluck... can succeed in business... The credo of unlimited opportunities for the ambitious assumes that self-styled intellectuals are not really intellectually superior – not where it counts. American anti-intellectualism will never again be the same because... [he] embodies what was supposed to be impossible – the practical intellectual." ...Maybe. But good luck seems to have played a bigger role... Alternatively, he is the deceptively mild-mannered but actually ruthless businessman... who has got rich on the brain-power of others... Edison and Ford employed manual workers in their hundreds of thousands; Microsoft employs 20,000 or so "smarts" – the merely bright or the ferociously brilliant... What about Microsoft's strategy of buying up smaller software companies to acquire their top brains? ...surely the only strategy in a business [is one] which relies on "smarts" – the very best brainpower. - 1997

Because Aristotle has been used as an ancient example of a *merely intelligent* person, it makes sense to compare him with a *wise* contemporary – of which the best example is Socrates.

Socrates... Regarded as one of the wisest men of history, he ...left no writings... Socrates taught that self-knowledge is more important than speculation about the universe; that truth (or knowledge) and virtue are inextricably connected; and that vice arises from ignorance.

Socrates brought the search for meaning down from heaven to earth. The influence of Socrates was not in a school of philosophy but in his person, in his life and the circumstances of his death. Unlike Jesus, Socrates had the misfortune to have his life reported by literary persons – Aristophanes, Xenophon, Plato, Aristotle – each with his own philosophical axe to grind. Still the dominant spirit of Socrates' ... is revealed... in the... dialogues.

Socrates was apparently ugly, snub-nosed, with a paunch and a shrewish wife, Xanthippe[– his last (he 'married 3 times')]. He took part as a good citizen in three military campaigns... and distinguished himself by his bravery, remarkable physical endurance and indifference to fatigue, climate and alcohol. He otherwise held aloof from politics, guided by his 'voice' which impelled him to philosophy and to the examination of conventional moral attitudes and assumptions with his fellow citizens and with the notable politicians, poets and gurus of the day. He represented himself as just the midwife for the opinions of others, and gave that as a reason for the Delphic Oracle's pronouncement that he was the wisest man alive.

It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied. And if the fool, or the pig, are of a different opinion, it is because they only know their own side of the question. The other party to the comparison knows both sides.

The Socratic method tended to expose people's ignorance. It showed that many things they assumed to be true were false. - THE WORLD BOOK ENCYCLOPEDIA

This endeavour to show people that they knew nothing goes far to explain why Socrates shared the odium with which conservative Athenian opinion regarded the Sophists[(who 'were in business offering the equivalent of university education: for a hefty fee they would teach, in particular, rhetoric – how to argue a case in a law court or an assembly')], but we can see the essential difference between them. They believed the kind of knowledge he sought to be impossible, because absolute and universal moral qualities did not exist to be known. When they claimed to teach virtue they had nothing of that sort in mind, but only a purely practical and empirical training. His procedure on the other hand was based on a passionate conviction that the knowledge could be attained, and moreover that the only way to reform conduct was to lead men to an understanding of certain permanent and unvarying principles on which to base it; but his conversations had shown him that most men suffered from an illusion of knowledge which must be dispelled before the positive side of the inquiry could begin.

Socrates was thus a rebel against authority as such; and he shrank from no consequences. He did not hesitate to show his companions that an old man has no title to respect because he is old, unless he is also wise; or that an ignorant parent has no claim to obedience on the mere account of the parental relation. Knowledge and veracity, the absolute sovereignty of the understanding, regardless of consequences, regardless of all prejudices connected with family or city – this was the ideal of Socrates, consistently and uncompromisingly followed. But men using their intellects often come to different conclusions. The command issued by an authority which Socrates may reject has been, directly or ultimately, the result of some mental process. It is manifest that we require a standard of truth and an explanation of the causes of error. The solution of Socrates is, briefly, this. When we make a judgment, we compare two ideas; and in order to do so correctly it is obvious that these ideas must be clear and distinct; error arises from comparing ideas that are undefined and vague. Definition was thus the essential point – and it was an essential novelty – in the Socratic method for arriving at truth. - History of Greece

Socrates... His interests lay not in the natural-philosophical speculation of earlier thinkers but in the question of how men should conduct their lives, an inquiry pursued through the method of cross-questioning those he met. Self-denying in his own life, he was the centre of a circle of devoted friends who included the great and the rich.

Because Socrates' devoted friends included the rich it would have been easy for him to become like them.

Sons and daughters of the rich have rich models to emulate. They learn what it is like to be rich, to think in terms of large sums of money, and to become knowledgeable about business and finance. While some children reject these models and rebel against the values of their families, most do not. They not only inherit the family money, they identify with the family's attitudes toward money and imitate its money-making behaviour... By attending the right schools, meeting the right people, making the right friends, joining the right clubs, and moving in the right social circle, one increases the opportunity for making money. Associating with people who have money and who are involved in making more money may not only stimulate one's own money-making desires, but may also present opportunities for investments and business transactions that would otherwise be impossible... A great deal of learning takes place by imitation... Poor people associate primarily with other poor people... The models available to the poor... are not wealthy, successful individuals. More likely, they are examples of failure, at least financially.

Socrates should've had more *influence upon western thought* than Aristotle. One reason why Socrates hasn't been more influential could be that he is something few people aspire to become – an example *of failure, at least financially*.

Socrates was an Athenian, born in 470 or 469 B.C. His father, named Sophroniscus, worked as a stone-mason. He probably did a certain amount of everyday sculpture of statues in the many temples dedicated to different gods. He and his wife, Phaenarete, who was a midwife, lived in a district on the road between the city of Athens and the famous marble quarries of Mount Pentelicus, about ten miles away to the north-east. Sophroniscus seems to have been liked and respected by his fellow Athenians, and was probably reasonably well off. Their son may have practiced his father's craft for a time and made quite a good living, but he chose to abandon it, willingly giving up all hope of making money and collecting personal possessions, and turning his attention instead to less material things. Such a decision could only bring poverty to himself and his family. - Socrates, the wisest and most just?

Living frugally, he was materially independent, thanks to a small inheritance and the state subsidies that were paid out to all Athenians (theatre fees and the like).

...his indifference to such externals as money – in later years he was extremely poor – fine food, and clothing, made him a challenging figure. He was famous for his robustness and capacity for self-denial, and he commanded respect by the simplicity and rectitude of his private life. He seems to have ventured outside Attica only once, to attend the Isthmian games, besides taking part in three military expeditions during the Peloponnesian War... Philosophers before Socrates speculated – naively, though interestingly – about the composition and workings of the natural universe, but Socrates made others conscious of the absence of any agreed standard of truth in such matters. He introduced a concern for method in philosophy, stimulated an interest in the logic of argument, and turned his attention to human affairs, where he thought that careful and properly self-conscious philosophy might produce worthy results. The reorientation he accomplished is reflected in the standard practice of referring collectively to his predecessors as “pre-Socratics,” and in the view, common for later antiquity, that, except for Epicurus and his followers, all subsequent Greek philosophical schools were his more or less direct intellectual heirs. - Encyclopedia Americana

“Universal History... the history of what man has accomplished in this world, is at bottom the History of the Great Men who have worked here.” ...what is called the spirit of an age is the spirit of the man in whom the age is mirrored. Socrates was one of those historical personalities who reflect and summarise an epoch. He gathered into his own experience the profoundest movements of the mind of Greece in his time, a time when authority in religion, morality, and society had broken down or was breaking down, and thought wandered between two worlds, the dying world of tradition and convention and the world that now travailed to be born, the world of reason and freedom. It was a transition period in the history of Greek civilisation and therefore of world-civilisation, and Socrates looms out of it the figure of one who in the midst of the flux of nationalism in thought, sentiment, and outlook stood steady and secure, building a bridge between the old and the new, between that which had been and that which was to be... Not what a man has but what he constitutes his only title to rank and admiration... And he is rich indeed before whom the universe stoops to offer the gold and frankincense and myrrh of its own secrets, purposes, and works. Socrates did his high thinking on pretty plain living and dressing. He had all the unconcern of a St Francis about his own personal wants. There is a fragment from one of the plays of Eupolis, a comic poet of the time who had a considerable vogue... in which a character delivers himself on this wise: “I hate this Socrates, this babbling beggar, who has meditated more than anybody else, but has never asked where he was going to get his dinner.” ...In all respects he was a model of

the simple life. He only ate and drank as a rule when hunger and thirst intimated the legitimate and necessary claims of Nature, and at such times a good appetite provided all the sauce or spice that was necessary... "Others live to eat," Socrates once said. "I eat to live." ...His abstinence in these matters was a notorious characteristic, in allusion to which Aristophanes makes the Clouds promise old Strepsiades that if he also will join their cult he will be able to endure hardship, stand or walk without fatigue, never suffer from cold, nor be concerned about breakfast, and he will keep aloof from wine and gymnastics and other follies... As for clothing... Alcibiades relates that he had Socrates to supper, and then he was wearing a "threadbare cloak"; he was struck alike by the man's wisdom and powers of endurance... In the manner of dress he dispensed with sandals altogether, following what was the indoor fashion even outside. The latter practice would not have been such a matter for remark unless it had been very rare. There is a fragment of Ameipsias where it is said of Socrates in regard to this economy that "he was born to be the curse of shoemakers." ...The same moderation and self-control characterised all his actions and passions; if his face gave evidence of sensuality subdued, his face was a true witness, for Socrates held the reins tight on the lusts of the flesh and its bewildering pleasures. No historical figure gives a stronger impression of possessing an absolute power over the rage and tumult of the heart's unquiet seas. Odysseus stopped the sailor's ears with wax, and tied himself to the mast, as his bark sailed past the treacherous rocks where the fateful Sirens sang with baleful charm; but Socrates moved free and unfettered, with all his senses open, amid the siren music of pleasure, moved with a sense of absolute self-possession. He had made the "great renunciation," the decision for the higher as against the lower, for spiritual attainment as against self-indulgence. He had counted the cost, and he knew Hesiod's lines: "Wickedness may a man take wholesale with ease, smooth is the way and her dwelling-place is very nigh; but in front of virtue the immortal gods have placed toil and sweat, long is the path and steep that leads to her, and rugged at the first, but when the summit of the path is reached, then for all its roughness the path grows easy." And with the substance of the teaching of Prodicus' famous allegory, "The Choice of Hercules," he had the greatest sympathy, bringing out, as it does, that decided and final choice between virtue and vice, labour and ease, self-discipline and self-indulgence, which every youth must make whose life is to rise above mediocrity of achievement and be an enrichment to the world. - Socrates, the man and his mission

Socrates recommended good association because if one is to develop good qualities, he must associate with those who are virtuous and similarly interested... Socrates believed that through meditation, a person can attain knowledge, and through knowledge he can become virtuous. When he is virtuous, he acts in the right way, and by doing so, becomes happy. Therefore the enlightened man is meditative, knowledgeable, and virtuous. He is also happy because he acts properly.

Socrates believed that human nature leads people to act correctly and in agreement with knowledge. He felt that evil and wrong arise from ignorance and the failure to investigate why people act as they do... Socrates devoted himself completely to seeking truth and goodness... Inevitably, Socrates made enemies among influential Athenians. He was brought to trial, charged with corrupting the young and showing disrespect for religious traditions... The jury found Socrates guilty and sentenced him to death. The jury may have given Socrates the severe sentence because it resented the unbending pride with which he conducted his defence. He refused several opportunities to escape from prison, and carried out the sentence by calmly drinking a cup of hemlock poison.

At his trial, if Plato's account is reliable, Socrates steadfastly refused to admit any wrong-doing and defiantly insisted on continuing his past practices unless forced not to. He was unwilling to take any steps that might have won him acquittal or a light sentence because he regarded them as compromising. After being convicted, he could have, under the law, proposed a substitute for the death penalty demanded by the prosecutor... Instead he insisted on having a reward for the services he had rendered the Athenians in arguing with them and examining their opinions. He yielded in the end and accepted his friends' offer to pay a fine of 30 minas, about \$1,000.

...my dearest Socrates, do finally listen to me now, and save yourself. For my part, if you die, it will not be just one misfortune; not merely shall I be deprived of such a friendship as I never again shall find the like of; but, more than that, to many who do not know you and me too well, I shall seem like one who could have saved you had he been willing to spend the money, and did not care to do it. Now, tell me, is there any reputation worse than that of seeming to put money above friends? ...The sum of money is, in fact, not large which certain persons are willing to accept in order to save you and get you out of here. Then, for the informers do n't you see how cheaply one can buy them off, and it does n't take much money to deal with them? My own fortune is at your service, and I believe it is enough. Further, if you care for me, and think you ought not to spend my money, there are our friends from elsewhere who are ready to spend theirs. - CRITO

Perhaps Socrates' reason for not saving himself was that he had visions of being a martyr?

It is as if he insisted on confronting the Athenians as sharply as possible with the consequences of their unjust attack on him, hoping thereby to give them one final lesson in self-knowledge.

...Socrates, in his last words begged his judges: "When my sons are grown up, I would ask you, O my friends, to punish them; I would have you trouble them, as I have troubled you, if they seem to care about riches, or anything, more than about virtue; or if they pretend to be something when they are nothing... The hour of departure has arrived, and we go our ways – I to die, and you to live. Which is better God only knows."

At the conclusion of *The Republic*, Socrates gives the analogy of humanity living within a dark cave. The self-realized teacher has seen the light outside the cave. When he returns to the cave to inform the people that they are in darkness, many consider him crazy for speaking of such a thing as the light outside. Thus the teacher often puts himself in a very dangerous position.

There is little to link Socrates with Aristotle other than the fact that the former was the tutor of Plato, who was the tutor of the latter. However, although Socrates died in 399BC and Aristotle wasn't born until 384BC, they can be regarded as belonging to the same time (r:p25, ln51). If the Microsoft chairman is a modern version of Aristotle, the modern version of Socrates could be Albert Einstein.

Einstein was not only the ablest man of science of his generation, he was also a wise man, which is something different. If statesmen had listened to him, the course of human events would have been less disastrous than it has been.

What an extraordinary situation is that of us mortals! Each of us is here for a brief sojourn; for what purpose he knows not, though he sometimes thinks he feels it. But from the point of view of daily life, without going deeper, we exist for our fellow-men – in the first place for those on whose smiles and welfare all our happiness depends, and next for all those unknown to us personally with whose destinies we are bound up by the tie of sympathy. A hundred times every day I remind myself that my inner and outer life depend on the labours of other men, living and dead, and that I

must exert myself in order to give in the same measure as I have received and am still receiving. I am strongly drawn to the simple life and am often oppressed by the feeling that I am engrossing an unnecessary amount of the labour of my fellow-men. I regard class differences as contrary to justice and, in the last resort, based on force. I also consider that plain living is good for everybody, physically and mentally... The ordinary objects of human endeavour – property, outward success, luxury – have always seemed to me contemptible... I am absolutely convinced that no wealth in the world can help humanity forward, even in the hands of the most devoted worker in this cause. The example of great and pure characters is the only thing that can produce fine ideas and noble deeds. Money only appeals to selfishness and always tempts its owners irresistibly to abuse it. Can anyone imagine Moses, Jesus or Gandhi armed with the money-bags of Carnegie? - Einstein

Carnegie... U.S. steel manufacturer... son of a poor Scottish weaver... In 1899 he consolidated his vast steel and iron interests in the Carnegie Steel Co., which in 1901 he sold to the new U.S. Steel Corp. for \$447 million... He endowed several foundations... with \$125 million – to build public libraries... and advance public education... Violently opposed to labor unions, his Homestead Steel Works was the scene of the Homestead strike... one of the bloodiest in U.S. history... It lasted almost 5 months... and discouraged future steel-industry unionism. Disagreement over renewal of an employment contract... led to the strike, during which 300 Pinkerton detectives were hired to protect nonunion workers and company property. A battle between detectives and strikers ended in deaths on both sides... and the strike was broken when the National Guard was called in...

One of his most notable achievements was the creation of the Carnegie Peace Fund to promote international peace.

Ford Henry, 1863-1947, U.S. inventor and manufacturer... His chief contributions to the... automobile... industry were thorough standardization of parts and a labor policy long considered enlightened, although he was the last of the major auto manufacturers to accept unionization[and, 'during the Depression, Ford sped up production, cut hours and rates of pay – leading to demonstrations in which 4 people were shot dead by the police; the deaths helped draw public attention to the plight of the car workers' 'turning out petrol-driven machines at the rate of one every 10s')]. Ford gained national attention in W[O]I when he sponsored a Peace Ship which carried him and others on an unsuccessful mission to end the war... At his death the bulk of his fortune was left to... a nonprofit fund bestowing grants and appropriations (c.\$[US]83 million in 1957) for research and developments in the U.S. and abroad, primarily in the area of man's social relations... *Nobel, Alfred Bernhard*, 1833-96, Swedish chemist, inventor of dynamite... [whose] father had manufactured nitro-glycerin... On his death, [Alfred] left a fortune of some \$10 million, most of which he ordered to be used to found the five *Nobel Prizes*, awarded annually for the most important discoveries and works for the benefit of humanity in physics, chemistry, physiology, medicine and literature, and the furtherance of peace in the world. A Nobel Prize amounts to c.\$40,000. It was first awarded in 1901.

Nobel Prize[s are]... adjudged by... the Norwegian parliament... A Nobel Prize for economic sciences was added in 1969, financed by the Swedish National Bank.

...created in 1786[the]... Swedish Academy, which this week chooses the winner of the... \$US1.12 million (\$[NZ]1.6 million)... Nobel prize for literature, is suffering from a crisis out of character with its prestigious reputation... [M]any in Stockholm's literary circles... fear that bickering among the members will tarnish the respect... of the Academy... Over the past seven years, four of the Academy's 18 life members have asked to be relieved of their duties following disagreements with the permanent secretary... [Two had disagreed with the secretary's] refusal to condemn the death sentence issued by the Iranian regime on[a] British author... According to its statutes, at least 12 votes are needed in order to ensure the selection of a Nobel prize laureate. Any new departures or serious illnesses could prevent the academy from awarding the prize. The life members... can only be replaced after death. - 1996

The Nobel Committee hopes its annual award, worth 7.6 million kroner (\$[NZ]1.86 million), can spur progress among recipients.

“...who needs millions? Health, family, friends, that's all you need.” “Right... the simple life is the best life.”

...learn how good the simple life can be. Once you learn that you're set for life.

...man, by subordinating his spirit to natural necessity, finds perfect peace.

Dr. Einstein was a simple man. He could not be bothered about such matters as dress and grooming. He often appeared in public without socks... He was not an avid reader, preferring to think rather than read... He never owned an automobile, preferring to walk wherever he went... His remarkable mind was so engrossed in his work that he had to simplify his rigid routine whenever possible to save every minute for thinking. No matter how busy he was, he always had time for children, and often would help them with their homework... A modest man, Einstein refused the presidency of Israel... Money meant little to him.

Money motives are considered among the lowest of all motivations... Some... rare... individuals, of course, have transcended the use of money as a measure of their worth... They find great satisfaction... in what they are doing... [especially if they are] helping others, and the amount of financial reward, as long as it provides a living, becomes secondary... If they do have any extra income, they find some excuse to spend it on others rather than themselves since they firmly believe it is better to give than to receive... They have no need of monetary riches because their lives are so rich in other respects... When Albert Einstein was offered a position at the Institute of Advanced Study at Princeton just prior to W[O]II, he was asked to name his own salary... Einstein asked for \$3,000 a year. Even in those days, that was a meager salary. The Institute said nothing, and paid him \$16,000... [Other examples of such] people drop out of the money rat race... Albert Schweitzer, the brilliant philosopher, musician... and physician, gave up a comfortable, intellectually stimulating and potentially lucrative life in Europe to become a medical missionary in the jungles of Africa.

The greatest humanitarian of our time, Schweitzer was awarded the Nobel Peace Prize in 1952.

...Jean-Paul [Sartre]... French philosopher, novelist... a nephew of Albert Schweitzer... In his philosophy and literature... he set out to show that the human situation is characterized by lack of a permanent nature, essence, or divinely bestowed destiny, and as a result possesses a terrifying freedom of choice. His later philosophy, cast in a Marxist mould, explores the social setting in human relationships conditioned by material scarcity... In 1964 he was offered but refused the Nobel Prize...

OUR AGE IS PROUD of the progress it has made in man's intellectual development. The search... for truth and knowledge is one of the highest of man's qualities – though often the pride is most loudly voiced by those who strive the least. And certainly we should take care not to make the intellect our god; it has, of course, powerful muscles, but no personality. It cannot lead, it can only serve; and... is not fastidious in its choice of a

leader. This characteristic is reflected in the qualities of its priests, the intellectuals. The intellect has a sharp eye for methods and tools, but is blind to ends and values. So it is no wonder that this fatal blindness is handed on from old to young and today involves a whole generation. - Einstein

It is possible that Aristotle, the Microsoft chairperson, Socrates and Einstein all had similar intellects (or IQs). However, according to the quotes used so far in this thesis, it isn't possible to match the behaviour and beliefs of the first two with those of the last two. Because Socrates and Einstein were identical in many respects it should be safe to assume that there has been little change in the essence of wisdom during the past 2400 years. Furthermore, the fact that both men had to speak out against their respective societies suggests that there has also been little change in the behaviour and beliefs of the average human during the same period. Therefore, whatever progress has been made must only have come in the areas of general knowledge and technology – most of which originated in recent centuries. As if to offset this recent progressive activity, some facets of human society seem to have regressed!

...in intellect and culture and especially in moral qualities, the rich men and those who now stand at the head of governments no longer constitute the flower of society as in olden times, but on the contrary are below the average... In the same way the majority of rich people of today no longer constitute the most refined and educated portion of society, but are either coarse money-grubbers only concerned with enriching themselves (frequently by shady methods) or else the degenerate heirs of such money-grubbers, who far from playing any prominent part in society are for the most part held in general contempt.

A trail of bizarre fashion sense suggests that Europe's heads of government and rich have all been *degenerate* for centuries!

...the industrial revolution started in Europe. Why it started in Europe, then a backward peninsula of the Eurasian continent, is a question awaiting sustained investigation. The (by then) ancient civilizations of India and China and the younger Muslim empire, embracing Asia Minor and Africa north of the Sahara, were richer and technically more advanced. Akbar, the great Mogul emperor of India, was in possession of 10 times the wealth of Louis XIV and 40 times that of Elizabeth I... Perhaps it is that European societies, from the times of the Graeco-Roman Mediterranean civilization, were more egalitarian... Disparities of wealth and income were great, but not as extreme as in the empires of the East... With more equal participation in the wealth and income of society, Europeans had longer life expectancy. The persistence of the individual beyond the age of 25 compelled respect... It had become possible, as a practical matter, for society to cherish the individual... The sanctity of life displaced the divinity that hedged a king. In history, the industrial and the democratic revolution have come forward together.

Perhaps *the industrial revolution started in Europe* because of capitalism?

Capitalism has been a fantastic success, in its own terms, since it was invented in Tudor England in the sixteenth century.

Capitalism has, however, been modified somewhat *since it was invented*.

mercantilism, a politico-economic movement dominant in the 16th- and 17th-cent. W Europe. Its principal concern was to raise exports and diminish imports, thus fostering the influx of precious metals and the accumulation of bullion... Mercantilist nations tend to neglect agriculture and develop industry and foreign trade. Their discriminatory trade practices and harsh tariff policies... led to wars, often undertaken to conquer new markets and to destroy competitors. Colonies were not permitted to develop industries or to trade freely. In the 18th cent. mercantilism fell into disrepute, mainly through the efforts of... English economists... such... as Adam Smith, who pleaded for free trade.

Capitalism may have been invented in the 16th c. but the roots of the economic system go back beyond the earliest days of European civilisation.

neolithic... of the later part of the Stone Age... [T]he 'Neolithic Revolution', [turned] man from being dependent on nature to controlling it at least partially and indirectly. The change led to the establishment of settled communities, accumulation of food and wealth... and had spread to northern Europe by the 4th millennium BC.

Celt... a member of one of a group of western European peoples (including the ancient Gauls and Britons...)... Their unity is recognizable by common speech... but they did not constitute one race or group of tribes ethnologically. The origins of their culture can be traced back to the Bronze Age... Celtic political sense was weak, and the numerous tribes, continuously warring against each other, were crushed by the migratory Germans and the power of Rome...

There were settlements in England from at least palaeolithic times... followed by the arrival of the Celtic peoples whose civilization spread over the whole country. The Romans under Julius Caesar raided the south of Britain in 55 and 54 BC, but full-scale invasion did not take place until a century later; the country was then administered as a Roman province until the Teutonic conquest of Gaul... In the 3rd-7th c. Germanic-speaking tribes... known as Angles, Saxons and Jutes, raided and then settled, establishing independent kingdoms, and when that of Wessex became dominant in the 9th c. England emerged as a distinct political entity before being conquered by [the] Duke of Normandy, in 1066. The neighbouring principality of Wales was gradually conquered during the Middle Ages and politically incorporated in the 16th c... English... authority... [over Ireland] was never secure and by the 16th c. was confined to an area round Dublin (the English Pale) until the Tudors succeeded in establishing it over the whole of the island... During the period of Tudor rule (1485-1603) England emerged as a Protestant State with a strong monarchy and as a naval power. Scotland and England have been ruled by one monarch from 1603, and the two crowns were formally united in 1707... After an unsuccessful rebellion in 1798, union... [with] Ireland followed in 1801... [to form] Great Britain... The spread of the... English... language has its origins in colonization... and the consolidation of the British Empire particularly in the 19th c... [The existing British *politico-economic* system evolved from] a medieval European... system... [in which t]he nobility held lands from the Crown in exchange for a specified amount of military service; the peasantry lived on their lord's land and had to provide him with labour or a share of his produce in exchange for protection. The feudal system began to break down in England in the 13th and 14th c., although feudal tenures were not actually abolished by statute until 1666.

Although feudal tenures were abolished in 1666, the division of English society into peasants and nobility (or aristocrats) has remained largely unchanged. Ironically, the term ARISTOCRACY has little to do with Aristotle (although aristocrats probably admired him) – it comes instead from the Greek phrase 'best power' or 'a State governed by the best representatives.' This is similar to selecting the head of a class to be leader. Indeed, English people were eventually slotted into 3 CLASSES – upper, middle and lower. The aristocrats gained the top rating: a 'social class' of professionals and businesspeople (or merchants), plus managers and small landed proprietors, created the middle; and unskilled or unemployed labourers (i.e., the poor) were at the bottom.

From the earliest of times of which we have record... down to the beginning of the eighteenth century, there was no very great change in the standard of living of the average man living in the civilized centres of the earth.

The average man (i.e., the majority) has tolerated a low *standard of living* for a long time. What little education the majority received tended to emphasise the opinion that there was little that could be done to alter their situation. Tudor England had a Parliament but its members weren't elected by the public. Indeed, when a civil war started in 1642 it was between the forces of the monarchy and the Parliament – instead of between the rulers and ruled. However, even if the public could've elected different rulers or chosen a different system, it is possible that pre-20th century Britons would've decided to keep the status quo – because Britain was long regarded as the most powerful country in the world (i.e., “We might not be perfect but at least we're better than anyone else!”).

...in the 18th c. Britain was the leading... power in the world, while the Industrial Revolution which was then beginning made it the first industrialized country...

The industrial revolution must be recognized... as an abrupt and very recent change in the human condition... The living beneficiaries of the first industrial revolutions... have dim memory of the event in their histories and small record of its human cost. In the dismay and distaste they feel for the regimes under which the revolution has more recently proceeded, however, they might find some measure of the price paid (or exacted) by their ancestors. The agony of the revolution was surely more prolonged in its earlier events. History shows that the economic discipline required to induce capital formation by sufficiently adequate resources was imposed by the political invention of the nation-state. In the dense cultural diversity of the European peninsula, this invention involved four centuries of nation-building wars... The reckless commitment of resources to... those wars induced some of the principal advances in technology and in the building of the infrastructure of the Western industrial nations.

While Britain remained the most powerful political and military force in the world, plus the leader of industry, it would have been easy for its leaders to convince the lower class (or working class) that they stood to benefit from it – because *the trickle down* effect, which allegedly improves the standard of living of every person in a society, would gain momentum – and, for some people, it did.

...the English middle class is larger and more vigorous than its ever been before...

Comparitively working-class standards have risen sharply. Even the worst paid in such industries as agriculture, retail trade and the health services are much better off than their predecessors. - MAN AND MONEY

[A] FASHION designer... says she must be working class because, “I work for a living.” Her ex-Beatle father... is worth \$1 billion. - 1997

Although the British public has never risen en masse against its ruling class, and the class boundaries are less obvious today than in the past (they aren't, however, as blurred as is suggested by the quote above), debate over the merits of such classifications has continued throughout the 20th century.

When I first had the opportunity[in 1992] of standing on the steps of Downing St [as the newly elected Prime Minister (PM)] I said that I believed in a nation at ease with itself, the development of a truly classless society with opportunities for all, from wherever they came, to do whatever they can with their own life, by their own efforts, and with encouragement to achieve everything that they can. That is the sort of society that my colleagues and I will be working hard to build in the next few years.” ...“...what a stupid thing to say... It never will be classless...” ...“[The PM's] absolutely right... Of course we want a classless society. We also want a society without sin... avarice... greed... envy. We want all those things to go away... they won't.” ...“I think the class structure's there, in a sense, to help us all move onwards and upwards... in a benign ideal world, which we don't have, of course.” ...“You know, human nature is human nature, and when [the PM] said that one should do away with class he was as likely to succeed as somebody who said we should do away with sex. What is human nature will be with us forever.”

A lot of dead French aristocrats might disagree with that last quote – if they could!

French Revolution [T]he overthrow of the Bourbon monarchy... was the first of a series of European political upheavals, in which various groups of French society found common cause in opposing the feudal structure of the State, with its privileged Establishment and discredited monarchy.

Prompted by the example of the American Revolution, it set in motion or gave new impetus to forces of nationalism, democracy, and socialism that are still changing the world. Its numerous underlying causes included misery of the peasantry under the feudal system, increase of the restless industrial working class, heavy taxation and economic handicaps of the middle class, and corruption, luxurious habits, and indifference in much of the nobility and clergy... The active period of the revolution was precipitated by the financial collapse of the French government, bled by wars and extravagance, in the latter 1780s. The first phase began, 1787... [when, c]ompelled by the financial emergency, Louis XVI summoned the States General... which had not met since 1614. Meeting in Versailles... it soon came under control of its middle-class members, and after declaring itself a Constituent Assembly... began to reorganize the French constitutional, administrative, judicial, religious, and fiscal structures. This was the second phase of the revolution. Opposed by the king, the Assembly found support in Paris, whose populace formed a national guard to defend it, attacking the Bastille... to provide themselves with weapons... Royalists and other anti-revolutionaries were rounded up and imprisoned, and in September massacres, in Paris, Lyons, and other cities, many were dragged from their cells and murdered by mobs... With the assassination of Marat... began the Reign of Terror... [The guillotine was] a device for capital punishment by decapitation first introduced into France during the Revolution... With the meeting of the National Convention... the third phase of the revolution began. Declaring France a republic... and offering assistance to all peoples who wished to overthrow their governments, the convention executed Louis XVI... and declared war on Great Britain...

France had been England's foremost rival since at least 1066.

...rivalry between the two ending in British victory during the Seven Years War.

...a war (1756 – 63) which ranged Britain, Prussia, and Hanover against Austria, France, Russia, Saxony, Sweden, and Spain. Its main issues were the struggle between Britain and France for supremacy overseas, and that between Prussia and Austria for the domination of Germany. After some early setbacks, the British made substantial gains over France abroad, [including] capturing... French Canada... [When t]he war... ended...

Britain... was... the supreme European naval and colonial power... The[French] revolution failed to produce a stable form of republican government, and after several different forms of administration had been tried, the last, the Directory, was overthrown by Napoleon in 1799... Having risen to power... Napoleon became successively First Consul and Emperor, and after a series of dramatic military... campaigns... against... other European powers... established a French empire stretching from Spain to Poland.

However, France's empire never matched Britain's – which, 'covering nearly a quarter of the globe at its peak, was the greatest the world had ever seen' – and Britain remained the 'foremost world power until the turn of the 20th century.'

To the accumulation of capital, the new worlds overseas made their own large contribution... The Treaty of Nanking, ending the Opium War in 1842, exacted the cession of Hong Kong to Britain and opened the ports of... China... to each of the nations that followed Britain into industrial revolution. At Berlin in 1885, the colonial powers parceled out to each other what was left of Africa and conceded portions of the continent to the newly united German nation, giving it, too, the status of empire.

Britain lost its place as industrial leader to both Germany and the US, with the latter becoming the *undisputed world champion* after WWII. The rise of the US brought a new enthusiasm to capitalism, which had been seriously shaken by the Bolshevik overthrow of the Russian Tsar in 1917. Although this event led to an increase of revolutionary activity in their own country, most Britons were more concerned with the Industrial Revolution.

A century ago London was the first city in... history to top two million. Britain was the first country in the world where over half the population lived in cities. The U[S] is the biggest industrialised country, but Britain was the first into the industrial revolution, and first out the other side.

...alongside that old-fashioned subjective permeable British class system we are developing a class system based on money... I would hate to think what England [will] be like in a hundred years time.

Social conditions in Britain have returned to those of the previous century, according to a report out today. The Health Visitors' Association survey painted a bleak picture of widespread malnutrition, unsuitable and overcrowded housing, debt and lack of money for heating. As a result, diseases once thought banished from Britain have returned... It found... 29[%] of health visitors came across TB every year[, 4%]... encountered rickets and 93[% gastroenteritis, 62%]... visited families which had fuel bills deducted direct from their earnings or state benefits... 71[%] cared for families living in "overcrowded" conditions and half for families in "unfit" buildings. Nearly two-thirds visited house-holds which had been disconnected by phone, gas or electricity companies... And [5%] visited people who lived in homes where the water had been cut off. Most of the families disconnected had children... The many improvements in health and welfare were being undermined by the effects of desperate poverty on a national scale. "Health visitors are uniquely positioned to tackle many of these problems and the service needs to be strengthened and expanded, not watered down and dismissed in this cold climate of Scrooge-style economics." - 1996

Although Britain was no longer the most powerful country after the 19th century it still had its empire, which remained a contributor of capital. Gradually, however, the colonies became independent, and the empire eventually transformed itself into the BRITISH COMMONWEALTH – a title that was both patronising towards many of the member nations and most of their citizens. If the original intention was to create a group of countries where everyone has wealth in common, or a common amount of wealth, it would have gone a long way towards justifying the decision to hold a leaders' summit every other year.

Edinburgh is attracting the biggest array of leaders ever seen at a... Commonwealth Heads of Government Meeting... 50... CHOGM will also produce the strongest-ever presence of non-governmental organisations (NGOs). For the first time, they will have their own special centre, set up in Edinburgh's Assembly Rooms... With 1.7 billion consumers and a 20[%] share of total world trade, the Commonwealth is a veritable source of riches... Scottish police face the biggest security operation in their history. More than 18,000 officers will keep a 24-hour watch, aided by an airship with powerful cameras. Another first will be an opening speech by the Queen, the Head of the Commonwealth. Although she has almost always been present wherever the biennial summit is held, she has never before actually appeared at the meeting. Her practice has been to be on hand, to meet heads of government individually, to hold a banquet for them, and to leave soon after the talks begin... Her role as head of the Commonwealth is purely symbolic. She took the title from her father... for whom it was devised in 1949 as a means of keeping India in the Commonwealth as a republic. The duties that go with this position have never been laid down... Today, the Commonwealth is taking on a new lease of life, attracting increasing international attention. Its membership... has grown from 36 to 54 member countries... and more countries are knocking on the door to come in. It has long ceased to be a British Commonwealth. Indeed, in recent years Britain has often seemed to turn its back on the association, pursuing narrower, more Europe-oriented policies... Although the Commonwealth is enjoying a renaissance, the summit duration has again been shortened. It is now down to three days. The last CHOGM to be held in Britain – in 1977 – lasted eight days. Cutting back on time began in the mid-'80s when major players, such as Britain, India and Australia [(AUS)] began to say that their leaders could not be away for so long. Smaller countries were not pleased. Their heads do not get the same opportunities to meet other leaders. The highlight of CHOGMs is the weekend retreat – a Commonwealth invention which enables leaders to get away from the summit venue to a resort and talk at some leisure about tricky issues. Normally the leaders are away for 36 hours. This time they are going to St Andrews for only one day... All the signs are that this year's CHOGM will be too short. The agenda is crowded. For the first time there is a main theme aimed at developing more trade and investment within the association. The British want CHOGM to issue an economic declaration and the meeting may decide to convene a Commonwealth trade ministers' conference... By... [the year] 2000... the Commonwealth aims to have firm decisions on the amounts and terms of... relief for at least two-thirds of eligible poor countries... High on the Commonwealth list these days, too, are the battles against money laundering and drug trafficking. Environmental matters are sure to be pressed... Other pressing issues include the thorny questions of membership applications, human rights violations... and how to get [the President] back into power in Sierra Leone... He was elected in... February 1996 and elbowed out by an army major in May this year... Never before has an ousted leader been present... although many coup leaders have...

Two years ago Nigeria's military rulers were given until this weekend to become a "good government" or the country would face severe sanctions. But in a few days Commonwealth leaders will give Nigeria a stay of execution and stop short of throwing the West African state out of the... organisation... Nigeria's suspension from the Commonwealth was announced... in 1995, after that country defied world opinion by hanging nine Ogoni activists while the leaders' summit, hosted by N[Z], was going on.

...Support staff at this weekend's Commonwealth conference have had a crash course in avoiding social gaffes and understanding the cultures of the world... With 800 delegates flying into Edinburgh... no detail of their cultural differences has been left unturned for the 75 conference staff... Passing food with your left hand may cause offence to Singaporeans, Indians and Malaysians because it is the one used to clean oneself after going

to the toilet. The so-called Anglo nations – British, Australians[(AUSns)], Canadians and N[Z]ers – are said not to like having the personal space around them to be too crowded... [Do] not... wink at A[US]ns, show the soles of... feet to Indians or ever pat a Malaysian on the head. - 1997

After the summit it was announced that the leaders had ‘talked a lot but achieved little.’ But even if CHOGM was capable of achieving something, it would never be to become commonly wealthy – the wealthiest member states are incapable of, or unwilling to, create common-wealth amongst their own citizens!

Australia and New Zealand – once the most affluent countries in the world per head...

The promised land for the Poms... TO austerity-battered Britons[(Poms)], it seemed like a ticket to paradise – just £10 for a new life in A[US]. That was the proposition advertised in our newspapers by a country beset by post-war paranoia and desperate to boost its sparse population with whites in a bid to keep what was seen as the “Yellow Peril” at bay. More than a million fell for the bait between 1947 and 1972, when the scheme ended. You had to stay at least two years – or else repay the A[US]n government for paying for your passage out. But life Down Under proved a far cry from what ration-beleaguered Brits – lured by promotional films featuring exotic fruit, cheap meat and happy families living in suburban dream homes – were promised in the early years... [One couple] were well-to-do when they left Newcastle in 1947 with three small children. They bought land but were cheated out of their life savings... swapped... for a bleak tin shack in the bush... More than 150,000 disillusioned Poms returned home, many before their two years were up.

Children in Britain are more likely to be born into poverty than anywhere else in the European Union, according to a study just published. The report, by the Institute for Public Policy Research (IPPR), shows that nearly one-third of all children in the U[K] are living below the breadline, compared with 13[%] in Germany, 12[%] in France and 24[%] in Italy. The EU average is 20[%]. “The UK’s record on child well-being is not entirely black... but the overall picture provides much cause for concern, with the UK emerging as a serious contender for the title of worst place in Europe to be a child,” the report says... [The] research director of the institute, said that... the Government... would have to do much more to fulfil its pledge of eradicating the problem... [of] child poverty... in 20 years. “Twenty years ago there were 1.4 million children living in poverty and that has now increased to more than 3 million. The figures are all the more shocking because Britain is one of the more affluent countries in the EU...”

Report shows one in three A[US]ns live in poverty... As unemployment begins to climb again in A[US] a new study... estimates that almost one-third of the nation’s 800,000 jobless are supporting young children, and that as many as 12,000 homeless people a night are taken in by federally funded crisis accommodation... The... study... rejected official income-based assessments of poverty as too narrow... “Money alone, however, cannot eradicate the full effects of poverty... It does not give immunity from breakdown in physical or mental health, bereavement, loneliness, job loss... family breakdown, domestic violence, injustice, misdiagnosis or thoughts of suicide. Poverty, therefore, is not just an income level – it is a lifestyle.”

...The distinction between “cosmic” and “procedural” justice dates back at least to Aristotle... In N[Z], why should we prefer a model of... justice which tolerates a level of poverty in the order of 20[%] of our population... It is an error... to think of the 20[%]... at the bottom of the income distribution as a class. To do so is to ignore the fact that the members of the group change; hardly anyone is in the group for longer than a decade... the numbers of permanently poor are... closer to 3[%] of the range. But... [a person] does not need to forget that the members of the set change to object to the fact there is, permanently, a set whose members at a time make up 20[%] of the population... Old ideas on what is poverty are no longer valid...

A... High Court judge... was under fire yesterday from the P[M]... and the Minister of Justice... for attacking key Government policies affecting poverty... [while] speaking as N[Z]’s representative on a U[N] committee on the elimination of discrimination against women... The judge also criticised politicians who said there was no poverty in N[Z] and called on political leaders to recognise its existence. In April, [the PM], and the... Acting Minister of Social Welfare, dismissed a study which concluded that 18.5[% of NZ]ers lived in poverty. [The PM] said no child in N[Z] needed to go hungry because there was a social welfare system. - 1996

The [NZ] Government denies that 20[%] of the population lives below the poverty line but... said the latest figures... showed that 4.9[%] of households with two or more people were earning less than \$96 a week.

...Poverty: what is it and how is it measured? Last year, a survey using a threshold of \$[NZ]16,891 a year for a family of two adults and one child recorded 18.5[% of N[Z]... households, 20.5[%] of all people, and 32.6[%] of all children below the poverty line. The Acting Minister of Social Welfare suggested that if internationally accepted measures had been used the number of people defined as living in poverty would have been below 5[%]... But relativity means little when hunger pains set in. Lunchless children in N[Z] are unlikely to find much comfort, or any sustenance, in being told they do not know what poverty is – try an African refugee camp. Nasty thing about leaving relativity-based poverty to take care of itself: the condition is like a disease; untreated it tends to grow worse. Europe, which hardly dominates any poverty discussion, is a case in point... Remember that European countries have prided themselves on a relatively... equitable distribution of national wealth. So the statistics translated into real-people terms do not fit comfortably with the self-perception... The poverty growth has reached into state consciousness. In France the state telephone company has placed homelessness on a level with emergency services, providing a three-digit number that people living on the street can ring for assistance. And try this comment with echoes from N[Z]: a Dutch Catholic bishop insisted that, if necessary, a poor man could steal bread. One final comment encompasses poverty no matter what its relative state. A... Marseille... social worker... said the essential change in the past few years was “the hopelessness”...

Thank goodness for the British economy. The “figures” have never looked better... The economy is booming... Far away from the celebrations by business leaders... and economists I found a short article on the United Nations Human Development Report. The story it told was somewhat different... Britain is the most unequal country in the Western world... Britain’s poor are now poorer than in any other Western country for which figures have been collected, and a higher proportion of old people live in poverty than anywhere else in the West. The child poverty rate is second only to the U[S]. The report measures wealth and poverty in a new way, comparing purchasing power rather than purely income. On this scale... Britain is the only major Western country where poverty has “increased substantially” since the beginning of the 1980s. The changes coincide exactly with... [the] Tories... coming to power... 18 years [ago]... The more right wing the political climate the more of the wealth that finds its way into the coffers of the wealthy. The trickle-down theory is a very handy one for those at the top of the tree, but it doesn’t really work. Britain provides a model of what happens if the market is left to its own devices and government is not active in wealth redistribution. - 1997

In a world where everyone is poor, there is nothing very remarkable about poverty. It becomes remarkable, and also less forgivable, in a community where the great majority of people are well-to-do. And the explanation for poverty in the well-to-do society must be sought in the general and not the particular aspects of the case – not in the nature of the society of the poor but in the nature of the society of the rich which allows or requires some to stay poor.

...the continuous supply of steerage immigrants (35 million from 1865 to 1915) permitted the installation of the U.S. welfare state to be postponed until 1936... Only the older generation recalls Franklin D. Roosevelt exclaiming, in his second inaugural address in 1937, "I see one-third of a nation ill-housed, ill-clad and ill-nourished!" In fact, the investigation by the Bureau of Home Economics of the U.S. Department of Agriculture that grounded this statement had found two-thirds of the nation in such deprivation. (According to... his Secretary of the Interior, Roosevelt thought two-thirds too depressing for the occasion and rounded it down...) ...Poverty... is... a social arrangement not attributable to lack of resources... [P]lainly... the U.S. public tolerates... poverty... in its midst.

In '1979, the percentage of the US population below the poverty line was: persons – 12.4%; families – 9.6%; related children under 18 years – 16.0%.'

As of July, 1982, the official poverty rate in the United States rose to 14 percent – its highest level in almost two decades.

In '1960, 22.2% of all Americans were Below Poverty Level', but the figure remained relatively constant from 1982 to 1994 – when the '14.5% figure equalled 38.1 million' citizens.

During... [the period from 1960 to] 1990... the percentage of Whites below the poverty level declined from 18.1% to 10.7%, and the percentage of Blacks from 55.1% to 31.9%. The percentage of children below the poverty level grew from 14.9% to 19.9%. In 1990, 15.1% of White children and 44.1% of Black children lived below the poverty level... Between 1970 and 1990, the median family income rose from \$10,326 to \$36,915 for Whites, and from \$6,279 to \$21,423 for Blacks. [The income of]Hispanic families... rose from \$8,715 in 1973 to \$23,431 in 1990... The percentage of households earning below \$10,000 declined for Whites from 14.3% in 1970 to 12.8% in 1990, while it increased for Blacks from 28.0% to 30.8%, and for Hispanics from 20.3% to 21.1% over the same period. The percentage of households earning over \$75,000 grew for all races: for Whites from 6.1% to 10.4%, for Blacks from 1.5% to 3.8% and for Hispanics from 2.0% to 4.3%... The mean family net worth in 1989 was \$203,800 for Whites and \$45,900 for Blacks, non-Whites, and Hispanics... Between 1979 and 1987, the cities with the highest percentage changes in per capita income were Boston (98.1%)[and] Atlanta (78.8%)... The cities with the lowest percentage changes were Houston (36%)[and] Oklahoma City (44.4%)... The Poverty Index was devised by the Social Security Administration in 1964 and revised by the Federal Inter-agency Committee in 1969 and 1980. It is based solely on money income... The Poverty Threshold is updated every year to reflect changes in the Consumer Price Index... In 1990, the threshold was \$6,800 for one person under 65... rising incrementally to \$26,848 for a unit of 9 persons.

Considerable concern has been focused on differences between the life situations of low socioeconomic class families and middle-class families in the American culture... The critical importance of children having the opportunity of learning to control and shape their environment has been discussed repeatedly. Without this growing sense of power based on the responsiveness of others, the child's feelings of helplessness, incompetence, and low self-esteem are reflected in disruptions in cognitive, emotional, and adaptive processes. In an analogous manner, powerlessness is a basic problem of the poor. They have less influence over the society in which they live and are likely to be less adequately treated by social organisations than are members of the middle class... In addition, the low educational level, restricted experience, and lack of information of the poor make it difficult for them to understand and avail themselves of the limited resources that are open to them. The poor get involved in cycles of disadvantage. There is a higher probability of encountering sequences of events which make childrearing difficult and which lead to adverse outcomes occurring in poor families. - Powerlessness and Poverty

The US Department of Health and Human Services gave two Chicago universities a \$7.5 million federal grant to study poverty. - 1996

People could be forgiven for wondering why a US government department would spend millions on studying something that has been part of human society forever instead of using the money to help poor people directly. However, helping poor people directly is a task that has traditionally been handled by charities rather than governments.

New... [c]haritable trusts... are being formed at the rate of two a day, but the laws governing charitable trusts are vague... If you thought choosing between donating your hard-earned dollar to the Red Cross, IHC or crippled children was tough enough, be grateful you don't get appeals from all 17,000 entities that call themselves charities. N[Z] has one registered charitable trust for every 314 people – [and the number of charities is]... growing at a rate of 70 a month. On top of that are incorporated societies and charitable companies. Yet the rules that govern charities – or even define what constitutes a charity – are loose by comparison with other countries and the sector itself is largely left to monitor itself. The... deputy secretary of business and registries... [at] the Ministry of Economic Development... says that while there is no legal requirement for charities to register, the great many do. No one appears to keep records of the number of unregistered charitable trusts... [– which] do not have to make their trust deeds or any other information public... [–] because there is apparently no way of tracking them, but [the deputy] estimates there would be between 100 and 200. Inland Revenue formerly required all charitable trusts to apply for tax-exempt status – and says it is aware of 7500 with that status – but it now allows trusts to make their own judgment about whether they qualify or not, although it has the final say. The department says 5348 incorporated societies and 437 charitable companies are tax-exempt. [The]Revenue Minister... has promised a review of the law covering charitable trusts, to be carried out this year or next. The Trustees Association says that cannot come soon enough...

Charities deal with a wide range of social problems but most focus on addressing immediate issues (e.g., lack of shelter or food).

With an estimated 365 foodbanks operating throughout N[Z] in May 1995, the provision of food parcels to those in need has become an established part of the voluntary welfare landscape... While foodbanks emerged as a distinct phenomenon during the 1980s and underwent a rapid growth phase during the early 1990s, feeding programmes in themselves are not new to N[Z]. Soup kitchens, for example, have long provided food, in the form of prepared meals, for the needy and frequently homeless. Foodbanks... in providing parcels of groceries... are based on the assumption that recipients are able to prepare meals for themselves.

FOOD banks will shut their doors to the needy... to protest against poverty. The striking food banks will leave desperate families hungry and government officials to fund or find emergency supplies. Food bank operators claim the action will affect more than 20,000 people... [The] Wellington region convener of food banks, said the strikes were a last-ditch effort to raise the issue. "...Nowadays, government departments are quite openly referring people to food banks... It has got to the point where food banks are seen by government departments as part of the infrastructure..." ...Auckland food banks have decided not to take part in the strike... during September 30 to October 6, which has been called National Action on Poverty Week... October 3 has been declared the New Zealand Day for Eradication of Poverty.

...yesterday... Auckland church workers... [marked] the beginning of a national poverty awareness week... [by piling] 800 food parcels... in Aotea Square... About 3200 Aucklanders a week are fed by the 80 foodbanks in Auckland with about \$42,500 worth of food given away... The food is donated by church parishes, supermarkets and manufacturers... Auckland foodbanks rejected a call... to close during the Act on Poverty Week... The Auckland City Missioner... said he would not turn away hungry people to make a political point.

...the principal of Finlayson Park School... in Manukau... told politicians in the audience... at... a meeting on poverty... about having to provide food, transport and clothing for... pupils and said some parents were forced to send ill youngsters to school because they could not afford to be away from their jobs... A Public Health Commission report last year estimated that 22,605 children regularly went hungry in N[Z]... 60,018... went without breakfast and 21,152 had no lunch... The meeting voted to put pressure on the... government to work to immediately alleviate hunger and other symptoms of poverty. Health, education and housing policies were singled out as the most influential on the well-being of children.

...A primary school child collapsed with malnutrition and spent two days in hospital, according to a report by the Christchurch Methodist Mission... and a large increase in the number of food parcels handed out by the mission... showed poverty was entrenched in N[Z]... "In the year to September 1996, the foodbank handed out a total of 2243 food parcels valued at \$74,527. In the previous year 1885 food parcels were distributed at a cost of \$52,985. Despite the economic recovery, poverty is increasing." ...the only way foodbanks could become a relic of the past would be if N[Z] had a government which recognised that poverty existed and addressed the problem... [T]he case of the child who collapsed was very disturbing and followed reports of a Southland family who lived on a diet of swedes for several weeks... The mission's report said access to affordable accommodation remained one of the key issues confronting people it helped... The mission was struggling to meet daily demands for help and was expecting its resources to be spread even thinner with Christmas approaching. - 1996

We need your donation to give children from... thousands of... low income families a Christmas they wouldn't otherwise have. New, unwrapped presents can be dropped off at any New Zealand Post Shop. - AUCKLAND CITY MISSION

There are hundreds of Aucklanders who struggle to cope with our winter weather. The Auckland City Mission needs your help to make their lives a little easier. You can help with blankets and warm clothing... or... make a donation...

A[US] is sliding down the same bleak path of poverty that N[Z] travelled several years ago, says the new head of one of the biggest aid agencies across the Tasman... Mission Australia, a \$50 million sister organisation to the Auckland City Mission.

...Pressure on charity's ability to help needy... An Auckland charity will today high-light the growing pressure on the region's social services as more people seek help. The Catholic Caring Foundation yesterday released a research report which showed welfare organisations in Auckland are struggling to cope as more people go to them with more severe and complex problems. The report's author, [a]Massey University senior lecturer... will this morning outline the study which was done between November last year and February... [R]esearchers asked 130 voluntary agencies in Auckland about six social needs – social security and poverty; employment and unemployment; housing; domestic violence; mental health; and family and child services. The... [responses] revealed that more Aucklanders are going to them for help from more diverse backgrounds and with multiple needs. Many are asking for help when they reach crisis point. Because of growing demand and shrinking funding, many services are having to replace preventative work with crisis work, especially when working with children and families. The report highlights a widening gap within Auckland's four cities in the six areas, with significant overall gaps noted in mental health services, pre-crisis work in domestic violence, and funding unemployment. The[foundation's] executive director... said last night that he was concerned at the level of need in Auckland but hoped the report would get organisations working together to improve the situation "instead of fighting."

...Churches are crossing religious boundaries to beat hunger. Leaders of the Jewish, Catholic and Anglican communities in Auckland are asking their congregations to fast and donate food to the city's needy.

...The Methodist Central City Missioner... said more homeless people were using the mission's Queen St shelter than in any other time in its 146-year history. In the past year the numbers of people staying overnight had doubled... In the first fortnight of May, the mission served... nearly triple the figure for the same period last year... He believed people from greater Auckland, Northland and Waikato were drifting into the central city to find work following shrinking employment opportunities in rural areas and the end of seasonal employment. "But of course there's not a lot of hope here either."

...fundraising is entering a new era of professionalism [because of] greater competition for the charity dollar... With about 300 active charities, N[Z]ers are constantly being asked to put their hands in their pockets... There are more than 30,000 incorporated societies and charitable trusts registered in N[Z], up from 5000 40 years ago, and about 20... are added each week, as society relies more and more heavily on voluntary sector organisations to provide services.

...N[Z]ers are traditionally generous people. The... Band-aid concert provided a rare opportunity to measure that generosity. We gave ['over \$4m' –]the second highest amount per head in the world. Sadly, however, there are growing concerns over fundraising practice. Two facts can help understand good and bad fundraising. The first is that there are two main types of fundraising and they are very different. One is philanthropy[. which]... constitutes by far the more important type... the act of giving purely for the sake of helping those less fortunate or for the advantage of our community. Statistics New Zealand believes we gave some \$199 million that way last year... It returns far more income than the other fundraising – special events such as Poppy Day, Red Nose Day, Daffodil Day, telethons and so on... They are different in motivation, in execution and in purpose. The biggest problems that arise in fundraising occur when people confuse the two – you think or are led to believe that you're giving a donation... – when in fact you are participating in an activity. You might wonder whether special event fundraising is valid. The answer is "yes." Not everyone wants to become a serious, committed donor to every organisation. But every organisation wants the public to be aware of what it stands for and what it is trying to change or achieve. If the organisation can raise its profile, heighten awareness, cover the costs of its education or promotional activities and maintain a means of recruiting additional philanthropic donors and supporters in a way that raises money at the same time, then ultimately everybody wins. And that brings us to the second misunderstanding about fundraising – the cost. I know of no organisation that actively chooses to spend more than the absolute minimum necessary on a fundraising effort. The very reason organisations fundraise is that they are short of funds to do the real work of the organisation. Organisations tend to be relatively frugal in their fundraising expenditure. Special events do cost more to run. Valid costs can include promotions, stock, distribution, volunteer training and management, accounting and others. Various articles have suggested that fundraising activities are irresponsible if they cost more than 25[%] of the money they raise.

...Householders have been warned against collectors soliciting donations for the Auckland City Mission. The mission cautioned that it... does not use door-to-door collections and suggested anyone approached contact the police.

...It is cold in Queen St at 7.30 pm. But [a boy], aged 14, wears a \$200-a-week smile as he sells you a 125g bag of lollies for \$3 and tells you the money will keep kids off the streets. Working a few hours three nights a week... for Kandy Kids... the Selwyn College student pockets a dollar for every bag he sells... His... [boss's] brother... runs a similar operation selling \$2 bags for 50 cent commissions... but most of the money was being pocketed by the organisers of the schemes... Yesterday the... national president of the... Fundraising Institute... said the problem of bogus collectors for charity had been around for years. "Until more donors start asking questions about who benefits from the schemes, people will continue to misrepresent themselves to collect money – profit is their primary motive." She said it was unlikely that the lolly-selling operators were taking

money that would otherwise go to genuine charities: “Most people who give money to street vendors do so because they want the product being offered.” ...[however, she also] said some donors were misled into believing they were giving to good causes because the sellers used vague terms such as child cancer or school projects as the reason they were seeking money... “We don’t have any control over these people because they are not members of the institute.” ...Organisers of such schemes could [only] face fraud charges if they falsely claimed to be working for bona fide charities... She[then] said genuine charity organisations were wary of using small children to collect donations unsupervised because of the risks involved... A senior Labour Department inspector... said child workers were covered by the Employment Contracts Act even if they had not signed a formal contract, by virtue of their having accepted a job offer. He said there was no minimum wage for workers under the age of 16. A Manurewa resident... said a boy aged about 11 arrived at his home selling lollies at 8.30 pm in the rain... on his own... “He was cold and wet and miserable... he said he was collecting for the Horizon Trust for employing young kids.” - 1997

Competition and bogus collectors are not the only problems charities face. Amongst the others is the fact that they are entirely dependent on the generosity of wealthier people. Furthermore, although charities serve the purpose of helping the poor, they are also used by wealthy people to feel better about themselves.

...They put their hands in their pockets It relieves their conscience There’s something wrong with human nature...

Ill-gotten money is referred to as “dirty...” Many people who “sell their souls” for money suffer later. Guilt about their transgressions can take many shapes, but it is obvious that many persons who have achieved fortunes by unscrupulous means feel compelled to cleanse themselves by giving their money away. A number of the world’s great charitable and humanitarian foundations owe their origin to the guilt feelings of their founders.

...in the words of Andrew Carnegie... “to die rich is to die disgraced.”

...the world’s most famous computer industry figure, has given \$US20 million... to Cambridge University. The present... for a new building for the university’s computer science laboratory... comes just three months after... Microsoft... announced a \$US50 million investment in Cambridge to create a research centre. - 1997

Microsoft[’s] chairman... and his wife... have made \$US3.34 billion... in new donations for health and education projects worldwide. *Fortune* magazine said the gift from the world’s richest private citizens is believed to be the largest-ever charitable donation.

The couple’s recent gifts to... their foundation dedicated to improving global health and learning, rais[ed] its total assets to \$US17.1 billion.

...No longer content with just giving money to charities run by other people, the world’s richest men are starting their own... THEY are the new philanthropists: billionaires who make giving personal. American moguls including... Microsoft[’s] co-founder and chairman... are part of an increasing trend among the rich to give away money the way they made it – on their own, bypassing traditional charities that are feeling the pinch. “It’s the control factor,” says... a University of Southwestern Louisiana expert on charity. “They think, ‘By establishing a foundation, it gives me the longevity on influencing how the money is spent’... I would also suspect there is a factor of ‘no one is doing it right, the way I would do it.’” The *Chronicle of Philanthropy* has detailed the rise of billionaire-initiated foundations through the 1990s on its Philanthropy 400 list. “There have been criticisms,” says... the... chronicle[’s] editor... “A lot of recent giving has not been focused on the very poor; the arts have [also] suffered.”

...Getty during his lifetime was considered the world’s richest man. He was also known as one of the stingiest... On the other hand, he would freely spend hundreds of thousands of dollars for a piece of art...

Americans overall gave what financial planners describe as a “stingy” 1.9[%] of their income to charity last year... That level – which includes the value of donated goods or gifts in kind – has remained relatively unchanged over the past 20 years and has never exceeded 2[%] going back to at least 1975. Only one out of 10 Americans donated more than 5[%] of their income last year... There is no shortage of outstretched hands. According to the National Charities Information Bureau in New York, there are about 500,000 charitable organisations in the U[S] and their numbers are growing at a rate of 30,000 a year. Last year gifts by corporations, organisations and individuals spiked upward to \$US143.9 billion... - 1996

The reason there are all these charities is because there is a huge amount of worthwhile causes out there and there is no funding for them, so people have to somehow try to raise money to help them, otherwise they don’t get helped...

“I’ve got a weekend job helping the poor...” “That’s not a job, it’s a waste of time. What can poor people pay ya? Nothing! What satisfaction do ya get from helping them? None! Who wants to help poor people anyway? Nobody!”

There must be a lot of nobodies in Beverly Hills because ‘each year the 5 sq. mile urban oasis raises over one billion dollars’ through charity events!

Our willingness to donate large sums to causes espoused by celebrities is laudable – but is it the causes or the celebrities we are giving to? Why do we even need celebrities to excite our altruism? ...We profess such admiration and regard for those who do good... We exalt them almost to sainthood. But only, of course, if they do the work for nothing... [C]aring and compassion don’t have a high market value. If they did, the workers in... community houses and workshops[for the intellectually handicapped] would be among the highest earners in our society... Are we perhaps reluctant to pay for caring because caring is its own reward, and brings such pleasure to those who do it, that they don’t need to be paid much? Well, if that were our criterion, we wouldn’t pay... stars at all, would we? And we would have millions clamouring to be allowed to do full-time caring... It actually seems to me that the more caring people do, the less they are valued. The further they get from the day-to-day work of wiping bottoms, cooking and cleaning, the more likely they are to become rich and famous... Is it because caring isn’t a skilled and demanding occupation? ...We certainly complain loudly about the lack of skills and competence many voluntary carers show...

Americans urged to adopt summit’s volunteer spirit... The specific goals of the... three-day “summit” ...were to... encourage... all Americans to adopt... volunteerism to help... an estimated 15 million disadvantaged youth by providing health care, mentoring, education, a safe place for after-school activities and an opportunity to serve their community... A challenge... will be to relay from the summit a sense of urgency... “We have to get people to believe that there is a significant problem...” - 1997

The 42nd US President apparently believed it. However, while the President could be called a catalyst in the creation of a volunteerism summit, he has also been a contributing factor to the *significant problem!*

[The 42nd US President] has signed a law which will cut billions of dollars from the federal budget by shifting responsibility for welfare to the states, limiting eligibility and ending direct federal aid for poor children. "Today we are ending welfare as we know it," he said, echoing his 1992 presidential campaign promise as he signed the bill delivered by the Republican-controlled Congress. "But I hope this day will be remembered not for what it ended but for what it began, a new day that offers hope, honours responsibility, rewards work and changes the terms of the debate." Under the new law... federal welfare spending will be cut by about \$US55 billion over six years. The bill upset many Democrats and their traditional allies. "This isn't welfare reform, it's welfare denial," said [the]Senator... of Illinois... At the same time... a spokeswoman for[the] Republican presidential challenger... said that "by selling out his own party, [the President] has proven he is ideologically adrift." [The President] twice before vetoed welfare legislation crafted by the Republican Congress, but with election-year politics heating up, several of his political strategists recommended that he sign this version and try to amend it later. He said the law was far from perfect but the object was to help the people who were trapped in the old welfare system. - 1996

The bill included making it 'compulsory to work after two years' with a 'lifetime limit of five years on welfare' – as is already practiced in at least one US state. It is difficult to see how forcing people to take whatever source of income they can get once they are no longer allowed to obtain welfare is going to help them. It is also unlikely that the 42nd US President would consider performing some of the jobs that might be available (especially the low-paid ones)! What will the future hold for a city like Philadelphia, which 'is losing jobs' and where, already, 'one out of every six adults and three-quarters of all children currently needs welfare'? The President either knows nothing about the history of welfare systems, or he is determined to return his country to the days when charity was all that the poor could rely on.

In England in 1601, a national law was passed requiring the parishes to administer locally certain kinds of relief, including work relief, and to raise funds locally for this purpose. During the 17th cent., poorhouses were developed to accommodate the ill, aged, and insane, as well as the unemployed. A later development was the workhouse, employing those unable or unwilling to find work elsewhere. During the 19th cent., the laws were revised, with greater emphasis on poor relief as a national responsibility requiring improved institutions and administration. With the rise of industrialism... the old laws gave way to modern relief systems...

social welfare... any of a variety of governmental programs designed to protect citizens from the economic risks and insecurities of life... Methods of financing and administration and the scope of coverage and benefits vary widely among countries... In many societies charity has been the traditional way in which provision was made for the poor... Obligations on communities... to provide for the poor can be traced back for hundreds of years in a number of different societies. For example, part of the function of the Christian tithe or the Islamic zakat was to provide for the poor... From the 16th century it became recognized... that there were people who could not find work... Town poor laws were passed in Germany from 1520 onwards, and a law of 1530 clearly placed on towns and communities the obligation of sustaining the poor. In 1794 the Prussian states assumed the responsibility of providing food and lodgings for those citizens unable to support and fend for themselves... The earliest modern social welfare laws were enacted in Germany in the 1880s... A floor of minimum protection has come to be viewed as one of government's general responsibilities with respect to specific risks, and in many countries the consensus holds that public responsibility extends to all those unable to care for themselves for whatever reason. In this view social welfare is extended and received as a matter of right rather than need... While industrialization has undoubtedly added to the need for social security by breaking up the extended family and leading to urban poverty, it is by no means the sole reason why the system evolved. Two of the first three countries to make provision for old-age pensions were primarily agricultural societies – Denmark in 1891 and N[Z] in 1898. The Danish scheme was clearly an attempt to alleviate rural rather than urban poverty.

In 1883, Germany passed the first sickness insurance law. In 1884, it passed the first worker's injury act. By 1889, Germany had established the first compulsory old-age and disability insurance programme. Most European countries soon passed laws similar to those... The U[K] did so in 1908... The U[S] was slow in following the European countries. By the time of the Great Depression of the 1930's, U.S. political and business leaders came to realize that economic misfortune could result from events beyond workers' control. The U.S. passed its first comprehensive social security legislation in 1935. Canada began its social security system in 1940. All industrialized countries and many developing countries now have social security systems... There are... problems in the administration of welfare... for example... [if] recipients cannot earn much more from a job than they can get from benefits... some may be discouraged from looking for work... [But this problem involves a small percentage of the population and could be offset by the people who] consider it a disgrace to receive welfare and... even refuse to accept it, even though they are extremely poor.

For instance, an *International Herald Tribune* survey has reported... German charities estimating that for every 100 welfare recipients there are 167 "hidden poor" who do not claim assistance...

Unlike most... social security systems, the N[Z] scheme is non-contributory. Benefits are financed from general taxation... An advantage of this is that people who are unable to pay... regular contributions to a social security fund... are covered to the same extent as wage and salary earners.

The number of... N[Zers]... claiming the maximum state grant for food has doubled from... last year[. 'Labour's social welfare spokesperson said it was alarming that there were nearly 13,000 instances of people who had already reached their limit for this year. The number of special needs grants for food handed out by Income Support rose from 268,045 in December 1995 to 275,875. It was no surprise the figures had risen because grants were easier to get, the Minister of Social Welfare said. The grants are given out by Income Support after essential expenses have caused a family or individual's budget to be blown leaving no money for food. They could be anything from a visit to the dentist or repairs to the fridge. The grant can be given to beneficiaries or low-paid workers. A cash limit over a year exists, ranging from \$200 for single people to \$550 for a couple or sole parent with three or more children'...

N[Z] has nearly twice the proportion of single parents dependant on Government benefits as A[US]. This is a disturbing trend and shows no sign of declining... and the life-style may be transmitted to children.

...The Income Support Service says pregnancy is the biggest single reason people are being granted the sickness benefit... [accounting for about 19%], or... nearly twice the number for depression or arthritis... of the 34,200 people on the benefit... In the year to June 30, the benefit cost taxpayers \$378.8 million. The benefit is granted to people 16 years and over who cannot work because of an illness, accident or pregnancy. For the woman to be granted all or part of the... benefit, she has to be living alone, or – if with a partner – their combined income must be under \$466 before tax each week... Overall, sickness benefit numbers have risen sharply in recent years... Alarmed at the trend, the Government introduced a tougher vetting system a year ago...

Fewer people are signing up for the sickness benefit since conditions have tightened, but more are opting for the invalids benefit... and... the... Income Support transitional benefits manager... said the higher rates have enticed some people to try switching... A single 25-year-old gets \$142.50 weekly on the unemployment benefit, compared to \$148.43 on the sickness benefit and \$178.11 as an invalid. [Incidentally, 'the average time spent on a domestic purposes benefit (DPB) is now three years nine months – up from three years in 1982.']

...Before April 1, 1991, a... DPB... beneficiary with one child received \$213.14. That amount became \$185.93. Today the sum is \$204.10... [and] \$222 for two or more children... While it can be seen as a gift to those who receive it, it's hardly a fortune... But it is topped up by the parent's automatic eligibility for family support which gives low-income families an extra \$42 for one child, and \$27 for each subsequent child. This becomes \$35 for children over 12. [By the way, 'a man who doxxed in his neighbour to Income Support has had to pay \$5000 to the person he informed on. An MP said yesterday that Income Support approached the man for information on his neighbour. The man agreed provided his name was not to be revealed. It was only late last year, when he was sued for defamation by the neighbour, that he found his name had been released.' • 'Figures released in Parliament showed a recent Income Support campaign detected 1871 cases of benefit fraud, totalling \$17 million. Only 160 had been referred for prosecution.'

...Nearly 101,000 NZ beneficiaries] were investigated in the 1995-96 financial year and 53,256 were found to have defrauded Income Support... to a total of \$65.6 million. That is \$8.3m up on the year before... As a result 38,207 benefits were altered or cancelled and \$28.8m of overpayments established... [P]rosecutions figures were low because many of the overpayments were small amounts... The actual... figure is likely to be much higher because the \$65m represents only the identified fraudsters... [B]enefit crime was a "huge problem" fuelled, in part, by a public attitude that considered Government money fair game... The operations manager... says the benefit crime unit is now investigating 2000 cases a month, mainly randomly, hence the rise in... detection... More than a third of the... fraud was detected through data matching with Inland Revenue, Education, Justice and Customs departments... [In related news from overseas, a] Jordanian millionaire who has been claiming \$US32... a month in social benefits designed for needy families has agreed to pay back all the money he claimed as an investigation begins into how he qualified for a benefit.

...The scale of benefit abuse among immigrants granted permanent residency is horrifying... [-] some immigration consultants "pick people up off planes and take them straight to the DSW [Department of Social Welfare] office." ...Permanent residents could apply for the emergency dole after two weeks in the country if they declared they had no funds... [but] the department "had no way of checking if someone had assets overseas if they don't tell us."

...[She] suffered 18 years of abuse at the hands of the man who fathered her child. She was convicted of benefit fraud for not revealing to Social Welfare that she was living in a relationship "in the nature of marriage" and ordered to repay \$45,000 at \$10 a week – which would have taken her into her 80s. But a majority decision from the Court of Appeal this week overturned the conviction... It said her relationship could not be equated to marriage and there was no financial interdependency... Current [DSW] rules say if a man stays in a woman's house for more than three nights he is considered to be in a relationship with her... [O]ne of the barristers representing the Auckland Women Lawyers' Association, who were involved in the case... says that leads to "the bizarre situation of men living in caravans and visiting women." She said it was annoying that many of the people who had been labelled benefit fraudsters were women who had no other means of support... The Women's Refuge movement is relieved that the issue of financial abuse has been legally acknowledged... [but an] Auckland University associate law professor... said the decision threw open implications of a different form of benefit abuse, where the male partner decided not to contribute financially so his female partner could stay on a benefit... [T]he implications of the decision are huge. Benefit application forms will have to be changed, guidelines rewritten and resources allocated to enable more investigation into the lives of people applying for benefits.

...A \$1500-a-head conference on benefit dependency has raised the hackles of social welfare watchdogs. The three-day international conference, organised by the D[SW], will be held at the up-market Sheraton Hotel in Auckland next March. Registration fees before January 31 are \$1475 but anyone registering after then will be charged \$1675. [The] Unemployed Workers Rights Centre co-ordinator... said that it was ludicrous to hold a conference about poverty which the poor could not afford to attend. - 1996

Bringing together some of the world's finest minds in the field of welfare, the conference is unusual in its focus on solutions and practical approaches. It is an opportunity for N[Z] to learn what other countries and agencies are doing to give welfare recipients opportunities to move towards independence. In other words the prime reasons for the conference are for N[Z] to pick the brains of the top workers in the field and for us to share our considerable experience with them. While it is highly unlikely that any of the overseas programmes covered at the conference can be picked off the shelf and dropped into the N[Z] setting, just learning how to avoid reinventing the wheel will make the conference a worthwhile investment. - Director-General of Social Welfare

The convener of the conference is the Director-General of the D[SW]... whose remarkable, for a civil servant, recent outburst about five-year-olds dreaming of growing up to be beneficiaries leaves little to the imagination as to the dryness of her views on social policy.

...Front-line social agencies are angered by claims that beneficiaries have lost their living skills and raised a generation which aspires to be on the dole. The Director-General... said N[Z]... had produced thousands of children "whose only fantasy, whose only dream, is life on a benefit." ...Her comments were supported by the... Minister of Social Welfare... who described the situation as a sad reality... The Unemployed Workers Rights activist... said... the... Government needed to address the problem of generations of beneficiaries stacking up, but blaming them was not the answer... An Alliance [Party] co-deputy leader... laid the blame for the welfare dependency trap on Government policy. "It is hardly surprising that children make pessimistic assessments of their chances when they witness how their parents' jobs have been taken away, their family incomes eroded and their social services dismantled."

...The Minister of Social Welfare... was grilled in Parliament yesterday over the [probable] cost of the [benefit dependency] conference. He said of the 463 registered to attend, 142 were from Government departments. Sixty-four were from Social Welfare and the cost for those came to \$90,000... Accommodation costs were not yet known[, nor were the associated travel costs. However]... Social Welfare spent more than \$3 million on air travel and nearly \$200,000 on entertainment over the past year... more... than many other Government agencies... despite funding pressures elsewhere in the department... But the Minister... said the... spending was only 0.69[%] of the overall budget... He said Social Welfare employed more than 6500 staff spread over about 200 sites... "...Social Welfare staff are... being flown around to go to work."

...Delegates[for the conference] have come from 17 countries with key speakers from the U[S, NZ, AUS, the UK], Sweden and Canada. The most controversial... is... an administrator... responsible for developing and implementing... Wisconsin Works... a "welfare replacement" programme.

...WISCONSIN, the most inflammatory word in welfare politics, gets a big airing in N[Z] this week. The dairying state in the American mid-west makes its beneficiaries work for their money, and promotes itself as an international model for welfare reform... The Right likes Wisconsin's "tough love" policy: Beneficiaries, it says, gain dignity and real jobs, and the taxpayers save heaps of money. The Left calls it punishment for the poor... The... latest plan in... [the now] decade-long programme... requires virtually all beneficiaries to work. If they cannot find a job in the market-place, they can take either a state-subsidised job, do community service work or join the "transition" programme – special work for people with particular problems such as a drug habit. But if they fail without "good cause" to do their full complement of work, or to attend the related training and education courses, their pay is cut. Nobody can stay on any one of the programmes for more than two years; and there is an overall

limit on welfare of five years. This, says anti-poverty critics, shows how punitive the... scheme is. "The reason people are not working... is that there aren't enough jobs." So when someone has fulfilled their two years' work requirement and genuinely cannot find a job, what happened? Are they simply thrown on the scrapheap? No, says... the[programme's] architect... It was "highly unlikely" that at the end of either two or five years the person would be unable to find a job. A former two-year programme... called Work Not Welfare, expired last December, but none of the families needed to go beyond then. However... "we have a clause which allows for the time limit to be extended on a case by case basis." The greatest benefit of Workfare, she says, is removing the stigma from the beneficiary. Far from punishing them, it helps them up the ladder to self-sufficiency. This was in line with the original intent of the social security brought in by President Roosevelt in 1935. "Those programmes were intended only to be temporary – they were never meant to be a way of life." But now some families spend generations on the dole – and [the architect] blames this mainly on the fact that benefits are entitlements. Under the Wisconsin scheme, there is no entitlement... "When my daughter started getting an allowance on Saturday morning, she felt she was entitled to it because it was always there... Then, when she found there were some requirements attached to it, she viewed the money differently... The value of it seemed to change – she didn't race out and spend it on candy. I'm using a very simplistic example, but we tend to value more something that we have a personal investment in – and typically it's because we worked for it." In law, entitlement conferred a property right and allowed legal mechanisms "for arguing for [welfare] going on forever." It made it, in other words, harder to cut off the benefit. There are carrots as well as sticks in the Wisconsin programme. In return for work, the beneficiary gains a grant of \$555 a month (community service) or \$518 (transition) along with subsidised child care and health care. The critics say these carrots are rotten. "In many cases, families working every available hour under programme rules will be poorer than they are under current law," says... the Centre for Law and Social Policy in Washington DC. Under the federal Aid to Families with Dependent Children (AFDC) programme, larger families get more money. But Wisconsin Works, which replaces AFDC, gives families only a flat grant, regardless of the number of children... [However, according to Workfare's architect,] "The vast majority of our caseload – over 80% – is actually... receiving more money than they received under the old benefit structure." The reason for the flat grant "is to make sure that our programme is run as much like the real world as possible," she says. "I've had nine jobs in my life, and I've never had one where the employer said... 'Oh, you've had another baby, I want to increase your salary.'..." Programmes which give more money to large families "risk sending a signal that says, 'Have more children, get some money.'..." Employers had told the Wisconsin government that it was harder to hire people "if there was an alternative form of income out there..." The work programme ensured that the welfare system was no longer in competition with employers. Under the scheme, a parent who is under 18 is not entitled to any cash benefits at all. Under the former scheme, they could receive such a grant. "We have felt for some time that that is the wrong message to send." Children who had children should be living at home so that they could receive the kind of help and nurturing that they needed, she said. Giving them living expenses was offering the wrong sort of help. If the family could not provide care, the parent should be in a supervised setting. Beneficiaries with a child under 12 weeks are one of the very few exempt from work. Previously, those with children up to a year old were exempt... Wisconsin would increase its spending on childcare from \$60 million last year to \$180 million for the new programme. "These are enormous dollar amounts for a state the size of Wisconsin (about five million)." Workfare helps stop welfare fraud... When beneficiaries were contacted for work, some simply "dropped out, and it turned out that many of them had jobs – they simply weren't reporting them." And Wisconsin has cut its caseload... In 1987 the number of families with dependent children receiving aid was 98,000. In September last year the figure had dropped to nearly 50,000... It is saving \$30 million a month in welfare payments... None of this will quieten Wisconsin's critics... It will cost an estimated \$2.1 billion in the [next] two years – \$110 million more than projected costs of the previous welfare system... Thousands of residents in Wisconsin have had their benefits cut for not participating[. • 'From April 1, NZ's Employment Service was given responsibility for the Community Taskforce – a compulsory community-related work scheme set up in 1991 – and had cut the benefits of 19 out of 3711 beneficiaries on projects by September 30'...

Technology, says an] Auckland University economist... is replacing labour-intensive jobs in the private sector. Unless the state steps in and creates work... "I don't see there's any way in which you're going to get adequate work opportunities..." The state can "force people into very low-paid jobs by making benefits so low that people simply have to take any kind of work they can get." ...the result would be worse poverty and social trouble... Forcing parents out to work leads to increased child abuse and neglect and risking the safety of the child in unsafe childcare conditions... There is much American material available now showing the damaging effects of... Workfare[-like]... programmes. For example, in New York City 35,000 dole recipients are now used for local body jobs in place of regular waged, unionised workers... Recent research in the U[S] shows that in the... years 1992-1995, 0.5[%] of families (around 500,000) increased their assets by \$1.6 trillion while the "other" 99 million households together earned far less... Another study shows that the new Welfare Reform Act will allow massive tax cuts for the rich of \$135 billion to 2002, while cutting welfare for the poor... Some worry that the conference... [is] an attempt by the establishment to smuggle Wisconsin-type reforms into N[Z]. The NZ] Employment Minister... who is designing a work-for-welfare scheme for introduction next year, denies this. The proposed community wage scheme "is very much a N[Z] solution to a N[Z] problem," said the minister's] spokeswoman... "He's not seeking to replicate any overseas model."

...[THE NZ] EMPLOYMENT Minister... says he will be offering up to half of the unemployed part-time community work or training. But... his aim was to put all... people on the unemployment register into community work or training... The bulk of the work-for-dole scheme would not be announced... this year... but regional commissioners of employment would be hired at the end of the year and the entire programme would come into force next year, he said.

...Over the past 13 years governments and the Business Roundtable have time and again tried to use this sneaky, back-door way of getting an agenda through. They call a meeting, import overseas "experts," select likely supporters to attend, often through the high price mechanism, and then bombard the public with publicity about the conference, claiming consensus for new reforms has resulted. The whole new right agenda inflicted on us since 1984 has been developed and implemented by this very technique... The... Government needs to learn from the failures of the past rather than repeat them. Workfare programmes failed in 1932 and 1933 and will not achieve their goals 65 years later... The creation of decent jobs with decent wages is the basis of solving the unemployment crisis that successive Government policies... have caused.

...Recently, I attended a dinner hosted by the New Zealand Business Roundtable, part of its programme on welfare and related social policy issues... The Business Roundtable advocates a free market across all sectors. Its simple ideology is that the "market is good" and the "state is bad." Being "dependent" on an employer for a job, no matter what the personal or family cost, is "good," being "dependent" on a benefit, with the possible exception of severe disability, is "bad." And that's why they invited us to dinner – to reinforce the message... Basically the Roundtable is telling us that the problem lies in the state refusing to distinguish between the deserving and the undeserving poor... And they, in their corporate offices, with their ever so ethical business practices, are so much better placed to label who is "deserving" and who is "undeserving"... Unfortunately, the corporate sector does not have a very good record in N[Z] of sponsoring welfare organisations, because companies prefer to be associated with the glamorous end of the... market... And of course the community groups who are "dependent" on corporate sponsorship can hardly bite the hand that feeds them. That is what already holds so many back from criticising Government policy – they jeopardise their funding.

...the... social scientist brought here by the Business Roundtable for its last annual lecture[. a]... senior fellow at the Hoover Institute, Stanford University, observed that social scientists seem much more comfortable dealing in statistical abstractions than in flesh-and-blood human beings... Not so long ago the... D[SW] said it had "360,000 working-age customers." That is a fearful figure, the equivalent of... [10% of NZ's population],

and it does not include pensioners, by far the largest category of state dependants [(‘57% of the total number of beneficiaries, or 469,239 people, in 1995’). Of those 360,000... how many are “locked into dependency,” let alone “an inter-generational cycle of dependency,” as distinct from tumbling temporarily into the welfare net? Social Welfare has no idea. It has only just begun an attempt to get to know every one of its “clients.” If it does we might begin to get some interesting social policy. If academics could adopt a less static view of people they could contribute too.

...Labour’s social welfare spokeswoman... is questioning why an Auckland film company is getting \$300,000 of taxpayers’ money for a “highly political” documentary on welfare dependency... Communicado had produced National’s election broadcasts last year, and it shared the party’s view on welfare, she said. - 1997

The Labour Party represents the Left in NZ politics and the National Party the Right. Labour was responsible for expanding NZ’s welfare system after the ‘Great Depression of 1929-34’, and all subsequent expansions.

IS THIS WHAT MAKES OUR SOCIAL WELFARE SYSTEM TICK? ...We spend 5 million dollars every working hour... providing benefits... Twenty five percent of our population receives a benefit of some description... 134,000 N[Z]ers are on the dole. Twenty two percent of these people have never, ever had a job... 28% of children live in one parent families. 1 in 4 children in N[Z] have the State as the sole provider for the family... 76% of liable parents pay less than ten dollars a week in child support. 219 million dollars is owed to the Child Support Agency. Somewhere out there in all of this, is a solo mum... [who] is sick because she has been fasting on alternate days to save money. She needs to; she has 3 kids and 7 dollars to get her through two days until payday. Welcome to our nightmare. - “Timebomb”: The Tuesday Documentary

An Income Support form containing a clause that clients should not ask for help for food is being used as evidence that... the Government is becoming dependent on food banks... and... the social welfare system is failing... The form indicates that the applicant will get assistance to move into a new property only if he or she signs [the] clause...

The number of families getting Social Welfare assistance to meet their housing costs has almost doubled in the past three years... from 66,290 in 1994 to 128,674 this year.

...At the end of March 1962, for example, there were just 232 unemployment beneficiaries. Now there are about 140,000. There were 4346 sickness beneficiaries – today, around 75,000. There were no domestic purposes beneficiaries (today more than one hundred thousand), because it hadn’t been invented then... In 1962... [95%] of children were living in households with two parents... [while] both sickness and unemployment benefits for a married man with children were 55[%] of the average wage – today that ratio has been squeezed to around 42[%]. Zero unemployment was not simply the result of high Government spending. Per capital state expenditure was only half, in real terms, what it is today, and the ratio of Government spending to GDP was actually significantly lower than it is now. [Since ‘1991, the number of NZers receiving the Sickness Benefit has risen by 68%; the number receiving the Invalids Benefit has risen by 44%; and the number receiving the DPB has increased by 11%.’ However, between ‘1991 and 1995 the net DSW fiscal impact as a percentage of Gross Domestic Product decreased from 13.4% to 11.5%.’]

...The relentless upward trend of working-age beneficiary numbers is certainly of concern to beneficiaries who face growing competition to get on the ladder to independence and self-reliance. It is also of concern for taxpayers who must continue to meet the ballooning costs of social welfare. There is little room to feel complacent when we reflect that even during the past few years of substantial economic growth, welfare has continued to account for \$1 in every \$3 of Government expenditure... Since 1985 welfare dependency has grown from 8[%] of the working-age population to around 20[%]. The percentage of the nation’s children in welfare dependent families is growing even faster. [The figure was 12% i]n 1985... Currently, 25[%] of our children have no parents in paid work. The figure for Maori is 48[%] and for Pacific Island children 45[%]. Children who have no experience of a working parent are likely to encounter much greater difficulty entering the workforce themselves.

...Sickness, invalids and domestic purpose benefits could be restricted under benefit reforms the [NZ] Government is considering... Yesterday, the Social Welfare Minister... refused to divulge any information... [Later in the day the PM] said... that there would be no across-the-board cutting of benefits as happened in 1991, but the Government would look at benefit alignment issues to determine why people were trying to migrate from one benefit to another.

...The P[M] signalled yesterday that N[Z] may well follow A[US]’s example and tighten the dole entitlement for new immigrants... And... the A[USn] P[M]... made it plain that A[US] would not consider making an exemption for N[Z]ers, saying that when the law was passed it would be “applied in a non-discriminatory fashion.” The bill will make migrants wait for two years, instead of six months, before being eligible... The proposed change means the social security agreement between the two countries will have to be renegotiated... Income Support says only about 800 A[USns] in N[Z]... are getting the dole... [A]bout 20,000 Kiwis are on the dole or its equivalent... in A[US]... - 1997

N[Z] currently has six overseas social security agreements: with the U[K] (1990) – which recently introduced ‘new regulations to prevent people under the age of 18 from claiming a benefit’]; the Netherlands (1990); Greece (1994); Ireland (1993); A[US] (1994) and the States of Jersey and Guernsey (1995). Discussions are at an advanced stage with Denmark, Italy and Canada. The main purpose... is to encourage free movement of labour and to ensure that when a person has lived or worked in more than one country, each of those countries takes a fair share of responsibility for meeting the costs of that person’s social security coverage. These agreements are becoming part of the basic infrastructure for the global village, enabling people to move about the world, for short or long periods, either to work or to be with family... By entering into agreements, N[Z] is better able to attract skills, specialist knowledge and technical know-how from overseas when they are not available here. An ever-widening network of agreements will enhance N[Z]’s edge in the international market place, and also provide greater choice for N[Z]ers who wish to live overseas...

Government moves to overturn a landmark court victory for women beneficiaries will put lives at risk, women lawyers say. Legislation introduced to Parliament this week, and touted by the Government as helping battered women, would abandon gains expected from the... Court of Appeal... case... last year... [over a woman who] was described... as a “slave or chattel” who suffered broken teeth and limbs, rape and death threats from her partner of 18 years [(r:p37, ln25)]... Lawyers said the appeal decision meant Income Support had to take into account whether there was “financial interdependence” in relationships when deciding about granting benefits. The bill removes that necessity and... would allow women to get an emergency benefit for up to six months so as to leave a violent relationship. The Minister of Social Welfare... said it gave women an escape route. However, that measure is under attack... [The] president of the Auckland Women Lawyers Association... said [the minister’s] comment underlined appalling ignorance about battered women. “I don’t see how a knowledgeable Government could introduce legislation like this when the statistical evidence makes it quite clear than women are most at risk of being murdered by their violent partners at the time of or shortly after separation... and frankly I’m forced to make the fairly strong suggestion that it is a misogynist piece of legislation.”

...The Ministry of Women’s Affairs has criticised welfare benefit rules which mean most couples on the unemployment benefit receive \$118 each a week, whereas single people receive \$142... [However, the] Minister of Social Welfare... said reasons for the policy were “very, very sound.” The amount of benefit was not based on how household incomes were distributed but on what was fair. Unlike people living alone, couples could share some costs.

...Many people are missing out on their full benefit entitlements because staff at Income Support are overworked, says [a] beneficiaries advocate... of the Auckland People's Centre. He was speaking after a Wellington woman... was put on two years' supervision for beating her 17-month-old son... to death in January. Her defence lawyer said [the woman] had been under added pressure because she had not received all the Income Support payments she was entitled to.

...Superannuitants may soon be paid their pensions by a non-Government organisation such as a bank rather than by Social Welfare. The Government is questioning whether super payments should stay with Social Welfare when the department's "payments" arm, the Income Support Service, merges next year with the... Employment Service within the Labour Department... The new agency [is] yet to be named... The departments involved employ 4594 staff, 14[%] of the public service. It is not yet known if there will be redundancies.

...The Government is facing a multi-million-dollar redundancy bill for former... staff, many of whom are still on the state's payroll[, after an]... Employment Court decision... overturned a ruling by the Employment Tribunal... [concerning the Housing Corporation restructuring in 1992. In related news from Britain, Tarmac has] announced 1996 pre-tax profits of £10 million, down from £20 million the previous year but better than the £6 million loss forecast by analysts. The downturn was due to a one-off charge of £65 million to cover the restructuring of last year's asset swap with Wimpy. Under the £600 million deal, Tarmac handed over its housebuilding division in return for Wimpy's quarrying and contracting business... [T]he swap, which has led to 1,500 redundancies, should give annual savings of £38 million – double estimates.

...Generation X is developing its own career creed, an A[US]n researcher... has found... That creed had its own particular me-first commandments... Thou shalt change jobs often... If you want loyalty, get a dog.

...FIFTY years ago... embarking on a career was like getting on a train. "You were an accountant or a plumber and you'd be in this profession for 40 years. It was all very predictable and the tracks were fixed. In the 1970s, it was like you were in a bus. During your working life you might have to transfer from bus to bus but there were established routes and roads. Today, having a career is like being in an all-terrain vehicle and there are no roads." ...On the eve of the 21st century, the concept of a job is undergoing a radical redefinition... The ensuing loss of job security isn't a problem if you're confident and enjoy your independence... [-] chances are you'll also enjoy moving around and being in control of your destiny... [However,] most people don't like uncertainty and change. - 1997

...the middle class is taking a shaking at the moment... [because] it... has to take on board the sort of insecurities that working class people have had to live with for centuries. [At] the beginning of the '60s it was generally taken for granted that you had a few years training in [an] apprenticeship and you sort of had a job for life. That's gone... "I worked for Dunlop. I joined them when I was twenty... I had been working for them just over twenty years and I was called in to see the Marketing Manager thinking in my mind... perhaps there's something good coming out of this. The conversation was very short and said 'I'm sorry... your job is being... stopped' ...inside me said... what's going on? I came home and eventually I told [my wife] and... brought a bottle of wine with me... to try and ease the pain... I expected that to be a job for life. Unfortunately I was made redundant and since then I've worked for six other companies, in various positions, and I'm now looking for another position to continue my employment until... genuine retirement age. I suppose one has had to cut back. I used to play a lot of tennis and squash... [Now] I play croquet because it doesn't cost very much. I'm 58 and most of my friends are actually retired and therefore have a very... solid pension... I'm still looking for a job... which is the difficult thing to accept." [His wife says:] "I don't like being the one that's going out and leaving him at home and then coming back and he's still at home... I think it must be very demoralising for him... not the role that he wanted at all."

About 820 million people worldwide, 30[%] of the world's labour force, are either jobless or lack sufficient work for minimum living standards, according to a United Nations study released yesterday. The study by the... UN['s]... International Labour Organisation said the figures from early 1994 represent the worst global employment crisis since the 1930s. About 120 million people are officially unemployed around the world, and the untalented jobless would raise that figure... About 35 million people are unemployed in Western Europe, half of them for more than a year... In 1993, the average per capita income fell globally for the fourth year in a row... an indication of the general stagnation in the world economy... One of the reasons for the crisis is the... increasingly competitive global economy, which has forced companies to cut back. "No single country has the capacity to deal with the problems on its own,"... said the ILO director-general... "We believe that the world needs an international strategy and an international framework." The report comes a week ahead of an international conference called by the U[S] President... which will bring together Government, business and labour leaders from the Group of Seven countries...

Hopes big, jobs few in G7 view of world... The world's... most powerful economies see huge economic opportunities ahead from new technology and freer world trade, but remain hesitant on how best to harness them to thin out their jobless armies. Economy and Labour Ministers from the Group of Seven industrial nations, at a two-day forum in unemployed-scarred Lille in... France, cast an envious eye on the U[S]'s record but fought shy of its meaner welfare cover... Fr[ance's] President... called for "a third way" between U[S]-style flexible labour markets and mainland Europe's cushioned, but unemployment plagued, workforces. Europeans have an average 11[%] jobless rate against the U[Ss' 5.5%]. But concrete proposals from the ministers of the U[S], Canada, Japan, Britain, France, Germany and Italy were thin on the ground. European officials, however, sought to talk up confidence, saying that trade liberalisation and new technology promised a long period of growth if countries knew how to adapt.

...*Job news has little promise...* The latest job statistics show the [NZ] labour market is faltering... [The] part-time workforce... rose by 25,000 people, while the number of fulltime workers dropped by 10,000... in the September quarter... [Overall, unemployment went] up from 6.1[% to 6.3%]. As a result N[Z] has slipped to sixth place in the OECD table; behind Japan on 3.4[%], Switzerland... Norway... the U[S] and the Netherlands...

Jobless total increases by 3.4pc in a month... taking the... registered unemployed... total to 159,144 at the end of November. That is an increase of... 4.7[%] since November last year. The Minister of Employment... was disappointed with the rise, but... said... the figure traditionally rose during November and December, partly because of students finishing courses.

...Summers of surf, sand and sun on the dole may be over for hundreds of Western Bay of Plenty holidaymakers. Employment Service centres at Tauranga and Mt Maunganui are taking a harder line and introducing "job logs." The registered unemployed... will have to report to the Employment Service weekly, showing who they have approached for work and what efforts they have made.

...*Hunting for a job?* Over 2000 positions are advertised each week in the *New Zealand Herald*...

The number of jobs advertised in Auckland increased to 17,812 [in October, up 1.1%] on September, while positions in Wellington and Christchurch continued to decline. The increase in Auckland job advertisements followed a 0.3[%] rise in September... Nationally, the number of job advertisements in October was up 0.5[%], recovering from a 0.2[%] fall in September, but still down 5.4[%] from October 1995. - 1996

The official number of jobless in N[Z] in the household labour force survey of December was 186,000, or one in ten people of working age. The Maori rate of unemployment at this time was 15.1[%]... and the Pacific Island rate was 14.8[%]... compared with... a Pakeha [(European)] rate of just 4.7[%]... In January 1997 there were 164,147 people registered as unemployed. This meant that for every job notified to the Labour

Department's employment service there were 22 registered unemployed people. On top of that there is a lot of hidden unemployment among people on other benefits such as superannuation, the DPB and the sickness and the invalids benefits. It will be clear to many on such benefits, and to the D[SW], that the unemployment figures are kept artificially low because of the disproportionate take-up of these benefits in the period that we have had mass unemployment. What this tells us is simply that there are not enough jobs in this country now...

The number of job advertisements continues to fall... Compared with... last year, the number... has fallen on a trend basis by 7.5[%]... Auckland had 1[%] fewer advertisements over the month, with the number down 8.7[%] on an annual basis.

...*Bleak job news for young*... A second survey of the Auckland economy has forecast a rise in regional unemployment over the medium term... [due to] large numbers of young people entering the workforce... The regional council study also notes that while unemployment is well below levels reached in the early 1990s, "its tendency to affect the young and Maori and Pacific Island populations is a concern."

...The Minister of Maori Affairs... is demanding that talks stop and action starts on the issue of Maori unemployment. Responding to figures that show Maori have the highest jobless rate (18.2[%]), he said it was time to get rid of the bureaucrats and to go straight to the problem. "We have to cut out the middleman and go to the coal face. Let those who are in the middle of the problem fix it." ...A glaring statistic to emerge from the latest figures was that the highest number of unemployed were in the 15-to-24-year-old age bracket, and the longer they were unemployed, the less inclined they were to seek work. [The minister] said there was no quick-fix solution, but if things were not turned around quickly it could be too late.

...EXPECTATION of a reliable job is being erased as nimble organisations strive to keep pace with rapid change... ENJOYING a life-long career with one organisation [also] is no longer a realistic expectation... Redundancy is now an ongoing fact of life, as much for senior executives as for the lowliest employee, according to... a career management guru from the U[S]... The idea of a job for life [has] been "beaten out of us,"... "People no longer expect job security," says... [a] human resources consulting... and outplacement specialist... Around 70% of [its] clients have lost jobs before. Even the younger age group – 25-30 years – are unemployment veterans. "Most people are now pragmatic... There is a new level of acceptance. Only a small percentage have difficulty coping with job loss." This was not the case 10 years ago when... cutbacks... "re-imaging"... change of ownership, efficiency drives, shift to centralisation from regional focus, and relocation all signalled probable job casualties... It was a time of great stress for senior managers who suddenly lost their jobs... "We were seeing top people from large organisations. Many would come to me in tears. There was... a stigma about job loss... and... no support network... Sacked staff were stripped of their dignity – the ritual handing back of company car keys, clearing out the desk, and being escorted off the premises. That was brutal..." ...A client in the senior (around 50 years) rung would typically have had little experience in the job market and have a lot of catching up to do. "These people need to be trained in how to apply and find a position,"... The middle age group of jobseekers (around 40 years), saddled with a hefty mortgage and family commitments, did not have as much discretion as the older category... "...Today it's not such a sudden departure. The process is more civilised." ...Most of the major staff cuts had been made by the early 1990s... [However,] job loss could be a positive experience. "You get to have time with your friends, meet new people. Some managers have no idea what goes on in the world outside their office."

...A rise in the number of older people claiming discrimination in the job market shows bigotry against the elderly, says the president of Auckland Grey Power. Thousands of people aged in their 50s were "put on the scrapheap" by employers who wanted to employ younger people at cheaper rates... when many... older people... would accept... junior wages... One man, aged in his 60s, said employers were often asking job applicants for qualifications that had only recently been offered... The rejection led to intense stress and depression... [By the way, unemployment in N[Z]... has fallen to one of the lowest rates in the developed world... [according to] figures... based on standardised seasonally adjusted unemployment rates prepared by the U[S] Bureau of Labour Statistics. This places N[Z] fourth among 16 developed nations... [during] December... And N[Z] was one of five developed countries to have a drop in unemployment since 1991, tumbling from 11[%]. NZ's... rate was well below the 8.6[%] recorded in A[US], almost half those of France, Italy and Sweden, and a third of Spain's 21.7[%] – although NZ is still a long way behind Japan's 3.3%. However, it pays to]... ignore the rigged numbers in Japan.

...The unemployment rate for the December quarter fell from 6.3[% to 5.9%] – the lowest rate recorded by the household labour force survey since January 1988. But Statistics N[Z] says the fall is largely the result of women leaving the workforce... [to] look... after children... during... the Christmas quarter... Because they are not available for work, they are not counted in the figures. The jobless figures are also linked to new rules that allow beneficiaries to earn more before their benefit is reduced. The new rules took effect from July 1 last year and allowed beneficiaries to earn \$4160 a year or \$80 a week, instead of \$50. That attracted people back into the workforce soon afterwards, with the September quarter's figures showing an increase in women working... The Government Statistician... said one could only speculate over the reason for the reverse in the December quarter. It could be that childcare is more available during school time than over [the holiday period]. It might also be that a beneficiary earned the \$4160 in the first three months after the new rules took effect.

...Registered unemployment fell 3.5[%] to 152,711 last month... The Employment Service figures also show a slight increase in the number of people in temporary work or subsidised employment – 15,588 compared with 14,073 last year.

...The number of people on the jobless register rose 5130... during April, the Minister of Employment said yesterday. Slower economic growth contributed to the increase.

...Oops! When the Employment Service said unemployment rose last month, it really meant it had fallen. The embarrassing error was caught when checks were being made about why the registered unemployed had risen so much... In fact it fell 974... the Minister of Employment... said yesterday[– c]learly angry with having to needlessly deflect criticism about rising unemployment... [T]he... error happened when a link that feeds mainframe computer information to a separate database system was misprogrammed...

A botch-up between Government departments has resulted in the number of registered unemployed being understated by more than 10,000. Social Welfare has found 10,700 recipients of the unemployment benefit are not registered with the Labour Department as job seekers. The Minister of Employment... has asked for a report on what went wrong. "Essentially it's about two computers not talking to each other as well as they could," a spokeswoman for him said... [I]t remained to be seen how many of the 10,700 now re-registered with the Labour Department.

...The number of registered unemployed rose by more than 7000 last month... to 170,624... but the Government lays most of the blame on the discovery of previously unregistered people claiming benefits.

...About 12,000 job seekers have been added to the Employment Service's list of the long-term unemployed. Previously job seekers who left the register for short periods were recorded as new job seekers if they returned to the register after eight weeks. The new limit is 13 weeks.

...Unemployment is at its highest level since December, 1994, after rising to 6.7[%] in the June quarter... [A]lmost 12,000 people had not worked in over four years[; '1080 have been on the dole for more than 10 years']...

Govt to declare war on unemployment... N[Z]'s... Employment Service... [plans] to slash unemployment in just over three years to ensure no one is registered out of work for more than six months... About half of... [the] registered unemployed have been out of work for more than six months. That... will drop to zero by the end of 2001 if the service meets its target... [In related news, t]he Minister of Employment... yesterday rejected suggestions that the community taskforce employment scheme was slave labour... [The minister] said the programme had been going about six years and nearly 46,000 jobseekers had gone through it, most of them voluntarily.

...An influential Asian business journal has urged [AUS's P]M... to be more radical and learn from N[Z] in his efforts to tackle unemployment in what it describes as possibly the Southern Hemisphere's most inflexible labour market... The message for... [the PM came a week after he had] said his plan to make young people work for their unemployment benefits in a bid to tackle the country's high jobless rate would not create slave labour... An editorial in... the... latest issue[of] the *Far Eastern Economic Review*... agreed with [AUS's]Opposition leader... in dismissing the P[M]'s controversial work-for-the-dole proposal as "a Mickey Mouse stunt."

...The A[US]n federal Government would introduce legislation next Tuesday to amend the Social Security Act to allow the work-for-the-dole scheme to be compulsory, the P[M]... said yesterday. He said... that the scheme would apply to 10,000 18 to 24-year-olds in 50 to 70 pilot schemes operating in areas of high youth unemployment... [P]articipants would receive award wages up to the value of their dole payments, and be expected to work an average of two days per week and six hours a day, for a minimum of six months. He warned the Senate minor parties not to obstruct the scheme. The A[US]n Democrats, although welcoming the concept... have expressed reservations about compelling people to join... [Meanwhile, AUS]'s unemployment rate was a seasonally adjusted 8.6[% last month]... Total employment rose 74,700 to 8.4506 million...

SERIOUS job losses are predicted in one of the many reports released last week on the state of the [NZ] economy and prospects for growth... [U]nemployment... would reach 8.3% in June next year, and stay at 9% for the following two years... [Incidentally, t]ens of thousands of... people... turned Brussels into a sea of colour and noise yesterday as they vented their anger at rising job losses, inhumane firms and uncaring governments.

...If you look at the bare figures, Britain's unemployment record is the envy of Europe. A jobless rate of 5.2[%] – the lowest in 17 years – is a distant dream for Europe's[other] major powers... About 1.5 million people have dropped off the dole queue in Britain since the economy began climbing out of recession five years ago... Not satisfied with rapidly falling unemployment... the... Government... put a "welfare-to-work" programme at the heart of its... [latest] manifesto... Britain's Chancellor of the Exchequer (finance minister)... has not been slow to extol the virtues of British policies to his European counterparts. He says Europe must copy Britain and free up its labour markets... Not only... are... British... benefit levels... lower... but... the power of trade unions... has... been severely curtailed over the past 15 years... [Consequently,] the number of working days lost through strikes has been cut by 94% from the levels of the 1970s... [However, the] director of the London Business School's Centre for Economic Forecasting, said the 1980s union-bashing in Britain was not the key to a more vibrant jobs market... [Furthermore,] businessmen in Britain are complaining that they cannot find the skilled workers they need... "It is undeniably true that we are enjoying much lower jobless levels, but where Europe shapes up much better is in skills levels," said [the]development director at Britain's Employment Policy Institute... And many of the jobs that have been created in recent years have been temporary or part-time, without the benefits most workers take for granted... such as... sick pay or holidays.

...The U[S] unemployment rate slid to a 24-year low of 4.6[%], as payrolls rose sharply in November, showing a strong economy at the beginning of the crucial holiday-spending season... - 1997

The quest for economic security has been with man from his beginning, but until the Industrial Revolution, it lacked sufficient impetus to culminate in extensive group action. As more and more people became dependent on exchange of their labour for wages, the adverse consequences of unemployment became ever more painfully apparent to greater and greater segments of the population. Inability to work was often entirely beyond control of the individual. Injury and sickness might strike despite every precaution. Moreover, despite a person's best efforts, he was often helpless in the face of wide swings in business activity... For most people unemployment meant destitution, and workers in industrial nations sought solutions to the problem.

Many people were attracted to the alternatives to capitalist democracy which emerged in the 1930s... [B]oth Fascism and Communism claimed there was no need for mass unemployment[. In] comparison, the efforts of democratic governments like America's and Britain's seemed puny... Despite the clamour from [both the] Right and Left for action, the British government wasn't diverted from its orthodox economic line[– still inspired, perhaps, by the Irish potato famine in the 1840s, when 'Thomas Malthus was brought, by the logic of his economics, to testify to a royal commission that the country would be better off without one million redundant Irishmen.'] Elsewhere countries continued to turn to political extremes, but there was one country where the demand for intervention came from the Centre. In Sweden the growing Social Democratic movement campaigned against the Swedish government's inaction... Sweden's plight was not inevitable, said the Social Democrats, if the government spent more public money to create jobs... Swedes were paid real wages to rebuild their country. There was government money to help fishermen and factory workers. The Social Democrats didn't try to balance the nation's books. "There was no question of cutting back on anything, [but]rather of finding more things to be done. Pushing forwards instead of going backwards..." ...Foreign visitors came to study... a government that was neither Fascist nor Communist but whose stated purpose was to put people back to work. With nowhere was the contrast greater than the U[S]. In 1932 Washington was under siege. The Capitol building was surrounded by unemployed [WWI] veterans from all over the country. Their only assets were the bonus certificates they'd been given on leaving the army which promised a cash sum years later. "...a whole lot of people speak of ...u[s] as tramps. By God, they didn't speak of ...u[s] as tramps in 1917 and 18..." President Hoover had to decide what to do about the veterans when the Senate rejected their demands. The marchers had stayed on, camped out in central Washington. "It's war! The greatest concentration of fighting troops in Washington since 1865." "I knew... that they might be attacked... I saw the soldiers advancing into the[veterans'] camp... I'd never seen anything like it. They systematically went down the lines, burnt up all the tents and all the possessions of all the people there... I thought this would be the finish of Hoover." ...That summer, Americans were rallied by a new message. "This is more than a political campaign, it is a call to arms. Give me your help, not to win votes alone, but to win in this crusade to restore America to its own people." [Franklin]Roosevelt ran for the presidency saying the Depression could be beaten... The American people gave Roosevelt a land-slide victory... He offered a new style and a new confidence... "I shall ask the Congress for the one remaining instrument to meet the crisis... [– the] executive power to wage war against the emergency as great as the power that would be given to me if we were in fact invaded by a foreign foe." When he took office in 1933... 4 out of 10 industrial workers were unemployed. But however grim the situation, the new mood was irrepressible. Roosevelt described his program as bold, persistent experimentation... In a matter of weeks Washington was transformed by the rhythms of the 'New Deal'... [– in which t]he Administration tried to kick-start recovery and tackle unemployment. 16 major measures were put before Congress and passed in the first 100 days. There was immediate help for American farmers, who were facing ruin... "President Roosevelt came on the scene and what he done was that he would pay the farmers... 30 or 35 dollars... for a cow because there was so many cattle and not enough hay or water... then they would take it to the caning factory and they would can this meat, then they would give it to us... When you don't have food and somebody gives you food, well, what could you think but that he cared for you?" ...People were put back to work on schemes that would benefit the country at large. The Works Progress Administration was one of many new government agencies. There were jobs on roads and public buildings. Men were sent to remote areas to do conservation work... Roosevelt was the president to use the new power of radio on a regular basis. "I stand... by my refusal to accept as a necessary condition of our future a permanent army of unemployed..." Assistance from the New Deal was desperately needed in the southern states. 8 million livelihoods depended on one crop – cotton – and prices had fallen 70% since the [stockmarket]crash... But the tenants and farm labourers were confused by a government scheme to try to raise prices by destroying crops... Nearly half the cotton fields were ploughed up or left fallow, but the government compensation for this didn't reach the tenants and the labourers... They found that it was the land owners who benefited... Many who

protested were evicted. Nor could the New Deal help the struggling midwestern farmers whose poverty was made worse by years of drought and dust storms... Up to a million made the trek west... “...people would beg, borrow, steal or[do] anything just to get enough gas to get a few more miles.” At the end of their long journey the migrants didn’t discover the promised land of their dreams. California was still in the grip of the Depression itself[so t]he influx wasn’t welcomed... For Britain’s unemployed there was no great schemes of public works and no New Deal. Instead of government action they got royal sympathy... Britain’s mass unemployment was still seen as an act of God... “...the government turned a deaf ear to all our pleas[,” says a shipyard worker]... But the shipyards weren’t idle for much longer. The government... had to respond to what was happening in Europe. Hitler was building up a new navy and[had] started to seize territory. The German... [aggression was] good news for [Britain’s] northeast... “Thirteen years ago Britain launched her last battleship... [– at least] we thought she might be the last we should ever need to launch. Today those dreams lie shattered...” The shadow of war was growing over millions of lives but it was rearmament that brought back pay-packets... The late 1930s turned into a period of revived production and trade... The last countries to rearm were the last to come out of depression. Once the war started America[’s recovery was also] assured... For the duration of the war everyone was needed. But when they looked forward to a better post-war world, people hoped politicians had learnt a lesson. In future they’d expect their governments to provide jobs for all... Mass unemployment would no longer be tolerated. The memories were too bitter.

Unemployment as a major national and world-wide problem refers more to persons able and willing to work but unable to find work. It is a particular problem of an industrial society, in which mass production, changes in fashion, introduction of new machinery, seasonal fluctuations in business, and similar factors share responsibility for varying amounts of unemployment. It becomes most acute in times of business depression. Some unemployment, perhaps 5% of employable persons, is considered normal in a free enterprise system... Since a perfect equilibrium between production and consumption can never be reached, unemployment is not likely to disappear unless the overflow is absorbed by public works and compulsory labor services. The latter, with their low level of wages, are contrary to democratic principles but account largely for the U.S.S.R.’s claim that it has banished unemployment.

The Authoritarian state systems... seem to solve the problem of unemployment at the expense of efficiency and of freedom.

For decades the CCP maintained that, in contrast to the pre-1949 era, unemployment had been eliminated in urban China... [However], the party achieved its goal through tightly controlling rural-to-urban migration, particularly after 1955, and by periodically forcing millions of urban residents to resettle in rural areas. Despite these stringent controls, in the late 1970’s the number of unemployed workers in cities and towns was conceded to be as high as 10 million, or about 10% of the urban work force... After 1978 urban unemployment was substantially reduced, though not eliminated, through accelerated hiring by state units and relaxation of barriers to self-employment and private hiring... in service industries such as tailoring and restaurant operation.

Soviet experts say serious economic problems are a prime factor behind [recent] unrest, particularly in the central Asian republics where officials say about one million people are in effect out of work. - 1989

Before 1989 ended, the Soviet Union (USSR) had begun to disintegrate, and a few years later former member-nations such as Russia became part of the so-called free market world – ‘leaping out of the pan and into the fire’, so to speak!

The outstanding faults of the economic system in which we live are its failure to provide full employment and its arbitrary and inequitable distribution of wealth and incomes... Moreover, the evidence indicates that full, or even approximately full, employment is of rare and short-lived occurrence. - The General Theory of Employment, Interest and Money

The lowest unemployment rate (that is, the closest the United States ever came to the concept of full employment) was achieved in 1944 during wartime (1.2%); the highest rates were in 1894 (18.3%) and 1939 (17.2%).

Full employment is also more likely to occur for a generation following a war because those killed while fighting are eliminated from the future work-force.

In 1959 a British election was fought on the slogan ‘you’ve never had it so good’. “The country has never been so prosperous, as the P[M] has said, ‘The standard of living has gone up, we’re better fed, better clothed, we’re using more electricity, more people have motor cars, bicycles, televisions, and a host of other things which only a few years ago were the luxuries of the few’.” ...After the war... all politicians had agreed it was the government’s duty to see there were jobs for all. Full employment had become a reality... In 1960 unemployment in Britain was just 1%, and real wages went on rising... [C]heap credit made spending even easier. Televisions, carpets, cars, were bought on the never never, with plenty of time to pay, and people found new ways of spending their money in new places... In Germany, for five years, unemployment never rose above 1%...

New Zealand is a prosperous country. It’s people are happy and fully employed. - 1954

However, by 1978 there were ‘25,000 NZers registered as unemployed’, and by 1980 the number of registered unemployed (which doesn’t take into account the number of people who don’t work because they can afford not to) had risen ‘above 40,000; then above 100,000 during 1988, before reaching a post-war record of 279,834 in 1993’ (when there were ‘1,510,100 employed persons’). Clearly, NZ’s politicians have long ceased to agree that *it was the government’s duty to see there were jobs for all!*

From guaranteed jobs for all to doleful days... Young N[Z]ers are often surprised when told this nation once stood head and shoulders above all others in providing jobs for virtually everyone who wanted work. Certainly nobody now under 30 has been lucky enough to live in such a blessed country. Perhaps those for whom 1967 is not such a distant memory should keep quiet about N[Z]’s former state of grace, for shame at not having bequeathed it to their young. From 1938 to when a crash in wool prices prompted a devaluation and loosening of import controls, N[Z]... was untainted by the blight of unemployment which subsequently turned the land of the long white cloud into one of gloom for hundreds of thousands of its people. As for that tall-sounding tale about being able to count unemployment beneficiaries on the fingers of one hand[a]... search through musty yearbooks confirms that on March 31, 1956, just five souls were drawing the dole. The unemployment register was never a very reliable measure of joblessness, though, and the census conducted the same month found 7936 people wanting paid work. Even so, the... Government’s Minister of Labour... still felt entitled to boast some years later that there were fewer than “a hundred genuinely unemployed people – and I know

the file on every one of them.” Now unemployment remains stubbornly above 6[%], and despite]... the Government’s avowed intent to help businesses to create more jobs, it is shy of announcing specific targets.

Present governments dishonestly use unemployment for their own ends as a means of controlling inflation... and of social engineering.

The market economies tolerate the presence of unused capacity and unmet need – of unemployment and poverty – in their populations.

Helplessness is assured by the industrial reserve army – by the rising and falling but enduring margin of unemployment which is part of the system. Any worker at any time can be flushed into this reserve, which ensures that he[']ll be co-operative and... accept the wage... offered [to] him.

Hello... Work today? But today’s Saturday and I’m planning to play golf... Those are the latest unemployment figures... Okay, I’ll be right down.

When there are less jobs than workers, employers gain the power to keep wages low – which increases their profits!

labor, in economics, one of the main factors in the production of wealth, the others being land and capital... The share of the joint product which should fall to labor in the shape of wages has been the subject of much discussion and conflict, and, since the Industrial Revolution, has loomed large in political and economic debates. One idea is that labor is a commodity to be bought in the market at the lowest possible price...

[But p]overty from low wages denied choice and created its own dependence.

Whereas the Soviets tried to use authoritarian methods to gain equality for the workers, in capitalist countries this task was performed by UNIONS. Unfortunately, when unions don’t get what they want, they tend to STRIKE – which, basically, means the same thing as being unemployed!

on strike... employees’ concerted refusal to work unless a grievance is remedied... The first strike on record took place in Egypt in the mid-12th c. BC... when tomb workers at Thebes downed tools because their rations had not arrived; it caused considerable alarm.

You can’t treat the working man this way. One day we’ll form a union and get the fair and equitable treatment we deserve. Then we’ll go too far and get corrupt and shiftless... [a]nd make life-long connections to the world of organized crime.

As dawn breaks over the crossroads of America’s industrial east, thousands of trucks are grinding their way on to the Pennsylvania turnpike... Suddenly a man with the second most famous name in America (after Kennedy) alights from his campaign van... “Good to see ya! ...Let’s take care of business...,” he says sunnily... Late this week, [the man] thought he had finally cleared his way to becoming the next president of the biggest, most muscular trade union in the American West – the International Brotherhood of Teamsters, made infamous by his father... [who] ran the Teamsters from 1957 until 1963, when [he] was... jailed for fraud and jury intimidation. Corruption was the union’s calling card; guns and knuckledusters were the tools of industrial relations. [The father] invested union funds in the... construction of Las Vegas, and one biographer... claims he used a union local as a front for a narcotics operation. The hugely popular [father] disappeared in 1975. Some say he was buried on a turnpike or beneath the end line at the New York Giant’s football stadium. Others think he was crunched in a car-wrecking yard... [His son] has another theory: an abattoir meat-shredder in the Midwest. The Government, he said, will never let him find out what happened. The... [father] made a Faustian pact with organised crime to protect his men. Now the Teamsters organise all kinds of people – from airline staff to the guys who dress as Mickey Mouse at Disney World. The union has 1.5 million members, with an annual budget of \$560 million a year... On Monday, [the son’s] rival, the Teamsters’ supposed Mr Clean – was disqualified by a court from the forthcoming election because of improper fundraising. [Mr Clean’s] disqualification horrified the... establishment... His slogan was: No Corruption, No Excuses, No Exceptions... Whereas the old Teamsters’ corruption came from the union itself, this alleged... sleaze sprang from a process designed by the Government, and the party of the American President. And not only that: it seems to have been protected by that Government... But meanwhile [a]Judge... of the U[S] District Court in Manhattan has ordered... investigators... to look into accusations that [the son], too, received improper campaign contributions... The scandal threatens to decapitate the labour movement. - 1997

A N[Z] Labour Party was formed in 1910, but it was renamed the United Labour Party in 1912. It represented the ‘moderates’ of the trades councils. The militants were represented by the ‘Red Federation’ and its political subsidiary, the N[Z] Socialist Party. The militants fell into disarray following the defeat of the 1913 watersiders’ and miners’ strike. This and the war – which many people on the left felt presaged the collapse of capitalism – brought the disparate groups of the Labour movement together within the N[Z] Labour Party in 1916... The Labour Party gained eight Parliamentary seats in the 1919 election...

The major domestic achievement of... N[Z]... was a system of export marketing agencies in which authority was shared by producer and state. These laid the foundations of a collectivist marketing structure... When overseas prices began to recover in 1934, the country was financially strong, but little had been done for the unemployed. Conditions in towns and relief camps led to rioting, violence, and widespread discontent, all of which were favourable to the Labour Party... During the 1920s it was predominant only in working-class electorates. In its quest for votes, however, Labour increasingly abandoned its socialist theories and adopted welfare and credit-reform proposals, which had wider appeal. In the election of 1935 Labour won a considerable victory... The National Party... was rendered temporarily ineffective... The farmer enjoyed increased earnings; the worker, increased wages and shorter hours. Jobs were multiplied by a public works and housing program. The education system was revitalized. In 1938 the Social Security Act provided a state medical service, extended the pension system, and increased benefits. The extension of secondary industry was accelerated after the outbreak of W[W]II... The alacrity with which N[Z] went to war in 1939 showed that dominion autonomy had not weakened the country’s ties with Great Britain. At first the... troops... saw action in Greece, Crete, North Africa, and Italy... At home the total economy was mobilized in the war effort. Controls were extended over the whole economy. Conscription... directed allocation of the labour force to strategic industries... heavy taxation, war loans, bulk purchase, and controlled marketing kept the economy in a firm grip... After 1941... N[Z] forces were also engaged in the Pacific. Well before the end of the war, the strain upon the country’s manpower, together with the demands of home production, forced a reduction of commitments... The Pacific theatre was dominated by the U[S], the forces of which provided N[Z]’s sole defence. The fact that disaster was averted by American and not by British forces required a change in N[Z]’s attitudes; security was conferred by a foreign, though friendly, power. External relations in the postwar period reflected this new situation... Discontent with [Labour’s] controls and the rising cost of living helped... the revival of the National Party, which culminated in victory in 1949... The National government

benefited... in 1951... through the ANZUS pact... [-] a defensive alliance between A[US, N]Z... and the U[S - and]... from its vigorous handling of a serious waterfront dispute...

February 15, 1951, marked the start of the longest and costliest sustained industrial upheaval in our nation's history. Draconian emergency regulations were imposed, virtually unheard of in a democratic state. By the time the 8000 wharfies and their allies finally acknowledged defeat, 151 grim days later on July 15, the country is estimated to have lost anything from £42 million to £150 million from a dispute that began over a 3d (6c) an hour wage-bargaining gap... [L]ost wool sales alone accounted for £31 million in the midst of the Korean-war inspired export boom, and more than 20,000 workers were off the job at the height of the "big blue." ...But the British shipowners who allegedly set up the dispute ended 1951 with record profits, having unilaterally imposed a surcharge on the country's freight rates while leaving [NZ]'s National Government... to clean up.

On 30 January 1951 the Arbitration Court issued a general order raising wages by an unprecedented 15[%], but... the... Waterfront Authority... employers'... [offered] a mere... 9[%]... This, described as a final offer, was clearly provocative, designed to goad wharfies into action. And it had the desired effect... A special national executive meeting[of the Waterside Workers' Union] on 13 February decided to request branches to operate immediately a 40-hour overtime ban. The employers... retaliated... by placing men on penalty... [and] refusing to offer work unless a man was prepared to do overtime as required. Wharfies rightly regarded themselves as locked out by shipowners... The Auckland Chamber of Commerce wired... [the P]M... demanding "urgent action"... but cabinet needed no prodding... The government, dropping all pretence of impartiality, took the shipowners' side: it gave the union an ultimatum to resume overtime... declared a state of emergency... [and created the] Waterfront Strike Emergency Regulations... which gave the authorities powers which normally exist only in authoritarian states. It became an offence to take part in a declared strike... or to encourage, procure, incite such a strike or to print or publish anything likely to encourage, procure, incite, aid or abet a declared strike. The... Minister of Labour... could appoint a receiver to seize union funds... Picketing, processions, meetings and a display of posters were banned and police officers above the rank of sergeant gained the right to enter any land, premises or place to enforce these regulations... The *Auckland Star* even wanted the police armed, with orders to shoot... The armed forces were authorised to do... strikers' work... Auckland newspapers had gone overboard praising the work of the armed forces with headlines such as "Servicemen Show How Wharf Work Can Be Done"... On April 9 however the *N[Z] Herald* had to admit that the port of Auckland was choked with 42... ships, 15 of them riding at anchor in a long queue stretching beyond the harbour limits. Some of these vessels had arrived well before the start of the lockout and were still waiting to be unloaded. Ironically, the union's earlier campaign against peacetime conscription had some belated success when the government suspended compulsory military training and sent some 4000 18-year-olds home, in order to free their instructors and other regular force personnel for wharf work... In the long run the armed forces could not keep the ports working... On April 27 the Auckland Labour Department sent telegrams to 500 men who had registered for work, asking them... to form a new port union. The locked out men quickly learned of these plans... Several hundred wharfies watched in Queen Street as 115 scabs filed past under police protection and under a barrage of abuse... On May 18 some 500 wharfies assembled opposite the wharf gates at lunch time. They stood quietly for some 20 minutes, until police linked arms and pushed them up Hobson St towards the Trades Hall. There was no violence, but the men were back a 5pm, when the scabs were due to stop work. This time the police, who had been forewarned, were there in force, together with "suitably equipped" army, navy and air force platoons... "The police absolutely lost control of themselves," reported the *Bulletin*, which accused the authorities of provoking trouble by attacking a peaceful gathering... [T]wo days later [a union leader] quoted the number of a constable whom he accused of vicious behaviour in this incident. One immediate result was that Auckland policemen removed their collar numbers to avoid identification... Rather than tackle the wharf area again, the union decided to hold a march through town on Friday, 1 June... A strong police contingent stood ready to intercept the procession in Queen Street... [After] the marchers... refused a request... to disperse... [the] Inspector... ordered his men to move in... which they observed with zest... Not until early July did the National Strike Committee approve a return to work; by then Auckland wharfies found that their jobs had long been filled. - WHARFIE

...the 1951 waterfront dispute was, in the words of one observer, "[a] full-scale industrial battle..." [that 'nearly brought the country to civil war']... Many of the... 20,000 workers... involved saw it as part of an international struggle by working men to introduce a new and more just system of bargaining between capital and labour... Conservatives came to see the dispute as "the most outrageous challenge ever issued to the authority of the State." ...The dispute still arouses emotions and prejudices in most N[Z]ers' hearts, and its reverberations can still be felt by all those concerned with industrial relations in N[Z]. In 1950 the N[Z] Waterside Workers' Union was one of the most powerful and successful... in the country... The union's challenge to the National Government of the day over pay claims and the principle of direct negotiations with employees resulted in... a determined union and an even more determined Government... [adopting] attitudes from which it became increasingly difficult to withdraw... The *impasse* was not helped by emotional accusations of subversion on the Government's part, or by the one-sided attitude of the press. The waterfront workers, isolated and disparaged by most other members of the community, established among themselves an *esprit de corps* which saw them through 151 days of increasing hardship before finally the sheer weight of numbers and political power of their opponents forced them to capitulate... N[Z]'s system of industrial conciliation and arbitration was established in 1894, fifty-seven years before... the onslaught of... 1951. The unique act... was designed on the one hand to strengthen labour, on the other to save it from itself, by limiting the likelihood of strikes. The... IC & A Act... promised the protection of the law to any group of fifteen workers who registered themselves as a union under the Act. As a consequence of registration, a union had to accept that a strike was illegal while any industrial dispute was being considered by a Board of Conciliation or by the Court of Arbitration. In the first few years of the new system workers improved their position within the economy, while employers... viewed the system with disfavour. However, in time attitudes reversed... Not only did the Arbitration Court appear to be keeping wage rises to a minimum; the provisions... restricting the use of the strike weapon... had also ensured a measure of stability in industry... [Therefore] employers were anxious that industrial activity be confined rigidly to the system of compulsory arbitration. And governments... were prepared to assist them to that end... The... Labour Disputes Investigation Act 1913... the... Public Safety Conservation Act 1932... [and the] Strike and Lockout Emergency Regulations 1939... [meant NZ] Governments possessed virtually limitless powers to deal with any strikes. Yet, although it became increasingly dangerous, industrial unrest continued. After W[W]II the number of working days lost through strikes rose; in 1949 more were lost through strikes than ever before in N[Z]. Two years later... the National Party[, which was also frustrated]... at having to administer the welfare state inherited from Labour... embarked on a crusade in the name of eliminating strike action... The number of days lost through strikes declined only temporarily. - confrontation '51

The most disruptive year in recent decades was 1986 – the year of a major dispute at the Tasman pulp and paper mill – when 1.33 million working days were lost in disputes. The 1986 figure topped even 1951's, when 1.16 million days were lost... The number of stoppages increased significantly after 1969[– 'in 1970 NZ lost 277,000 working days in industrial disputes, but unemployment was responsible for 503,000 working days lost' –] reaching a peak of 538 in 1977. In the 1980s, there was an average of 326 a year...

As measured by the number of work stoppages, strikes, lockouts, etc. [in the US], the 1980s were marked by relative industrial peace... From 1980 through 1989, there were 831 work stoppages, involving 5.066 million workers, and 119.542 million lost workdays compared to 2,888 work stoppages, involving 14.878 million workers and 260.098 million lost workdays from 1970 through 1979... In 1991, there were only 40 work stoppages involving 392,000 workers and 4,584,000 lost days.

[In comparison to the US,]labor unions play a modest role in China since they do not have any power to bargain on behalf of their members... Although the... All-China Federation of Trade Unions, organized in the early days of the People's Republic... was abolished during the Cultural Revolution, ostensibly for resisting the extension of the revolution into the factories and for supporting a conservative line, it was resurrected in the late 1970's. Like other "mass organizations" it is under the control of the CCP and serves in large measure to mobilize support for party policy.

South Korea has been plunged into a crippling general strike... Hospital workers walked out yesterday, leaving only emergency care, as industrial action spread from factories and shipyards to key services... The Korea Federation of Trade Unions had planned a 24-hour stoppage from... yesterday... but its chairman said the walkout would now last at least until the end of the year... He said that bus services in six cities, including Seoul, would be halted... The federation, generally seen as moderate, is the only union umbrella organisation recognised by the Government. Its new militancy is an ominous development... The outlawed Korea Confederation of Trade Unions called out its... members on an indefinite strike on Thursday... The... strikes... are... in protest at a new labour law... The law gives employers the right to replace striking workers. But... the Korean Employers Federation pledged... that member companies would not seek to use this provision to break the current strikes... The Government declared the strikes illegal, but although it has threatened "stern counter-measures" there was no sign yet of any crackdown... Opposition members of Parliament staged an overnight sit-down protest against the Government's tactics in ramming through the labour law...

CRIPPLING strikes have gripped key A[US]n industries, erupting into violence at one picket line, as trade unions flex their muscle ahead of major changes planned for the nation's labour market... [Meanwhile, t]he general strike in South Korea [also]turned violent at the weekend as thousands of workers took to the streets demanding the abolition of a law they feared would jeopardise... decades of near-total job security... Fighting erupted when police fired tear gas to break up a rally of about 7000 workers and students... Many South Korean workers assumed that once they entered a company they had a job for life... The new law... was supposed to bring South Korea's labour conditions up to par with those of other economically advanced nations... Businesses said they needed the flexibility to restructure and lay off workers to compete in world markets... South Korea was expected to register a record \$US20 billion... trade deficit this year... A promise to revise its labour law was part of South Korea's campaign this year for admission to the Organisation for Economic Co-operation and Development (OECD), the Paris-based think tank of rich countries. But an OECD labour advisory group condemned the new South Korean law, calling it a "slap in the face to both its own workers and international public opinion." ...South Korean unionists accused the Government of trying to turn workers into slaves... - 1996

South Korea's outlawed union said yesterday it was abandoning its one-day-a-week strikes, partly due to economic turmoil caused by the collapse of the country's second largest steelmaker, the Hanbo Steel Co. But the Korean Confederation of Trade Unions still plans full stoppages starting on February 18 unless the Government scraps a controversial new labour law... However, [South Korea's]President... has rejected union demands...

Behind the surge of strikes in South Korea lies a political and cultural shift. The country is in the midst of moving from a system founded on paternalism and authoritarianism to one based on more liberal values. The new labour law, which has provoked the strikes, was meant to be more liberal in two respects. It would make it easier for employers to sack workers. But it would also make it easier for unions to organise. Many of the workers marching on South Korea's streets are angry because they believe the Government has forgotten the second half of its promise... [In related news, a]bout 700,000 Israeli workers went on strike yesterday, closing down Ben-Gurion International Airport... the Tel Aviv Stock Exchange... the country's seaports, railways, Government offices, banks and state-owned industries. The strike was called over demands from[the] Finance Minister... that a pension agreement signed by the previous Labour Government be cancelled or drastically modified.

...A strike by 700,000 workers paralysed Israel for a second day yesterday... [Incidentally, t]ime lost to strikes and other industrial disputes in A[US] fell 27% in April, even though the number of disputes rose... to 39... compared with 35 in March... There were 34,300 working days lost... the A[US]n Bureau of Statistics said... The number of employees involved in industrial disputes fell to 28,800 in April from 34,800 in March... For the year, though, the amount of time lost to disputes rose 32[%] to 829,300 working days...

The number of working days lost[in NZ] to industrial strife shrank in the May year to its lowest point in almost four decades. Seventy stoppages caused the loss of 20,587 working days in the year at an estimated cost to workers of \$2.7 million in wages and salaries. By comparison, employees lost an estimated \$6.5 million due to stoppages in the previous year and \$4.4 million in the May 1994 year. The last year in which the number of days lost dropped below 21,000 was 1958, when the figure was 18,788... The 38 work stoppages in the private sector cost the affected workers an average \$293 each and the 32 in the public sector an average of \$144.

...Strikes are escalating as employers and employees continue to discover how much industrial action is possible under the Employment Contracts Act... "The [ECA] dampened down the industrial relations scene for five years. But the calm has not lasted. N[Z] has already experienced more than 70 strikes this year, and many have been particularly intense,"... an employment lawyer said yesterday... [T]his year's dramatic rise in strikes and lockouts was due to a combination of factors. They included... dissatisfaction with little or no real wage rate increases for many years, and the expiry of collective employment contracts... Strike action this year has also proved that industrial action could still be used to achieve broader social and political aims. - 1997

The NZ Government reformed its labour laws with the introduction of the ECA in 1991. As a result of this legislation, the annual number of working days lost to industrial disputes rapidly dropped – but at what cost?

It is said that... reforms on the N[Z] model inevitably create more inequality. Inequality is a difficult trend to measure, but high levels of unemployment in the 1980s probably increased inequality; and the resurgence of employment in N[Z] is the most important single force in alleviating long-term inequality. Many economists argue that the unskilled in Western countries can only expect to maintain high wages if they are more productive than the unskilled in less developed countries. Otherwise, owners of capital will move production to poorer, lower-wage countries. The less skilled also compete with new technology, which is often cheaper and more productive than lower-skilled workers. N[Z]'s reforms in industrial relations have lowered wages at the bottom end of the wages ladder, and created many new jobs for those who previously would have remained on social benefits. But N[Z]'s reforms are attacked by some... for focusing on lowering wages rather than improving productivity. Only improving productivity creates the opportunities for higher wages for all, without tax increases that may reduce incentives and damage international competitiveness.

The main purpose of the ECA was to allow employers and employees to negotiate contracts directly, thereby removing the need for unions. In '1986 there were 259 unions in NZ with a total membership of 683,000. In 1996 there were only 82 unions with an estimated 362,200 members.' This follows the trend in the US where, 'in 1996, union membership fell to 16.4 million, or 14.9%', 'from 20.1% in 1983'.

Unionisation has never been high... [in the NZ] retail sector... and... [at] the time of the introduction of the E[CA 10 awards covered]... some 48,500 employees... [out of] 275,000 fulltime equivalent staff... The repeal of the Shop Trading Hours Act allowed shops to open all hours, mergers of major companies in the retail sector, and a general anti-union attitude by retail employers. These conditions combined to form a potent cocktail exerting considerable pressure on retail pay and conditions, particularly penal rates... service pay and many allowances such as laundry, meal, education payments... As one general manager of... [a] supermarket chain... said... "There's no... penal rates for Saturday and Sunday work... we have no clock hours – people can be employed on any day of the week... or at any time of the day on ordinary rates. Penal rates apply only when an employee has worked eight hours a day or forty hours a week. The [ECA] made this possible." But in fact what also made it possible was the conduct of such employers... There was no negotiation. Workers seeking a job had no representation. They simply agreed to the conditions as they got the job... [If] a new supermarket opened [it] offered a contract to workers which was significantly inferior to what applied at... [the chain's other] stores... This was to be repeated by many employers. With 3500 or more applicants for 300 jobs it wasn't hard... There were some absurd contracts. One required 12 hours' notice of absence due to illness. It also said that the worker agreed to be dismissed "if I am even suspected of stealing." In another contract workers could have their hours reduced to one per day from eight hours... [However, even if there was negotiation, it doesn't necessarily follow that workers who are honest, conscientious and hard-working are better negotiators than those who are greedy, lazy or unscrupulous. Furthermore, many managers now receive *bulk funding*, which means they have a limit to negotiate with (i.e., if they pay one person more, there is less left for the rest – or for themselves). In many areas of unskilled employment the rates of staff turnover have increased, due in large part to people searching elsewhere for better contracts, but also due to increased unrest and jealousy because people working together can have different rates and conditions for performing the same tasks. Although an increase in worker turnover decreases efficiency – because it takes time for new employees to become familiar with their tasks, the environment, other staff and customers – few employers seem to care. Perhaps this is due to the fact that every time they need to employ a new worker they get the chance to offer a contract that has less pay and worse conditions! Applicants are faced with signing such a contract or staying unemployed. Incidentally,] 17 workers at an Onehunga timber pallet repair yard will begin their second month of a strike today in protest at being asked to work for 48 hours a week at flat hourly rates ranging from \$8.25c to \$9... A Wood Industries Union organiser... said 27 workers... had signed a "diabolical" two-year contract but the rest would not accept an increase of 15c an hour for cuts to conditions.

...The Employers Federation will spend about \$1 million promoting N[Z]'s economic direction in the run-up to the election... [The ECA], the Reserve Bank Act and the Fiscal Responsibility Act were the key laws employers wanted retained. "The changes over the last decade haven't been easy for anyone, including employers... To go backwards at this stage would be counter-productive."

...A major advertising campaign planned by the Employers' Federation was described yesterday by the New Zealand First [Party] leader... as a "Trojan Horse" for National... He cited this as evidence that National intended to use its "political mates" to do its work in the face of legislative limits on how much political parties can spend on advertising in the three months before polling... [-] \$20,000 for each electorate... [or, for each party, up] to \$1 million...

[The] television advertisement featured a construction worker who said he was better off under the E[CA. However, the]... secretary of the Northern Amalgamated Workers Union... said he doubted the man who fronted the advertisement criticising industrial action in the industry in the 1980s was really a construction worker... Workers in that industry were paid up to 40[%] less now than before the act was passed. The loss of job security had been substantial. Many were working "on call" without a guarantee of 40 hours a week... The Labour [Party] spokesman... said the campaign demonstrated employers' attitudes that workers were lucky to have jobs regardless of their pay and conditions.

... "the right to sell their own labour at the best price they can get,"... [invites] us to believe that all employers will graciously work out what a worker needs to live on and pay that amount. At an Otahuhu fruit shop... the National Distribution Union... had to lead a picket to win a minimum wage for a worker who was being paid \$3 an hour. There have been many cases of extremely low wages... The N[Z] workforce is spread very widely with 75[%] of employees on sites with fewer than 100 workers... In a country where industrial legislation encourages employers (and even compels them in some cases) to compete against one another by paying lower wages, we need good minimums in wage rates and other conditions... [E]mployers who claim they cannot make a profit if minimum wages are increased... are pretty pathetic... They should step aside and let someone... who can use our labour force more productively... have a go...

With overtime, on a good week, he takes home around \$280. Without overtime, the... minimum wage... factory worker and Auckland father of three young children gets... \$255... for a 40 hour week... about \$208... [once] tax is taken out... [A] clutch of supplements from the state... [add \$158.50 a week. His] partner... believes... there are no excuses for employers to pay their workers such a low amount[– unless their motive is for the state to subsidise their profits ('but a brief survey of NZ history shows that the employers have always been the major beneficiaries of the welfare state')]... She said she and her partner made the decision to go off the dole three years ago. But when she got work they ended up \$6 worse off. "...It makes me feel pretty angry really, to think that if he didn't work at all we'd basically be in the same boat. The harder you try the more you lose." Saving for a house is so remote they do not think about it... [However, she] and her partner are lucky. Their[weekly] rental for a small three-bedroom private house is[only] \$240.

...We need look no further for an explanation of the great scandal of 1990s N[Z]. It is the unprecedented sight of real wages declining in the midst of a general economic recovery... Not long [ago two NZ]... parliamentarians were in A[US] addressing a conference on economic reforms. One MP, an architect of the 1991 [ECA], spoke glowingly of the success of that radical piece of labour market legislation. "There have been enormous productivity gains," he claimed. "No there haven't," said the other MP. He was right, and had the figures to prove it... [P]roponents of the act... cannot in the end escape the cold truth: it has been a washout in terms of labour productivity – less than 1[%] growth a year in this decade, well below the growth achieved in previous decades... Now this is very interesting to a professional economist as well as very important to everybody else. Of all the 100-plus major "reforms" that have been imposed on us since 1984, the [ECA] is perhaps the biggest and the purest in a scientific sense. It really does offer a fairly clean test of a specific economic theory. And the theory fails this test (as it has failed in N[Z] before – our great postwar miracle of zero unemployment is impossible, according to the economic model behind the act)... The act is above all an instrument for destroying social cohesiveness. It does this by fostering one-on-one negotiations between employer and employee... Each worker is supposed to haggle individually with the boss – a time-consuming business for both sides and one that can be distressing, even demeaning, for the person on the weaker side of the bargaining table... The theory is that productivity is the result of individual effort and enterprise, so workers should be rewarded individually to maximise their incentives to perform. Well, what if productivity performance is not solely an individual effort? What if *co-operation* is the key to getting things done in the workplace? Such co-operation can take many forms... [and are,] basically, all the things we call "team work," or social cohesiveness... Now – and this is the big insight – if productivity depends on the effort of a team, then the efficient thing is to reward the team collectively, not individually... [ECA]-type single-worker contracts discourage this because if you do something to help other workers they reap the rewards, not you... [O]ld-style collective bargaining agreements... do[n't] mean that individual ability and effort go

unrewarded. The most energetic and able members of teams are recognised as such, first by their team-mates and then by their supervisors and managers whose ranks they will eventually be invited to join at a higher salary.

...Mass redundancies are now certain at BHP N[Z] Steel's Glenbrook mill. About 300 staff will be out of work by the end of the year and the future of the plant near Waiuku hangs in the balance. A further 700 jobs could go next year. All of the 1630 staff, apart from the managing-director... have been invited to apply for voluntary redundancy... [The managing-director] said yesterday that he... had to show annual savings of about \$50 million to the parent company, BHP in Melbourne, which is reviewing all of its operations. The task was to convince the owners to spend \$27 million next year refitting one of the two melters and a further \$27 million in 1998 or 1999 refitting the second... If BHP made those investments the plant was likely to operate for a further 10 years at least. If not, it faced radical cutbacks when the first melter expired and closure when the second failed... The Minister of Finance[, who is] a... local MP... said last night that he... understood the company needed to cut costs to improve profitability. He acknowledged there would be a loss of wage packets worth more than \$250,000 a week to the local economy[. • 'A continuing decline in the international steel market had not deterred NZ Steel in its \$820 million expansion of the Glenbrook steel mill during 1982. The company's marketing manager said back then: "There is always a risk but the best time to invest is before the market recovery"']...

Plans by BHP... to slash hundreds of jobs at its Glenbrook mill sent shockwaves through surrounding communities yesterday. Suppliers of coal, gas, electricity and transport to BHP are also worried as the threat of closure hangs over the plant. The nearest towns, Waiuku and Pukekohe, are likely to be hit first and hardest... - 1996

New production targets 'insulting,' says union... Miners have vowed to fight "drastic" changes proposed by Huntly East Mine management in response to the financial squeeze on its main customer, the Glenbrook steel mill. The employer of the 92 miners, Solid Energy North, yesterday presented them with a new draft collective contract, saying they needed to make significant efficiencies to reduce the price of the coal sold to the Glenbrook mill... Changes included requiring miners to work on the weekends for no extra pay if they did not meet weekly production targets[, although they would receive more pay for]... an increase in weekly work hours from 36 to 42.5... The Glenbrook mill faced closure late last year... The coal the mill received solely from Solid Energy was its second highest cost. The general manager of Solid Energy... said the mine had to raise its production from 300,000 tonnes to 450,000 tonnes annually in order to reduce costs per tonne. [He] said the proposed contract was the best way to handle the situation, as it protected jobs. There would be no forced redundancies, but resignation payouts were available to unhappy workers... [The] union delegate... said he... did not believe the production target was achievable within a five-day week... [and] the target needed before workers would receive a bonus would also be "exceptionally difficult" to achieve. The new contract scrapped the provision of a bus for workers to and from the mine. [The delegate] said the union had twice offered to change work practices in an attempt to lower costs but management had not been interested.

...The last large-scale underground coalmine in Huntly is closing in a shock decision by owners Solid Energy. The decision comes despite the Huntly East mine's 92 workers agreeing to accept new employment conditions designed to increase productivity... in order to keep their jobs... The Huntly West mine, also owned by Solid Energy, was closed after an explosion in 1992 trapped expensive equipment underground. The company also runs an opencast coal mine... south-east of Huntly.

...As their town braces for yet another wave of redundancies, workers at Huntly East coalmine hope last-ditch talks... will save their jobs... The Engineers Union regional secretary... said the company's refusal to back down over the closure was a knee-jerk reaction because it had not anticipated workers meeting its demands.

...In 1987... a state-owned enterprise, Coal Corporation, was born out of the ashes of State Coal Mines. The new, lean SOE slashed almost 500 jobs and took about \$12 million of wages and salaries from the town... Coal Corporation, re-christened with the more environmentally friendly name Solid Energy, has been looking for further ways to streamline its operation. It looks as if Huntly East will be the next victim of that efficiency... The... [company's] trump card is a \$14 million coal-blending plant at its huge... 5km-long... opencast site... The plant... is designed to produce coal of a quality[acceptable to] Solid Energy's major customer... BHP... This means the company can meet customer demand without old-fashioned Huntly East... The company, which also mines on the South Island West Coast, is managing to return a healthy profit. In the six months to the end of last year it made a \$7.67 million profit on sales of just over \$100 million. This was down from a \$9.93 million profit for the first half of last year... Last week BHP signed a 10-year coal-supply contract with Solid Energy.

...The Huntly East coal mine will stay open after all. That's the good news for the 92 workers who last week were facing life on the dole. The bad news is that they have to increase production by 50[%]... The Engineers Union regional secretary... said last night that he was thrilled the mine was to stay open, but he would not discuss settlement details until workers were told at a meeting today... Miners... [also] refused to talk... saying they feared company reprisals if they spoke out.

...CEOs and managers have warmed to scare-mongering... FEAR works. Putting the frighteners on staff gets quick results and weeds out complacency. And the American author of the controversial findings said she could even predict stock performance based on how a company scared its employees... [The] professor of Entrepreneurship and Personal Enterprise at Cornell University, New York... argued it was necessary to communicate fear to rapidly transform an organisation and create lasting results. "But I prefer the word 'anxiety'," she said... [Incidentally, t]he Service Workers' Union and police believe that up to 1000... Chinese and Thai... immigrant workers, both legally and illegally in the country, are being exploited in Wellington restaurants... Police intervened only when crime was involved. The union's national secretary... said the problem did not appear to be widespread in Auckland, "although we do hear the odd story."

...['24 hours after police raided a West Auckland sweatshop and freed a group of Thai women who were allegedly paid only \$570 a month for gruelling 13-hour days, the Labour Department launched an investigation. But the Thai workers' employer denied running a sweatshop or taking the women's passports. She said she held the passports in case immigration officials wanted to inspect them and would have returned them if asked. She refused to comment further. Hundreds of Asians are believed to be sewing in Auckland sweatshops after being lured by unscrupulous clothing companies, a spokesperson for the Thai Embassy in Wellington said last night. "Economic difficulties in Thailand mean many women are coming here because they are told they can earn good money. Often they find they are trapped into working for a pittance." A National Distribution Union spokesman agreed that Thursday's police raid "merely scratched the surface. I came across one company where Chinese women were working around the clock and living down in the basement. As one was leaving the bunk, another took her place to get some sleep." The Auckland City police manager said officers were devising a national strategy to help foreign women forced by organised crime to hand over their passports then work for nothing to pay back their airfares.']

...*Big city offers the small pay packet...* Politicians make the point that Auckland is where the work is... Auckland is by far the biggest urban area in the country – so why are some wage rates lower and house prices higher than in the other main cities... Only when academic qualifications count do Auckland rates climb.

...What do you say to a bachelor of arts graduate? A cheeseburger, fries and a coke to take away please. Well not quite – but an Auckland University survey... showed 52.2[%] of its latest batch of... 5000... graduates have jobs [they didn't study for]... A master of philosophy graduate is using skills to teach people to drive... Two psychology students are... door-to-door... travelling sales people. Engineers and mathematicians are also selling wares. A graduate with a masters degree in political studies is sorting mail, while two other former students are delivering it... Science was a popular degree for checkout operators with four graduates taking jobs in that field... Decorators, telephonists, gardeners, cleaners and couriers

feature [too]... While the report says just 11.9[% were still] looking for work... officials admit the figure may be higher... [Also looking for work are t]wenty-five women at a Christchurch clothing factory [who] were given just 10 minutes to leave after being laid off. A National Distribution Union official said the[ir] treatment... was “absolutely... disgusting.” ...[the company’s managing director said it] was broke and could not pay redundancy.

...[a prominent politician recently] said that one of N[Z]’s big problems is that it costs companies too much to get rid of workers. [The NZ First Party leader] claims that “petty complaints” from employees who then take personal grievance cases become significant costs to business. He worries that the legal costs of getting rid of unsatisfactory workers discourages employers from taking on new staff. Most workers will be surprised to hear that this is one of our nation’s big problems... [but t]he Government is now weighing up changes to the E[CA] to ease the NZ First leader’s] concerns... At the moment the E[CA] contains mandatory personal grievance rights which cover every worker. It is not possible for a boss and a worker to agree quietly on a contract which has no protection against unjustifiable dismissal. According to the Labour Department, every year about 4000 employees make a personal grievance claim. Many more owe their jobs to the fact that they have those rights. Employers know they cannot sack anybody on a whim but must have good reasons and go through a proper procedure. This procedure irks [the NZ First leader]. Proper verbal and written warnings place too great a burden on employers, he believes. But the law in this area is well settled and has been consistent for nearly 20 years. The E[CA] simply continued the provisions of the law before it. And of 63 appeals to the Court of Appeal since the act was passed, just two concerned whether a performance dismissal was justified – hardly a sign of huge discontent in employer ranks.

...According to [the]Auckland City Council human resources manager... recent decisions by the Employment Court... damaged the employer/employee relationship. “Employers don’t want to take a risk with [hiring] staff members in an environment where it’s becoming increasingly difficult to sack and easier to end up being sued,”... While many employers were using the... ECA... to inject flexibility into the contract, they must justify why a contract terminates. “Many employers are using the ECA to opt for transient contracts which simply provide convenient exit options... At the management level there’s a tendency towards term-based contracts, but it’s questionable whether many term-based contracts are legal...”

...*At the start of this year I was working part time after school and in the weekend twice a week. I did not sign a contract, but agreed to one, after being told of the content. I was asked to work an extra day, which was a public holiday and one for which I wasn’t rostered on. I wasn’t able to work this day for family reasons and I was given the sack. I am wondering what my legal rights as a 15 year old would have been in this situation. Was I unfairly dismissed?* ...part of the problem here is that neither you nor your boss have the arrangements made in writing, so there’s no record of what was said earlier on. You may have a personal grievance action available to you in which case you should get further advice quickly. You only have 90 days from the date of the dismissal to begin action... Oh, and by the way, being 15 doesn’t mean you should be treated any differently than any other worker under the law – except when it comes to pay rates.

...Lovers be warned – sleeping with the enemy can cost you your job... [A] study of cases that had reached the Employment Court showed that a lesser standard of procedural fairness was required of employers who sacked staff because of an inter-corporate affair... No pillow talk needs to have been shared, just the possibility of damaging leaks is enough for dismissal... In the eyes of some employers, the relationship is the corporate equivalent of unsafe sex, a dangerous liaison with the potential for sensitive commercial information to be divulged... While relatively few people had been sacked for those reasons, potentially there were many people whose jobs were at risk.

...a cabinet paper written by... the office of the Minister of Labour... reveals that the Government plans to wind back the protections... for workers against unjustifiable dismissal... According to the paper, the rules are complex, employers are uncertain about their legal obligations and the procedural fairness requirements are too onerous.

...The number of unfair dismissal claims in A[US] has collapsed following this year’s introduction of the new Workplace Relations Act... The average fall across both federal and state laws is 27[%]... Under the old laws employers had to prove that they had a valid reason for dismissing an employee. Now the obligation is reversed... And unlike in N[Z, AUS]n employers no longer have to follow a drawn-out procedure of verbal and written warnings before firing unsatisfactory staff. Procedural fairness is no longer compulsory and... a dismissal cannot be ruled unfair, as it can be in N[Z], merely because of a technical failure to issue the requisite number of warnings... Frivolous or vexatious claims can make employees liable for extra costs and applicants must pay a \$NZ55 application fee before they can argue their case. The fee... is only waived if an employee is in serious financial straits... And in a move intended to inhibit the tendency toward the massive damages awards of the past which have all but wiped out small companies and needlessly eliminated jobs, the commissioners may now take the financial position of the employer into their assessment of damages if an employee has indeed been unfairly dismissed. [● Awards for damages in NZ could never be considered massive. The ‘average award to employees for personal-grievance cases in the Employment Court since 1991 was \$14,149’, and the less important Employment Tribunal ‘had an average payout over the same period of \$5465’.

...Workers in NZ’s] provinces will find it harder to take cases to the Employment Tribunal, which is ending hearings in 18 smaller centres.

...British ministers were under pressure last night to curb a huge rise in industrial tribunal hearings, which last year cost business a staggering £250 million... Demands for swift action came after new figures showed the total number of hearings – ranging from unfair dismissal complaints to claims of sex[ua]l harassment and management bullying – has soared from 12,325 in 1991-92 to 19,503 during 1995-96. The cost of actually running the 11 regional tribunals and paying staff salaries has spiralled from £22 [million] in 1993 to £36 [million]... Taxpayers are also picking up the bills for claims backed by the Equal Opportunities Commission for Racial Equality. The deluge of cases is likely to be boosted still further if Labour wins the general election. The party has plans to extend legal aid to claimants at tribunals, who have to pay their own bills if they lose. That could encourage many more people to bring cases. Even without legal aid, the tribunal tally is set to climb still higher this year as a result of the Disability Discrimination Act, which came into force last month. It means firms cannot refuse jobs or promotion on the ground of physical handicaps and must design their premises to fit the needs of disabled workers. But legal experts believe the wording is so imprecise that it will open the way for a flood of test cases... Unions have also seized on tribunals as a means of regaining some of the power they lost through Tory strike-curb laws. They are increasingly funding claims brought by their members... [In local news, w]orkers at an Auckland carpet factory downed tools yesterday in a dispute over tea breaks... A company director... said the company was offering staff \$12.50 a week to have 10-minute tea breaks at their work stations instead of taking 25 minutes to walk to the factory canteen and back[– an offer]... the National Distribution Union [described as] a “return to slavery.” ...The 60 workers meet on Monday to review their strike.

...A plan by Auckland bathroom manufacturer Athena Products for a 44-hour working week did not impress staff, who walked off the job at Athena’s two Avondale factories for 24 hours... An organiser from the TradeSec Union... said the company offered a 1[%] pay rise in exchange for staff working 44 hours of ordinary time, instead of 40, and would pay only time-and-a-quarter for the first five hours after that. Staff wanted a 2.75[%] pay rise. The company has now withdrawn its pay offer and more strikes are planned... [Incidentally, E]mployment Court decisions are often held up as creating barriers to job creation... [and yesterday the] Minister of Finance... sa[id] changes to the [ECA] are necessary to help business. He says... the Employment Court... needs... more flexibility... Take away the pillars of fairness in employment and history tells us workers will be left to seek their own justice. And history tells us that is not good for business.

...Employers have tended to criticise the Employment Court, and now the... Council of Trade Unions... has lashed the outcomes of decisions by the higher authority, the Appeal Court... [that mean] workers’ entitlements to paid holidays are being eroded... The... council... says the court has confirmed that... [an] employer can insist an employee works a statutory holiday, then choose which day off in lieu the employee takes... [and it] is

legitimate for an employer to contract out of substituting Monday for Christmas and New Year holidays when they fall on a weekend... Labour Department staff are now awaiting instructions on how and when to implement the... Government's policy of bringing all employment-related laws, such as the Holidays Act, under the umbrella of the E[CA], which itself is to be reviewed... Trade unions promise a huge battle to protect holidays and to try to prevent an expected hardening of the [ECA]... At present workers get a minimum leave of three weeks, and 11 statutory holidays... An employee does not have to work on a public holiday which falls within their working week (unless a contract states otherwise)... Courts have ruled anyone who works on a statutory holiday must get another paid day off in addition to any payment for working the holiday... [except for] Anzac Day and Waitangi Day... More than 1000 breaches of labour law relating to holidays were recorded by the Labour Department in 1996...

The Labour Party wants to give workers more holidays... to bring N[Z] into line with A[US]... by increasing the minimum annual leave entitlement to four weeks... but the Employers Federation opposes the move, saying it will cost about \$850 million a year.

...The year 1999 could seem a long one at the office, if employers have their way. The Employers' Federation is bidding to stop the "Mondayising" of public holidays, whereby those that fall on a weekend are marked with a day off on the following Monday. In 1999, such a move would leave workers enjoying just six public holidays [instead of 11 (workers in 'some AUSn states get 13 statutory public holidays – as do Germans and Austrians'). By the way, through the influence of 'Samuel Parnell, a British immigrant carpenter living in Wellington, NZ became the first country in the world to introduce the 8-hour working day in 1840 (it was decreed that anyone who worked more than 8 hours per day was to be thrown into Wellington Harbour')].

I wonder what the *New Zealand Encyclopedia* will say about Labour Day in its next edition? Perhaps "A public holiday introduced in 1899 to celebrate the introduction of the eight-hour working day; no longer observed since an employment contracts act in the late 1990s effectively removed the eight-hour day and all statutory holidays."

...Labour Day was once described as "the grand old lady" of public holidays. The title was apt because... [it] was the first "modern" holiday in N[Z]. Before its introduction... most workers were entitled to only four public holidays – Christmas Day, Boxing Day, New Year's Day and Good Friday. The origins of Labour Day have been given new relevance by [the Minister of Labour's]... announcement last week of a radical rewrite of the Holidays Act. And the call by the 1996 National Party conference for Labour Day to be scrapped suggests that t[hi]s holiday may not be with us for much longer.

...Workers could trade away their rights to statutory holidays in return for receiving at least double-time pay, a leaked official paper on the Government review of the Holidays Act suggests.

...The Minister of Labour... said the review of the Holidays Act was not about taking away workers' entitlement to holidays but to let people enjoy holidays the way they wanted. The discussion document, released by the Government yesterday, includes four options, ranging from the status quo through[to] a mix of trading annual leave and public holidays for cash... [with] a guaranteed minimum payment... enshrined in legislation... At present N[Z]ers can only sell any leave entitlement they get above the statutory minimum of three weeks. So if their employment contract provides for four weeks annual leave they can cash in one week's leave provided the employer agrees... [NZ employees usually receive 'four weeks annual leave' after they have] stayed in the same jobs for periods ranging from two to seven years.

...As the Government considers making some or all of our annual entitlement tradeable for cash, many might wonder whether we have enough to sell... N[Z] workers lag behind their A[US]n and European counterparts when it comes to annual leave... From 1999 all countries in the E[U] will have to provide minimum paid annual leave of four weeks, compared with our three... Britain, despite being the home of trade unionism, never legislated for paid annual leave, just eight statutory public holidays. About 12[% of the British] workforce got no paid annual leave until the first stage of a 1993 EU working time directive took effect in November last year... The... directive also introduced a ceiling of 48 hours on the average working week, a requirement for one day's rest a week, rest breaks if the working day is longer than six hours, 11 consecutive hours' rest in each 24-hour period, and a restriction on night workers' shifts to eight hours... The U[S], by contrast, has no legislative requirement for employers to give any days off. A U[S] Embassy spokesman said yesterday that while most employers offered days off on national holidays such as July 4 and Christmas Day, they were not compelled to do so. Similarly, annual leave was a matter for negotiation. Government employees were likely to get as little as two weeks off a year, which could increase to three or four as they gained experience... An economist with the Council of Trade Unions... believes the [NZ] Government, by even considering making the existing entitlements tradeable for cash, is signalling an intention or willingness to breach an International Labour Organisation convention that N[Z] ratified in 1950. "We... sign these treaties and they don't mean a damn thing." [He] says that with the bargaining environment tilted in favour of employers, it will be hard for many workers to defend existing entitlements if bosses want to take them away to cut costs... With the increasing move to put workers on salaries rather than wages, many people are working longer hours to meet contractual obligations or performance targets[(when, previously, they worked *longer hours* to get more pay) – and employers are spending less time calculating pay]... "...you work frantically then you blot out in Bali. Now they are saying work frantically and cash up your week and work some more." ...For most people it would mean a loss of social cohesion – less time to spend with children... "You end up with the Japanese situation where people are staying at work as a matter of face, not doing anything. You stay until the boss goes and the boss has got to stay to show that he is dedicated... [N]obody can go home in case it indicates that you are not dedicated."

...“Let me hear another sound from you,” said Scrooge, “and you’ll keep your Christmas by losing your situation!” wrote Charles Dickens in *A Christmas Carol*. Annual holidays form part of minimum standards of employment... [and many of NZ's factory] workers will receive little extra Christmas cheer this year. A... University of Auckland poll shows that nearly 68[%] of manufacturers will not give their staff any time off over the Christmas-New Year period apart from the statutory holidays. A lucky 32[%] will score at least an extra day over that time.

...Our ancestors fought to require all employers to provide paid holidays and personal grievance procedures because they knew that “contracts” between employers and workers are not equal. If we let employers “buy” back holidays by paying higher wages, this unequal relationship means that eventually the extra pay would be eroded by inflation, or by new workers being hired on lower wages, so that in the end the holidays would have been lost for no real gain.

...All work and no play makes Jack a dull boy, and it may leave Jill unemployed – or so many European politicians and trade unionists seem to believe. The governments of France and Italy have lately proposed cutting their legal working week to 35 hours as a way to trim unemployment. To a lot of people this seems to make excellent sense. Why should so many workers complain about being overworked, when one in nine Europeans is idle? Better, surely, to share out the work more evenly... It is depressing that supposedly responsible governments continue to pretend to be unaware of the... illusion that the out-put of an economy and hence the total amount of work available is fixed. In fact the demand for labour depends upon productivity and wage costs. Fewer hours will create more jobs only if weekly pay is also cut – which workers tend to resist. Moreover, recruitment, training and other fixed costs can make it more expensive for a firm to employ a large workforce for shorter hours. Instead of limiting hours of work, governments should do the exact opposite and allow firms and workers greater flexibility.

...SEVEN-day shopping and two weeks in Bali are the prizes of nineties consumerism, but they come at a price... As workers contemplate swapping holidays for pay... the... 1996 [NZ census reveals] that more than a million people worked at least 40 hours a week, 567,807 put in between 45 and 59 hours a week and for 180,483 the working week was 60 hours or more... Evidence suggests that long hours could be a multifaceted health hazard... [For example,] working more than 48 hours a week doubles the risk of coronary heart disease.

...We used to talk about the idle rich and the toiling masses. Well, you have now got the frenzied rich and the idle poor – the concept of work-rich households with lots of work and work-poor households where nobody has got any work.

...Unions have renewed their calls for the scrapping of the E[CA]... ON MAY DAY, 1991, unions were flung on to the free market and... [t]he union-held monopoly on representing workers at the Employment Court became a thing of the past as did compulsory union membership... When the Federation of Labour and Combined State Unions merged in 1987, the new Council of Trade Unions (CTU) covered 530,000 workers of the roughly 700,000 covered by awards. The full-time workforce at that time was about a million. In 10 years, the number covered by the CTU has halved and those covered by collective contracts hovers around 400,000 out of a workforce of 1.1 million. [A u]nion veteran... believes the movement could have galvanised against the Act by holding national stoppages, something the CTU did not advocate. [The]Public Service Association president... [– who heads 'NZ's largest union at 50,000 members' (although 'lawyers for another member claim their client is the rightful PSA president') –] believes this is a source of bitterness among many of his members. [However, the veteran] claims some major unions were broke at the time and powerless to resist.

...The E[CA], six years old tomorrow, is up for review. The act's designers love to trumpet its "success" abroad. And indeed it has held wage costs down, which has helped our exporters at a time when our exchange rate would otherwise have made them utterly uncompetitive. It is also true that the number of people in paid work has risen since the act was passed, by an impressive 230,000... [– although NZ's population rose by a similar amount during the same period!] Yet if... asked... for my view of the act, I would say it's time it went. That's because I think a country's economic success should be measured in higher wages for everyone, especially the worst off. In real terms, after allowing for price increases, the average hourly wage (including overtime) has hardly moved at all – down 0.3[%] from May 1991 to November 1996. Top executive salaries have gone through the roof[, with some]... earning over \$1 million a year. At the other end of the scale, 10[%] of workers took actual cuts in hourly rates in the first two years after the act was passed. [NZ workers aren't alone in this respect. Many people in the US are 'working longer hours for less money than they were 30 years ago' – 'according to the US Census Bureau the medium income of white males aged 25 to 34 fell from \$23,839 in 1979 to \$20,962 in 1987, using constant 1987 dollars, while the medium income of black males of the same age group fell from \$16,653 to \$13,650; and, the standard of living of the poorest quintile of the population dropped by 9% while the standard of living of the wealthiest quintile rose by 19% in the same period, according to a House Ways and Means Committee report; meantime, the richest quintile of families paid 5.5% less of their income in federal taxes at the end of the 1980s than they had at the beginning, while the poorest quintile paid 16.1% more of their income in taxes.' In Britain, 'hourly wages for the lowest-paid were lower by 1992 than in 1975 – but middle-income earnings grew in the same period by 35% and upper-income earnings by 50%.']]Workers have lost what little power they had at work. Union membership has almost halved, from 41.5[%] of the workforce... to 21.7[%] by the end of 1995. The number of workers covered by collective bargaining has halved, too. The act ties workers' hands. They are not allowed to negotiate contracts which give preference to union members; they can't strike until their contract has expired; and they can't strike in pursuit of a contract covering more than one employer. They are at the employer's mercy, because the act lays down no minimum period of notice of dismissal, and no requirement for redundancy pay. In international terms, these measures are extreme. And they're reinforced by the Reserve Bank Act, which requires the central bank to raise interest and exchange rates every time any general wage increases threatens to push prices up by more than 3[%]. The result, as we're seeing now, is a stalling of job growth and a rise in joblessness. The formula is simple: just tilt the law in favour of employers, then let the market rip. But it's unfair.

...A couple of weeks ago... Labour's social welfare spokesman... wrote: "In the closed economy we used to have, it was possible for a Government to guarantee work and reasonable pay. In the open economy... we have today, no such guarantee is possible." ...Judging by opinion polls, [he] speaks for a majority of the population. Most N[Z]ers appear to have lost confidence in our ability to ensure collectively that everyone who wants a job at a reasonable rate of pay can get one. Yet there is no doubt that... full employment at reasonable rates is by far the best social welfare policy...

FEELING underpaid? You're not alone. Some 40% of N[Z]ers reckon their pay packets are too small. But that's not too bad by international standards... [–] workers in other countries are even less likely to feel happy with their pay... N[Z] rated highly on the issue of employment security, with 73% of employees feeling their job was secure, so long as their performance was up to scratch. This was six percentage points higher than Australia, and compared with the United States' 52% and Britain's 47%.

...In March 1987 [NZ's] average hourly wage before tax was \$11.06. In March 1997 the average hourly wage before tax was \$16.53. So the average wage has increased by almost 50[%]. Yet in the same period prices have increased by only 37[%], which means that on average ordinary workers are better off... The difference becomes more pronounced when... the fortunes... of those who... were in the top 5[%] of income earners... [and] were aged between 25 and 34 years in 1987... [are traced. T]his age group earned \$38,500 a decade ago and \$83,000 in 1997. This means that a typical yuppie... can now expect an income that has risen... more than twice the increase of the average N[Z] worker.

...70[%] of women and 46[%] of men earn less than \$20,000 a year... a new study by Statistics N[Z] shows... The average gross weekly income for people over the age of 15 was \$411... [but the] average male income was \$516, while the average female income was \$311. The top 20[%] of earners received \$650 a week or more... (including 6897 over \$1[923 a week])... Those earning the minimum wage, roughly \$15,600 a year, number around 400,000. [● 'A commission has been set up to advise Britain's Government on setting up its first-ever national minimum wage (some workers earn 37p/h').]

...Views on minimum wages are at odds with how world labour markets work. The supply and demand model of markets applies to dead fish and labour alike. There may be no market for people per se, but there clearly are markets for the variety of services that people perform – accounting... teaching... janitorial services, and so on... Labour that is more valuable in an alternative employment than in its current employment is a profit opportunity for anyone who notices the discrepancy and bids the labour away from the lower value employment into the higher value one. Both employers and employees have automatic incentives to be alert to such opportunities... Employers who do not know how to use labour productively are forced, by competition, to step aside... Furthermore... a paper published by the National Bureau of Economic Research in 1995... showed that legally imposed increases in the cost of hiring labour decrease the amount of labour employers want to hire. But you don't need economists to explain this phenomenon. Why would an employer wait until he was forced to pay higher wages to hire additional employees? If higher wages are good for business, wouldn't he raise them voluntarily? ...Under some circumstances an employer can increase productivity by paying workers higher wages. If the increased productivity is more than enough to pay for the increased wage, the employer will want to hire more employees. But profit-seeking employers have an automatic incentive to notice and grasp such opportunities. They don't need government to force them to do so. It is individual employers, with their unique knowledge of local circumstances, who are best able to determine whether wage increases will pay for themselves. No central regulator setting legal minimum wages could possibly know as much. Even an economics professor cannot know enough to identify a one-size-fits-all minimum that is "efficient" in each case it affects... [An] Auckland economics professor... writes, "the real bottom line here is social – even moral – not economic. Wages are what people use to live on. Very low wages mean people living on not very much." ...[the professor also] writes that raising the legal minimum to \$7.50 an hour "won't eliminate the poverty of the working people, but it will help." ...But would you rather be employed at \$6 an hour or unemployed at \$7.50 an hour? ...What it will actually do is convert many working poor into non-working very poor... Who are those workers? The least able, least educated... least experienced... and [least likely to be alert to opportunities]...

Consider the market for economics lecturers... [W]age control need not deliver, indeed has very little chance of delivering, the wage rate at which the market clears – where the supply of lecturers equals the demand... If the wage is set too high then we get a proliferation of economics lecturers.

Supposedly the university will opt for the very best and the surplus will opt for the dole or even retrain for some other career. Set too low, the wage will deliver a shortage of economics lecturers and in order to meet the market universities may have to lower the standard of lecturer they employ or restrict entry to the courses... Now consider the reality. On the supply side Government intervention determines that lecturers' wage rates are set in a lockstep system, driven only by seniority... But the intervention in the market for economics lecturers is even heavier-handed than this. On the demand side, the client pays only a fraction of the cost of supplying the services of economics lecturers. The client's agent, the tax-payer-funded University Grants Committee, pays the bulk. Importantly, what economics lecturers are paid bears virtually no relation to the demand for their services except insofar as that demand bears a relatively to the demand for other... courses which compete for the overall funding budget.

...Like rust, some things never sleep. Fifty-five years after establishing the right to a minimum wage, the economic and moral debate over its continued existence rages on... According to Statistics NZ, there were 126,300 workers earning less than \$7.50 an hour in the year ended March 1996. Taking account of their hours worked and the distribution of wages beneath \$7.50 an hour, the Alliance has estimated that the cost of raising the minimum hourly rate to \$7.50 would be \$416 million a year, out of a GDP of \$93 billion, that is, 0.4[%] of GDP. This is surely a reasonable price to pay for improved fairness at the bottom end of our income distribution... Insofar as an increased minimum wage is passed on in prices, then the rest of us who are not on the minimum wage accept a very slightly lower real wage in order that the lowest paid in our community can have a minimum decent level of earning. This is a perfectly valid decision to make and an appropriate subject for Government policy.

...The Government... yesterday... [raised NZ's] minimum wage to \$7 an hour... The rise from \$6.37 represents an increase of nearly 10[%]. Youth rates paid to workers aged 16 to 19 are set at 60[%] of the adult rate and have been raised from \$3.82 to \$4.20 to maintain the relativity... [The] rise to \$7 was pretty significant and... the... Government... would want to assess its impact before proceeding to... \$7.50 an hour... on March 1 next year.

...*Rise in minimum wage could hit young people*... [R]esearch suggests that increases in the minimum wage in N[Z] reduce the employment of the age group most likely to be directly affected by the legislation. [Researchers have also] conducted a number of "natural experiments" involving both state and federal increases in the minimum wage in New Jersey, Texas and California, of which the New Jersey study is the most famous. The real value of the federal minimum wage fell steadily with inflation during the 1980s. In November 1989 Congress and [the 41st] President... agreed to raise the minimum wage from \$US3.35 (\$[NZ]4.72) to \$3.80 an hour on April 1, 1990, and again to \$4.25 on April 1, 1991. The state of New Jersey increased its minimum to \$5.05 on April 1, 1992. But the minimum wage in the neighbouring state of Pennsylvania remained at \$4.25... [T]his offered an excellent opportunity to study the effects of the minimum wage... Telephone surveys were conducted of 331 fast-food restaurants in New Jersey and 79 similar establishments in Pennsylvania... The authors found that, contrary to the predictions of standard economics, full-time equivalent employment in the New Jersey restaurants increased relative to their Pennsylvania counterparts. Critics of the experiment have attacked the quality of the data... Pennsylvania was not an adequate control... N[Z]'s minimum wage qualifies much better as a kind of "natural experiment." Until March 1994 the minimum wage covered only adults of age 20 or more... Using quarterly data from 1985-93 I found that a 10[%] increase in the adult minimum wage... increased the... unemployment rate... of young adults... by 3.5 percentage points. Even larger effects were found among young adults without school or post-school qualifications. The same increase... caused... their unemployment rate to increase by 6.5 percentage points.

...The courts might wish that the community could more readily see the "extraordinarily high" percentage of unemployed people who were committing offences, said a judge in the High Court at Auckland... yesterday... ['Statistics from a recent prison muster show that 3882 of 4203 male inmates were on the dole or other benefit before they were jailed and, for women inmates, the figure was 227 out of 245.' The judge also] said... that while courts would not be slow to impose substantial prison terms, it was perhaps too simplistic to believe that lengthening sentences "will necessarily deal with every problem." ...In sending two 18-year-old youths to jail for four and a half years on two charges of aggravated robbery, he said the courts could not close their eyes... A number of... unemployed people who were committing offences... had learning difficulties, such as one of the two before him... [T]heir victims had been outraged that aggravated robberies were "becoming like a joke to teenagers." [One] victim had spoken about the need for severe penalties... [However, the judge] said that at the end of the day, prisoners had to come back into the community and crushing sentences would not assist in rehabilitation. [The two youths] were entitled to receive "substantial discounts" because of their guilty pleas.

...Key findings... of... a Ministry of Justice report... show that [NZ's] number of burglary, theft and fraud offences fall when business confidence is high, and the number of violence and property damage offences increase when the economy is expanding... [Incidentally,] 50,000 demonstrators lay on the boulevard in front of Taiwan's presidential office at the weekend in a mass protest against the Government's failure to check a spate of violent crimes... Taiwan's social order had deteriorated to a "shocking" level, with the crime rate souring by 80[%] between 1990 to 1996. - 1997

Between 1980 and 1990, the number of criminal offences... in the U[S]... grew by 8% but the crime rate per 100,000 declined by 2.2% [during '1989, the US had an average rate of 5,741 offences per 100,000 population, with the highest rate of 10,293 being recorded in the District of Columbia and the lowest rate of 2363 in West Virginia']. This decline in the rate resulted from a 4.9% drop in property crime rate, whereas the violent crime rate during the same period rose by 22.6%... [Between] 1985 and 1990... violent crime grew by 36.9%... In 1990, one in 13 Americans was a victim of a violent crime, according to the National Crime Survey; 23.7% of all households were touched by at least one criminal incident... Most crimes, including 41.2% of robberies and 20% of assaults, took place on the street... Of all criminal incidents... [in] 1990... 31.7% involved firearms... In 1987, there were 15,118 law enforcement agencies... with 757,508 employees and \$28.071 billion in expenditures.

Others will take to the one profession for which absolutely no formal qualification is ever likely to be required – namely crime. In any increasingly competitive society I think we must expect rising figures of crime. - 1984 and after

The Enclosure Acts enacted by parliaments of landlords and merchants in eighteenth-century England provided not only pasture to grow wool for the new textile mills but also a work force of displaced, impoverished yeomen willing to accept work in the mills at sufficiently low wages... By the end of the century, the number of offences against property that earned capital punishment in England increased to more than 200. The world forecast in the deliberations of the Lunar Society had to wait out the world described by Charles Dickens... The presence of a permanent underclass, made apparent by beggary, homelessness, and a rising crime rate, reflects inadequacy in the welfare measures authorised to offset the inequality in the distribution of income...

A violent crime is committed every 18 seconds... in the U[S], an FBI report said. The good news? – violent crime is falling.

...Violent crime and burglaries in Auckland continued to rise in the past June year – against the national trend. Assaults and muggings in the city went up by 12[%] and burglaries jumped by almost 10[%], while in the whole country violent offending dropped by 1.3[%] and burglaries by 4.1[%]. Papakura showed the biggest jump in reported violence, 16.23[%], and... also topped the crime statistics for Auckland by having the largest rise in reported crime overall... The other big jump in violent crime was on the North Shore, where reported cases went up by 13.3[%]... The North Shore recorded the biggest jump in burglaries, up 14.9[%]... The acting northern regional commander... said the increase in burglaries was a concern, particularly when police were trying to cut the rate of property crimes.

...there is a link between poverty and crime. According to... a reformed master burglar... that is. And he should know... [The master] was the seedy star of last night's hour-long *Inside New Zealand* documentary on house breakers (*The Business of Burglary*, TV3, 8.30pm). Here was a professional at work. Returning to his trade – for our benefit this time – [the master] seemed to enjoy himself exposing the average householder's security shortcomings... And how about the loser who reckoned he was only a criminal during the act, and the (use your own expletive) who thought he was Robin Hood... The statistics were startling: Burglars earning up to \$100,000 a year... 50,000 homes broken into each year, \$50,000 of unclaimed recovered goods auctioned by the police every six weeks... It was gratifying to see the police potting the ratbags, particularly in the surveillance video which netted an extensive burglary and receiving ring. Unfortunately the losses outweighed the wins, and will continue to do so until there are no ready buyers for the booty. Market forces rule here too, for the business of breaking and entering seems to be booming.

...WHEN... [c]rime becomes a career... [B]efore... 13-year-old Shiza... began beating people for their money, breaking into houses and doing drugs – she dreamed of being a police officer. But now the South Auckland[er]... has a different career in mind... Shiza isn't her real name... But hers is the face of South Auckland street crime. Young people like her are causing police and community leaders enormous concern, and are fast becoming political footballs as politicians look at ways of curbing youth offending in the run-up to the election. Latest police statistics on juvenile offending... make grim reading. In the year to June 30, police cleared 45,857 offences committed by people aged 16 and under – an increase of 21[%] over three years. Of particular concern is that violent offending by juveniles has skyrocketed by 63[% during] the same period... Shiza talks matter-of-factly about getting into trouble with police when she “smashed a girl through a window for her money” in central Auckland... She doesn't go to school. She is waiting for a Children and Young Person's Service family group conference to decide her future and is living with her 23-year-old sister in Pukekohe in the meantime. When the *Herald* caught up with her, she was waiting in a car outside a pub in Otahuhu for her sister. [It] was... 9 pm and she was still waiting there at midnight. A YOUTH aid officer with Otahuhu police... says youth crime in South Auckland is disturbingly high and something has to be done about it. She says the police and the C[YPS] are only dealing with the “tip of the iceberg” and are taking punitive rather than corrective measures. No initiatives are under way to... get the young people back on track. “I believe the situation is getting worse... The offenders are getting younger and the crimes are getting more serious.”

...TWO children... held up a superette at gunpoint in broad daylight yesterday. [The superette's c]o-owner... handed over about \$350 after she and her 12-year-old daughter were confronted with the single-barrelled shotgun. The boy brandishing the weapon was aged between 10 and 12 and his accomplice about 14, she said. The two young robbers rushed from the store in Green Bay, west Auckland, with the till and two packets of cigarettes and got into a waiting car driven by a youth in his mid to late teens. The armed holdup has shocked police already alarmed at the rising level of violent offending by youngsters nationwide... 45% of robberies [are] now committed by people aged under 17. Children under 14 can be arrested for a criminal offence, not charged. They can be dealt with in the Family Court and if a serious offence is proven, the child can be placed in the care of the Director General of Social Welfare. Secure care can be used. The mayors of N[Z]'s nine biggest cities met last week to ask political leaders to commit themselves to... the introduction of a five-point... anti-crime and anti-violence programme... including early intervention for children and young people to stop them getting into crime. Waitakere City[']s deputy Mayor... said yesterday[it] was “very disturbing that young people felt so isolated from the patterns of support that they become involved in quite violent actions. Society is not what it was 20, 30 or 50 years ago – we have to look at ways to support people so they do not go down the downhill path.”

...We think of ourselves as an ageing population, but in fact about a quarter of N[Z]ers are children or adolescents and they've grown up in a society that experienced profound change. “N[Z] society is actually a very harsh place now and it's got to be recognised that pitting people against each other in the way that has occurred, particularly over the past 10 years, has its consequences – there's a social cost.” ...that social cost is seen on the streets of our cities where some young N[Z]ers have chosen to live, and it's seen in the juvenile crime statistics... “We have got a generation of juveniles at the moment that are completely out of control and short of the parents actually chaining them to their bedrooms, they can't stop them.” Even the agencies that are charged with restraining our wayward youngsters... are finding it a challenging task – Social Welfare because of lack of resources, the police because of perceived shortcomings in the law. “If something is not done to not only address the problems we have now but to do something about the problems in the future, then the whole system is going to be out of control.” So... what are the ramifications for the future if this situation is allowed to go on unchecked?

...A 14-year-old boy, believed to be the youngest person ever convicted of murder in the [AUSn] state of Victoria, was sentenced to 13 years' jail yesterday for cutting a taxi-driver's throat... The judge said the sentence was greatly reduced because of the boy's youth... The boy showed no emotion as... the Supreme Court... passed sentence. The boy was aged 13 when he killed... Mr Peter Coe, aged 41... In December last year, the boy's 14-year-old accomplice, now 15, was sentenced to be held in a youth residential centre for three years after pleading guilty to manslaughter and armed robbery. Each boy blamed the other for the death of Mr Coe. Mr Coe's mother... criticised the Victorian Department of Human Services under whose care the 14-year-old boy had been at the time, saying it had “let everyone down, the children as well.” ...[the judge had] said the standard of care by the department was “lamentably inadequate.” The trial was told the boy had absconded 26 times between 1994 and the time of the murder. - 1996

A [British schoolboy has been] found guilty of... rap[ing] a woman tourist... The Filipino boy – just 4ft 11in tall and aged just 14 at the time – [had] yawned and rubbed his eyes as [the victim] relived her 45-minute nightmare... The... petite... 33-year-old Austrian victim was raped by a total of eight youths. The others have admitted the attack. As a judge warned that they all face prison sentences, it was revealed that the woman's marriage collapsed in the traumatic aftermath of her ordeal. The bravery of the woman, a mother of two on a shopping trip to London, was praised after she helped convict her 15-year-old attacker by taking the stand. [The p]rosecutor... told the Old Bailey she had more courage in her little finger than any of the eight youths who laughed off her ordeal... The gang was caught after closed-circuit TV cameras recorded them with the woman... just outside [King's Cross railway] station... None of the gang – [consisting of] two Filipino brothers, four Afro-Caribbeans, a Colombian and a Greek Cypriot... all aged between 14 and 17... – can be named for legal reasons... The youth showed no emotion at the verdict... [The prosecutor] said there was a complete absence of parental care for the boy, who came to Britain with his mother and four brothers and sisters in 1992... The baby-faced convict claimed in court that he watched the attack and took no part in it... But the tourist... told detectives that “the small one was particularly aggressive... They were all involved. If I had noticed one standing aside I would have had the hope that someone might help me.” ...The woman encountered the group when she went out on a lone late-night walk... after dinner with friends, said [the]prosecutor... “She was unaware of the risks that the King's Cross area may have held for her. She was approached by a group of what she regarded as children,”... The gang, led by a 14-year-old schoolboy... who is over 6ft tall, asked her if she wanted to go to a party. “She was not alarmed because they were so young. But then the ringleader shouted, ‘Now the party is going to begin’,”... The woman was frogmarched to the Regent's Canal towpath. “She was... stripped... hit and kicked in the face and thrown to the ground and pinioned by her arms and legs. She was repeatedly raped and compelled to have oral sex.” ...the woman was raped so many times she lost count. The gang then asked if she could swim. She lied and said she couldn't and they threw her in the canal. “She swam to the other side and... attracted the attention of a security guard... She was intended by some of her attackers to drown... [but a]ll eight were as bad as each other. This is a particularly unpleasant case where these youths acted as a pack. Their actions simply defy rational understanding.” ...their victim was returning to Vienna to rebuild her life.

...The young victim of a horrific gang rape in Auckland has returned to family and friends in her home town to start rebuilding her shattered life. The 19-year-old woman was dragged from a car on the summit of One Tree Hill on Saturday and while her male flatmate was held in the car, the men took turns raping her. Police say the rapists had earlier attacked a couple in their car at Bastion Pt... The couple was... robbed and the woman indecently assaulted. In both cases, the offenders were travelling in a red Japanese model van... The offenders were all described as Polynesians in their late teens... Auckland police said the rape victim was a relatively naive young woman from a small town in the lower North Island... [whose] dreams of life in the big city had “gone up in smoke” because of the “horrific, animalistic and degrading” attack... A spokeswoman for Rape Crisis... said life would never be the same again for the rape victim... – ...a devout Christian who had chosen to remain a virgin until her wedding night... – ...but with the right support and counselling she would be able to get through the trauma. Gang rape in N[Z] was relatively rare, making up under 3[%] of the 1200 or so cases Rape Crisis dealt with last year.

...*The gang of four savage Auckland teenagers who pack-raped a woman had been expected to explode into violence...* [says] *their local policeman...* In the High Court at Auckland yesterday the teenagers each admitted raping and sodomising a 21-year-old woman at the summit of One Tree Hill on March 22 after pulling her from a car and beating her male companion with a wheel brace... The four “casually indifferent” teenagers... were... sentenced to a total of 54 years’ imprisonment for that and other crimes... [Three of the group], all 17, received 14 years[each. The other member]... sobbed and looked for his mother in the public gallery when guards led him away to begin what is believed to be the longest single sentence handed down to a 15-year-old... [in NZ –] 12 years’ imprisonment... Last week in the same court, as their families sat behind them, they admitted each taking turns to force the woman to perform oral sex. In a final act of degradation before... the foursome, then aged 15 and 16... walked away, they stole the couple’s wallets... At Bastion Pt another couple were attacked... Six days earlier, again at One Tree Hill, two others fell victim to another vicious assault. What turns four teenagers into brutal pack-rapists? Mt Roskill[’s] police projects manager... has a quick answer: violent videos and too much time. That combination kicked off a debut in petty crime at the age of 12 or 13, and led to a spiral into horrific offending, he said. “It is the American videos. The violence these kids see with their eyes goes straight into their minds... Ask them where they get their ideas from and they will tell you the same thing.” ...The four are the king-pins of a teenage Mt Roskill street gang which excels in petty crime and street brawls... The gang call themselves the Central Soldiers. Local police prefer to call them a “bunch of kids who are too big for their boots. They are unemployed guys aged between 14 and 18 who want to play little gangsters... They watch videos, drink beer, smoke dope and rumble other gangs because they are bored and want to kill time.” ...the youths – who are all Tongan or part-Tongan – were born in N[Z] so feel divorced from their Pacific Island roots. However, they do not fit into our society: “They band together to form an identity and mimic the Los Angeles black street gangs they watch in videos.” ...a youth worker... [also] described the group as a time bomb waiting to blow. “They were out of control. They were going around doing stupid things and it was only a matter of time before they got put away.” ...[one of the foursome] has attended eight family group conferences this year for burglary and theft from cars. He laughed at the last one when a police officer warned him that his days of freedom were numbered. “You can’t touch me. I’m only 16,” he said.

...Organised criminals in South Auckland are avoiding prosecution by using children to do their dirty work. A growing number of youths under 17 are committing burglaries and other serious offences for older ringleaders, say police... “But by the time you get to the main guy, he’s so far removed.” ...[‘Just like the classic tale of Oliver Twist, adult Fagins are training kids as young as 6 for a life of crime.’] Some as young as 14 are often “hardened... criminals,” and should face tougher charges... Young criminals... committing adult crimes... [are currently] treated as juveniles... Papakura police officers estimate three-quarters of burglaries in their region are committed by children who can only be dealt with by the youth courts and are usually given supervision... “It is well known in the criminal fraternity that if... people under 17 commit a crime they’ll get off lightly,”... Manurewa police charged a... 32-year-old beneficiary... with shoplifting after she forced her 10-year-old son to steal disposable nappies and chocolate from an Otara dairy... [T]he mother told police she often made her children steal because she knew they would escape prosecution if caught... A former police chief turned politician... said the Children, Young Persons and Their Families Act was not adequately dealing with juvenile criminals... [and] has called for an overhaul of... the... law...

[Young o]ffenders not immune to the long arm of the law... Members of the public, and sometimes police, perceive nothing can be done to a child... [– t]he Children, Young Persons and Their Families Act defines a child as being under 14 years... [–] who commits offences other than murder or manslaughter. This is incorrect. There are ways of dealing with the offending. Recently I was involved in a case where a 13-year-old boy had committed an indecent assault on a young girl. Extensive inquiries were made and it was clear the boy posed a serious risk to young children. Immediate intervention was required in the public interest. Youth Aid officers prepared the appropriate documents, went to his school, arrested the boy and brought him before the Family Court. Within two hours he had been placed in the Weymouth Residential Centre... The point is... [that t]here is a process for dealing with child offenders... Some of the comments made relating to the Children and Young Persons Act have come from those who are unfamiliar with the processes. There have been minor shortcomings, but we have to be very careful that these are not the result of ignorance rather than the inability of the act to deal with child offenders.

...“We are pulling 11 to 13-year-old... shoplifters... in on a regular basis where we were not a year ago,”... says... [the] national security manager for the 12-store K-Mart N[Z] chain... “Either they are getting more blatant or more greedy. I believe the younger people are getting more schooled in the techniques of how to get things out. These are not kids who do it as a dare. They’ve seen how the system works and use good thought on how to beat the system.” K Mart staff have [also] noticed the young shoplifters seem more aware of their rights, forcing shop security officers and police to take more care dealing with them... “We will get a recitation of the Bill of Rights and the trespass law. They will tell you what you can and cannot do. Some kids are quite definite. They say: ‘I will just ring my case worker and he will handle it.’” [The security manager] is critical about the lack of response from... the... young offenders’ parents, who say things like “Clip him over the ear,” “How dare you catch my child?” or “My child would never do that.”

...When a Manukau youth aid police officer spotted videos in a local store featuring American-style carjacking he predicted drama would soon become reality. And within weeks... similar crimes hit N[Z] streets for the first time – in his patch. Carjacking is now reported regularly. Some of Manukau City’s youngsters are regarded by police as the trend-setters for N[Z] youth crime. They even blame the district’s youngsters for starting the debilitating glue-sniffing craze some years ago. Now it seems the habit is on the wane in Manukau but glue-sniffing continues to afflict young people elsewhere... It’s not even as if the young people here are particularly inventive. The police do not think they devise the latest robbery tactics but there are, readily available, videos which show American crime and gang cultures and which translate easily into the street scene in parts of South Auckland. The tendency... for younger criminals to commit offences more serious than those of their predecessors is worrying local law enforcement agencies... [A] youth justice manager for the C[YPS] in South Auckland[says:] “I could not put my finger on a reason. It has grown over the last 12 months...” ...But if you need to study the face of juvenile crime in a concentrated form, Manukau – the under-19 population of which is proportionately higher than in any other area in the country – is a place to start... “The thing about South Auckland is its size and sheer volume of young people. Then you consider the socio-economic factors...” ...with a higher rate of unemployment among South Auckland residents and limited access to benefits, it was understandable why parents could not afford to give their children pocket money. “A young person cannot claim money in their own right unless they can get employment. They [in South Auckland] are likely to be less skilled than other young people. They have to get money and they commit crime. The majority would not do it for a buzz.”

...TEEN CRIME... CONGRESS MADE AN AGREEABLE DISCOVERY THREE years ago. Early in 1994, in an abrupt statistical spike, voters in large numbers started saying that crime was their No. 1 concern. So when the House and Senate passed the omnibus crime bill later that year, people actually noticed. Which is one reason why, in a sluggish political summer... Congress is going after crime again. In May the House passed a bill that would give \$[US]1.6 billion to states that agree to toughen their handling of kids who commit serious felonies, in part making it easier to try them as adults. Last week the Senate Judiciary Committee was pushing forward on a similar bill, in the hope of bringing it to a vote this month. "People are expecting us to do something about these violent teenagers," [the] committee chairman... complained as he tried to speed through more than 100 proposed amendments... From 1985 to 1995, juvenile arrests for violent crimes rose 67%. [In 1989, 77,000 juveniles were convicted of violent offences (while a further 1.112 million juveniles were convicted for property and delinquency offences; and, during that year, 96,148 juveniles were in custody).] Perhaps a fifth of all violent crimes is the work of teens. "In America today, no population poses a greater threat to public safety than juvenile criminals," says... the Florida Republican who wrote the House version of the bill. Some criminologists are also warning that a new wave of "superpredators" will soon hit the streets. In fatherless households and fractured neighborhoods, millions of four- to seven-year-olds, the baby boomers' own mini-boom, are heading for their teens. So Congress wants to make it easier to... incarcerate them in adult prisons[- even though, as the]... head of the Washington-based Youth Law Center... [points out:] "Children commit suicide eight times as often in jails as they do in juvenile-detention facilities[.]..." Under both the Senate bill and the House bill, states that want the federal dollars would have to make prosecutors and not judges the ones who decide whether a teenager charged with a serious violent felony or drug offence should be tried as an adult. To demonstrate that crimes really do carry punishments, states would also have to impose a rising scale of "graduated sanctions" for all juvenile offences, beginning with the first, and keep adult-style criminal records on juvenile offenders. Under the present system, most such records are often closed, meaning prosecutors can't learn whether an accused youth is a repeat offender... Over the past five years, however, every state except Hawaii has decided to allow some kids to be tried in adult criminal courts. Altogether, some 12,300 youths are prosecuted as adults each year in state courts. That is about 9% of all juveniles arrested for violent crimes and a 70% increase over the number who were tried as adults a decade ago. But if the bills become law, those numbers would climb further. Child-welfare advocates say that would effectively dissolve the separate system of justice for kids that dates back to 1899, when Chicago established the nation's first juvenile court. Supporters of the bills say they correct a problem created in 1974, when new legislation channeled nearly all young offenders to the juvenile system. What isn't clear is whether moving young criminals back to adult courts has much impact on crime. According to a recent study by the liberal National Center for Initiatives and Alternatives, Connecticut has the highest juvenile-to-adult transfer rate and Colorado the lowest, yet their youth crime-rates are the same. Since the 1970s, New York has been automatically trying as adults kids 16 and older charged with serious crimes. In the same period, its juvenile crime rates doubled... The White House has proposed its own bill that puts more emphasis on money for crime-prevention measures, such as keeping schools open in the afternoon from 3 to 6, when almost half of juvenile crime takes place. While the Senate would allow states to use as much as 40% of the federal money they get for prevention programs, the House would require them to spend it all on law enforcement... While reportedly 8,000 teens are already... imprison[ed]... with adults, federal rules require "sight and sound" separation, meaning juveniles cannot be within reach of adults. Some corrections officials say that requires a pointless division of facilities used by both populations - for instance, two exercise areas when one could be shared. The Senate bill would override the complexities of the sight-and-sound rule by imposing a "no physical contact" provision, which means... the same facilities could be used. But juvenile advocates say... breaking down the barriers would make kids prey to rape and other forms of abuse.

...An 11-year-old boy, whose face was painted for Hallowe'en when he was arrested last week on a murder charge, will be tried as an adult and faces a possible life sentence, prosecutors said... [The boy] is accused of firing his rifle from a hill last Wednesday, killing a stranger walking out of a shop. "I've never seen someone this young be this cold, this violent," said [the] Oakland County Assistant Prosecutor... [But the boy's lawyer] said... "We're talking about a... little boy, physically and emotionally... He did not know the ramifications of his actions. He didn't intend to commit [a] crime." ...Police said [the boy] admitted shooting a rifle but denied trying to hit anyone. "I learned... my lesson," they quoted the boy as saying. [However, p]rosecutors say... his violent behaviour... includes pulling a gun on fellow elementary school pupils, beating an older boy with a pipe, arson and burglary. This year his mother told authorities she needed help managing him... [A] trial judge could opt to sentence him as a juvenile, in which case he could not be held beyond the age of 21.

...A 13-year-old Ohio boy said he and a friend smashed windows and lights and set off fire extinguishers in... 32... school buses because less destructive methods of vandalism weren't exciting any more... The two[, who]... admitted causing \$US41,000... in damage... were placed under house arrest for six months and ordered to write 500-word essays about what they have learned.

...In an innovative approach to justice, a West A[US]n outback magistrate has dipped into his own pocket to reward a 13-year-old repeat offender with a bicycle for staying out of trouble. [The] magistrate... had dealt with the boy... [who suffers] from fetal alcohol syndrome... on numerous occasions since they met in April 1995... [W]hen the boy appeared in court for yet another minor offence, [the magistrate] called the child to the bench... and asked him what he dreamed of... "The boy thought, then his face lit up and he said 'I dream I have a bike'... The magistrate said 'I'm going to make a deal with you... if you don't come back before me in th[e] next[]... 90 days... I'll buy you any bike you like,'"... said a children's court spokeswoman... Three months later... the court proceedings were interrupted when the clerk placed a note before [the magistrate] stating the boy was outside the courthouse anxiously awaiting his reward. [The magistrate] adjourned the court immediately and took the child shopping. "When they arrived at the row of bikes, [the magistrate] told the boy to pick one, and the boy made his way straight to the end of the line and said 'this one,' which turned out to be the most expensive in the store,"... [In local news, four] teenage girls turned to crime... yesterday to satisfy a craving for lollies. Police said the quartet, armed with hammers, stole "a quantity of confectionery"... Nothing else was taken... [and the store] attendant was not hurt... Three 17-year-olds and a 16-year-old have been arrested and will face charges in Rotorua courts.

...He's a... small puny... 14-year-old... with... rosy cheeks. He looks disarmingly innocent, but he is charged with rioting... on the North Shore late on a Saturday night... and admits it with a curt nod of his head. Under the Crimes Act that is an offence punishable by two years' jail. It is not the normal misdemeanour charge that most kids face when they appear in [Auckland's] Youth Court.

...Youths accused of burgling homes and committing other serious offences are not being punished for weeks because of a backlog of family group conferences in Auckland. The delays are frustrating police, who say some young criminals are reoffending in the meantime... Conferences are held to either decide the fate and punishment of young offenders or, in more serious cases, make recommendations to the youth court... [T]he head of youth justice in Auckland... said the backlog had occurred because 100 new referrals were coming through each month and group conferences had to be set up within three weeks. He said 161 youth offenders were waiting to be assigned to family group conferences - about 100 overdue... [However,] four social workers had been seconded to work as youth justice coordinators to try to reduce the back log[.] • 'Research by Victoria University's Institute of Criminology found that youths are less likely to be convicted again after successful family group conferences. The institute researcher says just holding a family conference is not enough and there are a number of critical elements necessary if they are to make a difference to the probability of re-offending - such as if they are not made to feel like a bad person, if they feel remorse, are involved in the decision-making and agree with the conference outcome and then complete tasks given to them and feel they have made amends to victims']...

Youth crime was booming in the Waikato township of Huntly until... two local policemen decided to do something about it... The roadside hoarding on the highway north of town tells travellers that they're in "the warm heart of the Waikato." Welcome to Huntly, a riverside town of 7300 about

halfway between the urban sprawls of Hamilton and Auckland. The hoarding evokes a place where the butcher and grocer soon know you by name. But it doesn't tell the full story of a community fractured by 12 years of economic reform: high rates of unemployment, substance abuse, domestic violence, crime. Huntly has long had the outlaw image of a frontier town. A quarter century of rural downturn has only made things worse. Then, [a few weeks ago], a curious report in the *N[Z Herald]* said that the town's Youth Court had been idle for the entire preceding month[, and there had been only]... one youth court appearance... [during the month before that. Huntly's c]ommunity constable... says that when he arrived in the town two years ago... as many as 40 kids a month were being arrested for property crimes – ...though he hastens to add that the crime was much like other small towns... With his colleague, [a]youth-aid officer[, the constable]... called two public meetings and hammered out a strategy to deal with youth offending. Relying mainly on a section of the Children, Young Persons and Their Families Act which allows police to pick up youngsters out alone after dark and take them home, they started cleaning up... They were generally pleased by the response of parents whom they had half expected to be aggressive about the invasion of their family life. But they didn't stop there. "If we saw kids out late at night we regarded that as circumstance enough to refer the families on to other agencies that were less threatening than the police in their uniforms,"... The change in policy was accompanied by a conscientious campaign by the local police to solve burglaries, and in particular to target the adult receivers who were providing young thieves with a market – and, in many cases, commissioning the novice criminals. "We've gone back to basic policing. We've gone away from the touchy-feely community policing and back to hard targeting of criminals,"...

Yesterday, a[n]... Auckland District Court... judge... reminded "hardened" teenage criminals that they could not escape hard punishment because of their ages... [as she] jailed four teenage boys... and... [gave] a suspended jail sentence... to... a 16-year-old girl... She said that on her past four working days she had jailed[another] four 16-year-old offenders for separate aggravated burglaries, some involving serious injuries to victims... [In international news,] Tel Aviv police officials conferred yesterday about the possibility of issuing a certificate of appreciation to a local thief who stole a bag... on Friday. When the thief... opened the bag in the stairwell of a nearby building, he discovered a 4lb bomb and ticking time device. Surrounding the bomb were nails intended to increase the casualty toll. [The thief] hastened to a nearby phone and... [then] posted himself at the entrance to the building to keep people away until the police arrived. Known to the police as a petty thief and drug addict, [the 30-year-old] at first said he had seen the bag in the stairwell and looked into it out of curiosity. He later admitted that he had taken it from the nearby beach crowded with youths. Police officials said [the thief] had prevented a potentially serious loss of life... [and] no charges would be pressed against him for the theft, since whoever had left the bag was unlikely to complain.

...More than \$4 million of property belonging to criminals has been seized and sold by the Crown. Money from the seizures has been put into the country's coffers and used for general spending... Court cases for the seizure of a further \$6 million in assets are pending.

...*Crime pays for Government...* Legislation which is set to net the Government more than \$13 million has been criticised by lawyers as draconian and mere revenue collecting. Criminal defence lawyers say the Proceeds of Crime Act needs to be amended to allow courts discretion when dealing with police applications for forfeiture of property... The president of the Criminal Bar Association... agreed, describing the legislation as sometimes "very harsh," in some instances unfair and saying the standard of proof required under the law was too low. Police did not have to prove beyond reasonable doubt that property was used or gained in the commission of a crime, but on the basis of balance of probabilities... If it is proved that a person profited from a crime, cash can be seized or an equal amount in assets confiscated and sold... [A]n Auckland barrister specialising in criminal work, said... police were targeting cannabis growers, as forfeiture applications involving drugs were easier to prove... "Farms that have been in the family for generations can disappear because of a not particularly serious drug operation." Spouses and children could suffer as they had to prove they were an innocent party unaware of criminal activity to keep their share of the property... Even property owned in A[US] can be sold for crimes committed in N[Z] under a transtasman agreement... In five years, the Government has reaped... \$4 million from convicted criminals under the act... [which] covers any indictable offence which has a maximum penalty of five years' imprisonment or more.

...Burglars are creating an underground economy based on a combination of stolen goods... second-hand dealers... and "honest citizens" who ask no questions... [when] paying low prices... [for] stolen televisions... stereos... microwaves and pieces of jewellery... [A]nyone on a benefit or low income knows how to get a television for \$50 and has little concern about why it is so cheap... Proceeds are passed off to myriad shadowy go-betweens who have taken up the market position once occupied by a handful of receivers... For the year to June... only 746 people in the Auckland metropolitan area were charged with receiving, compared to 4200 charged with burglary... Record numbers of break-ins plague the North Island, including central Auckland where police statistics... indicate one home was hit every 40 minutes... According to British statistics, a house that has been burgled once is eight times more likely to be burgled again[('in Britain, where half of all burglary offences are committed by young people aged between 16 and 24 years, a billion pounds worth of property is stolen from homes every year – returning the goods to their rightful owners is no easy task for the police; Christmas time in the UK is a time of rich pickings – there are more break-ins during the season of goodwill than at any other time of the year')]. Burglars and receivers are not the only ones who profit from burglary... [I]nsurance claims in Auckland [are] pushing premiums up... Electronics retailers who replace the stolen property for insurance companies do nicely out of the trade... So do people selling burglar alarms.

...Insurers want urgent changes to the laws covering pawnbrokers and second-hand dealers to shut off one channel for the growing trade in stolen property... [which is estimated at] \$60 million in goods each year... The... [NZ] Insurance Council... has told a police-security industry liaison group that the 34-year-old Secondhand Dealers Act and the Pawnbrokers Act 1908 are outdated in today's criminal climate... A council executive... says N[Z] law fails in two major ways: records of pawnbrokers and second-hand dealers were not required to be audited, and the standard of identification needed from people selling second-hand goods was low... [Meanwhile, p]olice have set up a special squad to combat a burglary epidemic in West Auckland which they say is out of hand... A spokesman for State Insurance said the company... had paid out \$12 million on claims in West Auckland in the past year... The cost of claims in Auckland as a whole was about 45[%] higher than the national figure.

...Crime in Auckland is rising nearly three times faster than in the rest of the country. Close to 170,000 offences were reported in the Auckland metropolitan area, a 5.5[%] increase on last year's figure, compared with a 2[%] increase nationally... from 506,359 offences in 1995 to 516,369 last year... The Police Association president... said people should be careful to say the crime rate had gone up only 2[%]. "...that is 10,000 more victims of crime out there." [Statistically, 1 out of every 7 NZers were *victims of crime* in 1996 (but there were '525,622 offences in 1991')]. In the year to June 30, Auckland's murder rate doubled... and the number of attempted murders and manslaughters soared.

...Three young Auckland men... aged 17... 19, and... 22, all unemployed... kicked a 55-year-old to death for little more than 50c each... They took his wallet containing \$1.60... - 1997

Approximately ninety percent of all crime is committed for money. Robbery, forgery, embezzlement, and kidnapping are money motivated. Even murder is sometimes done for a price.

...I'd asked her for two dollars just to kill the King... - MASTERS OF REALITY

A... man offered to pay \$25,000 to have his wife and three children shot, but the "hitman" was an undercover police officer. The man, who has had his name suppressed, pleaded guilty... in the Auckland District Court yesterday... In May he visited a woman and paid her a deposit of \$5000 to find someone to murder his family. The next day the woman telephoned the police... The man... transferred \$1000 into... [an] undercover...

policeman's bank account. He later couriered a further cheque for \$24,000, made out for cash, to the officer. The policeman then told the defendant that he could not kill children. In a later telephone call, the police officer was asked if he would accept \$40,000 just to murder the wife. At that stage the... man was arrested... The maximum penalty he can receive is 10 years in prison.

...A... man who tried to take out a murder contract on his wife and three children has been revealed as a former Catholic priest. In the High Court at Auckland yesterday... an order suppressing... [his] name and details... [was] lifted... He was jailed for five years.

...sometime, early in 1990, the friendship soured over arguments about housework... Late one night... [the NZ]er... went to the bedroom of his... lodger... clubbed the sleeping man on the head with a hammer until he was dead... dragged the body to the basement... and buried... [it] under more than 1m of soil... and later concreted a new floor. Months later he left London and spent the next seven years travelling, knowing all the time that no one would miss [the lodger], who had long before lost contact with his family. The perfect murder – until one day this year, when [the NZer] found God and confessed to a crime that London Metropolitan Police admit would probably never have been discovered... [Incidentally, l]egislation is needed to clarify whether convicted killers should be allowed to profit from their victims' deaths, says the [NZ]Law Commission. Common law at present holds that wills are invalid if a person stands to gain from the estate of someone they have killed. But the president of the Law Commission... said there were cases when the law was not clear enough. "For example, should a driver who by inattention kills a loved spouse be barred from taking property from the spouse's estate?" ...other cases where killers might be allowed to profit included women who suffered from the battered women's syndrome, infanticide, and those who commit mercy killings.

...[the NZer], who with her friend... bashed her mother to death in Christchurch at the age of 16, ...plans to cash in on her dark past after being exposed as a religious recluse living in England... [The n]ow... 58-year-old[, who]... has changed her name... is courting cheque-book-wielding British media executives prepared to pay for the story of how [the pair of teenagers] lured Honora Parker to a secluded spot and killed her with a brick in 1954. Like [her friend], who changed her name... and became a crime novelist, [the daughter] moved to Britain in 1965 after serving less than four years of a five-year prison sentence... Her past remained secret until this week when the N[Z] *Woman's Weekly* tracked her down. - 1997

Payment... for stories, pictures or information should not be made... to convicted or confessed criminals or their associates... except where the material concerned ought to be published in the public interest and payment is necessary for this to be done. - EDITOR'S CODE OF CONDUCT (UK Press Complaints Commission rules)

...another villain on the cover of a... magazine the victim somewhere in between...

There are rich pickings to be had from being an ex-gangster in Britain. Villains have become media stars, publishing memoirs and appearing on chat shows and in soap operas in response to seemingly endless public fascination with the criminal underworld... This appears to be borne out by the success of British gangster films, such as *The Krays* and more recently *Lock, Stock and Two Smoking Barrels*, which depict the East End gang scene in gruesome detail. Throngs of admirers, including many celebrities, lined the streets for Ronnie Kray's funeral in 1995, all eager to catch a glimpse of Ronnie's infamous friends. And the gangsters parading in suits and shades did not disappoint. "You play the part because people want to see you that way," said... [the author of] *Inside the Firm*, which became a bestseller... "It's not my choice but you might as well go along with it."

...ANOTHER day, another First Amendment war for... the *Hustler* magazine publisher... While... [the publisher] has made headlines lately for exposing the sexual peccadilloes of prominent Republicans, he also is testing the limits of taste – and the law – with a new business venture. [The publisher]'s new line of adult videos features women who have been incarcerated for various crimes from bank robbery to narcotics possession. The first video in the *Jail Babes* series was released last month. But [the publisher], who did time for contempt of court, may face a legal obstacle with his latest project: California's Son of Sam law, which blocks felons from profiting from their crimes. Named after the New York serial killer who sold the story of his 1977 murder spree, the law allows either the attorney general or a crime victim to file a civil action to recover income made by criminals who peddle their tales. While Californian lawmakers may not have envisioned adult videos as a vehicle for criminals to reap profits when the statute was enacted in 1983, the [*Jail Babes*] production underscores the potential breadth of a law that already casts a shadow in a Hollywood fascinated with true crime stories... Preventing [the publisher] from paying former bank robbers and drug dealers could prove difficult. Lawmakers revised California's Son of Sam law after the US Supreme Court struck down New York's version in 1991, and the new one has yet to be tested on appeal. The only three cases undertaken by California authorities have led nowhere... The latest case filed under the law remains unresolved. Frank Sinatra's family invoked the statute last year when it sued Sony Pictures to block its efforts to buy the story of [the person] who masterminded the kidnapping and \$240,000 ransom of Frank Sinatra['s son] in 1993... "In the big picture, we've got a problem as a society if we can't enforce this law," said[the family's] attorney...

AN INVITATION to coffee with the poisoner... is a luxury that few can afford to accept. In the past, many of those who did paid with their lives. These days the price is lower: A mere \$11,600... He is... sure that attempts... to stop him profiting from book and film deals will fail. Unthinkable or not, the selling of [the poisoner] – a handsome man whose charm is particularly effective on young women – is already a small industry... His soon-to-be-published memoirs, written in prison, have already netted him \$350,000 and he has negotiated a film deal worth a rumoured \$20 million... If he does have any regrets they seem to concern missed opportunities to market himself, rather than the fate of his victims... [In related news,] Britain has called on Iran to denounce an increased bounty offered for the killing of the writer [of the book *The Satanic Verses*]. But a leading Iranian politician has distanced his Government from the new offer of a \$US2.5 million... reward.

...[the] Indian-born British novelist... does not need as many bodyguards these days. But his life is still under threat eight years after [an]Iranian revolutionary leader... issued a fatwa... The threat of death at the hands of Islamic fundamentalist hit squads, who believe his 1988 novel *The Satanic Verses* is an insult to Islam, continues to hold him hostage and has turned his life into a nightmare... This month [the novelist] celebrated his 50th birthday. He is rich and famous but continues to... constantly[move] from one hideout to another. He is homeless... [T]he book has made global head-lines like few others before it... Many devout Muslims consider his... book blasphemous. In it [he] describes a scene in which the Prophet Mohammed meets Satan, who tries to seduce him to evil. And [he] also names prostitutes in the story after the prophet's wives, who are honoured in Islam as mothers of the faithful. The book sparked rioting in some cities, particularly after the edict... His apologies and declared belief in Islam were to no avail. A Japanese translator was stabbed to death. An Italian translator was attacked and a Norwegian publisher only narrowly escaped death... On June 12 the... London-based International... Defence Committee... called on EU member states to condemn Iran's actions as "terrorism."

...Iran reiterated yesterday that it would not seek to carry out a death order against [a]British author... but insisted it would not give written guarantees on the subject... [Incidentally,] Mexico is offering a \$US1 million... reward for information leading to the capture of three brothers who head a drugs cartel and allegedly ordered the recent shooting of a Mexican journalist.

...The U[S] has offered a \$US2 million... reward for information leading to those responsible for four letter bombs sent to the Washington offices of the *al-Hayat* Arabic newspaper in January. [● 'In the US, the FBI offers public rewards ranging from \$50,000 to \$5 million for crucial information.']

...Police posted a \$10,000 reward yesterday for information leading to the identity of the driver of the car that hit and killed [a Huntly teenager five months ago]... It is the first time a reward has been offered for a hit-and-run accident in... [NZ. R]ewards were uncommon and usually offered for murders... [T]he first reward... was... £50... promised for the capture of an Invercargill prison escaper in 1868... Police national headquarters has records of only about 50 rewards since the mid-1950s. The most recent was the \$20,000 offered for information about the murder of... [a] Christchurch... scrapmetal dealer... last year... A headquarters spokesman said rewards were usually unclaimed.

...The last known reward paid out was in 1992 when one claimant got \$10,000 from the \$20,000 offered in relation to... a... murder... in New Plymouth... \$20,000 is the norm in a murder case... but it is a modest sum compared with the \$100,000 offered by the police for information leading to the arrest of the South Auckland serial rapist three years ago... Police are considering posting a \$50,000 reward for information leading to the capture of the killers of [an]Auckland businessman... A[US]n police also offered rewards, as do the British. However, according to Interpol, they're "more constrained" than the U[S] where – despite concerns that 'in the past people have deliberately blamed innocent suspects for crimes in an attempt to collect' –] ...rewards are commonplace, [and]there are even so-called bounty hunters, in reality private detective agencies, who scan the wanted posters on public buildings. Most reward cases arise because of the multiplicity of law enforcement agencies and criminals crossing state and county lines into other jurisdictions.

...U[S] bounty hunters... kicked in the front door of a home, held children at gunpoint and shot a couple to death in a case of mistaken identity, police and a witness said. As many as seven bounty hunters – all dressed in black and wearing ski masks and body armour – broke into the home in Phoenix... in the early hours looking for an out-of-state bail jumper who apparently owed a bond company \$US25,000... Police said they didn't believe the bail jumper ...ever... lived in the house... No charges were filed, but police said [the bounty hunters] might be charged with murder...

It's not quite a "Dead or Alive" poster fluttering on a tree trunk, but when the police offered a reward for the capture of the country's most wanted fugitive... it conjured up images of saddling up a posse... In the 1990s... the... spectre of bounty hunters might be faintly discernible on the horizon... In 1910... a butcher of Moravian descent, was something of a folk hero in the Manawatu. He attracted a reward of £50 when he showed as much aptitude for breaking out of cells as he did for breaking into homes... But when he was accosted on the run by two police officers, one of whom was shot in a scuffle in the dark, the reward... jumped to £100. The wounded man took several days to die, but said on his death-bed that he couldn't be sure it wasn't his colleague who shot him, which rather damaged the police case. So, failing to nail him for murder, the police – after four more trials – got him on breaking and entering, theft and arson. To great public outcry he was sentenced to a hefty 21 years' hard labour. Within months, he escaped from the condemned cell at Wellington's Terrace Jail and was last seen fleeing through Kelburn in his white prison clothes. As late as 1963 he was still officially wanted, though the police – doubtless embarrassed by his case – offered no reward for his recapture. Decades later his family and friends confirmed he fled by sea to Canada. Is it worth the authorities' while putting in a call to the Mounties?

...Gang members will be "falling over each other" to get their hands on a \$20,000 reward for the capture of N[Z]'s most wanted fugitive, his employer fears... "Every gang associate in the country will be out looking for him – there will be gang wars over who found him first. This is inciting all sorts of civil unrest." ...The \$20,000 will be given to anyone providing information leading to the capture of [the fugitive] wanted in connection with the murder of a Nomad gang associate... in May. Wanted posters will be sent to every police station in the country... Police claim [the fugitive] is armed and dangerous – which his family denies – and that he has been kept in hiding by Highway 61 gang associates. [The fugitive's] employer, who... hired him about five years ago as a heavy-machinery operator, said he was willing to help set up a meeting between [his employee] and police, but he would not accept reward money "even if it was \$200,000." He said he knew how to contact [his employee] and could probably produce him for police within 24 hours... Police said yesterday they were aware that the employer had contacted [the fugitive] and would be happy to arrange a meeting... [which] would hopefully speed up [the fugitive's] capture and ultimately save money by freeing up police resources again... [P]olice did not have a warrant for [the fugitive's] arrest on a murder charge but would probably charge him with murder unless he had a "compelling explanation." ...One person is already in custody charged with [the Nomad gang associate's] murder.

...Armed police raided a house in Murupara on Thursday night after being told that [NZ's most wanted fugitive] was being hidden there. But he was not there... The Rotorua chapter of the Highway 61 gang said it had not seen [the fugitive] but would not do him in for a reward of any size... [Furthermore,] the chapter's sergeant of arms, disputed a suggestion that the \$20,000 reward... would incite violence between gangs competing to turn... [him in. However, a] Detective Sergeant... of Otahuhu, said... he... had "grave fears" for [the fugitive] and those harbouring him now that gang warfare had erupted in Auckland between the Highway 61 and Nomad/Black Power gangs. "We know the Nomad hierarchy have ordered 2:1 killing in retaliation to the murder. There have already been two arsons and a stabbing," he said...

One of two remaining hostages held by Taiwan's most-wanted fugitive walked free after 20 hours of captivity yesterday... [The girl], aged 12, smiled and wept as she was embraced by friends... There was no immediate sign of her mother... or the hostage taker... [who is also] sought... for... the kidnap-murder in April of an actress' teenage daughter... Police... found the[daughter's] body... floating in a river in Taipei county... two weeks after the 16-year-old was kidnapped... on her way to school... in a \$US5 million... ransom case.

...[a tired but apparently unharmed Japanese electronics executive was freed by kidnappers on Monday after they received \$US2 million in unmarked \$US100 bills, Government officials said. He was the first high-ranking foreign executive kidnapped in Mexico in recent years and his abduction fuelled fears that criminals may target some of the thousands of foreign executives who work in factories along the Mexico-US border.] ■ 'A NZer kidnapped while working as a bar hostess in Japan was repeatedly raped by gang members. Lisa (not her real name) said she was one of three NZ women kidnapped in Tokyo this year. News of the incident prompted the NZ Embassy in Tokyo this week to warn women against travelling to Japan to work as hostesses in clubs.'

...the 8-month-old daughter of a Maori lawyer and her High Court judge husband was yesterday found alive and well in a house near Turangi, 200 hours after she was snatched from her pram at gunpoint. At a press conference late last night, police confirmed that a \$3 million ransom demand – believed to be the largest in NZ history – was made "some days ago". In 1987, a woman was abducted at gunpoint from her Hamilton home. The kidnappers demanded \$500,000 in used banknotes and \$500,000 in uncut diamonds. They threatened to kill her if police were called. She was held in bush for two nights before police rescued her. Four years earlier in Oamaru, an Asian schoolgirl was dragged at gunpoint from her family's home at the beginning of a 38-hour ordeal. The kidnappers demanded \$120,000 and threatened to kill her if police were called. The officer in charge of the Asian crime squad in Auckland said that in Asian countries crimes such as kidnapping were commonplace. Because people were afraid of threats to their families they often paid up without reporting the incidents to the police, the Detective Sergeant added. A Hong Kong businessman had recently paid HK\$1 million to get his son back without going to the police. Between one and three cases of kidnapping involving Asians are reported in Auckland each month. Those taken are often students. Only two weeks ago, \$500,000 was demanded when a 6-year-old boy was snatched from his West Auckland home at knifepoint and held for nearly two days until the ransom was left beside an Auckland motorway. His frantic Taiwanese parents found him unharmed after the ransom was dropped off in an apparent police sting.'

... '93% of kidnappers screw up when they try to get the money.' Incidentally, a] judge in Switzerland has issued international arrest warrants for seven Israelis in connection with an alleged plot to kidnap... possibly the richest 12-year-old in the world... [The] sole surviving heir [of a]Greek shipping tycoon... has \$US3 billion... to her name.

...The... Foundation... set up in Switzerland to look after [her] interests and oversee the management of her wealth... says two Swiss judges probing an alleged attempt to abduct the 12-year-old heiress... conspired... to wrest control of her inheritance from the foundation and assign it to...

[her father, who] has accused the foundation of mismanaging the money... [Her father] fears for his family's security and for the well-being of his daughter... "My wife and I and our family have been living a nightmare since February,"... [F]ormer British SAS troops, guard the girl... [H]er security and other expenses... [cost] about \$6 million a year...

Allegations of a kidnap plot against the heiress to the Onassis billions were "ridiculous stories" invented by the girl's father, according to... trustees of the estate... [The father] said former Israeli agents were behind the plot but the claims have been dismissed by the Israeli Government... The trustees' two-page statement backed the Israeli version of events... [In related news, a]n armed hijacker demanding \$16.8 million seized a plane carrying at least 140 people en route to Moscow yesterday, but was seized by security commandos... who rushed on board... soon after landing. All passengers were released unharmed... Security officials said the man appeared confused and was... demanding to be flown to Switzerland.

...Four armed men hijacked a small plane yesterday, forced it to land in a vacant field in northern Peru and escaped with the \$1.7 million in cash it was carrying... [Meanwhile, a]uthorities in Switzerland and Italy have detained 13 people they believe carried out one of the largest heists in history – a \$US37 m... holdup at a Zurich post office... Over the weekend authorities recovered more than \$US14 m... of the stolen money.

...A MAD scramble for money by people in a poor, black district of Miami after a security truck spilled its assets has prompted some soulsearching in a city notorious for crime and corruption. Dozens of people in Overtown, a rundown central city neighbourhood, scooped up cash and coins when a... armoured security truck, believed to be carrying \$5.28 million, flipped on a highway overpass... [A] popular radio talkshow host, called their actions dishonest and undignified. Many callers agreed. But a black Overtown resident... said people were so deprived their actions were justified. "You don't understand. You just white, rich... Try coming to live in Overtown for a week – you wouldn't last one hour." ...Miami police gave people a 48-hour amnesty to return the hundreds of thousands of missing dollars but by Friday no money had been turned in.

...[Miami] police have announced a second amnesty... [People] have until tomorrow to return the money without fear of prosecution. The first amnesty netted just \$US20.38 of the \$US550,000... missing... [Incidentally, a] fleet footed robber bashed a security guard with a rifle and sprinted off with... cash at Auckland University yesterday... The Armourguard employee had just finished servicing automatic teller machines... It is at least the sixth strike on Armourguard staff this year... [T]he average haul... was \$68,000.

...SHOPLIFTERS may be less likely to cop a long jail sentence if the target store's holding sales in America. [A woman] has been charged with stealing goods – including videotapes, cigarettes and doughnuts – from a supermarket in... Vermont. Total value of her haul, according to the police, is \$US101.49. Vermont has a \$US100 threshold for a felony retail theft which can earn up to 10 years behind bars. Her lawyer is arguing, however, that slashed prices on the doughnuts helped reduce the total value to \$US97.37. And theft at that level is a mere "misdemeanour" – with a maximum punishment of six months. [● 'Shoplifters (most of whom are women) cost NZ stores \$500m a year.']

...Retailers be warned: the enemy lurks within. Staff are much more likely to steal from their bosses than customers – but employers appear reluctant to face up to the fact that employees are ripping them off. A study of retail crime in N[Z], believed to be the first of its kind... found that retailers consider customers twice as likely to steal from them than staff. But the University of Otago... [study of] known cases of theft... indicates... 59[% were] committed by employees, and customers were responsible for 39[%]. Theft]... by suppliers accounted for the remainder. - 1997

Stealing On The Job [TV3, 8.30pm] is a d]ocumentary investigating why N[Z]ers steal up to \$900 million annually from their employers. It meets the thieves to find out why they do it and how they get away with a crime that is not just a financial loss for the boss but a personal betrayal as well.

...Eleven nightshift workers allegedly locked into a Johannesburg chemical factory... have burned to death... [T]he 10 women and their male supervisor appeared to have tried to break open a padlocked door... Firemen had to cut locks on the outer security fence and enter the factory through a hole apparently blown in the wall... [after] gas bottles used for heating chemicals... exploded, but it was not immediately clear whether they caused the fire or exploded in the flames... Officials said some of the bodies had become stuck in melted plastic from large tanks holding chemicals... Police were investigating charging the owner with murder or culpable homicide... The owner was remaining silent on the advice of his lawyers... [but an employee, who had] stayed home on Friday night (local time) because of pain from an old burn on her leg... confirmed claims... that the owner of the factory had routinely locked nightshift workers in because he was afraid they would steal from his stores.

Honesty, of course, is relevant. Some people are scrupulously honest in all relationships. Others are honest most of the time. Some cheat anyone they feel they can, while others may cheat only on their income tax... Many of the world's greatest fortunes have resulted from business practices which were questionable, to say the least. John D. Rockefeller, Cornelius Vanderbilt, J.P. Morgan, Jay Gould, and Jim Fisk have been included in history books because of their wealth, not because of their ethics. It was not because of their honest business dealings that some of these nineteenth-century multimillionaires acquired the dubious title, the "robber barons." ...[as someone once said when] referring to financial manipulations by the heads of large corporations, "Crime, carefully planned and executed, is demonstrably the royal highroad to pecuniary success in the U[S]." ...Case histories show that people who start out with little or nothing in life and claw their way to the top of the money heap are obsessed with the acquisition of money and what it stands for. People for whom money is the most important thing in life have a very good chance of accumulating lots of it. Usually, they make lots of money, or land in jail, or both... Most people are unwilling to make money by means in opposition to their beliefs and values. On the other hand, the newspapers, as well as TV and movie scripts, are filled with stories of people who steal, embezzle, murder, and sell hard drugs for money... While it is possible for an honest person to become rich, the odds are lowered significantly the more dishonest one becomes... Crime, vice, and dishonesty generally produce considerably more money than does honest toil. In most cases, the person who desires a large sum of money in a hurry is forced to choose between wealth and virtue. And not infrequently money wins... Those who lack money but desire a great deal of it, yet who are unwilling to work long and hard to get it, have few options open to them. Unless they have unusual talent, they are generally limited to luck or crime to make their desire come true... There is probably nothing that someone won't do for money... A few years ago, the Boy Scouts of America, an organization which has practically become synonymous with honesty, found that some of its staff were padding their membership rolls with nonexistent boys in order to receive more federal funds... Americans are probably as moral as anyone, yet few would dispute the adage that "Everyone has his price." Morality is frequently bought off with money... People with money can often intimidate those who want it, and those who do not have money may allow themselves to be manipulated in humiliating ways in order to get it... Organized crime... owes its existence to the fact that some people are willing to accept money for performing illegal services... Organized crime is one of the largest industries in the U[S], netting billions of dollars a year. Free-lance crime adds billions more.

Hardly anyone likes to admit that the highest achievements of the Western mind spring from the same soils that nourish the lush flowerings of corruption and greed. On the one hand the capitalist system implies the exploitation of any available weakness, but on the other hand it encourages the freedom of thought and experiment. The two genies emerge from the same bottle, simultaneously and without benefit of ideology. In November of last year, in the same week that the usual number of public officials were rounded up on the usual suspicion of fraud, seven Americans received the Nobel Prize. - The editor of *Harper's*, 1977

Right this minute somehow, somewhere a fraudster is at work... Some are novices in the ugly, but seemingly popular, trade. Others are hardened cons who have become professionals through years of ripping people and organisations off. Criminologists say that once a person successfully completes one small fraudulent take it will encourage a further attempt at, perhaps, a slightly more productive assignment. It continues until he or she is eventually caught when greed engulfs that person's soul forcing a mistake after earnings have been built up to the hundreds of thousands and even millions of dollars. - 1996

Tycoon arrested in a £25 million timeshare fraud... Since his first headline more than 40 years ago, it seems nothing has changed about [his] criminality, except its scale... His sentence on the \$A1.2 billion [fraud] will be the final price the fallen tycoon will be called on to pay for his crimes during the 1980s... It also fulfilled a prediction [his] late father... made 40 years ago... "There's only two ways he can go... either he will end up in Fremantle jail or he will become the richest man in A[US.]"

...the former high-flyer who stunned the world a decade ago by spending a record \$A79 million... on a painting, can look forward to earning up to \$A40 a week in Western A[US]'s Casuarina prison... [after being] sentenced on Monday to three years in prison on corporate fraud charges... [In related news, a]n Egyptian court has convicted a Sudanese man who swindled people out of hundreds of thousands of dollars by persuading them he had a genie which could multiply their money. In one case the swindler deprived a teacher of his entire \$US800,000... savings.

...London police report that [a 52-year-old] became a millionaire by swindling banks and financial institutions. Her crimes might never have been discovered if she hadn't attempted the biggest fraud in history – a sting involving her having "power of attorney" over gold worth more than \$37.5 trillion. Financiers became suspicious... The gold was three times the total amount mined worldwide in the past 150 year[s]. She's now in jail.

...THE [NZ]public can have confidence in the credibility and thoroughness of the Serious Fraud Office... says [its]newly appointed director[, who]... is responsible for a staff of 40 people and a budget of \$4.6 million... He says that as long as there are people, money and business there will be some who will try and take advantage of others...

A South Pacific police chiefs conference has been told islanders are increasingly being taken for a ride by white-collar criminals. [Chief]s from 16 police forces – including those of N[Z, AUS] and the U[S –] ...asked for greater cooperation between regional law enforcement agencies. - 1997

Some people could be forgiven for thinking that the phrase *white-collar criminals* refers to ministers from certain Christian churches! That might be correct in some instances, but it usually means economic crimes committed by management or businesspeople and *the Mob*.

Mafia... a secret organization, opposed to legal authority and engaged in crime, that originated in Sicily in the 13th c. and later spread to... America, at first among Italian immigrants... it became an integral part of the sophisticated and ruthless organized crime that developed... the[re]...

...secret society or brotherhood, originating in 18th-cent. Sicily. At first a resistance movement opposing foreign control, it evolved into a group featured by "omerta," or "conspiracy of silence." ...When foreign intervention ceased after 1860, the Mafia, reluctant to relinquish power, turned to criminal activities, such as robbery, extortion, and kidnapping. Sicilian immigrants brought the Mafia to the U.S. in the late 19th cent., and exerted extensive control over non-Mafia Italians. During Prohibition the Mafia extended activities to lucrative bootlegging. Organization into national "syndicates" occurred, with notorious leaders, such as "Lucky" Luciano and Al Capone... After [the Prohibition laws were repealed], the Mafia focused on international narcotics traffic... and even control of legitimate businesses. After W[W]II, Luciano's deportation to Italy... inadvertently furthered Mafia internationalization.

Global crime is very big business.

...with crime now a global industry whose annual turnover is of roughly a trillion dollars... and with more than a million convicts in US prisons, should we take seriously the old warning that a civilization plagued by just 1[%] criminality would return to Stone Age conditions? ...Imagine a poor peasant boy. Let us suppose he is offered the opportunity to become a member of the Mafia... If he refuses, he will live a life of almost unimaginable poverty... If he accepts, he will do evil things... but he will also live comfortably, have friends and women, and, perhaps, even enjoy a kind of respect and admiration.

Italy has granted witness-protection status – and a \$US250... monthly stipend – to a notorious Mafia boss who... claimed responsibility in a prison memoir last year for more than 100 killings. He admitted pushing the button on a bomb that killed revered anti-Mafia prosecutor Giovanni Falcone and four others in May 1992. The killings outraged Italy and fuelled a 1990s crackdown on the Mafia. "It's like they've killed Giovanni all over again," his sister... said yesterday... "The truth is his death was for nothing." The head of Italy's anti-Mafia commission... called a special meeting for tomorrow to hear the witness-protection committee's explanation for its decision... In the mid-1990s, [the]... Sicilian nicknamed The Slaughterer... ordered the son of a turncoat rival to be kidnapped when the man began cooperating with prosecutors against him. [When he] saw on the television news that he had been convicted in absentia, [the Sicilian] ordered the 11-year-old strangled and dissolved in acid... [He] is serving a 21-year sentence for murder... A court in southern Italy has handed down 89 life sentences and a total of 731 years' imprisonment on 98 members of the Calabrian Mafia. One defendant was given 18 life sentences for 18 killings.

...THE Milanese used to boast their prosperous, cultured city was free of organised crime while the poor backward south of Italy was infested by the Mafia. But these stereotypes no longer hold true... "Milan is perhaps the only Italian city where all the major criminal organisations from the south – Sicily's Cosa Nostra, Naples' Camorra, the Sacra Corona Unita from Puglia and the 'Ndrangheta from Calabria – have put down roots,"... Over the past five years, there have been about 2800 Mafia-related arrests in Milan and surrounding Lombardy – more than in Palermo, Sicily. Police and prosecutors have carried out 37 major anti-Mafia operations since 1990... But the crime families continue to invest in local business and the financial sector... The gradual drift northwards by southern mafiosi was unwittingly encouraged by the Italian state. For decades, it sent gangsters into internal exile in Mafia-free areas, typically to the north, hoping that, by separating them from their power bases, they would turn their backs on their criminal past. Instead, they took their families and associates and set up shop in "safe havens". There are optimists... who believe that investigators have dealt a blow to organised crime in the north... [because] financial crime is on the wane. But others are not so sure... [A]n Italian MP and former city police chief, says investigators' efforts are hampered by inadequate laws to fight money laundering and by little co-operation between police. ['□ Just about everyone in Boston these days has a theory about why a celebrated FBI agent sold his soul to a murderous Irish mob boss. Back in 1968, the aggressively ambitious G-man helped smash the New England branch of the Italian Mafia. With the local cops in their pockets and the politicians on their payroll, the Italians had been conducting business with an open, defiant arrogance that galled the feds to distraction.']

...The greying Mafia lacks heirs apparent after a 10-year US Government assault on the Mob's top echelon... And New York City's five Mafia families, traditionally the largest and most powerful in the U[S], approach the 21st century with shaky futures... [T]he new generation is unskilled, undisciplined, lacking loyalty, and in love with violence...

[US] STREET gangs are following in the footsteps of other organised crime groups in targeting businesses for everything from simple theft to drug sales and money laundering. There are no hard numbers on how many gang members are in the work force. Many... don't break the law... But a hungry economy desperate for workers is making it easier for gang members to infiltrate businesses... When gang members do commit crimes in the workplace, their employers often are reluctant to disclose embarrassing lapses of expensive security systems. But law enforcement officials say incidents of workplace theft and violence involving gangs are on the rise... BankAmerica Corp... has prosecuted several fraud cases involving part-time branch tellers tied to Los Angeles gangs.

...Japanese police raided giant electronics companies Mitsubishi Electric and Toshiba as the "sokaiya" scandal over paying hush money to gangsters widened. The raids followed the arrest of the heads of general affairs at both companies on Monday.

...Mitsubishi Motors is the seventh firm this year to see staff accused of making... illegal payoffs... and newspaper reports said electronics giant Hitachi made payments to the same racketeer involved with Mitsubishi, although it was not clear whether those payments were illegal.

...[THE] TOP executives of... Japan's third largest bank admitted it had been unable to cut off its ties to racketeers in a widening saga of dubious deals and illegal payoffs. The fresh revelations, including hints more were to come, put... [the bank] in the dock with the country's biggest brokerage, Nomura Securities. The... [bank's] president... said the bank had made \$[NZ]320 million in loans to... the younger brother of... the racketeer at the heart of the Nomura scandal.

...These days much of Japan appears enmeshed in... deceptions and frauds. The president and 15 directors of Nomura Securities... resigned on Wednesday to take responsibility for bribing an alleged gangster-extortionist... The act of contrition impressed few Japanese: They had seen it all before. Just six years ago Nomura was accused of lending money to a gangland boss and helping him ramp shares to make stock-market killings. At that time [the] Nomura chairman... and president... resigned and the company solemnly declared it would never again deal with the yakuza (gangsters). But clearly Nomura has not changed its ways... Nomura is not alone in being implicated with the Japanese mafia. Last month police arrested two executives at Ajinomoto, Japan's leading processed foods maker, for paying \$68,180 to six sokaiya (gangsters who threaten to disrupt shareholder meetings). Top beer producer Kirin Brewery and Ito Yokado, a leading supermarket chain, have also been charged with bribing gangsters. The reason more than 90% of all Japan's public companies hold their annual meetings on the same day (June 27 last year) is to try to elude extortionists. But companies are not always successful at escaping them. More than a score of attacks, some fatal, have been made in recent years on bank managers who tried to collect debts from the yakuza. The involvement of the yakuza in Japan's long-standing bank debt crisis has also been blamed for slowing attempts by banks and the government to resolve the problem. But the main blame lies with the tradition of secrecy [and] a refusal to admit problems exist.

...CHINESE triads have been around for centuries. They were started with good intent by warriors swearing in secret to uphold codes of honour and patriotism. Gradually they became organisations to protect such members who dabbled in political intrigue and corruption; finally, they devolved into today's ruthless crime syndicates with international operations... ['The underworld Chinese triads wield enormous influence in Hong Kong and expect to profit from virtually any sort of activity there.'] In 1994 the head of the Independent Commission Against Corruption in Hong Kong... identified 57 active triads in the territory with cells throughout the world, including Britain, A[US] and the U[S]. One of the largest is the 14K Triad, which is said to have established linkups in N[Z].

...The police have revealed that the powerful 14K triad has used standover tactics to recruit up to 700 Auckland teenage associates. The police Asian crime squad... – made up of police, customs, immigration, the Security Intelligence Service and the Serious Fraud Office – ...said the... gang was gaining ground on male and female students... in school yards, karaoke bars and noodle houses... [T]he gang targeted recruits for their wealth and vulnerability – often new immigrants who spoke little English, had no friends and might have arrived in N[Z] without parents... Thousands of secondary and tertiary students came to N[Z] each year to study without their parents. And parents who had emigrated and then returned to their home countries on business left hundreds of youths behind... To many... the gang offered friendship, protection and excitement. A membership fee of several thousand dollars was handed over or broken into payments using the sacred triad numbers of three and six... [A] refusal to join was followed by beatings and threats of violence until the student relented. [One detective] knew of Auckland parents who paid \$3600 to get the gang off their 13-year-old son's back... The police believed that all the growth was linked to one man, whom they would not name... [T]he man was believed to be the only person in N[Z] officially initiated into the 14K in Hong Kong, in an ancient ceremony which included drinking chicken blood and swearing a lifetime allegiance to 36 secret oaths. That person[is] known in 14K circles as the "dragon head,"... One Auckland Asian leader... a spokesman for the United Asian Association... said he could not believe 700 youngsters were associated with the gang... In the[Asian crime] squad's first restaurant extortion case, five youths – allegedly linked to the 14K – were on trial... each charged with demanding with menace...

Most Chinese restaurants and takeaway bars in east Auckland are paying protection money to triad gangsters, a crown prosecutor says... His... claim of extortion has been backed up by one of the restaurateurs... [who] said he would rather pay them than report their threats to the authorities because the police were "weak." ...[he] says the police seem to try hard to avoid brutality and civil rights abuses. "They are not as tough as their counterparts in China and Taiwan... so I prefer paying some money to buy peace." ...much offending often goes undetected because many Chinese are reluctant to talk to the police... [T]he gangs were smart and would soon find out who reported them, "then you'll have a real big problem." ...the 15 Howick restaurant and bar owners spoken to by the N[Z] Herald declined to say whether they paid protection money.

...A shortage of police officers in Auckland is pushing Asian students into the arms of a private protection agency, says the Labour Party...

Asian students in N[Z] are paying fees to former Hong Kong and N[Z] police officers for round-the-clock protection from triads... For \$58 a week, the service provides regular visits and 24-hour contact throughout the country. [In related news, 'a war between two bikie gangs which has cost hundreds of lives overseas could reach NZ. Napier's Outlaws motorcycle club has joined the American Outlaws association – enemies of Hell's Angels. The bikie gangs have been at war since 1974, after an Outlaw allegedly raped the wife of an Angel in New York. The blood feud became a fight for control of the North American drugs market. Napier's Outlaws affiliation with the American Outlaws association places them in direct confrontation with the Hell's Angels, who have a prospect chapter in the neighbouring town of Hastings. The Outlaws – whose motto is "God forgives, Outlaws don't" – were formed in 1959. The gang has 34 chapters in America and Canada, with about 900 members, and 11 chapters in AUS. The NZ chapter was formed in the 1970s and has about 12 patched members. The Hell's Angels was born in California in 1948. They have around 1500 members worldwide, in more than 120 chapters in 22 countries. There are about 30 patched members in Auckland and Wanganui, and 10 prospects in the Hastings chapter – formerly the Loners MC. The Hell's Angels and the Outlaws are part of the Big Four motorcycle clubs – with the Pagans and the Banditos. The Hell's Angels recently began steps to register insignias of their rivals – the Outlaws' skull and crossed pistols, and the Banditos' fat Mexican – as its own.']

...It was a cunning plot which could have taken gang turf battles into the 90s, but the Hell's Angels Motorcycle Club has abandoned plans to register the insignia of rival gangs as trademarks in its own name. Bikers caught wearing Outlaws or Banditos gang patches could have faced legal action unless they had permission to do so from the Hell's Angels Motorcycle Corporation of Oakland... [Incidentally, Local Government N[Z]... has produced *Local Government – Getting To Grips With Gangs* – the first report produced on gang-related problems. Sixty-six of the 74 territorial

authorities responded to the survey, 24 of which experienced gang-related problems, although some pointed out these were not necessarily worse than the problems created by other members of the public. Key issues included councils' ability to deal with intimidation generally, noise compliance problems, dog problems – including registration and the use of dogs for intimidation – fortification problems and crime... Community fear in Invercargill was widespread and because few threats were witnessed and many people were too afraid to complain, the council felt the present law was unenforceable and totally inadequate... [P]olice powers to remove... fortifications... should be introduced, the council believed... LGNZ's president... said... it was time for government action on the issue. "Local government cannot continue to pick up activities that are meant to be taxpayer-funded, using local resources and initiatives to solve problems they have no mandate to address."

...Police are concerned... [about the lack of] progress on legislation giving them new powers to deal with gangs. The Harassment and Criminal Associations Bill, including a package of measures extending police powers to prevent intimidation, search cars and order the removal of fortifications, was introduced... last August. It was referred to the justice and law reform select committee but... nothing further has happened...

Extra police powers aimed at controlling gangs could be turned on innocent citizens... The Auckland Council for Civil Liberties vice president... said proposed changes to the Harassment and Criminal Associations Bill were "clearly another attack by Government on basic civil liberties."

...Gang members are holding two central North Island townships to ransom... Many residents are so concerned for their safety they are reluctant to speak to the law when they are attacked or witness an assault... The police knew who was responsible for... violent offences and beatings in Kaingaroa and to a lesser extent Murupara... but they could not make an[y arrests] because those who were attacked would not make a complaint... Some residents had been intimidated to the point where they were forced to leave the area.

...Civic leaders are jubilant over the successful prosecution of a gang, in the Environmental Court, to close a fortified headquarters... Highway 61 members cannot use the house... without applying to the... Kapiti Coast District Council... for consent. The perimeter fence must also be lowered in height... Mayors across the North Island say use of resource management legislation... in Otaki is a landmark case. Although the decision may be subject to appeal to the High Court, some leaders are predicting a landslide of amendments to city and district annual plans to designate gang headquarters as places of assembly requiring resource consent... It was not just local authorities celebrating the Environment Court decision, the police and politicians were also hailing Kapiti's victory... However, the Mayor of Manukau... said the removal of gang fortifications was not a solution to... [gang] activities.

...Everyday we are confronted by images of violence and escalating criminal activity... The level of crime in N[Z] is among the highest in the Western world... Our violent crime rate... of 785 for every 100,000 people... exceeds A[US]'s rate of 723... and the U[S]' rate of 709... [Furthermore, NZ]'s crime rate... has increased at a faster rate than any other Western nation... Our high crime rate is attributable to many factors. However one reason stands out. We have the worst gang problem in the Western world. The N[Z] Police Association estimates that there are 5000 gang members and as many as 15,000 gang associates in N[Z]. This is far higher than any comparable country. In N[SW], with a population almost double N[Z]'s, gang members and associates are estimated at 1500. Gangs have a culture of violence and intimidation. Many of them are simply outlaws, having abandoned the slightest pretext of abiding by the laws of society. We are now seeing people who have killed more than once and yet their families remain supportive. What chance of a normal future do children raised in a gang environment possibly have? The harassment and criminal association bill now before Parliament's Justice and Law Reform Select Committee will provide a more effective way of dealing with gangs but is not a complete answer. We must break the cycle of violence perpetuated by the gangs.

...Seven bills passed by Parliament yesterday created a new range of offences aimed at curbing gang power and protecting the public from harassment and intimidation. The... Minister of Justice... said: "The time has come to send a loud message that society has had enough of gangs and their activities. It is simply unacceptable for small groups in society to harm or intimidate ordinary law-abiding citizens to such an extent that they feel unable to go about their day-to-day life."

...Gangs are here to stay... Gangs cannot be beaten, an Auckland police gang expert has warned. With their sophisticated set-ups gangs are likely to stay one step ahead of the police... "They view the police as another gang – a gang that's getting weaker all the time."

...Most N[Z] gangs are disorganised and guileless and much of their activity is incompetent, says a university lecturer. The high number of gang members in prison for rapes, serious assaults, robberies and murders was testimony to their bungling efforts to make a life out of crime... [T]he University of Canterbury senior sociology lecturer... who has just written a chapter on organised crime in N[Z] for an American book on international crime... said the Hell's Angels were one of the few exceptions of organised, sophisticated gangs. Asian gangs were becoming more visible but were unlikely to gain a foothold in N[Z], partly because corruption was unknown in the police force. "The fact that police will break the law to enforce the law, but will not take bribes, is often lamented within the country's criminal fraternity,"... The chances of syndicated criminal groups taking root in N[Z] were slim, but [the lecturer] said police estimated last year there were about 45 gangs, with roughly 5500 members. However, the Police Association... president... said... "[The lecturer] is making the same mistake as the police administration in saying the gangs are not well organised... [S]ome lower members of the gangs might be incompetent but gangs were turning over millions of dollars a year..."

...a[n ex-PM]... says his figures indicate gang turnover is... worth... more than the \$1.23 billion... annual budget for all law enforcement agencies.

...The Minister of Police and the police union are sharply divided about whether crime is ebbing or flowing... Yesterday both the minister... and the Police Association president... used crime statistics to back their cases... In the five years since 1992 reported crime had risen only 3.5[%], compared with 20[%] in the five years before 1992, [the minister said. He also] criticised the media, opposition politicians and some police for a message of doom about crime... [However, the Police Association president said r]eported crime has risen since 1994... [He also] said gangs and their associates outnumbered police, creating unchecked growth in organised crime... [N]ational figures showed one gang member, associate or prospect for every 250 N[Z]ers... In contrast we have one police officer for approximately every 552 people[(up from '1:1000 in 1960 and 1:700 in 1990')]. - 1997

This financial year 620 recruits are scheduled to go through the police college in Porirua – double the number that went through in each of the previous two years[– but the]... police would like to see more people applying to join the force... The... officer in charge of recruitment at Police National Headquarters in Wellington, said applicants wanting to work in Auckland were likely to be accepted almost straight away while people wanting to work in Wellington could expect to wait a couple of months.

...Fifty-nine jobs have been axed at police national headquarters... as part of a review aimed at saving up to \$10 million. [The]Deputy Commissioner... has confirmed the cuts but admitted the review saved about \$3 million less than police had hoped. The job cuts affect the highest level. The vacancy for second deputy commissioner is unlikely to be filled. After suffering a 6[%] budget cut this financial year, the department must now find ways of saving the extra \$3 million and a further \$15 million for staff pay rises negotiated recently. The Government is refusing to give extra money for the pay rise until it is satisfied there is no more fat in the system. Treasury officials have been called in to check police spending and identify further savings... [One of the] ways... police were still looking at... to cut costs further[involves] selling the police car fleet and leasing it back.

...Britain's Police Federation is unhappy at an expanding list of activities that police officers are now being made available for on hire... The work includes providing uniformed officers for private parties, or sending officers to guard property for a fee... beginning at around £35... an hour... But the... union for police officers, said the trend is moving into "dangerous territory." [The union's]Vice-chairman... said: "An officer joins the police

to serve the community, not someone who can afford to hire him.” ...the Police Federation could understand the move because of a lack of funding within police, but... [a]ll people had a right to policing... and already paid for it with their taxes. Police call the subcontracting “special service agreements,” and although the Treasury forbids the police from making a profit, senior officers admitted they often charged “over the odds” for commercial requests... Police are following the lead of their colleagues in the fire service, who are already competing with commercial companies for a range of activities. Firefighters in Lincolnshire are available to fill – or drain – swimming pools at an hourly rate of £108... [In local news, a 26%] rise in complaints about police in the past five months could partly stem from restructuring of the force, the Police Complaints Authority said yesterday... [T]he increased tendency for people to complain and the higher public profile of the authority were other reasons for the rise in complaints recently. The Police Association president... said the increased complaints were another sign of a force under strain from lack of numbers, the loss of experienced officers and a growing workload. More assaults on officers were another sign of the problem.

Up to 50 police worked on the case and inquiries were made as far afield as Israel, but the investigation team had been scaled down to 12 in the last week. Police[had] considered the possibility of a contract killing, relating to [the offic]er’s duties with the fraud squad... [The officer] has been suspended from duty.

...Insurance investigators examining the burned out house of [a]Palmerston North detective... played a key role in events leading to his arrest for allegedly faking his brutal attack... [and setting his] house on fire. His wife... and their two daughters aged two and seven months, had left the house six weeks before after the first of three Satanically inspired letters threatening the detective with “fire and pain[” was]... sent to... the editor of the *Manawatu Evening Standard*... Friends said she was shocked and distressed after learning of her husband’s arrest from police. She and her family had been under police watch in another northern city since the attack... Friends said she now wanted to return... \$4100 in cash and about \$8000 in goods... donated directly to her in the wake of the fire which destroyed all their belongings... A further \$7000 raised by police in a separate appeal is [also]likely to be returned to donors... [The husband] faces several years in jail for the long trail of deception... He also faces reparation claims of... \$41,000 from AMI Insurance... and... \$350,000 from the police for their 37-day investigation... The end of the... investigation came at 5 pm on Saturday... [after the husband] had gone voluntarily to the Palmerston North station. A special sitting of the Palmerston North District Court was held at 6 pm when... [the husband] was given bail, which police did not oppose... The crown prosecutor... told the court that “the defendant decided to... separate from his wife... liquidate his assets... to give his family a good start after the separation... and effect a change of direction in his life.” ...[the husband’s] whereabouts were unknown yesterday... [An] insurance expert... is understood to have reconstructed the fire sequence and come up with conclusions at odds with [the husband]’s version of events... [The] Christchurch-based investigator... a former N[SW] police officer, declined to comment yesterday.

...A former N[SW] police officer yesterday told the... Royal Commission he repeatedly stole money recovered from armed robberies and drug searches so he could “fit in” with police culture. The witness, codenamed GUD12, was a detective with the Central Coast Special Operations Group before his resignation in February and is the 12th Gosford police officer to “roll over” to the commission[, which is looking into]... corrupt activity... in the N[SW] police service.

...*Cops and scandals go back a long way*... OUTBACK police who took bribes from... bookmakers were said to have contributed to Queensland Labor premier Vince Gair’s election slush fund in the 1950s and, in 1963, a Labor MP... accused [Queensland’s]Police Commissioner... of barnstorming country areas in support of... [the then] Country-Liberal government. [The Country-Liberal Premier kept the commissioner] on despite being provided with conclusive proof of his corruption... [F]earful of another scandal[, Queensland’s]... police minister from 1969... appointed [someone else] as commissioner and gave him a brief to clean up the force.

...*Cleaning up the bad cops*... When... [a deputy inspector]’s rear indicator was cracked one night at a traffic light, his reaction was to fire four shots into the windscreen of the car behind, whose seven occupants included a four-day-old baby and a toddler. Once, such behaviour would have gone unpunished in the Argentine police... [Indeed, the] family escaped unhurt but did not want to press charges for fear of reprisals from a force whose reputation for rough justice and corruption has improved little since the “dirty war” of the late 1970s. [However, the deputy i]nspector... is now facing criminal charges and the Interior Minister... has promised “severe punishment” for him and “a steady hand to eradicate from the police all elements that bring it into disrepute.” It has taken the deaths of at least six unarmed people this year, many more injuries, rapes and beatings in police stations – as well as the sight of policemen shooting demonstrators at point-blank range with rubber bullets in La Plats – for Argentina to address the issue of why, 13 years after democracy returned, the police are lagging behind even the military in adapting to change. Most cases happened in Buenos Aires and involved teenagers out drinking late. But Mr Roberto Roldan was shot dead by police while rushing his baby to hospital... and... a... heavily pregnant[citizen] could lose her child after a beating in a police station... Lately, the National Security Council has unveiled measures to try to curb police behaviour. These include a requirement that future officers have completed high school, take psychological tests every year and receive better training and pay. Pay now starts at \$NZ640 a month, obliging many officers to moonlight as security guards – making them even more itchy on the trigger. Privately, officials acknowledge that officers who learned their trade under the six-year military regime that began 20 years ago and under which up to 30,000 people “disappeared” have not all been rooted out and their methods still prevail. The independent Centre for Legal and Social Studies says cases of police killing unarmed civilians rose 57[%] in the capital last year, to 195... Most cases involve off-duty officers – such as the one who shot... his neighbour because her music was too loud... [T]he state prosecutor in the trials of the military junta leaders in the mid-1980s, says the police must learn that “security depends on a climate of not using weapons, since policemen who kill cannot integrate into society.” The Buenos Aires police chief... says the “excesses” happen because “society’s garbagemen sometimes get dirty with the garbage.” He worries, instead, about “the risk of tiring or worrying officers with precautions that could cost them their lives.” ...The number of police killed rose[last year] to 29, from 19 the previous year.

...*New 111 system giving good vibes* An elderly Hamilton woman is woken by screams coming from her neighbour’s house. She reaches for the phone and dials 111. A \$10 million computer system means her call, and follow-up police action, will all be co-ordinated hundreds of kilometres away in Wellington... A three-week trial of... [t]he new system, named Card (Communication and Resource Deployment)... began at the end of last month in the Hamilton and Te Awamutu districts... By next year the network will... provide a nationwide link for police emergency calls. Control rooms in Auckland, Wellington and Christchurch will replace the manual system many police systems use, as well as the present computer systems in the main three centres... [A] Superintendent... said the beauty of Card is its speed and wealth of information.

...former policewomen say sexual harassment by male colleagues was a reason for their leaving the police force... said the Wanganui police district commander[, who]... has completed a research paper on the experiences of N[Z] policewomen. He]... surveyed all policewomen who left from 1987 to 1992. About 20[%] mentioned sexual harassment as a reason for their quitting... Although some successfully complained, policewomen were generally unwilling to do so... There was a deep distrust whether the system at the time would help them with their complaint or punish the offender... Training began last month for N[Z]'s first police sexual harassment mediators.

...The police are worried about a sharp jump in the number of suicides in the force – and say more needs to be done to identify and help officers at risk. Five officers killed themselves in the 18 months to April, says an internal police report released yesterday. There were eight police suicides in the previous nine years... Although the police suicide rate matched the general population, it was higher than in police forces in such places as Canada and Britain, and this was a concern... The release of the report follows research by the Police Association which says there is a major stress problem among officers caused by attending murders, fires, vehicle crashes and suicides... [However,] a police psychologist... dismissed suggestions that police work was directly to blame for the deaths – but [the psychologist] recommends changes at recruitment level to recognise potentially suicidal staff. - 1996

The Police Association wants stress management to become a compulsory part of police training so fewer officers end up quitting or committing suicide... Police officers were leaving the force at a greater rate than ever, with an average of 38 resignations a month last year, the Police Association advocate... said yesterday... [I]n 1995, 404 resigned... A STAGGERING 2100 years of policing experience has been lost to the force already this year... Only half of N[Z]'s 6492 sworn police officers have 10 or more years' experience... Police chiefs say stemming the flow of experienced officers from the force will be difficult... "At the end of the day they would like to stay but they feel they can't continue. Staff are just not happy about the future. They don't like what is happening to the job or how they are being treated..." The association briefed the Minister of Police... on the problem last week and urged him to take immediate action... "This is not planned attrition and is a graphic reflection of the stress on individual officers and the inability of the police to address the causes," the brief said. "As well as the human toll, the cost of disengagement and training replacement staff is a significant drain on the organisation."

...Last October, a recruit training wing of 60 was cancelled because of a lack of applicants. "We desperately need... new staff to replace those who are leaving," says the Police Association president, "but how]... will we get [more police] if we can't attract recruits?" ...[Incidentally, t]he number of [Auckland police]officers had dropped since 1994 from 700 to about 650, despite Auckland City's population increasing [by]40,000...

New police recruits are being bound to Auckland posts for two years and English bobbies are being urgently sought as the region's police battle against a chronic staffing shortage... [F]igures released from police headquarters showed the Auckland region would be 266 officers short in about 14 months... Auckland currently needed 60 officers and was losing one staff member a day.

...BRITISH police are clamouring to bolster the Auckland force... The Auckland recruitment section is sifting through more than 60 applications... despite... [police] chiefs... being luke-warm on the idea. [The]Assistant Commissioner... said immigration criteria and training equivalency made it difficult to recruit overseas... Overseas applicants also had to pass an entrance test, physical examinations and psychological assessments[, and]... a stumbling block with English officers... could be... [their] requiring permanent residency status before working here... The priority was to hire from within N[Z], a view shared by the Police Association... N[Z] constables are paid... \$1500 less than a British bobby and \$41,000 less than their American counterparts.

...A buoyant job market in Auckland is one of the reasons the police have difficulties attracting recruits... The police say they are not about to lower standards... although physical requirements have been relaxed to meet gender and racial differences... It's now as much a matter of strength and fitness as centimetres... The selection process takes about five weeks... After that there's a five-month training course. A trainee is paid \$27,180 a year and on graduating receives \$37,800 a year['including penal rates']. A sergeant's pay ranges from \$49,588 to \$56,300; senior sergeants get \$53,300 to \$61,286, and inspectors' pay starts at \$65,000, rising to \$80,200...

Frontline police could be in for a significant pay rise under proposals to pay them for the job they do rather than the rank they hold... so their wages better reflected their work and kept up with other comparable professions... [Meanwhile, NZ p]olice chiefs are alarmed at Queensland moves to lure N[Z] police officers to shore up its forces. The Queensland Police Service wants to... boost its establishment from 6544 to 9100 within eight years to become the "best police force in A[US]." Several NZ]... police have already been employed after approaching Queensland police directly... Although unaware that N[Z] police had its own recruitment drive, that would not stop Queensland police from advertising here... [the] Queensland Police Service recruitment officer... said. A N[Z] police officer with five years' experience would start in A[US] on about \$A40,000 (\$[NZ]46,200).

...Police paid out to retire early because they are too ill or psychologically unfit to work have applied to fight crime across the Tasman. Queensland police confirmed yesterday that several former police who had "perfed" were among those keen to work in the Sunshine State. Their desire to re-enter the police, after being paid thousands of dollars to leave, comes as the controversial superannuation scheme is being reviewed... The... head of the Queensland police recruitment office, said Queensland wanted only the best officers and would not exclude those who perfed more than two years ago.

...A police officer who left the force [two months ago] with up to \$250,000 under a police rehabilitation scheme is the new... chief executive... of the Ministry of Pacific Island Affairs... The... scheme... allows officers... a payout of roughly \$10,000 for every year of service. The Government contributes \$2 for every \$1 paid into the fund by officers, who must contribute 7.5[%] of their pay. The scheme has been under review because of concerns about the record number of police officers leaving on medical and psychological grounds... [In related news,] Queensland police say they have ruled out recruiting N[Z] officers who have left the force for medical or mental health reasons.

...Up to 4000 police may be able to "perf" without actually having to leave the force as a way of stemming the tide of officers retiring early... The new deal would allow... officers who still belong to the old superannuation scheme... to transfer to a newer fund... and access their "perf" money straight away... [Incidentally, t]he Police Association confirmed yesterday that at least two police recruits with criminal convictions – and possibly up to five – got into the Royal [NZ] Police College recently and should not have on present policy. Earlier this year, police relaxed their recruitment standards to accept people with drink-driving convictions more than five years previously. Anyone with criminal convictions punishable by imprisonment is officially banned. The police head of human resources... said the force still preferred conviction-free recruits. He would not comment on the recent recruitment slip-up... However, applicants with less serious convictions were considered on a case-by-case basis. "We can risk losing some very good talent otherwise,"... The... Police Association... president... said: "The issue is bigger than the individual. We are talking about the reputation and integrity of the police here... There are plenty of people out there without convictions who would join if the pay was better." ...Police rules on accepting recruits with criminal convictions were vague and needed clarification, the police chief in charge of recruitment said last night.

...There was a time when having a criminal conviction, no matter how minor, was an absolute "no-no" for anyone wanting to join the N[Z] police. One man... says his dreams of becoming a police officer in the early 1970s were dashed because of a joyride in a bus with a group of mates when he was 15. Now there are claims that standards have slipped, and the force, desperate to make up staffing numbers, is sometimes willing to turn a blind eye to an applicant's previous dealings with the long arm of the law.

...An Auckland police constable convicted earlier this year of assaulting a woman had been prosecuted for assaulting a police officer before entering the force. Front-line police officers and the Police Association have expressed amazement that the man was ever allowed in... Red-faced police chiefs ordered an urgent investigation... The Auckland district police commander... said it was disappointing when a police officer appeared before the courts. "Unfortunately we have one or two every year that get prosecuted..."

...A Bay of Islands police officer has been arrested and charged with assaulting his partner... [A] Whangarei... Senior Sergeant... confirmed yesterday that the officer had been suspended on full pay pending the outcome of the court appearance and possible trial on the charge... The man is the second police officer known to have been suspended in Northland in the past six months. A Whangarei officer... [who] allegedly went to the house of a woman driver whom he had pulled over during a routine stop... is facing a hearing on three disciplinary charges... That officer is also on full pay pending the outcome of the disciplinary hearing.

...N[Z]'s deputy police chief is staggered by the actions of some of his staff and has given warning that the strong arm of the law will come down heavily on officers who stray. [The]Deputy Commissioner... said yesterday that he and other police executives were beginning to feel besieged by the number of unsavoury incidents involving police officers. "It's unbelievable the lack of judgment shown by staff at times,"... [The Deputy Commissioner] made the comments after revelations that an officer ran up a huge bill ringing sex lines from a police station... The matter came to light late last year when telephone accounts came in. The officer paid for the calls but police have launched an investigation into the matter... [The Deputy Commissioner] would not reveal the rank of the officer who made the sex calls, but said he had been in the police long enough to know better... The president of the Police Association... said he was "extremely concerned" by a surge in the number of criminal cases involving police officers. In 1996, 35 officers appeared in court, compared with 13 in 1992.

...Wanganui's head detective is the officer under investigation for allegedly making nearly \$1000 of toll calls on police phones, the police have confirmed... The police have [also]confirmed that... the phone calls in question were not made to A[US]n sex lines but to a dating agency in N[Z]. The Detective Senior Sergeant... was on leave yesterday and could not be contacted... The incident follows the arrest on 20 fraud charges of the Wanganui district commander... [In international news, v]ideo evidence is... bringing police under scrutiny in Brazil... [A]mateur footage led to the arrest of 4 policemen. It shows them repeatedly beating motorists stopped at a road-block... [The p]olice also fired shots at cars and motorists. One man was killed, another was injured.

...By the time the shooting stopped, three robbers lay dead, an innocent bystander was wounded and the reputation of the Los Angeles Police Department had suffered another black eye. The wild shootout on Tuesday night local time sent bullets whizzing through nearby homes... Still reeling from [the 'awarding of \$US23 million to a group of 35 mainly Samoan American people for suffering police brutality (on February 11, 1989, dozens of deputies armed with flashlights and batons stormed a house in the Los Angeles suburb of Cerritos, where a bridal party was being held - video footage shot by a neighbour showed police repeatedly striking guests, some as they lay on the ground; the most seriously hurt suffered brain damage from baton blows to the head'),] bad publicity over the videotaped beating of a black motorist in 1991, its handling of the 1992 riots and alleged misconduct in [a well-publicised] murder investigation, the LAPD now is being investigated by the FBI. The target of the probe is the Special Investigations Section, a 32-year-old unit which specialises in shadowing career criminals but is accused of shooting first and asking questions later... The day after the [latest]shooting, the man shot in error sued the city, alleging he was shot from behind. His lawyer... who has in the past filed federal lawsuits against the police, characterised the S[ection] as "a death squad. They run around chasing people... They wait for them to commit crimes, then they say 'they went for a gun' - something like that. And they shoot them and kill them,"... It was only a matter of time before they shot an innocent person. "And that's what they did here. They shoot at everyone in sight. They don't care who they hit." A former police chief... defended the S[ection]... He acknowledged the group allowed crimes to happen before making arrests, but said officers were powerless to do anything before a crime was committed... In October 1992, a commission... concluded that the city was woefully prepared for riots... and singled out [the then police chief for blame. The police chief] retired under pressure... But [his replacement has also] come under fire for a lack of control. [The replacement] is now threatening to sue the city if he does not receive a second term and his lawyers propose a deal worth \$US3 million to withdraw their threat of a long legal battle. [Incidentally, 'police corruption in New Orleans was so bad during the early 1990s that tourists were staying away.'

...AUS]'s last surviving police special branch was disbanded yesterday following allegations of improper activity at a police corruption inquiry.

...[NZ] police chiefs want to encourage rank-and-file officers to dob in their colleagues to keep the force corruption-free... For this reason... [a] Wellington sergeant who reported a constable for punching a prisoner has been backed by police leaders determined to uphold the force's reputation... [C]hiefs acknowledge it can be difficult for police to blow the whistle on a member of their team as this can bring the whole force into disrepute... In an earlier whistle-blowing case, Christchurch police launched an undercover drug operation after they suspected a colleague was a drug dealer... [He] was caught three times... [before being] convicted of drug supply and theft...

Police chiefs have bowed to pressure and tightened the recruitment rules to stop people with drink-driving convictions from joining the force... The changes, backed by the Police Association, come less than a year after the police hierarchy relaxed the rules... [regarding] people convicted of drink-driving more than five years before... At the time, police chiefs said talented officers should not be banned for a "lesser offence." But anti drink-driving campaigners said it suggested that police did not view drink-driving as a serious threat to road safety... After a four-month police review, applicants with convictions for assault, dishonesty, drugs, sexual offences and other serious traffic offences will also no longer be accepted... [In related news, the] Police Commissioner... admitted last night that he was concerned urgent work was not being done because of staff shortages. Prompted by... claims that shortages meant criminals were walking free, [he] said he was talking to the Government to increase staff numbers.

...If you were the victim of a swindler or a thief last year, chances are he's still on the run with your loot... [A]lthough nearly all of the homicide cases had resulted in arrests, police resources had been stretched and diverted away from other crimes, such as dishonesty... Crimebusters caught less than one in four people carrying out dishonesty offences in the year to December 31... Burglars did best in the battle with the boys and girls in blue, with police solving only 15[%] of the... break-ins reported... [c]learance rates... on the North Shore... are... about 7[%], which one sergeant called)... an "embarrassingly low clearance rate. If we were a private enterprise we would have been out of business years ago." ...But police chiefs believe the thin blue line is holding its own, and blame the mushrooming population and staff shortages for the trend... While bank robberies were on the decline, there had been a resurgence in robberies of corner dairies, superettes and service stations. Sex offences had risen 7.9[%], but the police believed much of this was a result of increased public awareness and reporting... The rate of clearance for violent crimes was... 77.7[%]... The overall clearance rate was 38.3[% in Auckland], compared with the national rate of 42[% (a rate which has remained fairly constant since 1985 - 'the rate was mostly between 50% to 60% during the period from 1965 to 1980; between 1880 and 1940 the clearance rate was mostly over 90%')].... Alarmingly, this police record of less successful prosecutions is coming at an increasing cost... In inflation-adjusted terms the cost of police has risen 31[%] over the past 10 years, while the number of successful prosecutions by only 5[%].

...The Opposition police spokesman... said... yesterday... that the Government needed to pour more money into the force. "The lack of resourcing is an open invitation to the crims." ...[his comments came after the] Police Commissioner... had... revealed that there were 250 fewer police on the beat than three years ago because of restricted Government funding.

...The Auckland region has been promised 260 new police officers over the next 18 months - almost a third more than it hoped for - to help to fight crime... The region's top police chief pleaded for extra front-line police to help tackle a staffing shortage when he met the commissioner... in

Auckland yesterday. They also agreed on ways to cut the region's budget by \$3 million in the next three months... However, the Police Association says the Auckland region needs 200 officers immediately.

...TREASURY has suggested the police training college... [- which is] used for recruit and management training, is worth more than \$40 million and costs \$18 million a year to run, with 38% of the operating costs going to depreciation and capital charge expenses... [-] could be closed as part of sweeping cuts to the force's budget. The *Sunday Star-Times* has obtained a copy of a draft report which was prepared by Treasury, the State Services Commission and police officials at the request of Cabinet after police said they could not meet the \$15 million cost of the 1996 wage settlement from the existing budget. The proposals, which have not yet gone back to Cabinet, [and]would shave \$15 million from police costs in each of the next two years, rising to \$47 million a year by the year 2000... include: • Cutting salaries, overtime, sick pay, annual leave and allowances. • Reviewing police superannuation, life insurance and the... PERF... scheme... • Renting property instead of owning it... • Selling police vehicles and houses.

...A... proposal to sell 270 police vehicles could see some officers catching taxis in the line of duty. A recent... survey found that the department could save more than \$3.1 million a year by reducing its 2700-vehicle fleet 10[%]. The Treasury report said the merger of the police and Traffic Safety in 1992 had not achieved the "economies of scale" expected in the vehicle fleet. According to police figures, the total annual cost of each motor vehicle was \$11,777 including depreciation, running expenses, accident repairs and maintenance. The Police Association Auckland regional director... said yesterday that the association was comfortable about the shedding of vehicles "if they are not being sufficiently used." ...staff who worked in areas such as prosecutions could use taxis on the job rather than departmental cars. "It's not much use having police cars parked outside court for eight hours a day."

...The Treasury's heavily criticised report on the police contains a suggestion that they own too many weapons. Police officers say the suggestion is one example of how the report's authors are out of touch with the operational realities of the force... Police officers yesterday pored over the leaked Treasury document, which... also doubted the viability of the force's radio network, saying cellphones covered as much of the population as radios... One police officer said: "What is supposed to happen when your partner goes to the back door and you're at the front door of a house you're waiting to go into? Do you give them a ring on the phone if something comes up?" ...the Police Association president... said that, if anything, the communications network needed updating, not scrapping... Another sore point was the recommendation to cut... 13 allowances paid to officers who performed special duties, such as armed offenders squad members.

...Police throughout N[Z] have reacted to proposed cuts to the police force with an anger not seen before, and have flooded their national computer system with hard-hitting messages to their bosses... Te Awamutu police district staff got the ball rolling by sending out a "switch message" on the computer addressed to [the]Commissioner... and all other staff[that] said police officers' loyalty had been undermined "as decision after decision is made against our favour, affecting every aspect of our ability to do our chosen job. Never has our morale been so low and our distrust of the administration been so high. We are sick and tired of hearing that there is no money and commissioned officers telling us and the public... there is no problem. The problem is real and the public are becoming dissatisfied with us and most of us are dissatisfied with the job."

...Treasury officials face a show-down with the Commissioner of Police over proposals to slash up to \$47 million a year from the... police delivery of services budget... [which, in] 1996-1997... is \$771.4 million, compared with \$777.5 million for 1995-1996... The Commissioner... said he was putting a strong case to the Government to ensure his staff had sufficient resources despite the Treasury report... He stressed that no decisions had been made on the paper and that the police were negotiating with the Government and Treasury over future funding levels.

...A police department already under siege has been ordered to slash costs by up to \$3 million within three months, sparking fears that some police stations will be closed and important crime-fighting tools will be axed by bean-counters. [The]Deputy Commissioner... confirmed last night that police regions had been told to cut "discretionary spending" to meet their budgets by June. He said the Government had agreed to only part-fund the \$15 million wage bill and the rest had to come from police coffers.

...a Treasury proposal to slash police costs by at least \$47 million... [that was] leaked to the media... four weeks ago... [has revealed] a police force... on the edge of anarchy... Hamilton police summed up the mood in saying that staff had "had a gutsful. We have had enough of being on the end of public dissatisfaction and trying to explain the lack of police response... of trying to explain to our families why we are being shagged around to cover lack of staff... of trying to explain to our kids why we come home unhappy,"... The background to their anger stretches back seven years, to March 30, 1990. For the first time, police took to the streets in a public protest, more than a thousand marching on Parliament in anger at planned changes by the Labour Government to the police superannuation fund. Morale was said to be at an all-time low... Then, as now, there were promises of more police... [I]n 1990, police got... [a] new minister - and [he] was determined to deliver. Police numbers were boosted by 900, and another 1100 odd staff joined the force following the police-Ministry of Transport merger. They were halcyon days - reported crime fell for the first time in 30 years and police appeared to be happy. But the euphoria was short lived. Police were asked to absorb costs such as rising... inflation and staff pay rises while simultaneously being asked to take a budget cut along with other Government departments... Staff numbers fell as police who left weren't always replaced and training courses were either deferred or axed, crime programmes allowed to lapse and education and prevention programmes put on hold. It was a vicious cycle: as people left, others were left to take the brunt and there was growing pressure on the front line. Senior, experienced staff decided they had had enough and left for other jobs. Reported crime again registered an increase... As the numbers leaving soared, a massive recruiting campaign was embarked on, and 600 extra police were trained over 12 months. The numbers leaving the force were so high, however, that the 600 extra recruits would... barely bring police up to required strength... Police administrators, meanwhile, were grappling with the future. Survival depended on them cutting costs and making savings because it was clear budget constraint would continue. Yet that would be a difficult task in an industry still hugely labour intensive. A massive investment in [computer]technology was seen as the answer and police bosses did a deal with the Government - in return for around \$100 million to spend on new technology, police numbers would drop by 540 over four years. Administrators were confident the drop in numbers would have no effect on front-line service. The new technology would free staff from paperwork, which accounted for a huge part of their working day, they maintained. The figure of 540 jobs was based on calculations showing productivity would be boosted by the equivalent amount as a result of introducing the new computers. Bosses also maintained that the jobs scheduled to disappear were from "administration"[, and] that the aim of the new technology was to free up more staff for the front line. But that's easier said than done when relying on attrition to make the promised job cuts. Staff leaving were those feeling the greatest pressure - many of them from the front line. Staff in administrative jobs were, in many cases, ill prepared for a return to the front line to replace those who had left... There's no doubt the decision to leave was made easier for many by the provisions of the Police Employment and Rehabilitation Fund... which allows lump sum payouts to those forced to leave for medical or psychological reasons. The[perfering] scheme pays out up to \$250,000 for someone with 20 years' service... The force was rocked by five suicides within 18 months - nearly all rookie constables... It is a fact... that many crimes go uninvestigated because of staff shortages but lack of staff is not the only problem facing the force. There is a desperate shortage of money for day-to-day police work and replacement equipment... Police had been told by the Government to come up with at least \$3 million to help cover staff pay rises by June - the rest would be provided by the Government - and there was a clampdown ordered on spending... There was controversy... [when] police cut... back on aerial spotting of cannabis plantations, while in Wellington there were reports police officers had been told money was so tight a restriction had been placed on the number of uniform shirts allocated to officers... Talk of industrial action concerned the Police Association so much that it felt compelled to issue a warning to staff of the consequences of strike action, which is illegal for

police. It has also advised against other threatened action, including calls for police to stop issuing fines. But [the advocate] says feelings are running high and it won't take long for the anger to boil over... Morale was plummeting[again], the Police Association said.

...police are talking about industrial action after their bosses failed to deliver on a promise of a pay offer... [and] postponed negotiations until mid-January [next year]... Officers have become increasingly frustrated as talks between the Police Association and the administration have dragged on for seven months. Their contract expired [four months ago]. The Hamilton representative for the association... said the delay was the final straw for officers already demoralised by insufficient resources... [H]e had formulated some protest actions that would not affect the public. The association head... said the union would not rule out industrial action if members called for it. Unprecedented demands and pressures had been placed on police staff this year, he said.

...The Police Commissioner... admitted last night that morale among his staff had tumbled in the past 18 months, but scotched suggestions that staff were ready to strike. "I've touched base with a lot of my district commanders in the last few days... [T]hey don't have any concern about strike action." ...[the commissioner] said "one or two people" had suggested that police use sick-day provisions to get around their being barred from striking, "but I've taken a firm view against this." ...[Incidentally,] Hawkes Bay frontline police are owed a total of 10,260 days in accrued leave – an average of 44 days each...

A [Labour] MP wants a ministerial investigation into "crisis" police staffing levels... after being refused police assistance when he spotted a carload of drunk teenagers driving recklessly... [along] State highway 10 about 8km south of Kaeo... The MP rang the Kaeo police station and was diverted to Whangarei. He was told there were no officers on duty at Kaeo or Kerikeri, and no other available police. The nearest were in Whangarei. [The MP] said he was "totally disgusted" at the response of the police, who also had admitted they might not have the numbers to respond to an accident at Kaeo. "That's not good enough – what if there had been a major fatality? ...God help the rural areas." The *N[Z] Herald* understands that one police officer based at Kaikohe was also covering Kaeo and Kerikeri... [When contacted by the paper, t]he Northland rural area police controller... said: "I'm not going to debate issues with a politician in the media. [The politician] should have had the courtesy to raise the matter with the district commander."

...The Auckland regional police chief... will plead urgently for extra frontline staff as police brace themselves to work harder on slashed budgets. His boss in Wellington... confirmed yesterday that police needed to cut costs by \$3 million by the end of June. Auckland was asked to trim about \$500,000 from its budget... [Meanwhile, t]he organiser of a nationwide petition to put pressure on the Government to increase police numbers... nationally... by 500 to a minimum of 7260 officers by October 1999... says the response has been "brilliant."

...The Government has said it cannot guarantee *N[Z]* will get 500 new frontline police... [but the Police] Commissioner... said between 30 and 40 staff would be added to the Auckland ranks by the end of the year. The figure is well short of the 200 officers the Police Association believes the region needs.

...ASHBURTON has a growing crime problem. It also has a growing police problem. There is only one patrol car on duty early each morning in the small mid-Canterbury town [which, at the time of the '1996 census, had a population of 25177']. If a person is arrested and has to be held in custody overnight, police can't hold the prisoner at the Ashburton police cells because they may be called to another job, leaving the station unstaffed. So a 30-minute drive north is required to rendezvous and transfer the prisoner to a Christchurch patrol so the prisoner can be held in custody in that city, 85km away. But if all the Christchurch patrols are busy, the Ashburton car has to make the journey itself, leaving the town without a police presence for up to 90 minutes. This is just one example of staffing problems throughout *N[Z]*... In Christchurch, one of the effects of the police staffing... crisis means that while most crimes are still investigated, vandalism, thefts from cars, some fraud and other minor offences are not pursued if there are no leads... In recent times, staff shortages have meant only one police officer has been on patrol in some areas... In Dunedin, police are no longer investigating large numbers of fraud cases unless there is an obvious line of inquiry. Officers say criminals are aware of that and are having a "field day" with forged cheques in the city. The fraud squad there was disbanded last November... In Greymouth, which is the only West Coast station open 24 hours, the vast region stretches resources to the limit. But [the] Senior Sergeant... refused to say how many police were on duty. "The thin blue line is thin enough now without telling criminals what we've got," he said... In the North Island, police are [also] having to prioritise... Property crimes – including burglary, car thefts and fraud – are taking a back seat... The problem was particularly serious in Auckland... Staff on Saturday shifts in[the southern suburbs of] Papakura and Manurewa have recently been halved in number... despite earlier requirements for all patrol cars to be staffed by two people... A Manurewa officer working alone was recently assaulted while on traffic patrol – probably as a result of the change.

...Anyone who came home bruised from work two days in a row might be forgiven for deciding to look for another job. But... [a] detective with the Takapuna police... reckons he would be a fool to expect anything else... [The d]etective... was moving a little gingerly at work yesterday. He came in for only three hours, in fact, to attend to a few things. Nobody would have blamed him if he hadn't made it in at all. He had some cuts to his righthand fingers and a knee that was only just starting to move freely after a nasty knock on Friday night... [from tumbling down a] 5m bank into the... waters of the harbour... He plays down the... incident[, which occurred when]... a young man he had caught with some dope at Birkenhead wharf... decided that consigning the evidence to the... water... might assist his defence... Then there was Saturday: a black eye, a sore jaw and a cut forehead after what he casually calls a "tete a tete" behind the Browns Bay shops ended up with [the d]etective... on the ground, warding off kicks from a pair of late-night assailants... But the detective doesn't seem too upset about it, describing the trouble as "an unusual run of events... But you'd have to be pretty ignorant to think you're never going to get assaulted in the police."

...Reported assaults on frontline police dropped 7[%] in the past year. Statistics show 1911 officers were attacked in the year... Ninety-seven assaults involved weapons... [Incidentally, t]he South Waikato Victim Support group has dissolved in crisis. The district has been without victim support services for 10 weeks[because i]ts executive committee decided the service could not fulfil its obligations. Former volunteers estimate that more than 500 people have missed out on professional help since they were told to stop providing support. It is expected to be at least three months before the service begins again.

...It is not every day that the entire police force finds out what it feels like to be the victim of a crime – and it hurts, especially when the crime is discovered by a mere civilian. When the police national headquarters in Wellington was burgled at the weekend, a worker in an adjoining office made the discovery and phoned the police. Headquarters staff knew nothing until they arrived at work on Monday to find cupboards had been flung open. The offenders stole a few dollars in petty cash and worked over six police floors. The Opposition police spokesman... yesterday called the security "clearly inadequate" but [the] Assistant Commissioner... said the police were not embarrassed – just annoyed... All confidential material was under lock and key and was not touched... However, police had been reviewing the building security and that would continue... But there were obviously more important things on the minds of the city's detectives than the headquarters break-in. When the *N[Z] Herald* called, no one knew whether any arrests had been made.

...A four-week blitz on burglaries in Auckland suburbs has led to 81 arrests and the recovery of stolen property valued at \$90,000... The operation had been so successful that... police... had doubled the number of staff on burglary squads to keep the pressure on burglars. Before the blitz about 400 burglaries a month were reported, but that had dropped to 200... [In related news, a] Massey University Statistics Research and Consulting Centre... [survey found that 90%] of vehicle-taking offences... 75[%] of burglaries, 25[%] of damage offences and 33[% of assaults are]...

reported to police[, or 40% of all]... offences... Survey respondents said they did not report offences because the offence was too trivial, police could have done nothing, or they had dealt with it themselves.

...New York-style police tactics are to be used on the streets of Auckland. Swamped by house burglaries and disorderly youths, officers on the North Shore are ready to begin the tough new strategy... [which] involves tackling “minor” crimes hard and using police intelligence specialists to identify repeat offenders... The American city – once labelled murder capital of the world – has seen crime rates plunge since the “Broken Windows” regime began three years ago... The North Shore police area controller... studied the New York model during a recent conference of top police in A[US]. The relevant points had been picked out because of the obvious differences between New York and the North Shore.[The] Detective Senior Sergeant... who was put in charge of coming up with the local version, said the public would see a more pro-active force... Frontline staff... would be encouraged to... take tougher action against taggers, thieves and unruly groups in the streets... Last year... more than 13... burglaries... were reported on the North Shore... [each] day... New York has one officer to every 250 citizens compared with one to every 1050 people on the North Shore...

Figures... show N[Z] has one police officer for every 564 people compared with 523 for Canada, 453 for A[US], 438 for Britain and 394 for the U[S] (although, according to the ‘Number of Full-Time Sworn Police Officers in State and Local Law Enforcement Agencies: 1992, West Virginia had one officer for every 714 people while the District of Columbia had one for every 112 people’).

...N[Z] could be “short-changed” over police numbers, a former New York police leader said yesterday... N[Z] had a comparable population to his native Ireland, where he had recently been acting as a consultant on crime fighting. Ireland had 10,500 police, and 1500 more were promised. At the end of June there were 6492 police staff in N[Z] with a target of 6692 by next June... [(The NZ police force also has ‘2000 non-sworn staff.’) He] said the decision by New York citizens in the early 1990s to accept a dedicated tax for the recruitment of 6000 more police[– raising the USs’ ‘largest police force to 38,000 officers’ –] had... played a part... in a crime drop of 12[%] in 1994, with reductions of 17[%] in 1995, 13[%] last year and a projected 10[%] fall this year... N[Z] police like what has been done in New York but they are also looking at a similar style of community policing in Strathclyde, Scotland... In 1995... the... region... surveyed the public and found 92[%] of the population wanted minor crimes to be given greater priority to make them feel safer... As opposed to New York, the... Scottish... police have not taken such a hard line...

[‘The person most credited with bringing Broken Windows to the whole of New York City was, in 1990, appointed commissioner of the New York Transit Police. Turnstile-jumping was rife in the subway system. Not only did it reduce revenue but the activity created disorder and, by extension, some fear and trepidation among honest subway passengers. Now the commissioner knew that not all turnstile jumpers were robbers and muggers, but you could bet that all robbers and muggers were turnstile-jumpers. So arresting turnstile jumpers became rather the order of the day and, lo and behold, the incidence of armed and aggravated robberies, muggings and the like reduced. Many robbers were, of course, armed. But what they discovered, to their dismay, was that in an attempt to save themselves 25c while on the way to commit a robbery they were, in fact, laying themselves open to being charged with far more serious offences, such as possession of a concealed weapon. Solve (or prevent) a “little” crime and you can stop a “big” one’]...

Frustrated rank-and-file police are challenging their bosses to shift to a New York-style of policing out of concern they are failing to tackle rising crime rates... On the North Shore, “broken windows” has led to a drop in burglaries by up to a third in some suburbs... [However, police] chiefs said policing initiatives like “broken windows” had been operating in N[Z] since the 1980s... [and the] Deputy Commissioner... said: “What needs to be remembered is that what is minor crime in New York is serious crime here.”

...The deputy commissioner... says hard-line police tactics may suit a city with urban slums... high vagrancy and illiteracy. They don’t suit N[Z]... It is true that N[Z] does not share such a startling murder rate. In New York, 984 people were murdered last year, compared with 119 in N[Z]. But turn to property crimes and the picture is different. In New York, a city of eight million, 61,901 burglaries were reported to the police last year. In N[Z], with a population of just over three million, 81,545 burglaries were reported... Since 1993 the New York Police Department has... hired... [more] police... cleared... corrupt officers... out of the force... decentralised police districts, and[made] local police chiefs... accountable for reducing crime in their areas... [NZ’s deputy commissioner] argues that is also happening here. Police managers get a bonus if they manage to cut crime and have to provide a good explanation if they have not. But... the N[Z] Police Association president... says this is not their focus.

...The New York architect of “zero tolerance” police tactics is being brought to N[Z]... The Police Association said yesterday that it had invited the former New York Police Department deputy chief... to address its annual conference in Wellington this month... New York, the Big Apple, once suffered from the reputation that it was rotten to the core. [However, the former] second in command... in charge of the department’s \$US2.7 billion... annual budget... [plus] 38,000 uniform and 9000 civilian staff... has watched New York crime rates fall more than a third since police began tackling crime with... “broken windows”... The association president... said [the] visit showed that [NZ] police were serious about taking a harder line on crime... “Latest statistics show there is a reported crime in N[Z] every minute and we seem to have built up an acceptance of crime...”... He [also] said police managers should be accountable for cutting crime rather than meeting budget targets... But... [one] Inspector... said... police... should not become too forceful and too visible as they would lose public support. “We need to reach a balance between where we are and where they are. People certainly don’t want to be stood over by police.”

...Criminals are not just offenders who must be caught – police are now urged to think of them as... “clients” or “customers” in an attempt to change attitudes and promote efficiency. The Police Association has declared that “trendy name changes” will not stop police doing their job of catching criminals and helping victims. However, it is concerned about a growing business orientation in the force... [In international news, the US public may start to agree with the notion that police officers normally only catch criminals who are less intelligent than themselves after newspapers reported a 46-year-old] took an exam to join the police in New London, Connecticut, but failed to get to the interview stage because he scored too high[(‘if I’d just been a little dumber I could have joined the force myself’)]. A police spokesman said high-scoring candidates could get bored with police work and leave not long after training, which costs about \$NZ36,950. “We are looking for bright people but we’re not looking for people who are so bright to an extent that they’re not going to be challenged by the job.” The police may yet be out of pocket because [the 46-year-old] has filed a lawsuit alleging discrimination based on intelligence. “I know I would be a good cop, but I had the misfortune of selecting too many correct answers...”

...The first victim of the teenagers who ran riot at lovers’ lane spots in Auckland in March believes police bungled a chance to catch the youths before they viscerally pack-raped another woman. The 17-year-old Mangere woman and her family are critical of the way police handled her complaint when she and a friend were attacked by the marauding youths on One Tree Hill in a prelude to several other heinous attacks. She told police the offenders were Polynesians travelling in a red van, but there was apparently no attempt to search for it. The officers involved, who also did not submit a report on the incident before going off duty, have been disciplined... The Auckland police commander... would not comment on whether the police officers’ mistakes had inhibited the inquiry.

...A second inquest for Agnes Ali’iva’a has ruled her death was suspicious and outlined shortcomings in the police investigation. The Whangarei coroner... concluded yesterday that the 12-year-old, found part-naked and bruised in a Mt Roskill drain, died on February 14, 1992, as a result of drowning in suspicious circumstances. In an unusual move, [the Whangarei coroner] commented on the failings of the first police inquiry and its effect on the subsequent inquest. The 1992 investigative team, headed by [a] Detective Inspector... found that Agnes drowned accidentally, and the Auckland deputy coroner... agreed. The case was reopened last year and an apology offered to the family after a second police team noted suspicious circumstances... The 1992 police investigation was being “looked at” by the Police Complaints Authority. [Yesterday Whangarei’s

coroner] said... "It seems unlikely that Agnes, a strongly built and athletic 12-year-old, would drown in a few inches of water unless she was incapacitated." Intoxication through drugs, alcohol and solvents had been ruled out. There had been no evidence of a medical condition, such as blackouts. "...the stream bank is not easy to see at night and is a hazard for someone not familiar with the area... One possible scenario is that Agnes was running from an assailant and fell, suffering a blow to the head, which led to her drowning." ● ['Usually, 1-in-200,000 deaths is unexplained.']

...A reward is again being offered for information about the death of Agnes Alli'va'a (12) after the Police Complaints Authority finding that the case was bungled. [The PCA] report... said the police inquiry was "surprisingly substandard". Agnes drowned in a ditch in Keith Park, Auckland, on February 14, 1992, in circumstances that suggested fowl play, but detectives failed to take proper account of her numerous injuries and that she was partially dressed... [In related news, the p]olice paid informants \$307,897 in the past financial year, with the average payment \$467 and the highest \$16,000. Figures given to Parliament show police budgeted to spend \$248,084 on informants...

Police in the top of the South Island are switching to a computer system... which diverts all emergency calls to Christchurch.[A Nelson] Inspector... said he was confident that the new system would work well and the public would barely notice the change.

...An Auckland woman waited... hours on Monday for the police to respond to a 111 call about an intruder on her property... It took the police five minutes to answer the call and another nine and a half hours to send a police car to her home.

...Police delays in picking up 111 calls are giving criminals a head start, says a Hamilton man who waited more than three minutes for his emergency call to be answered. When [the]... wheelchair-bound... businessman... dialled 111 about 1.45 pm on Monday after seeing his neighbour chasing a burglar, he said the Telecom operator warned him he would have to wait a while. After waiting at least three minutes, he gave up and rang the Hamilton Central police station, where a receptionist took his details and transferred him to the control room. He was then greeted by a recorded message, and gave up. The police finally rang back about 15 minutes after... Emergency calls from the Auckland and Waikato regions are transferred to a new communications and resource deployment centre in Grey Lynn. Any calls that are not picked up after 25 rings – about 90 seconds – are automatically transferred to a Wellington centre, which is in radio contact with the Auckland centre. A senior officer at the Auckland centre said staff recently had to deal with 300 calls in 15 minutes "and that's not counting 111 calls." ...One police telephone operator, who did not want to be named, said there were not enough staff to deal with the calls to the centre and too few frontline police to act on them.

...Police fear lives will be lost if the centralised emergency 111 system continues to fail. Hamilton police are outraged at a system breakdown... that left a 60-year-old woman without police assistance for nearly an hour after she was bashed by intruders. The Police Commissioner... conceded it could take to the end of the year to iron out faults in the system... [while t]he Police Association says the system may be fundamentally flawed.

...[a] young caller to Wellington central police station about 10.55am yesterday wasn't being attacked, or burgled. His need for the police? He was peeved with his sister, who had... "stolen" his yellow rubber ducky. But it takes more than that to get the boys in blue to come calling these days...

[An 'Auckland student was attacked by people he knew. But despite telling cops the name of one man and the nickname of the other assailant, he was told there would be no action. Stretched police resources, priorities and the bureaucratic jargon of "operational requirements" were offered as an excuse for the inexcusable lack of action. The police's apparent refusal to investigate the brutal bashing was depressingly familiar. It also happened to me. I was drunk but cheerfully drunk, walking home with friends after a night out on the town. There was another man we didn't know, who evinced a more belligerent than beatific attitude but we paid him no mind. Then it happened. As the man went to join his friends sitting in a car, my friend muttered "good riddance." An uncharitable comment perhaps but hardly deserving of the flurry of blows that knocked me unconscious or the big boot planted squarely in my right eye while lying on the cold pavement. I was taken to hospital for treatment, as was my friend who suffered similar injuries. Our female friend had sensibly noted the registration of the getaway car. Almost two months elapsed before police interviewed the owner. She told police that she met a strange man in a club about 2 am and offered him a lift home. She stopped to pick up a friend of the strange man when the pair attacked some other people. She was so upset she drove the pair only 5km more before leaving them on the side of the road to hitchhike home. She did not know where they lived. Officers accepted her explanation and that was the end of the matter. This isn't about stretched resources, this is about officers doing their job properly.'

... 'The Police Commissioner will apologise today to a woman whose rape complaint was ignored 18 years ago. The commissioner will make a special trip to Gisborne to meet the 35-year-old woman, who was savagely raped when she was 16. Susan, not her real name, was working in a Murupara shop when her employer handcuffed her to a bed, raping and impregnating her. The police, however, failed to properly investigate her complaint until 1995. By then, there was not enough evidence to convict the attacker. Her attacker was eventually jailed for nine years after police investigated rape complaints concerning his three stepdaughters.' Police have also] apologised to a Hamilton woman after it took them nearly an hour to respond to her emergency call. [The elderly woman] was attacked in her home 2 nights ago... Hamilton's Police District Commander is trying to find out what caused the delay.

...[a Hamilton assault] victim... says she has been let down by the centralised police phone system for the second time in a week... Police[had] apologised to the 60-year-old for botching the [first]111 call... reporting her beating by three teenage intruders. The central Auckland police communications centre that handles emergency and after-hours calls from Waikato failed to notify Hamilton police of [her] plight until an hour after the... call. That incident is one of several problems with emergency calls since the 111 service became centralised to Auckland. Police chiefs from Waikato are meeting board members of the Auckland communication centre today to discuss the controversial new system. But [the 60-year-old victim] said an apology would not be good enough after the latest incident, in which she reported a prowler at 6am on Monday. She did not call 111 to report the prowler, saying she no longer has faith in the system. Instead, she telephoned the Hamilton police station, but because it was after-hours, her call was diverted to Auckland. The Auckland call-taker... told her to go back to bed... [and] decided not to send police to her house... [She] is furious at that decision... She was still terrified after the call that the footsteps belonged to the offender involved in her bashing, who is still on the run. The central customer services manager... said the contents of the call did not warrant sending out a patrol. [He] said the call-taker did not realise who [the caller] was and therefore what she had been through. A Hamilton call-taker was more likely to have recognised [the victim], he said. The Hamilton District Commander... also said it was more probable [the victim] and her background would have been known by a Hamilton call-taker. Hamilton would have sent a patrol car if one had been available to reassure [the victim], given what she had been through. [The commander] is an angry critic of the system, as are rural police stations in the Waikato. Thames police are bypassing the system, while other rural centres are threatening to do the same.

...The public needs to be educated on how to use the emergency 111 system, in addition to the police ironing out glitches in the service, says an Auckland senior sergeant... Callers needed to be clearer and, for example, learn to identify their c[oun]try – some try to dial 911 (US) or 999 (UK) – plus c[ity], as Auckland and Hamilton had streets of the same name... Meanwhile, [a]... Mangere garage owner is angry that a safe containing \$30,000 was stolen... when police failed to respond to a 111 call. The incident was the third reported this week where calls to 111 were unable to bring police quickly to crime scenes. Despite that, the Fire Service still plans to join the same emergency communications system early next year.

...[a storeowner] rang 111 after two transvestites came into her store on Wednesday and began stealing garments. Her call was received by a Telecom operator at 1.06 pm but the call was not answered in the police communications room until 1.15 pm. Police were not sent to the scene until 1.26 pm and did not arrive until 1.34 pm. One of the offenders was arrested but the other, plus an accomplice who had been waiting outside, fled. [The storeowner] said she felt intimidated by the transvestites and they had the virtual run of the shop while she waited on the line to speak with

police. "I was pretty hopping mad about it – I was furious." ...Police have admitted they are to blame for the long delays on some 111 emergency calls. And the acting police chief has put a halt on the nationwide expansion of the controversial centralised 111 phone service until technical glitches and staffing problems are sorted out. Police national headquarters has agreed to throw more resources at the Auckland-based C[ARD]... centre, which handles 111 calls from the top half of the North Island... "A lot of the problems experienced have been the result of the human element and are being addressed through familiarisation and further training,"... said... the Auckland regional police chief... The system would not be expanded... until it was working better. "It is in our interests to make it work to protect police and the public," said... [the] Deputy Commissioner... "But I can't guarantee that all people in the communications centre will not make a mistake. They are not machines." An overwhelming number of emergency calls were coming in and there were insufficient staff to handle them, he said. The same computer system handles emergency calls in Victoria, A[US], where it is plagued with problems. In January, it crashed after failing to handle the flood of emergency calls generated by the Dandenong bushfires. However, [the Deputy Commissioner] said the system was the best in the world. Although he was aware of problems in A[US], police – rather than the company – were running it here... The number of complaints was small compared with the high volume of calls. More than 55,500 callers rang the Auckland-based centre for emergency help in the first six weeks.

...Police and Telecom are at odds over explaining the 36-minute difference between the time a Raglan resident dialled 111 to report eight lives in danger and the time police received the information... [A] Senior Sergeant... said last night that police received the call at 2.03 pm and answered it in just over a minute. A Telecom spokesman... said the operator received the call at 1.27 pm. [The]Senior Sergeant... could not explain the time difference, but said the police had so many lines it was impossible that Telecom would not have been able to get through... The operator taking [the] call told... she could not get through to police, despite trying for several minutes. [The caller] decided to drive to the Raglan Fire Station to raise the alarm, leaving the operator to continue trying to contact the police.

...A Christchurch family, first on the scene of a head-on car crash near the north-east Canterbury thermal resort... [of] Hanmer Springs... on Thursday, were unhappy to find the... Auckland-based... operator they spoke to seemed unfamiliar with the South Island... [The] Senior Constable... of Hanmer said the [father], who dialled 111 on his cellphone, later told him he planned to complain to Telecom. A Telecom spokesman... defended the operator, saying rescue services were correctly directed to the scene.

...police could not work out where... [an] emergency 111 call... came from... on Monday night... A person had been injured... in an incident in Lichfield St, Blenheim... Normally the telephone number and address of the caller flash up on a police screen. However... [the] call came from an address with a confidential number... [The] lack of details meant police were initially sent to Lichfield St, in Stoke. The manager of the... southern communications centre... said police had to go through Telecom to find the address of the caller, a delay which put people in danger... Fortunately... Blenheim police overheard what was happening in Stoke and realised the call had been made from Blenheim. Eighteen minutes had elapsed before police arrived at the address. A Telecom communications manager... said the company wanted to help the police as much as possible, and would next year ask its 120,000 confidential number customers if they wanted their numbers made available to emergency services.

...Police officers are angry that they are being paid less than some dispatchers operating the ...Card... system. Operators who have completed a five-week training course start on a basic salary of \$27,000 to \$34,000. But when a 31[%] penal rate is added, annual payment increases to \$35,000 to \$45,000... Civilian Card wages rise to about \$50,000 if operators complete seven units of a probationary constable's training... A Police Association advocate... said the union was considering the wage concerns. He said the pay issue further highlighted a funding crisis within the police force... "There is no suggestion the civilians are overpaid. It highlights the slippage in [police] salaries." ...One Wellington officer, who would not be named, said frontline police... felt the pay disparity was a sign that their work was going unappreciated. "This latest move by management reflects administration's attitude towards us, that we're expendable and can be replaced," he said. "The bosses have tried to fob us off but we are not stupid and know how much the civilians are being paid. How can we respect and support our bosses when they bring in civilians and pay them more than us? ...Some [civilian call-takers] don't give enough details or the right details. Walking into a domestic, you need to know the situation. If the details aren't 100[%] right, that's someone's life on the line. For this type of thing you need someone with police experience. A few months ago some of these people were filing clerks – now they're working in dispatch and are being paid more than a lot of the officers." ...The officer said frontline police were concerned civilians were delegating patrols to go to incidents.

...In Auckland, the chief of the Northern C[ARD] Centre... is on sick leave and has handed in his resignation. Fewer than half of the inspectors employed to run the new control room... are available for work. Sick leave, resignations and long-term leave have pushed out the rest in less than three months... Only one of the eight top officers initially in charge of running the controversial Auckland 111 emergency centre will still be there next month. The rest will have left... [The] Deputy Commissioner... acknowledged yesterday that stress was prompting top officers to leave. "It is always stressful running a communications centre. The problems the centre has been experiencing are articulated in the media and that just adds to the strain," he said. The vacant posts would be advertised. In the meantime, inspectors were being taken from other stations to relieve the centre. The Police Association regional manager for Auckland... said the centre was seriously understaffed and unable to handle the volume of calls from Auckland, Hamilton and Northland – about 75,000 a week. He said the top posts would be difficult to fill. The job was stressful and the centre had been plagued with problems. "Middle management has got completely frustrated dealing with top management, and so they are walking out," he said... As officers quit the troubled Auckland emergency callout centre, a Victoria MP wants an investigation of how the same company won police communication contracts on both sides of the Tasman.

...The head of a massive project to computerise the N[Z] police has resigned with the end of the project still months away... [He] is to take up a new job in A[US] as managing director of Victoria's controversial emergency services dispatch system... [Meanwhile, the NZ] Serious Fraud Office says there are no grounds for an investigation into the tendering process for the police 111 emergency computer system.

...A POLICE employee working in the Auckland 111 emergency centre faces fraud charges after allegedly attempting to wipe speeding ticket records from a computer system.

...The arrival of a new crime-busting computer has been delayed again – putting further pressure on an already overstretched police force which has already... shed 180 officers to fund the new system... However, [because]the system was still not up and running... the losses had hit frontline staff the hardest. "They haven't produced the machinery, let alone evidence of the productivity gains... Staff are desperate because the numbers are going down and the workload is going up and they don't see any light at the end of the tunnel," says... [the] Police Association representative for the Auckland region... The next 180 positions will go in June... The association was also concerned that other staff were being taken off normal duties to work on the system... When first approved by the Government three years ago, the Incis computer – which would allow North Island police stations to tap crime files from as far away as Invercargill at the push of a button – was due to be finished last month. The "final" date was then rolled over to October, but this week [the]Deputy Commissioner... said Incis would not be fully operational until at least the middle of next year. He also confirmed that the project would overrun the \$200 million budget... Once it was introduced, Incis would free up 1.9 million hours of police time normally spent on administration work each year. And it would help police fight crime: "It means police won't be bogged down in paperwork and will be out on the streets." [The current]Police Minister... has already raised concerns about the project, and last week said Incis might not produce the "promised efficiencies."

...Police hope to reap \$50 million from their troubled crime-fighting computer by selling the "world first" system to other countries. Police said yesterday they assured the Government in 1994 that they would sell... Incis... to police departments in... Britain and the U[S]. The revelation that

police are planning to recoup some of the \$200 million cost through developing a prototype of the IBM system computer to sell overseas comes as it is being attacked...

The new police computer will mean fewer police officers, but the experts say it will bring a new style of crime-fighting... [and] more time out on the beat. Many... officers... [would] be armed with laptops so they do not have to return to stations to fill in lengthy crime reports... By the middle of next year – if there is not yet another delay – police will be issued with 2000 personal computers and 1000 laptops... In the longer term, officers should be able to arrest alleged criminals and e-mail their details straight to courts. Technical whizzes... estimate the new computer will save about 11[%] of each officer's working day when it is fully introduced. As an example, the average cop takes about an hour to record a victim's complaint, filling in various forms and duplicating many details, such as names and addresses. When police get their new computer... this tedious job should take only 15 minutes... If Incis works, police should be able to call up crime files of individual offenders, complete with fingerprints and photographs, and follow the trail of serial offenders at the click of the mouse... The present paper-based filing system makes it difficult to track people who keep offending. "We can do it, but it's a bit hit and miss." ...But there may be drawbacks. Police fear they will burn out being on the frontline more often, especially when the troops shrink. "We're already having to rush from pillar to post," said... the industrial officer at the Police Association... "We don't pretend it will be the answer to all evils... we still must remember that policing is about policing people... there's nothing magic about a computer system. The human part of policing will catch [criminals] in the end."

...An Auckland lawyer is red-faced about being duped into giving the password of his stolen computer to the man who stole it from his car... He reported the theft to the police, then received a call at home from a man saying he was... [a constable from] the Ponsonby station. The legal buff agreed to give out his password to confirm the laptop was his. Later, he went to the station to pick up his property... It was then he realised he had been conned as well as ripped off because the laptop does not operate without the password... Police traced the phone call from the lawyer's home to a Grey Lynn house. They executed a search warrant, found the laptop, and arrested a man.

...Police have to... detail their time on the beat [next] year as part of a Government push to make the force more businesslike... [and] accountable... For example, they will have to respond to 220,000 to 226,000 disasters and emergencies and issue 770,000 to 895,000 traffic offence notices. But the Police Association fears that this approach fails to recognise the "fire brigade element" of policing – reacting to crime as it happens... The... Association president... said running the police force like a business might sound all right in theory but would not work in practice... Trying to measure everything police did in minute detail was a mistake... [and] it was "absurd" to try to make a profit out of policing... "No matter how busy we get, we don't get any of the money back from catching criminals." [The police are also meant to 'quit giving free crime prevention advice' and, instead, charge citizens for the service.]

...A new threat has emerged on the national crime scene and is putting the public at "unacceptable fiscal risk." The offender, identified by a Treasury report, is a fully manned and well-equipped police force. The Treasury believes this combination may end up catching too many criminals – and increasing the costs of courts and prisons. In a just-released report to the Minister of Finance in 1994, Treasury staff emphasise that the benefits of the... INCIS computer... need to be balanced by police staff cuts. Otherwise a full-strength constabulary with a whizz-bang computer system might be all too successful at crime-fighting for our financial good, the Treasury reasoned. The Opposition justice spokesman... said yesterday: "This bizarre piece of reasoning... defies belief. Taking the argument to its logical extension, we should sack the entire police force."

...A Government pledge to boost the police force by 500 appeared to be a distant memory last night amid revelations that overworked police are [looking at] hiring security guards to help fight crime.

...Talks about contracting out police work to security guards and private investigators are going on behind closed doors. A member of a top-level police and security industry group yesterday revealed that security firms hoped to be able to bid for police business through a formal tendering process. Two committees were set up this week to investigate how the police could work with private eyes and security guards on a formal basis.

...Moves to create a new breed of "private police" and strengthen crime-fighting on the streets begin today when a batch of security guards undergo training by police... Police training could possibly be privatised with officers training alongside security guards and their qualifications being transferable... But the Police Association has attacked the move... as "obscene."

...Auckland police will today advise private security guards on how to... behave at crime scenes and how to make a citizen's arrest... after a training session was blocked by rank-and-file officers last week... [when] the Police Association protested, saying the force was not in the business of training "private police." ...[recently released documents... spoke of private police being recruited to issue traffic tickets, attend emergencies when police were overworked, manage control rooms, and protect wealthy communities on a user-pays basis... [The association's] industrial officer, said the next step would be to give police powers to security guards. "The public is getting ripped off... for a service that should be their right," ...

Imagine that you and your next-door neighbour were ripped off by the same lawyer. While you had lost all your savings, your neighbour had some money left to afford a private investigating-prosecuting firm. That firm took a prosecution against the crooked lawyer and won back the lost money plus compensation for your neighbour. Meanwhile, you're still waiting for the over-worked and stressed-out police to return your call. An unlikely scenario? It is not as remote a state of affairs as many might think... A free-market policing model, which originated from the Treasury... and... is driven by National... is gaining a foothold. Under this strategy, police would retain certain key functions but private enterprise should be allowed to compete for the provision of many traditional – but supposedly non-core – police services. This, so the theorists suggest, will lead to greater efficiencies and free scarce police resources for the remaining core tasks. A paper prepared last year by a senior police strategist outlines how the free-market approach would work... The Government's official line is that privatisation and "civilianisation" measures enacted so far are temporary. But... the... fact that many of the paper's proposals have happened already means we can justifiably expect the rest to happen as well... Most importantly, the paper describes the "development of a more sophisticated security industry... offering... policing options and sector-wide investigations capabilities." In other words, the Government and senior police officers want and are encouraging private police forces... Wealthy N[Z]ers would be able to afford to pay for policing through the private sector while the poor would have to rely on an increasingly cash-strapped public police force. Wealthy suburbs will pay for round-the-clock surveillance of their homes. But low-income areas... would become police-free zones... In a democracy, justice and policing should be open to all, regardless of means or status, race, gender or age. When it comes to fundamental rights, society must not be divided into haves and have-nots – but it will be if private enterprise policing comes to pass. Justice would be like any consumer product...

The Minister of Police... said yesterday that he saw nothing wrong with the concept of people paying to get a prosecution in cases police did not have time to investigate... [and the] Auckland-based Private Prosecutions Company said it aimed to be the first company to specialise in helping the corporate sector to pursue criminal actions that the police or crown solicitors were unwilling or unable to take... The... Insurance Council, which says police delays are a major problem[, is backing]... Private Prosecutions... The prosecution company could earn \$155 an hour... Court cases in most countries apart from N[Z] are handled independently of the police.

...Business is overwhelmingly in favour of using private investigators and prosecutors instead of the police... [A] University of Auckland survey shows less than one corporate in 10 would continue to rely on the arms of the state to deal with criminal activity as it affects their own business... Two-thirds give the police a low rating for effectiveness, with less than 5[%] rating them as above average in investigating criminal activities... But as yet only a third of those responding have used private investigators and only a few have made use of the private prosecution services established this year.

...[NZ's] private investigation industry is booming with licensed PIs now numbering around 400. Many are former policemen. ['Having found that fighting crime does pay they've set up a private consulting service.']

...Private investigators are brokering deals with criminals on behalf of burglary victims and insurance companies who are by-passing the police to recover their stolen property. The no-questions-asked deals have concerned police, who have labelled the concept "a very nasty precedent." The actions come amid a rapid rise in the number of people hiring investigators to solve crimes which police no longer have the resources to handle... [The] head of Auckland-based N[Z] Investigative Consultants Ltd, said it was not uncommon for insurance companies to pay criminals cash in exchange for stolen goods and thereby avoid hefty payouts... "It's not a matter of ignoring the offender. If we can get the burglar by all means we will. But in most cases it's just totally uneconomic to do so and if we can get the property – that's our priority." ...An Insurance Council spokeswoman... said it was not official policy for insurance companies to front up with cash. "But if it meant for a company that they could make a small investment to get a large return that's got to be good for the insurance company and for its policy holders." A police legal adviser... said it was unlikely that the parties were committing an offence but added: "I find the concept somewhat repugnant because it tends to legitimise the burglaries. It appears that there is no legal sanction and in turn they get paid..."

...As of yesterday, the Auckland police region was 70 officers short... The Auckland central police district is... worst affected... 42 officers down. The Auckland central district commander... said one way of freeing staff for the front line was to employ temporary constables for duties which did not require the skills of fully trained officers. Temporary officers were already employed to act as jailers at the district court and the Auckland police station when Mt Eden prison is full, but he said they could be used in other areas such as fingerprinting... [O]n a busy night staff might have to fingerprint up to 60 prisoners and that tied up officers for too long... Retired police officers who had been out of the force a short time would be ideal... but civilians with no previous experience might be considered too... The... workings of the criminal investigation branch would... be reviewed, including the way burglaries were dealt with. Instead of sending up to three staff to a burglary which might have happened hours ago, one "scene of crime officer" might be appointed to attend and gather fingerprints... Auckland city police chiefs... are also considering making more use of security guards to mind crime scenes.

...Police are backing a plan for private security guards to patrol Auckland's central business district on mountain bikes. The security firm Group 4 has asked the Auckland City Council to fund a \$64,000 four-month trial... Decked out in reflector-uniforms and equipped with hands-free radios, the team will slowly sweep the streets searching out troublemakers... Bicycle and horse patrols were used successfully in Canada, and guards on skates patrolled areas of Amsterdam...

Cycling security guards might not make it to inner-city streets this summer, after an Auckland City Council committee declined funding and referred the issue to another committee... The patrols proposal will now be considered by the works and services committee on December 10.

...The works and services committee has decided not to fund... cycling security guards... saying the project involved a significant amount of unbudgeted expenditure which would mean other council projects would suffer.

...Auckland City ratepayers may have to pay another \$54,300 for the police camera surveillance network... In June last year, the council approved a \$100,000 contribution towards two new cameras, bringing the number in the central business district to 13... The... \$54,300... would go towards three new camera sites... It is also possible that council workers could be involved in staffing the... cameras for the police, who are unable to monitor the live lines 24 hours a day... The... council [already] ran a surveillance room with 15 cameras monitoring traffic flows at key central city intersections. [In related news, 'a South African inventor has designed a device which spews flames from the side of cars at the push of a button to protect motorists against car-jackings, one of the country's commonest crimes. The so-called Blaster can inflict severe burns on robbers who try to force motorists out of their vehicles. "We have had calls from all over the country. About a thousand cars will be equipped by the end of the year." South African police said over 7000 motorists fell prey to car-jackers in the first half of this year.']

...Although reliable crime statistics in Brazil are hard to get because many crimes go unreported to police, analysts say violent crimes like kidnapping, robbery and murder are on the rise... Sao Paulo, Brazil's largest city, has a homicide rate of about 50 per 100,000... Brazilians' need to feel safe has translated into a burgeoning \$150 million market for security equipment... according to a US Department of Commerce report. With theft on the rise, the market should grow about 14[%] a year by the year 2000... Fuelled by the fear of the many people, including children, who call the streets of Brazil their home, one of the first lessons learned when driving a car in Rio or Sao Paulo... is to avoid stopping at traffic lights. Depending on traffic during the day, motorists often slow or pause before moving on. However, once night falls often the only warning drivers give is a honk or two before bolting through a red light... The... armoured car market is... profiting... growing to \$US40 million... from about \$18 million last year... as wealthy motorists seek to shield themselves from the threat of kidnappings, carjackings and armed muggings at intersections... "There are about 250,000 people in Brazil with disposable income of \$US200,000 to \$US1 million and that is the market we want to reach... Armoured cars have become an important status symbol, aside from the obvious concern of being shot for no reason while stopped on the street," said [the director of a] Sao Paulo-based unit of... [an Ohio-based company that] can equip a car with armour for about [\$US36,000]. That price-tag is for protection against handgun fire. Protecting a car from heavier ammunition or hand grenades can cost far more.

...The general manager of Armourguard Security... said there ha[s] been a huge growth in all types of residential security... Thousands of Auckland residents already pay a security company to patrol their properties... Matrix Security, set up 18 months ago, was the first company to target non-commercial customers. It has 1000 clients in Remuera and 500 waiting for the second programme to be launched in Auckland's eastern bays.

...Security firms are struggling to keep up with demand as more people turn to user-pays policing for the safety of their home and family... The chief executive of the Security Industry Association... said yesterday that demand was so high security guards would outnumber sworn police before the year 2000... "Security companies traditionally just worked in the commercial field... But more and more residential customers are paying for it because the Government is not providing the police force." ...His revelation was accepted by top police last night, who admitted that the security industry had become a crucial part of policing as public resources shrank. "With progress, the police priorities have changed," said the assistant commissioner of crime and operations... "People who still want those services from more resourceful times are now paying for them." ...[the number of security firms has risen 'from 528 in 1988 to 951 this year,' and there are now] 6688 police officers to 5194 registered security guards... [- although there are also 'about 5000 unregistered security guards.' • 'In Palestine, the ratio of police to security guards is 1:50'. In comparison, in NSW (AUS),] there were three guards for one police officer and in parts of the U[S] the ratio was five to one. - 1997

Around the clock, seven days a week, police officers somewhere in A[US] will arrive at the scene of yet another crime. Their chance of solving it will run at less than 50 in 1000. And as A[US] retreats behind rising fortresses of barred windows and electronic walls, a largely hidden army of private crime-fighters... ranging from club bouncers and payroll guards to private eyes, bodyguards and corporate security advisers... is filling the gap... Their numbers have mushroomed in the past three decades in response to a rising fear of crime in a society whose changing lifestyles have in themselves increased the chances of becoming a victim... [-] families spending more time away from homes which are stocked with a growing number of easily stolen and fenced possessions... And as the security industry has flourished new concerns have emerged over the implications of the massive swing to private policing... Will A[US] become a society in which the wealthy are protected and the poor abandoned to crime? Will it become a nation of suburban and business castles? And how can private cops be prevented from turning feral? According to a study published by

the A[US]n Institute of Criminology, these issues... [and o]ther serious problems including the prosecution of leading[security] companies for misrepresenting patrol and alarm monitoring services, a pattern of serious assaults, the failure of some bouncers to protect patrons in licensed premises, corrupt trading in confidential information between police and security officers, and the huge waste of police time responding to false alarms, and shoot-outs between robbers and guards involving injury and serious threats to public safety... need to be tackled through a national approach to laws, licensing and regulation... [In local news, a]lmost three-quarters of the population are worried about... being burgled or attacked... in the place they should feel safest – home... Of the 70.3[%] who were worried, 28.5[%] said they were very concerned and 41.8[%] said they were quite concerned. The survey was taken during the high-profile spate of violent home invasions that included the murder on November 30 of dairy farmer Beverly Bouma – shot as four men ransacked her Reporoa home. Three days later, an Ohakune family were tied up in their home by three armed men. On Monday, a Kumeu woman in her late 70s was gagged, tied up and had a knife pressed to her stomach as two men ransacked her house. Early yesterday a Tauranga family were terrorised by intruders.

...the private security industry is rubbing its hands...

A burglary every 6 minutes, one vehicle stolen every 10, an assault every 15. Every day, every week, that's the pattern of crime in N[Z] today. The figures for more serious crime are not much better – there's a sexual assault every 3 hours and a murder every third day. With a cash-strapped police force, its ranks thinned by redundancy, early retirement and resignation, you could well argue that things are just about out of control. Politicians and senior police officers assure us that this is not the case, but try telling that to the citizens sick and tired of being ripped off. Now... some of them think they have an answer – private policing... There are two things rising in Auckland, the skyline and the crime rate. But some residents in Remuera, the home of Auckland's 'old money', have found new security... The wealthy here have a lot to lose. They want protection and they're prepared to pay for it. It's the kind of protection that can only be provided by their very own private police force. The kind of protection the N[Z] police force is unable to give. For \$15 a week they get Matrix, a monitored burglar alarm and 24-hour, 7 days a week patrolling... And... it's working... [- w]hile there's still crime in Remuera, none of [the] clients with alarms have been burgled during the past 18 months... and that, it seems, is keeping the customers satisfied. "[Matrix] concentrate on this area, they're not spread thin..." This semi-retired accountant... says the last time he was burgled, in another suburb, he had to call the police twice, and then it took them 3 1/2 hours to attend. Matrix took just 2 minutes... [One woman] already had a dog protecting her home but now she says she feels free to go on holiday leaving Matrix on guard. "...I just think it's where it's heading at the moment... private policing." No doubt about that. In a few years there will almost certainly be more security people in N[Z] than sworn police... Today staff open... [a] jewellery shop in Remuera... watched by two Matrix guards. That's because a month ago this store was robbed. In what's believed to be N[Z]'s largest jewellery armed robbery two men escaped on bicycles with gold, diamond rings and necklaces worth more than half a million dollars. "How many police officers, to your knowledge, are working on this [case]?" "I think one." ...[the owner] says he was cleaned out even though he had an alarm and a security camera... and[also] says the insurance assessors appear to have done most of the robbery investigation... "...you can at least get through to them?" "Police are giving tacit approval, at least, to their staff relying upon leg-work, just the donkey work, done by the private sector," [says an insurance investigator]. "You see the police only have a limited resource. We can not investigate everything to the nth degree," [said the assistant police commissioner]... The police have, for years, presented an image of working with communities to solve crime, but there have been recent signs that property crime is overwhelming them, and at times what starts out as property crime escalates into violence... and there are now hundreds of crime reports that are simply being filed without further investigation, even when suspects have been identified... "Across the board the police are simply unable to cope with property crime... which [is] just rampant, almost out of control." ...several North Shore retailers who've been the victims of multiple ram-raids [- the practice of smashing stolen vehicles through shop front doors or windows – are] now forced, because of massive insurance excesses, to sleep in their shops as a deterrent to burglars... "We are not happy with that," [said the assistant commissioner]. "...I'm optimistic that come the budget round the police will hopefully gain a fair share of the resources and we can provide a better service to the public." The Matrix people don't have to wait for budget handouts... The company has just signed a deal with Armourguard to expand into more suburbs in East Auckland, where paying customers are ready and waiting. There's nothing new about private policing and N[Z] certainly doesn't lead the world. In... South Africa the ratio... [of] security guards for every police officer... is ten to one. What happens is that private enterprise moves into the vacuum when state-funded policing can't keep up with the crime rate. Which is all very well for people who can afford private security but what about those who can't? Well, the message for them appears to be 'tough luck!' "I guess, in N[Z], we're used to the police providing a free service all of the time, to everybody[but in]... today's world it's a simple matter of economics. If you pay more you get greater protection... I guess... if you want greater protection for yourself, whether it's health insurance or life insurance or protection of your property, the more money you pay the greater service you get,"... [says the assistant commissioner. In response, one citizen asks:] "Are we looking at a situation where those who can afford it will get policing and those who can't won't?" ...[another citizen asks:] "How is it we can spend... money on things that perhaps are nowhere near as important as the people who can't afford the basics?" - 60 Minutes

Link Monitoring and alarms... peace of mind for under \$1 a day[, 'plus an up-front payment of \$640.']

A West Auckland security firm has had its master keys stolen, forcing a mass mobilisation of locksmiths to change its clients' locks... Neither police nor Henderson Security would comment on the theft or how many clients had been affected. The executive director of the Security Industry Association... said such thefts were rare... "The key question is how it happened..."

Intruders plague Paritai Drive homes despite security... Residents in Auckland's blue ribbon street are living in fear as intruders target their exclusive homes. In the latest incident... an elderly woman living alone was left with black eyes after fighting off an intruder... It was the second time in three months that burglars had got past the woman's security system... [Three months ago] thieves escaped with thousands of dollars worth of jewellery from her big brick home overlooking Waitemata Harbour. Police say... a lot of people in Paritai Drive had high-tech alarm systems but burglars were keeping up with the changes and getting past them. - 1997

There are a number of options for people who can't afford to pay for security guards or alarm systems, or are concerned about using them. One is to form vigilante groups.

Vigilante groups may take to the streets in the South Auckland suburb of Manurewa in a bid to curb what they describe as a crime explosion... The chairman of Manurewa Neighbourhood Support... said police... statistics showed that burglaries jumped from 107 in February to 196 last month... A more telling figure, however, was that there were 156 burglaries in only the first two weeks of this month. Car thefts showed a similar trend. In February 39 vehicles were reported stolen followed by 69 a month later. In the first two weeks of this month 42 were taken. Other crimes on the increase included sexual abuse and domestic violence... If all unreported crime was recorded the picture would be much worse... "There has never

been a more urgent need for crime prevention with the co-operation of groups like Neighbourhood Support... The community must be aware of crime in their area and be prepared to help the police whenever possible to try and put the lid back on crime. The epidemic we are now experiencing in Manurewa must be reversed," [the chairman] said. "I believe we are now experiencing a breakdown in society and decent folk are wondering where we are all heading." ...Residents... are considering daytime patrols of neighbourhoods by car and on foot... [A] Senior Sergeant... of the Manurewa police... supported the crime patrol concept, adding that they would operate only between 9 am and 3 pm when most of the burglaries and thefts were taking place. If it went ahead, Manurewa would follow similar steps already taken by other communities such as Howick and Papatoetoe.

...The Mayor of Manukau... the Mayor of Papakura... and the Mayor of Franklin... are urging the community to take an active role in crime prevention. They supported the use of community crime patrol groups taking to the streets.

...Residents of the... Waikato town of Matamata are about to stand up and be counted in the war against crime... [by] re-establishing a civilian patrol to watch over the streets at night... Other people are considering more controversial solutions – like taking the law into their own hands.

...Guatemalans yesterday called for Government action against lynch mobs after vigilantes in two villages burned and beat to death seven people this week... On Tuesday in the town of Comitancillo, 200 townsfolk lynched five men suspected of stealing two mules... [T]he five men were dragged out of the local jail, where they were being held by police, and stoned and beaten with clubs. They were still alive when they were set on fire on the town soccer field... The killings... brought the year's total to about 50, newspapers said. About 30 people were lynched during 1996... Police have made few arrests of suspected lynchers... "People were encouraged because the state didn't do its job at investigating or even prosecuting and punishing the [vigilantes," said the]... head of the Catholic Church human rights office... The lynchings are a public spectacle and entire towns, including women and children, participate. - 1997

Enraged Guatemalans yesterday torched the bodies of three... robbers shot by police, and then threw a captured robber on the pyre to be burned alive... Soaring crime has led to a vigilante backlash in Guatemala, where the death penalty has won wide popularity.

...More ears and eyes are out in Te Atatu sniffing out crime. The Citizens Operated Patrol Intelligence Team, COP IT, went out on its first official patrol last week. More than 25 residents are donning reflective jackets and communicating via two way radios while on peninsula patrol... [T]hey won't be getting involved in incidents, they will just be calling the police.

...Six jobless people have been handed cellphones and asked to patrol the inner city of Hamilton and report suspicious activity to the police... The scheme has run in Lower Hutt for just over a year... The Lower Hutt administrator of the scheme... said it was being evaluated. But an apparent reduction in shoplifting and car tampering indicated it had been a success. It was likely the project could be extended to Wellington and... other cities, including Auckland... Community groups and volunteers [are] increasingly being used to make up for shortfalls in the police budget [– as are television programmes that seek to solve crimes by appealing for witnesses and information from the audience]... Although no police officers would publicly criticise the scheme, many are understood to be unhappy about civilians doing a job they no longer have time for.

Criminals have changed since the days when [he] served time, he explains a little mournfully. "When I was breaking and entering a place, if the owner had caught me I would have given up." These days burglars are more likely to blow away an inconvenient witness. "They don't care about human life any more,"... That is why he decided to launch a crime prevention scheme based on the use of lethal force... "You've got two choices, man... You can stand up or... just[be] a victim." ...For \$15 a year, members of his Dead Serious organisation receive bumper and home stickers and a newsletter with tips on protecting themselves from crime. They also get a promise: any member who legally shoots dead a criminal who is committing a crime will earn \$7500... [He] says the money is not a reward or bounty. "It's a crime deterrent... [C]ash... is the only thing criminals pay attention to... they realise that someone is going to benefit from preventing a crime." He and his wife started the group two years ago after a Texas airline stewardess was followed to her home and beaten almost to death. Now he claims more than 6000 members spread across the U[S] as well as a handful in Britain, A[US and N]Z... Many have been victims of violent crime themselves... No members have been the victim of a robbery since they joined. Nor has any member claimed the \$7500 bounty, held in an escrow account... [The founder] himself is a quietly-spoken, sweet-faced 36-year-old who was brought up by his great-aunt in [the] over-grown cow town... [of] Fort Worth... His family were so poor they could not afford electricity... and he got into trouble almost as soon as he left school, aged 12. "I knew right from wrong at all times... I just didn't give a damn." He admits that the burglary for which he was convicted was not the only one he carried out, but insists that he did turn his back on crime after serving a nine-month sentence. He takes a dim view of the American criminal justice system, which he says fails to impose sufficiently severe sentences and too readily entertains excuses for violent behaviour. He does not support recent controversial moves to castrate sex offenders. "Castrating just stops them getting erections. I'm in favour of executing them." Since [he] started his group, Texas has legalised the carrying of firearms, a move many critics say encourages people to take the law into their own hands... He says the law change was long overdue but suggests it would have had a greater deterrent effect if guns could be worn openly... [A]s a convicted felon, [he] is not allowed to own or carry a gun himself. - 1996

Guns and other weapons are another option *for people who can't afford to pay for security guards or alarm systems*, etc.

Weapons are devices used in offensive or defensive fighting to destroy, defeat, or injure an enemy... Defensive weapons, such as a shield, a bullet-proof vest, or a bomb shelter, are used for protection... [M]ost discussions of weapons[deal] only with offensive weapons – those which reach out and strike the enemy, such as a spear, a gun or a bomb... Offensive weapons are also used for hunting game to provide food for man.

"Today you're going to be a man..." "You guys are gonna teach me to drive?" ... "No... you can't drive, you're only 10. You're going hunting!"

Shrinking police resources have prompted a call from a gun lobby leader for the police to train householders to arm themselves in self-defence... "Giving citizens guns and training is all about enhancing the ability of citizens to defend themselves," he said... [This followed an earlier statement] on radio that self-defence could almost be termed the most important human right... His call... was dismissed by [an]Auckland gun policy researcher... [who] said self-defence as a reason for owning a gun was specifically prohibited. He urged police to quash [the] proposal immediately... as "dangerous nonsense – a mad American notion we can do without." - 1997

The Declaration of Independence provides every American the inalienable right to the pursuit of happiness. And most Americans have been pursuing it madly ever since.

...happiness is a warm gun...

...celebrate the bullet Put your finger on the trigger... pull it...

...with a gun for a lover...

[The] film-maker... uses the western genre as... an allegory about guns and American obsession with them.

That big gun in your hand makes you look grown-up, you think! I bet you spend hours posing in front of a mirror holding it, trying to look tough.

The weakest person can feel tough and the smallest person big if they have a gun in their hand!

...I'm gonna get me a gun and all those people who put me down... better get ready to run...

"People just don't understand how cheap a gun and the bullets are..." ...We were amazed to learn that a gun... which shoots 100 rounds, can be bought for a couple of hundred dollars. No background checks, no paperwork. "It's cash and carry. I've been to some gun shows that look like Persian bazaars for weapons." ... "with all the ammunition and all the damage he did, [the gunman] probably didn't spend more than \$300 to kill all those people and to injure all the others, those that did survive... Black Talon bullets were used with the gun." ... "I don't know what a Black Talon bullet is..." "Black Talon... is a hollow-point bullet. When it contacts it has claws and it explodes." ...BLACK TALONS THE R-I-P-P-I-N-G BULLETS... designed to cut its way through flesh! ... "Why do we need a bullet manufactured to do that, isn't that the question you must ask over and over?" "Why? A hunter wouldn't use them, a sportsman wouldn't use them... As far as I'm concerned... they advertise that particular bullet... for people like... criminals... Who was going to buy a bullet like that except somebody who wants to do some damage to human beings?" ... "Every 20 seconds in the U[S] a handgun is manufactured." ... "several companies... produce assault weapons. Assault weapons are designed specifically to kill a lot of people in a short amount of time... [Manufacturers] make money in selling these things and then, when their product is used exactly as it's designed, they wash their hands and say they didn't pull the trigger... I find that lack of responsibility and lack of accountability to be an issue... My wife was shot five times in the back... [Her killer] had 600 to 700 rounds of ammunition. His goal was to kill a tremendous amount of people. He had two assault weapons... he had hell-fire triggers, he had 50 round clips, he could fire 8 bullets per second. This was a machine out to kill people... this guy was shooting fish in a barrel. No gun, no bazooka, no grenade would have saved any of them. They were hunted... [T]he tragedy that's missed here... is the impact on all the lives... mothers, fathers, grandparents, my daughter... [She was] 10 months old. She's three... [now.] just started pre-school and she wants to know where her mother is? All the other mothers are taking their kids to school. How [do] you answer that?" ... "How easy is it to get those guns..." "As... easy as making a phone call. A transaction in an alley... behind someone's garage... in someone's house or right on the street. The guns are readily available. All you have to do is know someone who knows someone... and you can get a gun within minutes... for a little [or] no amount of money..." ...Guns purchased from private... owners are completely unregulated... Regulations certainly didn't concern many of the gun sellers we encountered. In fact [we] got all kinds of tips on how to get around the law, like where to go to buy a gun if you're underage... "When you get a gun in your house, chances are very slim that it's going to be used against a stranger... you're setting the scene for a tragedy." ... "a woman is twice as likely to be murdered by her boyfriend, her husband or a family member with a gun than she is to be killed by a stranger using a gun, a knife or any other kind of weapon." ... "There's very clear medical evidence that a gun in the house will endanger you, it won't protect you. A gun in the home means that there is three times as likely to be a homicide in that home, that there's five times as likely to be a suicide... so people shouldn't think that they're getting a gun for protection... Having a gun does not make you safer... They pose risks to you and... very serious risks to your children." Today over... 50% of[US] households have guns... That means... there is a one in two chance that when your child goes to a friend's house there is a gun in that home... 1.2 million latchkey kids go home to a house... that has no parent, but does have a gun... EVERY DAY IN AMERICA... 30 CHILDREN ARE INJURED BY GUNS... So far in Chicago this year 132 children have died. 101 of those children died as a result of gun violence... "The lethal violence against children is dramatically affected by a single instrument – the gun. We know that kids fight, we know that male children fight, but what has happened is the deadliness of that fight has become epidemic and a real crisis for... all adults who care..." ... "the leading cause of death... in America, in terms of teenage boys, both Black and White, is gunshot wounds..." ... "There's no evidence that kids are more violent today than they were before but the violence that they do, the instruments that they use, are lethal. A fight with a fist... with a bottle, even with a knife, is much less lethal than it is with a gun and... it's easier for a child to get a gun than it is for them to get a book or a vaccination or a job. And that is not the children's responsibility, that's adult responsibility." ... "In the early '80s the typical victim was shot once with a low calibre revolver... By the 1990s 25% of my patients are now shot more than once, and the types of weapons have changed... We are literally fighting a war on the streets of our city and, unfortunately, it's a war that we're actually losing... I've become convinced that you shouldn't really have people like [accident and emergency staff], and trauma centres that deal with this mayhem... The word accident implies there's really nothing [that] could be done... that's not true. It was no accident that the gun was there... that it was a very sophisticated weapon... [that] the person knew how to use it, and, more importantly, it was no accident that the person resorted to violence... [W]hat we're really dealing with here is an epidemic of violence in our society. We need to understand the roots of that and try to stamp it out." ... "there are people that... are scared to death at night. Sometimes the only valuable thing they have, aside from their children, is a television set... [T]hey are in their homes, absolutely a prisoner, because of the breakdown of society, and the breakdown of the laws and... of the way the criminal justice system operates." ... "if current trends persist, by the year 2001 one million[US] babies will be born every year [into] poverty; 44 thousand teenage mothers will have children every month and 37 thousand children will be arrested every week... [I]f that isn't some reason why we ought to be devoting our attention to this very critical issue then I don't know what other statistics will turn Americans and American politics around. To me gun possession, the use of guns, is indeed a symptom of... the disease of poverty... the disease of living in a culture that perpetrates violence, that shows violence as part of our cultural heritage."

"...I know you're too young for that machine-gun you wanted, but I'm going to give you something that'll make sure when you're old enough you can still buy one – a membership in the National Rifle Association." "Wow, the NRA! Can I get armour-piercing, cyanide-tipped bullets too?" "It's in the Constitution son."

Those of us who manage to get through life without shooting anything would probably not object to the widespread ownership of the flintlock muskets that abounded when... the American constitution's second amendment guarantee to protect "the right... to bear arms"... was written. But we're living in the age of the semi-automatic and the pump-action shotgun... It is doubtful that the Oklahoma federal buildings bombers are the sort of individuals the N[RA] has in mind when it uses the constitution... [to defend] personal freedom.

...everywhere I went in America I was realising that the constitutional right to bear arms was costing thousands of citizens the right to draw another breath! I decided to find out just how easy it was to get a gun in Kansas... "...I'm looking for a... handgun... something hefty that'll do a bus queue in four seconds." "Are you a little crazy?" "No... I'm not crazy at all... [I want to know w]hat happens if somebody just walks in off the

street and says they want to buy a gun?" "If you're over 21 years old and have a Kansas drivers licence you can do it... [Just] fill out a little form... called a 4473... [with] your name, address, date of birth[... then answer]... seven or eight questions that are asking you if you're on marijuana, cocaine, if you've ever been in a mental institution, if you're a citizen of the US... if you've ever been discharged from the Army, sign it and date it, and you can walk out of here with a handgun..." "...ever check these [answers]? Is there any way of checking..." "We don't check." "You don't check anything?" "No... if they [are] a little loony we don't sell them a gun." "...you could walk in here and buy one of those semi-automatics just like that?" "Yes..." "...if [somebody]... wanted one of these would you not think they might be a bit nutty?" "...I would ask them if they were just going to target shoot or... [do] they want a toy... want to shoot somebody or protect... [themselves]. If that's what they wanted I'd sell it to them..." "You don't find that [a] worrying prospect?" "[I'd] find it frightening if I didn't have... [a gun,] but I'm 21 and I can..." "Yeah, but in an ideal world would you agree it would be better if there weren't any guns at all?" "No... [Anyway,] now you can't take them away from the criminals... If they outlaw guns only outlaws will have guns." "It... amazes me how cheerfully you accept it when... there were twenty-seven thousand people killed with handguns last year... I'm not being smug about it but there was only seven people killed with handguns in Britain last year... and that's because the handgun laws are very, very strict." "It's a dog eat dog world... and it's your right to protect yourself and your property and your family." "...There are twelve children killed with guns every day in the U[S, which is]... quite unbelievable. What happens is that... a lot of those wee 38s and 22 handguns look exactly like toys... they find them in mummy's draw, pull 'em out and go bang bang... [I]t's just too frightening to contemplate. It just seems crazy... But then... half the aristocracy in Britain dress like tramps and spend their days off shooting hundreds of wee birdies. It's a funny and confusing world really.

Princess Diana loves the Caribbean island of Barbuda and the privacy of its \$4000-a-night K-club – last week was her fifth holiday there... Apparently "bored rigid" with the breaks, [her eldest son – who is the 2nd-in-line to the British throne –] longs instead to be shooting at Sandringham or Balmoral. "He hates... the sun," says a royal servant, "...He'd rather be... on the moors with a gun in his hand – shooting is his passion."

The Princess of Wales, already at war with her former husband... is now fighting with her... 14-year-old... son... over his lust for blood sports[... T]he *Sunday Mirror*... said... Diana feared her eldest son would turn into "a remorseless hunter... The animal-loving princess is deeply concerned about the psychological effects that hunting – so favoured by the royals – will have on... [her sons." The eldest son] is believed to have stalked and shot his first stag last month on the Queen's Balmoral estate in the Scottish highlands. "In a stern warning from the palace, the princess has been told that their pastime is none of her business and she must not speak out,"...

The Princess of Wales says she will not question her son's interest in hunting. Diana spoke out yesterday in response to reports that she is deeply concerned over... [her eldest son]'s love of shooting... [In related news, n]early three-quarters of Britons want the Government to ban private ownership of handguns, according to a *Sunday Times* newspaper poll.

...A... House of Commons... committee... set up after the Dunblane massacre is preparing to reject a ban on handguns in favour of stricter licensing laws, a move expected to anger parents of the victims, according to the *Sunday Times*... [But AUS] will get its tough new uniform national gun laws – outlawing most rapid-fire and military-style firearms – following the capitulation yesterday of three rebel governments. Queensland, Western A[US] and the Northern Territory gave in to the P[M, who]... last week... warned that he would put the issue to a national referendum if the rebels did not fall into line... Newly illegal firearms will be surrendered under an amnesty costing at least \$A500 million in buy-back compensation... [funded by] a one-off increase in the Medicare health levy. However, no one knows how many of the weapons are held throughout A[US], with estimates from 3.5 million to 10 million, and extremists have threatened widespread concealment of guns.

...A[US]ns this week will begin noticing one of the first tangible effects of the Port Arthur-inspired gun crackdown – their pay packets will be a little lighter. Medicare-style deductions mark the start of a financial year in which taxpayers will fork out an extra \$A500 million... to compensate gun owners who turn in their newly banned firearms. The cost to individuals is not huge – less than \$A1.50 a week for the average earner. But neither is the amount of surrendered weaponry. Police figures indicate several thousand weapons at most have been handed in since the April 28 Port Arthur massacre, a tiny fraction of the... guns in the community... • Britons handed in 15,360 guns in a one-month amnesty declared after a weapons enthusiast massacred 17 people at a school...

Pressure is mounting on the [British] Government to ban private ownership of handguns as the press and public vent their fury at members of Parliament who rejected radical moves in the aftermath of the Dunblane tragedy. It has been increased by a court case in which a man who obtained by mail order the firearm with which he shot a young mother of two was found guilty of her murder... Meanwhile, parliamentarians in Tasmania, where 35 people were massacred at Port Arthur... have failed to agree on gun control legislation inspired by the tragedy. If the bill lapses, Tasmania could become the last place in the nation which had failed to implement the uniform national gun laws agreed by federal, state and territory police ministers... [In local news,] police... shot dead a man after an armed confrontation at a service station... in the busy Greenlane area... last night... The incident lasted for about half an hour and... three shots were heard... A representative of the Police Complaints Authority will travel to Auckland this morning to oversee an inquiry into the shooting. This is the latest in a series of shootings by police officers. Two weeks ago, a woman was shot in the arm after allegedly holding a knife to the throat of a dairy owner in Avondale...

The Police Association says lives could be saved if a fulltime rapid response unit, along the lines of the U[S] Swat teams, was set up in Auckland. The call comes in the wake of two police shootings in Auckland in less than a month – the fatality in Greenlane on Saturday and an incident in Avondale... In both cases the shootings were carried out by frontline sergeants not connected with the armed offenders squad, a situation the Police Association said was far from ideal. The association's Auckland director... said... "If an offender sees one cop with a gun he is more inclined to think he has a 50-50 chance than if he sees a squad of 10 guys all dressed in black pointing guns at him. It[']d be far safer for the public and staff." At present armed offenders squad officers work a normal eight-hour day and have to be called out from home if an incident occurs after hours.

...Startled diners on Ponsonby Rd in Auckland this week experienced an unforgettable taste of downtown Los Angeles when an innocent woman was shot during a bungled street robbery. The Monday night attack, which follow[s]... a string of headline-grabbing firearms incidents this year, has left many people fearing they are living in the wrong megalopolis. However, according to Police National Headquarters' statistics the total number of offences involving firearms has decreased from 4701 during the 1990/1991 year to 4361 during the 1995/1996 year. Homicides involving firearms reached 51 during 1990/1991, then dropped to 26 and 24 for the following two years, falling to 18 for 1995/1996... According to the statistics there were 198 incidents of intimidation/threats involving guns in 1990/1991 and the figures continued rising, peaking at 303 in 1994/1995. Armed robberies also showed a marked increase from 197 incidents in 1990/1991, 319 the following year and 240 in 1995/1996... [A]bout 100 weapons a month were stolen from legal arms owners around the country. About a quarter of these were recovered after being used in violent crime. Over half of the guns were not stored securely when they were stolen... said... [the] commander of the Auckland Armed Offenders Squad, who points out that although crimes... involving firearms had fallen... our streets ha[ve] become more violent... "The most trendy crime committed in N[Z] is aggravated robbery. A firearm is predominantly carried to be used as a threat, not as a weapon to cause serious bodily injury or harm. Yet on Monday night we had the same scenario but the weapon was used. I hope that's not a trend of the future." [The commander] cautions that the statistics do not include other weapons, including knives, crossbows, bombs, even chainsaws, which he said had contributed to increased violence on the streets. "Crimes with a weapon are increasing. In the days when I was a young policeman, if somebody... [was]

accidentally bumped in a hotel there would be an apology. Then it got to the stage when... you got a punch in the jaw... now it's out with the knife and an injury is inflicted. The degree of violence has certainly increased." Despite the escalation... he was "completely opposed" to the introduction of a full-time tactical unit. "There isn't sufficient work in Auckland to warrant that." His... Squad could go for up to a month without being called out on a live incident. About 60 staff would be needed for a tactical unit to operate around the clock... A squad of that size and type would lead to an over-reaction by its members in a bid to justify its existence and in the long-term contribute to a rise in violence, he said. [● NZ police, like UK bobbies, don't normally carry guns on their person, and a recent public survey found that '7 out of 10 NZers are against police carrying guns' at all times]

...*Police stand in the line of fire...* The Police Association believes that frontline police facing the daily prospect of an armed confrontation and having to shoot to defend the public and themselves need more training. At present most police officers get just two days' instruction a year, including live practice with pistol and rifle. This is to be increased to three days from the middle of next year. Only specialists in the armed offenders and diplomatic protection squads and those trained to deal with hijackings get more practice. Yet it is the men and women in blue who are usually the first on the scene. Three times in the past 12 months officers in this situation have had to make the decision to open fire – in Whangarei, where an armed man was shot dead in the street in broad daylight last November; in Avondale, Auckland, in August, where a woman holding a knife at a superette owner was shot and wounded; and two weeks ago when an offender sprayed shots from a semi-automatic weapon at a... service station in Green Lane, refused to surrender, and was killed with a single shot. Each time, the uniformed police on the spot felt they could not wait for the specialists to arrive because of the danger posed by the offender. [The] president of the Police Association, says every time officers go on patrol these days there's a risk of an armed confrontation... [He] is not suggesting that the police be armed as a matter of routine, but believes officers need to be more familiar with the weapons they do have... "When you get into an armed situation you don't want to be also thinking about the weapon you've got, only the job that you have to do..." At any one time in Auckland's five police districts there may be up to 27 uniformed police including a duty inspector and three sergeants [– driving 'supervisory patrol cars' – carrying firearms (in addition, 'our international airport police are required permanently to be armed in the precincts of the airport')]. The standard issue is a Smith and Wesson .38 six-shot revolver although that is now being replaced by a Glock, 17-shot semi-automatic firing a 5.56mm round. South Island police have been trained and issued with the new handgun and the switch is now being done in Wellington and nearby districts. In Auckland, where most violence and armed incidents occur, police won't start getting the Glock before next July – because of budget restraints. - 1996

The trusty .38 calibre... Smith and Wesson... revolvers, which were introduced in the mid 1960s, are being phased out of police stations around the country as the department upgrades its armoury with Austrian-made... Glock pistols. [The s]uperintendent... in charge of the operations support section in Wellington, said police armourers would check the... 1356... revolvers as they were handed in and those deemed unsuitable for sale would be cut up. The remainder... would be put up for tender to reputable overseas companies. None would be sold in N[Z]. However, a[n] Auckland arms dealer, said the international firearms market was flooded with second-hand police issue revolvers. "Most overseas police forces have already dumped their Smith and Wessons." He said the successful tender was unlikely to pay more than \$20 for each revolver, although they would be worth about \$350 to firearms collectors in N[Z]. The dealer also said that in recent years the Army[has] sold off its remaining Bren guns, boxed with spare barrels, to overseas buyers for just \$23. Holders of C class firearms collectors' licences in this country paid up to \$1600 each for them. He said the army was still seeking foreign buyers for 10,000 superseded M16 rifles. [The superintendent] said the transition to Glock pistols was due to be completed by the end of the year... The head of the police armed offenders squad in Auckland... said the Smith and Wessons had given good service during their deployment.

...N[SW] police would be re-armed with a lightweight, powerful automatic pistol to replace the 19th century Smith and Wesson six-shot revolver... which is considered difficult to load, heavy and inaccurate... the Minister of Police... said yesterday. The long-awaited \$A11 million... contract for the police sidearm brings the state into line with the FBI and the New York Police Department, he said... "I am advised that [the Austrian] Glock outperformed all other tendered weapons in safety features, accuracy, reliability, design and construction." ...A coroner's report into the deaths of [two] Senior Constables... at Crescent Head, near Kempsey, in July 1995, questioned the suitability of the present .38 calibre weapons and said frontline officers needed the protection of vests... Yesterday's announcement follows the state government budgeting for \$2 million to purchase 2,000 bullet-resistant vests over the next few years... The standard Glock 22 carried 15 hollow-point bullets in a pre-loaded magazine which would enable police to carry 30 rounds instead of the 12 most carried now... In the four years from July, 13,000 of the .40 calibre handguns would be issued... Every police officer in the state would be put through an extensive retraining programme. The introduction of the new police sidearm comes after years of police complaints about being out-gunned by criminals... Various versions... [of] Glock sidearms... also have been adopted by police in the Northern Territory, Tasmania, Queensland... and... the Australian Federal Police... [Incidentally, m]ore than 10,000 people in A[US] died by gunshot during the 16 years from 1980 to 1995, according to... the A[US]n Bureau of Statistics.

...[AN] ANTI-GUN lobbyist... said yesterday N[Z] has on average one firearm per household, 11 times as many guns per capita as Britain and 60% more than A[US]. He said the figures were staggering and needed to be addressed by the Government.

...HANDGUNS... are entering N[Z] and ending up in the possession of gangs, according to new research.[A] Canterbury University sociology lecturer... said the sources of the handguns were from sailors from eastern Europe who were able to buy guns cheaply in their home countries and sell them... in N[Z]... for... around \$1500... Police say while they have no evidence of handguns arriving from eastern Europe, illegal handguns were sometimes found in raids of gang houses. The Customs Department said around 18 months ago there were numerous reports of handguns coming into N[Z] from eastern Europe, but no seizures were made. Over the last year or so these reports had tailed off, a... spokesman said. [● Last week Customs expressed concern about the existence of a '35 keyring-sized gun that has a 20m kill range and is undetectable by customs x-ray machines.'

...A Customs Department review of the Arms Act has identified a loophole which has the potential to allow shipments of illegal arms into N[Z]. The anomaly arises from the wording of the 1986 Arms Act which excludes harbours and territorial waters from its legal definition of N[Z]. This]... means that guns entering N[Z] on foreign-flagged vessels have not technically been imported while they remain on board. In this situation, neither Customs nor police officers have any power to take action regardless of the type or number of weapons carried on board. This, the department said, could lead to N[Z] being used as a transit point for the illegal shipment of firearms to foreign destinations. It also raises the possibility of weapons carried on visiting yachts being landed, sold or stolen after the vessels had been cleared... by the Customs Department... [I]t was a poorly kept secret that mega-yachts sailing to N[Z] from the U[S] and Caribbean often carried mini-arsenals... to ward off pirates, though very few cases of piracy are reported, and certainly none in the South Pacific... Foreign yacht skippers are required to declare all weapons when entering N[Z] and to surrender these to customs officers. The weapons are then passed to the police and held until the yachts leave.

...N[Z] will be seen as "a nation awash with guns" when a U[N] study on firearm regulation is released early today... The... study, due to be made public in Vienna, compares the regulation of firearms in 49 countries... [S]tatistics... showed this country had... [the] third-highest rate of firearms ownership, with 309 guns per 1000 people. Only the U[S] and Finland had more firearms per capita... [NZ also has the] fifth-highest gun suicide rate, after the U[S], Finland, Estonia and Canada[; the]... fifth-highest rate of unintentional gun death[; and the]... 11th-highest overall rate of gun death... The report covered industrial and non-industrial countries, containing 68[%] of the world population... N[Z] and the U[S] were almost alone in the developed world in that most firearms were not required to be registered.

...While applicants for a gun licence in other countries must belong to a registered target shooting club, produce written evidence of permission to shoot on a named rural property or be primary producers with a proven problem with feral animals, N[Z]ers need only write the word "sport" for a licence application to be granted... [I]t is difficult to get a good "guesstimate" of the numbers of... those involved in sports shooting[, but it is somewhere between]... 150,000 to 250,000... The 12-gauge is the most common shotgun in this country... used primarily for the hunting of game birds, for rabbit and possum shooting, and also by a large number of those involved in the wide-spread sport of clay target shooting... The 12-gauge shotgun is a fearsome weapon at close range. At 30 to 40 metres it can cause horrific wounds... [●] The minimum age for owning a firearm in N[Z] is 16. In Canada and A[US] it is 18.

...GUN collectors are nice people. Really. Just ask [a]75-year-old... She loves Auckland's annual gun fair and the people who go there... "These are the real N[Z]ers, salt of the earth," she says... Every year for the past four years, she has set up her stall to sell Victorian china... bearing prints of gun dogs, ducks and the like... Organisers invite... [the 75-year-old] to display her porcelain because "the wives needed something to look at other than guns." ...the good keen men who come to the ASB Stadium in Kohimarama each year to look at pistols, rifles, shotguns and machine guns... [may be nice people, but m]assacres in Aramoana, Dunblane... and... Tasmania... have helped engender an environment where collecting guns is perceived as an unhealthy pastime. The collectors blame the media for their bad reputation and are noticeably gun-shy when journalists ask them about their attraction to the lethal devices. Do the collectors deserve the scorn? Are they any different from train spotters, stamp collectors and people who play fantasy role-playing games? No they say... "Just because they're lethal weapons doesn't make it any different to collecting stamps." Indeed, but stamp collectors don't refer to their prize Black Penny as a woman, as one gun club did about the presumably rare Sharps Long Range Express rifle. "Playmate of the Month... with her clothes off!" ...was the headline of the club's newsletter... Collecting guns is one thing, but imbuing weapons which kill with sexual characteristics is just plain weird.

...[a New Yorker] went shopping with a rather odd deadly weapon... And it ended up costing him a big slice of his life. [The man], aged 29, was convicted of robbing [someone] of \$US20... and a watch by pretending a zucchini hidden under his jacket was a gun. His defence had argued he was innocently shopping for vegetables. But [the judge]... declared: "You added to the climate of fear we have to live in." The judge pronounced... a minimum of 15 years in prison.

...A federal marshal in the U[S] shot dead a teenager after mistaking the silver wrapping of a chocolate bar... for a handgun... [The boy], aged 17, was walking past the car of undercover law enforcement officers... when he reached into his pocket for... [the chocolate bar. In further news from the US, a New Mexico farmer] who connected guns to his burglar alarm blasted himself to death... John Osbourne (51)[, of]... Holtsville... rigged up the booby trap for outlaws. But, home from a night of drinking, he forgot about the alarm trip wires.

...Momentum is gathering for worldwide action on gun control to stem the increasing number of deaths from firearms among civilians... The U[N] Commission on Crime Prevention and Criminal Justice is expected to approve a resolution this week to urge countries to impose tighter restrictions on gun ownership and export... The controversial issue of gun control came under the spotlight in A[US] and Britain last year following... massacre[s. A]... UN report showed that 41[% of U]S... households owned at least one gun, compared with 16[% in AUS and 4%] in Britain. A US Justice Department survey put the figure slightly lower at 35[%], but... showed that about 14 people per 100,000 die annually in the U[S] from firearms-related deaths... That amounts to 37,000 people... Burkina Faso had the highest figure at 26 people per 100,000, followed by Jamaica with 18 per 100,000... 44 million Americans in 1994 owned 192 million firearms, including 65 million handguns... 74[%] of the gun owners possessed at least two firearms... [O]n a typical day in the U[S] one million adults carry a gun with them and a further two million carry a firearm in their vehicle... 20[%] of all gun-owning households had an unlocked or loaded gun. Middle-aged, college-educated people in small rural towns were most likely to own guns... Also, 42[%] of men, but only 9[%] of the women, surveyed owned firearms. About 80[%] of the gun owners reported that their parents kept a gun in the house while they were growing up... The... Justice Department survey... cited the accidental shooting deaths of 185 children in 1994... [and] 1500 injuries to children... that [required] trips to the emergency room.

...MOST U[S] hand-gun manufacturers have agreed to provide child safety locks with their firearms as part of a pact with the [President's] administration, but the deal does not yet include three southern California companies that are among the largest producers of cheap hand-guns known as Saturday night specials... [In related news, a]fter his landslide election to the National Rifle Association board this week... [a] 72-year-old actor... is now... running for first vice-president... The potential power struggle comes amid concerns over the NRA's declining finances and drop in membership from 3.5 million in 1995 to 2.8 million this year. It is still one of Washington's most powerful lobbying groups.

...Washington is one of eight American states where more people are killed by guns than die in road crashes.

...JUST hours after a Louisiana law that allows drivers to shoot would-be carjackers took effect, one teenager was killed and another wounded by two men who stole their car... "These latest shootings are really ironic," a New Orleans police department spokeswoman said: "I mean, that's what the law was supposed to prevent. Now you can't help but worry that the next person's going to overreact when somebody walks up to his car for directions,"... The law, which took effect at 12:01am on Friday, permits intended carjack victims to shoot to kill when they believed themselves threatened by an assailant, armed or not. The law, approved by the state legislature earlier this year, is a companion to the 1993 "shoot the burglar" law... Louisiana law already permitted handguns to be carried in vehicles without permits.

...[his] chosen profession is saving lives... with a successful general practice in Auckland[, which is why]... some may see it as strange that the 49-year-old is also an outspoken voice for the country's pro-gun lobby. But, as vice-president of the N[Z] Shooters Association, he believes the public has been misinformed and led astray by anti-gun enthusiasts... "The promise... of gun-control lobbyists... that gun laws will save or reduce crime is a nonsense. The lives they save are the criminals because they actually disarm the law-abiding... It has been long known that the pattern of legal gun ownership and the pattern of crime has been opposite – they are mirror images of each other. For instance... [in] America the states with the toughest gun laws have the highest crime rate and the crime rate goes up after each extra restriction... [I]n the 1920s when there were plenty of firearms, violent crime was, in reality, very low... [and, today,] most of the guns are in the country but most of the crime is in the town[s]... So anyone who thinks there is... a link is basically not thinking straight."

...A firearms report by a retired High Court judge recommends that the Government buys back... up to 30,000 military-style semi-automatic weapons... from N[Z]ers... at market prices over six months... The review also recommended that semi-automatic weapons be limited to a magazine capacity of seven cartridges, and that... pump-action shotguns be altered to take no more than two cartridges. The Government should pay for the alterations... [M]ilitary-style semi-automatic weapons cost \$500-\$600 on average, so the buy-back exercise would cost... \$18 million[– 'and is rising every day' – but 'it will cost \$59.8 million to implement the recommendations (although a study showed that new gun laws would have to prevent only one to three gun deaths a year for NZ to break even – each violent death cost the country a minimum of \$1 million in direct costs alone, not counting court costs and indirect losses'), including the one]... that guns be registered... A gun policy researcher... said licensing gun owners but not their weapons, as is the case now, was like licensing drivers but not their cars... He admits registration is not going to stop shooting deaths any more than car registration stops road deaths. But car registration is one of many "commonsense provisions to make us personally and individually accountable for our cars. Gun registration will make us personally and individually accountable for our guns."

...4500 prohibited firearms... have been handed over in Sydney in the past month under the A[US]n Government's buy-back scheme... [The] guns... were picked up by a giant magnet and put through a shredder and destroyed... A total of 470,000 guns have been collected nationally, with owners receiving \$A243 million... in compensation... [Incidentally, m]ore than 500 million military-style, hand-held weapons provide massive

firepower for criminals, vigilantes... private Armies and other civilians... Worldwatch said in a report published yesterday... Add to that new small-arms production of several million a year... "It may not be much of an exaggeration to say that we are witnessing an era in which, in a sense, Armies are disarming while civilians are re-arming,"... said... the report... [S]ome weapons are sold by soldiers, some sent en masse to other countries and some stolen.

...Police on the streets of America's second-largest city have been given Army surplus M-16 assault rifles to match the increasing firepower of criminals. The Governor of California... said that 600 of the powerful weapons had been supplied to Los Angeles police officers in the wake of a shootout with bank robbers earlier this year that was shown live on television. Officers responding to the Bank of America robbery... were confronted by two men wearing body armour and firing assault weapons. Finding their 9mm service revolvers inadequate, the police were forced to run to a local gun shop for help. "Never, ever again do I want to see officers from the Los Angeles Police Department outgunned," [he] said.

...Used anti-tank rocket launchers, once sold in Army surplus stores but now deemed illegal weapons, are being sought by... [NZ police because they] were... being used by criminals to intimidate victims... If a criminal carried a launcher during a bank robbery, it would be difficult to tell if it had been used or not. Police were also concerned that the launcher could be reloaded by a qualified armourer... War veterans had also brought them back from overseas and gun collectors had imported them... Arms officers were checking gun collectors throughout the country to establish whether those possessing the used launchers were licensed. The Army has also warned soldiers that the weapons must be returned to an ammunition depot for disposal after use. Soldiers who did not do so faced a \$4000 fine or three years' imprisonment, or both... [By the way, i]t is 50 years since the first AK-47 assault rifle... – ...one of the world's most determined killing machines... – ...was made... [It was] the one mass-produced item the Soviet Union made that actually worked and had staying power. And it changed the course of history... There was a time when an outsider could tell which side of the world a soldier fought for, by looking at the silhouette of the weapon... A few years ago, [its inventor] said he wanted to set up a fund to help the victims of gunshot wounds... He is said to have viewed his weapon only as a defensive tool to protect the motherland from invaders, an ironic mission for a gun that has spread around the world and linked itself to bold, ideological aggression everywhere... The estimate... is that some... 40 million AK-47s... and its licensed imitators... have been pieced together... It uses a steel-jacketed, lead-headed ammunition that puts it just this side of the technical parts of the Geneva Convention. This gives it a deadly, crippling effectiveness on the battlefield because the round tumbles when it hits bone and can damage far beyond the entrance wound... It is so dependable... [and] so simple that a 10-year-old can use it... The AK-47 fires 600 rounds a minute and can be retrieved from mud and cleaned to firing status in much less time than it takes to crack open its more sophisticated modern competitors... It needs no tender, loving care at all, thriving on a little bit of oil... It can be bought for a few hundred dollars, and traded for almost anything of an equivalent value anywhere in the world. N[Z] police have estimated that there are more than 60,000 AK-47 lookalikes in this country alone.

...Two youngsters playing with a toy gun sparked a full-scale police alert in Auckland yesterday, bringing an angry response from the head of the armed offenders squad... Innocent parties all the way along the chain are being placed in jeopardy because some idiot has supplied a person with a weapon that looks so real." ...Because the play-guns on sale were so authentic it would not be long before someone was shot by police who mistook the toys for the real thing... [It] was the third incident involving toy weapons and the squad during the past six months and each operation was a drain on already strapped police resources... The[latest] operation is estimated to have cost several thousand dollars... Armed frontline police staff, the police Eagle helicopter and the armed offenders squad – dozens of officers in all – were called out after reports someone was seen with a gun... in... Mt Roskill... A cordon was set up in the area... two hours... before... police swooped on a house... The imitation weapons should be banned, [the head said. ● 'Kenya banned the sale of toy guns during the early 1980s.']

...The Vietnamese Government says it will ban toy weapons to protect the minds of the nation's children. A Trade Ministry official said the ban, which covered bamboo and plastic swords, bows, rifles and grenade-shaped cigarette lighters, applied to both imported and locally produced toys.

...It's official – most [NZ] police wouldn't know a real gun from a fake. A competition [asked] police officers around the country to spot the real police issue Glock pistol from... 11 replicas... Only three... [were correct out of] 50 entries...

The Minister of Police will raise the matter of replica firearms when he meets the Commissioner of Police today, following a series of incidents at the weekend... Legal issues of importing replica weapons into N[Z] would be considered... The Minister... said Parliament was... reviewing firearms legislation... [but] section 46 of the Firearms Act 1983... already... prohibited the carrying of imitation firearms... Offenders faced up to two years' jail. The weekend's firearm alerts... involved... [a] 50-year-old... wielding a fake gun in a Waihi shop[; a]... 16-year-old... taking pot-shots at students camping at Dickey's Flat[;] ...two youths playing with paint guns on a Wellington reserve[;] ...a 12-year-old boy [using] an imitation gun to challenge an Invercargill officer[;] ...three 16-year-olds carrying plastic laser guns; a 17-year-old who faces firearms charges after allegedly carrying a gun; and two 14-year-olds referred to youth aid after armed police found them with an imitation Colt 45 outside a takeaway shop. - 1997

WAITAKERE[S] police chief Superintendent... is calling for tighter controls on sales of imitation guns... follow[ing]... the fatal shooting of Edwin "Eddie" Leo near Helensville... Leo was shot three times after pointing an imitation Glock pistol at two police officers after a crash at the end of a car chase. The... Police Complaints Authority... report says the shooting could have been avoided had Leo complied with police demands to put down the gun... The... [superintendent] says any person pointing a firearm – toy, imitation or real – at an armed officer can expect to be shot... At least four west Auckland schools had confiscated air rifles, BB and replica guns from students in the months leading up to the Leo shooting... [In related news, the] father of a... teenager shot in a hunting accident says the killer must pay. Beau Fathers, a 15-year-old Rotorua boys' high student, was shot in bush near his parents' Hamurana farm on Friday... Beau and his cousin... were setting up camp when they heard what they thought was a stag roaring. The noise was a roar from another pair of hunters. The two young men began stalking it but one of the other hunters shot Beau... [A] Senior Sergeant... of the Rotorua police, said it had still to be decided if charges would be laid against the hunter. It is the second time this month that a person has been accidentally killed by another hunter. Ngaroma farm manager Russell Welch, 31, was shot in Pureora Forest on April 2. [A 39-year-old], of Hahei, was sentenced to two years' supervision and fined \$2000.

...An American... was shot dead on his sixth birthday when a 4-year-old fired a hand gun the two found in a purse... Neighbours said it appeared the children had been playing outside when their usual game of pretend gunplay took a deadly turn... Police may charge the gun's owner under a law that prohibits leaving guns accessible to minors. Meanwhile, in Pennsylvania, a 14-year-old boy was charged yesterday with killing a teacher at an eighth-grade graduation dance which had the theme "I've Had the Time of My Life." ...He... fired several shots... [while] his schoolmates were dancing to the last song, *My Heart Will Go On* from the movie *Titanic*... Two 14-year-old boys... [and another] teacher... were wounded.

...Nearly a million U[S] students took guns to school in the past academic year, according to a private study... [T]here was some good news. The survey's author's noted the percentage of students who say they carried guns to school has dropped in the past five years, from six... to 3.8... The latest academic year has seen deadly shootings at schools [in Pennsylvania], Mississippi... Arkansas and... Oregon. [Some schools have employed security guards, installed metal detectors, and a few 'hold practise drills so the children have an idea of what to do if the school becomes a target for bullets.'] ● 'Over 6000 US high school students were expelled in the 1995-96 school year for carrying weapons, according to a Department of Education report.'

...Stung by the first school shooting in a nation with strict gun control, Dutch authorities want to know how a student was able to get a handgun and wound five people... In the aftermath of the shooting at a vocational school in Veghel, a quiet working-class town south of Amsterdam, [the] Justice Minister... said he would not rule out the use of metal detectors at schools to prevent another incident. Dutch people struggled to understand how a school shooting, so dreaded in the U[S], could happen in Holland.

...A kid in a white shirt heaved something up on to the high school roof, and it exploded in billowing smoke. Student[s initially]... thought it was just a lunchtime prank, a firecracker maybe. Then bodies started falling... They were the first victims in yesterday's bloody late-morning shooting spree at Columbine High School in [the] affluent Denver suburb of Littleton... By early today 15 bodies had been recovered – nine boys, three girls and one adult. Twenty people lay critically ill in hospital, but police fear more victims may lie inside the booby-trapped school. Hours after the shooting – by two teen killers clad in balaclavas and trench coats who giggled as they sprayed bullets at their fellow students – Columbine High was rocked by two explosions. Bomb disposal experts were combing the classrooms last night, and had recovered more than a dozen handmade devices, including pipe bombs. A pipe bomb was also found at the home of one of two 18-year-olds whose bodies lay in the library after what police say was a “suicide mission,” possibly timed to coincide with Adolf Hitler's birthday.

...What drove two teenagers to walk into a Colorado high school and kill at least 15 people may never be known, but behavioural experts say giving troubled teens easy access to guns can spell disaster... [T]eenage years are a tumultuous, impetuous time when issues such as popularity can become all-important. “It's a time when people feel they don't fit in... They're highly sensitive to whether they're included or excluded... Adolescents are also impulsive. They make sudden decisions without thinking them out. There is a tendency to be self-absorbed, that how they're feeling now is how things are going to be forever.” Fellow students identified the Denver killers as two seniors... who belonged to an anti-social “gothic” clique that calls itself the Trench Coat Mafia and was ridiculed by other students... The killings at Columbine High... were the latest in a series of shootings at schools across the U[S] in the past 18 months that have killed another 14 people and wounded more than 40... [The US] President... said... “We do know that we must do more to reach out to our children and teach them to express their anger and to resolve their conflicts with words, not weapons.”

...A defiant... head of the biggest US gun group, told cheering supporters yesterday that the N[RA] would not... take the blame for the Columbine High massacre. As thousands of anti-gun demonstrators marched to protest against the NRA's holding its annual meeting so close to the scene of the worst school shooting in US history, the former Hollywood star declared... anti-gun advocates were wrongly blaming gun owners who... had a constitutional right to bear arms. “They want us to play the heavy in their drama of packaged grief, [but we're]... not the rustic, reckless radicals they wish for. No, the NRA spans the broadest range of American demography imaginable. We defy stereotype except for love of country,”... The [actor who once portrayed Moses]... was scathing when he spoke of demands – including one from Denver's mayor – that the 2.8 million-member NRA cancel its meeting because of the deaths, although the group did scale back its convention and held a minute of silence for the Columbine victims... Police have said that the shooters Eric Harris... and Dylan Klebold... got three of the four weapons they used from Klebold's[18-year-old] girlfriend... She allegedly bought them at a gun show where neither a waiting period, identification or a background check was required.

...[US h]andgun manufacturers were found liable of negligence in a landmark decision yesterday in which they were blamed for seven shootings with illegal guns, resulting in the deaths of six people... The... case... drew national attention because it was the first time lawyers for shooting victims had argued that manufacturers' distribution and marketing practices made it easier for criminals to obtain guns. In addition to the negligence and liability findings, the jury awarded \$US4 million... in damages... to the only surviving victim in the case... The gun companies... American Arms, Beretta USA Corp and Taurus International Manufacturing... said they were being wrongly blamed for the criminal actions of individuals... [■ L]ast week's amnesty... [– during which] District of Columbia residents would be paid \$US100... for each gun they turned in during a five-day period, no questions asked... [–] was so successful that on the third day some of those lined up to exchange their firearms had to be turned away because the programme temporarily ran out of money. Across the U[S], police and community groups running similar programmes have... overwhelmed[ed]... cash-strapped cities... In places, officials are making payments with gift certificates, sneakers or even sewing machines, to make sure people giving up their guns won't turn around and buy new ones... While many cities destroy or melt down the collected weapons, New Orleans found a more ingenious use. Local sculptors assembled the gun parts into works for an exhibition called Guns in the Hands of Artists.

...[the Aucklander] is an intelligent man with a wife and two children, a good job and a passion for the guns of choice of mass murderers. In a cabinet made of 6mm-thick steel, the Auckland computer expert keeps a military-style semi-automatic (MSSA) that he brings out regularly to shoot at paper targets, and occasionally goats. His Chinese-made SKS Norinco rifle is the kind of weapon that many people – from High Court judges to families of massacre victims – want to see turned into scrap metal and banned forever. But the Government this week rejected a recommendation... to follow the A[US]n example of banning and buying back MSSAs. The Minister of Police... when asked why anyone should need to own a MSSA, said some people “get enjoyment out of their use.”

...*Kiwis need more guns says doctor* A MODERN day Doc Holliday advocates American-style gun laws for N[Z]. The Mt Eden GP... thinks people should have the right to carry guns claiming they are a “big deterrent” to violent crime. He... told *The Daily News* the recent Columbine High School massacre... illustrated his stance... [T]he 50-year-old... blasted Auckland City councillors... over their support for tougher gun laws[, claiming that]... the council's position was “naïve and undemocratic”... [Meanwhile, t]he committee... hearing the Arms Amendment (No 2) Bill, which aims to have all firearms registered[, was told by the]... Police Association president... [that] at least 90[%] compliance was needed for the law to work but no figures were available on how much that would cost... Figures suggested ranged between \$50 million and \$100 million... [I]ntroducing similar laws in Canada had cost \$C350 million... in three years, instead of the projected \$C87 million. As well, there was only 26[%] compliance. The bill has drawn 6500 submissions...

About 222,000 N[Z]ers hold an A-class firearms licence, the general firearms licence that allows holders to have or use sporting shotguns and rifles... [There are] also... rarer B, C and E endorsements... The B endorsement (there are around 2400 B endorsement-holders in N[Z]) allows members of incorporated pistol clubs to own pistols. The C endorsement (around 3200 holders) allows bona fide collectors to have restricted weapons. The E endorsement allows holders to keep [MSSA]s and shotguns... To get a general firearms licence in N[Z], applicants begin by filling in a two-page form that asks for basic details. Candidates must offer the names of two referees, say whether they have incurred non-molestation orders or have had any criminal convictions, and if they have had psychiatric treatment. Then, if all is in order, they pay a \$123.75 application fee. Next there's a 30-minute police interview, which... finds out what your interests are, what you intend to do with a firearm, where you intend to keep it and what your beliefs are in areas like the use of a firearm in self-defence. After that, your background is checked, your referees contacted, and your home inspected to ensure gun-storage facilities are satisfactory. The last step is th[e] Mountain Safety Arms Code lecture. They run candidates through what are known as the Seven Commandments of Shooting, seven fairly obvious standards, including: treat every firearm as loaded, always point firearms in a safe direction, and avoid alcohol and drugs when shooting. You are given a copy of the Arms Code, the gun world's version of the Road Code, to study before the lecture. At the end of the lecture candidates sit the Arms Code theory test. They must score at least 28 out of 30 to pass. Food for thought here: the theory test is so easy that I passed it first time, even though I'd never opened – let alone studied – a copy of the Arms Code in my life.

...An internal review is under way at a Bay of Plenty police station after a Glock pistol, two magazines and 32 rounds of ammunition were discovered to be missing... The latest mishap follows revelations that weapons had disappeared from another North Island police station... [An]

MP... on the select committee looking at the registration of firearms and owners... fears criminals are using the police weapons in armed raids... “I think the theft of the firearms was very embarrassing for the police... But what I found more amazing was that police used to treat the theft of firearms the same as a normal burglary.” He [also] said criminals had targeted legitimate gun owners after they got hold of a list of expired gun licenses that police had given out to a collection agency... [In related news, t]he traditional police wooden baton will soon be replaced by a high-tech handy extendable version... The move follows a trial in Auckland and Wellington, where motorcycle officers found the... ASP21, which extends from 19cm to 53cm at the flick of a wrist... to be handy, practical and unobtrusive. They will be phased in over the next 15 months, leaving only special police task groups possessing the... side-handled PR24 riot variety... Police will receive their new batons after two days of training, and will carry them in scabbards on their belts. A survey of police earlier found many did not carry their wooden batons because they were uncomfortable to wear. Police have carried long riot batons since the 1913 general strike. The strike escalated rapidly and police numbers were reinforced by regular and mounted volunteers. [But the p]olice did not have enough batons to issue to these temporary police, so they were instead given hickory buggy wheel spokes. After the strike, police introduced 71cm-long, machined hardwood batons, which were kept... until 1960. The PR24 was introduced after a riot in the Northland town of Moerewa in 1979... [A veteran protester] said yesterday that he was “not lamenting” the loss of the PR24... “I bear the scars of a PR24, courtesy of a sergeant in the Blue Squad,”...

CRIMINALS could become marked men thanks to a defensive dye that stains skin... dark green... for up to seven days... The... foaming green vegetable spray... Dyewitness... has received guarded backing from [the] police minister... The dye is being carried by taxi drivers, security staff and service stations in Auckland and Wellington... Dyewitness is sold on the internet for about \$50... [but an] Auckland businessman... is negotiating to sell Dyewitness here. “You don’t have to register the spray and with the rate of home invasions it gives people some security,”... [He] hoped the spray would be available[locally] within a fortnight... [A] police legal adviser... said Dyewitness was legal but warned prosecution could follow if it was used offensively, rather than in self-defence.

...Rape Crisis wants the Government to throw out a bill that would allow people to carry passive resistance sprays, saying the sprays could be used to attack women.

The Government Accountability League plans to defy the law and offer disabling pepper spray for sale to women... by mail order for \$19.95. “Women have a right to protect themselves and if the law can’t do it we will help them,”... [the league’s] founder... said... He did not... care what anyone thought of the idea. “They can’t stop us,” he said... The spray temporarily blinds its victim and can cause coughing, nausea and ringing ears... A spokeswoman for Police National Headquarters in Wellington... said disabling sprays were restricted weapons. “We [police] are entitled to use it but no one else is.”

...The Police Association wants all frontline police to be issued with pepper spray immediately... [T]he police executive committee last year... estimated set-up costs for national use to be \$2.2 million, mainly for training... The spray is similar to mace – widely used in the U[S]... It comes in a small disposable aerosol can which can be clipped to an officer’s belt... The association’s Auckland regional director... said last night that too many officers had been injured recently in the line of duty for action not to be taken. There was a small risk that criminals would grab the cans and use them against officers, he said. But he added: “They can grab our batons, too, and I would rather be capsicum-sprayed than batoned.” Unlike batons and firearms, the spray did not have any long-lasting effects.

...All frontline police officers will now be armed with pepper spray, despite fears about its side effects and possible misuse... Police will pay about \$200,000 for 5000 cans... The decision follows a two-month trial in Christchurch involving 54 officers. They used the spray only four times – twice against people and twice against dogs. The spray[– which was originally developed ‘in the US to help posties ward off dog attacks’ –] has been shown to have a serious effect on people with severe asthma... [P]olice would now carry “bronchiodilator” inhalers to give to asthmatics who showed severe reactions. People sprayed would be handcuffed, then left sitting... The effects... can last for up to 45 minutes.

...Admission of a crime from a suspect incapacitated by pepper spray may not be allowed in court, police have been told. People arrested after having been incapacitated by pepper spray must be read their rights twice, once immediately after arrest and again when they have recovered. The guidelines are published in the latest issue of the police magazine... Police will be issued with the spray next month.

...Police in Tokoroa cannot wait for pepper sprays after five officers were set on at the weekend outside a fast-food shop. The police would prefer stun guns, but believe pepper spray would have stopped the attackers. Batons were used to subdue the offenders. Eight men face charges ranging from breaching the peace to assault... [Incidentally, ‘the Government is hastening to patch up a controversial home-invasion law after crucial constitutional anomalies emerged yesterday. They came to light in the case of the person who was sentenced to a minimum 13 years in jail for killing Beverly Bouma during a vicious home invasion. In the High Court at Auckland, a judge found he had to sentence the 25-year-old under the law change, even though the murder occurred seven months before the law was passed. The judge expressed concern that the retrospective operation of parts of the new law appeared inconsistent with the Bill of Rights Act. The Justice Minister said that while he had no sympathy for the 25-year-old, the law was “hugely anomalous,” rushed and contained inconsistencies. The Government would move quickly to repair it. It would be a tragedy if problems in the act meant that the 25-year-old’s sentence was reduced on appeal, he said. Ironically, it was the Bouma case and a host of high-profile home invasions that led the Government to introduce the tougher legislation.’

...‘a hired hitman has been jailed for 13 years for his role in a vicious home invasion that put three people in hospital and allegedly earned him \$500. The 32-year-old, of Otara, had admitted taking part in a raid on the home of a Manurewa man last Labour Weekend to carry out a “kneecapping” contract paid for by the man’s ex-wife. The victim, aged 54, his new partner, 56, and her son, 34, were subjected to a night of terrifying violence as intruders inflicted injuries so severe that veteran plastic surgeons were left reeling. Sentencing the 32-year-old in the High Court at Auckland yesterday, the judge told him the crime was of a type seldom seen in NZ courts. The 32-year-old, a Ngatonga gang member, had been raised as a ward of the state and involved with gangs since age 14. A habitual burglar with 103 convictions for offences including wounding with intent, he was on High Court bail at the time of the home invasion.’]

...The Judiciary has rejected police criticisms that a High Court judge acted inappropriately when he granted bail to an Auckland man accused of kidnapping and raping a woman... in a Ponsonby churchyard... on New Year’s Day... The police officer in charge of the case... said bail should not have been granted, no matter how stringent the conditions. [But the Judiciary] said police did not indicate to[the High Court] Justice... that there were any risks associated with... [the 37-year-old] fitter and welder[’s]... release... Because of the “court processes” [hi]s trial would not be held until February next year. “The accused, too, has rights. He has pleaded not guilty to the charge and must be regarded at least at this stage as innocent.”

...A 24-year-old man charged with the multiple rape of a 15-year-old Auckland schoolgirl is free on bail... despite opposition from the police... Despite the stringent bail conditions imposed by... the Papakura District Court... Judge, police are furious at the decision, but would not be quoted. The Chief District Court Judge... said police could appeal against the granting of bail if they were unhappy with the decision. “It should also be remembered that none of the charges have been proven... It is not helpful to debate the issue of bail on the basis of a case which has yet to be heard by a court.” The schoolgirl... and a 16-year-old friend were waiting on an Otara street to be picked up by relatives when a man approached them and asked them if they wanted a lift. The friend, who was in the back seat, escaped after the man drove to a rural area in Papakura... [In related news, t]he Department for Courts is investigating how a convicted murderer was left sitting for an hour with the public outside a courtroom... [The

21-year-old] is serving a life sentence for the murder of pregnant West Auckland teenager Nicola Rankin in July last year. He was transferred from Mt Eden Prison yesterday for a scheduled sentencing on other matters at 9.15 am before Judge [L]. However, Judge L... was on annual leave, so the matter was moved to courtroom six, which has no cells for inmates in custody... Normally, defendants in custody are escorted to and from the courtroom through a side door attached to the cells and have no contact with the public... The department apologised for “any distress [the 21-year-old]’s presence may have caused[’], although h]e was handcuffed to guards at all times and posed no direct threat... [The 21-year-old] was to be sentenced yesterday for kidnapping and raping [an]Auckland prostitute... in April last year. He was on bail for that crime when he murdered... Nicola Rankin and buried her in a shallow grave in Riverhead Forest.

...**OUT ON BAIL AND FREE TO KILL** Despite bitter protest from the prosecution, police and his first rape victim, [a 21-year-old] was set free... to fulfill his fantasy to kidnap and murder Nicola Rankin – at the same time taking the life of her unborn child – two weeks before his court hearing. Tonight 20/20 investigates how our Justice System could have made such a fatal error in judgement.

...[The] Labour... party’s spokesman on justice... explains why he is putting a member’s bill to Parliament to reform the bail law... In 1996... [someone] tracked down the family of a boy he was charged with sexually molesting and murdered the father. In the same year [a then 20-year-old] murdered teenager Nicola Rankin. Both murderers had been released on bail and were awaiting trial for serious charges. The concept of bail is based on the accepted premise that a person is innocent until proved guilty and it is central to our justice system. However, the bail system is also supposed to protect the public. For... [Nicola] and for earlier victims like schoolgirl Kylie Smith who was murdered by a man on remand, the bail system failed with tragic consequences. [When the child molester] committed murder he had been granted bail twice by the High Court, on both occasions overturning the District Court’s decision to remand him in custody. This was despite police evidence that [the molester] was planning to track down the family. [A similar thing occurred with the person who] murdered Miss Rankin... Once again the original District Court decision to decline bail was overturned by the High Court. While on bail he breached his bail conditions, was arrested for the breach, and was then bailed again by the High Court... These cases are not isolated incidents of violence while on remand. [14%] of bailed offenders reoffend while on bail and 7[%] commit violent offences on bail... Bail laws were tightened in 1991 for people facing charges of serious crimes who also have similar prior convictions... The onus is reversed and the accused must demonstrate that bail should be granted. If an accused with a prior conviction has pleaded guilty to such a charge bail will not be granted under any circumstances. Neither [the molester nor Nicola’s murderer] had previous convictions for serious crime. Indeed, the vast majority of alleged offenders charged with serious crimes do not come under the special provisions enacted in 1991. Most people charged with serious crimes have their initial hearing in the District Court. If bail is denied, the defence may lodge an application in the High Court. The police have no warning of this and may have as little as a few hours to prepare a case to oppose the application. My bill would amend bail laws by ensuring that police have fair warning... [Then there’s the issue of whether it’s fair to have a justice system which can favour the rich – currently highlighted by the case of the] man accused of kidnapping and raping a woman in an Auckland churchyard[who] is still in custody in Mt Eden Prison, despite being granted bail by a High Court judge seven weeks ago... [A] \$25,000 cash bond has not been paid... [The accused had already] spent eight months in custody waiting for a hearing.

...Six repeat offenders have notched up almost 100 crimes between them while on bail, a record the Opposition blames on a soft touch from judges. Yesterday the Labour justice spokesman... made public the case histories of [the] six repeat offenders, including one who breached his bail conditions three times in a month but each time was given bail again. And a woman with a long list of convictions was freed on bail, only to commit a string of frauds the next day. The information was leaked to [the Labour MP] by disgruntled senior police officers – he will not say who they are...

Criticism of judges... and bail laws is ill-informed, says the acting Chief Justice... [He] said... figures from a partly completed study released in Parliament this week show[ing] that 1300 people committed violent crimes while on bail in 1994... omitted crucial material such as the offences with which the persons concerned were charged... Without such critical information and no proper analysis, no useful conclusions could be drawn from the figures, he said... [The] president of the Criminal Bar Association, agreed, saying the public was “pretty well served.”

...A Ministry of Justice study of about 50,000 successful bail applications in 1994 shows that nearly a fifth... reoffended. Nearly 3[%], or 1266, of the reoffenders used violence. A study in 1986 showed that 1[%] of people given bail committed violent crimes. The Labour justice spokesman... [has] said the figures indicated an urgent need for changes in bail laws... But the Minister of Justice... said... High Court rules changing the procedures for bail applications, introduced last month, would stop the wrong people being freed... The Assistant Commissioner... of police national headquarters, agreed, saying the new rules gave officers time to prepare a proper opposition to applications. There had been occasions where police had not had sufficient time... he said. But the Police Association president... [said officers] or crown solicitors were often ambushed by defence applications for bail...

POLICE took into account not wanting to waste court time when releasing... [two men] on bail four days before... [they murdered a] Christchurch bottle store worker... [However,] an investigation had found police acted reasonably. No action would be taken against them... But inquiries... show the day they would have appeared was one of the quietest court sittings in Christchurch this year... [Furthermore, legal experts said the man who shot the store worker] should have been held in police custody pending a court hearing... because he was already on bail for stealing a video game in Nelson earlier in the month – seven days after being released from jail. He also had an extensive criminal record, including convictions for failing to answer bail. [In international news, ‘a Canadian mugging victim got less than he bargained for in court when the judge called him “stupid” for failing to be careful in a rough neighbourhood, and then let his attacker go. “If you walk around jingling money in your hand it’s like walking in the wolf enclosure at the city zoo with a pound of ground beef in your hand,” the judge was quoted as saying by the *Winnipeg Free Press*. The theft of \$C12 took place earlier this year after the man, aged 46, left a store late at night and was approached by two men, one of whom grabbed the money he was holding in his hand. The judge said he was not satisfied there was evidence of a robbery. The prosecutor’s office is considering an appeal.’

...‘Prosecution and defence lawyers are preparing for two murder trials set to make NZ legal history – they involve multiple accused, of whom none speaks English as a first language. In one case, six members of a Vietnamese family are charged with murdering a Vietnamese refugee, Thong Van Duong, in Otahuhu in February last year. In the other, five young Asian men, all refugees, are accused of murdering Auckland businessman Graham Kirkwood. Both cases will make extensive use of interpreters and translators. In an added twist to the Duong trial, set to start later this month, a deaf and dumb Vietnamese man will give evidence for the prosecution in sign language, requiring a sign interpreter. The trial will run for five weeks and the prosecution will call 65 witnesses, 18 of them Vietnamese. The five accused in the Kirkwood case speak Cantonese, Mandarin and Vietnamese, and all have different lawyers. Police have disclosed 11,000 pages of documents to the defence, and more are to come. A lawyer who is involved in both cases said police had so far disclosed only a fraction of the documents they were required to make available. His job has been made more difficult because these were not in order. The lawyer said no defence counsel enjoyed cases that relied heavily on translators. There was always the fear that questions might not be translated literally or that some comments made by a witness or defendant might be missed. The officer in charge of the police inquiry into the Kirkwood killing said police would call about 130 witnesses at the trial, about one-fifth of whom needed translators. He said the Kirkwood case had been the most expensive he had worked on – petty expenses alone were more than \$100,000. Three detectives had gone to AUS to arrest one of the defendants and two officers travelled to the US to find a witness. There had also been several trips around NZ. The Detective Sergeant said three weeks had been set aside for a depositions hearing and the trial could take up to six weeks.’]

...An upsurge in the number and seriousness of criminal cases has led to increased pressure on N[Z]’s courts and Judiciary. Jury trial waiting-lists clog the... courts as they struggle to process longer and more complex cases... [T]he Report of the N[Z] Judiciary 1996... says pressures on the

system and its professionals are enormous compared to 20 years ago. N[Z]'s international record for fast-tracking court cases has slipped because of an increase in offending, reporting child abuse, and legislation such as the Bill of Rights and new Domestic Violence Act. We live in a culture that emphasises rights... says... [the] Chief Justice... The result is... a generally high level of demand on public money to fund the process of justice. Courts have a bigger hand in the administration of the mental health system, and statistics indicate that the work of the Youth Court has increased 50[%] in the past five years. But the hardest-hit by the mounting pressure is the District Court. The balance of work has been affected by the High Court policy of keeping mostly civil and criminal cases which are high-profile, complex or serious, and passing the rest to its counterpart... Last year, [despite 'a rare legal move in which the Human Rights Commission took High Court action over lengthy delays in delivering decisions on sexual harassment and sexual discrimination cases' ('after the Commission started court action to get speed on their resolution, the backlog of sexual harassment and discrimination cases has been cleared'),] the upper jurisdiction of the District Court and the power of judges was lifted, further increasing the load. In response, the maximum number of District Court judges was increased to 120... Last December there were 1000 jury trials waiting to be heard in the District Court. It was estimated that at the present rate it would take five months to clear outstanding cases. But evidence suggests that the backlog will be difficult to shake. The average length of a District Court criminal trial has increased by 31[%] since 1986. The landmark Domestic Violence Act 1996 implemented on July 1 last year – which defines domestic violence as physical, sexual or psychological – is expected to be time-consuming for the courts. Between July and December there were 3329 applications for protection orders, which replace the former non-molestation and non-violence orders. The... number of applications over a full 12 months is expected to exceed 7000 – 30[%] ahead of original estimates... According to 1996 figures, 19[%] of criminal jury trials took longer than a year to be processed in the High Court. At District Court level 27[%] were still being processed a year after the charge was laid... Of the 22 cases in 1995 and 10 cases last year dismissed under the Bill of Rights provision against undue delay for those facing criminal charges... 11 had been solely due to "systematic delays." ...However, the Department for Courts... announced... that a \$73 million package including new computer equipment... would help speed the flow of cases and reduce the backlog... About 170 of the department's 1150 jobs are expected to disappear... [but new] courts will be built in Manukau and on the North Shore within two years to serve growing populations. The Government has announced that more than \$20 million will be spent on the Manukau Court... The department... and the Judiciary were [also] examining other ways of tackling the problem without appointing more judges.

...[Nothing, it seems, moves very fast in legal circles, witness recurring reports of criminal cases at risk of dismissal on the grounds of undue delay in coming to trial. It is also six years since the Law Commission recommended restricting the role and use of preliminary hearings or depositions hearings. The purpose of depositions is to determine whether the prosecution has established a case to answer, in which event the matter goes to trial. The benefits are held to include the filtering out of weak cases, giving the defence fair disclosure of the prosecution case and an early opportunity to concede guilt. It is to be hoped a new Department for Courts draft paper on the subject makes better progress; its research suggests change is essential, for the system consumes huge amounts of time and money for little benefit. Last year there were 2941 preliminary hearings, involving judges in some 1400 hours of court proceedings and 4000 hours involving justices of the peace. The rate of discharge is astonishingly low (between 1 and 3% of heard cases). Can the standard of prosecutions cases be so high as to achieve what, statistically, amounts to near perfection? Or could it be that the legally untrained minds of JPs are not well equipped to identify flaws and shortcomings, so virtually all cases get passed straight on for trial anyway? Either way, the percentage of discharges suggests that the present procedure is virtually pointless, as long as a defendant continues to have access before a trial to details of the case and the evidence to be faced. The department argues for abolition']...

Abandoning depositions hearings, dumping justices of the peace and opening night sittings are part of sweeping changes planned for the country's courts. But the moves have angered the Criminal Bar Association which has labelled them unrealistic and impractical. Unveiling the proposals, the Minister of Justice... last night said JPs would be replaced by community magistrates in a bid to speed up hearings and clear the backlog of cases clogging the district courts. The magistrates' powers will be extended to cover undefended cases, including sentencing via a fine or community-based service. The magistrates will also be responsible for fines enforcement. [● Fines can be used as an alternative to sending people to jail (although, while the number of 'convicted defendants sent to prison in the US rose from 46% in 1980 to 68% in 1995', the number who received a 'fine or other – excluding probation – decreased from 15% to 7%'). Unfortunately, fines aren't just another way that the justice system *can favour the rich* – there is the problem of making people pay up!]

...DATA matching through the Social Welfare Department is likely to begin before the end of the year to help trace fines defaulters. The Courts Department is working out protocols and procedures to govern data matching, which will be used as a last resort. In another development, the Courts Department collections business unit had begun reviewing its files and re-issuing unpaid fines dating back 10 years or more. [The] unit communications adviser... conceded many people getting a notice to pay a 10-year-old parking ticket may not even remember what it was for. The Courts Department made collecting old fines a priority when it was established in 1995... Most outstanding fines were less than two years old, but about \$40 million worth were more than five years old... In 1990, the court collected 90% of fines imposed in that year, but 26,000 fines worth \$6 million – involving 10,000 to 12,000 people – remain unpaid. As at June 30, \$158m was owed.

...The long arm of the law plans to reach out through television to round up fines defaulters but some experts are sceptical of the plan. The Department of Courts has confirmed it will from this month run publicly funded television advertisements encouraging payment of fines. Research shows many people do not understand the consequences of not paying fines, the department said yesterday... The campaign's cost would be "well below" a million dollars and modest compared to some other Government department promotions. A lecturer in criminology at Victoria University in Wellington... said last night that he thought the campaign was a waste of money. "I think they are trying to bluff their way to getting a few people to come forward and pay because they are unable to contact them." An advertising expert from Auckland University... said the campaign would probably fail to motivate people who had not responded to letters to pay their fines. It might, however, motivate those fined in future to pay up promptly... Up to 200,000 people [a]re estimated to owe... fines.

...People fined in court had 28 days to pay in full or to make other arrangements... "The Judiciary are becoming very supportive of the new ways we are using to collect fines. People are less likely now to be walking out of that courtroom and over the horizon,"... said a collections unit spokeswoman... "We try to sit down with a person before they leave the court and work out what their situation is. Ideally we get up-front payment of the full amount... But we call the shots. Paying \$10 a week forever is no longer acceptable. We are learning to drive a pretty hard bargain. After all, sentencing was designed to bring discomfort. It's supposed to be a punishment."

...Fine dodgers face airport customs net... Court bailiffs may soon widen their net to airports in relentless pursuit of unpaid fines. The Department of Courts confirmed yesterday that it wanted to set its sights on fines owed by travellers leaving or entering the country... A memorandum penned by... [t]he department's Tauranga collections manager... said... that... [t]his would cause distress and disruption for some people... so he proposed as a "useful customer service" that travel agents suggest to clients that any fines be cleared beforehand. However... travel agents made it clear they want no part of rounding up clients... [T]he department's... collection unit's communications adviser... would not say whether bailiffs would try to stop people leaving until they paid fines, but noted that defaulters with warrants out against them already risked being arrested at any time.

...Fine dodgers caught by court bailiffs have coughed up \$15 million in the past two months... [A] Department for Courts collections spokeswoman, said July and August was the first time staff had exceeded fine collection targets... The cost of collecting fines had also dropped from 41c to 35c for every dollar collected, she said.

...Fined \$40 for parking in a disabled persons' car park, [an] 85-year-old Wellington woman sent the city council a cheque for \$40.25. It is her custom "out of courtesy" to add 25c to cheques for bank fees. Soon after, the cheque was sent back, with a letter saying payment could not be accepted because the cheque was for the wrong amount. [The spinster] was also told to pay up smartly... A council spokesperson[has since] apologised. "Unfortunately our computer system only accepts cheques for the exact amount. We can assure... people that we have now changed this." ...[the spinster] said that when she used the car park she could "hardly walk" after breaking her hip 12 months ago. She now has a disability sticker... [Incidentally, drives] to collect unpaid fines in N[Z], which recently generated heated controversy, seem mild compared with the experience of [a]London mother... Her \$30,000 car has been seized and auctioned to cover a \$70 parking fine.

...Fine dodgers face bank raids... [NZ courts could] get... new powers to deduct money from people's bank accounts in a fresh get-tough effort to clear the vast backlog of unpaid fines. And persistent fine dodgers owing more than \$10,000 w[ould] risk court orders being attached to house or land titles in their names.

...A TEENAGER has been forbidden from owning any property until he pays his court fines... If... [the 16-year-old], of Timaru, acquires any property in the next few years, such as a vehicle or stereo, it can be seized under a police warrant. The rule applies regardless of whether or not he owns the chattels – just possessing them is enough to have the items confiscated... The scheme has been introduced by the Department for Courts, the police and the local... District Court... judge, tired of young offenders accumulating huge fines that eventually have to be written off... [O]ne 17-year-old had amassed fines worth \$11,000 that he had no hope of paying... [In another development, b]eneficiaries with overdue court fines can now be traced through D[SW] records. The Department for Courts... agreement affects all people receiving money from Income Support.

...Courts are in line for new legislative powers to dock welfare benefits for unpaid fines as arrears threaten to soar to \$210 million this year. The Government has decided to allow fines to be deducted from this source without the consent of beneficiaries, the Minister of Justice... said last night. Opposition support seems assured with Labour's justice spokesman... saying he has been pushing... for such legislation for some time to put law-breaking beneficiaries on the same footing as wage earners[, whose fines]... can now be deducted automatically from pay packets by court order... He said beneficiaries... were [currently] able to "just thumb their nose at the law" and avoid making reparations even on modest time-payments... But an Auckland People's Centre spokesperson... feared children would go hungry under such legislation as benefits were too low for any level of fines to be deducted. He believed that beneficiaries should receive community service or periodic detention sentences, rather than fines of any description... The Department for Courts... told the parliamentary justice law reform select committee last week that it had difficulties coping with increasing numbers of fines imposed by judges, from 328,287 in the 1993-94 financial year to 503,966 last year. - 1997

Court fine collectors are embarrassed at having sent "red card" warnings to innocent people. Alarm bells began ringing along with the phones yesterday as falsely accused people contacted the Department for Courts after being told they had 48 hours to pay outstanding fines. A dud batch of up to 4000 cards had been dispatched. A department spokeswoman... said the "red card" system had worked well until now, but a different form of data matching had been used in the latest lot. As a result, people with the same names as long-time debtors had received their fine demands... Despite the... glitch... the department would still use the system, but employ a more reliable means of tracing people... Other methods being used to chase defaulters include an advertising campaign, publishing their names, and the setting up of a "call centre" where debtors can ring in to make payment arrangements.

...fines are [going] unpaid as criminals ignore court sentences and infringement notices. Nearly \$311 million in fines... was outstanding for the year to June, the Department for Courts annual report shows. This was nearly \$65 million up on the same period for [last year], and means only one third of fines imposed were paid last year. The figures show that... [t]he average fine was \$306... the average time payment was overdue[by] 3 1/2 years... and... [the total includes] \$36 million owed to victims of crime... Victim Support... said the report showed that victims were receiving a double blow from offenders – firstly when the crime was committed and again when criminals failed to pay reparations. The organisation had appealed to the... Government for victims to be paid reparations by the court, which would then have to get its money back from offenders.

Victim Support is to receive a 50[%] boost in resources... [P]resent Government funding of about \$1.15 million would increase by close to \$600,000 a year... The service supported 170,000 N[Z]ers last year, compared with 85,000 three years ago. The number of Victim Support groups climbed from 52 to 77... The chief executive... estimated it cost about \$3 million a year to run Victim Support. Seventy staff managed 2000 volunteers. The new policy also means victims will be informed as of right when an offender's parole hearing is coming up and will be able to make submissions... [In international news, a] six-day courtroom interrogation of a rape victim by her attacker provoked calls yesterday for changes to the law that allowed the man to conduct his own defence. "I have been raped twice; once in his filthy den and once in front of judge and jury in a British court of law," said [the victim], aged 34, after the trial... "The law must be changed. I do not want other women to go through what I have been through." ...[the attacker], 42, was found guilty of raping [the victim] on two occasions while he held her imprisoned at his home in London for 18 hours. [The victim], who took the unusual step of waiving her anonymity so she could tell her story to the media, said she believed [her attacker] had got further gratification from being allowed to humiliate her in court. "He lapped up the exhibitionism and gained perverted pleasure by asking me about my private parts and his. It was sickening," she said. She had to be prescribed tranquillisers and at one stage ran from the court complaining she was feeling physically sick... [The attacker], who made a living selling condoms to prostitutes [– and]... had a history of offences against women, which under British law could not be revealed to the court during the trial[–] ...dismissed his lawyer on the first day... A spokesman for the Home Office said everyone had the right to defend him or herself.

...Making victims of crime more confident in the court room is the key element of the Court Services for victims programme, which will be operating throughout [NZ] by the end of the month. The new court-based programme aims to give clients information and develop a stronger "victim's voice." "Going to court for the first time, even as an observer, can be very scary," says... [the] manager of the programme at the Otahuhu District Court, one of four pilots for the scheme. "So the first thing we can do is take a victim on a familiarisation tour around the courthouse beforehand, showing them where everybody will sit, and explaining the process." In understanding how that process works, victims are also more realistically prepared for the possible outcome. Overseas research shows that some victims, when a case is dismissed through lack of evidence or a light sentence is handed down, may take matters into their own hands and exact their revenge... The new programme is different from but complementary to the existing Victim Support organisations; they are primarily a crisis intervention service, offering immediate emotional and physical support to victims of crime and accident... [In related news, the Labour Party] will today announce a victims' justice policy that would make reparations orders practically automatic for most offences... Just one in a 100 victims of crime now receive reparation payments from the offender under the current system. Only a fifth of the payments ordered by the courts are actually made. - 1996

A man repeatedly molested as a child in the 1950s and 1960s has won \$70,000 from his abuser's estate in an unusual deal spurred by civil court action. In the out-of-court settlement, the victim will not receive the money until [the now]78-year-old... [abuser] dies. The victim's name has been secured against [the abuser's] home and the \$70,000 will be paid on his death. [Meanwhile, 'the first house in NZ to be forcibly sold to pay court-ordered reparations raised just \$13,500 at a Taumarunui auction. The owner of the house, who has served one year of a 9-year prison sentence, was ordered to pay \$25,000 reparation to his victim. The court would try to recover the remaining debt, which would remain outstanding unless the offender was found

to own other assets. All details of the case are suppressed. Under the Summary Proceedings Amendment Act, recently passed by Parliament, courts can seize homes from people owing \$10,000 or more in fines.’]

...A first-time burglar received a... nine-month... suspended prison sentence, six months’ periodic detention and was ordered to pay \$6000... [at] \$75 a week... in reparation... to the occupants of the [Auckland] house he broke into... after failing to return items he stole... The judge considered seizing [the burglar’s] car until he was told that it was worth only \$1000 and was shared with the accused’s sister, who had two young children.

...[a] British motorist... decided to mete out his own brand of justice when he caught two vandals aged 10 and 11 jumping on the roof of his car. They had already smashed every light and mirror on the car so he gave each one of them a slap across the face. But it was the two boys who ended up with compensation when [the motorist, aged] 28, was hauled before a court and ordered to pay them £25... each. He was also told to pay £54 prosecution costs and given a 12-month conditional discharge. On top of that he has a £400 damage bill... [Incidentally, a] 15-year-old disabled A[US]n girl, who sued her father over injuries she suffered in a car accident when she was a baby, was on Friday awarded \$A2.2 million...

Tasmanian officials are starting to assess 310 compensation claims arising from the Port Arthur massacre. But they are almost entirely limited to the \$A1.18 million... from the assets of... [the gunman. In local news,] the Court of Appeal... said... yesterday... [that i]t would be almost impossible to put a price on the loss a man might have suffered in his life after bad parents adopted him... “How on earth can you access damages... Who can say how he might have turned out even with ideal parents?” The judge’s comments came on the second day of argument on an application by the Solicitor-General... to stop... [the adoptee] and his natural mother... suing the D[SW] for \$1.2 million. [The adoptee], now in jail for murder, has claimed departmental workers failed in their duty to him when they recommended an alcoholic criminal and his wife of poor reputation as suitable adoptive parents when he was a baby. He has claimed they failed him again at age 14 when Social Welfare did not investigate a claim that he was not being looked after properly. [The natural mother] has sought \$300,000 general and exemplary damages, claiming social workers who had a duty to advise her honestly, assured her that her son was going to a good home when they had not made a proper investigation. [The Solicitor-General] has argued that the case should not go ahead on public policy grounds: allowing social workers to be sued would mean they would spend more time ensuring they avoided legal action than they would doing their jobs... “It... may have been a slip-up or it may be that[back then] the DSW was in chaos because of inadequate management,”... He said the Adoption Act was designed to make adoptions final. “For better or worse people should be getting on with their new relationships and experiencing whatever life brings.” ...There was preliminary argument about the admission of a sworn statement from the chief Children, Young Persons and their Families Service social worker... about the effect on the department of allowing the case to go ahead. Part of his statement referred to in court said precautions to avoid the threat to social workers facing breach of duty claims would cost \$79.1 million. [The Solicitor-General] said the statement should be admitted because it would help the court to decide the public policy implications of their decision. But... [the] lawyer for the plaintiffs... said the statement should be produced only during a full hearing of the case...

Former at-risk children are preparing to take Social Welfare to court after a Court of Appeal ruling that a convicted murderer can sue the department for negligence. Child lawyers yesterday hailed the ruling... [By the way, a] former... Auckland police commander... turned private investigator says people are being falsely charged with crimes because overworked police have not got time for full investigations... Frequently he uncovered evidence that proved the accused could not have committed the crime – evidence that was available to the police. “I don’t blame the officers themselves,” he said. But [his] claims were challenged by Auckland’s... Assistant Commissioner[, who]... had never heard of people being wrongly charged because of limited police resources and wanted to know what cases [the P.I.] was referring to... “I am aware that sometimes we hear allegations that police haven’t been able to get to a case and so no one is prosecuted for an offence, but not of people being wrongly charged.”

...People wrongly convicted of crimes are not entitled to compensation in N[Z, and]... according to the Ministry of Justice, there is no precedent for granting compensation in this country... [However, in] 1980 the Government granted... \$950,000 compensation... [to a man] convicted of the murders of Jeanette and Harvey Crewe and later pardoned.

...In June, 1970, Jeanette and Harvey Crewe were killed at their Pukekawa, south Auckland farm. [Someone who] lived nine miles... away... was convicted of their double murder. [The suspect] was pardoned in 1979 after[one] journalist... waged a seven-year campaign that proved [the suspect’s] innocence and revealed how police had planted a cartridge case to strengthen their case against him. In an exclusive... [the journalist] explains how he believes the Crewes died... THOSE who ask the question are getting older year by year, but they still keep on asking: ‘Well, if he didn’t then who did kill the Crewes?’ They ask the question as if it’s unanswerable. It isn’t. The answer, I believe, is at the very beginning of the mystery. Then, police searching the Crewe farm and beyond told the media unofficially that they believed they were looking for two bodies – one in the river, the other up a tree. The bloodstained house was, they believed then, the scene of a murder and suicide. Shortly after, having settled instead on it being a double murder, they focused exclusively on... Jeanette’s father[, who was also]... the Crewes’ next-door neighbour. Then, in the infamous double switch, they changed both the method and the suspect... In the process, the murder-suicide theory was well-buried. Whatever happened in the Crewe house on the evening of June 17... coincided with the eve of their fourth wedding anniversary. In a bleak house with no pictures on the walls, few ornaments, nothing on the walls of their baby daughter’s cluttered and curtainless room, there was also no sign of planned celebration. They had both been to town that day, but neither had bought a gift or a card. Not surprising, in Harvey’s case. He had only \$34 in his personal bank account. Jeanette had \$4640 in hers, another \$1667 in a joint account with her husband. The farm had been left to her... when her uncle... died in a tractor accident in 1950... They had driven... to a stock sale at Bombay, then to Tuakau and returned home late in the dusk that wet and miserable day. While Harvey moved stock, Jeanette cooked them a meal of flounder and peas and a fire was lit in the lounge hearth. Over the meal, they opened the mail... The envelopes and contents are clearly visible in police exhibit pictures of the table... One item was a panelbeater’s bill. I believe a major domestic row erupted at the table. Harvey Crewe was said to have a fierce temper. People very close to him have told me that, at his worst, he had all the symptoms of a manic depressive, a condition not unknown in his family. When her body came up in the flooded Waikato two months [after her disappearance], Jeanette’s nose was broken, her eye bruised and some of her teeth were missing. A dentist suggested that could have been the result of a blow. Quick to exploit any evidence, [the] Crown prosecutor... suggested... that [the suspect] had hit her with the butt of [a] rifle after killing Harvey, then raped her before shooting her as well. There was no evidence to back the theory. Quite the reverse. Her body was fully clad, including pantyhose, when recovered. I believe that Harvey hit her, very hard, then settled into his favourite chair in front of the fire. Bloodstains show that’s where he died. Jeanette left the room after that blow and got a .22 rifle from the spare room, perhaps the rifle listed in the estate she inherited. A rifle never found by police. A single shot killed him... It seemed plain that the stained chair had been swung around to move his dead weight clear... The police theory had always been that both the Crewes’ bodies were dumped in the Waikato River [that] night. It is more likely that Harvey was not disposed of until sometime later, between that Wednesday and the following weekend. That would explain a series of proven events around that house between Thursday and Saturday... On the Friday night... a schoolboy neighbour of the Crewes, was with his father driving past the farm. He pointed out a big shower of sparks from the lounge chimney. The sparks were so thick he wondered at first if the Crewes were having a winter barbecue... [But the] police... were not prepared to link the Friday night fire in the chimney with the remains of a mat and a cushion found in the fireplace... for their own good reasons. Both [the suspect and his wife] could prove they were at his sister’s 21st birthday party miles away in Pukekohe that[Friday] night – and not in the Crewe house. The police took decisive... action: They rejected the boy’s evidence and did not disclose it to the defence as they were required to. Earlier that Friday, [a] farm labourer... oblivious to the undetected tragedy, was working in a paddock opposite the Crewe farm. He saw... a woman in the garden around the house. He assumed it was Jeanette Crewe, whom he had never seen. At the first trial, the Crown sought to suggest that the woman was... [the suspect’s wife – w]ithout

success, since [the labourer knew the suspect's wife] and had specifically denied it was her. Unable to show, as they hoped, that [the suspect's wife] was the woman in the garden and had probably fed the baby, the police typically simplified their prosecution process – they dropped [the labourer] as a witness at the second trial. They said he had confused the day of the sighting, despite the fact that was the only day of the week he worked for the farmer involved... [Therefore] the second jury did not hear evidence that was regarded as significant at the first trial. The police also abandoned the theory that the child had been fed at all and offered evidence from two doctors with opposing views... A neighbour noticed... the... Crewes' stock... moving noisily and hungrily up and down the fenceline on Friday. He thought "Harvey didn't feed out yesterday." ...They never bellowed again. Someone had fed them... There was one more strange unexplained incident... [the] police... did not bother to tell anyone about – defence, judge or juries, and would not have told the commission either but for the need to answer an innocent question. Under pressure... a police witness at the inquiry admitted for the first time that what looked like part of a piece of waterproof material seen lying beside the wheelbarrow on the lawn in... police photographs had been destroyed by a mysterious fire where it lay. Forensic evidence showed the wheelbarrow had clearly been used to dispose of the bodies. [The commission] chairman... was affronted that the detail of the destruction of this exhibit had been withheld. "This coat could have been worn by the murderer." The police explanation was that a cigarette butt flicked out of the house by a detective must have set the material alight. The commission rejected that entirely... Someone came back in broad daylight to a farm they knew was occupied by police to destroy evidence. Someone whose presence on the farm would not have aroused suspicion... It is inconceivable, as the police maintained, that a murderer would have done all those things, returning to the farm three or four times to feed dogs and stock, for instance, in daylight and risking detection each time... Physically in pain from Harvey's blows, and overwhelmed by what had happened, Jeanette shot herself at some stage on that weekend. Her father, having disposed of her body and the rifle, staged the apparent discovery of the house on the Monday. As an indication of his state of mind at that stage... [his first phone call was] not to the police but to cancel a stock truck booked to pick up sheep from the Crewe farm. This was not the action of a man stunned by shock at the discovery of the bloodstained house, a distressed child and all the dreadful conjecture that went with that scene. [Jeanette Crewe's father] underestimated the Crown and police. When, to his surprise, [the suspect] was convicted some months later, he could not tap [the police] on the shoulder and say: "There is something I should have told you..." If my scenario is correct, I do not excuse [the father's] actions. I simply see how a sequence of events could have led him to the totally unjust decision he made.

...[lawyers] acting for... the man... acquitted... this week... of the 1992 abduction and rape of an 11-year-old-girl, are considering seeking compensation from the Minister of Justice. [The lawyers' client] spent three years in prison before being released last year after the Court of Appeal quashed his conviction... [when DNA] confirmed seminal stains on the... victim's clothing could not have come from... [the client. The police] had always maintained [the client] was the real offender and the "stray" seminal stains on the girl's underpants and pyjamas were the result of contamination unconnected with the rape. This was despite scientific evidence that the semen was fresh and the girl's testimony that her underwear... was clean on the day of the rape, only one person attacked her and she had not had sex with anyone else... The Court of Appeal refused [the client's] first bid for freedom in 1994 and the case was reopened through a petition to the Governor-General last year... A new trial was held this week and [the client] was found not guilty... Any errors by police... can be blamed on stretched resources, not incompetence... because the DNA results which should have freed [the client] after his first trial were incorrectly interpreted by the... Institute of Environmental Science and Research... claims a former detective who worked on the case... [The client's lawyers believe that a precedent for compensation was set by the payment of almost \$1m to the person wrongly convicted for murdering the Crewes. However, a] Ministry of Justice spokeswoman... said that the difference between the cases was that [the first man] was pardoned after a royal commission of inquiry into his conviction. [The second man] had been found not guilty in a second trial and, under the law, his situation was no different from that of anyone else who was charged and not found guilty of a crime. [An] Auckland barrister... yesterday called for a process for compensation to be built into the justice system. People wrongly convicted were victims of crime and should be compensated. Their only chance of redress rested on the whim of the Minister of Justice. The most sensible approach would be to appoint an eminent person with legal experience to do the job of setting compensation. The Minister of Justice... would not comment on the issue yesterday... [A] new hunt for the real offender has begun.

...The mother of a young rape victim, who was tied and blindfolded before she was abused five years ago, now fears the rapist will never be caught. The woman, who cannot be named because it would identify her daughter, said yesterday that she believed the police might not have the resources needed to solve her daughter's case... The girl's mother [also] said the police had told her they had to interview her daughter again if they were to continue with the investigation[, even though]... her daughter had already given evidence at two High Court trials... She had to balance the risk of putting her daughter through further trauma against the chances of bringing the rapist to justice... [Meanwhile, a] veil of secrecy has been drawn over compensation negotiations for [the] West Auckland man who was acquitted... for rap[ing her daughter. The man, who is]... now living in Warkworth with his de facto wife and children, said yesterday that he had heard "nothing at all" about his claim... However, the freed man's lawyer... said he had signed a "deed of confidentiality" with the Government agreeing not to discuss the matter until a decision was reached... [The lawyer] said he was not troubled by the delay and believed the Government was taking the compensation issue seriously. "They are being their usual thorough selves..." The Minister of Justice... said he was not aware of any secrecy about the matter. "There is nothing to hide. It is a complicated issue and we are taking it quietly..." The case required careful consideration because there was no precedent under N[Z] law for compensating people... [O]fficials were studying similar cases in Canada and England.

...The release of three men who served 15 years' jail for a murder they did not commit has left a bad smell about British justice and the methods of senior police. The men, known as the Bridgewater Three, were set free on Friday amid emotional and chaotic scenes at the Royal Courts of Justice in London. They would still be in jail were it not for new forensic evidence which found a confession central to the murder case had been doctored by police. [A now 35-year-old], his cousin... 42, and [an associate], 63, were convicted in 1979 for the murder the previous year of 13-year-old Carl Bridgewater. The newspaper delivery boy had been shot dead while apparently stumbling across a burglary at a farmhouse near Stourbridge in the Midlands. The elder [cousin and their associate], plus a fourth man involved in the case... had been petty criminals. They were connected to the Bridgewater killing after [the elder cousin] was arrested following a bungled robbery at a nearby farmhouse. Investigating police secured convictions for the Bridgewater killing through a confession made by [the fourth man –] despite him later retracting it[– and because]... at the... trial the prosecution had failed to disclose vital evidence... This crucial evidence concerned unidentified fingerprints found on [Carl's bike. Someone involved in the murder had hurled the] bike into the pig sty. Two prints were found on the bike's down bar, which would have been a natural place to grab it. Before the case came to court the police had high hopes that the bike prints would identify at least one culprit. But, despite comparing them with prints held by 27 different police forces, they drew a blank. And one of the blanks they drew was the Bridgewater [Three and the fourth man. The elder cousin and the associate]... were given life sentences, [while the younger cousin], a juvenile at the time, was detained at Her Majesty's Pleasure. [The fourth man], given a 12-year sentence for manslaughter, died in jail in 1981, of heart disease. The convicted men steadfastly maintained their innocence and in 1983 [the younger cousin] staged an 89-day protest on a prison rooftop. Family and friends repeatedly sought appeals only to be denied by the courts or the Home Secretary of the day. A hunch from their lawyer... proved to be a way of undoing almost two decades of injustice. After the matter had finally been referred to the Court of Appeal last year, [the lawyer] sought forensic tests which showed [the fourth man] had been provoked into making his confession by another confession supposedly made by [the elder cousin. But the elder cousin's] statement had been written on paper resting immediately on top of [the fourth man]'s, at a time when [the elder cousin] was being dealt with at a different police station... This new evidence was enough to convince appeal judges to grant the Bridgewater Three unconditional bail and

the likelihood... of the murder convictions being quashed... [The Bridgewater Three] should receive compensation of about £200,000... each. But [the elder cousin] said: "Nothing compensates for 18 years locked up." The biggest losers of all remain Carl Bridgewater's parents, whose son's killer remains at large... Some Bridgewater Three campaigners believe the real killer... was... later convicted of murdering a man at the farmhouse where Carl died. [However, that person] denies killing Carl... As the freed men readjust to life on the outside after 18 years in top security prisons, questions were being asked about widespread police corruption... One of the detectives alleged to have forged the [elder cousin's] statement... died in 1993 – four years after being fined for fabricating the confessions of four men accused of robbery... The case was the latest of several in recent years that have been mishandled or manipulated, leaving many Britons disillusioned with their justice system. It is, some have said, a miscarriage of justice that was made possible by a system that does not question police... Other acquittals following years of appeals about phoney evidence involved an Irish family in London convicted of bomb-making, and a black man convicted of murdering a white policeman in a race riot. In 1991, authorities acquitted six Irish Republican Army suspects who had spent 16 years in jail for a pub bombing in Birmingham. Two years earlier, four men were acquitted after 14 years in jail for an IRA bombing in Guildford... [In local news, the] Minister of Justice... has asked the Law Commission to consider the issue of compensation for people subsequently acquitted of crimes for which they have been imprisoned. [He] said yesterday that there had never been rules on when or whether to pay compensation. Some rules were made by the cabinet last week when the Government announced it would not pay compensation to [the] Aucklander... who was acquitted at a retrial... for the rape of an 11-year-old neighbour. The president of the Law Commission... would not comment on whether its investigation would have any bearing on [that] case... The commission had looked at the issue of crown liability for several months...

The Government has adopted a new test to work out how much compensation should be paid to people wrongly convicted of criminal offences. The cabinet approved the criteria last month when it considered [an Aucklander's] wrongful rape conviction... The criteria include whether the prosecution acted in good faith in bringing and continuing proceedings against the accused; whether the prosecution had sufficient evidence at the start of the case to support a conviction; whether it took proper steps to investigate matters suggesting the accused might not be guilty, and whether it conducted its investigation in a reasonable and proper manner.

...[lawyers acting for the Aucklander who was cleared of raping an 11-year-old due to DNA evidence] are considering a civil claim for damages after the Government turned down his bid for compensation[, despite]... police advice that... [they] made "a genuine but honest mistake" in identifying... [the client as the assailant. Incidentally, about] one in four criminal suspects given DNA tests by the FBI are found not to have committed the crimes for which they are suspected... Since it started in 1988, the FBI crime lab's DNA analysis unit has exonerated about 3000 suspects... Most were rape suspects whose genetic characteristics were found not to match those of the rapist when samples of body fluid were compared... FBI officials say the high exoneration rate is evidence of the impartiality of the FBI's crime lab and the value of DNA testing as an investigative tool... DNA tests... [have been used] in American courts since 1987... But until recently, [they] could not be said to positively "match" a suspect to an incriminating sample... But a leading criminal defence lawyer has called the exoneration rate "shockingly" high and says it[, and the fact that 'every year 8,000 to 10,000 defendants – or between 15 to 20% of citizens facing criminal charges in US District Courts between 1980 to 1995 – were not convicted'] shows how often police and prosecutors focus on the wrong suspect. "A gigantic percentage of those (exonerated) had already been charged... This is not a few cases we're talking about. As a citizen... this is something that clearly frightens you," says... [the] president of the 9500-member National Association of Criminal Defence Lawyers. Last April, a Justice Department investigation reported a pattern of sloppy work and erroneous testimony in three... of the FBI's... 24... lab... units... - 1997

A man who spent 23 years in prison for a murder he did not commit has been awarded \$C10 million... in damages, tax-free. [The man], aged 46, was not available for comment. His mother, [who]... had door-stepped [the current Canadian P]M... and his two predecessors... said he[r son] had gone camping... She refused to say how the money would be spent – apart from saying that she expected an aircraft that her son had promised her "a lifetime ago" once the compensation deal was completed... [Her son] was a 17-year-old drifter when he was convicted... for the brutal sex slaying of nurse-aide Gail Miller. He was eventually released in 1992 after the Supreme Court ordered a review. But he was not cleared until July 1997, when DNA tests proved that the semen found at the crime scene was not his. Another man... has since been charged with Miller's rape and murder... The... case is one of several proven or alleged cases of wrongful conviction that have come to light in Canada recently[, respectively resulting in awards of]... \$2.1 million... \$479,000 plus an annuity... and... \$2.8 million... [In local news,] Labour wants an inquiry into forensic DNA testing procedures, after revelations that an innocent man was implicated in two murder investigations on the strength of DNA tests. The party's justice spokesman... said yesterday that a full inquiry was necessary because "the blunder in dealing with DNA samples has huge implications in relation to the potential for miscarriages of justice." On Tuesday, a detective told the High Court in Wellington that DNA results linked a Christchurch man to two unrelated killings in Wellington last year. But... police later accepted that the man was not at either scene and was not involved in the deaths... In Parliament yesterday, [the Labour justice spokesman] asked the Minister of Police... what assurances he could give that DNA testing, analysis and use as court evidence were being carried out in a competent way. [The minister] said he had been advised not to comment because the question related to a matter before the courts. Both the Police Commissioner's Office and the Environmental Science and Research Institute, which carried out the tests, have also refused to comment.

...New DNA tests are being sought in the... case [of the Aucklander who]... was wrongly jailed... [for raping an 11-year-old. The Aucklander] says he does not know why new tests are necessary. The Justice Ministry – which would foot the bill if compensation was recommended... – has asked[a] Queen's Counsel... to seek the further testing. [The QC is investigating the Aucklander's] request for compensation... He had been due to report within weeks. But now the ministry wants more sophisticated testing of samples, and suggests technological advances may give more information in the case... [A local s]cientist... who questioned the Institute of Environmental Science and Research's (ESR) initial findings after [the Aucklander's] unsuccessful first Court of Appeal hearing, said he could not understand what basis there could be for further tests. He was outraged but not surprised by the development... [The AUSn scientist who]s... results – showing the clear profile of another man in semen stains on the 11-year-old rape complainant's underpants, pyjamas and rectal swab – ...helped to clear... [the Aucklander, said t]he tests available today are in fact less sensitive to minute traces of DNA... The... Justice Minister... said it would be wrong for him to comment...

[THE] JUSTICE Minister... has made his strongest concession yet in the [Aucklander's] compensation case, admitting: "I may be wrong"... [The minister] also released the Ministry of Justice reports in which he was advised to decline compensation... [to the Aucklander, and said] those papers reveal his officials had dismissed an earlier police report that concluded more than a year ago [that the Aucklander] was innocent... But he protested that it was his concerns about a possible miscarriage of justice that had allowed [the Aucklander] to be retried and then become eligible for consideration for compensation... • [The] Detective Inspector... who conducted an independent review of police handling of the case, concluded last June the 11-year-old complainant was genuinely but honestly mistaken in identifying [her neighbour as her rapist. • The]... Detective Senior Sergeant... who conducted the reopened inquiry into the rape allegation, found the complainant... may have created the complaint to cover for a "sexual experiment" with someone she knew. [The Detective Senior Sergeant also] said it was possible the girl was under some sort of pressure to take part. Police jobsheets note the girl's mother complained to them in 1992 – the same year as the rape allegation – about the involvement of a member of the family in pornography and shoplifting.

...An independent investigation into whether [an Aucklander] should be compensated for his time in jail is being hindered by the mother of his alleged victim, who refuses to sign a secrecy agreement. A... barrister... was asked to look into the issue... after [the]Justice Minister... admitted that he might have been wrong to rule out compensation... [The minister] had earlier criticised a police inquiry which found the 11-year-old complainant did not “provide a truthful account of events” in claiming that [her then neighbour] raped her... New methods of examining DNA found that semen stains on the girl’s underwear belonged to another man... [However, the girl’s mother] gave... a “lengthy submission” in December, stating that she still believed [the former neighbour] raped her daughter and should not get an ex gratia payment from the Government.

...A parliamentary select committee wants a re-examination of the threshold for compensating the wrongly convicted. It has also urged the Government to deal swiftly with compensation claims. Parliament’s justice and law reform select committee... said a person who had served all or part of a jail sentence who was subsequently acquitted on appeal, had his or her conviction quashed without an order for retrial, or was pardoned should have the right to be assessed for compensation. It said an independent compensation tribunal should hear cases, and would need to be satisfied beyond reasonable doubt of the person’s innocence before assessing the level of compensation. In February, the Government... decided the Ministry of Justice would consider applications... for compensation and making ex-gratia payments to those wrongly convicted and jailed...

HOW innocent is a person who is found not guilty? That is the difficult question on which compensation for [an Aucklander] rests. Unless he can prove “on the balance of probabilities” he is innocent, and also that his imprisonment was the result of a miscarriage of justice, he will receive nothing. And under a tougher, new compensation scheme proposed by the Law Commission last month, people in [the Aucklander]’s situation in the future are likely to face an even higher hurdle of being required to prove “beyond reasonable doubt” they are innocent. While that may prevent those who are guilty but “got off”... [- m]any probably guilty people walk free every year, acquitted either because of a technicality or because they lied to the court and got away with it... [-] from mounting compensation claims, critics note the proposed scheme... [doesn’t in any way benefit the] innocent... Ironically, it is only because of... [the Justice Minister]’s concerns over the possible miscarriage of justice in [the Aucklander]’s case that any policy on compensation exists at all. However, gaining compensation requires a further quantum leap. There are only three previous examples of compensation for wrongful conviction in N[Z] legal history, the most recent being [the Crewe murder case].

...the man pardoned over the 1970 Crewe murders... blames jealousy as the reason he and his family have fallen out. “Money is the root of all evil,” [he]... declared last night as he reluctantly commented on a long-standing split between him and the supporters who fought to have his conviction overturned... The *Sunday Star-Times* yesterday quoted [his] father as saying: “He never thought about sharing his compensation. And he never really thanked the [supporters].”

...The family of... the man twice convicted and later pardoned for the 1970 Crewe murders, say the real murderer is still free because police refuse to investigate new evidence... [One of his] three brothers... said they had affidavits linking a man to the axle tied to the body of Harvey Crewe, which was found in the Waikato River... [The brothers, who] made their allegations last night on TV One’s *60 Minutes*, ...also had sworn statements linking the alleged suspect to a .22-calibre rifle similar to the one used to kill Harvey and Jeanette Crewe. A set of fingerprints in the Crewe house which were unidentified at the time of the trial were crucial to their claims. But police had told the brothers that records relating to the fingerprints had disappeared. “Any time we want to check our evidence with the police files, they either go missing or get destroyed...” ...the killer[, who]... had worked with the Crewes... and... still lived in Pukekawa... cannot be named for legal reasons. Police refused to be interviewed for the show, and... rejected the brothers’ claims... [Meanwhile, their sister-in-law] has blasted the... family for talking about the family feud in public... “They’re just bitter and I hope the public sees through that... They’re a vindictive family and they... can all go to hell...” Last week, the family talked for the first time about how bitter they felt towards the man they helped free from jail. Family and friends claimed [the man] never thanked them for their years of campaigning to overturn his conviction. Some were upset he never shared his... \$1 million compensation... [The sister-in-law] said her husband... was now a happy man and nothing could hurt him, including a family fall-out, more than the jail term he served for a crime he did not commit... [A] key figure in gaining the [man]’s release... was saddened by the reports... “It is a tragedy that what had been a magnificent fight for a very worthy case has resulted in a breach in the family like that.”

...It is one of the enduring images of the 20th century. [A man], with his sisters... clinging joyfully to him, emerges from the Old Bailey, handsome, smiling and punching the air as he is freed after 15 years of wrongful imprisonment. For [the brother] and the rest of the men who had been convicted of two pub bombings in Guildford in 1974, the past had been defined by corrupt police officers, complicit forensic scientists and gullible courts. They had endured beatings, isolation and despair. But on that day in October 1989, the future finally looked bright. Fast forward [to the present. The brother] is alone in a small flat on the south coast of England. His voice on the phone is desperate. “I can see them, the men I saw die in prison... There was one who got some glue and cut up his mattress and glued the bits to his body and then set himself alight. I can still smell the burning flesh. I can’t get it out of my mind.” Plenty of other things haunt [the brother]. There is the sight of his father, [who was] also wrongly branded a terrorist, wasting away in prison before his eyes. He has nightmares about being stripped, spat and urinated upon. And the sound of boots echoing on metal, coming closer to his cell. [The brother] was 35 when he was freed on appeal. Now, after years of alcohol and drug abuse he is in trouble. For, like all his fellow victims of miscarriages of justice – the Birmingham Six, the Bridgewater Three and others less well-known – [the brother] was thrust into a vacuum; a place where people like him were forgotten by the state. “We got no help whatsoever, no support, no counselling, but we were so terribly, terribly damaged. I still am. I never had a single thought about killing myself in prison, but now I think about nothing else...” A lot of people are concerned about [the brother] and are trying to help. But they are not officials, professionals or representatives of the state. Instead they are fellow victims of miscarriages of justice, men and women whose campaigning has switched from releasing innocent people to keeping them in one piece now that they are free. At the heart of this network are two members of the Birmingham Six[, who]... both served 16 years... [until t]hey were released on appeal in 1991. Today, despite never having received full compensation, they open their homes to other victims... This week, the British Government announced that it would plug the gap in provision for miscarriage victims. It agreed to make up absent National Insurance contributions after the Birmingham Six, some of whom are coming up to pensionable age, found that they were not entitled to a state pension because they had not paid into it for 16 years – while they were in jail. “People sometimes argue, ‘Well, they get lots of compensation,’ but they don’t,” says... the solicitor who represented both the Guildford and Birmingham defendants... “Once you deduct lost and projected earnings, the compensation element of being wrongly locked up, beaten and abused for years, averages out at about £13,000 a year.”

...[nearly two] decades of investigation by countless professional and amateur detectives, journalists, psychics and others has still not solved the mystery of what happened to 9-week-old Azaria on August 17, 1980. Was she taken by a dingo, by persons unknown, or killed by [her mother]? Although the convictions against... [Azaria’s mother and father] were quashed and the [parents] declared innocent by the Supreme Court in Darwin in 1988, and further absolution given by a third inquest in 1995, many [AUSns] refuse to believe. On the A[US]n website Public Debate, Azaria’s death has, since April, leaped from 48th to 11th most debated subject, with opinion split 44[% to 40%] in favour of [the mother]’s innocence. Recently, scientists proposed testing Azaria’s matinee jacket, the evidence that finally cleared the [parents], for dingo DNA to determine once and for all if a native dog did kill the infant. The case is used regularly by international opponents of the death penalty to warn of the risks of executing the innocent... The... film *Evil Angels*... remains a jab to the stature of A[US]n journalism, so badly tainted in the early hysteria that followed Azaria’s disappearance. And the social and legal importance of the [parents]’ trial prompted the Canberra-based National Library to acquire [the mother]’s personal papers for its archives as a collection of national significance. The extraordinary 70 boxes of papers includes more than 20,000 letters and cards from an extremely broad cross-section of A[US]n society... They include many who changed their view from guilty to innocent,

and wanted to say sorry. As the... anniversary of Azaria's disappearance near[s], the mystery has regained its currency: new analyses, retrospectives, interviews and specials demonstrate that A[US]'s fascination has not faded. There is an almost mystic quality: Uluru, the giant, brooding rock from which Azaria vanished, is among the most ancient of the continent's sacred places, with its own secrets locked in... the time when Anangu people believed their ancestral beings created the land. The closest translation of Uluru, according to *The Cambridge Dictionary of A[US]n Names*, probably is howling... The young couple, N[Z]ers who had joined the great transtasman exodus of the late 1970s, had... camped at Uluru – then still known only as Ayers Rock... According to the [couple] and their camping companions, who maintained their belief in the [couples]' innocence, a faint cry was heard about 8.15 pm, and [the mother] went to check Azaria in her tent. As she approached [the mother] yelled: "That dog's got my baby!" ...Azaria... was never found, despite intensive searches of the area... The nature of the case guaranteed sensational coverage, much of it discreditable and including, for example, suggestions that the Seventh Day Adventist [parents] were members of a dark cult. Initially, they were cleared by [the]Alice Springs coroner... who found that a dingo did take Azaria but added the enigmatic observation that an unknown person helped dispose of the body, possibly to prevent widespread slaughtering of Uluru's dingoes. But disbelief was already mounting, recorded in [the coroner]'s observation that the [parents] had been subjected to probably the most malicious gossip ever witnessed in A[US]. Far worse was to come. In February 1982, after a second inquest, [the mother] was committed to trial for first-degree murder, with [her husband] charged as an accessory after the fact. Eight months later [the husband and the mother], then pregnant... were found guilty. [The mother] was sentenced to life imprisonment, [the husband] to an 18-month suspended sentence. [Their new daughter] was taken from... [them at birth]. Their trial was a process flawed both by emotion – [the mother]'s iron self-control and lack of public tears turned many against her – and by legal... failings. There was no motive, the opportunity for [the mother] to slip away and kill her child was narrowed to the almost impossible and, according to recent revelations by [the]former Detective Sergeant... who first investigated the disappearance, key evidence – including photographs of dingo paw prints – was ignored, lost or disposed of. Prosecutors dismissed evidence of aggressive dingo behaviour from park rangers, disbelieved the evidence of witnesses who were with the [parents], and claimed the [parents] lied about Azaria's missing matinee jacket. Five days after the jacket was found in February 1986, [the mother] was released from jail. But the worst failings were those of the forensic scientists who convinced the jury of [the mother]'s guilt. The experts said there was no way a dingo could have been responsible for the cuts found on Azaria's discarded clothing, that only a knife could have made them: later evidence proved them wrong. They said a handprint on the clothing had been made by [the mother]'s bloodstained hand: the blood was red sand. They said dark marks found in the [parents]' car were foetal haemoglobin, sprayed when [the mother] killed Azaria: it was bituminous sound deadener... [Today, the mother is] remarried to an American book publisher, [and] is... developing a tourist business in N[SW; the father], also remarried with a 3-year-old daughter, works for a... newspaper in N[SW]... But the scars remain, for both the [parents] and the nation.

...Ten years after [a NZer] was sentenced on a drug importing charge, the NSW Criminal Appeal Court has overturned the conviction because of a... detective's admission to the Commission of Inquiry into Police Corruption that evidence used to convict her was fabricated and that he and other officers lied under oath. [The NZer], aged 48, who now lives in Kerikeri, was wrenched from her... children [then aged 16, 19 and 21]... and served 3 1/2 years of a six-year term. After the ignominy of jail, she was deported to N[Z] – away from her three children and the country in which she had lived for 14 years and grown up to accept as home... The quashing of the conviction means she is entitled to go back to A[US], but somehow it doesn't seem very inviting. Instead, she has briefed a lawyer and is planning to sue the NSW Government.

Activists suing the police as a result of an April 1992 raid on the Auckland Unemployed Workers' Rights Centre... have won a settlement, but neither side in the dispute would divulge details... It is understood a sum of money was paid... Proceedings filed in the High Court in 1993 saw more than 30 plaintiffs seeking more than \$1.8 million from the police. They claimed the raid was contrary to... the Bill of Rights and that the police had been trespassing... [At the time, Auckland was hosting] an international investment conference... The police were said to have batoned and assaulted members... [Yet it was 5 of the members who] were charged with assault and obstruction. The charges were [later]dismissed... in the Auckland District Court... by [a]Judge... who talked of having "an uneasy feeling" about the motives for the prosecution... [In international news,]the British Court of Appeal ruled yesterday that... [a] jailed rapist has... the right to sue... for libel a woman he harassed, because she wrote to police to complain about his behaviour... [The woman], aged 38, a married bank worker who was not the rape victim, wrote... [that] she feared she could be the next victim... [The woman, who] said she had been subjected to his unwanted attentions for more than 15 years... [and now he was bombarding] her with letters from his Liverpool jail... was "devastated and bewildered" by the court ruling. She will now face legal bills of up to £50,000... to defend herself... [The rapist], aged 43, sentenced to life imprisonment in 1983 for rape and three attempted rapes, claimed his chances of gaining parole were shattered after [the woman] denied they had a romantic attachment. The Appeal Court's decision could have far-reaching implications in Britain for the legal status of written complaints from the public to police.

...McDonald's Corp has prevailed in its record-setting libel case against two environmental activists... although the judge said some of the criticisms of the hamburger giant were correct... McDonald's spent millions and received much criticism... [during] the longest trial ever in an English court... which... began almost three years ago... [after an unemployed] ex-postman... and [a]part-time bar worker... called McDonald's a multinational corporate menace – abusing animals, workers and the environment, as well as promoting an unhealthy diet... in an anti-McDonald's pamphlet they handed out... McDonald's called the attacks false and defamatory... The judge found that the defendants libelled McDonald's... when... [they] accused it of destroying rain forests and moving small farmers off their land... to make way for massive cattle farming... by calling its food unhealthy and saying that the company lied about how much recycled packaging it used. But the judge found that McDonald's was "culpable" in cruel treatment of some animals, including cases of hens being kept in small cages their entire lives... He also agreed that McDonald's runs advertisements that encourage children to pester their parents into going to the fast-food outlets, and with the contention that McDonald's restaurants in Britain pay low wages and sometimes treat young, impressionable workers unfairly by sending them home early when business is slow, which lowers their pay... "In 1993 most McDonald's senior management had salaries the equivalent of £36 an hour, while the starting rate for crew members outside London was £2.65 for 16- and 17-year-olds." ...one... court... witness told of preparing burgers at a branch in Colchester, Essex, while 5cm of sewage covered the floor... The judge awarded damages of £57,500... but McDonald's British president... did not immediately say whether the company will try to collect... McDonald's... legal costs [were estimated to be £6.3 million]...

The verdict in the McDonald's marathon libel trial has gone against two British environmental activists. But the burger giant cannot win... [One activist] is on income support, and [the other] earns £64 a week... [Furthermore, they] are to continue their campaign to discredit the fast-food chain... [because] the case had only hardened their resolve. "No force on earth is going to prevent campaigners from disseminating alternative opinions and facts about McDonald's to the public."

...[The defamation must be public, i.e. made known to a person other than the defamed, to constitute either libel or slander. A libel suit does not require proof of damages, but such proof is requisite in an action for slander except where the slander consists of accusing a person of a crime, a woman of unchastity, or imputing to someone a loathsome disease or professional incapacity.]

...\$1m to PM for being called a liar... A Singapore court awarded [the P]M... and senior colleagues in his ruling party a record Singapore \$8.08... million in damages yesterday in their libel cases against a political foe. The court ordered [the foe], who fled the country after losing in January

general elections, to pay the damages... to [the PM] and 10 members of the ruling People's Action Party (PAP)... [The PM], involved in three of the suits... was awarded \$S1.4 million. [A former P]M... involved in five of the cases, won the biggest amount – \$S2.3 million. The PAP leaders had demanded aggravated damages totalling \$S12.9 million. “This court must show its indignation at the injury inflicted on the plaintiffs,” [the judge] said in the written judgment. “It cannot be disputed that in terms of aggravation, these 13 cases have no equal,” he said. [The foe], who lost the cases in March when he did not return to defend himself, said last week he would appeal against the damages award. He was sued by the PAP leaders for calling them liars for branding him an “anti-Christian Chinese chauvinist” who endangered Singapore’s ethnic harmony.

...Record \$8m libel payout sends chill through Asia... The ruling drew criticism of Singapore’s legal system by several analysts in Asia who pointed to sharp contrasts between Singapore’s legal climate and courts in some of its neighbours such as Hong Kong, Japan, Malaysia, Taiwan and the Philippines... legal experts [also] said the ruling exposed a gap between the city-state’s economic and political development... “I feel sorry for Singapore because all of their economic progress is not matched by progress in political maturity and liberties,” said... a well-known Philippine political analyst and columnist. “In the Philippines talk is cheap, there is virtually no libel in this country. We believe repression will inflict damage on other parts of the body politic.” A member of Hong Kong’s Bar Council said the award seemed “very large” compared to cases in Hong Kong or Britain – which share a Common Law-based legal system with Singapore... “The English courts have said that when you get to such record amounts of damages you’re beginning to put curbs on freedom of expression because it will have a chilling effect.” But Indian lawyers cheered the ruling, saying it was a bold decision which could provide a model. “It is a very good judgment, particularly when a lot of irresponsible criticism or defamation takes place of people in power or position, or those who have acquired some fame,” said... a senior Delhi lawyer. Analysts in Taiwan said Singapore’s ruling came a month after a Taiwan court acquitted four journalists in a libel suit brought by the powerful business chief of Taiwan’s ruling party. Singapore’s Justice... [system ruled that the] “malicious” attacks on... [the incumbent PM, the former PM] and the others... could have affected “their moral authority to govern.”

...[a former] Aucklander... has won a seven-year fight to clear his name in a multi-million-dollar legal battle dubbed the most bizarre in Hong Kong this decade. Authorities in the colony had alleged the controversial immigration consultant swindled would-be migrants to N[Z]. But last night the 37-year-old... was celebrating after a district court judge in Hong Kong sensationally ended his fraud trial. [The]Judge... said he had heard enough evidence to set [the consultant] free and would throw out all 10 fraud charges... [The consultant] initially reacted to the news by vomiting and was taken to hospital... The trial... was... his second after the first... which saw the resignation of a judge, prosecution and defence lawyers and accusations that N[Z] authorities tried to influence the Judiciary in Hong Kong to convict... [the consultant was aborted. The] saga... started with [the consultant’s] arrest in 1990. Police later released him but the colony’s graft busters charged him again in 1992. They said he had conspired to defraud the N[Z] Immigration Service, conspired to obtain services by deception and forged documents with intent to defraud. The case went to trial in May 1995... amid warnings from [the consultant’s] doctors that the accused could drop dead any day due to heart problems... But 16 months into the trial, [the]Judge... discharged himself citing an “abnormality” of the brain... The second trial, with a new judge and legal counsel, started in February and the whole court moved to N[Z] to hear evidence... The... decision to end the trial came after several days’ testimony by [the consultant] and before 12 more defence witnesses were due to take the stand.

...A “bush lawyer” who plans to sue a former [NZ]judge declined an offer of \$10,000 compensation... in return for dropping his... claim... [of] \$400,000 in compensation, \$200,000 in punitive damages and \$5000 in court costs... [The bush (unqualified) lawyer alleges a] retired district court judge... acted maliciously in issuing a non-molestation order against him in 1992... [He] said his crusade... to clear his name... had cost him his life savings of \$60,000... In October last year, after the High Court granted [the bush lawyer] limited authority to proceed to trial, the Chief District Court Judge... wrote to him offering the... compensation... [T]he letter... says: “I accept... that errors occurred and that the handling of your case [in 1992] was not ideal. Also that you have suffered in consequence.” A second letter, sent by the Crown Law Office in March this year, repeated the offer... [T]he Chief District Court Judge... [is known to be] concerned that this... Court of Appeal decision would encourage disgruntled litigants to reopen failed cases... A constitutional law expert... said that while there was nothing unusual in the Crown Law Office trying to settle a case out of court to avoid costly litigation, he was surprised the matter had been dealt with by the Chief District Court Judge personally... Neither the Solicitor-General... nor [the]Chief Judge... was prepared to discuss the settlement offer... yesterday...

Pending law changes will trigger a boom in the number of bush lawyers seeking affordable justice. Amendments to the Disputes Tribunal Act will allow more people to head for the tribunal and bypass costly district court proceedings... The Government administration committee next month is expected to approve raising the limit on taking financial disputes to the tribunal from \$3000 to \$7500. With the approval of both parties, the tribunal could hear cases involving disputes of up to \$12,000... [T]he limits had not changed since the law was introduced in 1988... But the changes could worsen already lengthy queues... In the main cities, people wait between six and 12 weeks for a case to be heard. The number of applications for hearings has risen about 40[%] since 1990, and is expected to top 33,000 by the end of this financial year. Ideally, people should wait three weeks... said... the Consumers’ Institute[, which believes that the]... Department for Courts need[s] to employ more referees... Demand showed the tribunal was working “as a cheap, quick, efficient forum in which to provide people with access to justice.” Anecdotal evidence suggested that people with disputes involving sums of less than \$10,000 could not afford to take the matter to the district court... But... the chief executive of the Insurance Council, criticised the standard of tribunal judgments as biased against corporates and said the act allowed referees to ignore the law. “Referees are only required to take account of the law,” he said. “There are times that referees decide that there is a deep pocket called an insurance company and they can pay out.” ...[Incidentally, a] former aide of [a US singer-star claims] to have photos of the star in sexual acts with young boys and is trying to sell them to the media, according to the *Express on Sunday* newspaper in London. The paper said... [the] former manager of [the singer-star]’s Neverland ranch, was asking £15 million... for the rights to his diary, which... is illustrated with more than 50 such photographs... [Meanwhile, the boy – now aged 17 –] who received \$US20 million... from [the]singer-star... for dropping sexual-abuse allegations has turned into a shrewd investor, according to *Penthouse* magazine... [He] bought the private school that he attends after realising how expensive tuition was. Then he bought shares in three oil companies after realising how expensive gasoline was for his [new]sport-utility vehicle. [Ironically, one of the singer-star’s best-known songs includes the line: ‘be careful what you do before the lie becomes the truth’!]

...‘one of the most often repeated lies is that the singer-star paid 25 million dollars to settle his molestation lawsuit. The fact is it cost 40 million. Isn’t that more than any sane innocent man would pay to remove an aggravation?’

...a NZ rugby player faces legal costs of up to \$100,000 defending a charge that he raped a South African woman... in the Durban hotel where the Wellington Hurricanes were staying... [The player] could not afford to sue [her] for laying a false complaint...

A study of the Queensland legal system has found what many have long believed – going to court is the most expensive way to get justice. The study found that if family law litigation went to a judge, the average amount spent in Brisbane in legal costs is \$A16,832... If the parties settle their differences by negotiation, the average cost was less than \$A1800. - 1997

Over here... in... New York ...or... LA... when you start a lawsuit, it doesn’t matter who wins – at the end of the day it still costs.

Justice is... an expensive luxury which, except in minor cases, a man with small means can with difficulty afford.

Economic changes since... 1984 had made big law firms wealthy but many N[Z]ers still had trouble gaining access to justice, the Chief Justice... said at the weekend... "The art collections in the foyers of major firms hang uneasily alongside the problems of access to justice,"... [He] also criticised rich N[Z]ers who wanted their own way within the legal system. "The increasingly strident cries of the well-heeled sector of the community pressuring Government and the Judiciary as to the particular brand of justice they seek are not a pretty sound."

...an Auckland barrister... claims... [t]he legal aid system gives district court staff "unfettered power" to practise favouritism and does not serve its clients well... [B]ecause it was up to court staff to assign legal aid cases to lawyers... [they] can make or break a career... [The barrister] said that as a criminal lawyer he did well out of legal aid, but was often approached by others complaining they were not given work. "What is undesirable is that it doesn't encourage a robust and independent bar. It encourages the sort of individual who is prepared to be obsequious... with the courts. And often pleasing court officials is not the same thing as pleasing your client." [The barrister] said the system would improve if accused were allowed to make their own choice from the list of available counsel... The Department of Courts northern deputy general manager, case processing... said there was no foundation for the allegations. Court staff assigned lawyers from a list approved by each district's Law Society and this was done as fairly as possible... [However, t]he president of the Criminal Bar Association... said there had long been a concern about how legal aid cases were distributed. "I've never known how it worked. Some get a lot of work others don't." ...Earlier this week inmates on remand at Mt Eden complained to the Criminal Bar Association they were getting a raw deal from legal aid. In a letter to [the president] the prisoners expressed concerns about the integrity of the system and complained that some lawyers were not giving their clients adequate time to prepare for court hearings. The group also said some legal aid lawyers failed to turn up to court. "The people here have lost faith that many legal aid representatives have the spirit or the legal intention of adequately defending their clients, and that they, the lawyers, have now become a subliminal part of the prosecution," the letter said. - 1996

N[Z] is said to be the only country which uses lawyers so extensively to process legal aid applications... [Now] government administrators... say... [massive] reform of legal aid is needed because the system is under strain to the point of collapse... Legal services staff – many unpaid volunteers – faced an increased workload... [while] some lawyers were being paid more than they should be... Lawyers are [also] getting maths computations wrong, causing their colleagues to be paid the wrong amount. Rules are being bent... and there is general ignorance of fee levels and other requirements. For example, a refugee status appeal attracts a maximum fee of \$1500. But some staff have allowed an hourly rate, resulting in a bill three or four times above the maximum amount payable... Applications for civil aid last year were up by more than 20[%] compared to 1995... In Auckland[, where]... about 90 people volunteer their time to do a task which needs about 300 staff... there can be an eight-week wait for aid applications to be processed... And in the meantime you could be cooling your heels in a Mt Eden remand cell waiting for the approval allowing proper legal representation to get bail. In a report published yesterday, the Legal Services Board[(LSB)] recommended removing the power of court registrars to grant criminal legal aid and assign counsel, and allowing board-approved lawyers to assign themselves in simple cases. Accused people should have a "reasonable say" about who represented them. Judges would have the right to reassign cases. Legal aid would be granted only once, and would apply throughout all proceedings.

...More disputes could be solved out of court if lawyers dropped their perception that mediation was a second-class solution, says the executive director of the L[SB]... "There is always a perception that if you hand someone over to mediation you lose a client," he said... The board began funding legal aid for some mediation services on February 1, but... it would be about 12 months before the benefits of the scheme could be seen because lawyers first needed to be educated to use it... [A] national pilot scheme run last year resulted in 50 mediations in the Auckland area, nearly all of which were successful... [In international news, a] drunken punter left paralysed in a wheelchair after falling off a pub bar stool in Ireland is suing the landlord for £100,000... [He] has been given legal aid to take action against... [the publican, claiming the publican] was negligent for letting him sit on the one-metre bar stool. [He] fell asleep and minutes later fell off, breaking a bone in his spine leaving him paralysed from the waist down. His lawyers said [the publican] was at fault for not seating him at a safe height... The 36-year-old had reportedly admitted drinking several pints of Guinness and shots before he went to the pub. But he believed he was still entitled to compensation.

...Funds crisis could let criminals walk... [A suspect] has become an instant celebrity – not for the \$A5 million... worth of heroin he is alleged to have been holding, but because he nearly became the first man to walk free simply because the State of N[SW] does not have the money to provide him with a lawyer. If the case itself is startling, it is but a minnow compared to the much greater debate raging between the states and the Federal Government over a funding row that may mean [the suspect] is merely the first in a long line of A[US]ns facing serious charges who could be freed by Commonwealth parsimony... Arrested allegedly in possession of 3.8kg of heroin, he was granted legal aid to fight a case that ended... in a hung jury. He was almost set free because the N[SW] Legal Aid Commission, smarting from recent cuts to its budget, resisted powerful pressure and stuck to a policy decision that it would not allocate funds for second trials after a hung jury. "Just one retrial would cost us, we think, at least \$40,000," said [the] commission chairman... "We could get another half a dozen of these in the next week. There are at least 70 coming through each year and we would fund the bulk of these trials. We just can't afford to commit ourselves." Because of the implications of the no-second-trial policy highlighted by [the suspect's] case, the commission at a late-night crisis meeting delayed a show-down by deferring for a month a final decision on his funding... Behind this is the row between Canberra and the states over Commonwealth funding of the legal aid system. Until last year Canberra had given the states about \$A160 million a year to use for the defence of people appearing in cases under both state and Commonwealth law. But the rules have changed. The new Federal Attorney-General... told the states Canberra would no longer fund cases under state law, and would impose funding cuts of about \$A110 million over three years. The impact is enormous, and the implications... ominous. In N[SW] alone, two-thirds of the courts' caseload are criminal cases brought under state law, and federal funding accounted for more than half of the state's legal aid budget. N[SW] has already, in addition to the no-second-trial policy, made deep cuts. Fees for legal aid lawyers have been reduced, and there will be no funding for inquests, claims involving tenants of retirement villages, or unfair dismissal cases. National Legal Aid, the umbrella organisation for the nation's legal aid commissions, warns this is the tip of an ugly iceberg. It estimates the cutbacks will hit up to 130,000 A[US]ns this year, with Canberra "deserting" victims of domestic violence, the protection of children, housing and consumer law, compensation claims, criminal law and civil liberties. To add to this, Canberra has also announced huge increases in court and tribunal fees, designed to raise more than \$A100 million over the next four years. According to Opposition calculations, fees for a typical small business claim will rise from \$A1000 to more than \$A12,000, a family law dispute from \$A368 to more than \$A2000, and for an unfair dismissal claim to \$A2753. At a recent conference in Wellington, [the AUS]n High Court Chief Justice... said: "It is not an over-statement to say that the system of administering justice is in crisis. Ordinary people cannot afford to enforce their rights or to litigate to protect their immunities."

...N[Z] spends about \$16 per capita on legal aid. In comparison, Britain spends \$70 per capita... Last year more than 51,000 N[Z]ers received legal aid assistance, 19,294 in civil cases and 31,810 in criminal cases... For the year ended June 1996, the legal aid bill was... \$55.64 million[– of which the]... gross allocation from the Government... [was \$12m – but \$3m of the \$23.7m spent on] criminal legal aid... [was recovered. Now the] system is being reviewed... The L[SB], an independent Crown entity that oversees legal aid, has commissioned an \$80,000 research project... to see if experienced lawyers are avoiding legal aid work... The [LSB] executive director... said anecdotal evidence suggested a number of law firms "would not touch legal aid with a barge pole". Other commonly held perceptions were: That legal aid was used to train young lawyers; many senior lawyers with more than six years experience did not do legal aid work; and some thought payment rates were too low... [T]he survey may

find junior legal counsel doing a lot of legal aid work for \$100 an hour that senior counsel, paid more than the current \$150... an hour, may be able to do in less than half the time... [S]ome criminal trials chewed through a lot of legal aid – [one case that involved] three trials and [a]Court of Appeal hearing cost \$508,000 – [while]the average remuneration a lawyer received for criminal legal aid was \$700 for five hours work. [However, in] major trials much of the legal aid bill went on expert witnesses not on lawyers... - 1997

Our system of legal aid is under review, propelled in to the spotlight by... cases such as a Tongan-based millionaire who received \$46,000[, and]... burgeoning costs. Aid for civil cases is outstripping provision for criminal charges and the combined total is heading toward \$100 million a year. No one denies the need for legal aid. It stems from the belief, enshrined in both the Magna Carta and our Bill of Rights Act, that justice should be available to everyone... [The] review will try to balance the need for accessible justice with some form of fiscal constraint. It is not an easy task. The British have been grappling with the same problem and have arrived at radical solutions that mean an end to civil legal aid as we know it and changes to criminal legal aid. A series of alternative systems embodied in an Access to Justice Bill now before the British Parliament are designed to both speed the justice system and reduce legal aid costs... The British system (outside Scotland, which has its own justice system) was based on a time-plus charging system for legal aid lawyers... Both criminal and civil aid systems... [are] demand-driven and there have been few incentives for lawyers to expedite matters. They have continued to be paid “for services rendered.” The Lord Chancellor... in a speech in February described criminal legal aid as a greedy Leviathan. It is an understandable position to take when one considers that in Britain virtually all criminal cases are on legal aid. Indeed, of the 100,860 applications for legal aid to cover representation in the Crown Court in 1997, only 18 were turned down... Costs rose from £507 million... in 1992... to £733 million... in 1997... an increase of 40[%], while the number of cases... rose only 10[%]. Civil legal aid statistics are even worse. Between 1992... and 1997... costs rose by 35[%] to £793 million... while the number of cases fell 31[%] to just under 320,000. This year... the Lord Chancellor... produced a startling statistic: 1[%] of the... criminal... cases – high-profile, protracted... trials – accounted for 40[%] of the budget. “These are very high-cost cases and that part of the budget just has to be brought under control... You see, the problem is that the longer the trial goes on the more money the lawyers earn. Therefore, there are perverse incentives to spin the case out because for every day that the case lasts, the cash register merrily peals away... Of course... when the state brings a prosecution against a defendant which is likely to result in his imprisonment if he loses, then it is... right that if he cannot afford to defend himself, that the state... must make the means of his defending himself through professional lawyers available. But it is a fact that... legal aid is not nearly as popular a social service as its devotees would like to think it should be – ...because of the public perception that legal aid is primarily a means of funding lawyers’ bank balances.” Can he win against a profession notorious for stonewalling changes they do not perceive to be in their own interests? His predecessor... battled throughout his term and achieved limited reform. “What we have at our disposal,” [the incumbent Lord Chancellor says], “is one tool only. And it is a very old-fashioned tool and it is called contracting. What we have to do, so far as we possibly can, is contract at fixed prices.” ...The contract system will be employed by a new Criminal Defence Service that will replace the criminal legal aid service. It will be administered by a new body, the Legal Services Commission, that will also administer civil assistance. The commission will develop contracts for different types of criminal service. They will be tested in pilot schemes before being fully implemented. The aim will be to fix prices in advance of cases going to court. The rationale is that a lawyer on a fixed fee will want to move quickly... A planning service will set priorities for [civil case] funds. Cases involving domestic violence, care of children and adoption will have the highest priority. The present “merit testing” will be replaced by funding assessments to promote different approaches. For example, conditional fees will be encouraged: no win, no fee – an incentive for a lawyer to give his or her all. In the civil courts new procedural rules will minimise delay and plain English will replace arcane legal terminology. Automatic appeal rights will be replaced by a requirement that parties seek leave to appeal, removing weak cases that would only clog the system. Britain’s plans to wrestle the legal aid demon are, as yet, largely untested. However, if there is any lesson to be learned for N[Z], it is that the legal aid bill will... come down only if the legal system is made more efficient.

...A four-fold increase in the cost of legal aid over 12 years has prompted the Government to question the role that lawyers play in allocating the funding. But lawyers have hit back, saying the legal aid bill would spiral even higher without their cooperation. The Minister of Justice... yesterday... blamed... the blowout on increased lawyers’ rates... But a spokesman for the Auckland District Law Society... said lawyers were making less out of legal aid now than they ever had. He said recent L[SB] instructions, for example, had knocked back the fees lawyers were paid for work relating to the Domestic Violence Act... [The minister also] said the present system – where local subcommittees of lawyers could grant or decline applications – did not guarantee consistency. “Where you may qualify for legal aid in one part of the country you may not qualify in another. We need to look at how we can standardise that.” [The Act Party]’s justice spokeswoman... released figures over the weekend showing legal aid costs had skyrocketed from \$2 million in 1978 to more than \$90 million this year. Legislation introduced in 1991 had failed to curb the burgeoning bill, she said... In March, [she had] highlighted the case of a millionaire Tongan businessman who received \$46,000 to unsuccessfully defend himself against charges of cheating... It is understood the Tongan man qualified after he declared his past year’s income as \$4000... [The Auckland Law Society spokesman] said about 90[%] of those granted legal aid had incomes below \$13,000 and many were beneficiaries.

...ONE Auckland barrister earned more than \$400,000 from legal aid work last year, the L[SB] has revealed. Four others – from Auckland, Nelson, Invercargill and Dunedin – earned between \$302,000 and \$376,000... Twenty-one lawyers received more than \$150,000... [The LSB’s] executive director... issued the figures for a request under the Official Information Act. The figures refer only to barristers who are sole practitioners. Some lawyers working for firms would probably be earning even greater sums, [he] said, but he was not able to retrieve the figures quickly. [The]Justice Minister... said while the figures seemed high, he could not comment on individual cases. He said lawyers could have been working on a number of cases, which could make the big payments understandable... The figures suggested the top earners were spending most of their time on legal aid work... If the top earner had been paid the maximum legal aid rate of \$180 an hour, he or she would have had to work 2277 hours to earn \$410,000. [The LSB executive] said it reminded him of the joke about the lawyer who arrived in heaven to applause and acclamation. “We’ve never had a 332-year-old man here before,” the angels explained. The lawyer replied: “But I’m only 46...” The angels said: “Oh, we were working from your timesheet.” ...[the] President of the N[Z] Bar Association... said while some lawyers could be cheating the system, many suffered financially by doing legal aid work. “They do not claim all the hours they spend on a case and they do legal aid work because there is an element of public service. And the vast majority working in the legal aid area are doing so honestly and ethically. But, like in all professions, there are a few who will be ripping the system off and they should be weeded out. They are inflating the number of hours they work and sometimes taking cases to court which ought not to be defended. But I don’t agree with the general public perception that lawyers as a group are ripping off the system.” ...[In related news, a] North Shore lawyer is suing the police for \$40,000 for what he says was a demeaning search at Mt Eden Prison. [The lawyer] says he was appalled at the way visitors were subjected to a “pat-down” search and made to turn out their purses and pockets in full public view. Being a lawyer did not save... [him] from the indignity of being searched, despite his protests.

...The immunity which for more than two centuries has protected British barristers from being sued for negligence was swept away by the House of Lords yesterday. Seven law lords held that it was no longer in the public interest for members of the Bar to enjoy an immunity not available to other professionals such as doctors and accountants. The lawyers had been concerned that, if dissatisfied clients were allowed to sue, the floodgates would be opened to a mass of reiteration of cases already decided. But [one law]lord... said... the withdrawal of... immunity... would bring to an end “an anomalous exception” to the basic premise there should be a remedy for a wrong.

The remedying of wrongs via compensation or reparation payments effectively allows victims to profit from the existence of crime. Furthermore, criminals, informants, law enforcers, judges, jailers, security personnel and people who 'clean up after crime scenes', can also be said to profit from the existence of crime – if for no other reason than that crime provides them all with employment. But it appears that the people who profit most out of crime are lawyers – and if they aren't profiting from the existence of crime, it's from the existence of misfortune!

"...let me make one thing clear to you. I want your legal advice, I even pay for it, but to me you're all vipers. You live on personal injury... divorces... pain and misery..."

"...You let me down, man. Now I don't believe in nothing no more. I'm going to law school!" ..."Good for you... If there's one thing America needs it's more lawyers. Can you imagine a world without lawyers...?"

The number of students in American law schools has increased rapidly. In 1960, slightly more than 40,000 students were enrolled in schools approved by the American Bar Association. In 1970 that number had more than doubled to 82,000 students... By the 1970's there were about 350,000 lawyers, or one for about every 600 Americans.

The NZ Law Society estimated that during 1997 'between 40,000 and 50,000 people living in NZ were qualified to practice law.' However, it believed the number of people 'registered to practice law in NZ was between 7000 to 7500' – or about one for every 500 NZers. Incidentally, in '1995, US District Courts commenced 239,000 civil cases and 44,200 criminal cases (in 1985, the respective figures were 273,700 and 38,500').

The number of lawyers in the U[S] rose from 285,933 in 1960 to 723,189 in 1988, a 252% growth... Of personal consumption expenditures, the fastest growing[category] between 1970 and 1990... [was legal services, with] a 1,004% increase... from \$4.9 billion to \$49.2 billion...

What do you call 5000 dead lawyers at the bottom of the ocean? *Answer:* A good start! Lawyers[are] America's most reviled professionals...

He was critical of the lack of professionalism shown by some lawyers and quoted the movie *The Godfather*. "A lawyer with his briefcase can steal more than 100 men with guns."

"Today[, new entrants,] we're going to share what our parents do for work." "My mummy is a doctor." "My daddy's a truck driver." "My mummy's a teacher." "And your dad?" "Umm, my dad, he is a liar." "A liar! Oh, I'm sure you don't mean a liar?" "Well, he wears a suit and goes to court and talks to the judge." "Oh, I see. You mean he's a lawyer."

"Mrs Stevens, it's the innocent who need an attorney – the guilty can lie for themselves."

From now on I'm going to tell the truth because I don't have enough money to pay for a good lawyer.

Lawyers under the present system are paid antagonists hired to fight with one another on behalf of others... We lawyers should be training people to understand the law and apply it to represent themselves.

If the inexplicable occurs in Russia, the mafia is probably behind it. If the bizarre happens in Japan, a bureaucrat ordered it. In America, suspect lawyers... Lawyers in the U[S], always on the hunt for business, are looking to the school system... On October 8, a 14-year-old Ohio girl arrived at her school in a stretch limousine, accompanied by her lawyer. The lawyer was there to ensure her admittance, which had been earlier denied on the ground of "drug dealing." The drug in question was midol, a mild remedy for menstrual pain; the girl had given one tablet of this stuff to a friend. For this the school suspended her and required that she undergo drug counselling. Sensitive to illegal drugs, schools are paranoid about sex. In North Carolina a six-year-old was recently suspended from school: he had kissed a classmate on the cheek, and the school's authorities declared that this was sexual harassment[– even though]... the girl asked him to kiss her... In New York this month, a seven-year-old who kissed a girl on the cheek... "because I liked her" and had... pulled a button off her skirt... because his favourite book is... about a bear with a missing button... was sent home for sexual harassment also. What drives schools to such bizarre extremes? The answer is that both illegal drugs and sexual harassment of older girls are real problems; and that schools that fail to deal with them may face lawsuits. This month a Californian 14-year-old who had suffered months of sexual taunts was awarded \$500,000 in damages, some of which will be paid by her former school principal. To prevent more such cases, the federal Government sent out a set of guidelines on sexual harassment in August. The fear of lawsuits has driven some schools to forbid pupils to hold hands. From this it is a short jump to suspending a six-year-old for kissing... In the end, maybe better a country of lawyers than one of bureaucrats or mobsters.

...WHINGEING N[Z]... We used to shrug our shoulders when things went wrong. Now we call in the lawyers. - 1996

N[Z] lawyers are operating outside the law by using an American-style system of charging clients a percentage of money won in court settlements. But lawyers who use contingency fee arrangements, which are common in the U[S,] ...say the practice is the only way many people who do not qualify for legal aid can afford litigation.

...A controversial American-style system of charging lawyers fees will inevitably be adopted, says the Attorney-General... It is legal for lawyers to waive fees if a court case is unsuccessful and load the bill on a successful outcome. [The Attorney-General] said charging on a percentage basis was only a small step from that practice... The Auckland District Law Society... [is against allowing a lawyer to have] a financial interest in the outcome of a case. But... [a] Wellington lawyer... who is acting for 1600 women battling for compensation from American breast-implant manufacturers, said banning the practice would favour rich corporates and discriminate against poor litigants.

...*Guiltily as charged – or not guilty, not charged?* ...Cynics say that win, lose or draw, lawyers get paid. That's largely true under [NZ's] existing system where fees are a matter of negotiation between counsel and client... [T]he American system of being paid only if the case is won... may bring leaner pickings for some lawyers and even more bountiful rewards for others. When it comes to earnings, lawyers consistently top the list. There's anecdotal evidence to suggest that a partner in a leading firm with a good spread of corporate clients can expect to earn at least \$500,000 a year. The best surgeons lag behind by about \$100,000... An experienced barrister specialising in criminal cases earns upwards of \$250,000 a year; a few are reputed to have topped \$700,000. In a busy practice, a family doctor can expect about \$156,000. The average lawyer handling humdrum family matters gets between \$60,000 and \$80,000. Small-town lawyers may earn as little as \$35,000. This is less than some of the bright law school graduates recruited into major companies on between \$45,000 and \$50,000 after having some of their fees paid – but they may last no more than a year if they don't perform. Junior house surgeons in public hospitals get about \$50,000 for a 12-hour day. At the bottom of the rung some lawyers survive on as little as \$30,000, largely from legal aid work.

...Lawyers and the legal system are not cheap. The only way most people can get low cost, instant access to the justice system is to rob a bank. I therefore believe the Government should legislate to formally recognise as lawful contingency or "no win no fee" arrangements for lawyers. As a court lawyer I know many people cannot afford to bring cases. For example matrimonial property cases now cost about \$20,000 to bring to hearing... People seeking legal help are often in financial difficulty. Someone who has been unjustifiably dismissed from employment will often have no funds to bring an Employment Tribunal claim because he or she is unemployed. Such people are unlikely to qualify for legal aid under recent legislative amendments which base their entitlement on their income over the preceding 12 months. The paradox also is that although middle income N[Z]ers pay proportionately the most tax (as the rich have accountants and there is no tax on low incomes) those same people cannot use the justice system they have paid for. The contingency fee system would allow such people to get justice... Such an agreement with a solicitor clearly amounts to a consumer choice... Many other professionals are rewarded on a conditional basis. Licensed real estate agents and merchant bankers spring to mind... The fee could be a percentage of the result obtained, perhaps 30[%]... Unreasonable fees are prevented by Law Society rules. I do not believe that contingency fees would result in an American style drop in standards or excessive awards... Lawyers in N[Z] – unlike doctors – can be sued and excessive awards can be legislated against... I believe... contingency fees... are lawful as the cases banning them relate to medieval landlords financing other landlord's legal attempts to evict tenants and are outdated. It is time for Parliament to make the law clear.

...The Court of Appeal has affirmed a citizen's right to a "day in court." In a judgment released this week, the court held an almost three-year delay in progressing legal proceedings was not fatal to a Canterbury mother and son's claim against their former lawyers... [and, therefore, their] claim could go ahead. They alleged about \$343,000 was lost with the failure of a company in which their money was wrongly invested. A High Court judge... said they had waited too long in progressing the case, but [they] appealed. The Court of Appeal has allowed their appeal and awarded them \$3500 costs. A condition of the judgment was that within 10 days [they] must take the next step in the case... [T]he Appeal Court's judgment... said the case related to a land deal in 1986. [The mother and son] started legal action against their former lawyers... in 1991. Nothing was done about the case after March 1993. When [their] new lawyer wanted to progress the file he had to get the court's permission, which a High Court judge refused... [However, the Appeal Court judge said the High Court] judge had applied the wrong test. A citizen's right to his or her "day in court" was not to be treated so lightly. Fairness had to prevail over demands of efficiency.

...A PENNILESS couple has won more than \$1 million from an insurance company and a lawyer... They battled for years to get legal aid and finally... the High Court at Auckland... ordered AMP Finance NZ Ltd to pay \$850,000 for its part in the couple's financial destruction... The [couple] have settled with their former lawyer... out of court for \$250,000. After costs are taken out of the settlement, the [couple] estimate they will have \$600,000 to rebuild their lives.

...AMP has appealed a High Court ruling that it pay a penniless couple \$850,000 for its part in a property collapse that left them destitute... Included in the settlement is \$301,415 for loss suffered, with interest at 11% since September 1987; \$25,000 for loss of chattels, plus interest; and payment of... [\$80,000] for "distress, grief, anxiety and humiliation" and \$85,000 toward costs... [In related news, the NZ] Law Practitioners' Disciplinary Tribunal says some of... [a Wellington lawyer's] dealings on behalf of the... Druids Friendly Society... were so negligent they reflected on his fitness to practice law and brought the profession into disrepute... Some of his advice to the society was "extraordinary." [The lawyer] has been found guilty of professional negligence or incompetence, and professional misconduct. A decision on penalties was reserved.

...[a] Wellington lawyer... has been struck off the legal roll... The Law Practitioners' Disciplinary Tribunal ordered him to pay \$234,448 in costs... [Incidentally, NZ lawyers] have paid more than \$28 million to meet the losses sustained by clients of... collapsed law... firms. This year the Law Society repaid bank loans it used to settle claims on the fidelity fund... of which \$25 million was from the... biggest single claim on the fund in the society's history... [following a firm's collapse in 1992 which resulted in one lawyer being] sentenced to seven years' jail for theft and fraud involving \$6.4 million[, and his partner being]... jailed for six years for theft charges involving \$3.5 million... Lawyers in partnership or solo business were levied \$10,000 each in 1993, and most paid by annual instalments of \$2000... More than \$130,000 is still owed by lawyers, but the society has written off \$64,000 as unrecoverable because of bankruptcy or insolvency. [However, the] fund shows a healthy balance, and... it was sufficient to meet further valid claims "unless something unexpected or untoward arises."

...When... an authority on the management of professional firms, asked a group of lawyers in a prestige office how much they liked their clients, they fell about laughing. Not only had the question never occurred to them, they didn't think it even mattered. What really mattered was how much they billed their clients.

...in the February issue of *Playboy* magazine... John F. Kennedy jun... [-] who publishes the magazine *George*[- reveals he] didn't much like his former career as a prosecutor, having said: "I felt sorry for the defendants. Sure, they were all guilty, but they were all poor and stupid."

...All law students completing their degrees after July 31, 2000, will have to pass a course in ethics and professional responsibility to practice law, the [NZ] Council of Legal Education has decided.

...A Scottish law student is suing his solicitor mother for his living costs. [The solicitor], 53, is set to contest[her] 20-year-old... [son]'s claim to £400... a month maintenance when the case begins today at Edinburgh Sheriff Court. [The son], who studies at Aberdeen University, is bringing the claim under the Family Law (Scotland) Act of 1985. [The solicitor] is believed to be estranged from her son, who is living with her former husband... [In other law news from Britain, a t]op Belfast lawyer... was called to a police custody room after two men being questioned about an attempt to steal a car requested that he represent them. He agreed to defend them even though he found out that it was his car they had tried to steal.

...How can lawyers defend the apparently indefensible? ...the first rule of justice is the accused is innocent until proven guilty... "I defend clients on the basis they are probably innocent... If... clients tell me they are guilty I cannot defend them; they must plead guilty or secure other counsel..."

...The Court of Appeal is to rehear a rape case after revelations that the accused's lawyer failed to tell the jury her client was impotent... A new lawyer took up the case of [the] 58-year-old... who has now been in jail for 17 months. [His original lawyer] has since said that she has regrets about the way she handled the defence. She declined to comment on the case yesterday.

...An Auckland lawyer is expected in the witness box in the Court of Appeal tomorrow to face the question of why evidence about her former client's impotence was not called at his rape trial... [The accused man's] wife might also be called... [According to the accused man's current] lawyer... the impotence evidence was not a complete defence, but it was surely an expected part of the defence case because it raised reasonable doubt... A doctor who examined [the accused] before the trial could not rule out partial erection...

A man whose lawyer failed to tell a jury... that an accident... rendered[him] impotent... has had his rape conviction quashed. [In international news, 'the US government has agreed to settle a sex discrimination case dating back 23 years by paying out the equivalent of a billion NZ dollars. 1100 women sued the now disbanded Government Information Agency which once ran the Voice of America radio service. It's the biggest civil rights settlement in US history. In 1984 a judge ruled in favour of the women, quoting agency officials who said "they did not want that many girls around"; that "technical jobs were mainly for men"; that "a woman's place was at the stove, not on the air." The government fought that ruling – all the way to the Supreme Court – and lost. Today, the battle ended. The Justice Department agreed to pay \$US450,000 for each plaintiff.']

...A first-grader who was... separated from his class... for a day and banned from an ice-cream party after kissing a classmate... can put his mind at ease. The Education Department declared yesterday that a peck on the cheek by a six-year-old falls short of sexual harassment.

...A Florida student who was prevented from displaying a huge sculpture of a nude man at school has agreed to settle the suit she filed for \$US45,000... [She] sued the Broward County School Board last year for violating her right to free speech. Her oversized statue of a man wearing eye makeup and lipstick was removed from the school lobby by [the]principal... who said it was too risqué.

...A student who wore a skirt on a mufti day at a private school in Auckland last week was suspended after he refused to go home and change his clothes. The seventh former was one of several male students who went to Kristin School in Albany last Thursday wearing women's clothes... Teachers at the co-educational Christian school ordered them to go home and get changed, but one student refused, saying it was a breach of his rights. The pupil eventually went home, telephoned a lawyer for advice and returned in the skirt. He was suspended for a day and returned to classes yesterday... [T]he school chief executive, said the boys were sent home because they were "liable to cause offence to other students." [He also] said, however, that the student was suspended for "defying the teacher's authority," not because he wore women's clothing to school... [A] lawyer for the Youth Law Project, said Kristin "blatantly" broke the law when it sent home students who had not been suspended. "You can't legally be punished for disobeying an illegal instruction." [He] said the boys did it for "a bit of fun" and their action did not warrant punishment which could jeopardise their schooling... A spokesman for the Human Rights Commission... said students complained "fairly regularly" about dress codes at their schools. However, the commission usually refused to investigate such complaints because it believed the Human Rights Act was not intended for that purpose.

...PROVOCATIVE behaviour and clothing helped[a] secretary... lure her boss... into an affair that wrecked his marriage. That's the verdict of a North Carolina jury. Now she's been ordered to pay more than \$1.5 million "husband-theft" compensation to [the] former wife. Many other intriguing laws, mostly more than a century old, can still be enforced in the U.S. Some, if enforced, could trap the unwary. In McLouth, Kansas, for instance, it's illegal to rinse dentures in a public drinking fountain. In Minnesota, there could be trouble for anyone rash enough to hang male and female underwear on the same line. And, in case you ever visit Lexington, Kentucky, I should mention it's an offence there to stick an icecream cone in your back pocket. Don't ask me why...

Americans fight back against loony lawsuits... IN THE land where the litigant is king, a backlash is under way. Fed up with the embarrassment and huge costs of hundreds of bizarre civil lawsuits, Americans are turning their fire on the court system that allows "spurious" claims for damages. They have found an unlikely new group to champion their cause: Citizens Against Lawsuit Abuse, which has been heaping shame on litigants by announcing titles for "Loony Lawsuit of the Month"... People are now waiting for an award-winning litigant to file the first lawsuit against the group... [US] consumer advocates... believe... lawyers... take on virtually any case... [under] the current... "no-win, no fee"... system...

America's out-of-control legal system allows any crackpot to initiate costly litigation without serious fear of legal or financial retribution... The sound of trial-lawyer contributions pouring in to the President's re-election fund has clearly deafened [him] to appeals from the masses for tort reform. - 1997

A test was conducted in the US whereby 'a public transport bus gently crashed into the back of a parked car in order to see how many passengers would lay complaints' (e.g., of having received whiplash) – and, although it was obvious from the force of impact that such an injury could not have been sustained, a number of passengers did! Because many USers are eager to take a ride on the lawsuit bandwagon, everyone in the US who can afford to, or who can't afford not to (note that in the US 'people are legally responsible for any snow or ice on the footpath outside their own houses'), has liability insurance.

Additional liability insurance is recommended[when visiting the US] because of the high cost of lawsuits in the event of an accident. Extended protection to \$US1 million costs about \$US12 a day.

The highest mean malpractice insurance premium in[the US during] 1989 was carried by obstetricians and gynecologists who paid \$37,000 annually... In 1989, health insurance premiums totaled \$108 billion... Property and casualty insurance premiums in 1990 totaled \$217.8 billion, of which auto insurance accounted for \$95.4 billion... In 1990, there were 2,200 life insurance companies in the U[S]... 389 million life insurance policies were in force with a value of \$9.393 trillion. The... first life insurance company was the Corporation for the Relief of Poor and Distressed Presbyterian Ministers and of the Poor and Distressed Widows and Children of Presbyterian Ministers, incorporated in 1759 in Philadelphia. The first health insurance company was the Massachusetts Health Insurance Company of Boston, founded in 1847. The first accident insurance company was Travelers Insurance Company of Hartford, chartered in 1863. It issued the first automobile insurance policy in 1898... – the one-year premium was \$11.25. The first fire insurance company to receive a charter was the Philadelphia Contributionship for the Insurance of Houses from Loss by Fire in 1868... In 1990, 34 million Americans carried no health insurance. Of these, 38.3% were unemployed.

One in six Kiwis over the age of 15 (464,000 people)... have no insurance of any kind and fewer are taking out health insurance... A... survey found the most popular form... was car insurance, held by 71% of people over the age of 15, followed by house insurance (61%). The least popular was income protection, held by 11%... The... number of people holding health insurance had fallen in the past two years from 39% to 36%... In 1991, about 50% of the population had private health cover... [While on the subject of health cover, f]oreign doctors are billing U[S] insurance companies by submitting fake bills or by inflating bills, according to the FBI. A San Diego-based task force is looking into rings of Mexican clinics who falsely bill for procedures such as \$US17,000... emergency appendectomies on Americans. In Pakistan and Bangladesh, huge bills have been submitted for emergency surgery allegedly performed on Americans... In one case, Med-Cal – California's insurance programme for the poor and disabled – was billed \$US10,230... for five days of hospital treatment given a 10-year-old girl with... a runny nose... The girl had actually been examined for 20 minutes and given antibiotics.

...Genetic break-throughs are spurring fears of discrimination among people in[US] families at risk of hereditary disorders... Genetics tests are available for disorders including cystic fibrosis, sickle cell disease, and certain breast, colon and kidney cancers. One in four survey participants believed they were refused life insurance and more than one in five believe they were denied health insurance because of a genetic disorder in the family. [In related news, US insurance companies are 'declining to insure people who have taken AIDS tests, even if the result was negative' (the US also has 'a law that bans HIV positive people from entering the country').

...[a] Professor... said insurance disputes were one of the fastest-growing segments of Aids litigation. Major issues arose from the desire of dying patients to obtain innovative, last-hope treatments under health insurance plans that excluded such experimental therapy. Other areas of mounting litigation involved the right of health insurance companies to place ceilings on coverage for Aids treatment, and accusations that some... companies exploited Aids patients by persuading them to accept payments of their policies before they died – but at a lower rate... [C]ourts generally had sided with insurance companies. Health insurance companies had no obligation to reimburse patients for experimental treatments and had a right to cap their coverage, according to recent rulings. [Incidentally, the up-coming film 'The Man Who Sued God' is a romantic comedy about a man who sues The Almighty after his fishing boat is destroyed by lightning and his insurance company refuses to pay, declaring the incident an act of God.]

...[An insurance] company has paid out \$2.4 million to a man after he claimed he was abducted by aliens. Joseph Carpenter (23), self-styled "hardcore UFOlogist" from London, paid \$238 a year to unusual risks insurer... GRIP... for a policy against being "abducted, impregnated or eaten by aliens". [GRIP's] managing director... announced the payment... after [the 23-year-old] provided a transparent, webbed claw as proof of

the claim... The claw was examined by an unnamed Cambridge biologist as part of the verification procedure... The testimony of four witnesses and the video and photographs of the abduction were also required as proof. A[n A]ssociation of British Insurers spokesman... said: "There are only two people in the world who can verify whether this payment has been made and they are [the managing director] and the policyholder." ...GRIP... made its name offering bizarre policies including one for virgins concerned about immaculate conception [(the policy-holder was required to pay £2/week; any payment of £1m would be accessed by a panel of experts that excluded church officials')... - 1996

THE TRUTH is out there. But for a man supposedly paid \$2.3 million by an insurance company for being abducted by aliens, the truth is an embarrassing down-to-earth scam. Joseph Carpenter... an electrician from... North London, says he was taken aboard an alien craft while UFO-spotting... He and his insurer insist he was paid \$2.3 million from a policy covering him against abduction. The story of the payout was widely reported. If anything is out of this world in the tale it is Carpenter who, like the spaceship, does not exist. For Joe Carpenter read... an unemployed... courier, who dreamt up the idea of selling American-style alien abduction insurance in Britain. The man "paying" the... cheque is, in fact, [Carpenter's] business partner... an insurance broker with a talent for promoting bizarre policies to get publicity... It is insurance, but not as we know it... [The partner] boasts he has already sold 1100 policies against alien abduction with "many hundreds of inquiries" a day since the payout. Each policy costs \$233 plus \$5.80 tax. "I keep \$117 of that," he said. [Carpenter] first conceived the idea of selling UFO insurance last summer. He advertised in the *Fortean Times* and the US tabloid *National Enquirer*, offering policies for US\$17.99. In return, buyers were to receive a certificate offering to pay up to \$93,023 per alien encounter... [The partner] read about the offer in an insurance journal and contacted [Carpenter]. He struck a deal to become sole agent – with the cost of the policies rising to \$233. What was missing was a suitable case study to publicise the scheme. The story of green men abducting people aboard a spaceship was dreamt up in the green room of the Central Television studios... before both men appeared on a chat show in November. As the story took on a life of its own, [the partner] handed over a giant-sized Barclays Bank cheque... Barclays knows nothing about the cheque.

...AN ENTERPRISING conman pushed his luck a touch too far and is now behind bars at Charlotte, North Carolina. He insured a case of fabulously expensive cigars against fire. The insurance company refused to pay when he then claimed all 24 cigars had been destroyed in "a series of small fires." Understandably. He'd smoked the lot. The... [insurance company] lost a subsequent court case, and paid hefty compensation, because the judge ruled they'd accepted the cigars as insurable against fire – without defining what they considered an "unacceptable fire". After cashing the cheque, however, the smoker was arrested on 24 counts of arson. His insurance claim proved his guilt. Now he'll almost certainly be appealing against getting consecutive sentences of one year – on each of the 24 charges.

...Insurance companies in A[US] had caught out a fraudster who declared he made no claims but had submitted 20 in just a few months. To detect that crime in N[Z] was difficult... and many cases do not end up in court because police are not given the resources to investigate them properly... [But now the p]olice are considering charging insurance companies to access crime files through their controversial new crime-busting computer... due to go on-line sometime next year... The parties are discussing sending crime details to insurers via e-mail... The... Assistant Commissioner... said police already shared information on burglaries and insurance fraud with the industry.

...[the] assessor... shuffles a sheaf of household burglary claims and remarks wryly on the high cost of sunglasses in Auckland. "Just about everybody seems to wear \$125 shades in this town. I must be a bit of a cheapskate. Mine never cost more than \$19.95 from The Warehouse." It's an example of how some policyholders inflate their claims, how the leather handbag bought at the local crafts market becomes a designer label worth \$475, how the \$50 in cash in the matching designer wallet becomes \$500, how the 14in television grows to 20in even though the dust mark on the empty shelf indicates otherwise, how the twin-head video player becomes a four-head state-of-the-art model. "I suppose it's human nature for some people to try it on a bit but it makes you a bit of a cynic when you read through some of the claims... I ask for receipts, for a look at their last bank statement, perhaps for photographs of them wearing that expensive leather jacket... [S]ometimes it becomes a matter of tactful negotiation, or we can call in an investigator to pursue the matter further... We are entitled to refuse to pay out if there's proof of a deliberate attempt to deceive... A lot of people don't know that." [The assessor] works for National Insurance. The company's claim form starts with a bold-type warning that signing the claim is a declaration under the Oaths and Declaration Act, meaning any false statements can result in legal action and serious penalties... The Insurance Council estimates that false and inflated claims... amount to 10[%] of all claims. Inevitably this is reflected in rising home content insurance premiums, says [a] council spokesman...

Insurers to wage war on cheats... The average N[Z] family would save about \$40 in insurance premiums every year if every insurance cheat was caught. Some N[Z]ers are making a living out of false insurance claims, say insurers, who are about to launch a campaign to find them. And they want to use a controversial weapon to wage war against... insurance fraud... a national claims database... Four years ago [one man] was taken on as the... NZI Insurance... company's first investigator. Now he is heading a unit of 18 former detectives... Last year, they investigated 3500 claims and found \$6.5 million worth of insurance fraud – about a third of the total... Inflating values or claiming for the same items from more than one company are two common ways of cheating... [Another] headache for insurers... is... the problem of travel insurance fraud, which surveys last year showed to be significant. "It's so easy for box Brownie cameras to become hi-tech Pentax machines when claims are made,"...

EVEN the nicest of people commit insurance fraud. And they do it for apparently the noblest of reasons. Like the Wellington woman who flattered with four friends, was burgled, and made a \$5000 claim. The size of the claim raised suspicions with the insurer who found out that most of the stolen goods belonged to her uninsured flatmates. Why did she falsely claim? Because she felt sorry for her friends, she said. Have you ever exaggerated the value of goods when making a claim? Have you insured your son or daughter's car in your name? Then join the club. It's you that the insurance industry is targeting in its new campaign against fraud, as well as the out-and-out cheats who do the rounds of the companies claiming on the same "lost" or "stolen" item. Insurance fraud is estimated to cost the industry \$50 million a year; one in five of all claims are thought to involve an element of fraud. And companies say it's not just their profits that are at risk. [The]Insurance Council chief executive... said the average family would save more than \$50 a year in insurance premiums if fraud could be wiped out... It's not that we don't understand what insurance fraud is. Pretty well everyone questioned in [an] insurance council survey agreed that exaggerating a claim was wrong... "The problem is that insurance is such an easy target for fraud," said [the executive]. A genuine loss can be so easily exaggerated, and the insurance company is so dependent on your honesty and accuracy when taking out a policy or making a claim. "There's also a view that there is no 'victim' when the insurance company is ripped off, and that in making a slightly shonky claim you are doing no more than getting back what you are owed,"...

[An Aucklander] was diagnosed as HIV-positive two and a half years ago. The news came as a shock to the Aucklander who didn't know his partner of seven years had the human immuno-deficiency virus... which leads to Aids. Before [the Aucklander] learned he had contracted HIV, he and his partner bought a house and took out mortgage-protection insurance in case something prevented them paying off the mortgage. Yet when his partner died [the Aucklander] was forced to take over full repayments. The insurance company refused to pay out because they said [the Aucklander's] partner knew he was HIV-positive when the policy was taken out – even though [the Aucklander] knew nothing about it... The issue of discrimination against people with HIV was raised this week when the Aids Foundation said it will complain to the Human Rights Commission about Sovereign Assurance's income-protection policy. The policy excludes people who contracted the virus through sexual contact or intravenous drug use. It does, however, cover people who contracted the disease as the result of a blood transfusion, in-vitro fertilisation or artificial

insemination. [The]Aids Foundation executive director... says the policy appears to make a moral judgment about how people contract the disease. Sovereign Assurance's director of operations... denies this, saying the company relies on statistics to back up its decision.

...[NZ's] 1993 Human Rights Act aims to prevent discrimination against people carrying an organism in their body capable of causing illness, including HIV and Aids... [T]he act became law in February, 1994... In the past two years the [Human Rights Commission] has upheld at least three complaints linked with HIV and insurance companies... One person was refused mortgage protection insurance because he was considered at risk of contracting the disease. The complaint was upheld, the complainant received a policy and premiums were waived for a certain time. He also received a five-figure settlement in compensation. A case last May involved an application for life insurance. After answering questions about sexuality the complainant was quoted a premium double the usual amount. The commission upheld the grievance and the complainant received a four-figure settlement. Another person complained about a life insurance application form, saying the questions discriminated against gay and lesbian people. He received a small settlement and the company was ordered to adhere more strictly to the Aids code of Practice for Life Insurers drawn up by the Life Office Association, now known as the Investment Savings and Insurance (ISI) Association.

...An insurance company has decided not to exclude cover for people who contract HIV through sex or drug use... This week Sovereign Assurance's director of operations... said the company had removed the HIV exclusion clause two days after the... article appeared. Sovereign still reserved the right to exclude individuals if they were a high risk, but would not apply a blanket exclusion to people with the virus... [In related news, i]nsurance companies are refusing to provide new flood cover to flood-prone houses in the Thames suburb of Moanataiari, saying the risk is too great. State Insurance and NZI, which hold 80[%] of the cover for Moanataiari, are writing flood exclusion clauses into new policies, with NZI requiring houses to be lived in, not just used as holiday homes. The decision has angered a Thames man... who fears he will be unable to get tenants... [T]he flood-damaged units were ready to be let again, but NZI had denied contents insurance against floods to a prospective tenant.

...An insurance company's refusal to fully insure a house in the flood-prone Thames suburb of Moanataiari is threatening the occupants' mortgage and increasing the already high level of stress the owners feel... [The owners] say they have been on tenderhooks since AMP pulled its cover against flooding after [a c]yclone... The company paid out \$65,000 to replace damaged furnishings after 45cm of seawater surged through the home... Thirty-three other homes were left uninhabitable... National Insurance... [has also] withdrawn flood cover and State Insurance and NZI refuse to cover new clients in the suburb, despite the Thames Coromandel District Council pledging to improve flood protection... A council working party has recommended raising and widening the existing sea wall, improving the drainage system and supporting it with water-removing pumps. Costings are expected to be put to the council for debate within three weeks...

Under the Earthquake Commission Act 1993, all residential property insured against fire in N[Z] with a private insurance company is, by law, also automatically covered by the Earthquake and Hydrothermal Commission against natural disaster. Natural disaster means earthquake, natural landslip, volcanic eruption, hydrothermal activity, tsunami... fire, or (in the case of residential land) storm or flooding. From January 1, war damage is no longer included, as a result of a change in the law... Non-residential property is [also] no longer covered against natural disaster under the new law... Another change in the law is that the cover for natural disaster is now on a replacement basis, rather than the previous indemnity basis. Replacement cover means residential property is now insured on the basis that any damage will be repaired and the property replaced, no matter what the cost may be. However, there is an upper limit on this cover... Under the law as amended, the amount of cover for replacement value is limited to \$100,000 including GST. Owners of homes with a replacement value of more than \$100,000 can seek top-up insurance from the insurance company upon payment of the extra premium required. The automatic cover does not extend to any consequential loss, including loss by theft or vandalism.

...['She was a single white female looking for a trustworthy flatmate. But her efforts to find someone to fill an empty bedroom left her with an empty house after her choice turned out to be a con man. She had given him a set of keys before leaving for her job as an accountant. When she arrived home she found her new flatmate had stripped her home almost bare, leaving the 33-year-old with a bitter taste of flatmate-hunting. The accountant feels stupid, and wishes she had vetted the man properly. She is now in dispute with her insurance company as her policy does not cover theft by someone living in her home.']

...Last summer, homeowners lazing by the beach on Boxing Day were rightly alarmed by news of a reserved High Court decision that an insurance company did not have to pay out \$300,000 claimed by a... couple whose house was burned down while it was unoccupied. The judge ruled the couple failed to inform the insurance company they planned to leave their house unoccupied for almost a year. The insurance company's lawyer said the decision highlighted a potentially disastrous situation for holidaymakers... [S]ome... companies required notice from clients who planned to leave their homes empty for as little as 30 days. "But... most companies require notification only if a homeowner was away for 60 days or more..."

...BEING under the legal alcohol limit while driving is no guarantee your insurance company will pay up if you have an accident... Most insurance companies have traditionally made being over the legal limit the test on whether they will pay up. But... [the NZ] Insurance Council has warned drivers that... [they] should check their policies to find out whether or not that was the case... The warning is contained in a document on "10 ways to blow your insurance cover." ...The council has [also warned against not]... paying your premium by the due date[; driving]... while disqualified or allowing a disqualified driver to drive your car[; driving]... an unsafe vehicle where obvious defects such as faulty steering or poor headlights may contribute to your crash...

Couple told to sue their son... A HASTINGS couple is being taken to court by an insurance company for refusing to sue their son for crashing the family car. In October 1995, State Insurance paid out... almost \$19,000 for their written-off [car]. The couple's lawyer... said [the son] was covered by the... policy. State nevertheless proceeded to sue him for the money in the couple's name on the basis that he'd taken the car unlawfully. The company's statement of claim said that on March 27 1995 "without the plaintiffs' express permission, the defendant wrongfully drove the plaintiffs' vehicle, therefore depriving the plaintiffs' of their vehicle and converting it to his own use". Last February the [couple] cancelled the action against their son... [Mr Couple] said his son had often driven the family car, but knew he could only do so with permission. In this case, the car had been parked in front of the [son's car], and because it was early in the morning and his parents were still asleep after a late night working at their fish and chip shop, he decided to take [their] car rather than wake them... [Mr Couple] said the car hadn't been replaced and the money had already been used to pay... associated[car] hire purchase costs. A small amount had also been put into the... shop the couple were working seven days a week in to keep afloat... Two months ago the company started proceedings against the couple in the Hastings District Court to get the money back... [Mr Couple] said he and his wife, who had been insured with State since 1965, were devastated and would probably lose everything if they had to pay the money back... The family is now counter-suing the company.

...Parents who insure their children's cars... could be refused payouts... This follows a warning yesterday by the [NZ]Insurance Ombudsman... that where false information was supplied, insurance companies did not have to pay claims. He said some parents considered it reasonable to insure their children's car because... people... under the age of 25... were more likely to have an accident... [and therefore] had to pay... much [higher] premiums... Insurance companies plan to clamp down on the dishonest practice, which is believed to be widespread... [A] spokeswoman for the Insurance Council... said claims could also be jeopardised by half truths, such as a parent claiming to be the main driver and naming one child, the car's real main driver, as nominated driver... "The bottom line is we are trying to get the costs where they lie, and if parents get away with it, then

their children are not paying their fair share into the premium pool.” ...The difference in premiums for different ages and risk ratings was substantial. For example, a 20-year-old insuring a \$3000 car... [in] Auckland would pay... \$829 and... a 50-year-old... \$420. [Most Aucklanders who own a \$3000 car would get a ‘third-party’ insurance policy, which is much cheaper but only insures them against any damage they do to other people’s cars or property. Unfortunately, it isn’t always possible for insurance companies to get the costs where they lie (‘accidents caused by uninsured drivers cost up to \$85 million a year’). Some NZ insurance companies have complained that a growing craze amongst teenagers to set stolen cars on fire (‘in Auckland alone, 650 vehicles a year are stolen and torched’) – which usually means the car has to be written-off – now ‘costs them \$25 million per year.’]

...Alarm at soaring car thefts in Auckland has prompted the police to set up a dedicated hit squad to investigate organised car rings... In Auckland as many as 2000 cars stolen each year are never recovered. Police believe the vehicles are modified, re-registered and sold... “Car thieves manage to take a wrecked car and then use its identification...” ...The Insurance Council chief executive... said car theft was a “national disgrace,” costing policy holders about \$40 million a year... More than 32,000 cars were stolen in N[Z] last year – at a rate of almost two out of every 100 vehicles on the road... The risk of getting your car stolen was almost twice as high... as in A[US] and... six times greater than in Germany.

...POLICE in Coesfeld, Germany, thought they had heard everything until a 12-year-old boy reported his car had been sideswiped by another. The boy said he had parked at the kerb and returned to find his car smashed. Tyre marks indicated... a hit-and-run driver... “Do you think the other driver’s car insurance will cover the damages?” ...[the boy] then produced a bag holding a mangled remote-controlled toy racing car.

...[‘An entrepreneur schoolboy selling flowers to save up for a skateboard has fallen foul of local laws by failing to take out a public liability insurance policy. The boy had been selling chrysanthemums for 50 cents a bunch at a table outside his family home in Wonthaggi, in Victoria, until council officials stepped in. “He hadn’t been set up for long when the bylaws officer stopped him because he didn’t have a A\$20 council permit,” the boy’s mother said on television. The A\$20 wasn’t a problem, but he needed A\$5 million in public liability insurance to get the permit and it would cost A\$500. The ban highlights the frustration facing event organisers in AUS who must meet the mounting cost of liability insurance when holding fairs and social events.’]

...‘The social and cultural life of AUS is under threat from its citizens’ enthusiasm to run to their lawyers EVERY September the tiny village of Herberton, on the Wild River southwest of the north Queensland city of Cairns, celebrated the reason for its birth with a festival of tin. The festival was a major social and commercial event for Herberton’s 1000 residents, whose life revolves around tourism, maize and potatoes now that the rich veins of the Great Northern Mine are history. Last year the tin festival also became history. The town simply could not afford the rocketing cost of public liability insurance. In a country that has embraced litigation with glee and zest, Herberton would not risk celebrating without the safety of millions of dollars of insurance cover. During the past two years, claims on public liability insurance in AUS have soared by 60%, with the average payout on the preceding seven years tripling to A\$18,000, and the once-profitable business of insuring against accidents diving permanently into the red – losing an industry-wide A\$229 million on total payouts of A\$1.2 billion in the last 12 months (last year, the huge AUSn insurer HIH failed in a A\$4 billion collapse that shook AUS and gave force to the warnings already emerging around AUS). Insurers have responded, predictably, by either increasing liability premiums or simply refusing cover. Across AUS, orthopaedic surgeons and other medical specialists are abandoning country towns, sports clubs are shutting down, council swimming pools are closing and local fetes are being cancelled, gymnast clubs have folded, pony club events have been cancelled, art workshops for pensioners and the disabled have been closed, senior citizens clubs have vanished, Scout groups are under pressure, and daycare centres have been forced to put up fees, forcing out many children. The Victorian Employers Chamber of Commerce found that one-third of the companies it surveyed had trouble paying higher premiums – despite never having made claims – following average cost increases of 40%, rising to 174% for finance, property and business service businesses. Small businesses are being pushed to the brink. At the heart of all this, according to their host of critics, are lawyers, feeding off the greed of litigants fed on tales of huge damages claims and what the insurance industry calls the lotto jackpot mentality.’

...‘Police are seeking arrest warrants for 2 men, in the latest grisly attempt to defraud insurers in South Korea. A debt-ridden grocer paid an acquaintance about \$79,000 to cut off his feet at the ankles in a bid to collect \$3.2 million insurance, police said yesterday. Detectives were called in after a customer found the man lying on the floor of his shop earlier this month with both feet missing. The 51-year-old shop-owner from Seoul told police that someone must have sliced off his lower limbs after he had passed out during a heavy drinking binge. But detectives became suspicious after neighbours revealed that the grocer had for months been asking them to slice off his feet. A local pharmacist told police that the grocer had bought an anaesthetic a day before the amputation. Officers then discovered that the grocer had taken out about two billion won in insurance policies in the months before the horrific mutilation.’

...‘a year-long investigation in the US into parents who insure their children and then try to murder them for the money, uncovered 50 cases.’ In local news, ‘a Hastings man convicted of trying to kill his wife in a house fire and endangering his children was yesterday sentenced to 10 years jail. During the trial in the High Court at Napier a crown prosecutor said the 44-year-old orchardist wanted to kill his wife of almost 14 years for her \$500,000 life insurance policy. The defence lawyer has appealed against the verdicts, saying enough new material emerged during the trial to support the suggestion that the fire was lit by someone in the house other than his client. However, the judge did not accept the orchardist’s suggestion that his eldest son was responsible. The judge said he believed the orchardist’s debts and personal problems drove him to crime, but pointed out that countless other NZers had suffered financial stress in the last 20 years without resorting to crime.’

...‘A money manager has vanished with as much as \$US3 billion in clients’ money, leaving behind a things-to-do list (item No. 1: Launder money). Insurance company regulators said the 44-year-old’s unlicensed brokerage had siphoned off money from a dozen small insurance companies in five states. The companies, based in Mississippi, Oklahoma, Tennessee, Missouri and Arkansas, were placed in receivership when they could not account for assets invested with the 44-year-old’s Liberty National Securities Inc.’

...NZ’s] Securities Commission has called for a review of the Life Insurance Act 1908 after a discussion paper found an industry with a hodge-podge of practices, investment policies and only limited regulatory supervision. Financial reporting by life offices is already under detailed review with a draft reporting standard already issued, but there are not prescribed standards for solvency of capital adequacy. A commission discussion paper found there were often only limited constraints on life offices on what they did with investment assets which, including superannuation savings, currently exceed \$20 billion. In one case, four-fifths of a life company’s total assets had been advanced to a related party while the life insurer had also guaranteed a bank overdraft obligation to its parent. Others had excess investment concentrations while N[Z]’s one life company failure, ACL Insurances, which collapsed in 1989, had investments concentrated in a retirement home which was a related party and a commercial development which was... subject to a bank mortgage... The commission said policyholders also had little say in changes in ownership of their policy contracts and how the risks and rewards of portfolios of life insurance business were affected through reinsurance. Processes for determining the division of profits between different classes of policyholder and between policyholders and shareholders were generally unclear to the outside observer. With the recent move to demutualisation, the splitting of profits between policyholders and shareholders was going to assume greater importance in the future... In contrast to N[Z, AUS] had direct controls over external borrowing by life companies and separated life company business from the rest of the operations through statutory funds... [Incidentally,] National Mutual’s 69[%]-owned Hong Kong-based subsidiary [has] increased profits before tax by 13[%] to A\$215 million... The... [i]nsurance company... is now waiting to see if it has won the “A[US]n” licence to do business in China promised in September by the Chinese Government.

...National Mutual[s] boss... might be wishing he were an American import. If [a] rival AMP chief executive[s]... \$17 million three-year package... is to be used as a benchmark, then [the NatMut chief executive] would have to figure he would be worth at least half that. Based on the results produced by [NatMut] over the past few years, the group’s half a million shareholders, including the 130,000 in N[Z, might agree. The chief executive] is a home grown boy who has been at NatMut since 1970, but as it is he is not doing too badly in the salary stakes. Last year, he was

promoted to be one of the 40 or so A[US]n chief executives that are pocketing more than \$1 million a year. [He] received \$1.16 million in 1996, his performance bonus should take him above that in 1997 and so far the 750,000 options that he was awarded at the annual general meeting earlier this year are nicely in the money. So what's he do[ne to deserve it]? Quite simply, in October 1992 he took control of a moribund organisation that was near collapse and turned it into a powerhouse... group that has added \$2 billion to [its] funds in the past two years. Last week, he delivered a 42[%] increase in annual net profits to a record \$300 million... Nat[Mut] Asia's net contribution during the year of \$139.2 million was up 40[%]... The group... will report its N[Z] performance next week...

Tower Corporation is congratulating itself on what it says has been its best year in its recent history, if not since its inception in 1869. The group, which now has half its activities in A[US], reported a 73[%] jump in revenue to \$3.7 billion in the September year, with assets of more than \$10 billion up 27[%] on 1996... The general insurance operation, National Insurance, reversed a small loss in 1996 to return a profit "in eight figures." ...The details come as the group fights off a hostile bid by Guinness Peat Group to demutualise Tower through a marriage to its A[US]n life subsidiary Tyndall. - 1997

The insurance industry, no stranger to fire, storm, and the predations of the nation's less savoury inhabitants, is weathering another risk, that of unprecedented competition as overcapacity bites into profits and forces a round of takeovers and exits... Even some of the majors have struggled: State Insurance and National Insurance both wracked up huge underwriting losses in 1996... \$11.5 million... and... \$13.2 million [respectively]... They were only saved from torrents of red ink by healthy profits returned by their investment funds... In 1996, the industry... in N[Z]... took in a total of \$1.8 billion in premiums. From that, it made a collective underwriting profit of just \$34.4 million, a mere 2c in every dollar... Still, not everybody is in a bad way. Royal and SunAlliance, 10 years ago a nipper with only \$40 million in turnover, has flourished in size and profitability. In 1996, SunAlliance took in \$237 million in premiums, making it N[Z]'s third largest general insurer, while chalking up an \$18.4 million underwriting profit... even though it wrote off \$9 million... [The] \$163 million sale of NZI Life to Prudential worked to the advantage of buyer and seller... NZI, which shares the top ranking in terms of size with State Insurance, reported a \$15.6 million underwriting profit in 1996.

WHAT WOULD HAPPEN TO YOUR LOVED ONES IF ANYTHING HAPPENED TO YOU? ...THEIR FUTURE - YOUR RESPONSIBILITY... Nobody likes to think about death, but if you have a family dependent on you, you owe it to them to ensure that if you die they are looked after. While life insurance cannot remove the emotional trauma of losing a loved one, it can help minimise any financial suffering... It's simple to protect their future... Protect their future now. - NZI Life

"Give us regular payments and we will protect your family. However, unlike the Mob, when you die we will give the money back to your family plus interest - unless it can be proven that they murdered you, or you committed suicide. In the meantime, we will use your money to finance big expensive cars to fill parking spaces while we sit at big desks in big offices in big glass towers, and to pay ourselves exorbitant incomes for a superficial form of employment."

50 Plus Life Insurance means my family aren't going to be landed with funeral expenses and bills when I die... [The policy provides] guaranteed acceptance if you're between 50 and 79... [There is also n]o medical or health questions... with premiums from \$9.95 a month.

...A television advertisement for 50 Plus Life Insurance was misleading, says the Advertising Standards Complaints Board. It upheld a complaint that the advert omitted to say there was no payment on policies in the first two years.

...[the new 50+ pays the benefit as soon as anyone's diagnosed with a terminal illness. That gives you the comfort of knowing you can settle your affairs before you die. Triple benefit death-by-accident cover starts immediately; full life insurance cover starts after 24 months.]

...WHO needs life insurance these days? Probably far fewer people than have it... There are only two reasons to buy life insurance: Debt and family responsibility. "Unless you have either one or both... you do not have a need for life insurance,"... [But] if you do need life insurance, steer clear of "whole of life" or "endowment" policies... These "dinosaurs" were difficult to understand and expensive to feed. Policy owners spent the first few years paying commission to the agents who sold them the policy, so it took six to seven years to achieve a value equal to the contributions... And... the average life of such a policy was seven years. Insurance companies knew this, so you paid a lot of the fees up front.

...Insurance industry observers say that a case before the High Court in Wellington this week shows how life insurance companies make money out of the lapses of its clients... The... hearing involves a type of... policy named Lifewise... Colonial Mutual Life Assurance Society Limited may be liable for between \$190 million and \$380 million when it may normally have expected to be liable for only about \$76 million. That is because life insurance policies are sold on the assumption that, in N[Z], 60[%] will lapse during the life of the policy because the clients lose interest or change plans. The worldwide average for lapses is 70[%; in AUS it's 75%]... Lifewise, originally, was an attractive policy which covered the lives of the policyholder and one other named beneficiary for \$50,000 each. It also offered substantial cash benefits by CML from investment of the premiums... To encourage wide marketing of the policy, CML offered its agents high commissions. The court was told that commissions averaged 129.5[%] of the high first-year premium. The industry standard is... commission of between 40 and 50[%] of the first year's premium. Two of CML's commission agents calculated that, because of a combination of the high commissions, diminishing premiums and the bonus benefits, they could in fact offer the life assurance free to clients. The total premium would be covered by the high sales commission plus the long-term investment benefits... The business opportunity was apparently sound enough to attract a finance company, Policy Management Limited... It seems that the agents were able to bulk-sell the policies as, for instance, free employee benefits to large companies. CML saw sales of the policies skyrocket. In 1992, policies with a commission value of \$2 million were sold. The following year the commission value was \$4.4 million, in 1994 \$10.6 million and in 1995 \$12 million. Some close to the case say that eventually CML would have realised that, because the policies were free, there would be no lapses. CML would be liable not only for the usual 40[%] of policies issued, but for the full 100[%]... The matter has come to court because CML alleges that the payment of premiums by the finance company, PML, has been discontinued, and CML is suing the sales agents for return of commissions totalling about \$25 million. In submissions... this week... [PML] claimed that policyholders - in 2314 cases the policyholder is effectively PML - were entitled to stop payment because of conduct by CML. They allege that the company changed the wording of the policies without advising the sales agents or PML... One alleged change... involved the clause: "The maximum amount payable under the special death benefit will be the value of your investment account plus \$50,000." ...this was changed to: "The special death benefit payable under this policy shall not exceed \$50,000 inclusive..." As a result, the defendants say... CML[- which believes that it i]s within the rights of an insurance company to change conditions of its policies from time to time... [-] is in breach of... the code of practice which allows insurance companies to be exempt from the Securities Act; the Life Insurance Act 1908; [and]the Fair Trading Act. - 1997

...set up by the Accident Compensation Act 1972[the]... **ACCIDENT COMPENSATION CORPORATION** controls a comprehensive, compulsory accident insurance for all N[Z]ers... with the threefold aim of promoting safety from accident among all citizens, providing for the rehabilitation of the injured, and ensuring prompt, fair and reasonable compensation to every accident victim. The philosophy behind the scheme is that the community as a whole accepts responsibility for the accidents which inevitably afflict a proportion of its members. Therefore the scheme is funded

by the following means: (1) levies on employers (including the Crown) and self-employed, paid through the Inland Revenue Department as a agent for the corporation; (2) levies on motor-vehicle owners, paid at the time of registration through the Post Office, acting as agent; and (3) general taxation. The benefits include earnings-related compensation at the rate of 80% of normal average earnings, subject to a maximum, with adjustments in special circumstances for partial incapacity or for loss of potential earnings; lump sums for permanent physical impairment; and funeral expenses and lump sum payments to dependants in the event of fatal accidents... The scheme was a world first and is regarded as an innovative piece of Social Welfare. It supersedes legal rights previously held by citizens to sue through the courts for damages in cases where negligence contributed to the cause of an accident[, and replaces the Workers' Compensation for Accidents Act (1900)].

[A] LAWYER... took it hard when a bank knocked back his loan application for \$1.5 million to buy a West Auckland marina. Two years later, maintaining the rejection was an "accident" that had caused him severe psychological trauma, he lodged a claim with the Accident Compensation Corporation, now called the Accident Rehabilitation and Compensation Insurance Corporation (ACC)... When the ACC turned him down, [the lawyer], a former mayor of Waitemata, appealed. This time, a sympathetic adjudicator disagreed with the ACC lawyer's argument that [the claimant] was the architect of his own misfortune as he had not signed up finance before agreeing to buy the marina. He ruled that [the claimant] was eligible for compensation. The High Court subsequently reversed the decision but not before countless hours of court time had been occupied... Not surprisingly, the ACC has become a financial nightmare for N[Z]ers. It now costs the nation seven-and-a-half times more than it did 20 years ago and carries \$7 billion in unfunded liabilities... Litigation against the ACC is often paid for by legal aid... "It's another black hole down which we pour money," observes... [the] editor of the *N[Z] Law Journal*... After one plaintiff received five legal-aid grants to finance a drawnout minor case, [a]... High Court... Justice... fumed... that legal aid should not be used to "take steps which would be regarded as unjustified luxuries for those funding their own litigation." ...While the government obviously wants to cut back on the payouts[– in 1992, due to inflated costs, lump sum payments were replaced by a weekly allowance ('under the current law the claimant answers 136 questions which are sent to Wellington where someone converts them into a disability score, which in turn is converted into a percentage of the minimum and maximum allowance (\$4.38/week to \$43.82/week – although the allowance is actually paid quarterly); if a claimant is unhappy with the allowance the case will be reassessed, and if no change is forthcoming the claimant can appeal to the courts') –] more and more lawyers are succeeding in winning compensation for bizarre cases never envisaged in the corporation's original concept. "It's appeal gone mad," [the P]M... was reported as saying after the [West Auckland marina] ruling. "A pup that has turned into a pitbull," fulminates... [the] executive director of the Business Roundtable, [who is also] a member of the anti-ACC lobby group Campaign for Choice in Accident Compensation... In a recent case, a 51-year-old Whangarei truck-driver had already collected \$14,250 for injuries he suffered when, while drunk at the wheel, he caused a crash that killed four people. When the ACC stopped his additional earnings-related compensation, the truck driver appealed and won. The appeal authority ruled he be paid 75[%] of his earnings-related compensation, partly because, the judge said, he had paid his dues to society with his term of imprisonment. (The ACC is appealing this decision.) The judgment outraged many N[Z]ers. An angry Whangarei MP... insisted the truck driver deserved no compensation. "This man drank far too much booze... He was no victim... and was responsible for killing someone." ...When a pig damaged the right knee of... a kaumatua [(Maori elder)] from Moerewa in Northland, he won \$6000 in compensation. He rejected this sum as "insulting" and sought \$10,000 for pain, loss of prestige and suffering because he could no longer stand up on the marae[('open space reserved for Maori assembly and the focal point of Maori social life, both formal and informal')] to greet visitors. The Accident Compensation Appeal Authority awarded the elder a further \$2000... Scores of cases like these are crowding our courts and industrial tribunals as N[Z] develops a taste for victim culture and litigation, with the motto: *If anything goes wrong, get compo*... Nowadays, almost any dismissal, injury or mishap – even stress – leads people to seek compensation, sometimes years after the event. Thirteen years after battling with demonstrators... [a] retired Hamilton police officer... was found eligible to claim up to \$10,000 compensation for job-related stress... "Does this mean that every member of the police force will have the right to compensation after attending a disturbance?" asks [the Business Roundtable executive director]... Incredibly, similar claims are encouraged by fine print in N[Z]'s unique compensation law that guarantees anyone judged to be a victim of accidental injury comprehensive 24-hour no-fault cover... A landmark 1994 ruling of the Court of Appeal held that the law's principles meant that even people injured while committing a crime should be refused compensation only for some exceptional reason, one of these being that the award was "repugnant to justice." [Someone who was] jailed in 1990 for the manslaughter of a man he knifed in the back during a brawl, laid a claim with the ACC for an injury received shortly after the stabbing. The appeal authority heard that a departing car had run over [his] left foot at the scene of the fracas... and permanently damaged his ankle. It ruled [he] was eligible for compensation even while he was in prison.[The corporation itself was criticised 'for being too literal in awarding compensation after an inmate who injured himself while jumping off a prison wall during an escape attempt received a five-figure payout.'] "Compo" is even handed out for self-sanctioned injury. A prisoner at Paparua Prison... had permitted his cellmate to inject him in the wrist with Palfium (analgesic) tablets crushed in saliva. Gangrene developed in [the prisoner]'s arm, which had to be amputated four days after the injection. The High Court sitting in Wellington rejected the ACC's argument that [the prisoner] was responsible for the loss of the arm. [The prisoner, said the] Justice... had not intended to harm himself, but to get pleasure. Nor, the judge added, was it enough to say [the prisoner] was reckless or careless. He judged that [the prisoner] was eligible for compo... Sexual harassment claims have mushroomed in the last five years with bigger and bigger sums being awarded. Payouts sometimes reach \$40,000. This year, potentially the highest ever award for sexual harassment was made possible for a woman claiming that she had been sexually abused by her psychologist – 17 times. The ACC deemed her personal injury was the cumulative result of the sexual relationship and awarded her \$10,000. But the appeal authority thought differently. It ruled that each incident should be counted as a separate "injury" – clearing the way for her to claim up to \$170,000... As the victim culture throws up case after case of baffling decisions, many defendants cave in and settle out of court to avoid crippling legal costs. "It's a real dilemma for insurance companies," says... [the] public affairs manager for the Insurance Council... who believes that fraudulent claims are widespread. "It's often been easier and cheaper for insurance companies to cut their losses rather than pursue offenders."

...A 50-year-old... man appeared in the Auckland District Court yesterday charged with defrauding the [ACC] of \$74,000. The corporation alleges the man claimed earnings-related compensation between May 1992 and October 1995 while he was working.

...Bigger fines are urgently needed to sting employers ignoring safe work practices, says the Labour Department... Most employers were aware of safe work practices, especially after a landmark... occupational overuse syndrome (OOS)... ruling against FAI Metropolitan Life Assurance last year... [and the] ANZ Bank was fined \$30,000 on Thursday for... OOS... suffered by three staff... [However, the] deputy chief executive of the Employers Association... said the threat of tougher fines was a concern when some OOS cases were not solely confined to work habits. The 5817 OOS claims put to the... [ACC] last year cost \$6.9 million... up from the[previous year's] \$4.2 million paid on... 3234 claims...

DOMESTIC injuries are rising at such a rate that accident compensation officials are going back to the drawing board to tackle the problem. Accidents at home and in sport and recreation jumped dramatically last year, costing the country an estimated \$12 million more than 1995... In the latest figures, home accidents accounted for about 46% of earners' claims while recreation was just 23%. Injury claims from earners to June jumped by more than 20,000... compared with the previous year. There were 377,767[earners'] claims in 1995, which rose to 400,094 in 1996. ACC estimated the earners' claims cost \$208.5 million in 1995... Employers' claims, for injuries to employees during work hours, dropped from 292,328

to 292,206. Non-earners, by far the largest group of claimants for injuries, went from more than 718,000[down] to 711,928. Medical misadventure claims dropped by 16 to 2051.

...A 76-year-old man who says his sex life “died” after a prostate operation left him unable to ejaculate is collecting \$10,000 in accident compensation. The Accident Compensation Appeal authority has ruled that ACC officials wrongly refused to award him the maximum payout for pain, suffering and loss of enjoyment of life. It found that... [the 76-year-old] was not told by doctors of the likelihood of ejaculation problems after the surgery and ordered the authority to pay him an extra \$2500. The pensioner said yesterday that the payout could not make up for his... inability to have children, and he would fight for more. He underwent surgery at Auckland Hospital for an enlarged prostate... when he was 66 years old... The father of seven said he later separated from his wife and wanted to have more children if a suitable partner came along. He lodged a claim for... [ACC] in 1986 and was awarded \$6000 in 1993. A review in 1994 increased this to \$7500... However... he was now fighting for compensation under section 78 of the 1982 act for permanent loss or impairment of bodily function, which has a maximum payout of \$17,000. [Incidentally, ‘it pays to be an Aussie bloke if fate strikes and your testicles get the chop. An Aussie without his manliness is entitled to lump-sum compensation of up to \$NZ450,000, while his Kiwi cousin receives about \$15,000 for the same misfortune. Based on American Medical Association guidelines, NZ men are rated about 30% impaired for loss of both testicles – or one if that is all they were born with. The discrepancy gets worse if the Aussie sues whoever was responsible for losing part of his genitals. It is not unknown for payments to top \$1 million.’]

...A GROUNDBREAKING payment to a man crippled by an exploding tyre has paved the way for people injured in accidents to sue where negligence is involved. The High Court in Dunedin on Tuesday upheld a \$15,000 exemplary damages award to [the 52-year-old man] severely injured when an over-inflated tyre at a public garage burst, hitting him with two-tonne force. Until now, N[Z]’s no-blame accident compensation scheme was thought to rule out people suing for damages... [In related news,] ACC has put the skids under a \$40 million computer project – after spending millions of dollars developing the system... As many as 100 corporation staff and consultants have been involved... Staff were informed of the decision... on August 21... The corporation yesterday refused to say how much had been spent on the project to date, but internal sources said costs had been running at \$1.3 million a month since January... The ACCtion Project was designed to transform the corporation from a paper-based system to a computer-based one, greatly reducing claims processing times and costs. - 1996

ACC’S crackdown on fraud... will... [shift] into high gear... when a multi-million dollar computer system... [is eventually] unveiled. The \$45 million network, Pathway, will improve efficiency, says the ACC – but will also alert staff to cheats.

...The ACC will start swapping information with the Internal Revenue Department next month in its campaign against ACC fraud... [By the way, ACC’s] fraud unit investigated 1300 cases in the past financial year, referring 315 for prosecution, of which 246 resulted in convictions. Of the \$20 million in estimated savings from the prosecutions, more than \$235,000 was recovered from health-care professionals.

...Have you heard the one about the doctor who made over \$1250 in one day while watching his son play rugby? The minister for accident compensation... has – and she is determined to end such scams. The minister yesterday promised to get tough with doctors who abused the [ACC] system... ACC is being ripped off to the tune of \$100 million a year... based on insurance statistics that 7%-15% of claims are false[, and]... officials estimate that 20[%] of fraudulent claims involve health practitioners, who get \$25 for each consultation with a patient injured in an accident... The doctor... [given as an] example... ended up checking children as they came off the field with injuries. Just five of the children were unable to play on, but the doctor claimed for all 52 he checked during the tournament... [In another case a doctor] claimed ACC reimbursement when patients cancelled bookings or had not even made an appointment, for services provided by nurses or for treatment unrelated to accidents. After fining [the doctor] \$900 and ordering him to pay \$58,265 costs, the Medical Council reduced the costs on appeal to \$31,068.

...The Minister for Accident Compensation... said yesterday that she would bring legislation to Parliament soon... to stop drunk drivers getting accident compensation benefits... “The original law has been interpreted by the courts in the way Parliament wrote it,” she said on National Radio... [after the] High Court at Wellington... rejected a bid by the [ACC] to stop paying compensation to a convicted drunk driver who killed four people. The corporation had appealed to the High Court for the weekly compensation to be stopped on the ground of repugnance to justice, but the court decided the appeal authority had acted correctly when it ordered that the payments continue... [However,] a lobby group... [called the] Coalition on Accident Compensation... said: “It is a pity that some of the people who are ready to piously condemn drunk drivers to penury are silent when it comes to the widespread hardship and under-compensation suffered by thousands of people as a result of the National Government’s changes to ACC.”

...the Government is committed to rebuilding public confidence in our accident compensation system and to restore 24-hour comprehensive but affordable cover... There have been 11 major reviews of the scheme since its inception... All have failed to halt spiralling costs or address some fundamental deficiencies and inequalities in its operation. Between 1985-95 spending on [ACC] increased... from \$339 million to \$1592 million... The cost of reform could be nil. There is scope for the Government to save money.

...Workers’ accident pay will be slashed... [from 80%] of their weekly pre-accident earnings... to 65[%]... if the Government accepts a recommendation that officials are considering as part of a revamp of the... [ACC system. However, a] spokesman for the Coalition on Accident Compensation... said it was difficult enough for people to live on 80[%] of earnings. “...the Government [should] restore the scheme to what [it] was intended, which was 100[%] compensation...” The Employers’ Federation said a cut to compensation could mean more pressure on employers to pay larger top-ups. Some already made up the difference between the 80[%] ACC paid and full pay. A senior policy analyst with the federation... said that in Victoria, A[US], compensation was based on 95[%] of earnings for the first 26 weeks. For partial incapacity it then dropped to 60[%] and then nothing after two years. [Incidentally, ‘almost a 1/4 of NZ’s ACC payments in 1996 were for back pain – and the total is rising 18% annually.’]

...MOST of the more] than 41,700 N[Z]ers... on compo with a crook back should return to work. There’s nothing wrong with them... [according to the] senior lecturer in rehabilitation at the Wellington School of Medicine... Only 2% had a serious, identifiable, problem such as a fracture, cancer or infection... “Back pain occurs in almost every adult at some time and usually only lasts for 48 hours. It is not possible to say where back pain is coming from... Yet everyone, including the medical profession, talks about injury. This is the language of compensation.” ...People should stay active. Even if the back hurt for a while, it would soon settle... Back pain, by far the biggest claims category, is a major headache for the ACC... ACC spends \$350m a year on back injury cases... In the year to June, there were 7584 new claims for work-related back pain or injury that cost an additional \$20.6m... Around 26,700 have been compensated for more than one year... A study by the Injury Prevention Research Centre noted builders, labourers and other construction workers had the greatest number of back injury claimants (18.6%), followed by metal, engine and car workers (9.9%)... But cooks, chefs, bakers and shop assistants were the greatest risk for compensation [to continue] after 12 weeks. [● ‘ACC has declined to pay a woman who hurt her back while avoiding a kick from a cow because there was no contact – a decision which creates a grey area for people who receive strains while exercising.’]

...ACC plans to introduce tough new tactics in October aimed at dumping claimants who have been deemed fit for work. At the moment, many... claimants had been able to stay on... compo at 80[%] of their former wages... even though they had been rehabilitated because there were no guidelines for assessing their capacity for work... Under the proposed new work-testing criteria, long-term ACC claimants... will have no excuses. Those capable of... working 30 or more hours a week... even in a position outside their field, will have three months to find a job... Claimants will also have to take jobs that pay less and have less status than the positions they held when they were injured. If there is no work in their area, they

will be expected to move town to find employment. Those who refuse face a switch to the unemployment benefit and a substantial income drop... The... Department of Labour, said there were about 29,500 long-term ACC claimants, compared with about 26,000 three years ago.

...The... work-testing regime... which is due to take effect shortly... is expected to reduce ACC costs by nearly \$1 billion over five years but increase Social Welfare benefit costs by \$270 million over four years... But the scope of the claw-back on individuals is only now becoming apparent... Paraplegics and amputees could be among those forced into menial jobs or on to the dole...

ACC claimants deemed fit for work but unable to find jobs will have to wait for up to 10 weeks without income, says the Department of Social Welfare... [T]he standard stand-down was one week but it ranged up to 10 weeks, depending on how many dependents there were and how much the beneficiary was paid in the previous six months... [Incidentally, a]n Auckland pensioner who wrongly received \$18,000 in [ACC] payments will not have to repay the money... [after] the ACC decision... was dismissed by [a j]udge... this week... because it had wrongly advised [the pensioner] about claiming the money... [The pensioner] was forced to stop work in 1993 because of his injuries... [from] a 1990 motor accident... But... in February last year... the corporation told... [him] that he could continue to receive weekly compensation... until June this year or change over to the pension... However... in November the corporation wrote to the 63-year-old telling him it had made a mistake and wanted its money back...

A young man is missing out on... [an operation for] hernia that ACC had accepted was due to an accident... because of a delay in the signing of a contract for surgery... [between his local hospital and the ACC. T]hat contract was due to be signed last month but proceedings had stalled. Meanwhile, the... Health Authority [responsible for funding hospitals has] said it would not reimburse... [local hospital's] for any routine surgery on patients with ACC-related conditions...

ACC is considering doing away with coverage for minor claims. The move, part of plans to chop \$400 million from its burgeoning budget, would force victims to pay for their own medical expenses or face higher insurance premiums... ACC regards... serious injuries and rehabilitation... as its core business... [while] minor claims – those involving medical bills... for no more than \$150... [-] make up 90[%] of claims but account for only 12[%] of ACC's \$1.6 billion spending... Compensation for sports accidents, falls and lesser car injuries not requiring long-term treatment could also end. At present, claimants in... the “up-to-four-week-entitlement” category... are entitled to a range of subsidised treatments including general practitioner and physiotherapist visits... An ACC spokesman confirmed that... claims for minor injuries, which now fall into... that category... could include many occupational overuse syndrome claims, which have skyrocketed in recent years.

...[the number of cases in NZ increased] to 8196 last year... OOS is an umbrella term for a number of disorders, including epicondylitis (tennis elbow), tenosynovitis (inflammation of the tendon sheath) and myofascial syndrome (trigger points in muscle tissue), carpal tunnel syndrome (compression of the median nerve at the wrist), and complex regional pain syndrome. It ranges in severity from intermittent pain of varying intensity, experienced when specific activities are carried out such as key board work, writing, and ironing, to constant debilitating pain that affects all daily activities... Emotional and psychological changes invariably appear with prolonged and severe cases and an individually designed rehabilitation programme is necessary.

...Just when you thought it was safe to talk to your computer, a new occupational hazard has emerged in the office. American voice experts are warning that dictating to a computer all day – which requires an unnatural pause between each word and a constant pitch and tone – can lead to O[OS] of the larynx. The U[S] magazine *Occupational Hazards* has reported more than 100 cases of people suffering “cumulative speech trauma” from using speech recognition software. A N[Z] ergonomics consultant... said there were no reports of the trauma here but ergonomists were aware of the American cases. Lawyers, who often dictated on to computers, were one of the professions most likely to be at risk, he said. The director of the Toronto Voice Laboratory and Treatment Centre... [confirmed that] dictating to a computer abused the voice, producing muscle fatigue similar to the overuse syndrome found in Repetitive Strain Injury, now renamed OOS. “The only difference is it’s the larynx, not the wrist, that is affected.” OOS sufferers who switched to speech-recognition software risked losing two ways to communicate, she said.

...*Scepticism still reigns about OOS. For patients it’s all getting a bit repetitive.* The one thing I’ll really miss when I leave work is my computer,”... a secretary, told me recently. After 20 years as a manager’s personal assistant, she was leaving because of company restructuring. [She] was lucky. She had never experienced the anxiety that many office workers feel when they sit down in front of the keyboard each morning. The computer, until recently regarded as a user-friendly wonder-machine, is now viewed with a good deal of apprehension in many offices. And with good reason. Computer use is mainly responsible for the epidemic incidence of occupational overuse syndrome... OOS, or RSI as it is still known in the rest of the world, is now the most claimed-for condition in N[Z] and the leading compensatable cause of absence from work. Last year, ACC dealt with 8277 OOS cases costing \$9.75 million. Unions say that figure is only the tip of the iceberg because many cases go unreported by workers who fear for their jobs. ([The]ACC Minister... is now proposing that “minor injuries” such as OOS will no longer be covered.) In the US, RSI has cost business an estimated \$US20 billion a year... Despite the widespread incidence of OOS and the fact that the most conscientious workers are the ones who tend to suffer most, there is often an unspoken scepticism about it. Aren’t they making too much of a few aches and pains? And how come typists 20 years ago never got OOS? The answer is that manual typewriters stopped people from going too fast, the tiered arrangement of the keys prevented bad hand posture and the carriage return allowed tiny rests between lines... Those who suffer from OOS, though, are in no doubt – the pain is too real. In some cases the injury not only prevents them from working but can permanently disable, stopping them from doing such mundane tasks as driving or dressing... One of the best books on the subject is *Repetitive Strain Injury: A Computer User’s Guide*, co-authored by... a journalist who became afflicted with RSI, and... a doctor... who specialises in treating RSI sufferers. [The journalist] warns that you are in the danger zone for injury if you use a computer for as little as two hours a day. Prevention, the authors argue, is the best medicine. Plenty of exercise, frequent breaks, good posture, proper technique (never resting your wrists on anything when you are typing or using the mouse) and “avoid using the mouse or trackball wherever possible. Use keystrokes instead.”

...[‘an obedient officer worker, injured while exercising to prevent computer strain, has been denied accident compensation because no external force or resistance was involved in the injury’, which is kind of ironic, especially when the fact that s]taff of the **Accident Rehabilitation and Compensation Insurance Corporation** have cost taxpayers... \$1,126,717... in claims for occupational overuse syndrome in two years – the highest reported cost of any Government department[– is taken into consideration]. Papers... show that 252 ACC workers have registered claims for OOS-related injuries since September 30, 1994.

...The Government will take a \$260 million hit in its financial accounts for the 1996/97 year due to an [ACC] provision relating to its liability for long-term care for the disabled... ACC agreed to cover 24-hour-a-day care for a group of about 300 seriously disabled people from April 1995 but a court case[had] sought to get the cover backdated... In some cases it went back 11 years.

...The P[M] has signalled the most radical shake-up of accident compensation in its 23 year history, saying the Government may expose it to private sector competition.

...Attempts by the accident compensation scheme to shake off its “social welfare” image have a long way to go, says the Insurance Council. The council – which is pushing for private sector involvement[in ACC] – has acknowledged that the... [ACC] is trying to run the scheme along insurance company principles. But big changes were needed before the scheme would be viable to the private sector... The present scheme could not be opened to competition while the \$7 billion debt from the “tail” (claimants on ACC for more than a year) was included... Once the debt was removed... [the council’s] chief executive... favoured an interim step towards full privatisation, with the private sector managing claims on behalf of a Government authority.

...Set up under “Pay As You Go” funding... [arrangements, NZ’s ACC system once] guaranteed compensation to all... [Unfortunately, the system had to work with] the historically low premiums – particularly under periods of National Party Government where the employers’ account was allowed to run into deficit. This ultimately led to snowballing contingent liabilities [– now] totalling some \$8 billion.

...The 360 businesses who responded... [to a] recent survey of Auckland Regional Chamber of Commerce and Industry members... indicated that in 1996 they paid \$7.1 million in premiums, and just 70 of those firms... lodged claims totalling \$734,000 against ACC. The average premium was \$20,000 and the average claim just \$2000, leaving a whopping 90[%] margin in the hands of ACC for reallocation.

...Proposed changes to the [ACC] system could see small businesses forced to fork out thousands of extra dollars to cover the cost of claims for employees injured at work. Small companies – those paying less than \$10,000 a year in premiums – would be heavily penalised by the plan which aims to spread the ACC scheme cost more fairly among employers. An ACC discussion document... says the changes would even out anomalies which have developed since 1992, when ACC began charging higher premiums to employers in “high-risk” industries... Businesses with a low-claim incidence are rewarded with bonuses, while those with high claims costs pay a penalty... [However,] companies paying more than \$1 million a year in premiums are less likely to make claims.

...[NZ’s ACC] premiums could drop substantially because of a big drop in the future cost of present injury claims, predict officials.

...[ACC] levies for wage-earners are set to increase over the next few years, dragging an extra \$100 a year from the pocket of the average worker by 2001... From next April... the earner premium for people on wages and salaries... will... increase... from 70c per \$100 of taxable income to 80c... and “in a smooth series of small annual rises,” to about \$1... But... employer premiums are likely to fall 36[%] on average, to \$1.67 per \$100 of liable payroll, and stay at that rate for five years... The Government [also] announced... it would stop paying the hospital costs for accidents outside work from July 1 to save itself \$40 million a year.

...The International Labour... organisation’s application of standards committee[has] ruled in Geneva that N[Z]’s ACC system should comply with the convention’s requirement that accident victims’ medical treatment should be free. The breaches have been admitted by the Government[, which yesterday increased workers’ ACC levies 70%]... to \$1.20 for every \$100 of gross income... The increase... will boost the earners’ account, which covers non-work and non-vehicle-related injuries, from \$346 million to \$512 million. The account already holds reserves of \$313 million, equivalent to nine months’ expenditure, but [the PM] said it was still “immature”[, meaning]... further... increases for income earners are on the cards... [The increases are designed] to move the earners’ account onto a fully funded system and set the stage to introduce competition in accident compensation... Instead of dropping employer premiums from \$2.61 for every \$100 of payroll to \$1.70... the Government settled for a \$2.35 premium[, which]... will see that account fall from \$1.23 billion to \$1.15 billion. [● Self-employed workers pay higher ACC rates into the earners’ account than wage and salary workers (e.g., during ‘1996-97, self-employed plumbers were levied at a rate of \$5.30 for every \$100 of gross income’).]

...Opening accident compensation up to competition is good news for [a] self-employed plumber... The Auckland tradesman said he had paid \$5000 a year in [ACC] levies for the past five years, yet had never made a claim. He was confident he would get a better deal in the private sector. This now seems very likely...

The chief executive of the Insurance Council... predicted premiums would be cut and claims would be handled more efficiently if private insurers were given part of the market. But... a lecturer in social policy at Massey University, said it was doubtful that insurance companies would be able to provide a cheaper service than the state-owned monopoly... “It depends what you call efficiency... The quality of service would be good on one level, but if they can find some way of denying you cover they will be very efficient at doing that.” ...The ACC monopoly gave it administrative efficiencies that multiple providers would have to replicate... [Private] companies would push up premiums for accident cover because of the need to return a profit to shareholders and greater marketing overheads... Labour’s ACC spokeswoman... also said there was no economic sense in making ACC compete with private insurers, with an American study showing that public schemes provided cheaper premiums than private insurers.

...People in dangerous jobs stand to lose as the Government opens [ACC] to market forces, say insurance companies... [who] would inevitably “pick and choose” clients... Top-dressing pilots and coalminers are among those likely to be considered almost uninsurable by the private companies. [However,] low-risk customers are being promised lower premiums and no-claims bonuses.

...Those who have long been campaigning for the unwieldy Accident Compensation system – and the corporation which administers it – to be given a well-deserved kick in the proverbial, are crowing that a failure to factor into Treasury’s financial calculations a proposed drop in employers’ ACC levies has left the Government facing an estimated \$1.5 billion-plus black hole in its financial forecasts for the next three years. A crisis of such dimensions... could quickly be eradicated by leaving levies where they are – or even increasing them as part of a transition to a fully-funded ACC scheme... [A] levy is essentially just another tax... But instead of allowing... extra ‘tax’ to wash through the Government accounts like some fiscal slush fund, employers want [the money] back where it belongs – in their own companies’ bank accounts. Some 91.8[%] of employers surveyed by the corporation favour this option. The... Government has given itself the ability to delay the projected decrease in employers levies... by putting ACC under the microscope through [a] joint Labour Department/Treasury study...

[‘Workers will be hit with a 14% jump in ACC levies from April next year. Employees on the average annual wage of \$35,000 will get \$70 less in take-home pay a year. However, employers’ premiums will fall 9% on average, as the Government rejigs the ACC in preparation for partial competition’...]

‘Big increases in ACC premiums under the renationalised workplace insurance scheme have confirmed the worst fears of some employers – though ACC says most are better off. Six weeks after law changes restored the ACC monopoly and forced employers to cancel accident insurance policies with private companies, groups as diverse as childcare centres, electrical contractors and farmers have been hit by bills up to 56% higher than they had been paying.’]

...FARMING is the country’s most deadly industry and its high fatality rates – which appear to be increasing – has prompted the Occupational Safety and Health Service to set up a task force to attack the problem... 323 farm-related deaths had occurred since 1975 – 57 of those children... ACC has also been concerned about farming-related deaths... It has been running an injury prevention programme for farmers for several years... “It is a sad and tragic fact that if you are a farmer, you are three times more likely to die[at work] than the average N[Z]er. It is even worse for farm workers who die at seven times the national fatal accident rate,”... Fatality rates among N[Z] farmers was believed to be worse than their overseas counterparts – although hilly terrain here was partly responsible... [F]arming was by nature a more dangerous occupation than many. Farmers... had to work with a wide range of often potentially dangerous machines. They were geographically isolated, often worked alone and had to carry out a wide variety of... unpredictable tasks... Task forces have also been set up to investigate two other industries with high fatality rates – forestry and construction... Since July last year OSH had investigated five deaths in the construction industry – which had more workers – and two in forestry. [‘An OSH survey found that 1-in-5 construction sites were unsafe’, and in recent years ‘accidents on construction sites have risen 70%.’]

...‘OSH investigated 182 work-related fatalities between July 1992 and June 1996.’ When the difference in population size is taken into account, NZ’s death rate resembles Britain’s (where ‘a thousand people are killed at work, a million suffer injuries and 23 million working days are lost because of industrial injury or disease every year’). ● ‘The death rate in industrial accidents in the US declined from 21 per 100,000 workers in 1960 to 9 in 1990. The rate was lower in manufacturing than nonmanufacturing industries. The industry with the highest occupational illness and injury rate was shipbuilding, and the lowest, nonferrous diecasting.’

...In NZ] death certificates don’t necessarily detail a person’s occupation. For example, a retired spray painter may have died from lung cancer. The death certificate will record the cause and the Ministry of Health will add another cross in the cancer columns. However, it won’t show that the worker was... [in an] industry with a high rate of lung problems before the introduction of masks and fan extraction systems. The result is that

those industries which pose the biggest risk to health are not clearly identified... Researchers estimated that 4[%] of lung cancer deaths in N[Z] are work related. That means about 270 cancer deaths last year were the result of job conditions. To this can be added work-related respiratory diseases like asthma, chemical-related diseases caused by solvents and chromium compounds, infectious diseases like hepatitis, HIV and legionellosis, and stress-related cardiovascular disease and depression... Probably the best-known industrial danger is from asbestos, previously widely used in insulation materials and some cladding products. While it has largely been replaced, and when found in renovations is carefully removed by workers wearing protective clothing, it was only attributed by the [ACC] as the cause of 30 deaths in the eight-year period between 1987 and 1994... How many people die yearly from complaints arising from their employment is unknown but the “guess rate” exceeds 400. That’s not including those killed on the job, which last year numbered 41 – 31 of them in the farming, forestry and construction industries. Loggers felling trees are most at risk... “If you’re... a logger, your chances of death are 70 times greater... But whereas a logging accident kills outright, occupational diseases may take 25 years to kill you. We just don’t know the full extent [of occupational disease death] although this should not cause undue alarm...”

...The Government is being asked by the Building Trades Union to provide \$50 million for lump-sum compensation for asbestosis sufferers.

...[“Greenpeace activists in Auckland disrupted last night’s sailing of a P&O container ship due to be scrapped in Asia, saying the vessel was contaminated with asbestos and toxic heavy metals. Police cut free five activists who had chained themselves to the Encounter Bay’s mooring lines. The protesters will appear in court today. One of them said the company had been asked to remove the contamination before the ship was broken up. Otherwise it would harm the environment and the health of Asian workers. He said that if the NZ Government ignored the passage of the Encounter Bay it was supporting the dumping of toxic waste in Asia. The ship was also boarded by protesters in Barcelona, Spain, last month, and in Sydney last week.”

...AUS’s National Occupational Health and Safety Commission estimates the annual work-related death toll across the Tasman to be 2900, compared to the 1997 A[US]n Yearbook’s figures of 2367 suicides, 2029 deaths in vehicle accidents, 333 homicides, 298 fatal poisonings, and 259 people drowned. The Aussies have conservatively estimated the cost of work-related injuries and disease to be \$A27 billion each year. Compare that figure with their current account deficit of around \$A20 billion, or their total public health expenditure of around \$A26 billion. That’s pretty serious company for something as traditionally little-regarded as workplace health and safety. Happily, N[Z]’s figures may be a little lower, for we lack the A[US]ns’ notoriously dangerous mining and mineral processing industries. Even so, the proportions are likely to be distressingly comparable. Until now, little has been done to raise public awareness of this issue. [The NZ]OSH’s budget for the 1997/98 year is \$21.6 million, of which only a tiny portion has been allocated to raising public awareness. Contrast that with our friends in A[US], where a series of blunt television advertising campaigns, supported by prominent use of billboards, has succeeded in lifting workplace health and safety into the public consciousness... In world terms, our workplace health and safety performance is adequate. But we can’t afford to slip down the world rankings... Internationally, achieving excellence in workplace health and safety is becoming recognised as a source of competitive advantage, both at the company level and between nations.

...Three shearers in southern N[SW] were awarded a total of more than \$A600,000... yesterday by a judge who found a pastoral company negligently exposed them to chemical contamination... The judge said... the... managing partner... who mixed the chemical compound used to tar the sheep, was well aware of the risks of exposure to diazonin contained in warnings issued by the manufacturers... on labels and information sheets... [T]he shearers’ clothes were saturated with tar containing the chemical as they manhandled the sheep. [They] suffered headaches, diarrhoea, vomiting... itchiness... and sores... on the skin... Thousands of N[Z]ers are exposed daily to killer chemicals, says [OSH]... Many workers would not know what harm the chemicals were doing them...

It seemed like a godsend, a chemical that could sterilise hospital instruments without boiling. But to some of the staff using it... it became a nightmare... Three years ago illness forced... a charge nurse in a theatre at Whangarei Hospital for 30 years... to stop... [working. N]ow, at 52, she potters delicately around her garden... or does a little patchwork. More energetic activities give her severe headaches, dizziness, joint pains, and prolonged tiredness. Sometimes her nose bleeds. In April last year... [ACC] agreed that her illness was the result of exposure to... glutaraldehyde, and paid 80[%] of her wage. Two weeks ago, as a result of a new screening system, ACC revised its decision and stopped the payment. [She] is seeking a review... According to information obtained by the N[Z] Herald more than 70 people may have been accepted by ACC as suffering from glutaraldehyde sensitivity[, including]... five nurses at Whangarei Hospital... but the corporation’s system of record-keeping makes it impossible for it to confirm this... Glutaraldehyde was first used overseas in the mid-1960s and promoted as safe... Whangarei Hospital introduced it in 1978. Before that heat-sensitive instruments were sterilised by soaking them in... formalin tablets... [The smell] made... eyes water. “So we backed away from it. But the glutaraldehyde had no smell. We thought it was wonderful stuff. We dipped our hands in it and used it like soap and water. I got dermatitis. The hospital said something about putting gloves on, but we had no masks until 1994 when I asked for them.” Chemicals enter the body through inhalation of the fumes, by absorption through contact with the skin, or by ingestion of fine particles. Opportunities for absorption have been multiple in N[Z] hospitals because of poor ventilation and the use of uncovered containers... In many cases these conditions still pertain... A subsequent 1995 environmental audit has shown no unsafe levels of chemicals in Whangarei Hospital but the management refuses to discuss the issue of its air conditioning because of the impending court case with one of its former employees. Glutaraldehyde has been replaced as a sterilant by the use of another chemical called steris. This, and another alternative called sterant, aren’t suitable for use with all instruments. Neither are their possible effects necessarily understood... [Glutaraldehyde is also] one of the ingredients in the developing solution of x-ray film... Darkrooms for processing x-rays have often been small, confined spaces... Workplace Exposure Standards have been set in N[Z] for glutaraldehyde only since 1994 and are at present 0.2 parts per million. [This is] likely to be lowered to 0.1 to conform with A[US]n standards... Glutaraldehyde is considered less toxic than its associate formaldehyde, another disinfectant and also a preserver, which is classed as a probable carcinogen and which occurs in an enormous range of consumer products and in scientific and industrial processes... The toxicity of formaldehyde has been recognised since the 1940s and our standards, set at 1.0 ppm, are about to be reviewed. It is unlikely, however, that they will be set as low as in the U[S.] where the threshold is 0.3. In Britain the level is 2.0 ppm.

...Radiation exposure five times higher than internationally accepted standards is allowed under... [NZ law. I]nternational guidelines suggested people working with radioactive equipment or substances should not be exposed to more than 20 millisieverts of radiation a year. In N[Z], regulations allowed for 50 mSv. The limits set for the rest of the population were 5 mSv a year while the internationally accepted limit was 1 mSv... A parliamentary select committee was also told yesterday that the... Radiation Act and its accompanying regulations were written more than 30 years ago and did not cover some modern developments. No limits were set for the amount of radiation people can be exposed to from ultraviolet rays, lasers, infrared and high-intensity lights... Controversy has arisen over the amount of radiation people are exposed to and possible side-effects. In February, it was revealed radiation from the Navy’s communications station at Devonport exceeded safety standards inside a neighbouring childcare centre, but test results were kept secret for two years... High-frequency power lines and cellphone transmitter sites in residential areas have also caused concern... [However, the] director of the National Radiation Laboratory... said that although N[Z] regulations allowed exposure higher than accepted overseas standards, such high-level exposure was unlikely ever to occur... [Incidentally, a] boat-building company, an employee of which... suffered burns to 40[%] of his body... [after he] was “engulfed in a fireball” when a faulty halogen light ignited spray paint, was fined more than \$18,000 by a Christchurch District Court judge yesterday... [for failing] to ensure the safety of employees... \$15,000 of the fine [is to] be paid to [the injured worker (‘the maximum fine is \$100,000; the maximum fine levied was \$40,000 against Tranz Rail’)].

...An Auckland health supplements manufacturer was fined more than \$10,000... for failing to ensure the safety of its employees by not fitting a guard to the mincing machine... after an employee lost the tip of a finger while mincing shark cartilage... [The] Auckland District Court... ordered that \$6000 of it be paid to the injured worker... The company... [also failed] to notify the Labour Department of the accident as soon as possible and... to notify the department on the prescribed form. It was convicted and fined \$1500 on the first count and convicted and discharged on the second. The... [company's] research director... said he did not know how the guard was removed...

An Auckland bed maker... has been fined \$13,500 after a factory worker's hand became trapped in a machine that did not have proper safety guards... (\$2000 will go to the injured worker)... Instead of notifying the... Labour Department... the company continued using the machine... [for] more than a fortnight after the accident... [still] without a safety guard... [until the department's OSH] inspector received an anonymous tip-off... The... Auckland District Court... heard last week that... [the] crushed and lacerated... process worker... spent 72 hours in hospital [but a] Sleepyhead production manager told the inspector that he had not realised the accident was serious... Sleepyhead's general manager... said the firm was very safety-conscious. "But in any factory that employs a lot of people and uses a lot of machines, there is always the potential, due to human errors, of accidents occurring."

...The Engineering, Printing and Manufacturing Union... [is] spending tens of thousands of dollars preparing... [a] High Court... challenge, including hiring a private investigator to interview witnesses... after the Labour Department decided not to prosecute an Auckland chicken factory over a horrific death in the workplace... The law allows charges to be laid only by the department and only within six months of the accident[, but the union is]... seeking an urgent judicial review. The union believed the true cause of the accident... [in which] a 33-year-old father of two, was crushed under a conveyor inside a blast freezer... had not been identified either by the Department or by... [the factory owners. The man] died in hospital two days later. The accident so shocked some staff that they required counselling... The union's health and safety officer... said interviews with [the dead man's] co-workers revealed five of the six emergency stop buttons for the conveyor belt were believed to have electrical faults... [Furthermore, the] company's training officer told the union he was asked after the accident to sign records showing that he had fully trained the staff, including [the dead man], although he had never kept training records and did not consider himself fully trained.

...Poor workmanship by a car mechanic led to an accident that killed three people, a prosecutor said in the High Court at Auckland yesterday. [The] Crown counsel... told the jury... a tie rod end – vital to the steering – came loose, causing the car to go out of control... as [it] entered a left-hand bend on State Highway 5... [The] car veered into the path of an oncoming ambulance that spun into the wrong lane, causing the vehicle in which the [three people] were travelling to crash into it. A patient was injured when thrown out of the ambulance. On inspection of the [first] car, it was discovered that the right-hand tie rod had come out. The nut on the left-hand tie rod was only finger-tight and no split pin was securing it... [The Crown's counsel said the mechanic] was obliged to check that such a vital piece of equipment was properly connected before the vehicle was handed back to a member of the public relying on his skill and expertise... [The] jury is being given a beginner's course in mechanics with the aid of a full-scale mock-up of a car wheel, suspension and steering rod assembly... The charge of manslaughter for faulty mechanical workmanship... is the first of its kind in N[Z], says a criminal law expert... "It is a reminder for all people in occupations that could place people at risk in terms of their lives and health that they should take care in the way they do their job."

...The trial of [a mechanic], who was yesterday acquitted... of charges of manslaughter on the grounds of faulty mechanical workmanship, throws up some interesting challenges to the motor-repair business, tradespeople in general – and anyone who fails to take care when carrying out his or her duties. Cause a death or an injury and you could be up on criminal charges... From the police point of view, the decision to bring a criminal charge rests on their ability to prove the case. The law has been in place for years... The second avenue for legal action against faulty workmanship is through a civil claim – usually under the Health Safety and Employment Act of 1992. Although civil and criminal cases may not be brought for the same offence and claims for general damages are ruled out by ACC legislation, claims for exemplary damages (taken to provide an example or disincentive to others) are increasingly common... Different trade associations have differing guidelines for their members... The... 1400 members... [of the] Electrical Contractors' Association of N[Z]... are bound by... the... Electricity Regulations of 1997... which runs to 85 pages. All electricians must attend courses in safety before beginning work and refresher courses once every two years. Consequently... electrical contractors "have the best safety record among the more common trades," meaning ACC premiums for electricians have dropped considerably in the past few years. "The suggested reduction in premiums for the 1997-98 year is 43%." The Motor Trade Association points to 1995 Transport Safety Authority figures which show that of 20,000 accidents only 450 were caused by mechanical faults. Of these, only 22 were steering-related. "However, the statistics don't indicate how many of these 450 faults were related to faulty workmanship in garages,"... [Incidentally, t]he Crimes Amendment Bill (No 5), which has reached the select committee stage... requires a higher standard of proof of negligence before a person can be held criminally responsible... [T]he impetus for the bill came from the medical profession, where doctors had been charged with manslaughter after the death of patients in their care... The new legislation would bring N[Z] in line with... Canada[, AUS] and... Britain...

IN THE fast-paced world of the '90s, workplace stress has become an accepted, almost expected, part of the job – but that could be about to change... Putting the blame for excessive stress on your boss is difficult – but overseas the worm is turning and it could be only a matter of time before the trend catches on here. Some employers found guilty of negligently placing employees in situations of serious stress or mental trauma are being sued for big amounts. In Britain, 14 police constables have successfully sued the chief constable of the Yorkshire police for \$2.8 million. The officers attended 1989's Hillsborough stadium disaster, in which 96 people were killed. Their case stated they had suffered mental trauma because of having to deal with an accident that they weren't staffed to handle. In another British case, [a] social worker... won \$400,000 from the Northumberland County Council on the grounds that his workload had been so intolerable that he retired early... N[Z]ers... have had the right to sue employers for damages... since... mental trauma... was exempted from... ACC... claims... in 1992...

A MAN is suing his former boss for compensation for a stress-related illness in a landmark case that may open the floodgates for other employees... [The] former probation officer, claims he suffered burnout and multiple health problems caused by the pressures of... dealing with violent and serious offenders. He left his job at the Corrections Department in March last year, after being told by his doctor he would die if he stayed. "At one point I had around 20 sex offenders, 20 parolees, several psychiatric cases and... five murderers," he said. This was "over the top" compared to other professionals with similar roles, such as social workers. Now his lawyer has filed proceedings in the High Court in Auckland and the Employment Court for compensation for the loss of his career, and exemplary damages, totalling around \$900,000. [The former probation officer] is also suing for breach of contract... Other professionals, such as prison officers and nurses dealing with violent and serious offenders, said similar legal action was likely. [● 'A former police video producer was yesterday awarded \$242,000 in damages in a court ruling that said senior officers should have recognised signs he was suffering from post-traumatic stress. The award totalled \$373,000, but the judge deducted 35% for "contributory negligence."']

... 'Looking for a low-stress job? Best not run for President. A recent US survey rated the job as the most stressful possible, with firefighters and senior corporate executives a close second and third. Stress is no longer regarded as just a flimsy excuse for not getting your work done or for not liking your job. Recently, a police video operator received \$242,000 and a probation officer was awarded \$1 million after suffering significant stress at work. Both had complained to their employers repeatedly of intolerable stress levels, but nothing ever changed. As a last resort, they sued their employers. And yesterday, two former constables won almost \$500,000 damages against police for lost income through early retirement and the physical and mental consequences of their work.'

...The Accident Compensation Appeal Authority... [has ruled that a] woman and her two daughters... were entitled to... [the maximum ACC payouts of] \$10,000 each after suffering more than the ordinary grief process following the death of their... husband and father... six years ago... by medical misadventure. The authority overturned a corporation ruling which rejected the claim on the basis that it would entitle "every person who has experienced shock upon hearing about a loved one's unexpected death." ...The payout to the family for mental trauma comes four years after a precedent-setting case in which a Hamilton woman was paid \$27,000 in compensation for mental suffering... [after being] at the bedside of her 23-year-old son... for the last 20 hours of his life after he was beaten and tortured by gang members in November 1987.

...A sexually abused woman suffering post-traumatic stress disorder has won her battle to have the severity of her injuries recognised by compensation authorities. The woman, who was sexually abused many times in the 1970s, appealed against an [ACC] ruling that her injuries represented "20[%] functional impairment." It paid her \$1400 compensation on that basis, despite its own doctor saying the woman was one of the three most "damaged" cases he had seen... [Her] post-traumatic stress disorder... was also linked to her diabetes, substance abuse and suicidal tendencies... Another doctor said... "Her degree of continuing permanent impairment will be considerable. In my opinion [she] is 70[%] disabled." The Appeal Authority agreed, saying... 70[%] was a more credible figure.

...[a man awarded \$290,000 in back-dated interest from the ACC may have opened up a new front for claims. The man had an accident in 1986 but the corporation did not accept his claim for earnings-related compensation until 1995. When it did, it declined to pay interest on the amount that accrued during the dispute. A judge has now ordered the corporation to pay the interest. And it faces having to pay interest in other cases where it delayed a decision for a month or longer but eventually accepted a claim. The lawyer who represented the man at his appeal hearing said she had another four clients who were owed \$700,000 between them. A corporation representative said it was not known how many people could be affected by the decision or what amount ACC might end up paying out under the ruling. However, a claim would have to have been lodged before July 1 last year, when a law was passed to close the loophole.] Meanwhile, it was revealed yesterday that the... ACC... corporation had paid one of its senior staff a performance bonus of nearly \$55,000. The action has been condemned by Labour as totally inappropriate for a state service agency plagued with funding problems... [A] Labour MP... said... "No person should be paid that sort of bonus out of money collected from workers, employers and vehicle users... It brings the whole ACC system into disrepute." ...Since April last year, almost \$1 million has been paid out on employee bonuses at ACC... But the Government's duty manager... defended the practice of bonus payments... He agreed with "paying reasonably low levels of base pay and attaching bonuses for performance to them. "It encourages better management and... better performance."

...A parliamentary committee yesterday strongly criticised the [ACC] board for weak controls, and expressed alarm about its troubled management... The... committee... had "deep disquiet" at not being able to present a full picture of the corporation's performance because of ongoing investigations. The Serious Fraud Office was called in to look at irregularities last month after the [chief executive's] forced resignation...

An internal audit ordered by a concerned ACC board has led to... 22 charges of fraud, theft and money laundering... against the [former chief executive, including one of]... misusing \$1.4 million of public funds to buy three aircraft... [He] was forced to resign from the \$242,000 post in May...

The brother of [the former ACC] chief... has appeared in court charged with conspiracy to defraud the ACC of \$886,297.

...Coming on the heels of... the indulgences... at Aotearoa Television and the celebrated case of [the] Sports Foundation chief... there has to be at least a suspicion... that there's something seriously wrong at the top of some public sector organisations... [Now that the former ACC chief's predecessor is also] being charged with a swindle... the taxpayer can be forgiven for suffering fraud fatigue.

...In the High Court at Wellington yesterday... a... chief executive of the ACC from 1985 to 1992... [- plus] president of the Society of Accountants from 1989... and Auditor-General from 1992 to 1994... [-] pleaded not guilty to 21 charges, 18 of using a document with intent to defraud... two of theft, and one alternative charge of obtaining by false pretences... His trial... will hear charges relating to offences between 1989 and 1994 involving nearly \$140,000... Despite having a salary of more than \$150,000, he had also incurred about \$100,000 in debt on 14 credit cards.

...The former Auditor-General... faces a possible jail term and being struck off as a chartered accountant following his conviction on 10 fraud charges yesterday... [He] was released on bail... after a 12-day trial. He... is believed to be the most senior N[Z] public servant to be convicted on dishonesty charges... The frauds he was found guilty of amounted to a total of around \$60,000... Because the counts are property offences, [the judge] will have to be satisfied that special circumstances exist to impose a jail term... On the ACC-related charge that [he] dishonestly obtained \$20,000 in advance travel expenses for a 1991 trip to Indonesia, the judge found that the money was used to pay... pressing mortgage arrears... [At one time his] liabilities were around \$400,000... Friends and colleagues... remain puzzled at how [he] got into such a financial mess, but several suggested he was seduced by the high-living associated with his high-powered posts... His defence was that he never had any intent to defraud but rather was careless and made mistakes.

...the former head of ACC and the Audit Office... treated [them] like a bank, using their money to cover his debts... [The judge described his] offending as, "...a serious abuse of a position of authority and trust... Auditor-Generals are supposed to control financial offending, not commit it... The message must be that high positions carry high standards..."

...Police have laid 13 fraud charges against the former Attorney-General of Western Samoa... The charges, involving \$89,000 of clients' money, related to the Auckland legal practice... [the now-]disbarred lawyer... ran from 1982... until late 1990. He left to take over as Attorney-General in Apia in 1991, when his Auckland activities were under investigation. He resigned as Attorney-General after he was struck off... the N[Z] law register in May 1993 after being found guilty at a disciplinary tribunal hearing of four charges of professional misconduct... In 1994, he was appointed acting chief executive of Polynesian Airlines to oversee the carrier's bid to climb out of its financial troubles... [He] told the N[Z] Herald yesterday that he knew nothing of the charges... [In related news, t]he disgraced former Auditor-General... [of NZ was] released from jail... on December 10 after serving half of his 18-month sentence... Last night the Audit Office confirmed that crown lawyers are [still] trying to recover the public money frittered away... [on] stretch limousines, Concorde flights and stays in lavish hotels... The conviction of [the] former Auditor-General... on 10 fraud charges... exposed... [an] incredible paradox... - 1997

The free market claimed to be clean of corruption... Changes to our economy since 1984 have been a powerful force for more ethical conduct in both business and government. By reducing the scope of government over economic life, liberalisation has reduced the scope for bribery and corruption. [However, according to an Auckland] Professor... that is "precisely wrong" and "the opposite is true." Academics should usually be prepared to produce supporting evidence for their views. He offers us none. In fact the available evidence suggests overwhelmingly that freer economies are associated with less corruption... As the least corrupt country in... a survey by Transparency International... N[Z], with a high degree of economic freedom... takes pride of place... while economically unfree countries like India... and Brazil have a high level... of corruption... No one should be surprised. Corruption is much more likely to thrive in countries where the Government has extensive powers to help or hinder individual firms because it plays a dominant role in the economy. Where business has few favours to ask of government, and is largely left to pursue profits through satisfying customers, the incentives for corruption can only be reduced. Because it requires co-operation, a market economy by its very nature encourages many of the social virtues important to a healthy society. Since reputation and successful long-term relationships are crucial to most businesses, markets strongly encourage the cultivation of those personal qualities that assist in maintaining relationships – honesty, friendliness, courtesy and good faith... A freer system has the moral advantage of putting a greater premium on merit and fostering social mobility... A Nobel laureate in economics... has summed the issues up in the following way: "The great economists of the past believed that a market economy was not

simply more efficient and produced more output than other economies. In addition, a market economy makes people more self-reliant, more independent and more moral in the fundamental sense of being able to take care of themselves instead of being dependent on governments and others for support. Moreover, a good businessman engages in moral behaviour for very practical reasons – he will get more customers in the future if he acquires a reputation for honesty and reliability. So good business practice, not always but very frequently, produces moral behaviour.” A Nobel prize awaits [the]Professor... if he can demonstrate the opposite conclusion... Of course opportunistic and underhand behaviour can occur in business just as it can in the professions, politics, the sporting arena and every other walk of life... [M]arkets need to be supported by broader codes of personal responsibility and moral conduct... [The professor also] says he... objects to the large sums earned by some of our company chief executives... [O]ur chief executives operate in competitive environments in which the need to satisfy the customer is paramount. No one is forced to buy the products of any private company – and in this way contribute to its chief executive’s salary – in the same way that, say, all taxpayers are forced to contribute to the salary of a tenured university professor. The economic “value” of a chief executive meets a much stiffer test than the “value” of many other occupations. Moreover, under our pre-1984 command and control economy, some people earned fortunes, not through being good at satisfying customers but simply through having the skills and connections to secure Government licences. Consumers were gouged with high-cost and low-quality products. That was genuine privilege; the rest of us were effectively coerced into subsidising the unearned standard of living of a fortunate few. We were lucky to avoid the worst forms of corruption that such a system usually breeds, but the whole business environment of the times – in which firms and industries were constantly lobbying governments for special favours – was itself only one step away from the real thing. So too was the political environment, where taxpayers’ money was spent and economic policy decisions often made not because politicians believed them justified, but purely in order to win votes. It is arguable that the morality of political actions for electoral purposes is no less questionable than the morality of bribes. - 1996

The above article – written by the executive director of the Business Roundtable – was accompanied by a line-graph depicting levels of Economic Freedom and Corruption for each of the 54 countries in Transparency International’s survey. NZ’s level of corruption was given as ‘approximately 5%, followed by Denmark with approximately 7.5%, then Sweden, Finland, Canada and Norway (all approximately 10%)’. Interestingly, the US, which was next below NZ for economic freedom, and Hong Kong, which was the only survey country with higher economic freedom, both had higher levels of corruption than NZ – placing 14th and 18th respectively (although their levels of corruption – approximately 20% and 30% respectively – were significantly lower than the 50% plus of most ‘controlled markets’). Two of the survey countries – Nigeria and Pakistan – were estimated to be ‘over 90% corrupt’.

In 1990, 1,176 [US] public officials were indicted and 1,084 convicted for corruption, compared to 255 indicted and 179 convicted in 1975. Of the total in 1990, more than half were Federal officials...

State corruption[is] rare in NZ but[there’s] a need for care... There is no reason to believe that Transparency International’s ranking of N[Z] as one of the least corrupt countries in which to do business, and more generally, is anything but accurate... [However,] it is probably time that provisions were put in place for auditing... regulations... Corruption is an ever-present threat, globally on the increase, and a threat better tackled prudentially rather than after the event... It is also commonplace that the public, as well as some more scholarly observers, fail to distinguish between corruption, incompetence, apathy and several other ailments of the body politic and administration... N[Z] is ripe for the establishment of formal counter-corruption measures and it is certainly not beyond the wit of our legislators to do so... They would, however, be advised to think through this extremely complex issue and to take expert advice... [T]he real danger... is that the control of corruption will become so central to every government activity that at worst the real objectives will be forgotten and at best initiative will give way to inflexibility... Every A[US]n state has a history of corruption on a scale unknown in N[Z]. But AUS] not only has relevant, mainstream ideas on corruption control, but others which have never been put into practice and yet are particularly relevant to our “clean” condition... It is sadly the case that it is exceptionally difficult to get parliamentarians to see such issues in [anything] other than party terms. Optimistically, however, it must be added that N[SW]s’ Independent Commission against Corruption has been generally deemed a success... [while powerful interests had] good reason to work energetically for its failure. The experience of most such bodies has been of a large number of complaints, most of which cannot be upheld. This is no reflection on commission competence. Rather it reflects the extreme difficulty of proving corruption, on almost any definition; the vagueness of popular ideas as to what constitutes corruption; and the existence of a substantial group more interested in self-publicity than the real problem.

...Getting companies to care about corruption is hard enough; getting them to do something about it is even harder. Imagine you are trying to win a big public contract in a developing country. The minister in charge makes unmistakable references to the disgracefully low pay of local civil officials and the benefits his own children would enjoy if they could study abroad. The cost of providing this (concealed as a scholarship paid for by your company) is minute compared with the value of the contract. Your competitors, given the chance, would assuredly find the money. Do you pull out, or pay up? Most businessmen in such situations find that their scruples are soon swallowed. So do most governments. Germany is one of several European countries where bribes paid abroad are tax-deductible. The U[S] is harsher... executives can face jail for paying bribes... under the Foreign Corrupt Practices Act... But it is hard to prove and many American... business people think that bribery in the third world is a fairly innocuous affair. The only victims are the bribers (ie themselves)... This... is just the sort of argument that sends... the founder of Transparency International, an anti-corruption pressure group based in Berlin, into paroxysms of high-minded rage. Corruption is not a victimless crime, he says. Poor people in poor countries are the losers when officials are on the take: corruption means that good projects are squeezed out by bad ones. Over time, argues [this man] who has the touch of the Old Testament prophet about him, corruption threatens to reduce a country’s entire administration to a... state of decay. Honest officials give up. Bribes grow ever bigger and more ubiquitous. The trough becomes less well-stocked; the snouts plunge deeper. Like most saints or zealots, [he] sees the world a touch too simply... On the other hand, all... countries would surely be better places if there were fewer backhanders. One recent study, by an American academic... calculated that an increase in the level of corruption from that of Singapore[– which placed 8th on the line-graph (r:ln20 above) –] to that of, say, Mexico[(38th)] would be the equivalent of increasing the tax burden on foreign investors by over 20[%]... But, even assuming that [he] is on the side of the angels... the question... still... [remains:] what on earth can he do about it? His first problem is getting people to admit that corruption is a problem. In this respect, [he] can claim... success. He set up Transparency International four years ago mainly because his employer for the previous 25 years, the World Bank, was reluctant to raise the issue... Now the bank has a much clearer anti-corruption mandate as does the O[ECD]... In developing countries, Transparency International’s new idea is to set up bribe-free zones, grandly termed islands of integrity, where all participants in, for example, a public tender, would publicly pledge to pay no bribes... But so far, only one place has fully accepted this idea – the province of Mendoza in Argentina, where the governor recently won election on an anti-corruption platform. Mendoza now has televised hearings on all big public procurement deals. Some apparent breakthroughs have gone awry (an ally in Ecuador turned out to have bribed members of parliament to pass the anti-corruption law backed by Transparency International). And in some places, such as the former Soviet Union and parts of the Arab world, the forces of corruption are gaining rather than giving ground. It is hard to imagine a Russian mafioso quaking in his shoes at Transparency International’s attention.

...However, crime and government corruption featured large in executive minds[in an international survey]. “If pundits often dismiss corruption as an unavoidable cost of doing business, the executives in our survey clearly take the matter more seriously,” the... World Economic Forum, an

international grouping of government, business and academic leaders... which has its headquarters in Switzerland... said. "They report that tax evasion is extensive in 33 countries, bribery is endemic in 20 countries, police are dangerously ineffective in 13 countries, and organised crime carries a high cost in nine countries.

...*Time may be up for second-oldest profession...* Graft, of one form or another, is probably the world's second-oldest business. And despite a raft of high-profile arrests in recent years, including one or two former heads of state, it is still much safer to engage in than the world's oldest. Many governments, however, are growing increasingly determined to stamp out what has been referred to as the "corruption eruption." On May 26, members of the OECD – the Paris-based club of rich countries – agreed to forge a treaty that would make it illegal for firms from member countries to bribe foreign officials. At the moment, the proposal is just that. The treaty, which the OECD hopes to have drafted by the end of this year, would need to be backed by new laws in each member's country, criminalising bribery abroad. Such laws have long been urged on others by the U[S], which already has its own. As a result, American businessmen argue, they face unfair competition from their less scrupulous foreign rivals. One Government study estimated that U[S] firms lost some 100 deals worth \$45 billion over the past two years to less principled rivals... The rapid growth of cross-border investment, and the growing competition to supply it, have increased the pressure on rich-country governments to support their exporters. Indeed, all of them, including the U[S], occasionally lobby foreign governments on their own firms' behalf. The most politically palatable way to curb bribery, therefore, is for all rich countries to take the leap together. For this reason, even a watered-down treaty would be better than the current arrangement, under which overseas bribes are tax-deductible in many places. Still, efforts to reduce corruption by stemming the supply of dirty cash can only go so far. For starters, even strict laws making bribery illegal are often easy to by-pass. Many American firms simply hire third parties with local ties to "make introductions" for them. In countries where there is little difference between shaking hands and greasing palms, this allows foreign business to do deals without ruffling their consciences. If the battle against bribes is to succeed, therefore, it will have to involve a change of heart on the part of those who take as well as those who give. Rooting out corruption is almost always in a country's best interests, but not always in those of its politicians. Some progress, however, is being made. Foreign-aid donors are becoming less willing to bank-roll economies which allow corruption... Most recently, the World Bank, a major player in the developing world, has placed anti-graft efforts near the top of its agenda. It now stands ready to cancel contracts and to black-list companies suspected of corruption... Since the bank finances 40,000 contracts a year, worth a total of some \$25 billion, such efforts may make a difference. For those developing countries that are determined to reduce graft, the best bet may be to do so indirectly, by enacting the kinds of liberal economic reforms that reduce the opportunity for it. Abolishing export licences, for instance, is the best way to ensure that businessmen do not bribe bureaucrats to get them... If handled improperly, however, some liberalisation efforts can backfire. Privatisations, for example, tend to reduce the scope for graft in the long run, by transferring assets into the private sector. But the privatisation process itself tends to invite corruption. For this reason, graft-busters must also concentrate on making civil servants honest by improving accounting systems and increasing bureaucrats' official (that is, legally obtained) salaries. Serious strides to curb corruption are still a long way off.

...Theories that paying civil servants well to curb corruption are very difficult to prove. Indeed, the costs may outweigh the benefits... Corruption in government is an age-old problem, but a new subject of study for economists concerned with economic growth. Within the past year, organisations such as the World Bank and the International Monetary Fund have begun to argue that corruption can deter investment and retard growth. Last week, the IMF suspended a \$220 million loan programme for Kenya, to punish the government for its failure to root out graft... How, though, are governments to curb poor performance? One common recommendation for poor countries is to increase the pay of civil servants... The fly in this ointment is the assumption that officials are driven to corruption by necessity. They might simply be driven by greed. And the balance between these motives will affect the amount by which their pay needs to be raised in order to make them less corruptible. In a recent paper, two IMF economists... tried to work through these complexities. One surprising implication of their findings is that while higher pay for public servants might indeed reduce corruption, the benefits could be smaller than the... costs. Quantifying costs and benefits in this murky domain is difficult... Establishing a statistical link between low wages and corruption does not show which way causation flows... A telling finding from the research is that when its authors looked at trends in individual countries over a 12-year period, changes in public sector wages had no significant effect on the reported extent of corruption. Still, there is another reason to question the efficacy of paying officials more. Arguably, the type of corruption that most damages economic growth is not petty bribery but rather the massive theft of state funds by venal politicians and their senior henchmen.

...An audit by the state comptroller's office in May found that \$NZ506.44 million – nearly half the 1997 budget – had been lost because of corruption or mismanagement by Palestinian officials. The... deputy planning minister... said the situation was chaotic with nearly 500 directors in 18 ministries. Positions and entire departments had been created to appease well-connected individuals... The... Palestinian leader... has already received a letter of resignation from his justice minister, who riled the U[S] by supporting the killing of Arabs who sold land to Jews...

The Israeli P[M] has rejected calls to resign over a corruption scandal... The State Prosecutor and the Attorney-General... are deciding whether to charge [him] with fraud and breach of trust... Many Israeli's are comparing what... he's done to the Watergate affair which toppled [a US President] more than twenty years ago.

...A... former chairman of the Washington-funded agency that handles US interests in the absence of diplomatic relations... said... he has evidence to support the charges... that staff of Washington's de facto embassy in Taipei... took bribes, that... \$NZ7.7 million... in visa fees was missing and that a visa investigator forced at least one applicant to trade sex for a visa approval... [The former chairman also] said he was forced from his job when he tried to shed light on what he called widespread corruption at the institute.

...The trial of [a]former Italian prime minister... and 33 other people accused of embezzling \$US1 billion... collapsed yesterday with the judge calling for a new investigation into the case.

...Italy's former [PM, who is]... one of the country's richest businessmen, faces a second trial for corruption and fraud after an investigation by Milan public prosecutors. The latest charges... stem from alleged payments to a Rome judge in exchange for favours[and follows]... a series of corruption cases pursued by public prosecutors against the country's largest companies and most prominent figures...

[I]n accordance with Church law... [the] Pope... has accepted the resignation of a Sicilian archbishop who is on trial on charges of corruption and defrauding the European Union... The Vatican says... [the archbishop] is one of the highest-ranking Catholic churchmen to face Italian justice. [Meanwhile, 'the crisis over allegations of fraud and nepotism in the European Commission is about to reach fever pitch with the publication of a report expected to trigger the downfall of one or more members of the powerful EU executive. A controversial former French PM is seen as the most likely casualty of what is expected to be a damning report on the commission's financial management and its handling of the allocation of lucrative jobs and contracts.']

...The shadow of magistrates probing political corruption looms over France's parliamentary election campaign – a threat to both right and left... Charges of illicit funding of most major parties through rake-offs on public contracts have plagued France for years. The scandals hit the Socialists first, playing a major role in their 1993 election rout. The... Socialists are also embarrassed by a scandal over illegal wiretapping of private citizens ordered by the late president Francois Mitterrand in the 1980s. A special court is still investigating whether [a]Socialist ex-premier... and two of this ex-ministers will face charges of poisoning over the 1980s distribution of Aids-tainted blood products which killed hundreds of haemophiliacs. The... far-right National Front, the only major party that has so far escaped charges of illicit financing, has... indicated corruption would be a major... campaign[issue].

...Anger over top-level corruption lies behind election violence... Shops and businesses in Jakarta closed in anticipation of violence on Friday morning and in the afternoon their worst fears were realised when sporadic rioting broke out... Analysts point to the wider issues of discontent among Indonesia's urban poor at corruption and collusion among Government officials and the [President's] family as reasons for the violence... More than 150 people have[so far] died from violence and accidents during street rallies[, including at]... least 130 people... killed when a shopping complex burned down during an election riot in Banjarmasin, capital of the Indonesian province of Kalimantan... [S]ix government buildings, nine banks, two hotels, six restaurants and a number of... houses were [also]destroyed... 181 people... [were] arrested... The riot erupted following clashes between supporters of the ruling Golkar party campaigning in the city and angry crowds emerging from mosques after Friday prayers.

...South Korean state prosecutors yesterday summoned the Home Affairs Minister... for questioning over a loan scandal. They also summoned another leading MP from the ruling party... [who is] a former ambassador to China and now the head of the Finance and Economic Committee at the National Assembly... Both men are close associates of [the]President... who last month ordered a thorough probe into huge loans to the failed Hanbo Steel Co... The... Hanbo Group founder... has already been arrested on charges of fraud and other violations in connection with \$8.53 billion in loans its steelmaking flagship piled up before it was declared insolvent on January 23. Two bankers have also been arrested on bribery charges. The... President... has described the scandal as a typical example of corruption which is still widespread in the nation despite his anti-graft campaign launched shortly after he took office in 1993.

...Charismatic leader on corruption charges... [T]he former chief minister of [India's] eastern state of Bihar... [was sent] to jail this week for allegedly siphoning off \$435 million of state funds meant to buy cattle fodder...

Former state premier falls from grace... The political career of... the Western A[US]n high-flier once tipped to become A[US]'s first female P[M], this week nose-dived into the nation's growing pool of scandal. The announcement... further undermines the stature of a federal Parliament already embarrassed by charges against two Government members and the allegations of fraud against [an]independent Senator... Both major parties are suffering. On Monday, a Newpoll in the *Australian* reported that voter perceptions of the P[M]... and the Opposition leader... had plummeted to their lowest levels... [In local news, two] Wellington company directors have appeared in the Wellington District Court on 60... charges of fraud, conspiracy to defraud and money-laundering worth \$1.12 million... Three other men involved in the case faced fraud charges involving almost \$3 million when they appeared in the Christchurch District Court yesterday. Their names and the name of the limited liability company involved were suppressed... They were allowed bail but also had to surrender their passports.

...[Wellington signs up for war on corruption] NZ will outlaw bribery of foreign officials by companies trying to prise open new markets as part of a global bid to stamp out corruption. Despite strong reservations, the agreement was reached in Paris binding NZ to act at home against any companies or executives found to have paid public officials to buy favours abroad. With US estimates of bribery worth \$US80 billion in the past three years alone, and 80% of companies paying bribes to foreign officials winning the deal, the OECD considers its new convention on combating corruption essential for economic development and international commerce and trade.' Incidentally, 'NZers are among the most honest people in the world, according to *Reader's Digest*, which carried out an international "honesty test." The test involved leaving wallets, with \$50 inside, in a number of cities and seeing how many were returned. NZers returned 83% of the wallets, compared with a 70% rate in AUS. The honesty rate in the US averaged 67%, in Europe 58% and Asia 57%. Two cities recorded a perfect honesty score – Oslo and Odense, Denmark. At the other end of the scale, Manila and Milan scored 40%. Wellington was the most honest city in Australasia, with nine out of 10 wallets returned. Auckland and Christchurch were close behind. The test found that women were more honest than men, and under-25s were slightly more honest than those older.'

...[Corruption is alive and well in "honest" NZ] A young Inland Revenue clerk with two small children to support found herself desperately short of money. With access to the department's database, the Manukau woman began selling taxpayers' names, addresses and phone numbers to debt collectors who were trying to track people down. A dept collector, aged 41, yesterday received a nine-month suspended sentence for bribing the clerk. After giving birth to her third child in June, the clerk was jailed for nine months. The judge had told her that her actions struck at the heart of the public service and eroded its integrity – but unfortunately, her case is not an isolated incident. Transparency International's sixth annual Corruption Perceptions Index, made public on Thursday, ranks NZ third equal with Sweden, behind Finland and Denmark, in the least corrupt nation stakes. NZ has remained in the top four places since the survey began and held first place in 1995 and 1996. But despite the country's reputation, cases involving bribery and corruption continue to come before the courts. Officials from the Department of Internal Affairs, Housing NZ, Department of Corrections and the Immigration Service, and even an Auditor-General, have all been found guilty of corruption in recent years. For a nation that has always prided itself on having an honest and dedicated public service, such cases suggest standards are slipping. A Victoria University criminologist, who specialises in white-collar and corporate crime, agrees that corruption, particularly in the public sector, seems to have risen in the past 20 years. But, he said, any increase could not be confirmed as the authorities may simply be detecting more cases. However, changes within the public sector since the 1980s made corruption more likely. Public servants no longer had a job for life. Increased mobility and the perceived level of pay and working conditions also helped influence the incidence of corruption.'

*...[It used to be said that Japan had a first-rate economic system and a third-rate political one. But with the economy no longer a source of pride, public tolerance for the blatant palm-greasing, pork-barrelling and horse-trading in the world of Japanese politics is at breaking point. Corruption is seen as being so widespread that influential voices are invoking the bygone age of samurai knights to inspire a return to honourable public service and an end to "money politics." But not everyone agrees that the samurai are the best models of morality. "Behind the myth, the code of the samurai was actually to squeeze the peasants as much as you could without actually killing them" says the Professor of Economics at Shimonoseki University. "People were pretty samurai-minded in the pre-war years, but the corruption was at least as bad. Anyone who pines for the good old days is either naive or deliberately shifting attention from the need for strong laws, fiercely independent prosecutors, and hefty penalties for corruption." In the latest of an endless stream of political scandals, the Opposition's lawmaker was arrested this month on suspicion of embezzling 23 million yen of Government money by claiming it as the salary of a fictitious policy research secretary. In fact, the money went on kimonos for his mistress and superior-quality hairpieces for himself. Apart from his being a member of the Democratic Party – supposedly the standard-bearers of clean government in contrast to the ruling Liberal Democratic Party – the lawmaker's case was not considered unusual. The political editor of the *Yomiuri Shimbun* explains "Everyone in Nagatcho (Tokyo's political hub) reacted sympathetically, saying everyone was doing the same thing and that the Opposition's lawmaker should simply have done it more wisely."']*

...Eighty years ago... Halifax, Nova Scotia... was the hub of the Dominion of Canada. W[W]I had brought activity and prosperity to the port... The population was swollen with troops... and people who had come to benefit from the plentiful employment... Convoys of ships loaded with war supplies of food... and... munitions... gathered in the Bedford Basin ready for the voyage to Europe with heavily armed warships as escorts... At 7.30am on December 6, the French ship Mont Blanc left her anchorage... She was loaded with 2335 tonnes of wet and dry picric acid, 205 tonnes of TNT, 10 tonnes of gun cotton and 35 tonnes of benzol – a highly explosive mixture. At the same time the Norwegian vessel Imo, in ballast, set off from the basin bound for New York... At the Narrows, after a series of ill-judged manoeuvres, the Imo struck the Mont Blanc on the bow. Although the collision was not severe, fire immediately broke out on board the Mont Blanc. The captain, pilot and crew, expecting the ship to blow up immediately, launched the life-boats and ran into the refuge of a nearby wood on the Dartmouth shore. Their ship burned for 20 minutes, drifting until it rested against Pier 6 in the Richmond district, the busy, industrial north end of Halifax. The spectacle was thrilling, and drew crowds... unaware of the danger. Just before 9.05am, the Mont Blanc exploded. Not one piece of her remained beside the dock... Fragments rained on the surrounding area, crashing through buildings with enough force to embed them where they landed. Churches, houses, schools, factories,

docks and ships were destroyed in the swath of the blast. Children who had stopped on their way to school, workmen lining the windows, families in their homes, sailors in their ships, died instantly. Injuries were frightful, blindness from the splintering glass added to the shock and bewilderment. The harbour was sucked dry by the force of the explosion. Freight cars went flying three kilometres through the air. Debris killed people 7km away. More than 1630 homes were destroyed, many by fires which quickly spread, and 12,000 were damaged. 6000 people were left homeless and hardly a pane of glass in Halifax and nearby Dartmouth was left intact... The sound of the explosion was heard 500km away, three square kilometres were laid waste and to add to the disaster, that night a blizzard hit... More than 150 bodies were never identified, many victims never found. Limbs had to be amputated from 25 survivors, more than 250 people had an eye removed and 37 were left completely blind... The captain, pilot and five Imo crew members were killed. All from the Mont Blanc survived, but for one man who later died from his wounds... The death toll rose to more than 1700 – eight times the number of people who perished in the Chicago fire of 1871 and four times the number of people who died in the 1906 San Francisco earthquake and fire... The Canadian Government appointed a Halifax Relief Commission to handle pensions and various claims. Its work was not finished until 1976, although pensions are still being paid to survivors. The official inquiry opened less than a week after the disaster. The captain and pilot of the Mont Blanc faced charges of manslaughter, but they were later dropped. Canada's Supreme Court found both ships were equally at fault, the Privy Council in London concurred. It was the largest man-made explosion until the atomic age, and its effects were studied by Robert Oppenheimer in calculating the strength of the bombs destined to wipe out Hiroshima and Nagasaki. - 1997

...who the hell makes those missiles when they know what they can do...

...you Masters Of War... that never done nothing but build to destroy you play with my world like it's your little toy... you fasten all the triggers for the others to fire then you sit back and watch while the death count gets higher... while the young people's blood flows out of their bodies and... [into] the mud... I hope that you die... soon I'll follow your casket... and... watch while you're lowered into your death-bed and... stand over your grave till I'm sure that you're dead.

In the autumn of 1806 everybody had begun talking of the war with Napoleon with even greater warmth than the year before. Orders were given to raise recruits, ten men in every thousand for the regular army, and besides this, nine men in every thousand for the militia. Everywhere Bonaparte was anathematized and in Moscow nothing but the coming war was talked of... On the 12th of June the forces of Western Europe crossed the frontier, and the war began, that is, an event took place opposed to human reason and all human nature. Millions of men perpetrated against one another so great a mass of crime – fraud, swindling, robbery, forgery, issue of counterfeit money, plunder, incendiarism, and murder – that the annals of all the criminal courts of the world could not muster such a sum of wickedness in whole centuries, though the men who committed those deeds did not at that time look on them as crimes... This is how the battle began... The thick fog still hung over the low ground... nothing could be seen of what was going on in front. Whether all the enemy's forces were, as we had assumed, ten versts away from us, or whether they were close by in that stretch of fog, no one knew till nine o'clock... Not the French troops only, but Napoleon himself with his staff were not on the further side of the streams, and the villages of Sokolnitz and Schlapanitz, beyond which we had intended to take up our position and begin the attack, but were on the nearer side... The fog lay stretched in an unbroken sea over the plain, but at the village of Schlapanitz, on the high ground where Napoleon... [sat] on a little grey horse... surrounded by his marshals, it was now perfectly clear. There was bright blue sky over his head, and the vast orb of the sun... quivered on the surface of the milky sea of fog... He was looking... silently at the hills, which stood up out of the sea of mist, and the Russian troops moving across them in the distance... His face – still thin in those days – did not stir a single muscle; his gleaming eyes were fixed intently on one spot. His forecasts were turning out correct. Part of the Russian forces were going down into the valley towards the ponds and lakes, while part were evacuating the heights of Pratzen, which he regarded as the key of the position, and had intended to take. He saw through the fog, in the dip between two hills near the village of Pratzen, Russian columns with glistening bayonets moving always in one direction towards the valleys, and vanishing one after another into the mist. From information he had received over night, from the loose order of the march of the Russian columns, from all the evidence, he saw clearly that the allies believed him to be a long way in front of them, that the columns moving close to Pratzen constituted the centre of the Russian army, and that the centre was by this time too weakened to be able to attack him successfully... That day was for him a day of triumph – the anniversary of his coronation. He had slept for a few hours in the early morning, and feeling fresh, and in good health and spirits, in that happy frame of mind in which everything seems possible and everything succeeds, he got on his horse and rode out. He stood without stirring, looking at the heights that rose out of the fog, and his cold face wore that peculiar shade of confident, self-complacent happiness, seen on the face of a... boy in love... When the sun had completely emerged from the fog... he took his glove off his handsome white hand, made a signal with it to his marshals, and gave orders for the battle to begin... On reaching the village of Pratzen... the Russian... commander-in-chief... halted... Kutuzov seemed exhausted and irritable that morning... He greeted the men of the foremost regiment, and gave them the command to march, showing thereby that he meant to lead that column himself... Prince Andrey was behind among the immense number of persons who made up the commander-in-chief's suite. Prince Andrey was in a state of excitement, of irritation, and at the same time of repressed calm, as a man often is on attaining a long-desired moment. He was firmly convinced that to-day would be the day of his Toulon or his bridge of Arcola... An Austrian officer... galloped up to Kutuzov and asked him... [had] the fourth column started? Kutuzov turned away without answering, and his eye fell... on Prince Andrey... 'Go and see... the Emperor [(Tsar)]... and... ask what they are doing!' ...Prince Andrey galloped off to do his bidding... After passing Austrian troops of some sort, Rostov[(Prince Andrey)] noticed that the next part of the forces... had already advanced into action. 'So much the better! I shall see it close,' he thought. He was riding almost along the front line. A body of horsemen came galloping towards him. They were a troop of our Uhlans returning in disorder from the attack. Rostov, as he passed them, could not help noticing one of them covered with blood, but he galloped on. 'That's no affair of mine!' he thought. He had not ridden on many hundred paces further when there came into sight, on his left, across the whole extent of the field, an immense mass of cavalry on black horses, in dazzling white uniforms... These were our horse-guards, charging to attack the French cavalry, who were advancing to meet them... The horse-guard had hardly passed Rostov when he heard their shout, 'Hurrah!' and looking round saw their foremost ranks mixed up with... [the] French. He could see nothing more, for immediately after cannons were firing from somewhere, and everything was lost in the smoke. At the moment when the horse-guards passing him vanished into the smoke, Rostov hesitated whether to gallop after them... 'I have no need to envy them, my share won't be taken from me, and maybe I shall see the Emperor in a minute!' thought Rostov, and he galloped on... Rostov was appalled to hear afterwards that of all that mass of huge, fine men, of all those brilliant, rich young officers and ensigns who had galloped by him on horses worth thousands of roubles, only eighteen were left after the charge... Rostov rode along the line of the reserves for fear of getting in the way of the front line, as he had done in the charge of the horse-guards, and made a wide circuit round the place where he had heard the hottest musket-fire and cannonade... 'Where's the Emperor? Where...?' Rostov kept asking every one he could stop, and from no one could he get an answer. At last... Rostov stopped the horse of a groom or postillion of some personage of consequence, and began to cross-question him. The groom informed Rostov that an hour before the Tsar had been driven at full speed in a carriage along this road, and that the Tsar was dangerously wounded. 'It can't be,' said Rostov... 'I saw him myself,' said the groom with a self-satisfied smirk... Rostov rode on at a walking pace, not knowing to whom and with what object he was going now. The Tsar was wounded, the battle was lost... What had he to hasten for now? What was he to say now to the Tsar... even if... [it wasn't] wounded? 'Go along

this road, your honour, that way you will be killed in a trice!’ a soldier shouted to him... Rostov pondered, and rode off precisely in the direction in which he had been told he would be killed. ‘Now, nothing matters; if the Emperor is wounded, can I try and save myself?’ he thought. He rode into the region where more men had been killed than anywhere... All over the field, like ridges of dung on well-kept plough-land, lay the heaps of dead and wounded... The... shrieks and groans... [of the] wounded... had a painful... sound... Rostov put his horse to a trot to avoid the sight of all those suffering people... He was afraid of losing... his pluck... which he knew would not stand the sight of those luckless wretches. The French had ceased firing at this field that was dotted over with dead and wounded, because there seemed no one living upon it, but seeing an adjutant trotting across it, they turned a cannon upon him and shot off several cannon-balls. The sense of these whizzing, fearful sounds, and the dead bodies all round him melted into a single impression of horror and pity for himself... He thought of his mother’s last letter. ‘What would she be feeling now?’ he thought, ‘if she could see me here... on this field with cannons aimed at me?’ In the village of Gostieradeck there were Russian troops, in some confusion indeed, but... they were out of range of the French cannons, and the sounds of firing seemed far away. Here every one saw clearly that the battle was lost, and all were talking of it. No one to whom Rostov applied could tell him where was the Tsar... Some said that the rumour of the Tsar’s wound was correct, others said not, and explained... the fact that the Ober-Hofmarschal Tolstoy, who had come out with others of the Emperor’s suite to the field of battle, had been seen pale and terrified driving back at full gallop in the Tsar’s carriage. One officer told Rostov that, behind the village to the left, he had seen some one from headquarters, and Rostov rode off in that direction... simply to satisfy his conscience. After going about two miles and passing the last of the Russian troops, Rostov saw... [a horseman] with a white plume in his hat... Rostov instantly recognised his lamented... idolised sovereign. ‘But it can’t be he... in the middle of this empty field,’ thought Rostov. At that moment Alexander turned his head and Rostov saw the beloved features so vividly imprinted on his memory. The Tsar was pale, his cheeks looked sunken, and his eyes hollow, but the charm, the mildness of his face was only the more striking. Rostov felt happy in the certainty that the report of the Emperor’s wound was false. He... knew that he might, that he ought, indeed, to go straight to him and to give him the message he had been commanded to give... But, as a youth in love trembles and turns faint and dares not utter what he has spent nights dreaming of, and looks about in terror, seeking aid or a chance of delay or flight, when the moment he has longed for comes and he stands alone at her side, so Rostov, now when he was attaining what he had longed for beyond everything in the world, did not know how to approach the... Emperor Alexander Pavlovitch, who was spoken of at that time in Moscow by the designation of the ‘angel incarnate.’ ...thousands of reasons why it was unsuitable, unseemly, and impossible came into his mind. ‘What! it’s as though I were glad to take advantage of his being... despondent. It may be disagreeable and painful to him, perhaps, to see an unknown face at such a moment of sadness; besides, what can I say to him now, when at the mere sight of him my heart is throbbing and leaping into my mouth?’ Not one of the innumerable speeches he had addressed to the Tsar in his imagination recurred to his mind now. These speeches for the most part were appropriate to quite other circumstances; they had been uttered for the most part at moments of victory and triumph, and principally on his deathbed when, as he lay dying of his wounds, the Emperor thanked him for his heroic exploits, and he gave expression as he died to the love he had proved in deeds. ‘And then, how am I to ask the Emperor for his instructions to the right flank when it’s four o’clock in the afternoon and the battle is lost? No, certainly I ought not to ride up to him, I ought not to break in on his sorrow. Better die a thousand deaths than that he should give me a glance, a thought of disapproval,’ Rostov decided, and with grief and despair in his heart he rode away, continually looking back at the Tsar... While Rostov was making these reflections and riding mournfully away... Captain Von Toll happened to ride up... and seeing the Emperor, went straight up to him, offered his services, and assisted him... The Tsar, feeling unwell and in need of rest, sat down under an apple-tree, and Von Toll remained standing by his side. Rostov from a distance saw with envy and remorse how Von Toll talked a long while warmly to the Emperor, how the Emperor, apparently weeping... pressed Von Toll’s hand. ‘And it might have been I in his place!’ Rostov thought, and hardly restraining his tears of sympathy for the Tsar, he rode away in utter despair... from feeling that it was his own weakness that was the cause of his regret. He... ought to have gone up to the Emperor... it was a unique chance of showing his devotion... And he had not made use of it... At that period the Russians were so used to victories, that on receiving news of a defeat... all Moscow had at first been thrown into bewilderment... [S]ome people were simply incredulous, while others sought an explanation of so strange an event in exceptional circumstances of some kind. At the English Club, where every one of note, every one who had authentic information and weight gathered together, not a word was said about the war... it was as though all were in a conspiracy of silence... But a little later, like jurymen coming out of their consultation room, the leaders reappeared to give their opinion in the club, and a clear and definite formula was found. Causes had been discovered to account for the fact... that the Russians had been beaten... These causes were: the treachery of the Austrians; the defective commissariat... the incapacity of Kutuzov; and (this was murmured in subdued tones) the youth and inexperience of the Emperor, who had put faith in men of no character and ability... But what should happen at that... moment but the rising against us of a third enemy, which is the “holy armament” fiercely crying out for bread, meat, biscuits, hay, and I don’t know what else! ...The inhabitants are totally ruined, the hospitals are overflowing with sick, and famine is everywhere... The storehouses are empty, the roads impassable... The Emperor proposes to give authority to all the commanders of divisions to shoot marauders, but I greatly fear this will oblige one half of the army to shoot the other... [R]egiments have turned themselves into free companies, and are overrunning the country with fire and sword... [With] what object... was the battle of Borodino fought? There was not the slightest sense in it, either for the French or for the Russians. The immediate result of it was, and was bound to be, for the Russians, that we were brought nearer to the destruction of Moscow (the very thing we dreaded above everything in the world); and for the French, that they were brought nearer to the destruction of their army (which they, too, dreaded above everything in the world). That result was at the time perfectly obvious, and yet Napoleon offered battle, and Kutuzov accepted it... The battle of Borodino was not fought on a carefully picked and fortified position... The fact remains that there were stronger positions on the road the Russian army had passed along, and... the plain of Borodino... is in no respect a more suitable position than any other spot in the Russian empire to which one might point at hazard on the map... [T]he Russians fought... in conditions in which it was... senseless to fight for ten hours and gain a drawn battle... [A]pparently Kutuzov despised both knowledge and intellect, and knew of something else that would settle things – something different, quite apart from intellect and knowledge... This change of position... made Pierre more than ever doubtful of his capacity to comprehend military matters. As he heard Bennigsen and the other generals criticising the position of the troops... Pierre fully grasped and shared their views. But that was why he could not imagine how the man who had placed them there could have made so gross and obvious a blunder. Pierre did not know that the troops had not been placed there to defend their position, as Bennigson supposed, but had been stationed in that concealed spot to ambush, in order unobserved to deal a sudden blow at the enemy unawares. Bennigson, ignorant of this project, moved the troops into a prominent position without saying anything about this change to the commander-in-chief... And so the battle of Borodino was fought... in order to cover the blunders of our commanders... not... as... it is described by our historians, whose accounts, consequently, diminish the credit due to the Russian army and the Russian people... In warfare the force of armies is the product of the mass multiplied by something else, an unknown x ... To define and express the significance of this unknown factor... is the problem... Military science, seeing in history an immense number of examples in which the mass of an army does not correspond with its force, and in which small numbers conquer larger ones, vaguely recognise the existence of this unknown factor, and try to find it sometimes in some geometrical disposition of the troops, sometimes in the superiority of weapons, and most often in the genius of the leaders. But none of those factors yield results that agree with the historical facts... X is the spirit of the army, the greater or less desire to fight and to face dangers on the part of all the men composing the army, which is quite apart from the question whether they are fighting under leaders of genius or not, with cudgels or with guns that fire thirty times a minute. The men who have the greater desire to fight always put themselves, too, in the more advantageous position for fighting... The French, on

their retreat in 1812, though they should, by the laws of tactics, have defended themselves in detached groups, huddled together in a crowd, because the spirit of the men had sunk so low that it was only their number that kept them up. The Russians should, on the contrary, by the laws of tactics, have attacked them in a mass, but in fact attacked in scattered companies, because the spirit of the men ran so high that individual men killed the French without orders, and needed no compulsion to face hardships and dangers... From the time of the burning of Smolensk a war began which did not follow the old traditions of warfare. The burning of... Moscow... the retreat after every battle... the capture of marauders, the seizing of transports... was a departure from ...regular warfare... Napoleon was aware of it, and... he never ceased complaining to Kutuzov and to the Emperor Alexander that the war was being conducted contrary to all the rules of war. (As though any rules existed for the slaughter of men!) - War & Peace

First you'll need a declaration of war... that way everything you do will be nice and legal.

war, a legal condition which equally permits two or more hostile groups to carry on a conflict by armed force. It is that condition which exists when the social and political equilibrium known as "peace" is upset and the resolution of outstanding issues is accomplished by force and violence, as contrasted to negotiation.

However, although warfare is somehow deemed legal while in progress, afterwards – at least since WWII – leaders (normally those of the losing side) have sometimes found themselves charged for *war crimes* or *crimes against humanity*!

One night in Bosnia, 7000 people disappeared off the face of the Earth from a 'safe haven.'

...In the makeshift morgue at Kalesija, about 23km east of Tuzla, they have examined the remains of 154 bodies unearthed six weeks ago from one grave alone, near Cerska in Serb-held eastern Bosnia. That grave, and others still to be dug up, likely hold the bodies of many of the up to 7000 Muslim men who disappeared after Bosnian Serbs overran Srebrenica in July 1995. Although all sides in the war are accused of mass killings, the sheer numbers of the alleged Srebrenica massacres dwarf similar atrocities in comparison. Bosnian Serbs deny the testimony of survivors and physical evidence of massacres, saying most victims died in battle. [The doctor] whose team has just finished the autopsies for the U[N] war crimes tribunal, disagrees. "There is no doubt that these people were executed," he said of the Cerska victims. [The doctor] is on loan from the Boston-based Physicians for Human Rights, where he heads the international forensic programme. The computer-generated autopsy reports reveal what he calls a "monotonous pattern" to the deaths: "multiple high-velocity GSW [Gunshot wounds] of torso and extremities," one reads... Bone fractures, bullet casings and other evidence show an average of 10 shots per person, fired at relatively close range... "That indicates these people were standing there lined up and someone was spraying them with machine gun fire," [the doctor] said. The tribunal in The Hague, Netherlands[– an ironic place to hold the tribunal considering how 'Dutch UN soldiers had looked on as people were taken away from the safe haven' (and one of their own 'vehicles is accused of having driven over 13 Muslims') –] is expected to use the evidence against suspected war criminals, including the Bosnian Serb's political leader...

[The man] has been vilified by the West as a criminal and warmonger, but to his people in the nationalist stronghold of Pale outside Sarajevo he is a saviour and brilliant politician akin to a God. "The people love him more than God,"... [one supporter] said when asked to sum up his feelings for [the man]... who in July was forced by heavy U[S] pressure to step down as "president" of the Bosnian Serb entity and head of the Serb Democratic Party because of war crimes charges pending against him. "There is no one in the world, including... the Nato-led peace Implementation Force [(IFOR)] who can arrest him... They would have to kill all of us before they can arrest him[," the supporter added]... When asked to explain their esteem for a man said to be responsible for some of the worst atrocities in post-war Europe, supporters dismiss the charges as a pure fabrication by the West – or more specifically the U[S]... "What about the crimes the Americans committed in Vietnam?"... said... a former adviser to the [former Bosnian Serb President]... "...He is a brilliant man and... has an extremely high IQ." [However, that wasn't enough to prevent him from being 'cheated out of \$US6 million by the Russian mafia when a 1995 bid to buy a nuclear bomb left him empty-handed']

...the new] Bosnian Serb President... was to lead a swearing-in ceremony for her new military commander and his deputy yesterday, completing a manoeuvre to oust [an] indicted war criminal... as Army chief. The Bosnian Serb news agency SRNA... statement appeared to confirm weeks of speculation in the Belgrade media that a purge of the Serb military's top brass had taken place. One independent weekly newspaper said as many as 80... top officers and advisers would be pensioned off, including... heads of the military intelligence services. International mediators in Sarajevo were cautiously pleased. One U[S] embassy official said the move was "a good first step that should have been taken a long time ago."

...The Bosnian Serb Army has been thrown into crisis after [an] indicted war crimes suspect... refused orders to quit as Army commander, sparking a showdown with his political masters... 80 other officers were sacked by the newly elected Bosnian Serb President... at the weekend, and a new military leadership has been sworn in, although it remained unclear who is actually commanding the Serb forces. In a statement [aired] by the Yugoslav news agency Beta, about 100 officers pledged their "entire loyalty" to [the General. The new President's move against the] General... heralded a long-anticipated clean-out of chiefs-of-staff designed to placate the international community just a few days before a major summit in Paris to review the Dayton peace process. Her predecessor... the indicted Serb leader forced to step down earlier this year, had himself tried to remove [the] General... in 1995, only to be forced to reinstall the general held most responsible for the atrocities in the war.

...the... General... fashioned the Bosnia Serb Army (BSA) in his own image. In the years when the fighting in Bosnia ran in the BSA's favour, it was a model of ruthlessness, daring and brutality in the Serb warrior tradition. Even in decline, it was capable of acts of breathtaking audacity such as the blitz on Srebrenica or the use of hostage U[N] peacekeepers as human shields against Nato air attack. Everything the BSA did in battle bore the imprint of its 52-year-old creator, commander and arch-strategist. It earned him a sobriquet as the "Butcher of Bosnia" and two U[N] indictments for war crimes in the process. The son of a... W[II] partisan fighter killed in 1945, [the] General... was a star officer in the old communist Yugoslav Federal Army... when ex-Yugoslavia's disintegration began in 1991. He won his first media fame in Knin in southern Croatia where his intervention ensured the success of a local Serb rebellion against Croatian rule. When the Bosnian Serbs rose in 1992 against Bosnia's Muslim-led secession, [the] General... was picked to command the new Bosnian Serb Army which swiftly overran 70[%] of the country. The strategy [the] General... employed formed the basis of the indictments laid against him... The key element was ethnic cleansing to drive Bosnian Muslims and Croats from their homes in territory claimed for the embryonic Bosnian Serb Republic. The BSA used its tank and artillery superiority to lay sieges against Muslim towns in east and central Bosnia and the capital Sarajevo that became a byword for civilian slaughter not seen in Europe for half a century. The 22,000 troops of the U[N] Protection Force (Unprofor), crippled by political and diplomatic constraints, stood by more or less helplessly as [the General]'s army carved up Bosnia. The strategy culminated in the horror of Srebrenica, a U[N] safe area for Muslims in east Bosnia which the BSA captured... under [the General]'s personal command. Some 8000 Muslim men disappeared in BSA custody after surrendering, many believed to have been executed in a four-day bloodbath by firing squads and bulldozed into mass graves. It was almost [the General]'s last fling in a war with which his political backers in Serbia as well as the international community had lost patience. The BSA was crumbling, suffering defeats from Muslim and Croat forces elsewhere in Bosnia and its ability to fight hit by the withdrawal of equipment and fuel supplies from Serbia. [The] General... a political player in his own right and notoriously impatient of civilian authority, became an albatross for the

Bosnian Serb leadership which tried unsuccessfully to sack him in 1995. He remains a hero for ordinary Bosnian Serbs... As a military commander, he fought on the ground alongside his men... in contrast with the staff college bureaucrats who commanded U[N] and Nato forces.

...The commander of the Nato-led ground forces in Bosnia yesterday inspected a key Bosnian Serb military site, effectively averting a potential military conflict. In a highly public demonstration of Nato's determination to carry out its military rights under the Dayton peace accord, [the] Lieutenant-General... flew by helicopter to the site at Han Pijesak for the inspection. "We are here to robustly enforce the military annexe of Dayton... and if there is a requirement to use force to do that, we will do so," said... [the commander. In related news, US] arms shipped to the former Yugoslavia will be handed over to Bosnia's Muslim-Croat Federation only after a Bosnian official seen as close to Iran has resigned... The weaponry that arrived in Ploce on board a chartered ship comprised the bulk of a \$US100 million shipment for the Federation under a U[S]... programme designed to make the Muslims and Croats a match for the Bosnian Serbs... The equipment includes 45 M-60 battle tanks, 80 M-11 armoured personnel carriers, 15 UH-1H helicopters, 840 light antitank weapons, 45,000 M-16 rifles and ammunition. The programme also includes instruction for Federation Army troops. - 1996

...commandos are training to capture Bosnian war criminals, possibly as early as a few months from now, according to news reports citing military sources in Washington... Meanwhile Nato troops have begun a crackdown on Bosnia's paramilitary special police forces, inspecting arsenals and ordering containment of weapons larger than sidearms.

...*Allies crack whip over war criminals' round-up...* A sudden swoop on Bosnian war crimes suspects by... British special forces... the first Nato operation against indicted war criminals since a peace treaty was signed in 1995... has shocked nationalist Serb leaders and signalled a tougher policy by Nato... [A] notorious Bosnian Serb police chief, was killed when he opened fire on soldiers trying to arrest him, and a]... hospital director, was captured at work and flown to The Hague to face trial before the U[N] war crimes tribunal. Both... were wanted in connection with a genocidal campaign to deport Muslims and Croats and were charged under sealed indictments, a new tool employed by the tribunal... The Nato action backed up tough rhetoric from the U[S] and European allies who are increasingly frustrated with the slow-moving peace process in Bosnia... [Previous] policy had ruled out "manhunts" and required soldiers to arrest a suspect only if they encountered them during their regular duties... ['Serb leaders are alleged to have ordered their troops to rape and pillage.' There are] 67 suspects on the tribunal's published list of indictees... The... ex-President... and [the] retired Army commander might be next... [to be targeted. However, while the ex-President] keeps a low profile... in the Yugoslav capital, Belgrade, where his family lives in an affluent suburb, [the ex-commander]... is guarded by heavily armed police and continues to wield power behind the scenes... The British operation came amid a tense power struggle among Serb leaders...

Sending troops to watch over a society naturally gives us proprietary interest in that community's development. So it is that N[Z]'s contribution to countering the Balkan upheaval encourages a close watch on how Bosnian Serbs sort out their leadership tensions. After all, we might have to go back... [W]e see a power struggle between [the ex-President and the current one], upon whom the western states appear to be depending to isolate the indicted war criminal. [However, assuming] any enemy of [the ex-President] is automatically a western ally has all the ingredients of a flawed strategy. Nato thinking in other areas can also attract a wry shake of the head. For instance, [extra]... American F-16 aircraft were sent from Germany to Italy for flights over Bosnia... to ensure a peaceful campaign before municipal elections during the coming weekend... Just what the aircraft were supposed to do if for any reason voters' passage was blocked is hard to imagine. However... American defence officials suggested that "sonic booms" from fast jets could intimidate hardliners attempting to disturb voting. There are many who would suggest that if the fast jets and their intimidating "sonic booms" had been let loose over Croatia and Bosnia in 1991, it is highly likely that U[N] officials would not now be digging bodies out of a pit near Bihac, a pit that locals call "Bezdan" (the abyss).

...[around 100 bodies of Muslim civilians killed early in the 1992-1995 Bosnian war have so far been exhumed from a mass grave near the eastern town of Zvornik, which is part of Bosnia's Serb Republic. Bosnian television said yesterday that it was one of the biggest mass graves found in the country following the 43-month war that killed more than 200,000 people.' Meanwhile, t]he... [from] the Serbian Republic... hinted yesterday that [it] expects the Nato-controlled peacekeeping forces to stop further arrests of indicted war criminals in the wake of a series of protests by Bosnian Serbs and attacks on the multilateral force... Several members of... [the] 60,000-strong IFOR, headed by three powers – the U[S], Britain and France – ...were slightly injured and a number of vehicles damaged in a series of Serb attacks following the July 10 arrest of a Serb war crimes suspect... "I think that was a great lesson for them... Those who do not draw the proper conclusions will be making a catastrophic mistake,"... the Serb representative of Bosnia's three-member presidency, told Kyodo News.

...Bosnian Serbs wanted for war crimes live openly in the same town where the alleged crimes occurred while Nato soldiers appear unwilling to arrest them, CBS News said yesterday... On the show... *Public Eye*... a Serbian soldier... who is wanted for rape... told a hidden camera: "...for 5000 deutsche marks (\$4470) I will tell everything. How I slit throats, killed them and dug their eyes out... and you can tape me." ...Asked on tape if he was afraid of Nato soldiers... shown at a restaurant next door... [he] replied: "No, I have this," and displayed two hand grenades on his right hip and a pistol on his left... He pointed to men milling around the cafe. "All these people are completely armed. I have 20 bodyguards to protect me. We have a lot of weapons,"... The CBS journalists never offered the money... and he did not describe his alleged crimes... [A] member of International Crisis Group, a human rights organisation in Bosnia, told CBS if Nato troops went after war criminals, there would be casualties but added: "War would resume in this country if these war criminals continue in freedom." ...Meanwhile the first visit to Bosnia's war-battered capital of Sarajevo by the U[S] President... is proving to be an unprecedented security headache for foreign troops and local police who must try to secure a country without effective borders... The discovery of a powerful bomb near a Sarajevo church and the roundup of suspected terrorists just days before the 12-hour visit illustrate the dangers facing the President and his guards.

...More than 800,000 letters and packages have piled up in Sarajevo in the last 18 months because Serbs, fearing letter bombs, refuse to take them. The Bosnian Serb post office doesn't have the necessary equipment to examine letters and packages... [In related news, t]he Nato-led force in Bosnia has snatched two Bosnian Croat war crimes suspects and warned that more arrests will follow if suspects do not surrender... A... source said the... Dutch... navy commandos used had been trained and brought in specifically for the task, and had left once it was over.

...NINE Bosnian Croats... [indicted] on war crimes charges will surrender voluntarily... if the UN war crimes tribunal can guarantee them a fair and quick trial.

...The group includes [the] Bosnian Croat political leader... [who is] one of the tribunal's most wanted men... The tribunal prosecutors' indictment against... [him] said the crimes committed under [his] direction were so widespread and systematic that almost the entire Muslim population of the Lasva Valley was killed or driven away... Six of the suspects... are accused of participating in a gruesome massacre at the village of Ahmici. The indictment said... unarmed Muslim civilians, including women and children, were systematically shot. More than 100 people died. Some accounts at the time spoke of families... being burned alive in their homes... The surrender of the... Bosnian Croats has doubled the number of indicted war crimes suspects in the tribunal's custody to 20...

Three Bosnian Croats released by a... war crimes tribunal... said they were looking into ways of suing the U[N] for damages... "They told us we were free. They didn't even apologise, they just said the prosecutor was dropping charges against us for lack of evidence," [one of the men] said... The UN war crimes tribunal... set up in 1993... for former Yugoslavia... raised indictments against the three men in 1995... Croatian officials said the release would contribute to the tribunal's credibility as it showed it was prepared to give up prosecution when it had no real arguments...

Charges have been publicly pressed against 18 Bosnian Croats, 57 Serbs and three Muslims... Over 50... are still at large, among them the two most wanted... Two indictees have been convicted and sentenced [to date]...

A] US envoy... won a promise yesterday that... the former Bosnian Serb leader... [and] indicted war criminal... would finally disappear from Bosnian politics... Sources close to the negotiations said Washington accepted the deal “in order to avoid the bloodshed” many fear would result if Nato-led troops moved to arrest [the former leader], who is guarded by hundreds of men. One senior source... gave no deadline... period to remove him... but noted it “would not be forever.” ...the US remained firm in its position that [the former leader] should present himself to the tribunal in the Hague for trial... [T]he Yugoslav... economy cannot continue without a life-saving infusion of fresh capital for much longer in order to feed... 11 million people, of whom already one third are poor and another 600,000 starving. - 1997

[The UN] Secretary-General... has strongly condemned atrocities committed by Serbian forces in Kosovo... [He] is deeply disturbed by the latest reports of an intensifying campaign against the unarmed, civilian population... The province has a 90% ethnic Albanian majority... [He] says Serbian military and paramilitary forces must not be allowed to repeat the campaign of ethnic cleansing and indiscriminate attacks on civilians that characterised the war in Bosnia.

...Scores of ethnic Albanian villagers slept in the open in the Kosovo hills for a third night as Serbian police continued their onslaught against alleged... terrorists... of the separatist Kosovo Liberation Army (KLA)... A leader of the local branch of the ethnic Albanian LDK party said: “We have... never had any guns and now the Serbs have come to kill us.” A pro-Government Belgrade daily said dozens of Albanian guerrillas had been killed in the whole operation, which began last weekend. It had earlier put the death toll at 70. According to the police the dead included... the... KLA leader... The KLA has emerged during the past two years... against a background of growing impatience with the lack of progress made by peaceful activism to demand independence for Kosovo province, which had its autonomous status removed by Belgrade in 1989... Without a lasting solution to the long-running Kosovo issue, the outlook looks as bleak as ever... [M]any locals believe... the latest government crackdown... can only help the separatist movement. “These children will grow up and it’s up to them to avenge their fathers and brothers,” said one refugee from the fighting. “So who is to say who is KLA and who is not? It is the bitterness that matters.” ...[Incidentally, a] military appeals court yesterday upheld the conviction of an ex-SS captain for war crimes in Italy and sentenced him to life imprisonment. But prosecutors said [the ex-SS captain, now] aged 84, would not have to go to jail. Instead, the [man who has been] convicted of helping to carry out the massacre of 335 civilians in German-occupied Rome in 1944, will stay under house arrest because of frail health... [He] admitted to shooting two victims... and... said he helped round up the victims because refusing orders – which the defence said came from... Adolf Hitler – would have meant death for [himself. He] has served time in detention since his 1994 extradition from Argentina, where he had lived for decades in an Andean resort town.

...A former KGB head has told how Hitler’s bones were secretly burnt in a night-time operation a quarter of a century after the Nazi dictator died... “Then the ashes were dumped in the city sewerage system through a manhole.” The remains had lain until then beneath concrete on the grounds of a Soviet military camp... 110km west of Berlin, their location known only to a small circle of Soviet leaders. They had been transported there in 1946, less than a year after their discovery by a Soviet military advance party in the yard of Hitler’s bunker, buried in a shallow grave in a large bomb crater... A report was sent immediately to Stalin, who gave orders to determine beyond doubt that Hitler’s corpse was among those recovered... But in 1970, when the Russians thought they would have to hand over the military camp to the East Germans... Yuri Andropov, then chairman of the KGB, later general secretary of the Soviet Communist Party... gave the order to dig up the remains and destroy them for fear that they would one day be discovered and the site turned into a shrine to Hitler. The... revelation... ends half a century of speculation and conspiracy theories that Hitler took advantage of the chaos at the end of... W[W]II to escape to Argentina... According to the latest reports, it is stored in a small cardboard box originally used for ballpoint pen refills... [In related news, a] top secret Death Squad was set up after W[W]II to locate and execute Nazi war criminals... according to a member of the special unit who claims he personally executed 16 Germans... The mission was intended to punish those war criminals who were not prominent enough to face justice at Nuremberg and other set-piece trials conducted by the allies at the end of the war. In the euphoria after VE Day, the British government was reluctant to publicly rake over some of the goriest episodes of the war. Disclosure of the hunter-killer units would have undermined the public display of legitimacy ensured by the war trials. The capture of German military records in Strasbourg, however, made it possible to wreak secret revenge on men who might otherwise have vanished... The... [Now aged 73, he] described how he was recruited in May, 1945, to avenge the deaths of Special Operations Executive... spies in concentration camps and SAS troops illegally shot by the SS as saboteurs... He said the unit’s preferred method was to collect the Nazis from allied prison camps, on the pretext that they were required to give evidence at Nuremberg[(‘the first time military leaders were tried for crimes against humanity’)]. He and his fellow soldiers would check their identities and confront them with a file listing their atrocities before executing them. “All the SS were tattooed with their numbers. Some used battery acid to try to burn it off and conceal themselves. If you saw a big scar, you knew who they were,” he said... [The squad] killed their targets using German guns... to make it appear as if... the Nazis had committed suicide. Alternatively[, the squad]... would claim they had been shot while trying to escape... The most notorious victim of the SAS unit was... a Hitler Youth leader who was suspected of... [castrating] two British secret agents... [and leaving] them to bleed to death hanging from telegraph poles.

...a 78-year-old... who [moved] to Britain from Belarus in 1946 and worked as a railway ticket collector[, has received]... a double life sentence... [for] murdering Jews... during [WWII]... in Britain’s first war crimes trial... [The 87-year-old] is the first Vichy official to face such charges and will almost certainly be the last... It wasn’t until 1981 – at the peak of his career – that his Vichy past was revealed... Why have the facts remained obscured for so long? And why didn’t the French go through the same kind of painful self-examination that Germany underwent after the war? The answer lies partly in the fact that at the time anti-Semitism was rife throughout Europe... Faced with a demoralised people and the threat of a national crisis, de Gaulle propagated the myth that France was a nation of heroic Resistance fighters...

The trial over crimes against humanity of [a] former French... official, whose... career culminated when he was budget minister from 1978-81... was to [begin] overnight – more than half a century after... [WWII.] and 16 years after proceedings were first opened against him. [He] is accused of ordering the arrests of more than 1500 Jews by Bordeaux police between 1942 and 1944 to be handed over to the occupying Germans. Nearly all were gassed at Auschwitz concentration camp in Poland including more than 200 children... Now aged 87... he says he was obeying orders and seeking to limit damages during his tenure as secretary-general of the local prefecture during the war... [He] has denounced the trial as a farce... [His] political career was brought to an abrupt halt... after a newspaper published documents unveiling his hitherto-unknown role in deporting Jews... [The trial] has fed new soul-searching about the role of French officialdom during... [WWII. A] number of other officials in the Vichy regime... pursued... successful [careers] after the war thanks to contacts... made among post-war leaders ignorant of [their] exact wartime activities... 76,000 [French] Jews were handed over to the Nazis. About 2000 survived...

[The accused] pro-Nazi... his defence shaken by his own testimony, faces a crucial phase of his... three-month trial... this week when the court examines the fate of child Holocaust victims... [He] has tried to convince the court he used his post as a senior bureaucrat... from 1942 to 1944 to save Jews from being deported to Auschwitz. But the prosecution says the local Service for Jewish Questions under his control rounded up children for deportation without orders from the Germans, who at first excluded children under 16 from arrests... [Last week he] admitted he knew about the concentration camps in June 1942 and saw his claim to have saved one Jewish girl disproven... The trial, originally due to end this week, has been extended until March [1998 because the suspect's] frequent illnesses have held up the proceedings. - 1997

Ironically, while Nazis and their collaborators were convicted – or hunted and exterminated – for the gassing of Jews and other war crimes, nobody faced charges over, for example, the bombing of Dresden!

...the difficulty... is... of persuading people that various acts are evil... In... W[WWII], great Allied statesmen saw little wrong with the firestorm in Dresden, a city of not the slightest military value and crammed with women and children. The scientists developing the atomic bomb contemplated poisoning half a million Germans with strontium... if the bomb itself couldn't be produced. ('There is no better evidence anywhere in the record of the increasing bloody-mindedness of... W[WWII] than that... Robert Oppenheimer, a man who professed at various times in his life to be dedicated to *Ahimsa* ("the Sanscrit word that means doing no harm or hurt"...), could write with enthusiasm of preparations for the mass poisoning of as many as five hundred thousand human beings'...)... I don't want to suggest that deliberate acts of producing firestorms in German cities, or even the atomic bombings of Japan, were very obviously and very purely wicked. The argument that the war was thereby shortened, and millions of lives saved, cannot be rejected out of hand.

In 1936 a British feature film, *Things To Come*, imagines what the next war will be like. It shows what millions fear – a war different from any before, with fleets of bombers attacking civilians from the air. Only one year later the prediction was coming true. In the war in China, Japanese planes bombed Shanghai, and in Europe thousands of civilians are bombed in the Spanish Civil War. Across the world the nature of war has changed... From now on civilians will be targets... In Northern Europe the first civilians to experience the nightmare of fast-moving modern war were in the towns that stood in the way of the German blitzkrieg. In Poland... then in the Low Countries and France, hundreds of thousands of refugees took to the roads... What the refugees came to fear most were attacks from the air even as they fled... Germans on the home front believed they were safe and were confident of ultimate victory... The Germans had started preparing much earlier than their enemy. British war production had to catch up fast. Factories were converted to turn out arms... A whole new workforce was mobilised... Soon all unmarried women between 20 and 30 were called up, many of them to do technical jobs... In conscripting women Britain went further than ever before to meet the demands of war... People working in factories found that they themselves became targets... Before America itself joined the war, President Roosevelt had taken the moral high ground and appealed to both sides not to bomb civilians, but a steady escalation began. When German planes attacked London in September, 1940, they tried to hit the docks and stations, but mostly they hit the streets and homes surrounding them... "We will mete out to the Germans the measure and more than the measure they have meted out to us," declared a defiant Winston Churchill... Because military targets were hard to hit, the British switched to area bombing. The RAF would try to stop German industry by de-housing its workers. In July, 1943, they mounted their heaviest raids so far. "...More bombs have dropped on Hamburg in the space of a few hours than on the whole of Greater London during the blitz." The British bombing created a firestorm with winds of a 120 miles an hour... Temperatures reached a 1000 degrees centigrade. 8 sq miles were ablaze... The number of civilians killed in Hamburg that week was 42,000 – more than all the British deaths in the whole of the blitz... 2/3rds of [Hamburg's remaining] residents left the city... "We walked for 10km through rubble, debris and a sea of flames... We looked back at Hamburg and everything was black. The sky was totally black. The sun couldn't shine through, and even 25km away soot was raining down." ...[back in February, Germany's propaganda chief had challenged:] "Do you want total war? Do you want war more total and more radical than you could ever have imagined?" "What total war really meant then Goebbels didn't tell us, but we felt really clearly what he meant in... Hamburg. That was total war – ...it just didn't happen as Goebbels had imagined." ...Total war was waged most harshly in the Soviet Union. In 1941 the Soviet people were invaded by German forces who had orders to kill or enslave them and take over the land. Soviet prisoners were treated as sub-humans. Everywhere the Germans advanced, they rounded up civilians and split up families. Women and children were sent away to fend for themselves. The [Germans] picked out some [civilians] to be deported as slave labourers back in Germany. Many would never return... The Soviet people who were left behind were engulfed in a war that took more civilian lives than in any other country. They were often caught between the German occupation forces and the resistance waged by Soviet partisans[, and were]... in fear of both sides... The Germans took ruthless reprisals after partisan activity. Soldiers were told the normal rules of war were not to be followed... "...they would take people to a shed and burn them there." ...Chinese civilians received much the same treatment from the Japanese[, who]... wanted living space and territory, and also treated their enemy as inferiors whose lives were cheap... Japan's troops were given orders to make the land uninhabitable. The Imperial Army's slogan was the '3 alls.' "Burn all, steal all, kill all... I rounded up the women and children in the villages, shut them into buildings, piled up firewood and burned them. I did many terrible things like that." ...When the Japanese attacked the U[S] at Pearl Harbor in 1941, the war had been widened... President Roosevelt threw the weight of American industry into war production... America saw itself as the arsenal of democracy, supplying both itself and its allies too... The pressure of war forced new and quicker methods. Ships were built in record time... [O]ne... San Francisco yard... broke all records by showing it could launch a ship in only 4 1/2 days after laying the keel... The end of the war was in sight in Europe and the final blows were to be delivered against Japan from a new long-range bomber – the B29 being mass produced by American workers. "We the people built it, we conceived it, financed it and gave it wings. Here the bomb bays will hold the greatest weight of death ever lifted into the skies..." The Japanese in turn were being asked to do more by their own government. Children were taken out of school and sent to the arms factories to work full-time, so desperate was the labour shortage... "Our teachers told us that in Japan we have an emperor who is descended from the gods – so, whatever happens, in the end a divine wind will blow and win the war for us..." ...By 1945 the Americans had island bases close enough for the B29s to take off for Japan. They attacked all major cities... Earlier concerns in the West about the morality of bombing civilians were long forgotten. After five years all the constraints had gone. In one night the Americans dropped 1/2 million incendiary bombs to set Tokyo alight... There was no way of stopping the fires... The B29s... had achieved their purpose. 334 planes killed 120,000 people in a few hours, more than any other single action of

the war. Though they knew they could never win, the Japanese leaders told their people to fight on... Five months later the technology of total war reached its zenith. It took only one plane and one bomb to devastate [‘67% of’] Hiroshima, and later [‘40% of’] Nagasaki, in just a few seconds. Japan’s leaders surrendered... Altogether the war had cost 55 million lives – 6 times as many as... W[WI]. What was new was not just the numbers but who they were... For the first time far more civilians had lost their lives than soldiers in uniform[, including]... up to 13 million civilians in China[, and] up to 14 million Soviet civilians. There were... victims of starvation, atrocities and bombing.

atomic bomb a bomb whose destructive power comes from the rapid release of nuclear energy by fission of heavy atomic nuclei, with damaging effects caused by heat, blast, and radioactivity... The first atomic bomb to be used in war was exploded by the USA 300m above Hiroshima...

The people who ordered the dropping of atomic bombs on Hiroshima and Nagasaki were predominantly regarded as heroes – though they could’ve arranged for a display of their new weapon’s power that didn’t involve inhabited cities! Nagasaki – ‘the first Japanese city to have commercial intercourse with the West, and the site of the largest Christian church in the Orient (26 Christian martyrs had been crucified in the city during 1597) which was completed in 1941 but was destroyed during the war’ – had an ‘enormous torpedo factory’, but if the US had exploded an atomic bomb on Mt Fuji or 300m above a Japanese naval fleet, ‘military base or installation’ (e.g., a small occupied island), surely the effect would have been just as dramatic while eliminating the murder and suffering of thousands of innocent children? However, USers weren’t the only group of people to escape punishment for war atrocities.

A prominent Jewish group has accused the U[S] of giving amnesty to Japanese doctors and scientists who carried out atrocities during... [WWII]. “The U[S]... now admits in writing that they shielded these people who had carried out horrific atrocities from prosecution by the Soviets and handed them tickets to re-enter Japanese society at a very high level.” ...a letter written to... [the] associate dean of the Simon Wiesenthal Centre... by... [the] director of the Justice Department’s office of special investigations... confirmed that... Lieutenant General Shiro Iishi, commander of the infamous Unit 731 of the Japanese Imperial Army, and his men had received total amnesty following the fall of Japan in 1945... [Unit 731 carried out] “field tests” in which hundreds of thousands of civilians in China and eastern Russia were exposed to and died from deadly germs... In addition, [the associate dean] said, prisoners of war from N[Z, AUS], Europe and possibly the U[S] were subjects of... “diabolical and horrendous medical experiments” which sometimes ended in their undergoing vivisection. Shortly before Japan surrendered... the order went out to kill all prisoners in the “death camps” run by Iishi, who died of cancer in 1959. [The associate dean] called on the US Government to rescind the amnesty order protecting the remaining members of Unit 731 and other Japanese who had engaged in medical experiments or chemical or biological warfare. [The associate dean] also urged the US Government to add the names of suspected Japanese war criminals to the Immigration Department’s “watchlist,” which denies entry into the U[S] for war crimes suspects.

JAPAN’S germ warfare Unit 731 conducted some of the most horrifying “live” experiments of W[W]II... Headquartered in the northeastern China puppet state of Manchuria, the unit conducted experiments on about 3000 Chinese, Korean, Russian and Mongolian prisoners. None survived... After the war, unit commander General Shiro Ishida won immunity from war crimes trials from US authorities in exchange for the file on experiments. These show how prisoners were injected with various germs, such as anthrax, and graphically records the spread of the disease through the body, often by dismembering the prisoners while they were still alive. Other prisoners were exposed to sub-zero temperatures for days, and then their bodies were dismembered to see how the various organs had been affected. Others were injected with cholera and observed by attendants, who provided no help, for four days until they died. The unit was most successful in spreading bubonic plague by dropping bombs containing it from planes, killing thousands of Chinese civilians... The Japanese government has never formally apologised for Unit 731’s atrocities or, until yesterday, formally admitted its existence... [Incidentally, the] Germans... paid a total of almost \$US60 billion... in compensation, restitution and other forms of war damages... while “the Japanese have paid almost nothing.”

...The Japanese P[M]... marked the 52nd anniversary of the ending of... W[W]II yesterday by saying he felt “deep remorse” for Asian victims of Japanese militarism. “The war caused pain and suffering to the people in Japan and many Asian countries,” [he] said in the main Government memorial ceremony for Japan’s war dead... [His] remarks were almost identical to the comments he made at last year’s memorial ceremony... [when he] became the first P[M] from the conservative, long-ruling Liberal Democratic Party... to express remorse to Asian war victims. In 1993, [a P]M... leading an anti-LDP coalition Government, became the first premier to offer a clear apology in the annual ceremony... [The current PM] did not pay his respects at the controversial Shinto religious site known as the Yasukuni Shrine. When he did go to the shrine on July 29 last year, the visit triggered bitter criticism from China and other Asian nations...

Air raid sirens wailed across China’s eastern city of Nanjing at the weekend to mark the 60th anniversary of a Japanese massacre of more than 300,000 soldiers and civilians.

...Sixty years ago... troops of the Imperial Japanese Army captured the Chinese capital of Nanking. Japan’s regional power had been growing since the turn of the century, and Taiwan and Korea had already come within its grasp. In the early 1930s, alleged sabotage gave Tokyo’s militaristic and nationalistic government an excuse to turn Manchuria into a puppet state. Another trumped-up incident, in July 1937, signalled the start of a full invasion by Japan. But Shanghai... held out for months. A people Japanese disdained as crude, poor, ignorant and divided was humiliating the instrument of a living god. So when Shanghai finally fell in November and the Japanese Army began pushing up the Yangtze to Chiang Kai-shek’s capital – known to the West then as Nanking, now more familiar as Nanjing – its mercilessness showed it wanted revenge... [W]hat happened next[is] in a new book, *The Rape of Nanking: The Forgotten Holocaust of W[W]II*. Admittedly... there is conflicting evidence on how many hundreds of thousands of people died, with disparity between the Japanese Army’s estimate and the Chinese body count... [M]any think the toll was more than 300,000 dead – maybe even more than 400,000. It was the manner of these deaths as well as their number that made Nanking notorious. “Chinese men were used for bayonet practice and in beheading contests... An estimated... 80,000 Chinese women were raped. Many soldiers went beyond rape to disembowel women, slice of their breasts, nail them alive to walls. Fathers were forced to rape their daughters and sons their mothers [in front of] other family members... Not only did live burials, castration, the carving of organs and the roasting of people become routine, but more diabolical tortures were practiced... Because of the presence of Westerners, including reporters, the savagery made worldwide news. Ironically, it was foreign criticism of the mass rapes that led the Japanese military to set up its notorious system of brothels and “comfort women.” ...The unexpected hero of this hell was a middle-aged German... [who] was an electrical-equipment company executive and a dedicated Nazi... [He became] head of the International Committee for the Nanking Safety Zone... established... [by] Western clergymen, doctors, professors and businessmen... As it turned out, 200,000 to 300,000 people jammed the safe area for the six weeks the slaughter lasted. The Westerners laboured to feed and shelter their guests and provide medical care... [The German] was especially bold in standing up to Japanese officers. He was much helped by his swastika armband and top Nazi decorations, symbols of a friendly European power... He returned to Germany in February 1938... After the war, he was arrested by both the Soviets and the British before undergoing a long and expensive denazification. Eventually he and his family were reduced to living on weed soup and dry bread. But in 1948 word got back to China, and a monetary subscription and regular food packages were sent to the man the Chinese called “the living Buddha of Nanking.”

...A Chinese woman who says she was raped, stabbed 37 times and left for dead during the Japanese Imperial Army's 1937 Rape of Nanjing wept as she told a Tokyo court yesterday of her ordeal and demanded compensation... [The now 79-year-old] is one of 10 survivors of the massacres in Nanjing who are demanding 100 million yen each... in compensation from the Japanese Government... She said Japanese troops tried to drag her from a basement hiding place she shared with 70 other people. "They took the men outside but the 30 women resisted, crying and shouting and holding on to doors... I was 19 years old and pregnant. I was terrified of the shame of being raped so I bit one soldier and then many others attacked me..." The 19-year-old... survived but lost her child the next day. She was then taken by her father to American Protestant Pastor John Magee, who hid her in a church. The court was shown a 20-minute videotape of footage taken by Mr Magee in which... [the 19-year-old] appears above the caption "Young girl attacked and raped by Japanese soldiers." ...The case comes amid a debate in Japan over the exclusion of Japanese wartime atrocities in school textbooks. In 1994, [Japan's then]... justice minister... was forced to resign... after telling reporters the Rape of Nanjing had never occurred.

...[Here's a new spin on a familiar story: a Japanese nurse wants to remember – not forget – the war that ended 13 years before she was born. The nurse in the acute ward at North Shore Hospital often finds herself caring for veterans of the war in the Pacific or their families. And each time she is confronted by the pain of a conflict she was never told about. It is not the animosity of those who suffered at Japanese hands that she must deal with, but her own guilt and sadness as history catches up with her. "I never knew anything about what happened before I came to NZ. I was so surprised. Nothing was written in the textbooks. If we had been told the truth, our attitude would be different." The nurse's story gives an instructive insight into the reaction of Japanese tourists who are cold-shouldered by those with long memories. Their apparent indifference is bemusement, not pig-headedness, and they would regard their hosts' hostility as saying more about us than them. She comes from a generation which has been raised to forget. A Japanese specialist in the history department at the University of Auckland says the Japanese as a people are very open to different interpretations of history – but they are not given any. "History is just not presented to them as something that is debatable." He recalls that General Douglas MacArthur, who accepted the Japanese surrender, once said the right to write history was one of the spoils of victory in war, but the Japanese seem to have retained that right in defeat. Incredibly, the standardised school curriculum controlled by a powerful and centralised Ministry of Education managed to keep all mention of the war as a world conflict out of textbooks until 1990. The war in the Pacific was alluded to, but its world context and the reasons for its outbreak were never part of the national discourse. The Japanese, in short, have spent the best part of two generations being told that they were victims of war – and particularly of the world's only nuclear attacks.'

...WWII prisoners of the Japanese were forced to build a 413km railway from Bangkok to Rangoon in occupied Burma. The death toll grew daily as the men toiled in monsoon rains with little food, their emaciated bodies shaken by recurring bouts of malaria. Only a handful of NZ prisoners of war were among the mainly AUSn, British, Dutch, US and Asian labourers, but each year either NZ or AUS hosts Anzac Day memorial services at the huge war cemetery at Kanchanaburi. More than 12,000 Allied prisoners died building the "Railway of Death" in an area perhaps better remembered for the film *Bridge on the River Kwai* than for the massive human suffering that unfolded there – and 80,000 to 100,000 Asian labourers are believed to have also perished.' In related news, 'former POWs and civilian internees took their claims for Japanese Government compensation to the Tokyo High Court yesterday. A former civilian internee from NZ told the court he felt sorrow as well as anger over Japan's inability to address the issue. Last November the Tokyo District Court rejected the POWs' 1995 suit demanding an apology and \$US22,000 compensation from the Japanese Government for each detainee.'

...During the war, the number of AUSn POWs on Ambon Island in Indonesia dropped from 1100 to less than 300 due to abuse by their Japanese captors.'

...the British Government has bowed to years of pressure by former prisoners of war and agreed to compensate those held in brutal conditions by Japan during WWII. Some 16,700 survivors and surviving spouses will get £10,000 each. Under the 1951 San Francisco peace treaty, the Japanese Government had paid former POWs £76.'

...the NZ Government can't find the will or the money to compensate old people still suffering from the barbarisms of Japan's ruthless jailers in POW camps – payments which Japan should be making but refuses to. What's our problem? The British Government had no qualms about its decision to pay something like \$NZ30,000 to each survivor of such horrors. Earlier, Canada decided on payments too. Germany gives pensions to Holocaust survivors. Even the Vatican has decided on compensation to slave labourers involved in church projects during the European war years. Others have not forgotten the Pacific POWs or what they went through – lashings, torture, untreated disease, starvation – while thousands of their comrades died or were executed. In Singapore, a new chapel dedicated to those men and women in notorious Changi jail and a museum of remembrance opened in February. Singapore's High Commissioner in NZ says his country will not forget the memories of those prisoners and their loved ones. But, NZ has no problem forgetting, accepting the official Japanese Government line that the San Francisco Treaty in 1951 officially ended the Pacific war. This treaty, Tokyo says, annulled Japan's responsibility for what happened to countries and individuals run down by its war machine. That's why Japan has consistently refused to even apologise to its victims – much less compensate them for their wrecked lives and health. Worse still, that 1951 phoney cutoff date is linked with one of the most immoral conspiracies of modern times. The Allied governments, including NZ, colluded in ordering a halt to the hunt for and the trials of thousands of Japanese war criminals. This wiped the slate clean for Japan and allowed it to rebuild politically, socially and economically. The impetus came from the Korean war and the rise of an anti-colonialist communism through Asia. The West needed a resurgent Japan as both an exhibit and a buffer. NZ prisoner groups have petitioned Japanese courts and written to the NZ PM, putting a case for justice. Of course, if the authorities can hold out long enough the need for action will have gone. Men and women, enfeebled by their dreadful imprisonment, will have died – with only long-forgotten files to worry the consciences of those who failed to act on their behalf. The Tokyo court submission and the letter to NZ's PM, both of which I helped draft, expressed sorrow more than anger. Sorrow that the Japanese, who are renowned for individual acceptance of responsibility, are failing to meet their own creed – and sorrow that our Government is not doing its duty either.' However, perhaps our Government is scared to pressure Japan in case it receives some counter-claims?

...On February 23, 1943, guards rained gunfire on Japanese prisoners of war held in a military camp near Featherston, NZ. It took less than a minute for the rifles and submachine-guns to stop. But it was enough time to kill 48 unarmed Japanese prisoners of war and wound 61 others. Added to that toll was a NZ soldier shot dead and five others injured by friendly fire. The official version of the event from a Military Court of Inquiry is that after the POWs refused to work a warning shot was fired. The POWs then rushed their armed guards, forcing them to defend themselves. The court found that the POWs "appear culpable" though no charges were laid against either side. It seems certain that the official version was a cover-up of what in another time could conceivably be called a war crime.' 'News of the event was kept secret till after the war, in case of retaliation on NZers in Japanese POW camps.'

...In a book just released in NZ, a Japanese naval officer who was captured off the coast of Guadalcanal during the war and interned in the Featherston Prisoner-of-War camp, expressed a "deep apology to those ill-treated soldiers and their families" for atrocities committed by his countrymen. In the epilogue to his revised book, *Beyond Death and Dishonour*, the former naval officer said that despite what he calls "the incident" in February, 1943, the Japanese were well treated by their captors. But he said after the war it became clear that Japanese forces had not been hospitable to the prisoners which they held.'

...WITH a quavering voice, [an 83-year-old man] told a Tokyo courtroom of the atrocities he committed as a Japanese military police officer in Manchuria during... [WWII. D]espite doubts about their guilt, he handed two Chinese prisoners over to the notorious Unit 731 in 1941, where they died as human guinea pigs in Japan's biological warfare programme... He called on the Japanese government to apologise and pay \$826,000 to the

bereaved families. Dozens of geriatric Japanese veterans are at last beginning to unburden themselves of their war guilt, delivering confessional lectures and publishing books. But [the 83-year-old] is the first to describe his atrocities in court. This was made possible by an extraordinary collaboration between Chinese who claim they were victims of Japanese aggression and a group of Japanese lawyers and activists who believe Japan has yet to shoulder full responsibility for its war crimes and so are helping their aggrieved neighbours sue the Japanese government. Seven lawsuits by Chinese victims or their families, all filed in the last two years, are the most ambitious of a clutch of cases, because they seek to hold postwar Japan liable for the Imperial Army's most heinous deeds. But the trials could drag on for years, if not decades... [In related news, o]n December 7, 56 years ago... Japanese bombs rained down on Pearl Harbo[r]. The]... commander-in-chief of the US Naval Fleet... was later accused of being ill-prepared for the raid that killed more than 2400 people – the scapegoat... [for a] humiliated... nation. Forced to retire after being demoted from a four-star to a two-star admiral, [the commander-in-chief] also blamed himself – until he learned, in 1944, that senior naval and government officials may have known of the impending attack, but never warned him... or his army counterpart... who was also demoted... [The] admiral... spent the next 24 years fighting to be exonerated and restored to the rank of four-star... but he died without success... But even if... true... to... absolve... [the commander-in-chief] would require the US government to acknowledge President Roosevelt let Pearl Harbo[r] happen. A]... retired three-star admiral and former Nato intelligence officer, also thinks President Roosevelt knew about Pearl Harbo[r]. But it was unlikely history would be revised at the expense of one of America's most loved presidents, he said... "Governments do not ever admit to mistakes... It isn't the truth that matters, it's perception." ...Even though the government recently softened its stance and now maintained that blame for Pearl Harbo[r] must be "broadly shared," [the last three] Presidents... have all denied... requests to posthumously restore [the commander-in-chief's] rank and exonerate him. Late last month, [his family] got another cold-water splash of bad news: [the]Defence Secretary... denied the most recent... [request], saying he "remain(s) accountable" for his actions 56 years ago... Germany intercepted a November 26, 1941, radio-telephone message from British P[M] Winston Churchill to President Roosevelt, warning of the Japanese attack. - 1997

Pearl Harbor wasn't the only military disaster that involved Winston Churchill (who had 'believed the US could be drawn into WWI if neutral ships could be caught up in U-boat torpedoing; U-boats used to give merchant ships a warning but Churchill ordered merchant ships to ram U-boats, so the U-boats began to remain submerged – giving no warning; however, two telegraphs to the luxurious Lusitania – one to the richest man on board and one to a Hollywood producer – warned it would be targeted, and the Germans knew she was loaded with ammunition for the British war effort, but although the British knew a U-boat was in the same region, because at least three ships had been sunk, the Admiralty gave no orders for the Lusitania to change course and provided no naval escort; amongst the 1195 dead, which included 94 of 134 children, were over 100 US citizens, prompting America's entry into the war')!

GALLIPOLI was the disastrous W[WI] campaign, instigated mainly by Winston Churchill, in which N[Z and AUS]n troops were first forged into Anzacs[(the AUSn and NZ Army Corps)]. Churchill was First Lord of the Admiralty and he resolved to force [his way past] the Dardanelles with the Royal Navy, capture Constantinople, the Turkish capital, and thus put Turkey out of the war. When the Royal Navy failed to get through the narrow seaway, he and other British military leaders decided to mount an amphibious expedition... On... 25 April 1915 – still celebrated as Anzac Day – 30,000 N[Z, AUS]n and British troops were poured on to the narrow beaches at Gaba Tepe and Cape Helles. The Anzacs were landed on the wrong beach and found in front of them broken terrain with high ridges and sheer cliffs, nothing like the markings on their maps. The first Anzacs ashore took their initial objectives quite quickly and then waited for reinforcements that did not come fast enough... By the next morning, the Anzacs had been subjected to merciless shelling and machine-gunning by the defending Turks. They were pinned down and just managing to hold an area of about 2000 metres by 1000. The first 24 hours had cost them approximately 8500 casualties. The Turks, who were present on the high ground in larger numbers than usual because of exercises, counter-attacked two days after the arrival and although the Anzacs fought on with unparalleled bravery and tenacity they never managed to dislodge the Turks from command of the heights. Briefly, on 8 August, the Wellington battalion... reached the summit and could see the campaign's goal, the Narrows, below. They were withdrawn after continual shelling, bombing and machine-gunning and after running out of water... The troops who took their place were soon dislodged by the Turks and the campaign was from then on hopeless. The war on Gallipoli was a saga of errors and horrors – the planners making the errors and the men enduring the horrors. The troops were badly let down... The infantry... were inadequately supplied with artillery shells, had no grenades; ...[went] without engineers or materials for the construction of piers... and... were not trained properly in landing from the sea... The N[Z] Expeditionary Force... had... spent weeks training hard in the desert... at Alexandria in Egypt... marching miles in the flat or undulating terrain which bore no resemblance to the rugged land of the peninsula at Gallipoli. Ironically, the terrain was 'similar to that surrounding Wellington'... In December 1915 the Anzacs were pulled off the peninsula... and... returned to Egypt for training before they went to the Western Front... 8427 [NZ]men had left home in October 1914... and when the N[Z]ers slipped away [from Gallipoli]in retreat... they left behind 2721 dead. Some of the 4752 wounded later died.

Barely 265 of those... 2721... men lie in marked graves. The rest lay where they fell, their bones bleached by the fierce Turkish sun. They went out of the trenches and simply disappeared... It was our coming of age and it was our loss of innocence. It was the moment when the world's newest dominion, not yet a decade old, staked its claim to nationhood... Gallipoli was by no means the bloodiest action N[Z] soldiers saw in... W[WI]: in 21 days 7900 of our men died at the Somme... But by that time we were numb as a nation to the idea that our best and brightest were dying on the other side of the world.

Such is the respect with which the term Anzac is held [in NZ]that an Order in Council was promulgated on 31 August 1916 forbidding the use of the word in connection with any trade or business... The Anzac Day Act of 1920 stated that 25 April was to be observed throughout N[Z] as a public holiday. All licensed premises were to be closed and no race meetings held. This was amended by a 1921-22 Act which stated that 25 April was to be observed in all respects as if Anzac Day were a Sunday... Between the two world wars Anzac Day was most solemnly observed. Even today it is commemorated in a more sacred manner than Good Friday on which certain organised sporting events take place. Recently, there have been unsuccessful attempts to introduce recreational and sporting activities in the afternoon following the morning's memorial parades and services.

When I was a young man I carried my pack and I lived the free life of a rover... Then in 1915 my country said son it's time to stop rambling cause there's work to be done So they gave me a tin hat and they gave me a gun and they sent me away to the war... the band played Waltzing Matilda as we sailed away from the Quay... for Gallipoli And well I remember that terrible day when the blood stained the sand and the water and how in that hell... we were butchered like lambs at the slaughterer... we stopped to bury our slain and... the Turks buried theirs and it started all over again... for seven long weeks I kept myself alive while the corpses around me piled higher Then a big Turkish shell knocked me arse over tit and when I awoke in my hospital bed Christ I wished I was dead Never knew there were worse things than dying... no more I'll go Waltzing Matilda... they collected the cripples the... armless the blind and insane... and they shipped us back to Australia... And as our ship pulled in to Circular Quay I looked at the place where my legs used to be and thanked Christ there was nobody waiting for me to grieve and to mourn and to pity... the band

played Waltzing Matilda as they carried us down the gang-way But no-one cheered they just stood and stared... now every April I sit on my porch and I watch the parade pass before me I see my old comrades how proudly they march reliving their dreams of past glory... the young people ask me what are they marching for and I ask myself the same question... the band plays Waltzing Matilda and the old men still answer the call But year after year their numbers get fewer Some day no-one will march there at all...

N[Z] is to build a \$1 million monument... [to] be placed at the head of Anzac Parade... in Canberra to mark the relationship between this country and A[US]. By the way]... 16,000 young A[US]n soldiers... landed at Gallipoli on April 25, 1915... The Department of Veterans' Affairs in Canberra conducted a national check and said while there are 12 A[US]ns still alive of the 68,000 Anzacs who eventually landed at Gallipoli, [a]Mr Matthews is the only surviving A[US]n Anzac who had landed on April 25... Today, this living link with a date in history that turned A[US] into a nation celebrates his 100th birthday. The irony is that... he says he should have been one of the first casualties... His mother had given him a thick pocketbook and it was hit by a piece of Turkish shrapnel that smacked into his chest within hours of landing... Mr Matthews, now living in a veterans' home in Sydney, did not think his place as the last... was so important. "Somebody has to be the last one," he said. "It just happened to be me." Mr Matthews calls the British politicians who planned the campaign "bloody fools." ...As a flotilla of Allied ships carrying 78,000 troops gathered near Gallipoli, the commander... found that guns and ammunition had been placed on separate ships. The transports returned to Egypt to be properly loaded. The Turks, alerted to the Allied plan, used the resulting month's delay to improve their defences with deadly effect. - 1996

A state funeral will be held for Mr Matthews, who died peacefully... this week... He was the quintessential Aussie of his generation, destined to live through two world wars and a great depression... He bore no grudge against his Turkish enemies... He was a signaller... firing a rifle at a Turk just once. "And I hope I missed the poor bugger,"... He believed strongly in Anzac Day... "Some people say it glorifies war – that is wrong... People like me can remember it every day. But the young... don't know the horrors of war. They need to be reminded. That's what their forefathers died for..."

...An old soldier collapsed and died and several others were taken to hospital yesterday during emotion-filled ceremonies across A[US] marking Anzac Day. Organisers said the annual day of remembrance was the biggest in years as hundreds of thousands of war veterans and spectators participated in marches and dawn ceremonies... Up to 3000 people... attended services at Anzac Cove[– the 'previously unnamed strip of land' which was] the site of the 1915 Gallipoli landing... The local tourist office at Canakkale said interest in Gallipoli was growing each year with crowds almost double last year's level... Only 11 Australasian Gallipoli veterans survive, 10 in A[US] and one in N[Z]. One British Gallipoli veteran survives.

...Percy Goring was the last-known British veteran of the ill-fated Gallipoli campaign (around 34,000 Allied soldiers were killed during the unsuccessful assault against Turkish positions). After the war, Mr Goring migrated to AUS. His survival had remained unknown to the authorities until last year when an amateur military historian uncovered his story. The 106-year-old Mr Goring, who was known fondly as a "Digger", albeit a British one, and proudly took part in Anzac Day commemorations, was described as "a local icon" by the deputy mayor of his adopted home town of Bunbury, Western Australia'...

GALLIPOLI veteran Doug Dibley answered quietly when asked with whom he could share his war memories these days. "No one really," he said... The last surviving Gallipoli veteran in N[Z] never meant to go to war. Doug Dibley, now aged 100, was just 17 when... offered a trip overseas. It was too much to resist for a group of young men from Wellington. "We were very enthusiastic because none of us had ever been[overseas]," he recalls with a grin... Mr Dibley... [– who] has 50 grandchildren, 180 great-grandchildren and one great-great-grandchild[–]...was a celebrity soldier among old soldiers[on Anzac Day]... More than 1000 people attended the ceremony at the Rotorua Civic Centre, overflowing the main auditorium and a second room... Mr Dibley, who turns 101 in June... did not dare dream... that he would see out a full century... [but believes his longevity] had much to do with good plain living and not being afraid of hard work... Another N[Z] Gallipoli veteran, Les Leach, aged 99, lives in Sydney.

...Les Leach, one of N[Z]'s last two Gallipoli veterans, reckoned he probably enlisted for the glamour. "You just signed up and they gave you a shilling. I think I might have bought a glass of beer with mine." He died on Tuesday, at the age of 99, and his funeral will be held in Sydney today. Interviewed in April, he said he was... only 16 when he enlisted, having lied about his age... He was wounded and sent back to N[Z]. After recovering, he served in France where his skull was fractured by a shell burst.

...N[Z]'s last living link to the Gallipoli campaign... had one of the worst jobs at Gallipoli: picking up his broken and bloodied comrades... "He had to pick up all the bits and pieces,"... said... [one of his] 11 children... "He didn't like it at all..." ...But the 101-year-old... met his Maker yesterday in far more serene surroundings... He was working for an oil company in Wellington in 1915 when he and a friend spotted a newspaper advertisement seeking helpers at Trentham Military Camp hospital. He volunteered but never got to the hospital. "They put us in uniforms and told us we were going to Gallipoli..."... Mr Dibley was evacuated from the Gallipoli Peninsula on the last day of the big retreat and ended up in Palestine with mounted Anzac troops... He always hated war. "No one wins in the end," he said last year. "The Great War took the best of our young men, and look how many came back maimed and broken. Many suffered dreadfully for the rest of their lives. Anzac Day is important – those men should never be forgotten." ...The RSA in Wellington estimates about 50... W[W1] (WWI) veterans are still alive...

The heroism of a N[Z] Army battalion virtually wiped out on a barren Gallipoli hill 82 years ago must be given national recognition, says the Anglican Dean of Wellington... The assault on the Turkish-held hill was led by Lieutenant-Colonel William Malone, who defied the orders of his British superiors to attack it during the day, saying it would be suicide. Instead he led 770 members of his battalion up the hill at night and threw the Turks off. The N[Z]ers regrouped about 300m from the hilltop... But British reinforcements could not stem the Turkish counter-attack two days later and Chunuk Bair reverted to the enemy. Only 70 members of the Wellington Battalion survived. One of the casualties was Malone, apparently killed by a British shell and then vilified by the British for failing to hold the hill.

...TWELVE Kiwi soldiers accidentally killed by British artillery... after they were caught in "friendly" shelling during the liberation of the French village Beaudignies... just weeks before the end of W[W1] were remembered at a special ceremony in Christchurch yesterday... As a mark of respect, the people of Beaudignies sent the village medallion to be presented... to the descendants of seven of the dead men. Descendants for the other five could not be found. - 1997

France yesterday bestowed its highest honour on all 160 surviving British... W[W1] veterans who fought on French soil, and thanked them "from the very bottom of her heart." Thirteen frail old men, several in wheelchairs and many over 100 years old, went to the Imperial War Museum in London to receive the Legion d'Honneur personally from [the]French Ambassador... He told them... "This is more than a belated gesture of recognition to [you]... It is a symbol designed to inform young people of what happened on French soil during those days." A minute's silence followed the presentation. "This is the proudest moment for me since I left the Army," said [one veteran], who will be 103 this week... Meanwhile, [France's PM]... said it was time to rehabilitate French soldiers executed for mutiny during the disastrous First World War offensive. But[France's] President... rebuked him by saying the appeal was untimely when France was recalling the 1.35 million of its men who died in the 1914-18 war... A similar debate is under way in [Britain].

...The families of 300 British soldiers... [– including] 23 Canadians, four Africans and a Jamaican[–] ...shot for cowardice or desertion during... W[W1.] held a service for the first time at London's official war memorial at the weekend and called for the men... [– some of whom] were as young

as 17[-] ...to be pardoned... [A] lone bugler played the *Last Post*... for those deemed cowards at the time, but who are now regarded as having been traumatised by the horror of life in the trenches and constant bombardment... Harry Farr was shot for cowardice in 1916 despite having spent five months in a hospital suffering from shell shock... William Nelson was bound to a tree in a mock crucifixion as a warning to other soldiers before being executed... “This is recognition... of the existence of these men and we want pardons for them. They were terribly mistreated by the British Army and it’s no good for people to say it is too late,” said... [someone] whose great uncle was executed for casting aside his weapon. The wreath-laying ceremony at the Cenotaph in Whitehall was the first time the relatives had been given permission to hold a service at the place where Britain’s war dead are remembered as heroes every November... The Ministry of Defence has expressed regret at the way the men were treated but has ruled out offering pardons. [● ‘31 NZers were sentenced to death by British court martial during WW1. 5 were executed.’]

...A bill granting posthumous pardons to five N[Z] soldiers executed during the First World War... will proceed, [the P]M... announced yesterday. The Pardon for Soldiers of the Great War Bill... seeks to pardon Privates Victor Spencer, Frank Hughes, John Sweeney and John King, shot for desertion, and Private Jack Braithwaite, executed for mutiny... The decision to push ahead with the bill follows an inquiry commissioned by the... Government and conducted by [a] retired High Court judge... [The judge]’s report concluded that shell shock or other stress-related disorders were the likely cause of the men’s actions... Three of the men were veterans of Gallipoli before serving in the trenches in France... Private Braithwaite was one of five sons from a prominent Otago family who went to fight in... W[W1]. Three did not return. [A nephew] said his uncle had written a letter asking for clemency, which gave an idea of how he felt. It said: “I am not a born soldier. Just a Bohemian journalist. Unfortunately I have made a serious mess of things and where I came to win honour and glory I have shame, dishonour and everlasting disgrace. There is no more patriotic country than N[Z] and to think that a native of that country is standing trial for mutiny is a soul-tormenting thought and bitter indeed.”

...[NZ’s] Returned Services Association has dissension in its ranks over Government moves to pardon five... W[W1] soldiers... Ministry of Defence files show th[at]... Private Braithwaite was executed at age 34 for joining a mutiny in a military prison where he had been jailed for escaping custody and other offences. He claimed he was innocent. Privates King, aged 39, Hughes, 28, and Spencer, 23, were shot for repeatedly being absent without leave... Sweeney, 37, went missing from the trenches of Armentieres when he was due on duty. He claimed he had lost his unit... [The n]ational president... said the association did not support singling out the men for exoneration when about 300 others had been disciplined, some of whom were sent back to the front line and were killed... “You can’t forget about the rest. If you’re going to do it for one, then you must do it for all.” ...But many veterans are outraged at his stance, which has offended relatives of the executed men. “He’s got no authority to speak along these lines on behalf of returned service people,” said... an alliance of 32 RSA clubs in Greater Auckland. “What happened was abhorrent and we feel greatly for the living families of these people.” ...Titirangi RSA[’s] president... was angry at [the national president]’s comments and had received many complaints about them. “We support the pardons. To come out and make this statement a week before Poppy Day is inappropriate.”

...The blood-red Flanders poppy by the graves of our dead in France[is] an international symbol of sacrifice... For the past 75 years the RSA has been... [using poppies to raise] money for those who survived... W[W1]... Last year the RSA raised around \$700,000. Nearly half of the 800,000 poppies given out were made by disabled workers. “They enjoy making them... and they get great satisfaction out of seeing people wear them.”

...RSA at war over poppies from foreign field... Branches of the R[SA] are at loggerheads over a new... poppy from China. The Auckland branch angered some others, especially in the South Island, by importing and promoting the Chinese poppy over the official Christchurch-made one during this year’s annual Poppy Day fundraising drive. The Auckland branch is accused of breaking the RSA constitution and, at worst, could be expelled from the national organisation. Auckland claims the new poppy... cost[s] about 5c to land in the country... allowing it to raise more dollars for members’ welfare... [than from the NZ-made poppy, which] was more than three times as expensive... The Auckland president... [also] said... people given the new poppies all responded positively... “They felt it looked... more like a poppy than the Christchurch one...” ...But the Christchurch branch believes the foreign poppy will meet resistance from donors and threaten work for the intellectually disabled helpers and veterans’ widows who assemble the official version... Tenders for the supply of poppies will be debated at the RSA national council conference... where up to 500 delegates will decide where future poppies come from and how much they should cost the organisation.

...Every nation is shaped by the battles it has fought but none more so than a young nation still seeking its unique identity... My grandfather was old enough to fight in the... War of 1914-18... He explained to me the sheer horror and one image remained with me: a mental picture of a fine pair of boots he found... with the feet still in them. He wasn’t at Gallipoli, where the Anzac legend was born and N[Z]’s nationhood confirmed. However, I... learnt about N[Z]’s navel contribution... His brother, Lieutenant Commander William Edward Sanders, had won the Victoria Cross for sinking a German submarine while commanding a Q-ship, an apparently inoffensive vessel that was, in fact, heavily armed. He was a N[Z] hero who died later when his ship, the topsail schooner *Prize*, was torpedoed. We were taken to see Sanders’ VC in the Auckland War Memorial Museum which also had a model of his ship. It was a minnow, however, alongside the model of the battle cruiser HMS *New Zealand* that our people had gifted to the Royal Navy. She fought in the biggest naval engagement of the war, the Battle of Jutland, and cost our taxpayers £1.7 million. We knew that N[Z]ers – 1000 of them – served with the Royal Flying Corps and that one of the nation’s... W[W2] (WWII) heroes, Keith Parks, had been one of our... W[W1] aces with 20 “kills”. We were unaware that N[Z]’s top ace was Captain Keith “Grid” Caldwell, who downed 25 German craft. We did know, however, the huge cost of that war. The final tally of N[Z] casualties was 18,166 dead and 41,317 wounded – more than half the total that went overseas and almost a quarter of the population of military age. N[Z] had, almost literally, lost its youth... The declaration of war on August 5 led to “enthusiastic demonstrations” and patriotic singing outside the *Herald*’s office in Queen St... Years later, there was no flag-waving fervour in my grandfather’s recounting of experiences on the Western Front where the N[Z] division fought from 1916 to 1918, where at Passchendaele in four hours on October 12, 1917... 640 Kiwi soldiers died and 2100 were wounded... – the worst day of war in N[Z] history.

...In that place, on one day... [a] total of 1190 N[Z]ers had been killed to gain as little as 180 metres of ground... Some of the division’s units had lost 85[%] of their men to death or injury. And the ratio of the dead to the wounded had been greater than was usual even for the killing fields of... W[W1]. Most who would be listed as missing after the abortive action had, in fact, been killed. But their bodies would never be found in the mud and debris of war. Ernest Langford, a private with the 2 Otago battalion... survived to record the horror in his diary. “Attack a failure on account of wire encountered... Hun machine guns and snipers play havoc. Absolute hell...” ...This absolute hell, this most disastrous of days for N[Z], was fought and lost near a place few of us associate with N[Z]ers at war, a small Belgian town called Passchendaele. We should not be surprised by our ignorance. Passchendaele appears only sporadically in this nation’s many war memorials. Those who survived it rarely uttered its name and, until now, it has never appeared on the spine of a N[Z] book. It’s almost as if the nation erased the horrific carnage from memory – and... the author of the first N[Z] book to put the name on its cover, has a theory on why that might be. Passchendaele, he contends... was a different sort of disaster from Gallipoli. “Gallipoli... [was] a... heroic failure where we nearly did it, we almost succeeded, it didn’t quite come off and it wasn’t our fault it didn’t. The blame for failure could be quite conveniently passed on to somebody else... But Passchendaele is not like that. It’s not an heroic failure, it’s just a dreadful failure. It is a massacre.” Certainly the N[Z] government of the time thought so. According to [his] book, at a meeting of the Imperial War Cabinet in London in June 1918, an angry N[Z] PM, William Massey, berated his British counterpart, Lloyd George, about the tragedy. “They were sent to Passchendaele,” Massey said, “to a swampy locality where it was almost impossible to walk and where they found themselves up against particularly strong wire entanglements, which it was impossible for them to cut. They were... simply shot down like rabbits. These are the sort of things that are going to lead to serious trouble.” Trouble was, says [the author], that the British weren’t necessarily to blame.

"If you delve beneath the surface on an historical investigation, there are some curly questions that have to be asked and answered. You can't really shoot the blame totally to those stupid British generals who are committing N[Z] boys on these types of campaigns. You've got to ask why did [N[Z]-born commander of the division] Major General Andrew Russell allow this to happen? Why wasn't he vocal in his protests? Why didn't he conduct a reconnaissance before the attack, and why did he use a brigade that was totally exhausted even before the attack began?... " ...The background of the battles near Passchendaele, just outside the British-held Ypres Salient (a salient being an outward bulge in a military line), was this: After the slaughter of the Somme in 1916 (the first day of the battle set the bloody 20th century's record for the most men killed or wounded on a single day – 60,000), the British high command sought to break the deadlock of trench warfare with a big push through Flanders in 1917. Britain's top soldier, Field Marshal Sir Douglas Haig, fancied that breaking the German defences in the region would be the springboard needed to take the ports of the Belgian coast, to outflank the enemy and to perhaps even push through to Germany's industrial hub, the Ruhr. The Ypres Salient, which was 22km long and 5km deep at its widest point, was an obvious choice to begin this imagined march to victory. The British positions in the Salient were tactically bad, being overlooked from three directions, with the enemy holding the high ground around Passchendaele village. If the British could take that high ground, Haig calculated, then everything else could follow. The first of eight battles in the area began on July 31. But it was not until October 4 that units from the N[Z] Division engaged the enemy in the Salient. This first battle, a carefully planned, textbook success, extended the division's reputation as an outfit which delivered what was asked of it. But crucial to that success were the dry conditions. In the days leading up to October 12, the weather broke and winter arrived... turning the fields of Flanders into a hellish quagmire. If the weather had gone to pot for the N[Z]ers' second attack, then so had the planning. The disaster was set in train by a series of blunders including poor artillery support, over-ambitious objectives and a failure to recognise the strength of the German defences... The Germans, having been warned of the assault by a deserter (not N[Z]'s one and only), and having observed the difficulties with artillery, placed a much stronger concentration than usual of machine-guns to cover the ground... The result on October 12, as Colonel H. Stewart noted in his 1921 history of the N[Z] Division, was our boys had "poured out their blood like water." It was, however, a disaster born of systematic failure rather than the fault of one or more commanders, [the author] concludes. "This was an imperial system of command that we were operating under, which is so rigid and an order is passed down and it's not to be questioned and if you've got any doubts about it you don't openly voice it. It did not encourage flexibility or adaptability. It was the fault of an antiquated command system." ...a fault with extreme and wide-ranging consequences. [The author] believes that not one N[Z] family was untouched by this single day. Even if a family had not lost a son, then their neighbours or friends had... Yet if October 12, 1917, generated suffering at the front and at home, the day had other legacies. [The author] contends... that N[Z]ers' suspicion of the military, which was particularly strong between the wars, can be traced to that day. Although most of us now do not remember the Passchendaele battle like we remember the baptism of fire at Gallipoli, we do – rather curiously, concedes [the author] – recall the substance of what happened on October 12, 1917. "People actually perceive the Great War through the experience of Passchendaele, that is the... occasion where these brave soldiers were sent to die without any chance of securing their objectives or winning. That is the way by which the war is remembered and I think people feel quite bitter and resentful about it." Which is quite certainly the reason [the author] was challenged when he gave a paper on Passchendaele at a conference in A[US]. "Someone said, 'Why are you researching something like this which is obviously going to cause people grief and pain. Isn't it something that we should just forget about?' I didn't actually have a good answer at the time, because it caught me somewhat by surprise. But after thinking on it, I would now answer that question by saying two things. First, we really owe it to those soldiers to remember what they went through and to actually try to account for the reasons why they did it. The second thing is that we learn by past mistakes. As philosopher George Santayana said, those who do not remember the past are condemned to relive it. The last thing we want for N[Z] is another Passchendaele." N[Z] political and military leaders clearly thought the same in the aftermath of the first war. When N[Z]ers again went into battle 22 years after Passchendaele, they were not... under direct British control. And from the time General Bernard Freyberg took command of the stand-alone N[Z] Division during... W[WII], he had special powers, granted by a government charter, which allowed him to refuse an operation request from the allies high command if he thought it too risky. Both these fundamental changes to the way the N[Z] armed forces operated have their beginnings at places like Passchendaele... That is perhaps the only victory of October 12, 1917... [■ Germany] planned to attack N[Z] coastal towns during W[WII], according to recently discovered German military documents... The pre-war planning documents showed that German cruisers planned to attack towns such as Westport to seize coal for fuel... The documents disprove the myth that [the w]ar... was a distant conflict with no relevance to this country... Spies from the German consulate found out a huge amount about N[Z]'s military strengths... "Both A[US] and N[Z] were seen as legitimate targets and seen as soft targets too," says... a[n]... army historian... visiting... Massey University's Department of Defence and Strategic Studies.

...A[US]'s last Anzac... celebrated his 103rd birthday yesterday, just six days after finally leaving his Hobart home to move into a nursing home. A[US]'s last living link to Gallipoli is still in good physical health, though very deaf and his short-term memory is unreliable, say family members. N[Z]'s last Anzac... is 105... [Incidentally, t]oday... the Devonport Community Board is expected to approve a formal recognition of Cyril Bassett.

...The quiet, unnamed lookout on Stanley Pt is set to be named after Cyril Bassett VC... Cyril... liked the view from the Stanley Pt lookout over the Waitemata. Before he died in 1983, aged 91, the nuggety Gallipoli veteran would walk the few hundred yards from his North Shore home to watch the yachts on the harbour. Few who saw him knew his past. To those who asked, he probably wouldn't tell. But the old retired bank manager scanning the Waitemata was among the bravest of the brave. As a 23-year-old corporal in the N[Z] Signals Corp he w[as]... the only N[Z] soldier to win the Victoria Cross [– 'the most prized of all Commonwealth decorations (founded by Queen Victoria in 1856 and struck from the metal of guns captured at Sebastopol during the Crimean War') –] at Gallipoli. Moreover, he won it in the hell of Chunuk Bair... Mr Bassett was unfailingly reticent about his award. He was always irked that he was the only N[Z] soldier to receive a VC in Gallipoli. "There should have been hundreds," he said. Or he would make light of it. Standing just 5 foot 4, he claimed he was so short all the bullets passed over him. But his award was not for one show of bravery but for many. As two British battalions were virtually scourged off the hill and the Wellingtons were holding on desperately on the crest, Mr Bassett and companions worked for a day and a night repairing the copper wires that gave the men on the hill their only link to headquarters. The wires were repeatedly cut and fixing them drew constant Turkish fire from the heights. They were, said one account, like "moving ducks in a shooting gallery." Later, invalided to an English hospital, Mr Bassett learned of his VC from a newspaper. By the end of the war, he had fought in France, been wounded twice and had risen to the rank of lieutenant... [His] funeral eulogy... spoke of a "picture of heroism beyond the understanding of most of us" but also of a private person who hated all the fuss – the ideal hero for a quiet memorial on Stanley Pt.

...A N[Z] expert on the Gallipoli landings has rubbished a British study largely blaming the poor quality of maps for the... disaster... [The] former Army officer and now a senior history lecturer in A[US], said last night that the Greenwich University study was another example of the myths that had grown up around the Gallipoli campaign. British geographers... used satellite and other technology to plot the Gallipoli battlefields, on which 42,000 Allied troops died... Their comparison with the maps issued to officers in the campaign found them to be inaccurate in almost every respect. A report in the *Sunday Times* said the research found that the maps came from tourist guidebooks bought in Egypt that were at least 10 years out of date. One general had obtained accurate maps for the second stage of the campaign in August 1915 but left them on a train. The report said in one case... A[nzac] troops were told to use a sandy beach for an easy landing but no one had charted the area for currents. The soldiers were swept onto rocks beneath steep cliffs, becoming easy prey for enemy gunners. In another incident troops took a strategically important hill, only to find a second one behind it, unmarked on the map, with heavy Turkish fortifications. But [the lecturer]... at the University of New England in

Armida, N[SW], said the maps issued were as good as could be expected at the time... “Unquestionably mistakes were made in the Gallipoli campaign but the Anzac errors and the British errors were not map errors. They were simply human errors.” He said the Royal Navy’s navigation errors in delivering the soldiers to the wrong beaches triggered a chain of mistakes.

Plans for such an adventure were considered by the British authorities between 1904 and 1911, but both military and naval opinion was against it. When war between the Allies and Turkey began in early November 1914 the matter was reexamined and classed as a hazardous, but possible, operation... On January 28 the Dardanelles committee decided on an attempt to force the straits by naval action alone, using mostly obsolete warships too old for fleet action... The naval bombardment began on February 16 but was halted by bad weather... On March 18 the bombardment was continued; but, after three battleships had been sunk and three others damaged, the navy abandoned its attack, concluding that the fleet could not succeed without military help... Small beachheads were secured with difficulty, the troops... at “Anzac” beaches... being held up by Turkish reinforcements under the redoubtable Mustafa Kemal, later to become famous as Atatürk... Altogether, the equivalent of some 16 British, A[USn, N]Z... Indian and French divisions took part in the campaign. British Commonwealth casualties, apart from heavy losses among old warships, were 213,980[, while ‘Turkish casualties have been estimated at between 250,000 and 300,000 out of 500,000.’] The campaign was a success only in so far as it attracted large Turkish forces away from the Russians... The campaign had serious political repercussions. It gave the impression throughout the world that the Allies were militarily inept... Winston Churchill, the chief protagonist of the venture, resigned from the government and went to command an infantry battalion in France... [F]ormerly HELLESPONT... *Dardanelles*... holds a significant place in history... The strait has always been of great strategic and economic importance as the gateway to Istanbul and the Black Sea from the Mediterranean... The Hellespont is the scene of the Greek legend of the two lovers Hero and Leander. The ancient city of Troy defended the Dardanelles from its strategic position at the southwest end... In 480 BC the Persian army of Xerxes I crossed the strait by a bridge of boats; and Alexander the Great... did the same in 334 BC on his expedition against Persia.

Alexander the Great, 356-323 B.C., [was the]successor at 20 to his murdered father Philip II of Macedon... who had mastered by conquest the Greek city-states. Philip’s ambition had been consolidation of the Greek world under a liberal despotism, and containment of the threatening power of Persia. His son inherited his vision and made it fact... [A]fter initial opposition (notably the ruthlessly suppressed Theban revolt) he rallied lethargic Greece to a Persian expedition undertaken in the spirit of a crusade. His army of 30,000 foot and 5000 horse, vastly inferior numerically but superior in morale and tactical potential, had its first victory at Granicus near the Dardanelles (334 B.C.). Here Alexander probably... embraced a concept of world domination... which... [depended] upon attacking the centre of the Persian Empire...

The... *Persian empire*[had been] the greatest enduring empire preceding that of Rome... Cavalry was used by the Persians... and Romans... The first great age of cavalry warfare, however, was in medieval times. Knights, with their heavy armor, could move only on horseback. In a compact mass they could crush hostile infantry, and as they could be checked only by other horsemen, the battles of the age of chivalry were between bodies of knights, with infantry secondary. The supremacy of cavalry was challenged by the English archers, notably at Crecy (1346), and a further blow was given by the invention of firearms. But cavalry still had a part to play. Freed from heavy armor, horsemen became a mobile force whose speed and shock action could be used with great effect...

Charge of the Light Brigade... A misunderstanding between the commander of the Light Brigade... and his superiors... led to the British cavalry being committed to an attack up a valley heavily held on three sides by the Russians. Immortalized in verse by Tennyson, the charge in fact decimated some of the finest light cavalry in the world to very little military purpose.

Errors led to carnage in military history’s most suicidal charge... DURING the Battle of Balaklava on October 25, 1854, a brigade of British light cavalry galloped into an obvious death trap – a valley which was a virtual shooting gallery of enemy... artillery... Exposed to withering fire on all sides, they over-ran the Russian position at the end of the valley, but without infantry support were unable to hold so were forced to run the horrendous gauntlet in retreat... The charge lasted only 20 minutes but in that time 247 men of the original 673 were killed... It was an immensely courageous but utterly futile gesture which came to epitomise the dunderheaded quality of leadership and planning that bedevilled the Crimean campaign... The official line that the British army was “the best appointed in Europe” was exposed as a lie and the Aberdeen Government was forced to resign. For the allies (Britain, France and Turkey) the purpose of the war was the destruction of Russian military power in the Black Sea by capturing their great naval base at Sebastopol. Up until Balaklava the war had gone largely in the allies’ favour – they had comprehensively defeated the Russians a month before at the battle of Alma and, completely surrounding Sebastopol, they were proceeding to bombard it into submission. But the Russians suddenly seized the initiative – they broke out of their fortifications and captured the hills that overlooked the British base at Balaklava. This caught the British entirely unprepared and it was only the famous “thin red line” (93rd Highlanders...) that prevented the Russians pushing them into the sea. Hugely outnumbered, the Highlanders held the line until the British re-grouped. Eventually the Heavy Brigade... was able to drive the Russian cavalry back and win the day for the allies. As the Russians fell back they carried off some of the allies’ cannon they had captured that morning. This could be interpreted as a moral victory for the Russians and in a desperate attempt to avert this the British commander, Lord Raglan, sent this written message to his cavalry commanders: “Lord Raglan wishes the cavalry to advance rapidly to the front, follow the enemy, and try to prevent the enemy carrying away the guns; troops of Horse Artillery may accompany. French cavalry is on your left. Immediate.” A certain over-zealous Captain Nolan conveyed these vague orders and when the cavalry commanders questioned which guns he apparently pointed to the valley stating, “There [is] the enemy, and there are the guns”. They weren’t the guns that Raglan had in mind but the order’s urgency allowed no hesitation so Light Brigade Commander Lord Cardigan gave the order to charge... While the impetuous cavalry commanders have taken much of the blame for this debacle some responsibility must fall on Raglan’s imprecise orders. A veteran of Waterloo 40 years earlier, he was so out of touch that he continually referred to the enemy as “the French”. He was brave and dutiful but according to... *The Times* correspondent William H Russell... “he was a man of strong prejudices and weak resolution and too apt to depend upon those around him when he should have used his own eyes”. Sebastopol did eventually fall but not until September 8 the following year, necessitating exposure to a vicious Crimean winter and a host of almost unimaginable hardships. The allies lost about 252,600 men – 70,000 in battle while disease (mainly cholera) and deprivation accounted for the rest.

Although the official line that the British army was “the best appointed in Europe” was exposed as a lie during the Crimean War, the ‘Royal Navy retained the position of most powerful in the world until WW2’ – a position it had held since the 16th century.

ARMADA... [is] the name applied to the great Spanish fleet that was defeated by the English... Few naval battles have had such far-reaching effects. The victory saved England from invasion. But it also marked a turning point in naval tactics, and it opened the way for the colonial expansion of England, Holland, and France by breaking the Spanish-Portuguese monopoly of overseas empire... The Spaniards were still strong enough to keep their established colonies in Latin America and elsewhere, but they no longer tried to monopolize America north of Florida or to

defend the Asian empire... The English, Dutch, and French moved into these two areas at once... [and] new overseas empires grew very rapidly... Ever since Queen Elizabeth had come to the throne in 1558, Protestant England had managed to steer a neutral course during the bitter religious wars on the Continent. The Catholics, with the powerful support of Philip II of Spain, were trying to stamp out Protestantism, especially in France and the Netherlands. Hoping to pave the way for maritime expansion, a group of bold and colourful English “Sea Dogs,”... engaged in successful but unneutral raiding of Spanish ships and ports in the Caribbean and more distant waters. Philip II put up with this for a quarter century but finally decided to invade England with his crack Spanish infantry, carried by an “armada.” Until this time most actions had been fought at close range, with ships lying alongside each other. In 1571 the Spaniards, with other Christian forces, had smashed Turkish naval power in the Mediterranean at Lepanto, using galleys, propelled by oars, of the type used since Greek and Roman times. But for Atlantic action the English Sea Dogs were planning a very different sort of tactics, developing fast, low-lying, maneuverable vessels that could get to wind-ward and pound the enemy at long range with [cannons], safe from hand-to-hand contact with the redoubtable Spanish infantry on the ships. In July 1588 the great Spanish-Portuguese force sailed for England, with 124 vessels of various sizes, carrying 1,100 guns and 27,000 men. [However, only ‘about 40 of these ships were line-of-battle ships, the rest being mostly transports and light craft.’] The English had 197 ships with 2000 guns and 16,000 men. The Englishmen were all seamen, while half the Spanish were soldiers. The English guns had the longer range. The Spaniards met the new tactics along the south coast of England when the Sea Dogs pounded their huge, clumsy vessels from beyond the range of the Spanish guns. The Armada sought refuge in the French port of Calais, but [were] dislodged... with fireships – vessels filled with combustibles and set fire to drift into the enemy fleet. The... Spaniards... [were] mauled... badly until the English ran out of ammunition (having fired some 100,000 rounds), but by that time heavy gales had begun to push the Armada northward around the tip of Scotland and then southward around Ireland. Many Spanish ships floundered while others were wrecked on the coasts... Barely half the force that had set out in July limped home in September. The new long-range tactics developed by the English were taken up by other naval powers. They continued in general use until the advent of steam and [steel] armor after 1850, which changed the methods of naval warfare [yet again].

Preparations, under the command of the marques de Santa Cruz, began in 1586 but were seriously delayed by a surprise attack on Cadiz by Sir Francis DRAKE in 1587. By the time the expedition was ready Santa Cruz had died, and command was given to the duque de MEDINA SIDONIA. The Armada... was to go to Flanders and from there convoy the army of... [the] duke of Parma, to invade England. It set out from Lisbon in May, 1588, but was forced into Coruna by storms and did not set sail again until July. Medina Sidonia’s orders were to proceed straight up the English Channel and refuse battle until he made junction with Parma. This gave the initiative to the English, whose main fleet... sailed out from Plymouth to achieve the windward side of the Spanish... [T]he Armada was severely battered, but a sudden change in the wind enabled most of the ships to escape northward. In attempting to sail home by Scotland and the west coast of Ireland... their provisions gave out; and many of those who landed in Ireland were killed by English troops. - The Columbia Encyclopedia

Tactically the Armada action was enduring to historical significance as the first major naval gun battle under sail... Only 60 ships are known to have reached Spain, many of them too badly damaged to be repaired, and perhaps 15,000 men perished. The English lost several hundred, perhaps several thousand, men to disease but sustained negligible damage and casualties in action.

As myth and naval lore the defeat of the Armada has inspired English pride and heroism ever since.

...Such a strange creature as the armadillo could barely escape folklore... In prehistoric times huge armadillo-like animals... were as big as oxen. Some were armed with a formidable spiked club at the end of the tail which could be used as a weapon against such predators as the sabre-toothed tiger. Today, there are many different kinds of armadillos... The name armadillo, [which came from the word ‘*armado* (armed man)’ and means] “little armored thing,” was given to the animal by the Spanish when they invaded the New World... The armor is a protection against flesh-eaters... Although they resemble the parents at birth, the... shells... of the... young... do not completely harden until they are full grown. There are up to four young in a litter. All are of the same sex, being derived from one egg, a phenomenon called polyembryony... Armadillos are of benefit to mankind since they devour large quantities of termites and other injurious insects as well as scorpions. They also eat snakes, poultry, fruit, and eggs.

The Spanish fleet had been called the *Invincible Armada* because the Spaniards thought it could not be defeated... The failure of the Armada was a great blow to the prestige of Spain, the world’s most powerful country at that time.

By the time the US had become *the world’s most powerful country*, the belief that such a country couldn’t be defeated was back in vogue.

Largely because of its historical background of opportunity, its industry, its rich natural resources, and its rapid rise to a position of world power, America values success. It is a win-oriented culture.

U.S. Finds War Much Tougher Struggle To Win - 1967

In Vietnam, ‘the US military commanders made the mistake of thinking that superior technology was capable of winning any war. Unfortunately, the Vietnamese refused to fight as the systems engineers expected them to.’ In a futile attempt to win the Vietnam War, the US increasingly resorted to activities that reduced to dust any moral highground it claimed to hold.

First reports emerge that U[S] troops shot Vietnamese civilians in My Lai village... - 1969

Bewilderment reigned and tears flowed at the weekend as people from both sides of the 1968 My Lai massacre revisited the site, stirring memories of one of the Vietnam War’s most shocking incidents... an event widely viewed as one of the most shameful in American military history. On the morning of March 16... some 500... villagers were... slaughtered... [by marauding GIs. At least one] US helicopter... crew tried to halt the carnage on that day... [by] loading people on to the chopper and [flying] them to safety... “I knew about war, but on that day everything suddenly rushed into chaos. It was all out of control...” said... one of those... rescued from the bloodbath... who at the time was just 14 years old... “...those people who rescued me I consider them kind,” she said. “But all the others were cruel. I don’t know why thousands of Americans killed Vietnamese. We were just ordinary people.” ...Western historians point out that a much larger slaughter, involving actions against civilians by Communist forces in the nearby central city of Hue, took place about the same time. But what happened at My Lai came to symbolise, at least in the U[S], all that was wrong with the Vietnam conflict. “It was a few misled men acting because of very poor leadership,” said... [a helicopter crew member who was] brought back by a US television network... to commemorate the... anniversary... “In a nutshell, war’s insanity. I pray that one day we’ll be able to evolve out of the war mentality.” ...[● Uncu]t news footage changed the course of the Vietnam War... Your regular American wasn’t terribly sure where Vietnam was until graphic footage of atrocities his or her countrymen suffered and perpetrated there began to turn up on the evening news.

...What was Vietnam all about? The fall of South Vietnam was not inevitable. After all, South Korea is still there. And if South Vietnam were still there too, it would probably be doing just fine. It's been only 2[decades], but the fall of Saigon on April 30, 1975, like the whole Vietnam War that preceded it, feels as if it happened in a galaxy long, long ago and far away. Perhaps that is because, though it was a big war that killed lots of people, it wasn't really about anything important. The strategic context... that fuelled the American intervention in Vietnam – [that] if Vietnam falls, so must Thailand, then Malaysia, then Indonesia and the Philippines – was manifest nonsense. None of them fell or even tottered. The political context seems even more antique. The Americans and their Vietnamese opponents were driven by the same ideological delusion: that communism (as the leaders in Hanoi devoutly believed and the decision-makers in Washington secretly-feared) was the wave of the future. But, in fact, it was the wave of the past, spending the last of its force on the beaches of Vietnam. The 1970s was the last decade in which communism, already viewed as a stupid but dangerous dinosaur in Europe, could still be seen as a successful and attractive ideology even in the further reaches of Asia... [T]oday... Vietnam has become an Asian version of Cuba – economically hopeless and politically backward, though still the beneficiary of much romantic goodwill in the more prosperous and freer parts of the world. It is a stunningly petty outcome for a war that at the time aroused such passion around the world. An entire generation in Asia, Europe and North America cut its political teeth on the Vietnam War... You could say that Vietnam gave the 60s, which actually ran from about 1965 to 1973, their unifying cultural theme. More than three million Vietnamese were killed, plus 55,000 Americans [– ‘the US had a total of 8,744,000 personnel serving in Vietnam, with 153,000 receiving non-mortal wounds’ (the corresponding figures for US forces during ‘WW2 were 16,113,000 personnel, 292,000 killed and 671,000 wounded’) –]and smaller numbers of A[US]ns, South Koreans and other foreigners. An entire country was devastated, and phrases like free-fire zone, defoliation and pain threshold entered the language. Neighbouring countries, Cambodia and Laos, were dragged into the fighting... All that misery, all that sacrifice, all that horror, and in the end all it produced was...? People hate it when history makes no sense, so they strive valiantly to give the Vietnam war a meaning commensurate with its cost. For the Vietnamese and especially for their neighbours, this often involves treating the present Vietnamese regime with a reverence that is unjustified in terms of its accomplishments. For Americans, it generally revolves around the lessons about sensitivity to casualties and the limitations of American power that were allegedly learned from Vietnam. But those lessons had already been learned once in Korea in the early 1950s, and would have been learned again in any large-scale American military intervention anywhere else in the 1960s... Korea and Vietnam were both originally divided by wars that arose out of rivalries between the victors in... W[W2]. By 1953 in Korea, and by 1956 in Vietnam, the countries were formally partitioned by the ceasefires that ended those wars. In Korea's case, that is where matters have remained to this day. In Vietnam, by contrast, the fighting started up again in a small way in the late 1950s. That happened mainly because the South Vietnamese military regime was less competent both politically and militarily than the South Korean military regime (perhaps because of its basic ethos derived from a lazy and corrupt French colonial regime, not an austere and efficient Japanese one)... The huge US military intervention of the late 1960s both increased the scale of the war and devalued the nationalist credentials of the Saigon regime. But the Americans were gone again by 1973, and at that point the North Vietnamese were very far from victory. The South Vietnamese Army was still in control of all urban and almost all farming areas. It was not even totally demoralised. It was, however, totally Americanised, which meant that it was addicted to using huge amounts of firepower – and was, therefore, dependent on massive amounts of munitions that only the US could provide. When the [US] Congress, in its haste to put all recollection of the lost war behind it, refused to keep the administration's promises to maintain the lavish flow of military aid to [South] Vietnam, morale there went down the toilet very fast. The end... was a rout that saw remarkably little fighting.

...The remains of... six... more American servicemen listed missing in action since the Vietnam War are back in the U[S]. First stop is the Army's central identification laboratory at Hickam Air Force Base in Hawaii, where forensic experts and other scientists will try to positively identify the men... Since 1973, 523 sets of remains have been recovered, identified and returned to their families. More than 2000 servicemen remain unaccounted for... [In related news, w]hen Jack Enwright returned in the early 1990s to visit the hospital in Qui Nhon where he had spent much of what they call the American War, the Vietnamese surgeon in charge greeted him as an old friend. “I never met you, but I feel as if I know you,” he said. It turned out the local surgeon had spent much of Mr Enwright's ...tour of duty there working in a Vietcong bush hospital nearby. He always sent his worst cases down to the N[Z] Surgical Team – and made sure they arrived on Tuesdays and Thursdays when Jack... was the admitting surgeon. “Jack never knew,” recalls one who worked with him, “that he was getting referrals from the communist surgeon over the hill.” It's no mean feat to command the respect of the enemy, but Jack... commanded the respect of all who met him. He spent... six of the... nine years in Qui Nhon... as the team's leader. He mastered the difficult, tonal language and pioneered numerous techniques for the emergency treatment of serious, especially intestinal, injury, which were well ahead of their time... [A] graduate of Otago Medical School who carried out post-graduate study in tropical medicine in Edinburgh, [Jack] worked for three years in Zululand in South Africa in the early 1960s. But Vietnam was his special love. He left Qui Nhon, grudgingly, the day before the North Vietnamese Army arrived, but “hung around Saigon” itching to return and was among the last to leave, plucked from the roof of the American Embassy at the end of April, 1975. When he came back to N[Z] he maintained his connection, sponsoring several families to immigrate to N[Z] and, latterly, arranging the collection and shipment of medical supplies to Vietnamese hospitals. He was named an Officer of the Order of the British Empire in 1976... [Jack, who was b]orn in Auckland in 1922[, d]ied in Auckland June 21.

N[Z and AUS]n policies of forward defence were based on the assumption of the U[S] holding the line against communist aggression in Indochina, and Britain's 90,000-strong presence in Malaysia and Singapore protecting the rest of the region with its aircraft carriers, warships, fighters and bombers... Anzac troops were sent to Vietnam as an expression of political support for Washington and as a message to both the U[S] and Britain that N[Z and AUS] would go to whatever lengths they could to keep the great powers in Asia... N[Z and AUS] faced serious economic and military problems in sending forces to both Vietnam and Malaysia – more so N[Z] because of its parlous economy and public veto of conscripts...

In May 1967, [a] 21-year-old Sydney journalist... was arrested for refusing to register for national service during the Vietnam War. He spent the next 30 days in Long Bay jail... On his release from jail, [he] battled to establish his status as a conscientious objector. When this was denied, he was forcibly drafted and taken by armed guard to Holsworthy Army Barracks... [He] politely... refused to obey military commands or dress in military uniform... was court-martialled and sentenced to 28 days' detention. In prison... he was thrown into solitary confinement, fed only bread and water, and woken every half-hour, day and night. How a young conscript could end up with such harsh treatment was hotly debated in federal parliament. The result was a military inquiry and... the abolition of such punishment... In December 1969, the phased withdrawal of A[US]n troops from Vietnam began. The country's combat role there came to an end in November 1970 and the National Services Act was repealed in 1972.

Children of Vietnam fighting a new war... [She] was five when her father returned from Vietnam, but she is fighting her own war for official acknowledgment of what he and other... [N]Z... soldiers suffered[(officially, of the ‘nearly 4000 NZers who served in Vietnam, 37 died and 187 were wounded’)]... She said she was not too young to recall her family's relief at having her father... home safely in 1966 “without a scratch on him.” But it soon became clear that [her father,] who also served with the Royal N[Z] Engineers in Korea and Malaya, did not emerge unscathed. First there were mood swings, nightmares and states of high anxiety, which spread to the rest of the household. Then his physical health deteriorated until he died six years ago, riddled with cancers. Two of the cancers, of the lung and larynx, are among 10 medical conditions accepted by the A[US]n Government as linked to exposure to the chemical cocktail Agent Orange. [The US Government also ‘accepts compensation claims for Vietnam vets

with certain conditions' (e.g., prostate cancer). No such luck for the 'at least 2 million Vietnamese thought to still be affected.' The N[Z]... **Government does not acknowledge such a broad link, treating war pension applications on a stricter case-by-case basis, although it allocated \$1.7 million last year to 634 people... Another... [woman,] whose father was 43 when he died of stomach cancer in 1975, three years after returning from Vietnam[, has become a member]... of a group... formed to push the Government for proper medical research... She spoke of how [her father] instructed South Vietnamese soldiers while being drenched constantly by Agent Orange sprayed over the jungle by U[S] aircraft. The group is disappointed at Wellington's lukewarm response to A[U]S Government research findings... A Government spokeswoman has said there are no plans to commission wider research here but further results from Canberra would be watched.** [Amongst other 'symptoms accredited to the defoliant Agent Orange are birth defects (e.g., blindness) in the descendants of Vietnam veterans.'

... 'a new book detailing the "disgraceful" treatment of AUSn Vietnam War veterans should be compulsory reading for all politicians and senior students, a former federal Government minister said yesterday. *The Battle After the War* book was the first account of veterans struggling to get official recognition of the harm caused by the defoliant Agent Orange. The book also says that since their return, up to 1000 veterans have committed suicide – far more than the 500 or so who died on active duty. In comparison to the triumphant welcomes to ex-servicemen after earlier victorious wars, Vietnam veterans were largely shunned by their fellow AUSns, who had been bitterly divided over the morality of the war that was ultimately lost to North Vietnamese Communist forces. Vietnam veterans around AUS mark Vietnam Veterans' Day today, coinciding with the anniversary of the Battle of Long Tan, the fiercest combat the AUSn troops were involved in during the Vietnam War. The author, himself a conscripted veteran, documents the Government's refusal to admit that cancer and birth defects were linked to Agent Orange, with grudging concessions made only after US authorities admitted the link. Launching the book on the eve of Vietnam Veterans' Day, the author said he became deeply angered at the Government in 1980 when the then Defence Minister joked in Parliament that for all he knew "Agents Orange, Blue, White and Purple could be four horses running at Rosehill on Saturday." The comment was followed by a roar of laughter from the Government benches. A Royal Commission held in 1983 concluded there was no link between Agent Orange and the veterans' medical complaints.' Incidentally, 'unwanted Vietnam War-era napalm which was shunted back and forth across the US earlier this year will soon be heading to Texas for recycling. A Houston company has won a contract to turn 12.92 million litres of 'the jelly-like substance developed during WW2 which clings to anything it comes into contact with, and which burns with intense heat when ignited,' into fuel for industrial furnaces.]

... **Canadians have opened their hearts and wallets to... the terrified girl immortalised in a famous photograph of a napalm attack in Vietnam, who is battling poverty... Hundreds of supportive letters and more than \$30,000... in cash have poured in... since the *Toronto Star*, Canada's largest newspaper, printed a story six weeks ago about her fight to build a life in Canada. [N]ow 33 and pregnant with her second child, [she] lives with her husband... and their four-year-old son in a cramped one-bedroom apartment in Toronto... [She] met her husband while studying in Cuba and they spent their honeymoon in Moscow in 1992. When their plane stopped in Canada for refuelling, the newlyweds disembarked and defected... The Pulitzer prize-winning photo of [the then]nine-year-old... fleeing burning and naked – arms outstretched in pain and terror – from her napalmed village, galvanised anti-war sentiment in the US and changed her life. She is still racked with pain from her injuries from the 1972 attack and she refuses to wear short sleeves, which would expose some of the burns that scar most of her body... [The girl] and her family were hiding in a South Vietnamese temple when napalm bombs were dropped on her village. The jellied gasoline vaporised her clothes, left her with third-degree burns over half her body and killed two of her younger brothers... [She] had 17 operations and was used after the war by the communist North Vietnamese for anti-American propaganda... Her greatest wish is to see her family again. So far she has been blocked by political and financial obstacles from visiting her parents in Vietnam.**

... **In a ceremony at the U[N] Educational, Cultural and Scientific Organisation's Paris headquarters... [the immortalised napalm victim], whose name means Golden Happiness[, was]... handed... the blue passport of a Goodwill Ambassador... Last year, while helping make a documentary film about her life, [she] travelled to America for the first time and visited the Vietnam Veterans' Memorial in Washington. There, in an unexpected meeting, she came face to face with... the U[S] commander who ordered the attack on Trang Bang. She took him in her arms and they both wept.**

... **The most senior figure in the Vietnamese Communist Party has admitted that corruption is rife in the state bureaucracy... [By the way, seven] children died and 34 people were injured when a fragmentation bomb left over from the Vietnam War exploded in school grounds. "The hospital looks like a battlefield," said... [the] Vice Chairman of the People's Committee in Ky Son, a mountainous district of central Vietnam near the border with Laos... [F]ive children, aged between nine and 15, died immediately in the blast and two died later in hospital. It was not clear what triggered its detonation, but officials in the area said rain may have eroded away surrounding soil and exposed the top of the bomb. At least one wartime bomb explodes every year in the... district, which was bombed heavily by U[S] planes during raids on North Vietnam and Laos.**

... '[the explosion of a WWII mine at the weekend at the site of the Battle of Stalingrad killed 5 boys, 3 of them brothers, who tried to dismantle it. More than five decades after the battle, the area is still littered with rusty weapons and ammunition, attracting curious children and professional trophy seekers.'

... 'An unstable WW2 mine that may contain 230kg of explosives has been found by a tourist snorkelling on Sudbury Reef, part of the Great Barrier Reef. A wide exclusion zone has been declared. AUSn defence officials said the British anti-shiping mine cannot be moved, and the only option seems to be to explode at the site.' In related news, 'thousands of litres of heavy fuel oil is leaking from a sunken US ship into one of the world's largest lagoons at a near-pristine Pacific Ocean atoll. Divers contracted by the US Navy were heading to the Ulithi atoll, in Yap state in the Federated States of Micronesia, to try to plug the leak, which threatened the food supply of 700 people living on the atoll. The oil is leaking from the wreckage of the only US Navy ship sunk during the war by a "kaiten" – a one-man Japanese suicide submarine. For a brief period before the US invasion of Okinawa in Japan, Ulithi was the largest Navy facility in the world. Up to 600 vessels were moored in the Lagoon. The *Pacific Daily News* in Guam reported that the Coastguard believed between 1000 and 2000 litres of oil was leaking every hour from the American tanker, the USS Mississinewa. The US Navy has denied responsibility for the new spill.'

... 'The US is downplaying the significance of an oil leak from the wreck of USS Mississinewa – a WW2 tanker believed to hold 1.6 million litres of oil – in one of the world's largest lagoons despite pictures seeming to show a heavy slick. The *Pacific Daily News* in Guam said yesterday that a US Coastguard preliminary assessment of the oil spill in Ulithi Atoll in the Federated States of Micronesia indicated the impact on the environment was minimal.'

... **The Solomon Islands, facing an environmental disaster from debris and relics remaining more than 50 years after... W[W2], is to pressure Japan and the Western Allies to pay for a clean-up of the country. The... country could not handle "such an emergency" on its own, [the Solomon Is P]M... said... At least 50 battleships and carriers lie on the seabed of Iron Bottom Sound, a narrow body of water between the main island of Guadalcanal and the volcanic island of Savo, and nearly all are oozing oil. Among the smaller boats... is the US vessel PT 109, captained when it was sunk by John F. Kennedy... Guadalcanal marked the southernmost advance of the Japanese during the war and was the scene of a protracted and bitter battle... of epic proportions... On land, there are war relics everywhere and much of the munitions is still live.**

... **Enchanting notions of sudden wealth have a long history, ranging from El Dorado and other mythical sources to present-day gambling. But the subject came up in another context this week, when I was reminded of the pipe-dream about supposed supplies of American wartime equipment still perfectly preserved and awaiting discovery in Pacific jungles. Persistent fantasies about abandoned aircraft, vehicles and weapons surface even today, the classic one being that there could well be a brand new Jeep sitting there, greased and oiled against rust and still in its original packing case. Veterans of the war in the Pacific tend to dismiss these tales... A former major in the US Marines... says his battle-tested outfit kept a tight inventory of all equipment, and... after the war he even got a letter from the Quartermaster-General's Office in Washington, billing him for a gas**

mask and six wooden tent pegs – “and boy, did I boil!” Whatever was left behind by the island-hopping US forces was a minuscule part of the \$US530 billion material cost of the entire war to America. But by [NZ] standards the pickings were worthwhile, for we did recover war surplus equipment from the islands... A [NZer who] worked for one of the big oil companies... [during the postwar years was] sent... to sort out problems with refuelling from drums at Pacific island airports. He returned with the news that there was abandoned American refuelling equipment, vehicles included, in excellent condition that would be useful in N[Z] “which was not importing much in that line.” He was given the job of dismantling it for shipment here in the trading schooner Tiare Taporo. I saw hardware left in the wake of the war on a 1971 visit to Guadalcanal. There were aircraft wrecks, rusting field guns. There was talk of a Japanese ack-ack battery here and US amphibian craft elsewhere. But the big preoccupation was bombs and shells. People were blown up trying to hammer the noses off them. Grass fires set off explosions. In a dry spell “the heat cooks them off,” said a British Army doctor who had dumped 450,000 at sea in 21 months, working with 30 islanders. An expanse of bush was wired off with the notice: “Unexploded bombs: Tabu”. Definitely no El Dorado.

...Two French air force officers got more than they bargained for when they went searching for... W[W1] relics on the battlefield of Verdun[– where]... 543,000 French and 434,000 German troops were killed... They trod on one of the estimated 60 million shells that were fired during[the] 10 months of fighting... in 1916. Unfortunately for them it was live and they were killed when it exploded... [Incidentally, m]illions of palmyrah trees have been destroyed during Sri Lanka’s protracted civil war in the north of the country. Government officials said that... the trees have been felled by the army and the Liberation Tigers... mainly to build bunkers and checkpoints. The trees help prevent soil erosion during the monsoon season, and their hardwood is a valuable export crop. - 1997

In all, some 14[%] of the standing crop of timber of South Vietnam was destroyed[by defoliants during the war] and the rare kouprey (*Bos sauveli*) further endangered. Animals that increased in number were the malarial mosquitoes which were presented with immense new breeding grounds in water-filled craters... Other technology employed in Vietnam included cloud-seeding (to try and flood the Ho Chi Minh trail) but the success or otherwise of the measure is disputed. Vietnam remains the outstanding example of the deployment of a full arsenal of non-nuclear weapons. The boundary with nuclear warfare, it may be observed, is now getting more blurred in the sense that it is possible for a single aircraft carrying appropriate high explosive devices to deliver as much immediate devastation as a tactical nuclear weapon with a 1 kt warhead.

Preparation for war involves, environmentally, the devotion of areas of land and sea to training and weapons testing.

War and preparations for war have contributed to pollution mightily. During the Vietnam War, US forces employed some hundred thousand tons of defoliants and other chemical warfare agents, Agent Orange being heavily contaminated with dioxin. Disregarding the Koran’s prohibition of such acts, [Iraq’s leader] took revenge for his defeat in the 1991 Gulf War by setting fire to Kuwait’s oilwells: the cloud of sooty smoke was 900km long and 600km wide. With the fires extinguished, thousands of square kilometers became covered by oil lakes which released... toxic fumes.

During the 1991 Persian Gulf War[‘Iraq 150,000 casualties – US 79’], the Iraqis deliberately dumped over a million barrels of crude oil into the Persian Gulf. This terrorist act threatened to cause unprecedented damage to the ecology of the region for some time. In the wake of their retreat from Kuwait, the Iraqis set fire to over 500 Kuwaiti oil wells... The smoke emissions, the worst ever recorded, caused severe and deadly pollution in Kuwait. It was the worst environmental catastrophe in modern history.

The Gulf War began after Iraqi forces invaded Kuwait and, in addition to the above-mentioned oil-well fires, was remarkable for the intensity of media coverage and the effectiveness of US weapons.

The intense air attacks on targets in Iraq and occupied Kuwait are costing the U[S] upwards of \$US500 million... a day, according to Government and private analysts... [Analysts also] say... German technicians and firms gave Iraq a vital boost in turning its Scud-B missiles into longer-range weapons able to strike deep into Israel and Saudi Arabia...

More than 45,000kg of mail is landed daily... in Saudi Arabia for the American forces... [In related news,] Germany and France have sent emissaries to Israel to soothe relations, ruffled by resentment that Europe helped build Iraq’s powerful war machine.

...To keep the American machine running, congressional staffers said, the Administration would seek a supplemental defence appropriation of at least \$499 billion... U[S] Allies had so far promised about \$US45 billion... to finance the war... [the] Budget Director... said.

...The White House repeated yesterday that Allied forces are not targeting Iraq’s President... [It also confirmed that a]t least 50... military vehicles have disappeared from a[US] Army compound near Allied front lines...

Two months after Yemen voted against the U[S] in a crucial U[N] Security Council debate on the Gulf crisis, the State Department slashed its aid from a planned \$37.1 million to less than \$5 million... [Incidentally, m]ore than twice as many Americans have died accidentally in the Gulf War as in combat so far. Military statistics show 28 men have died in accidents away from battle in the first four weeks of the war, compared with 12 killed in action... Accidental deaths haunt all wars. According to the *Defence Department Almanac*, of the... Americans killed in Vietnam, 10,000 died of causes not connected with combat. In... W[W2], the ratio was 291,557 battlefield deaths to 113,842. In... W[W1], it was the other way round – 53,402 battle deaths and 63,114 others.

...Nine British soldiers were killed by “friendly fire” from an American aircraft during fighting in southern Iraq... The British military have [also] admitted that a bomb dropped from a Tornado jet during an attack on an Iraqi bridge veered off course and hit a populated area.

...The commander of U[S] forces in the Gulf... said yesterday that it would not make sense to attack Iraqi troops if they began a large-scale withdrawal from Kuwait... Asked about the possibility of the U[S] pledging not to attack Iraqi troops during a withdrawal, he called this a “logical assumption,” saying “we can’t expect them to withdraw if we are going to pound them the entire time they are withdrawing.” ...The start of such a pull-out would constitute “an entirely different set of circumstances,” in which the U[N] resolutions on the Gulf crisis were being implemented...

The U[S] and its Allies tricked [Iraq’s] President... into losing the cream of his Army... and made sure he could no longer threaten his neighbours... The U[S] Marines... cut off the Iraqi retreat by closing off all avenues of escape... The Marines left a trail of devastation... - 1991

The US commanders wanted to ‘destroy the Iraqi Army’, but soldiers are just workers carrying out orders. Like members of the Desert Storm forces, Iraqi soldiers had partners and children to go home to. Apparently, US commanders had forgotten the old western code that ‘only the bad guys shoot people in the back.’ Ironically, the US and its Arab allies had helped to create the Iraqi Army!

The violent and savage rhetoric the Ayatollah used, not only against the U[S] but also against rich Islamic countries like Saudi Arabia and Kuwait for their religious and moral transgressions, made them willing accomplices of Iraq in its war against Iran. In effect, the Saudis and Kuwaitis hired [the Iraqi leader] to do their military work, to stave off the political disaster they feared from possible insurrection at home. Both pretended that

Iraq, in invading Iran, was simply making a contribution to peace in the Gulf. Each, fearing the Ayatollah, made considerable sums of money and substantial amounts of war materiel available to the Iraqis, believing that Iran's defeat was in the interest of all Arab peoples.

During... the Iraq-Iran war, when Iraq was the aggressor, the [US] administration secretly and cynically shipped arms to both belligerents... [I]t also shared intelligence information, which the Iranians found substantially less useful than the Iraqis... [Then came] the Gulf War... The American audience for the President's speech on January 16[, 1991,] had been the largest in history; CNN had come of age, rivaling all the other networks because it provided what the public craved – war news [24] hours a day. By Saturday, the beginning of the weekend, America's restaurants and movie houses were deserted – men and women much preferred to stay at home to watch the war... Within a day of the initial bombings... oil prices dropped more than \$10 a barrel – the largest single-day drop in history – and the Dow Jones average rose a healthy 114 points. Though historians could say, correctly, that war often encouraged new investment and created bull markets, rarely did stock markets register such very large gains.

...the dictator of Iraq extended his oil claims by occupying Kuwait... Operation Desert Storm rescued the supply of oil to the industrial countries and secured it at prices that permit the continued wasteful consumption of this diminishing resource and discourage development of alternative sources of primary energy. Incidental to this ugly episode, perhaps a tenth of the rescued oil pool went to foul the sea and sky. That cost is unregretted by most Arabs; it is not their oil. They and other peoples of the preindustrial world remain duly unimpressed, however, by the overnight dismantling of the electric power, communication, transportation, and municipal service systems in Iraq, that represented a relatively superior level of development among Arab countries... The U[S] celebrated its military triumph alone.

The US congratulated itself for being able to guide a missile to an exact target, and for dismantling Iraq's infrastructure, but it had failed to remove the person on whom the whole Gulf crisis could largely be blamed – thereby allowing him to continue tormenting everyone!

Iraq[']s political leader... was born... to a poor Arab Sunni family... [in] 1937. Following his attempt in 1959 to assassinate the premier of Iraq... [he] studied law in Egypt. He returned to Baghdad in 1963 when the Baath party seized power but was imprisoned in 1964 after the government was overthrown. In 1966 he escaped. In... 1968 the Baath returned to power, and he was named deputy chairman of the Revolutionary Command Council. Through military purges, intimidation of enemies, and careful control of his party, he became the most powerful person in Iraq, acceding finally to its presidency in 1979[– thereby fulfilling a 'Time' prediction. The Havana cigar-smoking despot marked his accession by executing 21 party officials'. After attempting] to increase industrial production, reorganize government policy in agriculture, improve education, and change the status of women[, he] put his economic and social advances at risk by going to war with Iran (1980-1988) in a vain effort to gain control of Arab-inhabited areas of oil resources... Although... Iraq... was... defeated by a U.S.-led military coalition early in 1991, the Iraqi leader retained power.

According to the *Washington Post*, the CIA... has... spent... \$100 million to implement a classified 1991 presidential order to oust [the President of Iraq]. The paper quoted Administration, congressional and dissident Iraqi sources as saying that despite the money there was very little to show for the effort... The operation fell apart last month when... a Kurdish rebel leader, requested [the President of Iraq's] military assistance to oust a rival Kurdish group from the region. Many of the 2500 Kurds who worked for the U[S] in northern Iraq were evacuated to Turkey last night in the first step in a long journey to America as refugees... Most worked as employees of U[S] aid programmes in northern Iraq but some are believed to have been engaged in intelligence activities for the Americans as well. All are considered to be at risk... About 250 members of the Iraqi National Congress, a U[S]-funded group dedicated to the overthrow of [the Iraqi President], are also set to cross the border in the next few days. - 1996

IN newspapers and on TV talk shows, Washington pundits and politicians... [have been] saying out loud what many have long thought: The best approach to [the] Iraqi leader... is to get rid of him once and for all... But assassinating the Iraqi president would be neither legal nor easy[– 'given that twenty attempts on his life have so far failed, he never spends more than one night in the same place and has a "volunteer" taste all his food' – and his] successor could prove no better... Reacting to past CIA assassination plots, Congress in 1976 barred US agents from killing foreign leaders or "asking anybody to do something you can't do yourself", said... a former CIA deputy director. "You can encourage others to put pressure, but you cannot explicitly or implicitly say: 'We'd like to see this guy gone'." That said, administrators have repeatedly pushed the envelope but often to little effect... "We chased [him] with bombers all through the Gulf War,"... Since the war ended, the CIA has [undertaken covert efforts...]

The 41st US President] declined to use military might to remove... [the Iraqi leader, but he] put up \$US40 million as a down payment... when he secretly ordered the CIA to create the conditions for [the Iraqi leader's] downfall in 1991. Much of that money went to buy and move a clandestine radio transmitter from Croatia and to finance a London-based propaganda operation that turned out fake Baghdad newspapers, television films and radio broadcasts. Within the agency, the Iraqi operation was instantly seen by some... as a can of worms. These officers knew they would never get enough money or political support from the White House... That feeling was reinforced when annual funding was cut to \$US20 million in late 1992, and then to \$US15 million in 1994, after [the 42nd US President] came to the White House and adopted [the] programme... The agency could not stop throwing money at the [Iraqi] problem if it wanted to. Refusing to admit defeat, the White House orders this international embarrassment prolonged to avoid being accused of doing nothing... This year covert operations against Iraq will cost about \$US5 million, the price tag for ineffective propaganda broadcasts by... radio stations in Jordan and Kuwait... The [CIA] has spent six years and \$110 million... trying to overthrow [the Iraqi leader] in the most expensive sustained failure in agency history... with fresh humiliation looming around the corner... Interviews in Washington and Europe with CIA personnel, Iraqi dissidents and foreign intelligence sources provide new insights into this colossal exercise in self-deception... Ambitious junior officers targeted the money on flashy projects that led nowhere but allowed the White House to pretend something was happening... Some Americans who worked in Iraq covertly now wonder whether the agency was a victim of an elaborate sting perpetrated by [the Iraqi leader], who watched with a benign eye as the CIA funnelled money and Iraqi military defectors into a Jordan-based exile group for two years before effortlessly rolling up that organisation and exposing its American roots last summer... Senators who normally line up to rail at expensive agencies for wasting taxpayer money have kept quiet on the CIA debacle... Congress should step in swiftly with its own investigation of a national humiliation.

...Along with the Bay of Pigs in 1961, Iraq stands as the agency's most expensive and embarrassing flop since it was founded... In Washington's labyrinth of bureaucracy and secrecy, a policy failure operates like a shaky bank loan: if big enough, it intimidates everybody connected with it into silence and inaction. Only foot soldiers... risk being sacrificed, and only if they pipe up. Those who draw up the grand schemes and give orders always seem to fall effortlessly upwards or sideways... [T]he CIA director who oversaw the Iraq debacle, is now comfortably back at Massachusetts Institute of Technology and defending the flawed strategy he chose. His deputy was confirmed by the Senate earlier this month as... [his successor. The new director started] his tenure by attempting an old bureaucratic dodge: shooting the messenger who brings unwelcome news. The messenger in [the director's] sights is... a former CIA officer who disclosed his role in the agency's failed effort to overthrow Iraq's [President]... It should have triggered investigations by the agency, the White House and Congress of this particular operation and the future of covert action... Instead, [the new director] has asked the Justice Department to determine if [the CIA officer] violated his confidentiality agreement with the spy agency by

disclosing classified information. Imagine... the owner of the Titanic... [greeting] news of the luxury liner's sinking by ordering an investigation of the radio operator who sent out distress signals, and you get the picture... [As the CIA marks] its 50th birthday... [it] is time for Congress... to... sharply pare down the \$3-billion-a-year agency... But Congress is as mute as the White House...

[The Iraqi President] is the corpse who won't die... America thought he had been buried forever. But [he] claws his way up periodically to snarl anew at the world. The... White House... spinners... portray the Iraqi dictator as an incompetent, erratic Mafia chieftain... But that neglects the moral and strategic costs that these continuing confrontations... impose on U[S] leadership in the world. Each new confrontation saps respect for America. Each... time [the Iraqi President] claws his way up, it also exposes the international community's complicity in his survival... they still treat [him] as a member of their club by... [sending] diplomats... to Baghdad... And Russia, France and the Arab League have gone on record as opposing any military action against Iraq... providing Baghdad with a significant diplomatic and psychological marker to cite in future disputes... [The 41st US President compared his Iraqi counterpart] to Hitler, reminding the world of his genocide against the Kurds, his use of poison gas and the rape of Kuwait. But after all that, [Iraqi] officials are still seated on U[N] human rights commissions as well as other important international institutions... Throughout the Arab world, rulers and citizens alike believe that the world's only superpower could remove [the Iraqi] regime if it really wanted to. Because [the Iraqi President's] continued rule serves a useful purpose for them – be it controlling oil prices or keeping Iraq's Shiites and Kurds subjugated and brutalised – the Arabs assume that his continued rule serves some unacknowledged U[S] purpose as well. This suspicion is increasingly voiced in Europe and Asia...

100 Kurdish refugees from Iraq, including 53... children, have been found in wretched condition on a beach on the Greek island of Rhodes. - 1997

FOR MORE than a decade, the Kurds in Iraq have endured a hellish reign of terror at the hands of [Iraq's President. When the] US President... called on Iraqis to overthrow the dictator at the end of the Gulf War, Iraqi Kurds responded instantly. Taking up arms, they drove [the dictator's] troops from several key points in northern Iraq. It appeared as if they would at long last win their freedom. But the American-led coalition inexplicably allowed [the dictator] to counter-attack. Nearly two million Kurds fled from their lowland villages into the mountains and into neighbouring Turkey and Iran. Thousands died before pressure from the coalition compelled [the dictator's] troops to retreat. The Allies promised safety to those survivors who would return to their devastated villages... [But] Allied air patrols – all that remain to protect the Kurds from [the dictator's] menacing armies – are scheduled to end in June. Here is the tragic story of a noble people whose survival hangs in the balance. THE DAY began mild and clear in the city of Halabja. Then, without warning, [the dictator's] troops sent MiGs shrieking in from the south. Detonations shook houses like pieces of cloth in the wind. The family of [a 20-year-old... fled to their basement, where they were packed shoulder to shoulder. [The 20-year-old] ran to a less crowded house nearby. Just before sunset on March 16, 1988, [the 20-year-old] climbed up on to the roof. Amid flames and cones of black smoke, he saw yellow clouds seeping through the ancient lanes of the city. "Gas!" people shouted. "God save us!" Corpses lay everywhere along the street. Once the clouds had drifted away, [the 20-year-old] raced home... and opened the basement door. Inside lay his family – dead... At least 5000 of Halabja's 70,000 inhabitants were killed that day. The wounded who went to Iraqi hospitals never returned. Later, Iraqi troops dynamited the remains of Halabja. After the Gulf War, when [the dictator's] security forces fled, [the 20-year-old] and other Kurdish refugees returned to their villages. Though Iraqi Kurds are enjoying the first taste of freedom they have known in half a century, they continue to uncover mass graves of [the dictator's] victims. In Halabja, on the floor of the home he has rebuilt with his own hands, [the 20-year-old] slowly turns the pages of treasured family albums... The photos are all that remain of his family. Finally [the 20-year-old] turns with a questioning look in his eyes. "Why did the Allies let that monster... live...?" IN 1920, the victorious Allies of W[W]I promised the Kurds a homeland, but three years later reneged. In the 1970s, the U[S] promised continuing support to the Kurds against Iraq. Then, at the request of the Shah of Iran, [the US Secretary of State... directed an abrupt halt to the arms shipments. The cost was tens of thousands of Kurdish lives. During the next decade, vast areas of Iraqi Kurdistan were completely depopulated. [The dictator's] armies herded hundreds of thousands into government compounds... Some 70 communities were attacked by poison gas. An estimated 4000 villages were wiped out... Systematically sweeping through once-fertile valleys, Iraqi forces... laid waste... 90[%] of the land... "It was like hell...", one refugee said. "Even the bees fled." ...While we speak, two American A-10A "Tankbusters" swoop low overhead with an ear-shattering roar. Like virtually every Kurd I met, [the refugee] is convinced that only this symbolic Allied military presence deters [the dictator] from renewing his war against the Iraqi Kurds. The overflights could end in June unless Western nations extend their commitment and persuade Turkey to allow continued flights from its air bases. "What will happen then?" I ask... "[The dictator] will come. And we will fight him to the last drop of blood... We want to live like men, not animals." SOME 20 million Kurds live scattered throughout Iraq, Turkey and Iran, with small numbers in Syria and the former Soviet Union. Some 4.5 million of them dwell in northern Iraq, where their ancestors have lived for thousands of years. But as I travelled across Iraqi Kurdistan, it seemed as if the very land had been murdered. Schools, hospitals and mosques had been blown to bits. I saw pitiful, frozen refugees struggling to cook meals amid the twisted heaps of metal and concrete that were once their homes. This was not the result of war. It was the result of [the dictator's] premeditated campaign to wipe Iraq's Kurds off the face of the earth, for the Kurds have steadfastly refused to bow willingly to his dictatorship. The majority of Kurds are Muslims, but they are not Arabs. For years, Iraqi Kurds have fought against Arab discrimination. Yet they have never resorted to international terrorism to attract attention to their cause... I journeyed ...to... [the sprawling], modern city of Sulaymaniyah[, which] lies in the shadow of snowcapped peaks near Iraq's border with Iran. Until last year, though, Sulaymaniyah's real centre was not the bustling marketplace in the middle of the city, but an ugly concrete compound known as the Security Centre. "This is where I lived for five months," [my guide] says as we enter a windowless, concrete cell about a metre wide by two metres long. "I was sure I would never come out." [My guide], 61, had been a freedom fighter for 30 years before he was captured by Iraqi police in 1990. He leads me through a labyrinth of filthy corridors to a small dark room. A large iron hook hangs from a bar attached to the ceiling. Blood has soaked so deeply into the floor that it is still visible months after the prison was liberated. "This is where they tortured me,"... Three times every night he was handcuffed and forced to climb onto a table. His wrists were hung over the ceiling hook, and the table was kicked away. The Iraqis beat him with thick cables as he dangled from the hook. Sometimes they squeezed off chunks of flesh with pliers. They pushed live wires into his ears, his tongue, his genitals. The torture sessions lasted up to two hours each. When he was returned to his cell, sleep was impossible, for the screams of other prisoners echoed throughout the prison. One night, [he] heard gunfire outside the Security Centre. Kurdish freedom fighters had begun an attack. [My guide] heard the guards stop at the cell next to his, then watched as they pulled a shackled prisoner into the corridor and poured acid onto his naked body. He thrashed helplessly on the concrete floor until the guards shot him dead. *My turn will be next,* [my guide] thought. But the firing grew louder, and the guards left. Several hours later, Kurdish freedom fighters battered down his cell door. Today [my guide] remains blind in one eye, and has trouble hearing. "Tell the nations what happened here," he pleads. "Tell them to put a border between us and the Iraqis. If the Allies give [the dictator] any breathing space, he will kill us all. Please protect us!" ...The plain truth is that without Western help, the Kurds will die. Continued Allied air patrols are vital. The U[N] must ensure an autonomous haven in northern Iraq where the Kurds can live in freedom. Most important is the public guarantee of protection against the vengeance of [Iraq's President]. The message to [the dictator] has to be clear: if he dares to attack the Kurds again, the Allies will retaliate. The... fate of millions of... Kurds lies in our hands. - 1992

Washington may offer the... Kurds full military protection against [the Iraqi dictator] if they allow the Iraqi opposition to base itself in areas under their control... [A] leader of the Kurdistan Democratic Party... told the *Independent* newspaper that the U[S] was seriously considering a proposal to give a military guarantee to the whole of Iraqi Kurdistan... The proposal is to extend the no-fly zone – which at present does not cover the large Kurdish city of Sulaimaniyah – and turn it into a no-drive zone. This would mean the U[S] building up a capability to stop an Iraqi tank offensive.

Iraqi Kurds have asked the U[N] to help them rid their ruined homes of snakes and scorpions[, which]... have... attacked small children... The U[N] has not responded to the Kurdish plea.

...Iraqi children suffer most from the West's war on [their President]... Since the end of the Gulf War, [over]... half a million Iraqi children under five ha[ve] died from starvation and disease. That's more than the total number of civilians and combatants who... died in the ethnic cleansing of the former Yugoslavia... It's a humanitarian nightmare, an unprecedented violation of the rights of children [– and i]t's a crime for which [Iraq's President] can't be blamed. Those responsible sit around the Security Council table of the U[N], aided and abetted by N[Z]. This country's navy patrols the Persian Gulf, part of the international blockade to enforce the sanctions imposed in... August 1990 when Iraq invaded Kuwait... During our term on the Security Council, N[Z] chaired the committee which every two months rolled over the sanctions. [I'm] not against sanctions as a tool to end conflict. But they can be a blunt instrument. They should be clearly aimed at the parties to the conflict, rather than inflicted on the poor and powerless. International attention is back on the region since the... Iraqi Government's intervention in northern Iraq on behalf of one of the two main Kurdish factions. What isn't seen is the way the Iraqi people are paying for the West's frustration at its failure to bring the dictator to heel... Even if... plans to extend the oil for food deal, which would... allow[the dictator] to sell US\$1 billion of oil every 90 days to buy essential food and medical supplies, after paying compensation to Kuwait... go... ahead, it will be too little too late to stop the deaths of hundreds of thousands of civilians... Iraq used its vast oil wealth to build up a comprehensive and generous welfare state. When the [Gulf] war started, Iraqis had the highest calorie intake a head of any Middle East country. Its children faced the problems of too much food rather than too little. To get back to even basic needs, the UN Food and Agriculture Organisation estimates Iraq must import almost \$3 billion of food a year. Its domestic food production has slumped, because of lack of quality seeds, pesticides, and spare parts for irrigation. The only reason there hasn't been widespread famine is the highly effective rationing system put in a month after sanctions were imposed... [But b]asic food prices have risen phenomenally. By August 1995 a kilo of wheat flour cost a staggering 11667 times its pre-war price. Even more crucial is the collapse in health services. Six years ago 90[%] of Iraqis had access to primary health care, including immunisation for childhood diseases such as polio and diphtheria. There was a network of large modern hospitals available at nominal cost, and a well trained medical work force. Under sanctions, many trained staff have left. Medicines, antibiotics, surgical instruments, gloves, syringes and bandages are in short supply. Water and power is erratic, and sanitation and waste disposal have become major problems. Across the country water and sewerage systems are collapsing because of lack of spare parts and chlorine and power failures... The deterioration of the system has seriously affected health. Raw sewerage floods the streets of the cities, creating breeding grounds for disease. Untreated sewage flows into the Tigris and Euphrates rivers, alongside whose banks two thirds of the population live... A World Health Organisation report released in March this year found the infant mortality rate has doubled, and the under-five mortality rate had jumped six-fold. Nutritional diseases of severe malnourishment such as marasmus and kwashiorkor, which had all but disappeared, have become common. The report warns this enforced starvation of the population has implications for... the quality of life of this and future generations: "The world community should seriously consider the implications of an entire generation of children growing up with such traumatised mental handicaps, if they survive at all." It is clear the sanctions are in violation of the fundamental principles of... humanitarian law. Iraqi children cannot be forced to bear the costs of [their President]'s intransigence nor punished for his deeds. The [NZ] Government should bring our frigate back from the Gulf and ask the Security Council to face up to its human rights obligations... The UN must... find a way of containing a dictator without killing his people. [After all, 'UN Resolution 688 – which states that Iraq's leader may not attack his own people' – is meaningless if the UN itself is doing so indirectly!]

...As tensions mount in the Gulf the frigate HMNZS Canterbury is on her way to join the multinational interception force imposing sanctions on Iraq... sanctions already responsible for the death of more than 560,000 children under the age of five, [according to] an American professor who headed a U[N] fact finding mission to Iraq late last year... [The] professor of nutrition at the University of Massachusetts, says another 100,000 children will almost certainly die if the Security Council sanctions are maintained for another 12 months. The [NZ Foreign Affairs] Minister... does not dispute the figures, but says there is no evidence that lifting the sanctions... would benefit ordinary Iraqis. "If [the Iraqi President] can watch his people starve and build an enormous new palace for himself and continue to manufacture weapons for his army, people don't mean a lot to him,"... A former N[Z] ambassador to the U[N], and chair of the Security Council sanctions committee... now director of the Centre For Strategic Studies at Victoria University, says he realised the sanctions were unduly harsh... in 1993. At that stage there were already reports of large-scale death and malnutrition... "I found it extraordinarily difficult to accept. There is nothing in the sanctions that say they are supposed to affect the livelihood of every-day Iraqis." Since [he] returned to N[Z], the sanctions committee has blocked the import of spare parts such as tyres for ambulances on the grounds that they are "not essential." Of the 50 ambulances in Baghdad, only two are operational... [His] comments come amidst growing international controversy over the consequences of the sanctions, which have been described by [a former US] Attorney-General... as "one of the greatest crimes against humanity this epoch."

...The U[S] launched a second cruise missile strike yesterday to blast Iraqi air defences and clear a path for American warplanes enforcing an expanded "no-fly zone" in southern Iraq... 17... cruise missiles... [– 'each costing \$US1 million' – were sent] from bombers and ships... [to] mop-up... targets not destroyed in the first attack... [of] 27... missiles... fired... at "about" 15 southern Iraqi targets [two days ago]... The expansion of the area in which Iraqi combat pilots are forbidden to fly went into effect... last night... The U[S] is calling the policing of the extended zone "Operation Southern Watch." [However, the Iraqi President] has ordered his pilots to shoot down any American airmen trying to enforce it... [He called the] imaginary lines north of the 36th parallel and south of the 32nd parallel non-existent... The zone is also a "no-drive" one for Iraqi troops... After the first strike, the Iraqi leader accused the Americans of cowardice in hiding behind the technology of their sophisticated weaponry. He said five people had been killed and 19 injured, some of whom were civilians, but... the [US] Defence Secretary... disputed that account, saying it was "exceedingly unlikely" that there would have been any civilian casualties... [The Iraqi President] still commands one of the region's largest war machines with a 400,000-man force, 2200 tanks after losing 2600 in the Gulf War, and a variety of fixed-wing aircraft – 150 to 350 of which are operational... The U[S] has about 20,000 troops deployed in and around the Gulf backed by more than 300 warplanes and military hardware stored in Gulf Arab states. The latest confrontation with Iraq was triggered by [its President] sending troops into Iraq's Kurdish north... in support of one Kurdish faction against a rival group.

...sensing that his popular support was waning, [the Iraqi President] ordered his troops to attack the Kurds, thereby leaving [the US President], as leader of [Iraq's] arch-enemy nation, with no choice but to order missile attacks again... which of course caused [the Iraq President's] popularity to skyrocket and also, as a bonus, made [his opponent] look presidential during his re-election campaign. So it was really a "win-win" situation, unless of course you happened to be a Kurd.

...It could only happen to the Kurds. They are attacked in northern Iraq by a despot who has launched at least three genocidal campaigns against them, and their superpower protector bombs targets hundreds of kilometres away... The missiles had the range and ability to hit Iraqi tank concentrations in Kurdistan, but were not used that way... The... weak and hesitant initial military response... [from the US Administration to the

Iraqi President's] renewal of his war on the Iraqi Kurds and his domestic rivals repeats a fundamental error that has plagued U[S] policy in the Gulf for a decade. [The Iraqi President] repays caution and deference in an adversary with bold defiance and risk-taking. Having survived a six-week air assault in 1991, he will see the latest cruise missile strikes on extraneous military targets... as a slap on the wrist. Indeed, he said just that in his televised speech after the first raid... Mountain tribesmen who inhabit northern Iraq and adjacent areas of Turkey, Iran and Syria, the Kurds have been betrayed throughout their grim history by putative friends and allies...

Like any patriotic American, I'm all for protecting "our interests," but like most Americans, I can't figure out what our interests are in this latest skirmish... As far as I can tell, Kurds don't do much besides try to survive, which isn't easy, since they don't have a nation of their own and are spread out over several countries, none of which treat them well. As to what they have – no, it isn't oil, gold, diamonds or even titanium, the hot precious metal of the 1990s since it is used in manufacturing overpriced golf clubs. The leading manufacturing product of the Kurds is rugs. Rug dealers in Chicago say the Kurds make fine rugs but they're almost impossible to find because they used to be exported out of Iran, but we've had an embargo on Iranian products for almost 10 years... "Kurdish rugs... are very durable and will last you forever... The price is determined by the age and quality of the rug... A rug that is six feet by nine feet would run from \$1100 to \$3000... a six-to-nine from China would run from \$600 to \$2000. A six-by-nine Persian would run from \$1000 to... \$15,000, depending on the quality." ...The Kurds also raise lots of sheep for wool and to make cheese. But since we have more than enough sheep of our own... I doubt that the Kurdish sheep are a factor in our shooting missiles... At least I hope not... So it has to be the sturdy Kurdish rugs, although I haven't heard of any of the talking heads from the Pentagon or State Department say so... Personally, I prefer Scandinavian-style rugs. They are colourful... less expensive, and we don't have to blow up any Swedes to get them.

...The united front formed against Iraq during the Gulf War... has cracked... Russia, China and France all oppose... the U[S]...

The US] Defence Secretary... arrived in Turkey... [last] night... hoping to secure support for continued... economic pressure against Baghdad. He... has so far met a lukewarm response in his attempts to win Arab support for a possible military showdown with Iraq... Turkey hosts Operation Provide Comfort, the U[S]-led air force patrolling northern Iraq, but has grown increasingly impatient with a mission critics say fosters Kurdish separatism and impinges on Turkish sovereignty. And Ankara is keen to normalise ties with Iraq, its third biggest trading partner until sanctions were slapped on Baghdad... The Saudi Arabia Defence Minister... said he did not expect a new U[S] strike against Iraq after Baghdad's decision to suspend air defence attacks on U[S] warplanes... A senior Iraqi official said that Iraq would keep its promise not to fire at U[S] warplanes, but he warned that a continued U[S] military build-up in the Middle East region could cause "problems." ...Kuwait [is] the only Arab state to support openly the American show of force...

[US President's] Gulf policy comes under attack... [F]ailure to rally international support for his stand against Iraq has become a central issue in the American presidential campaign. The Republicans were initially wary of attacking the President during a national security crisis, but they have now taken the gloves off. The Republican candidate... criticised... the... President... for inflicting only pinpricks on Iraq instead of real punishment. One of the main points of criticism is the confusion that surrounded the decision to send extra troops to Kuwait. The Pentagon announced on Friday that 5000 troops would be sent... but Kuwait had apparently not been consulted and took two days before it formally endorsed the proposal... [T]he Republican Speaker of the House of Representatives... said... "We can't even get the ally we're defending to agree to be defended before we issue the press release saying we're going to be defending them. It tells you there's a certain lack of co-ordination... The President owes the country a clear explanation of what he is doing, why he is doing it and what does he hope to accomplish." [No such explanation was offered, but the President did accept that there was a]... diplomatic blunder.

...Some of America's Gulf Arab allies say privately that they are irritated by what they see as a go-it-alone U[S] policy over Iraq that has ignored their concern about Washington's high-stakes confrontation with Baghdad. "We read about it in the news... What kind of a partnership is this?" asked a senior Gulf Arab military official... Saudi silence over the U[S] actions is widely seen as disapproval of American insensitivity towards the political impact of... [further] strikes on Gulf Arab opinion. Washington's attacks on Iraq have exposed Gulf states to the accusation that they are lackeys of a superpower that is inimical to the conservative values and traditions of the region.

...As the [US President's] Administration ponders what military actions to take against Iraq, a second battle front has opened within the Pentagon between the Navy and Air Force over which should get to bomb [Iraq next]. The rivalry between the two services has been played out during several conflicts since... W[W2]. But it has intensified as shrinking defence budgets and an upcoming review of all military programmes force each service to justify every man, woman and weapons system under its control... In the latest conflict, the Navy and Air Force have so far played to a draw, though Navy boosters complain that that is only because Pentagon planners have gone to extraordinary lengths to help the Air Force. When the U[S] struck out at [Iraq] on September 3, an aircraft carrier battle group was anchored in the Gulf with more than enough cruise missiles to do the job. The Air Force was essentially grounded in the region when Turkey and Saudi Arabia, where scores of Air Force jets are based, would not allow the jets to use their airspace for a strike... a problem carrier-borne aircraft do not have, the Navy is quick to note. Still, Pentagon planners dispatched two Air Force B-52 bombers from Guam to the Gulf – 17 hours and 11,000km away – to take part in the mission. The bombers fired 13 missiles; a Navy destroyer and cruiser... fired 14 more. "I find that very peculiar," said... [a retired admiral who is now the] director of the Centre for Defence Information, a Washington think-tank. "To me, that was a terrible waste of money and wear and tear on those B-52s." For its part, the Air Force issued a press release saying "B-52s lead attack on Iraq." The Navy regained the advantage quickly, taking sole responsibility for the follow-up bombing... But the Air Force has made a comeback with its bombers and stealth fighters being moved to strike positions in the Indian Ocean and Kuwait... [Meanwhile, a] successful military drive by a Kurdish militia allied to Baghdad has raised the spectre of a repeat of [the] 1991 refugee exodus when more than a million Kurds poured through the mountains to Iran and Turkey for safety. Iran[, which 'already has 1/2 million Kurdish refugees',] fears the arrival on its borders of another wave of civilians...

Some 2000 Iranian troops have launched an incursion into northern Iraq to attack Iranian Kurdish guerrilla bases... Iran did not confirm the intervention, but said it had shelled rebel positions inside... Iraq in a bid to halt cross-border attacks. An Iranian Army commander said... that the attacks would "continue until the areas where the aggressors are concentrated are evacuated." ...More than 450 families fled their homes and arrived in front of the U[N] High Commission for Refugees base in Arbil, seeking shelter from the shelling. - 1996

The U[S] has warned Iran its aircraft are in danger of being shot down if they violate an allied-imposed ban on flights over southern Iraq... Iraq said eight Iranian aircraft crossed its border on Monday. The Iraqi-based Mujahideen Khalq, the main Iranian opposition group, said two of its camps were bombed... Iranian aircraft... identified as MiG 21s and 23s, got into and out of Iraqi air space without any trouble.

...With the U[S] aircraft carrier Nimitz speeding towards the Gulf, diplomats and analysts say another military stand-off with Iraq may be in the offing. But they doubt that either side wants a serious confrontation, or that Iran, which bombed two Mujahideen rebel bases in Iraq last week, would be drawn into a clash with U[S] forces... The U[S] could be accused of a double standard by issuing warnings when Iranian and Iraqi planes violated the no-fly zone while remaining silent on Turkish Air Force and Army incursions into northern Iraq to hit Kurdish guerrillas... said... the head of Middle East studies at Britain's Royal Institute of International Affairs...

['Despite demands from Baghdad that the action be stopped immediately' s]ome 15,000 Turkish soldiers backed by more than 100 tanks and armoured vehicles have entered northern Iraq, after reports of fighting between Turkish troops and separatist Kurdish rebels... In May, 10,000 Turkish troops poured into northern Iraq in pursuit of... Kurdistan Workers Party [(PKK)]... guerrillas, who use the region as a base to launch

raids into south-east Turkey. [‘Kurds have long called for more investment in Turkey’s impoverished southwest, parts of which have been left devastated by years of fighting. They are also demanding a relaxation of the bans on broadcasting and teaching in Kurdish.’]

...‘Kurds lashed out in all directions after the leader of the PKK was captured and taken back to Turkey where he’s regarded as public enemy number one. In Europe, America and AUS they besieged and occupied the diplomatic posts of countries they blamed for their leader’s capture. One man in Athens made his point by setting fire to himself.’

...‘Turkey’s PM urged Kurdish rebels yesterday to surrender under a planned partial amnesty, but protests triggered by the arrest of the PKK’s leader continued across Turkey and Europe. Turkey’s old rival, Greece, tried to generate diplomatic pressure to ensure the rebel received a fair trial but Ankara said it wanted to know why Greece had harboured for 12 days in its embassy in Kenya the rebel whom Turkey labels a terrorist monster for leading a violent rebellion in which 29,000 people have died. Ankara also began to scale down a military onslaught on the rebels in Iraqi territory, but the PM’s call for an end to 14 years of bloody rebellion contained no concessions to Kurdish nationalists seeking to negotiate a solution. Nevertheless, it was Ankara’s first official gesture to the rebels since their leader was captured early last week. But the PM failed to impress tens of thousands of Kurds who demonstrated in at least 10 cities across western Europe, including London, Paris, Stockholm, Geneva and Vienna. The biggest rally was in Bonn, where riot police prevented 7000 Kurds from marching to the Israeli embassy to mourn three militant colleagues killed by security guards as they tried to storm the Israeli consulate in Berlin last Wednesday. In contrast to Wednesday’s protests, which included the occupation of more than 20 Greek and Kenyan diplomatic missions across Europe, yesterday’s demonstrations were largely limited to chanting and the burning of Turkish flags. But in Rome 50 Kurdish militants broke away from the main rally to throw petrol bombs at a Turkish Airlines office and clashed with police in riot gear. In Turkey itself, the state-run Anatolian news agency said unknown assailants had exploded bombs in Istanbul, thrown petrol bombs at vehicles and smashed shop windows.’

...‘a lawyer for the Kurdish rebel leader resigned yesterday, saying he feared for his life, and police detained a second member of the legal team for suspected ties to the guerrilla group. The moves are likely to stoke Western worries about the fairness of the rebel’s upcoming treason trial, where he could get the death penalty. The rebel’s capture has set off patriotic fervour through Turkey and the lawyer who resigned has received death threats against himself and members of his family. Turkish ultra-nationalists also stoned a bus carrying the lawyer and other lawyers to the island prison where the rebel is held.’

...‘Turkey’s PM accused Greece yesterday of sponsored terrorism over its decision to fly three of the PKK leader’s aides to Athens after they were stranded at its embassy in Nairobi following the rebel chief’s capture last week. But in Athens the three women aides accused Greece of betraying their leader and handing him over to Turkey. The PM also rejected a lawyer’s claims that he was unable to carry out a defence of the rebel, and again called on the rebel’s followers to surrender. Security officials in the southeast said troops backed by Cobra helicopters had killed 17 PKK rebels over the past two days. In related news, the bodies of three PKK sympathisers, shot trying to storm the Israeli consulate in Berlin, were buried in Turkey at the weekend.’

...‘Kurdish rebels will escalate the war for autonomy in south-eastern Turkey despite the loss of their leader, a spokeswoman for the rebels’ political wing said yesterday. Turkey hoped that last month’s capture of the founder of the PKK would deal a final blow to his rebels. But fighting has continued in the south-east and the Germany-based Kurdish agency DEM said the rebels had killed 29 soldiers in clashes over the past 10 days. The Turkish military refused to confirm the report that 29 soldiers had been killed. Earlier yesterday, prosecutors sought the death sentence for the PKK’s second-in-command, who was captured last year and has added to the list of atrocities attributed to his leader, by accusing him of ordering the killing of 33 unarmed soldiers in 1993.’

...‘During six days of hearings before a Turkish court, the Kurdish guerrilla leader tried to portray himself as a man who could bring peace to south-eastern Turkey. His lawyers are expected to take the same approach today when they make their final statements. The PKK leader is widely expected to be convicted and sentenced to death on charges of treason and separatism. Turks almost universally blame him for the deaths of 37,000 people, the vast majority of whom have been Kurdish civilians and guerrillas. If he is convicted, the sentence will be automatically appealed and must be endorsed by the Turkish Parliament and approved by Turkey’s president. Turkey has not executed anyone in 15 years.’

...‘Turks are hailing a death sentence for the Kurdish guerrilla leader, but the country is braced for possible rebel violence amid vociferous criticism from abroad. Foreign governments and international organisations urged Turkey not to execute the PKK leader. EU president Germany, fearing communal strife between its two million Turks and Kurds, said it regretted the judge’s ruling but called for calm. The Turkish Government was expected to rebuff all calls for clemency.’

...‘Turkish commentators yesterday welcomed the decision by the Government coalition to delay the execution of the Kurdish rebel leader while the European Court of Human Rights considers his appeal, which is expected to take about 18 months. The decision, pushed through by the leftist PM, would preserve the unity of the coalition Government, the commentators said. But there were critics of the decision, particularly among the conservative press that favours a rapid execution. However, the PM, who is seeking the abolition of capital punishment in line with EU requirements, feels that executing the PKK leader would run counter to Turkey’s national interests. The decision implied that any violence in the meantime from PKK guerrillas could trigger the resumption of proceedings against him. A columnist of the *Hurriyet* newspaper said the Government had skillfully transferred responsibility for keeping the leader alive to the PKK rebels in the mountains of eastern Turkey and Iraq.’ Speaking of which, ‘39 people “in the pay of foreigners” have been arrested following the failed assassination attempts against the Iraqi President’s deputy last week,’ and last month’s announcement that ‘key US lawmakers intend to offer military aid to foes of the Iraqi President with the goal of bringing him down. As the House International Relations Committee chairman introduced the bill to provide \$US97 million in military aid to democratic opponents of the President, he said it would “finally and irrevocably” commit the US to the President’s overthrow.’

...‘It would be “wonderful” if Iraq’s dictator were ousted, the British PM said yesterday. “It is without any doubt at all our desire to see the end of him. And if that could be assisted in any way by the campaign we have fought over these past few days then we would welcome that.” But he insisted that was not the goal of the air strikes, as he and the US President jointly announced the end of the four-day Operation Desert Fox campaign, in which British and US forces fired hundreds of missiles at 100 Iraqi targets. Substantial damage had been done to Iraq’s air defence, command and control, and arms production. The US President said he was satisfied with the air strikes but economic sanctions against Iraq would stay.’]

...Shoppers in Baghdad cursed [the US]President... yesterday and said Washington was... [trying] to scupper Iraq’s oil-for-food deal with the U[N]. Their concern, they said, was sparked by the use of some of the toughest remarks against the Baghdad Government since [the 42nd US President] took office... Officials at the State Department this week branded the Iraqi leader a “demon” and said there were signs of a power struggle in Baghdad. But the people in the streets of Baghdad see it differently. “He [[the US President]] is the greatest demon. We heard the news from foreign radios. They should be ashamed of themselves to say these things,” said... a Baghdadi shopper born in the Kurdish city of Sulaimaniya. “It is clear their aim is to kill the oil deal. The U[S] delayed it when our troops liberated Arbil. Now it is using this [alleged power struggle] as an excuse,” said [another shopper while] packing some onions and tomatoes in her basket. When Iraqi troops sided with one Kurdish faction to drive another from the Kurdish administrative capital of Arbil last year, Washington responded [with] two waves of missile attacks on Iraq and a decision to delay the implementation of the oil-for-food deal signed by Iraq and the U[N] in May. The deal, finally implemented in December, allows Iraq oil sales of \$US2 billion... in six months to buy food and medicine for its more than 20 million people... Iraqis have not benefited directly from the deal yet, but the flow of Iraqi crude to international markets for the first time since 1990 has lowered prices of essential goods and increased the value of the local currency against the dollar. In Washington on Wednesday, [a] White House spokesman[had] offered a terse but carefully worded assessment of the political situation in Baghdad. “There are a great deal of complicated internal struggles for power”

going on, he said in response to questions on reports suggesting instability in Iraq based on comments by a senior U[S] military official. The unnamed official [also said Iraq's] President... was changing locations more often out of apparent fear for his safety... [However, a]n Iraqi Government spokesman ridiculed the U[S] statements alleging a power struggle in Baghdad, saying they were a "distortion and propaganda ploy against Iraq. It seems the operating crew of information lies in Washington has resumed its task of misleading the public opinion in the U[S] and renewing fear among Kuwaiti rulers,"...

KUWAIT is "deeply concerned" about reports of Iraqi troop movements about 50km from their joint border. [The]Information Minister... said "between 150,000 and 180,000 troops" were estimated to be in the border area. "If these troops were given the order to advance, it would only take them a few hours to reach us. We... also have reports that... [the]Iraqi President... is boosting his regular army in the south with units of the Republican Guard," he said, referring to the country's elite fighting force. A senior U[S] official has warned that Iraq might once again invade Kuwait... But last week, the White House said it did not believe this was possible right now. [However, 'Iraq's President claims his country is capable of attacking bases in Kuwait and Saudi Arabia used in US-British air strikes, and a British newspaper citing Foreign Office sources yesterday said Russia had signed a deal worth some \$US160 million to upgrade Iraq's ageing air defences and bring them back to pre-Gulf War levels in a blatant breach of the UN arms embargo against Iraq. Russia bitterly opposed launching air strikes on Baghdad, an old Moscow ally, and the paper said Russia's PM approved the deal after the US and Britain carried out the four-day Operation Desert Fox air campaign. Since then there have been almost daily clashes between Iraqi air defences and US and British warplanes patrolling the no-fly zones that cover more than half the country. Six civilians have been killed and several others wounded in a new escalation of air strikes since Friday, according to Iraqi authorities. Iraqi diplomats said the "war of attrition in the air" was likely to continue until the UN resolved the matter.'

...Allied aircraft have not attacked Iraqi targets outside the no-fly zone and they do not intend "at this point" to do so, says the chairman of the US Joint Chiefs of Staff. The general reinforced denials by Pentagon officials of Iraq's claim that US aircraft attacked civilian targets near Baghdad yesterday, killing one person and wounding others. "Anything coming out of Baghdad should be questioned in terms of its veracity since we have seen very little of the truth coming out of Iraq in recent years." The general said actions by allied aircraft were taken in self-defence and in response to the Iraqi President's provocation. Iraq said its confrontation with the US and Britain over no-fly zones imposed after the Gulf War had escalated as a result of the alleged attack.'

...Moments before Iraqi soldiers captured... [a U]S... Marine... during the Gulf War, [he]... buried his wallet in the Kuwaiti desert so his family would not be targeted by terrorists. Six years later, the wallet appeared in... [hi]s mailbox with all its contents – three credit cards, his military identification, three family photos and 47 dollars in cash. A labourer had found it and sent it to the Marines, who forwarded it... The package contained a letter in broken English from... [the] labourer from Sri Lanka who works in Kuwait... [The wallet's owner], now 52 and retired... was shot down by an Iraqi surface-to-air missile in January, 1991... "...We were captured within five minutes. There was nowhere to run." During their 48 days in captivity, the prisoners suffered severe beatings and were paraded on international television by Iraq... Meanwhile, the [US]State Department said that Washington planned to press for the "strongest possible action" by the U[N] to make Iraq comply with a UN commission charged with scrapping Iraq's weapons of mass destruction... U[S] forces... launched cruise missiles... in 1993 against a Baghdad plant used to make components for nuclear enrichment material...

Iraq faced warnings of grave consequences yesterday, including the possibility of military action, after it ordered U[S] weapons inspectors from its soil. The ten inspectors are part of... the U[N] Special Commission... Iraq was "ready to continue the cooperation" with Unscm, "provided that no individuals of American nationality shall participate in any activity of the special commission inside Iraq." ...However... the... chairman of... Unscm... stressed that Iraq had signed an agreement obliging it to accept any staff hired by Unscm on the basis of their professional competence... The... toughest words came from Britain... "The rest of the world cannot sit by idly while Iraq develops its weapons..." [the]junior Foreign Office Minister... told BBC television... In response to the Iraqi ban, the U[N] team... temporarily suspended all field operations in Iraq.

...By kicking out American members of a [U]N... weapons team, [the]Iraqi President... is gambling he can exploit newly widened divisions in the front that once drove his forces from Kuwait... Since 1991, council members – including Russia and China – have issued repeated statements declaring their support for the inspectors and their insistence that Iraq comply fully with U[N] orders. But determining compliance is a subjective judgment. It is clear that the U[S] and Britain hold Iraq to a tougher standard than Russia, China, France and Egypt. Those countries have been negotiating lucrative oil exploration contracts with Iraq that would take effect as soon as sanctions are lifted... The wide-ranging sanctions... cannot be eased until [Unscm] certified all dangerous arms have been eliminated.

...Iraq says it will not back down on a decision to bar U[S] arms inspectors and it did not fear the use of force against it... [after refusing] to allow two U[S] members of the U[nscom]... team into the country... Iraq said the U[S] members... had turned... the team... into an instrument of Washington's policy and had prevented the commission from certifying that Baghdad no longer had any forbidden weapons.

...U[N] inspectors... say they were on the verge of finding Baghdad's stockpile of the lethal liquid nerve agent VX last week when [Iraq]... ordered the U[S] members of the team to leave... "I think we were getting hot, and maybe that's part of the reason why they took this decision in the last couple of days," the... chief weapons inspector... was quoted as saying... The Iraqis have told the U[N] that their programme was experimental and only capable of producing a few kilograms of VX... [T]he *Observer*... said a few grams of VX could kill millions of people... [It] is 10 times as lethal as... [and] persisted longer than... the nerve gas sarin, causes death by paralysis... and could be absorbed through the skin or inhaled as vapour.

...The Iraq crisis escalated last night when Baghdad blocked American arms inspectors from entering a missile site and the U[N] responded by halting the... weapons inspection programme for the second time in a week.

...[the] President... of Iraq raised the stakes in the Gulf crisis yesterday when he demanded an immediate end to the United Nations embargo against his country... Until yesterday Iraq had been demanding only the withdrawal of the American members of the... weapons inspection team... Iraq also threatened to shoot down a U-2 high-altitude spy plane which the arms inspectors have been using over Iraq... Iraq's deputy P[M]... repeated that Iraqi air space was "off-limits" to U[-2] flights and other foreign aircraft... Although the U-2 flies at over 21,000m, defence experts say Iraqi could threaten it with high-flying surface-to-air missiles... However, the leader of the arms inspection team... said the U-2 flights would go ahead as planned...

U[N] inspectors called off visits to Iraqi weapons sites for the third time yesterday after U[S] experts were barred access. They also called off the U-2 spy plane... However[, the US President said the Iraqi President]... had no valid reason to oppose the presence of Americans. "If he has nothing to hide... then he shouldn't care whether Americans or anyone else are on the inspections team. This may be just another dodge."

...The U[N] has accused Iraq of tampering with its weapons monitoring system, moving arms-related equipment away from... surveillance cameras and covering up the lenses of the cameras themselves... "...Some of the pictures... coming... to our office in Baghdad... are black... They have been turning the lights off in buildings that we are supposed to be seeing all the time..." ...They may also have moved fermenters that could produce seed stocks for biological warfare agents... Unscm has a monitoring system spread around some two dozen sites to observe so-called dual use equipment which may be used in weapons as well as for civilian purposes.

...VITAL medical supplies shipped to Iraq to prevent its civilians suffering unnecessary hardship are being smuggled out of the country and sold on the black market in neighbouring Arab countries to finance [the Iraqi President's] brutal dictatorship. The operation, worth millions of dollars... is being masterminded by... the dictator's son. Some of the profits have been spent on expensive medical equipment to assist [the son's] recovery for

the severe injuries he suffered during an assassination attempt... last December... He is partially paralysed in one leg... [and] has also been rendered impotent since the shooting, a grave blow for someone whose penchant for womanising is legendary in Baghdad, and may even have been the motive for the assassination attempt... Iraq was forbidden from buying medical supplies under... sanctions imposed in 1991... but the sanctions were relaxed to allow Baghdad to sell limited quantities of oil to buy medicines and other vital humanitarian supplies. The UN Security Council set strict controls designed to ensure the supplies reached civilians and were not used by the regime.

...INFANT mortality in Iraq is 10 times up on the rate before the U[N] imposed a trade embargo on the country... Iraq's health minister says... "The sufferings of Iraqis are even greater now than they were before," [he said while] attending the annual Assembly of the UN's World Health Organisation in Geneva... [The minister] told a news conference that despite the oil-for-food deal with the world body that went into effect last December "not a single tablet" had reached the country despite some 550 contracts signed with foreign firms... Approval of most of the contracts had been held up by the UN Sanctions Committee "largely on the insistence of the U[S]." ...before the sanctions, the mortality rate for children under five was an average of 540 a month. "It has now reached 5600 and is still growing." Among those over five years old and adults, the rate of death from illness had climbed from 1800 a month to more than 8000... [The] rise was caused by the collapse of the health and sanitation system...

[The Health Ministry says over 9000 Iraqis – including 6438 children – died last month, bringing the number of victims of UN sanctions to 1,292,446 since 1990. The UN's humanitarian coordinator in Iraq and the representative of the World Food Programme both resigned in February in protest at the continuing embargo and the worsening humanitarian situation in Iraq. The UN Security Council adopted Resolution 1284 in December allowing for a renewable 120-day suspension of the embargo if Iraq cooperates with the monitoring of its disarmament. Iraq has called for the unconditional lifting of the sanctions.]

...Today is the anniversary of UN Resolution 661 which imposed sanctions on Iraq. They remain in force as Iraq is adjudged to have not fully complied with the removal of its weapons of mass destruction. A report commissioned in April by the UN Security Council, drawing on the expertise of organisations including the Red Cross, Red Crescent, World Health Organisation, Unicef, Unesco and the World Food Programme, referred to "the gravity of the humanitarian situation of the Iraqi people." It documents a staggering decline in Iraq's GDP since the Gulf War – down by two-thirds – and dramatic rises in maternal mortality and morbidity. The Red Cross estimates 70% of Iraqi women suffer from anaemia. The WFP estimates access to potable water is 50% of 1990 levels (less in rural areas). Water-borne infectious diseases have increased as a result. A former NZ Director-General of Health has described the situation as a "public health disaster." However, our Government does not accept the figures on Iraqi health supplied to it by UN humanitarian agencies. The position of the Minister of Foreign Affairs and his ministry was stated in a letter which explained that as UN humanitarian data is partly or wholly based on Iraqi Ministry of Health data, "we have no reason to think that these figures are accurate or have not been manipulated to paint a negative picture." In March I wrote asking for proof that the Iraqis were massaging health data. None has been forthcoming. The US Embassy in Wellington eventually declassified a report which alleged some epidemiological fraud, but the report had no footnotes, no references, no detailed statistical breakdowns of even the most elementary nature, and is undated. It would have failed a stage 1 epidemiology paper. We – the Iraq Sanctions Medical Alert Group – asked for more evidence in May and are still waiting. We have sought a table, a figure – any concrete example of unreliable data. We have been told this request is a "preoccupation with statistical details." It is difficult to see the benefit for Iraq's President of exaggerating the adverse health effects of the sanctions – all he stands to gain is sympathy for Iraqis and a lifting of some sanctions. That would help the masses but probably not him. And the danger is too high. All it would take is one doctor or Iraqi Ministry of Health official to defect or leave Iraq and say that they inflated figures, or for one journalist or aid agency to notice deliberate manipulation of data. After 7 years this has not occurred, so perhaps it is the propaganda achievement of the century. There is evidence the Iraqi regime is using the food distribution network to increase its social control, and to pressure citizens, but that does not mean the figures of sick and dying are necessarily wrong. It is just possible Unicef, WHO and all the journalists and doctors who have been to Iraq have got it right about the impact of sanctions. Let us not compound the failure of policy by refusing to admit that sanctions are cowardly and ineffective. Incidentally, Iraq once again banned Americans from taking part in arms inspections yesterday despite a UN Security Council resolution imposing travel sanctions on Iraqi officials...

The U[S] has demanded that U[N] monitors... be given unimpeded access to suspect sites, including... palaces. Arguing for keeping all... sanctions in place in the meantime, [the US] Defence Secretary... said [Iraq's President] has ruled 63 sites off-limits to UNSCOM... "Those cannot be off-limits," he said on the NBC programme, "Meet the Press." ...Iraqi officials, meanwhile, had said they restricted access to just three sites... The truly palatial main presidential palace in Baghdad... [the] Qadissiya Hawk Palace: Built... near Baghdad airport during Iraq's 1980-88 war with Iran... [and the] complex at al-Oja, [the President's] hometown in Tikrit province, 190km north of Baghdad. The entire village is sealed off... The latest standoff came as... [diplomats] at UN headquarters in New York said [the] Secretary-General... was considering increasing to \$US3 billion... from \$US2 billion the amount of oil Iraq was allowed to sell over six months for food, medicine and other goods.

...Iraq's halt on oil exports proves [the] Iraqi President... "is responsible for the suffering of his own people", [the] US President... said yesterday. Iraq has stopped pumping oil through its main pipeline to Turkey and warned exports would resume only when the UN approved a new plan for the distribution of goods under the oil-for-food deal... About \$US1.32 billion of every \$US2 billion from the sale of Iraqi oil goes towards buying humanitarian supplies. The rest is earmarked for Gulf War reparations and other costs.

...All diplomatic channels in the Iraqi crisis appeared to have been exhausted last night after [Iraq's] Government expelled six U[S] weapons inspectors in defiance of the U[N] Security Council... The six American inspectors... crossed the border into Jordan yesterday afternoon accompanied by an A[US]n and a Briton. The other 68 inspectors were due to fly out overnight to Bahrain – with 13 N[Z] Defence Force staff who have been working in a support role. But staying behind in Baghdad were three N[Z] UN employees. Also staying is... [the NZ]-born... CNN correspondent... who... reported the 1991 conflict and... [is] one of the few Western reporters allowed to stay in Iraq... [after winning] kudos – and criticism – for his interviews with [the Iraqi President]... The increased tension in Iraq meant... [the correspondent] was forced to cancel a visit to his old school. ● A 32-year-old NZ humanitarian aid worker, Nicolas Geoffrey Speight, has been shot and killed while walking on a disused airstrip in the remote southern Kurdistan area in northern Iraq with a companion, also an international air worker, who was wounded. There is no indication of who killed Mr Speight or why. He was working for a British company, Greenfield Consultants, which is contracted to the UN to coordinate land-mine clearing'...

DECLARING the U[N] must not shirk from a showdown with Iraq, [the US] President... ordered a second aircraft carrier to the Persian Gulf yesterday in a high-profile military build-up... The George Washington will be accompanied by three ships carrying cruise missiles as well as a support ship... With some allies reluctant to use force, the White House asserted the US could act on its own if necessary... The... [US] Defence Secretary... said the administration was "reviewing all sorts of options" for military moves... [and the] US Secretary of State said: "Do not doubt we have the authority to do this." "This is not just a replay of the Gulf War," said [the US President]. "This is about the security of the 21st Century and the problems everybody is going to have to face dealing with chemical weapons." Britain will also move its aircraft carrier Invincible to the Mediterranean from the Caribbean, and announced it was putting a squadron of Harrier GR-7 planes on 48-hour notice to back up its forces deployed around the Gulf... [The Iraqi] Foreign Minister... said Iraq would not be surprised if the crisis escalated into a military confrontation, accusing the US and Britain of seeking such a clash. He said Iraq was not seeking conflict. "We are requesting our grievances be heard, be discussed and a serious dialogue be opened in order to get rid of the current situation of sanctions..." The sanctions have cost Iraq about \$162 billion in oil revenue.

...[US] policy-makers assume that [the Iraqi President] can be reasoned with or intimidated into backing down because he is frightened of U[S] forces. The assumption is flawed twice over: [he] cannot afford to be reasonable or intimidated. And it is not the U[S] that frightens him... While he savours the thought of using biological and chemical weapons on Israel and the U[S] for revenge, he] does not see [the US President's] Administration as a mortal threat... "[He] understands that Washington is not committed to ousting him," says a senior Arab diplomat with long experience in Iraq. "Others are." ...Iran frightens the Iraqi dictator. The ayatollahs have spent a decade rebuilding an army that today could defeat Iraq and finish the Persians' savage, interrupted war with their Arab neighbour. The weapons of terror that [Iraq's leader] hides from U[N] inspection are to him his ultimate means of survival... This explains why the Iraqi dictator has... [forsaken] oil revenue... rather than give U[N] inspection teams a free hand in Iraq. The laboratories that will enable [him] to manufacture chemical and biological weapons instantly if Iran charges across the border count for more than money or logic to [the Iraqi leader]... Does... the... U[S]... really expect him to ask what is best for his country and then do it? [He] does not survive through building consensus or winning elections, as [the US President does. The Iraqi leader] found poison gas invaluable in putting down his own rebellious citizens. He then incorporated terror into foreign policy by using chemical weapons against Iran in 1988, and issuing chemical warheads to Iraqi brigades for possible use against American troops in 1991. Those warheads apparently were not used because the war unfolded so rapidly and [the Iraqi leader] was worried about U[S] nuclear retaliation. But since Desert Storm... [his] cat-and-mouse game has systematically sacrificed "low quality capability to protect high quality capability," in the view of... the... Swedish diplomat who headed the U[N] inspection team for five years before becoming ambassador to Washington in September... Fear and vindictiveness make [the Iraqi leader] a far more dangerous and desperate adversary than [the US President assumes. Waiting the Iraqi leader] out, while letting him keep the means to make weapons of mass destruction during the wait, is the world's riskiest gamble... The Iraqis also hope to buy plutonium and eventually produce a nuclear bomb... Military force should not be used this time merely to punish... or to intimidate him into a solution for the phoney issue of Americans being on the inspection team... it should be directed at destroying his special weapons capability once and for all.

...[the] UN Secretary-General... said yesterday he was shocked by Iraq's use of "human shields" in allowing women and children to stream into... [the Iraqi President's] 80 palaces... in case of attack... "Even if they had volunteered – and indeed the government felt there was going to be an attack – you don't put women and children in those situations..."... Iraqi citizens, cursing the U[S] and chanting slogans praising [their leader, also] occupied a textile factory and a power plant... "This is our factory. We have come to die here. We'll stay and sleep here and fear no... missiles,"... The secretary-general still hoped a diplomatic solution could be found to resolve the crisis.

...A quarter of a century ago, [the US] with brilliant duplicity shut the Russians out of the Middle East. This week... the Russian foreign minister brought Moscow back into the region in a big way... Russia has persuaded [the Iraqi President] to allow American arms inspectors back into Iraq in return for a promise of help in having U[N] sanctions lifted soon... Russia and France have consistently argued that Iraq should be shown "light at the end of the tunnel" in its quest to have sanctions lifted... However, the Americans rejected any suggestion of a deal... "We are not ready to lift sanctions until all Security Council resolutions are complied with by Iraq, and if necessary we will use our veto to achieve that objective." ...The zero-sum game of diplomatic competition for influence in the Middle East that supposedly died with the Cold War is on again...

The U[S] has yielded to French and Russian demands at the U[N] by offering to delay for six months the imposition of new sanctions against Iraq.

...[the] 'Iraqi President has backed down, but the UN programme to find and dismantle Iraq's deadliest arms may now be so badly handicapped that inspectors are unlikely to ever complete their mission. The ability of the UN to ensure the destruction of all of Iraq's nuclear, biological and chemical weapons is under threat from efforts by Russia and other countries to dilute the power of weapons inspectors']

...it is a story that never ends. The inspection regime was set up just weeks after Iraq was defeated in the Gulf War... It was intended to punish and neuter Iraq... The story involves truck and helicopter chases across the deserts, searches in riverbeds and in tunnels for warheads... in ministries and universities for missing files or even stray documents that could give clues to the production of deadly weapons. There are trawls through the archives of companies around the world that sold goods to Iraq when it was legal to do so... It involves UN helicopters being shot at, Iraqi officials trying to manhandle inspectors, UN officials being stabbed, threats... The Iraqis threw Unscm a few bones. They declared that they had about 50 Scud missiles, 11 mobile launchers and 11,000 chemical munitions. They also admitted a chemical factory had been bombed in the war. But the munitions they produced were mostly at the end of their shelf life and the rocket launchers surrendered were too dangerous to be fired. More importantly, they promised that they had no biological weapons programme nor any nuclear weapons programme. Since then Unscm has discovered that both these assertions were untrue...

In the past six years, UN inspectors have overseen the discovery and dismantling of seven major nuclear weapons facilities, 28,000 chemical weapons, 480,000 litres of chemicals used in making the weapons and 1.8 million litres of 45 different chemicals that can be combined to make weapons. The UN also has accounted for 817 of 819 Scud missiles and blown up Iraq's major biological plant... [B]ut always it seems, there are more... Because Iraq has a large capacity for storing weapons in deeply buried bunkers, US intelligence has extremely limited knowledge of how many weapons of mass destruction are still available to Iraq's army... - 1997

[GERMANY'S] FOREIGN MINISTER... visited Israel during the Persian Gulf War... and was informed about German components of the Scud missiles that had fallen on Tel Aviv and Haifa. Without German assistance, he was told, the Iraqi Scuds may not have reached Israel. [The minist]er apologised and promised stern action. A week later he addressed his own legislature: "Historical and moral responsibility links Germany to the Jewish people... At this time when Israel's very existence is threatened, we stand at her side without reservation. For 30 years Germany has not authorized arms exports to Iraq. However, Germans, who broke our laws and misled the authorities, participated in [the Iraqi President's] poison-gas production. All of society must ostracize them." [The minist]er's speech was a monument to hypocrisy. For over a decade, German businessmen and scientists had played key roles in Iraq's \$90-billion programme to produce weapons of mass destruction – all the while claiming they didn't know Iraq was using their exports for military purposes. The best [US] estimates suggest that a majority of Iraq's nuclear, biological and chemical capacity was provided by Germans. What's more, the German government knew about all this in detail. German involvement with Iraq's chemical-weapons programme began in 1977, and four years later construction started on a "pesticide plant" at Samarra, a town 60 kilometres northwest of Baghdad. This heavily guarded complex clearly was no normal project. As a German technician later said, "You wouldn't need such high security if you were producing fly spray, would you?" German press reports even spoke of gas chambers "for large animals" specially built for the project by a German firm... This was hardly classified information. *The New York Times* reported extensively about German poison-gas plants in Iraq in 1984 – the year Samarra became operational – as did the German press following Iraq's full-scale use of chemical weapons against Iran that year. But... [Germany's] then economics minister, dismissed all this as professional jealousy on the part of the Americans.

Starting a biological warfare programme is easy. Iraqi institutes bought germ cultures from a commercial organisation called the American Type Culture Collection, based outside Washington in Rockville, Maryland. This company collects and sells hundreds of different cultures, some benign and some the most lethal bacterial known to man... Customers had only to have headed paper, pay about \$78, and show in a telephone conversation that they were scientifically literate. Baghdad University started by ordering some relatively innocuous samples and then in 1986 bought samples of anthrax... At the end of the 1980s, about 40 tons of growth media were quietly, and legally, shipped to the country... According to documents later

found by Unscm, the bills were paid by the Iraqi military... Iraqi scientists tested their bacteria on dogs, monkeys, sheep and other animals. These creatures were placed inside sealed plastic boxes and filmed as they died in agony. *The Sunday Times* disclosed their experiments were then conducted on human beings. From behind a glass screen scientists watched as Iranian prisoners of war and Kurdish dissidents were sprayed with anthrax bacteria and toxins suitable for use in chemical weapons... The Iraqi dictator... [instructed his sons to murder] their sisters' husbands for revealing details of Iraq's chemical weapons project... Since the 1991 war, Iraq's national debt has more than doubled, to an estimated \$3.4 trillion... Only one in three Iraqi children ever make it to secondary school... Military service is compulsory for Iraqi men aged 18, for a period of between 18 months and two years... The... last time US forces went to war against Iraq, they showed up in the desert ill-equipped and poorly trained to deal with a chemical or biological attack. Military officials acknowledged afterwards that had Iraq launched the nerve gases or germ agents it had stockpiled, American troops could have suffered significant casualties.

The U[S] has urgently begun vaccinating all its 36,000 troops in the Gulf against anthrax. British officials have said they will vaccinate the 3500 British military personnel deployed in the Gulf region... Anthrax, a scourge so ancient that it is described in the *Bible*, remains hard to treat and vaccinate against. Although antibiotics can kill the bacteria, they must be used quickly or they are useless. And the vaccine is no straightforward jab: it must be given in a series of shots over 18 months and be followed by regular boosters... [The] US Army Surgeon-General... says... "There is probably going to be a better vaccine in a few years but you have got to go with the best you have now." ...But... a molecular biologist at Los Alamos National Laboratory in New Mexico, said the particular vaccine now used might not be effective against engineered strains of the bacteria. Last month he and colleagues published a report for the National Academy of Sciences describing anthrax found in tissue samples taken from victims of a 1979 outbreak of the disease in the then-Soviet Union. Western governments said they thought the deaths resulted from an accidental release of anthrax from a research facility... [However,] there was evidence that at least four different strains of anthrax had been mixed to produce a more potent version. "They were probably trying to come up with a biological weapon." ...The... book *Biohazard* had revealed the hitherto unimagined scale of the Soviet bioweapons programme... The enterprise had employed more than 60,000 people... [L]ast month even the most jaded of Americans was jolted to attention after... [a former member] of the white supremacist group Aryan Nations, was arrested on suspicion of manufacturing the deadly... anthrax... virus... [The supremacist] was turned in after boasting to an associate that he had enough of the virus stockpiled to wipe out Las Vegas. It was his second run-in with the law, after [last year's] conviction for illegally obtaining bubonic plague. While the [latest] case turned out to be a hoax – the stockpile was non-lethal anthrax vaccine – authorities are well aware the threat is real.

With an increased possibility of germ warfare, [the US] Defence Secretary... has decided [all of] America's 1.5 million men and women in uniform will be inoculated against anthrax. The biological agent can be fatal even in microscopic amounts. The inoculations (six shots over 18 months) will cost about \$US120 million... Pentagon officials said yesterday... Iraq, Russia and as many as 10 other countries are believed to have the capacity to use anthrax in weapons. ['Iraq was also determined in early 1990 by a professor of the Swiss Federal Institute of Technology to have been capable of manufacturing prussic acid, used to destroy filters in gas masks.']

...Visits to civil defence centres by Israeli civilians seeking to have their gas masks checked have tripled in the past week as the possibility of a military confrontation between Iraq and Western nations mounts. Although Israel is not directly involved... there is fear that [the Iraqi President] may unleash missiles at Israel should war break out, as he did during the Gulf War... Israel did not respond to the firing of some 30 Scud missiles at its cities, a restraint urged on it by the US in order not to endanger the allied coalition, which included a number of Arab states who did not want to be allied with Israel in the conflict. The missiles, all with conventional warheads, caused widespread damage, particularly in Tel Aviv, but only one fatality... Israeli officials declined to say if the Air Force had been alerted in the present crisis. [However, the] Tel Aviv newspaper *Ha'aretz* reported that Jordan had promised to cooperate with Israel "in security matters" should Iraq attack Israel... This is generally taken to mean that Jordan would permit Israeli warplanes to overfly its territory in order to reach Iraq... Israel would... explode a... neutron bomb, which suppresses the nuclear blast but increases radiation levels to cause far greater loss of life... in an Iraqi city in the event of a chemical or bacteriological attack... said a report published in London on Friday.

...The world has belatedly begun to wake up to the dangers of biological weapons, weapons that kill by spreading deadly diseases. Ironically, it was the arch proponent of realpolitik who sent us to sleep on the issue. [The 37th US] President... pushed for and won the Biological Weapons Convention outlawing such weapons, convinced they were no longer in America's interest, since they were unstable and unusable. Today, because of scientific advances that were not even guessed at 25 years ago, biological weapons have become both more usable and more effective. Recombinant DNA technology has revolutionised their potential. Now they pose a serious threat on the battlefield and, in the not too distant future, could be delivered by missiles to an opponent's city thousands of miles away. In its latest "Strategic Survey," the International Institute for Strategic Studies observes, "preventing determined proliferators acquiring biological and toxin agents appears to be virtually impossible..." ...After all, the Biological Weapons Treaty is nothing more than a moral norm. There is no world-wide enforcement mechanism, not even a monitoring system. It can only work if the political climate is right. Bringing [the Iraqi President] into line is one, overdue, thing. Keeping up the momentum on banning all weapons of mass destruction all over the world is another. But the two are intimately related. - 1997

biological warfare, the employment of (or defence against the employment of) living organisms, toxic biological products and chemical plant-growth regulators to produce death or casualties in man, animals, or plants. It includes the military use not only of bacteria, but also of other micro-organisms and higher forms of life such as insects or other pests. The primary object of BW attack is man. It can be either direct or indirect through limitation of his crops or animal food sources. Although BW agents have never been used as a significant military weapon, they have been employed in various forms since early times. In the Middle Ages, war parties dropped plague-ridden corpses into the wells of their enemies. During the French and Indian War, the British infected the Indians with small-pox by giving them blankets and handkerchiefs taken from infected patients (c. 95% of those exposed died)... The principal research in the U.S. on BW is done under the auspices of the Army Chemical Corps... The U.S. is not a party to any treaty now in force that prohibits or restricts the use of biological weapons. The Geneva Protocol, which forbids the use of bacteriological weapons of war, was signed on behalf of the U.S. on June 17, 1925. Although this protocol has been ratified by a number of states, the U.S. Senate has refrained from doing so... However, the major powers have accumulated ample stocks of poisonous substances, among them chlorine, phosgene, mustard gas, lewisite, chloropicrin, and tear gas. Their effects range from the deadly to the merely irritating. - 1967

In... W[W1], above a million soldiers were casualties of chlorine, phosgene [(which caused people to take 'up to 48 hours to die from drowning as their lungs filled up with liquid')] and mustard gas, over ninety thousand dying. The nerve gases tabun, sarin and soman, discovered but not used during... W[W2], were deadly in far smaller quantities, while the yet more effective VX – the U[S] had four thousand tons of it in 1967 – killed when just a few milligrams reached one's skin. Still, an amount sufficient to destroy all the people in China... could in practice 'neutralize' only a square kilometre of battlefield. (A cynic might say that this is why many nations recently proved willing to sign a Convention banning manufacture of chemical weapons – adding, though, that sixty-five nations must ratify it before it comes into force.) Natural toxins, now manufacturable inexpensively through gene cloning, are far more lethal: three hundred tons might replace the eighty thousand tons to which the chemical warfare

arsenal of the superpowers had at one stage grown. Shiga toxin manages to be over a million times deadlier than tabun. The gene for it was cloned by the US Army, officially 'to create a vaccine' and thus 'for peaceful purposes', while the same army had earlier cloned the gene for diphtheria toxin 'to create a new therapy to treat melanoma, a type of skin cancer'. Properly protected troops... would... be slowed down by the bulky clothing and respirators needed to counter such agents... [However,] while civilians could suffer heavy casualties, the extermination of the human race would... require agents of a self-reproducing kind: the bacteria, rickettsiae, viruses and fungi of biowarfare. A single inhaled organism can lead to death from Q-fever. Just one genetically novel virus started the influenza pandemic of 1918-19. Its offspring infected at least two-thirds of a billion people, killing more than the world war had done. In 1346 besieging Mongols hurled plague-infected corpses into the city of Caffa, its fleeing inhabitants then helping to spread the Black Death. Twenty-five million people perished, about 30[%] of Europe's population... There were several allegations of germ warfare during... W[WI]. During WW2] the British developed anthrax bombs. They then ordered half a million from the U[S] 'for use', Prime Minister Churchill wrote, 'should this mode of warfare be employed against us'. Britain's Joint Planning Staff received instructions, all the same, to study whether the Allies could reach victory more quickly by first use of such warfare... [T]he Japanese... developed bombs for anthrax and gas gangrene. During their invasion of China they attacked at least eleven cities experimentally, their aircraft dropping plague-infected paper, cotton, wheat and rice. In addition they distributed one hundred and thirty kilograms of anthrax and paratyphoid bacteria. Several thousand prisoners of war became their experimental subjects... but the U[S] overlooked the deaths in return for the experimental data, then continued to deny Russian reports of the whole affair for the next quarter-century... In the U[S] a force which grew to four thousand persons worked on anthrax, yellow fever, plague, botulism and dozens of other diseases, including those of crops and animals... [C]rop disease bombs were produced for the US Air Force six years after the war... Post-war US activities included producing designs for a plant able to breed one hundred and thirty million mosquitoes a month, for spreading yellow fever... The Russians may have regarded all this as an invitation to pursue their own research, for in 1979 a US Congressional Committee reported that an anthrax outbreak in Sverdlovsk had been caused by an explosion at a biological weapons factory... In 1952, during the Korean War, an international scientific commission made the firm statement – the U[S] was equally firm in its denial – that 'the people of Korea and China did actually serve as targets for bacteriological weapons... mostly it was experimental work, as far as we could see', work which 'didn't seem to be very successful'. However, secret pseudo-attacks by the US military on San Francisco, New York and Winnipeg had been depressingly effective. In one of them, in 1950, wind blowing over two minesweepers sent... harmless bacteria into the lungs of virtually every San Franciscan. Secret British experiments from 1948 to 1959 were similarly alarming. Caged on rafts off the Bahamas and the west coast of Scotland, thousands of animals were exposed to wind-driven bacteria, while harmless zinc cadmium sulphide was poured from aircraft flying around the British coast. The results are said to have shown that Britain would be virtually defenceless against germs in aerosol form. All this activity had occurred despite first one and then another treaty... In 1985 half the developing countries had accepted neither of them... [T]reaty violations would be nearly impossible to detect... The difficulties of verification have been worsened by advances in production methods... Production times have been reduced several thousandfold... The arrival of genetic engineering was at first judged to make little difference. As recently as 1983 a spokesman for the US military said the world was already full of fine biological weapon agents... Such a reaction sounds foolish today. Techniques of gene manipulation have advanced so rapidly that lethal, highly infectious viruses are no longer regarded as too dangerous to handle... In 1985 [the British P]M... stated that biological weapons had become as potentially dangerous as nuclear ones. Normal germs 'don't want to kill'; there is an evolutionary penalty to be paid for murdering one's host... but toxin-producing genes can be deliberately added to remedy this... Natural resistance and vaccines can be thwarted by changing the surface structures of virulent organisms, making them 'unrecognizable'... [A]tttempted defences would be futile unless one knew exactly which organisms the attacker was going to use – whereas in fact one would probably first learn of an attack only several days after it had taken place... Germs are fast becoming the poor man's atom bomb, available to small terrorist organizations or to criminals wishing to hold the world to ransom... with utterly lethal organisms which mutate so rapidly that no vaccines could fight them... One's own privacy is worth a great deal. Still, it may not be worth a major risk of dying, in company with everybody else, because some people have been using their privacy for perfecting a new disease.

[Before] the American bioweapons programme... was cancelled... [they] had tested deadly agents on sheep, and... also... on humans... "Those of us who worked in the biological warfare laboratories felt that we were patriots – that we were doing something that was very important to the U[S]."

...With Iraq on the scene it would clearly be foolish to discount the possibility of germ warfare on an international scale. But at least you'd have an idea of where the threat was coming from and who was responsible... [W]hat really scares those in the know about this deadly business is the possibility of just one person with a grudge getting their hands on anthrax or smallpox, then spreading it – who knows where or when... [The] chief of the FBI's domestic terrorism and counter-terrorism planning section... says the public doesn't hear about everything. "I would say at any given time there is about 50 to 60 investigations ongoing. If... someone wanted to do it badly enough I think they could do it." "...it is not a matter[of] if this will occur, it's a matter[of] when... where... and how much panic and how much death we are willing to accept at the time it occurs."

... "You're going to be hearing more and more people who are what you might call the seasoned... members of the public health community coming forward and saying, 'I would never talk about this issue before because I didn't want to give people the idea, but now we as a group recognise that there are people who have the means to do it... and have the will to do it.' ...germ attacks are not only possible... they've happened before... September 1984... at first four or five people... [in] a small town in northwest Oregon... complain of fever [and] violent nausea, then in a week the number has risen to 30; after two weeks, nearly 200. It's salmonella, and when it's over 751 people are sick... nearly a tenth of the town. It was a mystery. No one knew that the cult on the edge of town... also had an underground tunnel leading to a secret lab where they cultivated salmonella in liquid, and then took vials of it into local restaurants, secretly pouring them over the salad bars... the salad dressing and coffee creamers. The mystery was solved only because an informant came forward who said the [cult was] trying to make people too sick to vote against cult interests in a local election. More than 10 years later... members of the Japanese doomsday cult... Supreme Truth... placed plastic bags full of nerve gas in Tokyo subway cars at rush-hour. 5000 people writhed in agony... 12 of them died. But the even greater terror was the discovery the 10,000-member cult also had its own lab and microbiologists – funded by \$300 million in assets. As the half-blind leader of the cult called for Armageddon one of his top scientists tried unsuccessfully to spray deadly bacteria from the top of a Tokyo building. There were special briefcases with fans which could blow germs through the air. The group set up offices in New York and went shopping in Africa for the lethal ebola virus... Six years ago a woman walked into the local sheriff's office in Minnesota with a small... coffee can. It belonged to her husband, and inside was a strange powder and a bottle of green gel. The powder was... a deadly biotoxin made from castor beans. It destroys your circulatory system. The gel was a liquid which makes it seep into the skin. Her husband and three other men were arrested. The men were reportedly members of a local militia and said they were planning to kill IRS agents, US marshals and the local sheriff. They... made the [biotoxin] from a \$12 kit ordered in a catalogue. The four were sentenced for up to four years in prison – the first people convicted under the Bioweapons Anti-terrorism Act... And it seems that if catalogues don't have what you want, research warehouses will... A terrorist can easily take aim with... that Saturday-night special of biological gunslingers – anthrax. "...It's the most stable biological organism." Stable because anthrax produces spores – the dormant version of the bacteria. Neither sunlight nor temperature has any effect on them. A lot of animals carry anthrax, and the spores have survived in horse hair for 100 years. And, unlike a virus, which needs live cells to grow... anthrax... thrives in a liquid nutrient and heat. In a couple of days one millilitre of anthrax culture can produce one billion spores. "We think the human lethal dose is... 10,000 spores... [I]f there's an aerosol cloud of this coming by that's

not hard to do.” ...So much antibiotic is needed that one million infected civilians would take only two weeks to use up the entire [US] supply... Iraq... has admitted making enough anthrax to kill everyone on Earth several times and... has warheads which can carry liquid anthrax 400 miles... The same place, it turns out, [that] sold... Iraq its first strain of anthrax lethal to humans... [also supplied the man who] was arrested twice in 1995 for possession of bubonic plague, and again... for what turned out to be inactive anthrax... So what is going on at American Type Culture Collection? ...The company refused our request for an interview but wrote to us, saying that they comply fully with all Federal regulations... [W]e know how deadly [anthrax] can be because of what happened... in the Ural Mountains of Russia. In 1979, in [a] military compound – where no one knew they were doing biological research – apparently one night someone forgot to turn on the filtration system and a small amount of anthrax... went up in a gust and floated out on the wind. It blew over a neighbourhood just south of the military plant in a plume that stretched 10 miles. American scientists say the number of dead [was] 62 but the director of a military hospital there told us she documented 259 victims... [T]he KGB confiscated all her records. The infected were treated with everything available... The victims’ relatives remember their agony... “Something was coming out of her mouth and later they told me these were parts of her liver covered in blood.” ...“You cough, you get a tightness of the chest... and then you begin to feel better... This is known as the anthrax eclipse.” ...that’s the cruel deception inside anthrax. You don’t think you need treatment – when, in fact, only massive antibiotics in the first 24 hours will keep the accumulation of toxins from killing you... For more than a decade the Russians refused to admit that their military had released the anthrax... Back in 1969 the U[S] took the lead in ending the development of biological warfare. A treaty was drawn up and... in 1972, along with 140 other nations... the Soviets signed it, saying that they would finish too. But that was a lie. In fact, they were about to launch the most terrifying and sophisticated programme the world had ever seen. The West didn’t believe the Russians could deploy germ warfare weapons. They could. The West didn’t believe they were passing information on to other countries, like Iraq. It seems they did. And the big question – is the Russian military still at it today? ...In 1989 the CIA learned that [a] vast complex of buildings... [spotted in a satellite photo from above] the depths of Siberia was the heart of what is called Black Biology... where nature’s viruses were being harnessed as weapons... It is a gigantic labyrinth of corridors sealed off by airlocks... [holding a] bank of 10,000 viruses – one of the biggest collections in the world, including 140 strains of smallpox [and] three types of ebola... The scientists... [claim] that the research is only peaceful... [but] some American officials... [who were prevented from entering] building number 6... worry that biological weapons research continues... [Smallpox vaccinations were] stopped back in 1971, and the disease was declared eradicated worldwide by 1979... [S]ince these shots only last 10 years, today nobody is immune... “If you freeze-dry smallpox virus it will last for quite some time... In dried form it’s inactive but the minute it hits a moist membrane, such as your lung, it comes alive.” ...100 cases of smallpox could lead to... 30,000 new ones in a few days – and a third of them will die. “There would be a need, essentially, to vaccinate all 250 million people in the U[S] in the event of a terrorist release of smallpox anywhere in the population... Currently there are about 7 million doses of smallpox vaccine on hand. If there was a major smallpox outbreak, the smallpox vaccine would become more valuable than diamonds.” ...What if someone who was vaccinated carried smallpox onto a 747 and released it? 400... passengers could walk around for two days not knowing that they had become human biological weapons. Or what about a mall with a central ventilation system? “I think it would be the closest thing to a living hell that I can imagine. This is really a doomsday scenario...” ...Supposedly, there are only two supplies of smallpox left in the world – one... [at the Ural complex] and one at the Centres for Disease Control in Atlanta – but... in 1990 the Russians devised a way to produce additional smallpox virus in a matter of days, and... by the tonne... not ounces... Building 6 is where they work on smallpox... [A former Russian officer says] there are... “Fifty-two biological agents [that] would be used in biological weapons.” “So... you’d have to vaccinate people... against 52 different agents to make them safe from biological weapons?” “...that’s impossible... because nobody will survive after fifty-two vaccinations.” “...“Did you ever say to yourself, ‘What are we doing?’” “...I’m sorry, but for a long period of time... we thought that the U[S] was doing it too.” So the Russians simply lied. And when the Americans wanted to come for an inspection... it took two years to hide the equipment... A Russian military scientist recently published a report in [a] British journal... announcing the creation of a vaccine-proof anthrax. The US asked to see it. The Russians refused... [I]f you read the recent Russian scientific publications it’s clear they can now genetically marry smallpox with [a] brain virus called VEE. And [some people believe] they have another deadly genetic merger – smallpox and ebola... [that has no] treatment techniques... As part of... [their training, US firemen, policemen and emergency medical] crews – what are called first responders [– are]... told to seal the area, don protective gear, [then] call for... back up... [from] army or FBI units trained to handle hazardous material... But in Washington DC last April the city’s emergency response was put to the test. Rescue workers rushed to the scene after receiving a call about a strange package... When they opened it, it was marked *anthrax*. Streets were cordoned off [and] EMS workers were literally hosed down after examining the contents. It turned out to be a hoax, but an instructive one for the workers – they made big mistakes. For one thing, if it had been anthrax, all those workers would have been sick or dead. They forgot the first rule of biological events – keep a safe distance... But critics say the US training programme has problems that go far beyond that... “It won’t be... firemen... [or] policemen who will be responding – it’ll be emergency room physicians and nurses... [and other] public health agencies.” ...[an] expert... from the Minnesota Public Health Department... says if health workers aren’t prepared they won’t recognise the symptoms of unusual diseases brought on by a bio-attack. They can become casualties themselves... yet these workers are going virtually untrained. “There hasn’t been a single alert put out to the public health system in this country...” New York turns out to be the exception. After the World Trade Centre bombing the city spent millions [o]n training and equipment... [E]mergency rooms in New York have been trained to recognise... deadly viruses and bacteria... American soldiers are getting vaccinated against anthrax but what about the rest of us? Virtually everyone we talked to said mass vaccinations are not the best defence against what we fear... “Terrorists like to target civilians.” “Certainly, but who are you going to immunize? ...I believe we should focus on being able to identify the attack very quickly and get people on antibiotics, and work out the logistics of doing that.” In a [similar] statement submitted to Congress, [the 42nd US] President... said that antidotes, antibiotics [and] new treatments should be stored in emergency warehouses around the country[– which, no doubt, pleased the manufacturers of those products (who could be accused of having an unhealthy economic interest in the level of terror that can be generated within the minds of US taxpayers!)]... But so far, according to the National Security Council, there are only enough supplies to treat casualties in one major American city... “...[H]owever, y]ou have to realise... unlike... a chemical attack, you have a little bit of time with a biological attack.” Which is one of the reasons the [US] military has only two hospital isolation rooms for handling a bio-level 4 – the most contagious or deadly attack.

It is the best part of a month since the first dead crows began turning up in New York’s parks and golf courses. Gleaming black bundles of feathers, the birds seem to have been struck from the sky by an unseen hand. Frozen in death with eyes open and beaks wide, it is as if they saw something terrible and were killed before they could tell of it. And in a sense, perhaps they have glimpsed the future – a tiny, terrifying preview of what might happen if a biological attack is ever unleashed on one of America’s major cities. It is a scenario that has stalked the Pentagon’s darker fantasies for more than 30 years. But now, because of the deaths of five senior citizens and some 950 crows... that fear is almost palpable. As America’s military commanders have admitted in testimony before a series of congressional committees, not only can the world’s premier power do almost nothing to stop a biological attack, it has no realistic hope of treating the sick, stopping the massive panic that must surely follow, or even burying the dead. Vaccines against the most likely biological agents are either non-existent or in such short supply that only a privileged handful could expect to receive them. As for those few treatments that do exist... the cure could be almost worse than the disease. Despite a story in the current *New Yorker* magazine that raises a possible link between New York’s viral outbreak and [the Iraqi President]’s biological weapons labs, officials at the Centres for Disease Control are adamant that the bug – dubbed West Nile-like virus – is nothing more sinister than another example

of Mother Nature's dispassionate mischief. Genes mutate all the time, this city has been told, and whatever is causing the trouble is but the latest random twist in a coiled strand of viral DNA... Despite the soothing words spilling out from City Hall and Washington, the fact remains that this virus is something entirely new. True, it bears a strong genetic similarity to the West Nile variant of the infectious agent responsible for causing a strain of encephalitis. But it is now clear it is not the same thing, which only deepens the riddle of how it took root. And the mystery adds considerably to the fear. While it would be wrong to say that the Big Apple has been thrown into a panic, there is certainly a low but persistent level of anxiety... A month of media reports, not to mention the nightly chatter of helicopters drenching the five boroughs with insecticide, can sharpen even the dullest imagination to a paranoid edge. And fear, almost as much as the disease itself, is what officials... [who've] mooted the possibility of a massive civilian inoculation programme... are most anxious to combat since they have seen the havoc it is wreaking in the armed forces... In Army units, Marine bases and Air Force stations from coast to coast, a near mutiny is brewing as servicemen refuse to roll up their sleeves and be inoculated with a controversial anti-anthrax vaccine. In Tennessee last week, officials admitted almost half the part-time pilots in an Air National Guard air-transport squadron had resigned their commissions rather than be vaccinated. In California, 20 out of 65 career fighter pilots at the Travis Air Force base quit when confronted with the same choice, while more than half the pilots and crew attached to the base's air transport unit also bailed out. Across in Connecticut, resignations from a squadron of A-10 ground-attack planes have so reduced the unit's strength that its commander conceded he would not be able to go to war if a sudden emergency erupted. Veterans groups are blaming the vaccine for Gulf War Syndrome and a slather of Internet sites now carry personal narratives from scores of servicemen who see their shots as the cause of a sudden and bafflingly diverse variety of debilitating symptoms. As everything from heart ailments to joint degeneration, rashes, impotence and liver failure is attributed to the vaccine, worried generals have begun making examples of those who refuse. The first vaccination refusenik to pay the price... has been dishonourably discharged after six months of hard labour in a military prison. The "get tough" attitude has done not the slightest good... 600 service personnel have so far refused their injections... [T]he US military has a dreadful record of putting its troops in harm's way and then covering up the consequences. Even civilians have not been immune to the military's curiosity about germ warfare. In the 60s, for example, agents dropped two laboratory flasks packed with harmless bacteria on to the tracks at a Manhattan subway station. Within 24 hours, the bugs had turned up at almost every stop in the sprawling underground transit system... The anthrax vaccine at the centre of the storm is a relatively new variant on a treatment that has been in use since 1970, when workers in slaughterhouses and tanneries began receiving it as a mandatory condition of employment... [W]hen the Gulf War erupted, the brand new vaccine was hastily administered to 300,000 troops likely to be deployed in the Middle East. Within days, the first confused reports of possible side effects were trickling in. By the time [Iraq's forces] had been booted from Kuwait, those complaints were a deluge. Critics... blame an organic chemical compound called squalene, which they insist was added to the vaccine's secret formula as a sort of biological catalyst to speed its assimilation into the bodies of recipients. The Pentagon insisted not a trace of squalene was used in the manufacturing process. Yet when... a... university test[ed] blood samples from servicemen inoculated during the Gulf War, every single sample was found to contain squalene antibodies – including the samples drawn from those troops who received the shots but were never sent overseas... The Pentagon's official response verged on the schizophrenic. On the one hand it continued to assert that, no, squalene was not used – and anyway, even if it was, the compound does no harm because it is a naturally occurring precursor to cholesterol. And at the same time it reluctantly conceded that a leaked... memo signed by [the]Secretary of the Army... was the genuine article. The anthrax vaccine "involves unusually hazardous risks associated with the potential for adverse reactions in some recipients," [the memo stated]... In the meantime those dead crows continue to pose an age-old question – the one that may someday demand a choice between the lesser of two evils.

At the Hague conference of 1899, proposals for banning certain chemical weapons were offered, but they were successfully opposed by... the American Secretary of State. A resolution forbidding asphyxiating gasses in artillery shells was adopted, but the US did not sign. When... W[W1] came... 120,000 tons of poison gas were used, mainly by Germany, France and, to a lesser extent, the U[S], producing one-and-a-quarter million casualties. More than a quarter of all American casualties... were due to poison gas.

Since... W[W1], when mustard gas and other foul concoctions inflicted terrible injuries on soldiers in Europe, chemical weapons have mostly been shunned... Yet international law does not forbid the possession of such weapons, merely their use; and even then retaliation in kind is allowed. That is about to change. The Chemical Weapons Convention, which bans all production, stockpiling and use of chemical arms and requires Governments to destroy any old stocks they still hold, is just two short of the 65 ratifications needed for it to come into force. This is perhaps the most ambitious arms control treaty yet... Teams of inspectors will fan out to check that chemicals companies in signatory countries are not secretly supplying their armies, and that old stocks of chemical weapons are properly disposed of. But the convention is in trouble. The [US] Administration, which was planning to submit it to a Senate vote, drew back last week, for fear it might not get through. Though the convention is backed by some leading Republicans, and was negotiated under Republican Administrations, that party's presidential candidate... has questioned whether it is enforceable... Russia, too, which faces an estimated bill of \$3.6 billion for the destruction of its huge weapons stocks – the Americans began destroying their own unilaterally in 1990 – is dragging its feet. Without these two, which have the world's biggest supplies of weapons and vast chemicals industries, the convention will look cock-eyed. Can it work? No arms-control regime is watertight. The trick is to make life as hard as possible for would-be cheats. Many chemicals used in everyday products can also be used in weapons. Routine inspections can check that information given by companies on their stocks and industrial processes is correct. The convention will require new national laws, banning the possession of chemicals for nefarious uses. These could help the fight against terrorism. (At the time of the sarin attack in the Tokyo metro, possession of such chemicals was not illegal in Japan; now it is.) ...What of those who will not sign? North Korea, Syria, Libya, Egypt and Serbia are among absentees known to possess chemical weapons. Iraq, another non-signer, is... subject to a separate monitoring regime... Countries that join must apply strict controls to trade in certain classes of chemicals. Non-signers will find it increasingly hard to buy some chemicals, even for civilian use. That prospect may encourage wider support. Indeed, worries that trade worth billions of dollars might be disrupted helped win support for the convention from America's chemical industry...

A landmark convention banning the development, production, stockpiling and use of chemical weapons will take effect next year now that 65 countries have ratified it. Hungary's was the last signature the U[N] needed for the Chemical Weapons convention, which... is of unlimited duration... It has so far been signed by 160 countries including all five permanent members of the Security Council... But among them only Britain and France have so far ratified the accord[, which]... was the result of a decade of negotiations in the Conference on Disarmament, the international community's main disarmament negotiating body. - 1996

The U[S] Senate has scheduled a debate next week on a global treaty outlawing chemical weapons... [The US] President... has been conducting an intensive lobbying campaign for the Chemical Weapons Convention, seeking Senate approval in time for formal U[S] ratification by April 29, when the treaty goes into force with or without the U[S]. A vote next Friday would meet this deadline. The treaty has already been ratified by more than 70 countries. Immediately after the agreement was announced... the Senate opened a brief debate on a separate bill opposed by the Administration under which the U[S] would act unilaterally to meet the threat of chemical and biological weapons. The bill... was approved 53-44 on a near party line vote. The White House called the measure a "deficient and unworkable" alternative to the Chemical Weapons Convention... a unilateral

approach to a global problem that requires an international solution... It was unclear what effect approval of the bill would have on the prospects for the treaty. Treaty opponents said it could give senators a way to vote against poison gas while also voting against the treaty. The bill would ban chemical and biological weapons within the U[S] and require... sanctions against other countries using them... [By the way, d]id you know there was a serious leakage of nerve gas last year from an army operation in Utah?

...As the U[S]... gets ready to end its nearly 100-year military presence in Panama, concern is growing that contamination will be left behind to sour investment opportunities Panamanians are eager to sell... [The] Panamanian Government... expects more than \$US800 million... to be pumped into reverted areas... and hopes to turn Panama's \$US256 million tourism industry into a \$US1 billion money-maker by the turn of the century... It aims to turn Fort Amador, a former US... W[W2] nerve centre, into a \$US450 million hotel, cruise ship terminal and recreation complex. Construction has already begun... [Unfortunately, environmentalists] fear that when the small Central American nation takes control of the 80km... [Panama Canal Zone, which has been] in US hands in perpetuity for annual rent... [since] 1903... and picks up more than 93,000 ha of land and 7000 buildings... it will also inherit unexploded munitions and chemical waste, the result of military exercises since... W[W1]. Panama's Interoceanic Region Authority... the state body in charge of the handover, voiced its concerns recently at a conference... "The contamination... in the canal zone areas worries us... We are also interested in knowing the true use of all the military areas that were used this century by the US,"... [T]he Pentagon spent \$US3 million on cleaning up last year and will spend another \$US5 million this year. "We believe we have done an excellent job in the environmental stewardship in this country,"... [one US colonel, who is a] co-chairman of the joint US-Panama sub-committee on the environment, said. "We are removing, containing or controlling known imminent hazards that are on the installations." ...[However, in] one document at the Panama City meeting, the US military Southern Command (Southcom), which moves its headquarters from Panama to Miami today, argued that "the technology does not exist to entirely clear the impact areas of unexploded ordnance and other safety threats without completely destroying the ecology, the rain forest, and the environment in the... process." ...Both Governments have said three firing ranges bordering the canal and used by US forces for practice are deemed hazardous and are unlikely to be used for redevelopment... [A] Southcom spokesman... admitted the US military's Tropical Test Centre at Fort Clayton had been used for chemical weapons testing. In the mid-1960s tests were held on low-grade Virex nerve gas shells and in 1993 exposure tests on depleted uranium shells were carried out to observe their reaction to tropical conditions. [In related news, the drums in which 'tens of thousands of tonnes of German chemical weapons (including nerve gas, sarin, cyanide and arsenic) were sent to the bottom of the ocean around Europe and the Baltic Sea by the Allies between 1946-48 are now rusting.']

...The worldwide treaty banning chemical weapons took effect yesterday afternoon, 180 days after the 65th country... ratified it... As of yesterday, 87 countries had ratified the treaty, including the U[S] which did so last week. Cuba was expected to become the 88th late last night or today... The Russian Parliament on Friday postponed adopting the ban, saying the country could not afford to destroy its stockpiles – a task it says would cost \$US5 billion... Russia's lower house, the State Duma, promised to ratify it by spring, the ITAR-Tass news agency said. Iraq and North Korea... also have not ratified the treaty... The U[S] and Russia are the only two countries that acknowledge they have chemical weapons... [but a]ccording to American estimates 11 nations are developing... biological [weapons]...

US fumes over mustard gas factory... LIBYA is stepping up construction work on the largest chemical weapons plant in the world in defiance of American threats to bomb the facility to prevent its completion. The vast 2.5ha production plant hollowed out of a mountain at Tarhunah... has been under construction for six years... Intelligence experts say an extra layer of concrete has been put over the network of tunnels deep inside the mountain to make a conventional air attack virtually impossible. In anticipation of such protective measures the Pentagon has given top priority to the development of a new range of "bunker-busting" bombs equipped with special rocket motors to "punch" the weapons through more than 30m of sandstone and concrete. The US has been examining satellite pictures and other intelligence to see if existing weapons would be capable of destroying the facility. But Tarhunah, which... the Libyan dictator, claims has nothing to do with chemical weapons and is part of Libya's irrigation system, can be reached only by two 140m tunnels. A conventional ground attack on the plant would involve hundreds of soldiers and dozens of helicopters. It would carry the risk of colossal failure[(and an attack on the facility could also inadvertently cause the release of any poisonous chemicals being stored – or already produced – there)]. Military analysts fear the \$770 million plant will be capable of producing at least 2500 tonnes of mustard gas and other deadly nerve agents every year. The Libyans have already received the technology to North Korea's Nodong-1 advanced ballistic missiles, which will eventually enable chemical warheads to be carried 1300km – enough to endanger some parts of Europe. [● 'The CIA estimates that by the year 2000 over 20 countries will have long-range ballistic missile capabilities.']

...Technology in recent years has been moving towards highly accurate small warheads such as the Trident D5, a submarine-launched missile deployed by both the U[S] and Britain... Scenarios have been posed by both... where small accurate[nuclear] warheads would be used tactically... Nuclear weapons are indisputably horrific weapons of mass destruction and it would be ideal if they could be abolished... "Abolition 2000" is a project to secure the abolition of all nuclear weapons by 2000. It has attracted a great deal of support and over 700 academic, professional and other non-governmental groups and organisations are now involved in the international network... Don't expect, however, nuclear weapons to be gone by 2000. They will certainly be around for many years to come... For both the U[S] and Russia – which has just... deployed its first regiment armed with new-generation intercontinental ballistic missiles called Topol-M... [-] nuclear weapons will always have a place in foreign policy. They will be valued as a deterrent against conventional attack, a weapon of last resort, a response to a chemical or biological attack from a rogue terrorist state, or as simply a symbol of international status... To give up the weapons completely would mean that the U[S] and Russia would have reduced options to deal with any new international crisis, or with real or perceived threats to their security and interests. This is not a position that any government wants to be in... Giving up nuclear weapons would also be staunchly opposed by military interests, especially in the U[S] where nuclear weapons have long been part of the national deterrent and where the nuclear industry has been a major source of income for military/industrial conglomerates. The U[S] Congress has always been sceptical of arms control, especially where "national security" has been at stake. What the U[S] will probably do is de-emphasise the role of nuclear weapons in its military doctrines, but the weapons will not go away. Neither will the drive to improve those weapons that are retained; in 1995 the Department of Energy was proposing that the Government build a new multimillion-dollar tritium producing plant to "boost" existing nuclear weapons... [The presidents of Russia and the US] in their summit at Helsinki agreed to establish guidelines for a new agreement in reducing nuclear arms. If Start III is negotiated the U[S] and Russia will reduce their strategic arsenals down to some 2000 warheads. That would be significantly down from the 30,000-plus maintained during the Cold War. Tactical nuclear weapons have been withdrawn by both sides, including those from surface ships, so it is only strategic weapons such as bombers and intercontinental ballistic missiles that can be launched from land silos or submarines that remain. Some studies in the U[S] suggest that the U[S] could go as low as 200 warheads and still retain a healthy deterrent. America is unlikely to go this low – nor is Russia – and neither is likely to abolish its weapons... If the U[S] and Russia don't give up their weapons, Britain, France and China are unlikely to do so either. All will want their weapons for the same reasons as the U[S] and Russia, though their forces are much smaller... As for states such as Israel with its suspected nuclear arsenal of up to 200 devices... – [and its penchant for handing out] 18-year sentence[s] in solitary confinement... [to people] found guilty of treason for disclosing secrets about Israel's nuclear weapons programme... – ...or India and Pakistan which both have the technology to rapidly deploy basic bombs, it will be the regional political situation that determines their disarmament plans above any other factor.

...The report of the Canberra Commission on the Elimination of Nuclear weapons... underpins its call for a global ban on nuclear weapons with a detailed rebuttal of the value of deterrence... The commission's report says: "It has been argued that nuclear weapons have reinforced caution in

the conduct of relationships between the major powers. But their existence carries the inherent risk of their use, which would inevitably have catastrophic results. The only complete defence against such catastrophe is the elimination of nuclear weapons and the assurance that they will never be produced again.” The report suggests that the Soviet Union never had the ability or the desire to invade Western Europe, and says new information emerging from Russia conflicts with the belief that only the prospect of multiple Hiroshimas kept them at bay. “The record... instead suggests that... W[W2] had reaffirmed for the Soviet Union, as for other powers, that major war between them was not a rational instrument of policy and should be avoided at any cost.” It quotes a series of key Cold War figures whose doubts on the value of nuclear forces included not only the validity of deterrence but their military worth and the U[S] commitment to their use... Significantly, two members of the commission... played central roles in American nuclear policy. One is... a former Secretary of Defence who in the Kennedy years helped to shape the policy of massive nuclear retaliation and faced down the Soviet Union during the Cuban crisis of 1962. The other... was commander-in-chief of the U[S] Strategic Command. A third, the 37th President’s... first Defence Secretary... described nuclear weapons as “useless for military purposes.” ...the commissioners said... “It is also plain that any attempt to unshackle nuclear weapons through contemplating a role for them in conventional regional conflicts would be short-sighted in the extreme. This would inevitably and significantly intensify proliferation pressures.”

...Why it’s not a wise idea to ban all nuclear weapons... Many of the ideas recently put forward by the Canberra Commission (an international body set up by the A[US]n Government), and by a group of about 40 mostly American and Russian ex-military men, make sense... Though they recognise it would not be easy, both the Canberra group and the old soldiers want nuclear weapons abolished completely. But could it be done? And would a nuclear-free world be a safer place? ...Unfortunately, the answer to neither question is as straightforward as the disarmers would like... As the new abolitionists see it, the risk that a nuclear weapon might go bang unexpectedly or fall into the wrong hands now outweighs whatever deterrent value these weapons may still possess... As North Korea and Iraq have shown, catching nuclear cheats is an uncertain business. Lining up enough international support to punish them is harder, even when the would-be chastiser – usually America, for want of much help from China or Russia – is dealing from over-whelming nuclear strength... Moreover, as long as some countries have nuclear arms, others will want to acquire them. The solution is for the haves to join the have-nots: dump the bomb... Attention is at last turning to getting rid of the old weapons rather than building new ones, but the big powers still have enough bombs and missiles to make the post-Armageddon rubble bounce. America, Russia, Britain, France and China are frank about their nuclear arsenals. Israel, India and Pakistan are more coy. Plenty of other countries could go nuclear if they wanted to, and some would if they could... Someday, possibly quite soon, the world will wake up to face a rogue regime or a bunch of terrorists with a nuclear bomb and [they] will use it. Urgently needed are missile defences – ones that avoid setting off still greater nuclear rivalries – to protect troops sent in to do the necessary dirty work... In a nuclear-knowing world, eternal vigilance, not disarming gesture, is the best hope for keeping the peace... In an imperfect world nuclear weapons do still deter.

...[the] President... has issued new targeting guidelines for US nuclear arms, dropping the dictum the military must be prepared to win a... protracted nuclear war, even if it meant the end of the world as we know it... The... new orders required the military to aim its nuclear forces to deter the use of nuclear weapons by threatening a devastating response... The new guidelines retain the U[S] “first strike” policy of allowing it to use nuclear weapons first in a conflict, and allowing nuclear attacks against countries without nuclear arms in certain circumstances... [However, a]cceptance of the nuclear deterrent is a threat to the world, not a defence. [‘If nuclear weapons become an instrument of terrorism there is no way nuclear weapons can counter that.’]

...Last week we heard that t]wo Lithuanians ha[d] been arrested in Miami on charges of plotting to sell nuclear and other weapons to US undercover agents posing as Colombian drug dealers... [Now a former] Russian National Security Adviser... says the Russian military has lost track of more than 100 suitcase-sized nuclear bombs... Last May he said at a private briefing to a delegation of U[S] congressmen that he believed 84 of the one-kiloton bombs... which could kill up to 100,000 people... were unaccounted for...

Two drunken employees at a nuclear facility in Russia stole two atomic warheads that were found later in a parking garage when security officials brought their prank to an end. The November 1993 theft of the warheads was believed to be the first-ever case in which nuclear weapons were stolen, the *Frankfurter Allgemeine* newspaper said yesterday... Even more worrying... [is the story about a] day in 1995... [when Russian military officers] were tracking a rocket about the size of a U.S. submarine-launched Trident that seemed to be streaking in from the Norwegian Sea... on course to hit Moscow in 15 minutes... On military bases across Russia, red lights flashed and klaxons blared, alerting troops in charge of the country’s strategic nuclear weapons to get ready to use them... It turned out to be a Norwegian scientific rocket sent aloft to observe the aurora borealis. The Norwegians had dutifully notified the Russian embassy in Oslo, but the word was never relayed to the military. “For a while,” says... a member of the Russian parliament’s Defence Committee, “the world was on the brink of nuclear war.” It may still be near the brink despite the end of the cold war... because Russia’s nuclear arsenal is... on hair-trigger alert... and... the elite Strategic Nuclear Forces... are paid very little – \$180 a month for a submarine commander – when they are paid at all... [A] retired colonel of the SRF... says... “If those who guard Russia’s nuclear weapons go hungry, we might face some terrifying consequences.”

...Plenty of enemies still knocking at the gate... Despite the thawing of the Cold War, world security is still threatened by any number of potential explosions... The Cold War could almost become the good old days. In those days there was a single ogre who kept his minions at bay: now, according to the U[S]’ latest defence assessment, there is an entire pack baying at the gates... The list runs from the emergence of a new superpower to challenge the U[S] – ...a re-arming China... – to the spread of weapons of mass destruction, nuclear or environmental blackmail or sabotage, computer warfare, a new wave of super-sophisticated terrorists and a host of other potential dangers. And the assessment reveals a far less secure and more nervous America... “The world remains a dangerous and highly uncertain place, and the US likely will face a number of significant challenges to its security between now and 2015,” America’s new quadrennial defence review gloomily reports. Oil, and US access to it, remains a potential flashpoint... “Between now and 2015 it is reasonable to assume that more than one aspiring regional power will have both the desire and the means to challenge US interests militarily,” the review says. “In addition, failed or failing states may create instability, internal conflict and humanitarian crises... creating the conditions for unrest, famine, massive flows of migrants across international borders, aggressive actions by neighbouring states, or even mass killings.” Governments are also struggling to control the flow of sensitive information and regulate the spread of advanced technologies with potential military uses... An American physicist [recently] pleaded guilty to passing classified information on nuclear weapons to China... The review says the proliferation of advanced weapons and technologies will continue, possibly destabilising some regions and boosting the power and number of potential adversaries... The worst potential lies in the wreckage of the former Soviet Union, where control of large stocks of nuclear, chemical and biological weapons is in some states dangerously weak. In east Asia... proliferation threatens to upset delicate military balances in a region “rife with long-festering territorial disputes.” ...a crumbling North Korea is a constant and highly unpredictable threat... And while the US is almost certain to remain the only superpower... through to 2015, American superiority is unlikely to remain unchallenged beyond this... [Furthermore,] the review says... forms of attack, such as terrorism, are no longer threats just to US diplomats, military forces and citizens abroad, but will also threaten Americans at home... [T]he US will be targeted by “increasingly capable and violent” terrorists, the illegal drug trade and organised crime will continue to flow across its borders... “It is important to note that this projection of the security environment rests on two fundamental assumptions – that the US will remain politically and militarily engaged in the world over the next 15 to 20 years, and that it will maintain military superiority over current and potential rivals... If the US were to withdraw from its international

commitment, relinquish its diplomatic leadership, or relinquish its military superiority, the world would become an even more dangerous place, and the threats to the US, our allies, friends and interests would become even more severe.” - 1997

Mutual assured destruction of the superpowers has indeed secured the longest period of peace among industrial states since the end of the Napoleonic wars. The breakup of the Soviet Union, with the possible parcelling out of its weapons to independent republics, and the proliferation of nuclear weapons into the arsenals of smaller states (and prospectively into the hands of tyrants or terrorists), sets a finite term, however, on security imputed to the possession of a nuclear arsenal... A significant portion of the U.S. nuclear arsenal is deployed outside the country's borders, where it is exposed to the frailty of political alliance... The daughter product that awaits recovery from tons of radioactive garbage around the world for use as fuel... can be made into bombs as well. The spread of nuclear-power technology must inevitably permit and promote the silent proliferation of bomb-making capability.

Every nation that has tried to make an atom bomb since 1945 has succeeded, so far as is known. More than 1,700 bombs have been tested[('1030 by the US, 715 by Russia, 210 by France, 45 each to Britain and China') since 'Julius Robert Oppenheimer led the team which designed, built and tested the first atomic bomb in New Mexico'].

“...in some sort of crude sense which no vulgarity, no humour, no over-statement can quite extinguish, the physicists have known sin; and this is a knowledge which they cannot lose.” - J. Robert Oppenheimer

Knowledge of how to build nuclear bombs cannot be eradicated. Small nations, terrorists and rich criminals wanting to become still richer by holding the world to ransom can already afford very destructive bombs. Production costs are falling and the world has many multi-billionaires... The bomb which destroyed Hiroshima was of roughly ten kilo-tons: that is, with a energy like that of ten thousand tons of the chemical high explosive TNT. Modern 'strategic' bombs are typically between a hundred and a thousand times more powerful. By 1961... the Soviet Union had tested a bomb of 58 megatons (58 million tons of TNT)[, which had to be dropped by parachute in order to give the plane enough time to get clear of the blast zone and whose 'cloud rose 40 miles above Earth and shock waves broke windows 1000 miles away in Norway'], and much larger ones are possible: with a fission device to trigger it, a fusion bomb can be virtually any size[('the Soviets scrapped plans to build a Doomsday Bomb, which consisted of a ship that was designed to automatically detonate a nuclear explosion capable of destroying all life on Earth should it sense enough radiation in the atmosphere to suggest that Russia had been destroyed). If the Soviet premier hadn't backed down over the missiles in Cuba – a situation which escalated when, apparently unbeknown to the premier, a U2 was shot down over Cuba – the US was, apparently, ready to launch an attack that would, inevitably, have led to a nuclear war. The affair was, effectively, the last time the two superpowers faced off with missiles']. During the Cold War, the U[S] and the Soviet Union each accumulated tens of thousands of warheads, the world's nuclear arsenals becoming the equivalent of a million Hiroshima bombs... Since then, the collapse of the Soviet Union has led to reductions in the arsenals, yet the world's supply of the essential ingredient, plutonium, has climbed steadily to about two thousand tons, some ten times as much as remains tied up in warheads. And recent improvements in bomb design apparently allow plutonium which has been recovered from the spent fuel rods of commercial nuclear reactors – a complex process, but within the technological capacity of many nations – to be used in bombs which are more than just highly polluting 'fizzles'... Although the details are secret, the US military seems to have exploded a test bomb made from it, and one comparable to that dropped on Nagasaki could, it is said, be built with just seven kilograms of it. But there will in any case be two or three hundred tons of best-quality plutonium, as now used in warheads, in civilian hands by the year 2000... Although over twenty million have died in warfare since... W[W2], the nuclear peace has in fact been kept throughout – but largely only through (1) fears of 'mutually assured destruction'... and (2) 'games of chicken', efforts to persuade the opposing side that one would prefer a major risk of destruction to abandoning one's aims... (3) Developing highly accurate missiles, which could destroy enemy rockets in their silos instead of civilians in their cities... Yet it... could lead to a war by encouraging a first strike – perhaps by a fearful enemy as the missiles were being readied for installation. The US Army's prolonged pursuit of ever greater missile accuracies was therefore dangerous. The fact that the US Navy later joined it in developing within-one-hundred meters accuracies was still worse, signalling as it did the rise to power of hawkish strategists who claimed that only between two and fifteen million Americans would die in an enfeebled Soviet reaction to a US first strike, this making a nuclear war 'winnable'... [A] committee of the US National Academy of Sciences judged in 1975 that the effect of a 10,000-megaton war on most ecosystems would be small at first, and negligible after thirty years. Today such assurances can seem misplaced... Perhaps a hundred million tons of dust would be thrown into the air, soon to be joined by maybe three hundred million tons of sooty smoke generated by forest fires, grassland fires, and firestorms in cities. Weight for weight, the smoke would be about a hundred times as effective as the dust at blocking sunlight. The outcome could be world-wide darkness for days or weeks, and twilight for months or for over a year. Temperatures might fall by 15° C or more. There is much disagreement among scientists here, some suggesting that heating could occur instead of cooling... It could be rather hard to say who or what – computers or commanders or politicians – could best be entrusted with launch decisions. It isn't only computer chips which can fail. In 1989... 'of the roughly 75,000 members of the US military with access to nuclear weapons and related components, nearly 2,400 had to be removed from duty. Seven hundred and thirty abused alcohol or drugs, and the rest had psychological or emotional problems, were insubordinate or engaged in criminal behaviour.' ...'Authority for transfer rests with the unit commanding officer who sometimes takes the view that the "good soldier", or airman, is one who can conceal his use of drugs, just as he can hold his liquor. Demonstrably unstable men have been kept on nuclear weapons duties against their wills', the problem being compounded by the fact that many apparently normal people 'delight in destruction', being expert 'at concealing their feelings and plans'. Bear in mind, however, that politicians aren't always models of rationality. Alcohol or drugs, prescribed by doctors or self-administered, have clouded the minds of world leaders, including those most generally respected.

HUMAN RACE or NUCLEAR RACE...

disarmament, the restriction or reduction of national armaments by international agreement. The Hague Conferences of 1899 and 1907 failed to stop the armaments race that led to W[W]I... Disarmament conferences in Washington, 1921 [to] 2, in Geneva, 1928, in London, 1930, and in Geneva again, 1932 [to] 7, failed to provide sufficient guarantees against potential aggression to satisfy the participating nations that they could safely decrease their own land and sea armaments, in spite of the economic desirability of doing so... After W[W]II the U.S. took the initiative with the "Baruch Plan" (1946) for the establishment of an International Atomic Development Authority to control all atomic energy activities potentially dangerous to world security, thereby ending the manufacture of atomic weapons. Although approved by the UN General Assembly (1948) it was rejected by the Soviet Union. Subsequent attempts (1952 [to] 4) to secure agreement in the reduction of conventional armaments and armed forces were also unsuccessful... Talks centering on banning... nuclear testing were held between 1958 [and] 1962 but were generally fruitless. On Aug. 5, 1963 the U.S., Britain, and U.S.S.R. signed a treaty in Moscow banning nuclear tests above ground.

The U[S] yesterday detonated a nuclear device of less than 20 kilotonnes, 300m below the desert at Yucca Flats, Nevada. - 1990

France's most powerful, in a series of underground nuclear tests in the South Pacific, received mixed reactions from environmental groups and nations which oppose testing. The bomb beneath Fangataufa Atoll had a force of less than 120 kilotonnes, according to French Defence Ministry officials, and registered a magnitude of 5.9 on N[Z] seismographs. France says it now plans to sign a comprehensive ban on nuclear tests.

...China [has] exploded at least one nuclear bomb beneath the Lop Nor Desert, sparking a fresh round of international criticism at the continued testing of nuclear devices. Japan's *Nihon Keizai Shimbun* newspaper reported the U[S] Government had advised Tokyo that more than one bomb may have been detonated simultaneously because of... the... growing criticism... Global seismological monitoring could not determine how many explosions occurred, but indicated the test had an effective magnitude of 5.7.

...In a breakthrough deal with U[S] negotiators, China has agreed to support a historic global ban on nuclear test explosions, said western diplomats. That left India as the lone hold-out on the compromise treaty developed by the 61-nation Conference on Disarmament.

...Almost three years of talks on outlawing all nuclear explosions have ended in failure. Disarmament negotiators conceded defeat early yesterday after India continued to block a comprehensive test ban... Pakistan[']s... ambassador... immediately took the floor... and... said: "Today, the mask of the 'Smiling Buddha' had been torn off, revealing the face of the Goddess of War." He was referring to India's only nuclear test blast in 1974, which was followed by the coded message "the Buddha has smiled." ...the 61-nation Conference on Disarmament, meeting in Geneva, could not even agree to report its failure to the U[N] General Assembly. The major powers are now saying they will work quickly to revive the draft and have it approved and opened for signature in New York next month despite India's opposition.

...Indian political parties... support... the Government's firm repudiation of a draft nuclear test ban treaty. The parties put up a united front to denounce the accord from being adopted by disarmament negotiators in Geneva... During the two-and-a-half years of negotiations, India has demanded that the treaty commit the five declared nuclear powers – Britain, China, France, Russia and the U[S] – to a disarmament timetable. The nuclear powers have resisted... India has said since the mid-1960s that it would not give up its nuclear option until the nuclear powers adopted a timetable for eliminating their existing arsenals... In Geneva, [however, the US] disarmament ambassador... said the real reason India had blocked the treaty was because "New Delhi wants to maintain the Indian nuclear weapon option." Like the nuclear Non-Proliferation Treaty, which was indefinitely extended last year, the CTBT is widely viewed in India as a discriminatory agreement that would divide the world into nuclear "haves" and "have nots."

...in a televised address marking the 49th anniversary of India's independence... [India's P]M... said yesterday that his nation's people supported the Government's decision to block a global nuclear test ban treaty... "We will make no compromises on national security," he said from the ramparts of the historic Red Fort in Delhi... "We hoped in this connection the CTBT... would remove nuclear weapons from the world within a definite time-frame, but [other] nuclear weapons states are not ready to accept this... They want to maintain their right to hold nuclear arsenals. We cannot agree to this. That is why we... made it clear that we... oppose any such test ban treaty." [He] said his Government would press ahead with the development of two missiles. The short- and immediate-range missile programmes have been criticised by the U[S]...

The 'US Congress failed to ratify the anti-testing treaty' while the 'first of 80 stations to be built worldwide to test the atmosphere for radiation as part of the treaty was being opened in NZ.' In related news, 'a lost US nuclear bomb may still lie on the seabed off the coast of Greenland. The claim, made by a leading Danish newspaper yesterday, will boost opponents of America's planned new missile defence system. The US wants to use a base at Thule in Greenland, but it was the presence of that base which led to nuclear weapons being deployed in the area. The crash of a nuclear-armed B52 on January 21, 1968, caused a crisis in relations between Copenhagen and Washington, as Denmark officially prohibited nuclear weapons on its soil. Denmark looks after the external relations of Greenland, its former colony. The bomber landed on the ice in Baffin Bay. Three of its four B28 thermonuclear bombs – with a yield of between 70 and 350 kilotonnes – broke, and tonnes of radioactive ice and debris was recovered. But the US State Department said at the time only that the bombs had been accounted for, not that they had been recovered. Denmark's Ritzau news agency reported that film from a US submarine searching for the bomber's wreckage showed a bomb-like object.'

...'Secret documents about a 3 1/2-tonne nuclear bomb lying off the coast of the American city of Savannah have sparked new safety fears and residents are angry the bomb will not be removed. The 3454kg bomb was dumped off the Georgia coast in 1958 by a B-47 bomber after it collided with a fighter jet on a training flight. The crippled bomber was forced to jettison the bomb. Officials estimate the bomb was dropped at least 8km off the coast and now lies beneath 3m to 12m of water and is buried under 1m to 1.5m of sand and silt. A military search never found the bomb and for four decades it lay forgotten'.

...'the US Air Force developed a top-secret plan to detonate a nuclear bomb on the moon as a display of military might at the height of the Cold War. The now-73-year-old physicist who fronted the project in the late 1950s at the US military-backed Armour Research Foundation revealed America's extraordinary lunar plan. "It was clear the main aim of the proposed detonation was a PR exercise and a show of one-upmanship. The Air Force wanted a mushroom cloud so large it would be visible on earth. I made it clear at the time there would be a huge cost to science of destroying a pristine lunar environment, but the US Air Force were mainly concerned about the US lagging behind in the space race." A Pentagon spokesman would not confirm or deny the plans. Many Cold War documents are still classified in the US, but some details of Project A119 emerged after a biography of celebrated US scientist and astronomer Carl Sagan was published last year. Sagan was hired to undertake mathematical modelling on the expansion of an exploding dust cloud in the space around the moon. The physicist produced eight reports between May 1958 and January 1959 on the feasibility of the nuclear plan, all of which were destroyed in 1987 by the foundation.'

...'party leaders in the State Duma lower house agreed yesterday to hold a long-awaited debate and vote on ratifying the Start-2 nuclear arms reduction treaty, which the Kremlin has long tried to secure'. 'But Russia's economic decline has devastated its conventional, or non-nuclear forces. It hasn't got the kind of high-precision weapons possessed by Nato, so its military leadership has concluded it must rely, at least for the foreseeable future, on the nuclear shield – no matter how tattered and ageing. This includes not only continent-spanning, nuclear-armed missiles, but also thousands of short-range tactical nuclear weapons. Although details remain secret, there appears to be a drive among some weapons designers to persuade Russia's political leadership to build a new generation of low-yield tactical nuclear weapons for use on a battlefield. However, last year a plan was adopted to slash the number of defence workers in the 10 closed cities in the atomic-weapons archipelago from 75,000 to 40,000 by the year 2005. On the anniversary of the first Soviet atomic test, on August 29, 1949, Russian scientists are coming to terms with a country which can no longer support such a vast nuclear-weapons complex.'

...Britain can regain world prestige by becoming the first power to scrap its nuclear weaponry. The message is from [a] [former Fleet Air Arm officer... who flew Buccaneer carrier-borne nuclear strike aircraft and anti-submarine helicopters equipped with nuclear depth bombs for 11 years. Now in the anti-nuclear camp he believes one nation has to be the first to break ranks and give up its nuclear capability. It would make moral, political and economic sense for the British to be that power. "Britain has the smallest nuclear arsenal. Britain could... outflank the French, save money, and again achieve a world role which they thought they'd get with nuclear weapons..." It was while manning sub-chasing helicopters that [he] first began to question the nuclear deterrent policy and the folly of firing such weapons. "We had these nuclear depth bombs, twice the power of a Hiroshima bomb, to use against Soviet nuclear subs because they could outrun any torpedo we had at the time. But as our helo's could do only about 100 knots we went up with the bomb. We couldn't clear the area in time... It was an own goal. I began to realise my leaders were not thinking straight, in fact they were incompetent. I began to quietly question what was going on." He eventually took voluntary redundancy after 20 years with the Royal Navy and, with the rank of commander, was released after the Falklands War... However, it was another decade before he

was sufficiently alarmed to publicly join the campaign against nuclear weapons. The Gulf War was the catalyst: he feared... Scud rocket attacks on Israel would result in nuclear retaliation by the Israelis. Today [he] chairs the World Court Project UK, which is working to enforce this year's International Court of Justice (World Court) decision that it could find "no lawful circumstances for the threat, let alone the use, of nuclear weapons." ...In N[Z] as part of the international project, and backed by the Canberra Commission which... reported on the feasibility of eliminating nuclear weapons, [he] says he's not a pacifist in the sense that he believes all weapons should be scrapped. That would be impractical in a world of [Iraqi presidents] and terrorists. But he believes those situations cannot be met by nuclear weapons capable of obliterating the planet. Tyrants and terrorists have to be dealt with by negotiation and, if all else fails, excised by conventional forces, he says... He is very much opposed to Britain's Trident submarines which are replacing Polaris. The Trident class, of which three are already built with a fourth under way, are 16,000-tonne vessels carrying 16 missiles, each with several 100-kilotonne warheads. They constantly circle the globe, submerged, monitoring pre-determined targets. "Now that the Cold War is over, I'd like to know who the targets are... Trident patrols should be stood down and the warheads put in storage. All they are doing is risking accidental nuclear war..."

...The Canberra Commission... believes that the nuclear trigger is becoming less – rather than more – stable, and that the world could be plunged into a catastrophe whose true consequences were beyond theoretical calculation. It said the greatest danger lay in accidental detonation, miscalculation in a crisis, or launches by maniacs with access to firing codes... Further potential for disaster lay in the continued state of high alert maintained by the nuclear powers which, despite elaborate precautions, had come close to failure in the past. Between 1945 and 1980 about 100 accidents which could have sparked nuclear explosions were reported in the U[S] and, after a number of serious in-flight accidents, American bombers were taken off high alert... [Incidentally, t]he environmental group Greenpeace has denounced the presence in the Panama Canal of a British-registered freighter... [t]he Pacific Teal, owned by... Pacific Nuclear Transport Ltd... that it said was... carrying... 18 tonnes of... irradiated nuclear fuel from Japanese nuclear reactors... to plants in France and Britain which extract the plutonium. [However, o]fficials from the Panama Canal Commission and the British Embassy in Panama said the transit was approved and proper safety regulations were followed. "The company has been going through the canal for 25 years and they've never had an accident," said a British Embassy spokesman... [Since l]ocal protests prevented the company from using the canal two years ago... up to 10 clandestine nuclear waste transits [have been going] through the Panama Canal each year... [a]ccording to Greenpeace... "Perhaps the Japanese, French and British Governments think it is appropriate to commemorate today the [51st] anniversary of the bombing of Hiroshima, by secretly bringing this nuclear transport through the Panama Canal and into the Caribbean Sea," a Greenpeace spokesman... said...

[‘The midsummer skies were clear, not a cloud, on the morning of August 6, 1945. Stopped clocks record the fact that the first atom bomb to be dropped in an act of war exploded at 8.15 am, that day. Later estimates put the number of people directly exposed to the blast at up to 320,000. By December, 1945, 140,000 of them had died. Those that lived paid another price, important in Japan where membership of a group is a vital cog in society. There was great fear towards those who had been exposed to atomic radiation. While the hibakusha – atom-bomb survivors – received medical treatment and some help to renew their lives after the war, it has been a battle in the decades since. No special case was made for their need for ongoing treatment and care until January 1953, when the Hiroshima Medical Association organised the Hiroshima Council for Treatment of A-bomb Diseases. The official explanation for the tardiness is that the US military prevented medical research from reaching the public domain because of the Cold War. It was not until 1957 that laws were drafted giving the hibakusha medical benefits that include regular twice-yearly medical examinations. A Hibakusha Special Welfare law was mooted in 1968 but has never been enacted. Lobby groups in Hiroshima and Nagasaki have sought to promote legislation that would provide state help to “stabilise the livelihood and welfare” of the hibakusha.‘]

...Bells tolled in churches and temples throughout th[e] hilly Japanese port city[of Nagasaki] yesterday to mark the 51st anniversary of its atomic bombing in the closing days of... W[W2]. About 25,000 people thronged leafy Peace Park for a memorial ceremony beginning at 11.02 am, the moment when the bomb was dropped on August 9, 1945... The blast... that... kill[ed] more than 70,000 people in a rain of fire... came three days after the atomic bombing of Hiroshima, and debate about whether it was really needed to force Japan's capitulation has persisted since. During yesterday's memorial ceremony, survivors and families of victims made offerings of water before an altar – a poignant reminder of hideously burned victims who died crying out for water. Few traces of the bombing can be seen in the city today. Unlike Hiroshima, where the half-destroyed Atomic Dome was left as a monument to the bomb, Nagasaki rebuilt everything, including a cathedral destroyed in the blast.

...[NZ'S] WAR Pensions Minister... has received a request for recognition from navy men exposed to nuclear testing in the 1950s. The men of Operation Grapple, many suffering from unexplained ailments and having witnessed birth defects among their children and grandchildren, have united for the first time in seeking government accountability. [A spokesman]... said the servicemen and their families had been ignored for almost 40 years. "At least when a military man is killed on active service there is pride through sacrifice... In our case there is nothing." The work of the men aboard the frigates HMNZS Pukaki and Rotoiti in 1957 and 1958 has always been classified a "no-risk" operation. [Hence] full provisions of the war pensions schemes have not been available to Grapple veterans. [But the minister] has begun a review... [He] said a report by [the] associate professor... at the Wellington School of Medicine concluded that there was an increased risk of leukemia and some other blood related cancers among nuclear test veterans. "...Anyone who considered that they are suffering from a disability as a result of their service around Christmas Island and Malden Island... should apply for a pension from the War Pension section of the[ir] local... Income Support Service office." - 1996

Britain's Christmas Present... Few have heard of Kirabati and even fewer know how to pronounce it... Kih-rih-bahss... "Discovered" by Captain Cook... who thought it unfit for human habitation... on Christmas Eve, 1777... it became the remotest outpost of the Empire... [until being] granted independence... in 1979... Britain brought Christianity to Kiribati and a century later delivered another present: a series of H-bomb tests with awful consequences for a local people who have never been to war and, to this day, never had an army... 12,000 [British troops], mostly conscripts, were exposed to radioactive fall-out in the tests. Up to 60[%] of those troops suffered illness as a consequence. Many have died, some in the most horrible circumstances. Their sons and daughters are prone to genetic disorders... [The troops] were made to parade on the beach as the bombs went off... dressed in standard Army gear for the tropics – shirt and shorts, without goggles or protective clothing. They did not have radiation checks afterwards. It was no accident that the troops were there... Classified documents unearthed at the Public Records Office in London make it clear that one purpose of the tests was to ascertain the effects of radiation on soldiers... [A Scot decided to go] on a pilgrimage, to retrace the steps of her husband, who two years ago died of leukaemia... One of the reasons [she] went was to see if the islanders suffered in the same way the troops did. As she... travelled round, it became apparent there are very few old people on the island. The... only doctor, [who] ministers to all 3000 islanders[said,] "Radioactive fallout is carcinogenic. People living here have reason to be scared." At this point, the doctor changed the subject to the tonnes of equipment the British left behind. Suppose they left it here because it was radioactive? ...The island is a carcinogenic dump... That night A[US]n aid workers, working on a badly needed sewage system, explained the extent of the problem... "The British have left... hundreds of rusting drums and jerry cans that produce thin layers of bitumen from seepage... Because of drought, wells have had to be sunk and sticky black material has been found on top of the water table. Derelict and dangerous water tanks stand abandoned... [as well as] liquid gas cylinders, one still charged with gas. This borders on criminal negligence. Asbestos-lagged boilers, old buses, building rubble and two large transformers... The British should remove [all of] it." ...Kiribati will be the first place on Earth to see in January 1, 2000. The potential for tourism is obvious and the

Government is eager to make the most of it. But... [the] island has few visitors and boasts just one “tourist attraction” – a seven-headed palm, the only one in the world. Palms are supposed to have one head. “Do you know the scientific term for that?” asks an A[US]n aid worker. “Mutation.”

...“We didn’t know there were going to be H-bomb tests,”... said... a seaman[who was] on the frigate Pukaki in 1957 when, after supporting... [an] expedition to the South Pole, the ship sailed at short notice to Christmas Island just above the Equator... The crew realised something was amiss when large washing machinery was installed to scrub the decks from any fallout “and we had to wear little meters on our shirts.” ...Crew members were told to turn their backs to the explosions but he recalls seeing the bones in his hands, which were clasped to his eyes, being lit up... A survey of... [members of the NZ] Nuclear Test Veterans’ Association... has found that half of 235 respondents lost children through miscarriages or early deaths. One in 10 veterans was sterile.

...Almost 40 years ago Phil Wernham stood on the deck of HMNZS Pukaki watching a giant black and orange fireball explode over Christmas Island. Now he is fighting leukaemia in an intensive care ward at Auckland Hospital – apparently the latest N[Z] victim of radiation from the 1950s British nuclear bomb tests. The 56-year-old Aucklander knows of at least five of his shipmates who have died of leukaemia and other cancers at relatively early ages. He says he cannot prove that radiation from the tests caused his life-threatening illness but he and his ex-Navy friends suspect the worst... Mr Wernham, who works as a purchasing officer, had few warning signs about his leukaemia apart from feeling constantly tired and generally unwell. Then a week before Christmas, he suddenly found he could not walk. After blood tests at North Shore Hospital he was rushed to Auckland Hospital... He hopes to be able to go home... this weekend but has not yet asked his doctors about his longer term chances. The chairman of the N[Z] Nuclear Test Veterans Association... said... “I suppose one day we will have a Minister of Defence who will proudly stand up and say ‘Yes, we will compensate the two men still living’.”

...Two more crewmen of a N[Z] frigate which monitored British nuclear tests in the South Pacific have died of cancer... Phil Wernham, who was 16 when he sailed to Christmas Island... in 1957, died of leuk[a]emia this week in Auckland Hospital... The N[Z] Nuclear Test Veterans’ Association also disclosed yesterday that a shipmate, Graham Mattingly, died of another form of cancer just seven days earlier in Dunedin... Of the 528 N[Z]ers who watched the tests, 97 had died by 1992... The leukaemia death rate among those exposed to the tests was found to be almost six times that of unexposed Navy personnel... The latest deaths... are likely to fuel legal action by nuclear test veterans against the British Government. Veterans... have been promised \$200,000 by the N[Z] Government to investigate joining a class action by former British crews before the European Court of Human Rights. Mr Wernham, [speaking]... from his hospital bed a month ago... recalled standing round the edge of the deck with other crew in goggles and white hooded suits during the explosion 50km away of the first of seven hydrogen bombs he was to witness... Veterans say the fifth test went badly wrong when the bomb exploded too low, sucking up water from the sea and debris from Christmas Island. The Pukaki then passed through ground zero – directly under where the bomb exploded – only 23 hours later... His brother... watched tests from the Rotoiti and recalled yesterday how the two teenagers viewed their mission at the time as “a big adventure... We had no idea of the long-term effects of radiation,”... [B]oth had suffered an ultraviolet skin allergy since their Pacific service. Meanwhile, the veterans’ group has welcomed a pledge of support by the Returned Services Association for its plea to the Government for war pensions to be extended to those suffering ill-effects from the tests.

...The [NZ] Nuclear Test Veterans’ Association has... welcomed payments of pensions to the widows of... former servicemen who died of lung and brain diseases... [However, the] veterans have abandoned a Government offer of help in their battle for compensation over claims of radiation-linked illnesses. Instead they are looking directly to a European court for a payout for former Navy crewmen... The [association’s] chairman... said the Government had promised to pay \$200,000... But a recent letter from the Minister of Defence... “did not show any urgency” so the association had decided to go it alone. “Time is running out for our members. We do not have time for reviews, fine-tuning and fiddling.” ...the association would ask the court to include N[Z] servicemen when it considered the British case in December. The court is being asked to order the British Government to pay compensation to its servicemen who were exposed to radiation from nuclear tests. It follows a decision by the European Commission of Human Rights that the British Government violated veterans’ rights to a fair hearing of their claims for war pensions and compensation. The commission also found the veterans had established a reasonable basis for their concern that they might have been the subject of human experimentation.

...N[Z] veterans of British nuclear testing in the 1950s are to have their health monitored in a British study running for the next two years... [Meanwhile, ‘the British Government has rejected compensation claims by Fijian veterans of the nuclear tests on Christmas Island, saying it will contest any case that comes to court. Veterans from the former colony – which gained independence in 1970 – say they were not informed of the nature of Operation Grapple and were horrified to discover the island littered with poisoned fish and dead animals when they arrived. They were given no protective clothing and in the first five years after the testing, many veterans lost their teeth and hair and a high proportion developed cataracts before the age of 40. Campaigners for the Fijian veterans have demanded that the British Government acknowledges that it committed a crime. A case for compensation has now been filed at the European Court of Human Rights in Strasbourg. NZ veterans have been unable to submit a claim in the European Court because NZ is not a member of the EU and was an independent nation at the time of the tests.’

...a mother ‘is reeling under a double dose of anguish from an official inquiry into the health of service veterans’ children. She has no doubt her family has been ravaged both by chemical defoliants used in the Vietnam War and by British atmospheric nuclear tests in the Pacific. But a report published this week found no convincing evidence of a link between the ill-health of veterans’ children and their fathers’ exposure to chemical or nuclear contaminants in the two operations. Its recommendation of free medical care only for children showing sufficient evidence of such an association gives little comfort to the Wellsford woman and her intellectually handicapped 21-year-old son. She blames the defoliant Agent Orange for part of his plight, and that of an older daughter born with Down’s syndrome, and nuclear radiation for the death of her brother Phil Wernham and their brother’s aching joints and ultraviolet skin allergy, which is shared by all three of his children. This week’s Government report found nine cases of club feet among Vietnam veterans’ children, more than double the rate for the general population, and six of Down’s syndrome. That was more than four times the general rate, as was the incidence of Down’s syndrome among children of the nuclear blast veterans. But only nine children from both categories found to be suffering from spina bifida are likely to be guaranteed free medical care if the Government accepts the recommendations of its inquiry team. A nuclear veterans’ widow said the inquiry report appeared to have ignored her research which found only 209 children “alive and well” among 475 born to NZ witnesses of the British blasts.’

...‘Massey University is preparing to step into the nuclear test veterans controversy. It was revealed last week that a study involving 110 veterans and 2000 blood relatives showed that, apart from a variety of cancers, the veterans suffered a range of symptoms consistent with a syndrome called synovitis acne pustulosis hyperostosis andosteitis (Sapho). This was reflected in the skin, skeletal, arthritic, respiratory, cardiovascular and blood disorders of their offspring. Massey’s Institute of Molecular Bio-Sciences, with the NZ Nuclear Test Veterans’ Association, is sending a researcher to Scotland to study new technology in genetic damage identification. Scotland’s University of Dundee and University of St Andrews have been involved in research on and for Commonwealth veterans of the British nuclear bomb testing. British Governments have shied from accepting responsibility for the health of the 22,000 men involved in Britain’s 31 bomb tests of the 1950s.’

...John Oughton, meteorologist on board the... Pukaki... has died of leukemia... British Government rules barred [his] family from claiming a disability pension, something the... British Nuclear Test Veterans Association... wants rectified. Britain placed a 25-year time limit on claims relating to its nuclear tests in the Pacific, although doctors agree that radiation-exposure symptoms become worse with time. The British association has three test cases going before the European Court of Human Rights...

THE DEATH of an English meteorologist who monitored experimental nuclear tests aboard the... Pukaki has renewed sad memories and increased anger for a Kiwi widow... [who] has also been campaigning for compensation. A colleague of Mr Oughton[, her husband] Charles Johnston, died... four years ago from cancer of the oesophagus... "When the doctors discovered he had cancer in 1992, they gave him three months to live. Six weeks later he was dead." ...Mr Johnston was seconded by the Royal Navy to the Pukaki at the age of 27 to monitor weather patterns during the experiments... He was put ashore after the tests and also released weather balloons for several days after the nuclear devices had been detonated. Mr Johnston was de-mobilised in Wellington after the operation and settled in N[Z. His widow]... said she had come to grips with the loss of her husband, but she was worried about her daughter, who was conceived five years after Mr Johnston returned from Christmas Island. She had recently discovered two keloids, tumours linked by Japanese scientists to the offspring of those radiated by atomic blasts. "...If... the British... and... N[Z governments]... would just accept what they did was wrong, that would make all the difference... The Americans accepted it years ago... they... have a list of cancers that they will compensate veterans of testing for..."

...Islanders from Enewetak Atoll, the site of 43 American nuclear tests from 1948 to 1958, are asking for... compensation for the lost use of their land. In testimony to the Nuclear Claims Tribunal this month, two U[S]-based appraisers... agreed the value of the land since the Enewetakese were relocated in 1947 had risen to approximately \$US309 million... The "Mike" test at Enewetak in November 1952 was the first hydrogen device exploded... in the Marshall Islands. It vaporised one island and parts of others... The value was calculated on the basis of loss of use of the atoll from 1947 to 1980, the year people were allowed to return, and for the northern islands (which are still off limits) from 1980 to the present time... But [their] lawyer... emphasised it was only a claim for "loss of use" and did not include compensation for damage to the land, the hardships people suffered and the cost of cleaning up the island... The claim was the first of three... that Enewetak is making... The next two "will include expert... testimony on the cost to restore the islands to a condition of full use, and a description of the suffering and hardship the people endured..." While Enewetak is claiming \$US300 million compensation, the Majuro-based tribunal has only \$US45 million from the U[S], all of which has already been awarded for the more than 1200 personal injury claims that have been brought by Marshall Islanders who are suffering from, or had family who died from, a variety of cancers. Islanders from Bikini, the site of 23 nuclear tests, and Rongelap, an atoll 160km downwind of Bikini that was engulfed in a snowstorm of radioactive fallout in 1954, have also filed claims with the tribunal. No monetary figure has yet been attached to these claims, although tribunal officials indicated that they expect these two islands to put forward claims similar to Enewetak's... Residents on the two atolls experienced a high rate of health problems from exposure to nuclear fallout in the 1950s... Since 1954, Brookhaven National Laboratory, a major Department of Energy contractor, has operated the medical research programme for the two affected northern atolls. Brookhaven has been the focus of increased criticism from islanders for what they say is the laboratory's focus on researching the health effects of radiation at the expense of health concerns of the islanders... The U[S] and the Marshall Islands have agreed to a major overhaul of the 40-year-old medical research programme... The change would shift the emphasis to medical treatment instead of nuclear research... Decades of efforts by the American Government to decontaminate [Bikini] atoll have led to the recent announcement that radioactivity there is well within internationally accepted levels. The island has been saturated with potassium fertiliser to prevent coconuts and other plants from sucking up radioactive caesium 137 from the ground. It is believed that locally grown food would now be safe for consumption.

...Former residents of the Bikini Islands are calling on [the US]President... to guarantee that the former nuclear test site is clear of radiation before they begin preparations to move back to it... An International Atomic Energy Agency (IAEA) panel of scientists recently said Bikini Island could be safely resettled if the 88 Bikini islanders... launched a cleansing programme on the atoll. But Bikinians, still wary after one false start... want Washington to endorse the IAEA findings... [F]ollowing an announcement by then-President Lyndon Johnson that the island was safe, more than 100 moved back to the atoll in 1968 only to be moved again in 1978 when officials decided it was still unsafe after all. The islanders ingested high levels of radioactivity from eating food from the still-contaminated islands, and many of them became ill. Nearly 20 years of study later, scientists believe that they have the answer to Bikini's contamination. Potassium fertiliser has been shown to prevent as much as 95[%] of radioactive caesium from getting into the root crops... [In related news, a]n American company has been hired to make a detailed study into creating a nuclear waste disposal facility in the Marshall Islands, a cabinet minister... said yesterday... The feasibility study was expected to take two years to complete and could start at any time.

...Radiation exposure from US nuclear tests in the 1950s is a factor in high cancer rates in the Marshall Islands, an American doctor said yesterday... "The legacy of the Marshall Islands, where nuclear weapons testing and military base needs contributed to uncontrolled urbanisation, has negatively impacted on the health of the Marshallese people,"... Other possible causes of the high levels of cancer in this island nation of 60,000 include high consumption of processed foods, smoking and possibly vitamin A deficiency... Cervical cancer in Marshall Islands women is 60 times the rate in the U[S]. Breast and stomach cancer rates are five times higher, while lung cancer is three times the US rate. "For all types of cancer listed [by the US Centres for Disease Control], the cancer mortality rates of the Marshallese are magnitudes higher than the U[S]," he said in a Symposium on Cancer in Minorities and the Medically Underserved in Washington. He said despite data tying cancer in the Marshall Islands to radiation fallout from the US nuclear tests, health care funding from the US Government would not be renewed when a current treaty expires... [H]is calls for more US-funded healthcare services could fall on deaf ears... [If money isn't forthcoming, the] Marshall Islands President... [might resort to a] 1994... proposal to store nuclear waste... from the Taiwan nuclear power industry... The US Energy Department has already rejected a proposal to add several atoll populations in the Marshalls to a US-funded medical programme currently servicing two atolls that received high doses of fallout from the 1954 "Bravo" hydrogen bomb test at Bikini, saying that extensive analyses of radiation fallout in the Marshall Islands indicated minimal exposures.

...*Animals exposed to nuclear explosions*... SCIENTISTS from the Atomic Weapons Research Establishment killed hundreds of dogs, donkeys and sheep after exposing them to fallout from plutonium bombs... The tests were carried out at the height of the nuclear arms race in 1963 and cost an estimated \$4.9 million... Nearly 100 scientists and officials from Britain's most sensitive nuclear defence facility and the Ministry of Defence took part in a... American programme codenamed Operation Rollercoaster. They carried out experiments on 300 animals on a bombing range in the Nevada desert to learn more about the effects on humans of an accidental nuclear explosion... Just before detonation, the donkeys, together with 84 dogs and 132 sheep, were placed in wagons. They were tied tightly, facing the blasts to ensure they breathed in as much plutonium as possible... More than 1000 plutonium-contaminated samples were shipped back to Britain and analysed at Aldermaston... The Aldermaston team concluded that the plutonium particles had contaminated the guts and lungs, but not their bones... Western defence experts had been keen to study the effects of a simulated nuclear accident involving plutonium on living organisms. Their concerns were justified three years later when an American B52 bomber crashed near the Costa del Sol in Spain, detonating two bombs which caused non-nuclear explosions close to the village of Palomares... The Defence Ministry confirmed the experiments had taken place but could not comment on their value: "At the time it was considered appropriate. Obviously the climate of opinion has changed a lot since then. We certainly don't carry out animal experiments... any more."

...The U[S] has] proceeded with plans to conduct an underground nuclear test beneath the Nevada Desert despite criticism from anti-nuclear activists and some members of Congress. The experiment is termed "subcritical" because it does not trigger a nuclear chain reaction, and is designed to check the reliability of... America]'s nuclear arsenal. Incidentally, the 'UN estimates that approximately 2 million people are currently dying each year due to cancer caused by past atomic tests.' A large proportion of the deaths occur in]... former Soviet Union [states such as Kazakhstan,

where]... at least 500,000... village[r]s... were contaminated by... the more than 473... nuclear tests carried out... on their territory between 1949 and 1989.

...[8 'years after nuclear testing by the Soviet Union was halted at Semipalatinsk in northern Kazakhstan, scientists are still not able to determine which areas of the site are safe for habitation. A total of 445 tests were carried out at Semipalatinsk – over 100 were above ground. According to Government estimates, about 500,000 people lived in and around the area during the 40 years of testing, and were exposed to radiation. Environmentalists say the number is closer to 1.5 million.']

...A TELEPHONE operator in Kazakhstan recalls a kind of Cold War delirium that encouraged Kazakhs to accept wide-scale nuclear testing on their soil when the country was part of the Soviet Union. "We were proud. The Soviet Union was No. 1... Yet we knew it was dangerous. Everyone had someone in the family with problems. Young men killed themselves because they were impotent. Babies were born in our village with tails." ...One in every three children born in the eastern region of Semey has mental or physical defects... [A] senator... put on a photo exhibit at the Senate building to show health and ecological damage wrought by nuclear testing. The pictures are horrifying: Children with misshapen heads... a cow with six legs... At the Republic Children's Hospital in Almaty, 50 to 100 children are treated monthly for a variety of illnesses apparently caused by exposure of themselves or their parents to radiation. Mothers bring in pale children with tumours of the digestive tract... Anemia is rampant, cancer deaths increased seven-fold in the 1980s, and half the population suffers from immune system deficiencies... "We are seeing some illnesses appearing for the first time. It is worrisome," said... a hospital official. She held up images from... scans that showed parts of a child's brain, petrified since birth... The realisation that... testing took place, largely in disregard of harm to civilians, has prompted Kazakhs to reflect on their own responsibility... "People are asking themselves, 'Where was I when this was happening'? ...This is not a comfortable question to answer." ...At a recent UN conference on nuclear pollution, [the]Kazakh representative... said the... oil-rich country, which is nearly four times the size of Texas... lacked resources to rehabilitate or compensate victims. She argued that because the Cold War nuclear powers were responsible for the arms race and, by extension, nuclear testing, they should pay for health care and environmental cleanup. - 1997

In the Altai district of southern Siberia in 1949, thousands received radiation doses like the ones suffered by those inhabitants of Hiroshima and Nagasaki who outlived 1945's nuclear attacks... Stalin had ordered the testing of his first atomic bomb, nobody worrying that the wind direction was such that radioactive dust from the near-ground explosion would be blown across more than a million people living nearby – people who were warned neither beforehand nor afterwards, so that they happily consumed the products of contaminated fields... [H]undreds of square kilometers had to be permanently evacuated when stored waste from Soviet military reactors exploded at Kyshtym in the winter of 1957... [In the Pacific, the President of France's] fun-loving refusal to delay watching a nuclear test until the wind had changed... [resulted in] fairly high radiation levels for people living as far distant as three thousand kilometers – don't forget that there were 461 such above-ground nuclear tests between 1945 and 1961. Residual radiation could render many Pacific islands dangerous to habitat for millennia.

France has never allowed comprehensive, independent, environmental impact assessment of Mururoa and Fangautafa Atolls. Such a study would need to include not only a radiological survey but also geological and hydrological surveys, and a full assessment of the ability of the atoll to contain radioactivity within what is effectively an underwater nuclear-waste dump... [C]oncerns about radioactive leakage at Mururoa [aren't] confined to Greenpeace. This was a key argument used by the N[Z] Government in the case it took to the World Court in 1995. In his dissenting judgment, [the]Judge... identified various risk factors of concern such as the structure of Mururoa Atoll, the need to apply internationally accepted safety standards for the storage of radioactive wastes, the dangers to marine life; and the possibility of accidental release. Unfortunately his concerns have proved to be well founded... In 1996 research at Amchitka, a high island in the Aleutian chain off Alaska which was the site of U[S] underground nuclear tests in the early 1970s, found plutonium and other radioactive wastes leaking into the marine environment... Greenpeace will continue to press for an ongoing, comprehensive study to be conducted... at Mururoa... under the auspices of an independent body such as Criirad, and for France to accept liability for cleaning up Mururoa and Fangataufa.

France conducted 193 underground and atmospheric nuclear weapons tests in Polynesia between 1966 and January 27, 1996... Enough plutonium to make a small nuclear bomb has been left in the Polynesian atolls used by France... according to an International Atomic Energy Agency report... The agency said the amount was "relatively big" but insisted it posed no danger to the population... It also said there was no apparent link between the tests and cancer levels in the region... A bomb the size of the US device dropped on Hiroshima... would need around 17kg of plutonium.

"Here it is, General... plutonium." "That's the first I've ever seen, but after this, if you don't mind, I wish you would hold something under it because, after all, there's... over \$50 million in that tube." [Plutonium, which was discovered in 1940, is ACTINIDE ELEMENT 94 in MENDELEEV'S PERIODIC TABLE. It is man-made, and fissionable. When a *fission* bomb is detonated in a hollow sphere, the shaped charges blast inward and bring together quantities of plutonium (or uranium) in a specific manner to create a "critical mass." A critical mass requires that a certain weight of fissionable material must be assembled to sustain a chain reaction. When the critical mass is attained, the nucleus of the plutonium atom is bombarded with tremendous amounts of slow-moving neutrons. Some neutrons are successfully absorbed and split the nucleus. The result is the formation of lighter elements, the emission of more neutrons, and a violent release of energy. As more neutrons are multiplied, more nuclei are split, thus accounting for the term "chain reaction." This entire reaction takes place in a fraction of a second. The size of the explosion depends upon the efficiency of the CHAIN REACTION. The first atomic bomb explosion was performed near Alamogordo, New Mexico, on July 16, 1945, atop a steel tower. The blast was so powerful that the tower disintegrated as a result of vaporization and the sand in an 800-yard radius fused to glass.']21 days after the New Mexico experiment a B-29 was over Hiroshima... The destruction was unlike anything before. In an instant 71,000 people had died[(none American – but the 'US ship that delivered the bomb sank after being torpedoed and, due of the mission's secrecy, the survivors spent 4 days in the water before being rescued; many perished to sharks')]. The survivors had no idea of the new science and energy behind the weapon that had been used... Three days later... another 40,000 were killed in a moment... [at] Nagasaki... The heat and light gave horrific burns to all within 2 1/2 miles... The victims were filmed, though the pictures were kept secret for years... In the weeks and months that followed, many who had no visible injuries sickened... Thousands... died. Others remained ill and would continue to suffer for years to come. The Japanese surrender, five days after Nagasaki, was a moment of intense relief for the Allies... It was a triumph and at that moment in 1945 few foresaw how the bomb would bring a new arms race and unprecedented fear around the world. Others now wanted the bomb too... Joseph Stalin put his secret police chief in charge of a Soviet drive to acquire a bomb at any cost. Starting in 1946, the Soviet Union built 10 secret cities, known as atomgrads. Thousands of scientists and engineers were sent to work in them... The Soviet scientists were under intense pressure to deliver results... By 1949 the Soviets had what they wanted. The Atomic Race was now on in earnest. The Americans worked to stay ahead... In [their] tests the generals practised the military tactics that would be needed for the new wars of the future. They planned to send ground troops onto the battlefield after a nuclear strike and they wanted to know more about the physical effects on the soldiers. The Army and Marines Corp competed with each other, seeing how near they could get their men to a test blast. [The men were told:]"You are here to participate in an atomic manoeuvre... Watched from a safe distance this explosion is one of the most beautiful sights ever seen by man. You're probably saying '...what makes it so dangerous?' ...Truthfully, it's the... radiation level... but if you

follow orders you'll be moved out in time to avoid sickness. Finally, if you receive enough gamma radiation to cause sterility or severe sickness, you'll be killed by... flying debris or heat anyway." Sixty thousand troops took part in standard uniforms without any special protection. Civilian scientists warned[that] the soldiers were too close, but the generals went ahead anyway. "When we were brought here a voice from an unseen loud-speaker said, 'Good morning gentlemen... you're going to be closer to... an atomic bomb than anyone since Hiroshima.' ...They were being used as guinea-pigs, establishing what was possible... Though the tests were secret, there were small communities near enough to see what was going on. St George, Utah, was... 150 miles across the desert. Residents watched the flashes on the horizon and worried when clouds of dust followed one bomb, later called Dirty Harry. The Atomic Energy Commission assured them[via radio that] the fallout was quite safe... A year after the Americans had built the more powerful H-bomb, the Soviets caught up... As both sides ordered more warheads they realised that each now had the ability to destroy the other and could, in turn, be expected to be destroyed. Retaliation was guaranteed. This strategy was known as Mutually Assured Destruction (M.A.D). "In the olden days – pre-nuclear weapons – the politicians could start a war, send out young people to kill each other, and nothing would happen to them... With the nuclear weapon, everybody was at risk." ...In the Soviet Union, Europe and America, citizens now lived in a heightened state of nuclear terror... In Britain the Government made complicated preparations for Doomsday... Because American bombers were based in Britain, the United Kingdom was expected to be the first target in Western Europe... A dramatised version of an attack came in a film made for showing on BBC television in 1965... *The War Game* was banned and not shown for 20 years. The authorities called it alarmist and bad for morale. In the Government's own information films, underground control rooms handled attacks calmly... They showed officials tracking radioactive fallout and evacuating whole cities in an orderly fashion... American H-bombs were fired on remote atolls in the Pacific... [Survey aircraft had] carefully searched the area and reported no shipping... when the Americans let off their largest H-bomb ever in 1954... but... [t]he wind shifted... [and a] Japanese trawler... *The Lucky Dragon* was... well within the danger area... The 23 fishermen all developed radiation sickness. One died. Their experience provoked an outcry in Japan, where the extent of the long-term injuries to the Hiroshima and Nagasaki victims was only now emerging. Those stories had been suppressed immediately after the war... The Japanese had the greatest first-hand experience of what both an atomic explosion and radiation could do to people... "...but... we don't know how it's going to affect future generations." ...In the U[S], many of the soldiers exposed to the desert tests developed radiation diseases. The assurances given to St George that the fallout was harmless also proved wrong... "The first time it really hit me really strongly was when in 1954 we had a Down's Syndrome son born to us and we were very young parents. We found lots of others with the same situation... [F]or a small town we have an enormous number of children with... various genetic defects that were born around 1954..." ...After the first British H-bomb test in 1957 an entirely new type of popular protest emerged and it showed the real... gap between political leaders and grass-roots feeling... Demonstrators called on the Western powers to stop the Pacific tests... While politicians had tried to do something about the fear of nuclear war, people had growing concerns about the nuclear peace. Fears that the powerstations could leak radiation grew... [However, e]xperts said there was no other way to provide for the peoples' needs and the people... could trust them... [when they say that the nuclear "r]eactors have proven to be safe, reliable, economical." ...Almost all Western governments stopped ordering nuclear power-stations after Chernobyl but, despite passionate opposition, the Japanese Government continued its nuclear programme [by opening] a new fast-breeder reactor.

Japan is... refusing to answer... questions about how close a ship with nuclear waste cargo will get to N[Z] waters on its way to Tokyo. The British-registered ship Pacific Teal left the French port of Cherbourg last night with its radioactive consignment... Greenpeace, which mounted a protest at the French port, yesterday called for the Japanese and French ambassadors to be summoned by the [NZ] Government. That was ruled out, at least in the immediate future, by a spokesman for the Minister of Foreign Affairs... [The minister] made it clear to Japan late last month that N[Z] did not want it to come into the country's 200-mile exclusive economic zone... [His] spokesman... confirmed yesterday that N[Z]'s ambassador in Japan had continued to press for answers since then but had been refused details of the route. Relevant French and British authorities had also declined to give details. A Greenpeace activist... said Japan, France and Britain "have decided to act in flagrant disregard for the sovereign will and legal right of other countries to protect their people and resources. Despite the tremendous risks involved in transporting such material, Japan and France have been unwilling to consult with en route nations over basic issues as route and emergency planning and liability coverage." A Wellington peace activist... said yesterday that the secret Government Communications Security Bureau had monitored the waste ship that passed by N[Z] in 1993 and he expected the same would happen this time... Japan... faced a hostile diplomatic reception from South American countries when it took the last shipment via Cape Horn... So far Japan has only said that it will pass round the Cape of Good Hope.

...A cabinet meeting next week is likely to discuss N[Z]'s response to the nuclear waste shipment passing through the South Pacific... Greenpeace yesterday called for the Government to commit the Air Force and Navy vessels to ensure that the Pacific Teal, which is carrying reprocessed waste, keeps out of N[Z]'s... exclusive economic zone... The Greenpeace campaign director... said... "These shipments are a slap in the face of N[Z]ers, who have made clear their desire to be nuclear-free,"... Greenpeace officials in France had earlier released French foreign ministry documents showing the ship would traverse the Tasman Sea... Meanwhile, A[US] has refused to join N[Z] protests. A Foreign Affairs and Trade Department spokesman said the federal Government was satisfied with arrangements and noted that a similar shipment in 1995 passed without incident. He [didn't] point out that, because it also generates radioactive waste, AUS is unlikely to protest, but [added] that the high-level radioactive waste did not contain plutonium or uranium and the... return of the waste to Japan after reprocessing was... consistent with international standards which made countries using nuclear energy responsible for waste storage... Indeed, N[Z], as a member of the International Atomic Energy Agency, is a party to this international approval... But the [NZ] Labour Party's spokesman on conservation... said that unless N[Z] could co-ordinate effective protest within the Pacific and A[US], the Tasman would become the preferred route for decades... An Alliance co-deputy leader... said the shipments showed up inadequacies in N[Z]'s anti-nuclear legislation, which covered only the 12 nautical miles over which it had absolute control.

...About six or seven shipments a year of spent nuclear fuel or reprocessed waste will be made from or to Japan in the next few years, representatives of three organisations said yesterday... The shipments are a result of an agreement between Japan and France for France to reprocess and return fuel which it had earlier supplied to Japan... Because Japan has to import almost all of its energy requirements, the recycled plutonium is of considerable value. Within a few years all reactor fuel used in Japan will be recycled in that country... [The organisations have] teams in N[Z] on a public relations exercise to try to counter negative reaction to the voyage of the Pacific Teal, which left France last week... [The representative from] British Nuclear Fuels... said the Pacific Teal would try to avoid territorial waters but could not avoid exclusive economic zones. "The captain is in charge of the ship and if he needs to avoid some things then he needs to have the ability to take his ship where he needs to go for the safety of his ship, the cargo and the crew." [The representative] also defended the safety record of the business. While the Pacific Teal was only the second shipment of reprocessed nuclear waste, there had been more than 155 others of nuclear material since 1969. The ships were purpose-built and there had never been an accident.

...The risk to N[Z] and NZers from the passage of a ship carrying radioactive waste or plutonium through the Tasman Sea is negligible. It is as close to zero as any reasonably informed person could demand. The total physical volume of the waste in the... shipment is small and is incorporated in solid glass cylinders. These in turn are inside extremely strong and thick metallic shipping containers... In any conceivable accident involving the Pacific Teal, the most likely scenario would be that the shipping containers would not be breached and no radioactive material would escape... If the ship were to be wrecked on the N[Z] coast they would... effectively shield any curious member of the public... Much hyperbole and

many tendentious arguments surround the Pacific Teal shipment as with similar shipments in the past. A recent editorial in a N[Z] metropolitan newspaper multiplied the amount of plutonium in a shipment through the Tasman Sea in 1992 by one million... An environment spokesman for one of the major political parties in 1992 implied that if the ship sank in the Tasman Sea N[Z] would be uninhabitable for 25,000 years. In fact, there would be no effect on N[Z]'s environment whatsoever... Greenpeace argues... one radioactive isotope [i]s "the most dangerous substance known to man." They refer to plutonium which, in fact, is rather weakly radioactive because of its long lifetime. Its radiation is also weak and easily shielded. Furthermore, it is very hard to disperse in the environment. In essence, the only feasible way in which a person could become exposed to it is by getting a small fragment of the plutonium in a wound. That happened to a small number of workers in the Manhattan Project 50 years ago who were actually handling it. Their health has been at least as good as that of their contemporaries and most are still alive... If eaten, this same small fragment would be excreted along with the other unused substances in the food. Plutonium is not taken up by the body to any significant extent through the digestive process... I marvel at the plethora of disinformation... and... hysteria... which is appearing in the media. This is all the more surprising given that N[Z] has an excellent radiations protection agency in our National Radiation Laboratory. What is more, its most senior scientist... is a man with a well-deserved international reputation whose advice is widely sought outside his own country. I have not seen one article here which has even suggested that the National Radiation Laboratory was ever approached for advice. In this matter N[Z] is rapidly losing international credibility... Informed, factual criticism can sometimes influence the behaviour of other nations. Ill-informed, inaccurate and meretricious arguments can only cause these other countries to undervalue, or at worst ignore, any international protests made by N[Z] on this, or any other, subject.

...The N[Z] Government is trying to politicise nuclear waste shipments and is not willing to understand scientific arguments, says the Japanese Embassy... "Even A[US] shows an understanding and is not trying to politicise this matter,"... [said a]n embassy minister... who attended a meeting with senior foreign affairs staff in Wellington on Wednesday... While a lot of information was given to foreign affairs staff, the deputy-secretary... had not taken notes of what was being said, [the minister added. However, the deputy-secretary] responded yesterday: "Maybe they don't like being told the facts of life. Obviously it shows the representations we've been making to them are hitting home." At the meeting [the deputy-secretary] said the shipment represented a new risk in this part of the world. N[Z] had strongly advocated a new liability convention as existing treaties covering disasters did not go far enough. A spokesman for the French Embassy... who also attended the meeting, was not prepared to comment publicly on the N[Z] approach. However, French diplomats are clearly worried that a row over the Pacific Teal will again sour the atmosphere just as it is planning visits designed to build up French-N[Z] goodwill. The First Secretary at the British High Commission... said he felt the meeting went well. "I think they listened and there were strong political messages delivered by both sides. They [N[Z]] asked some strong relevant questions,"... The Minister of Foreign Affairs... said he still hoped information about the ship's route would be made available nearer the time the ship sails through the Pacific. "We would rather it didn't come, but there it is and we know it can legally traverse the Tasman."

...The French phrase for reprocessing plutonium is "recyclage,"... For public relations purposes it is a wonderful way of sanitising... the... process... to make it sound as safe and desirable as [householders'] weekly recycling efforts. In fact, the reprocessing of plutonium is an inherently risky and dirty activity. Not only does it require shipments of spent fuel across the globe, it also results in the creation of yet more radioactive waste. It is estimated that by the end of reprocessing as much as 189 times more waste has been generated than that produced by the original irradiated fuel, including discharges to the air, earth and sea... Independent scientists have also raised questions about the integrity of the stainless steel casks and their elastomer seals... [used by] the... plutonium... reprocessing... trade... While Pacific Nuclear Transport Ltd claims absolute safety for the shipments, the International Atomic Energy Agency standards which the shipments must meet are seen as inadequate by many nations... For example, they recommend casks withstand 800 deg C fires for 30 minutes, when an average maritime fire burns for an average of 20 hours in excess of 1100 deg C. The idea of reprocessing plutonium from nuclear reactor waste to fuel fast-breeder reactors is a nuclear fantasy from the 1970s when it was thought uranium would dwindle in supply and skyrocket in cost. In fact, the uranium market is now characterised by very low prices and over-supply. At the same time, fast-breeder reactor programmes have proved extremely costly... [-] OECD countries are estimated to have spent more than \$NZ\$7 billion on fast-breeder development... [-] hazardous to the environment and have produced only very small quantities of energy... Japan's Rakkosho-mura reprocessing facility is to begin operations soon after 2000. However, Japan will not be using the plutonium shipped over the next decade until at least 2030 for commercial energy production. It already has a stockpile of some six tonnes of plutonium. By 2000 its plutonium stockpile is projected to be some 50 tonnes. In the meantime, while it is clear current Japanese policy does not countenance military use of plutonium, the International Atomic Energy Agency has observed that Japan has the ability to "weaponise" its plutonium within two weeks. The problem is not solely Japan's: by 2010 France, Britain, Russia and Germany will have commercial plutonium stocks of some 500 tonnes – more than twice as much as military stocks are projected to be, and adequate to construct some 71,000 nuclear weapons. Plutonium is highly radio-toxic and has a half-life of more than 24,000 years. It is difficult to predict any government's policy for the next 2.4 years, yet alone across millennia. Whether or not it comes into N[Z]'s exclusive economic zone, the Pacific Teal shipment is part of a global plutonium trade that poses a large and long-term risk as well as immediate threat. This has been recognised around the world, and is reflected in the efforts of Brazil, Argentina, Chile and Uruguay to ban the ships from the [ir] 200-mile zone[s]... To attempt to stop both the shipment and the plutonium trade, therefore, is an eminently rational response from N[Z]ers.

...Greenpeace presented a petition yesterday signed by 24,000 [NZers] opposing the nuclear waste shipment on the British-flagged Pacific Teal. Greenpeace estimates the ship... may pass through the Tasman Sea this weekend... [In this instance the estimate is correct, but w]hy is it that most statements by Greenpeace spokespeople on the subject... are generally wrong? ...[the] campaign director for Greenpeace N[Z], asserts that reprocessing of nuclear fuel produces 189 times more waste than has been generated by the original irradiated fuel. However, there must be less radioactivity in the waste after processing than before... But perhaps she has discovered a new way of creating energy? ...A standard Greenpeace technique is to make extreme and unrealistic claims. There are several examples of this in [the director's] articles. The one I liked was this scenario: Suppose one engine of the Pacific Teal broke down. Now suppose that the second one did as well. Now suppose that it experienced a Pacific cyclone and further suppose that there was a high-temperature fire as well. Clearly we should ban such risky ventures. This is akin to demanding that airliner flights over Auckland should be banned... on the grounds that... two aircraft could just possibly... collide... There are a number of errors when she discusses light water reactor fuel... The spot price of uranium oxide ore has risen from \$US9.60... a pound at the beginning of 1995 to around \$US16.50 in August of last year and is expected to go to \$US20 by 2000. World uranium production is about half of world consumption at present. This is hardly a market "characterised by very low prices and over-supply." ...Finally, I must comment yet again on "plutonium is highly radio-toxic and has a half life of more than 24,000 years." Because of its long half life it is not highly radio-toxic at all. Despite the oft-repeated mantra which implies that exposure to one milligram will give you cancer, the effect of eating 1000 times as much will not increase your chances of cancer in any significant way whatsoever.

...Advocates for the nuclear industry appear to be as blind to its hazards as the tobacco industry hacks who denied the link between smoking and cancer for decades... [A] professor of physics at the University of Auckland... accuses Greenpeace of being wrong about the risk of nuclear power and nuclear waste shipments. His article is a good example of what happens when facts take a back seat to rhetoric. For example, he repeats the nuclear industry's favourite line that until increases in childhood leukemia around nuclear plants are fully understood, the nuclear plants are innocent of any responsibility... You don't have to be a rocket scientist to understand that absence of evidence of what precise mechanism leads to

the cancer does not equal evidence of absence of such a case. [The professor's stance isn't helped by the fact that 'after decades of denying there was any risk to the workers who made its nuclear missiles, the US Government has finally admitted above normal rates of cancer had been found at 14 sites.' The p]rofessor... contests Greenpeace's statement that reprocessing plutonium creates more waste than the original spent fuel by arguing that the waste contains less radioactivity. The point is that the chemical separation of plutonium from spent fuel creates large amounts of waste that would not otherwise be created. The figure cited by Greenpeace is from a study of the THORP reprocessing facility at Sellafield in the UK, conducted by an independent industry consultant... and takes into account radioactive waste produced through all states of reprocessing, including the decommissioning of the reprocessing plant. [The p]rofessor... argues that the risk of any accident involving the Pacific Teal is "extremely tiny["] and makes a nonsensical comparison with the possibility of an aircraft collision over [Auckland]... Needless to say, aircraft accidents do not result in long-term exposure to radiation of the marine environment or the public. The Titanic was unsinkable – the accident involved factors which [sh]ould never have occurred at the same time – and the space shuttle Challenger was certainly built to fly rather than to explode and fall to Earth. Accidents do happen and the transporters of nuclear waste do not have the right to decide what risks nations along the route will accept.

...N[Z] is unlikely to send an Orion aircraft to monitor the... Pacific Teal, now steaming through the Tasman Sea, unless the ship alters course... Yesterday afternoon the ship... was 350 nautical miles due east of Sydney – well clear of N[Z]'s economic zone... It is thought there is little point monitoring the ship's movements by air, given its distance from N[Z] and the fact that intelligence agencies are tracking it by satellite... [Meanwhile, a] train carrying a[nother] controversial shipment of nuclear waste arrived at its destination in northern Germany yesterday after being delayed for several hours by anti-nuclear activists. The train, loaded with six containers of nuclear waste from Walheim, southern Germany, arrived in the town of Dannenberg after a 20-hour journey. About 5000 demonstrators near the station greeted the train's arrival with boos... Its cargo was to be loaded on to trucks and transported, probably today, to the Gorleben storage depot some 20km away. Anti-nuclear activists had staged several protests along the train's route. Two demonstrators who dug holes under a railway track near Dannenberg and secured their arms inside with quick-drying cement caused the longest delay... Some activists set up burning barricades to block a road the truck convoy was expected to use. Others tunnelled under other parts of the likely route to weaken the road structure. Police said it was possible one road would have to be closed.

...A controversial nuclear waste shipment completed the last leg of its journey to a dump in northern Germany, [where it was] greeted by boos... from a crowd of anti-nuclear activists. A convoy of six flat-bed trucks carrying containers of spent fuel rods arrived at Gorleben storage depot under heavy police escort after protesters tried to disrupt its 20km journey from a loading station in Dannenberg. What should have been a relatively short journey took three hours as about 5000 protesters posted along roads leading to the dump did their best to block the way. It took Germany's biggest post-war security operation, involving 30,000 police nationwide – and costing 66 million marks... – to ensure that the radioactive shipment completed its journey... Explosive experts were called to a spot where an anonymous caller said a bomb had been planted. It was not[yet] clear whether the object was an explosive device or a dummy... [In related news,] Vanuatu non-government organisations have called on their Government to ensure the island nation's 200-mile exclusive economic zone would be protected if the Pacific Teal... came near on her way to Japan.

...Jeered by anti-nuclear protesters, a British ship carrying nuclear waste from France docked safely in northern Japan yesterday. Escorted by two tug boats and six police helicopters flying overhead, the Pacific Teal ended an eight-week trip... that took it past about 20 nations... About 150 activists from environmental groups such as Greenpeace lined a road outside the harbour complex within sight of the ship to protest against its cargo... But the protests were minor compared with demonstrations over the first waste shipment which arrived in April 1995 at... the port of Mutsu-Ogawara... about 580km north-east of Tokyo, which was custom-built to handle nuclear waste shipments... After tests for any leakage of radiation, the... 40 stainless steel canisters... will be stored for 30 to 50 years at a special cooling facility at nearby Rokkasho village, Japan's only such storage place, and later buried at an unspecified location. The Government has not selected the ultimate destination and residents fear they may be stuck with the toxic material. Tokyo plans eventually to ship 7100 tonnes of spent fuel to France and Britain for reprocessing into 30 tonnes of fuel-grade plutonium, yielding 3000 tonnes of waste.

...Two more cargoes of highly radioactive nuclear waste will pass by N[Z] this year, a nuclear expert has warned... [The] president of the Washington-based Nuclear Control Institute... said the Pacific Teal was a test run for bigger loads. He predicted a shipment in July would carry 150 canisters, and another would follow in December. He said the N[Z] Government should condemn the shipping of radioactive nuclear waste before the Pacific became the path of least resistance for more shipments. "Eventually traffic from Britain will begin... That is why it's such a critical time right now for the opposition to be vocal."

...Britain said yesterday that it would ratify an international treaty to create a nuclear-free zone in the South Pacific... The Treaty of Rarotonga bans the acquisition, stationing or testing of nuclear explosive devices and the dumping of radioactive waste...

Legislation to extend N[Z]'s nuclear-free zone has been drafted by the Alliance co-deputy leader... Her private bill would ban nuclear-powered ships and those carrying radioactive cargo from coming within 200 nautical miles of the coastline. "It puts protection of our environment above the rights of foreign nuclear powers to devastate our waters and coastline," said [the MP] yesterday. - 1997

NZ officially declared itself a *nuclear-free zone* in the mid-1980s, and has been trying to have the zone extended over the entire Pacific region ever since. The reaction of a certain nuclear superpower to the anti-nuclear stance partially explains NZ's failure to convince the entire region to quickly follow suit.

Although complicated by politics and personalities of the day – including a deeply felt American sense of betrayal – the essential Anzus objection to N[Z]'s ban on nuclear weaponry was that it eroded the atomic shield which was supposed to keep communism and global war at bay. The position held in both Washington and Canberra was that all Western nations should bear a burden of responsibility for the continued security afforded by U[S] might – in essence, unquestioning acceptance of the doctrine of nuclear deterrence and of the weapons that made it work.

The U[S] has again given N[Z] the fingers about our anti-nuclear ship stance. The most powerful US delegation to visit A[US] since... the mid-1960s [– when 'AUS was the third largest market for US arms sales' –]will arrive in Canberra early next month... The bilateral talks with the A[US]ns centre on issues vital to N[Z]... The Government has passed the snub off... [A] Victoria University foreign affairs and politics expert... says N[Z] cannot deny the Americans ignoring N[Z] on the visit is a further snub but the A[US]ns will want to be seen to be letting N[Z] know what went on. They are well aware there is a feeling A[US] heaved N[Z]... over the Anzac frigate deal, he says. - 1989

As one military official said, the Americans are the worst for telling their allies what to do, with Australia a close second.

The letters AUS can, after all, mean *next-to* the US. Alternatively, AUS is just USA with its arse at the front!

Not a chink of light between A[US], US The communique at the conclusion of A[US-US] ministerial consultations in Washington this month illustrates rather well just how far the Anzus alliance has been transformed since it was first signed and its provisions were suspended in 1986 over

N[Z]'s non-nuclear policy. The transformation received impetus... last year... when [a new] Government took office in A[US] (during a meeting with the US President, the AUSn PM 'chronicled the influence US federalism had exercised in the shaping of the AUSn Commonwealth: "Our association goes beyond the formal elements of a treaty or an alliance – it's an association of like-minded people committed to common values with many shared historical experiences, many common cultural attitudes and, above all, a very deep commitment to democratic institutions, values and freedoms of the individual"; AUS's wartime PM Mr John Curtin started it after the fall of Singapore, when he declared: "Without inhibitions of any kind I make it quite clear that AUS looks to America"'). In its origins Anzus was... essentially a defensive treaty. The Anzus of 1997, on the other hand, is now... aiming... to deliver security to Pacific East Asia, and indeed to the world... A recent white paper on A[US]n foreign policy, places the U[S] relationship at the very centre of A[US]'s external policies, and at the core of that relationship is the security alliance... It is notable... that in a document replete with shared world view, the ministerial communique by the U[S] and AUS] nowhere acknowledges the security role of the U[N], nor peacekeeping and related activity, and the need for member countries to strengthen U[N] capabilities for ready response, conciliation or good offices. [■ A nuclear bomb may have been detonated in the air over a northern Queensland rainforest at the height of the Cold War. Declassified documents show that Britain, the US and AUS set off a 50-tonne bomb in the rainforest at Iron Range in 1963. It was part of a secret military experiment codenamed Operation Blowdown.]

... 'AUS's Government flirted with a nuclear weapons programme, even while it supported international moves against nuclear weapons proliferation. Cabinet papers for 1968 reveal a programme capable of producing up to 30 nuclear bombs a year would have cost what now seems a bargain price of \$A150 million. But after consultations with the US Secretary of State, AUS was left in no doubt that Washington regarded the non-proliferation treaty as vitally important.'

... 'NZ would need to change its anti-nuclear stance before it could be readmitted to the Anzus alliance, a senior US official said last night. The briefing, given ahead of the arrival this weekend of the Secretary of State, puts a tougher twist on a visit the Government claims as a coup. While the Secretary will be the highest-ranking official to visit in the wake of NZ's adoption of anti-nuclear legislation in 1985, the message is clear that the relationship has warmed, but the nuclear freeze remains.' ● NZ would abandon its anti-nuclear laws in a flash if it really needed US help, says departing US Ambassador']

...Glowing praise for N[Z] naval patrols in the Gulf has not cracked American opposition to resuming military exercises with this country... [The US] Embassy cites N[Z]'s ban on nuclear ship visits as a lingering obstacle... Military chiefs[in NZ] can... only cast a wistful eye across the Tasman to the huge Tandem Trust exercise between the U[S] and AUS], to which they have not been invited. That exercise, involving 27,000 armed forces [personnel], began this week under a joint security declaration by the two countries in July[1996] to update the 45-year-old Anzus Treaty.

...Representatives of [NZ's 3] armed services have just returned from a demonstration of a proposed American-designed command and control system... [that] would give strategic and battlefield decision-makers a comprehensive, global picture of the deployment and state of readiness of military forces around the world. [But the US] is unlikely to give N[Z] full access to the system while the port ban remains on nuclear warships.

...The [NZ] Minister of Defence... showed signs in Auckland last night of preparing to revive public debate over nuclear ship visits... "As a politician I must accept there is strong opposition to anything nuclear in N[Z]," he told... a select audience, the shadowy Secret Air Services at a regimental dinner... on the eve of the arrival... of a British conventionally powered warship... "However, if such opinions were formed on the basis of clear scientific facts, then it may be that N[Z]ers would come to a different view." [He] said it was not well known that N[Z]'s relationship with the U[S] following the ban over nuclear ship visits was costing this country dearly in terms of trying to maintain the highest military standards. But he believed the younger generation reaching maturity had a greater appreciation of N[Z]'s place in the world than those who grew up "in the cocoon of the welfare state. It may be that the younger generation of N[Z]ers who have an international outlook will start to generate renewed debate on such issues." ...While acknowledging he had no firm data to confirm that feeling, he indicated he was seeking information over the next few weeks to do so... Both Britain and the U[S] have removed nuclear weapons from their surface ships but Washington refuses to send conventionally powered craft here... [The 41st] President ordered all bombers off alert in September 1991... Although the bombers could be rearmed within 72 hours...

THE former... Commander-in-Chief of the United States Strategic Command... [who] was in charge of all US air force and navy strategic nuclear forces... arrived in Auckland early today... [and said] he was outraged at the time by N[Z]'s no-nukes policy... [The] General... retired after 33 years of military service in 1994... [and] was now an anti-nuclear activist... "...Now that I have made this difficult intellectual journey, I have... changed my mind, but at the same time I don't apologise... Here was the U[S] carrying the burden of deterrence for the free world and this country wanted no bar of it... The real concern was what if that attitude spread to other nations around the world – if the world became New Zealandised, what would that mean? ...Now I have concluded that nations, like people, must ultimately speak from their consciences and that's what N[Z] did – and I respect that..." He said it was much easier for countries on the sideline to take a dispassionate view... [However, his] first doubts about the American nuclear build-up came in 1969 when he realised antiballistic missiles were not a guarantee against nuclear attack. The military response was to create a formidable nuclear arsenal to act as the ultimate deterrent. "But what would happen if the deterrence failed? Complete annihilation... We fabricated 70,000 nuclear warheads at a cost of \$US4 trillion. What is it that prompted people to do this? Why is it that people like myself didn't hear any objections, didn't ask why?" ...When N[Z] officially declared itself nuclear free in 1987... [the] then vice-director of Strategic Plans and Policy, considered the act "outrageous." ...Nevertheless, by the time he was promoted to... Commander in Chief... in 1991... he had "grave reservations. I looked at the 12,500 targets and knew beyond a shadow of doubt that we had created an absurd circumstance. I felt I was caught up in a process which no one was in charge of." On his desk were orders for \$US40 billion of strategic nuclear warheads. "How could this be when the Cold War was ending? My answer was 'no,' we don't need to do this anymore."

...A former Labour P[M], David Lange, invited the U[S] in 1984 to bring the nuclear ships issue to a head to "see how things develop." This has emerged in Ministry of Foreign Affairs and Trade notes of a meeting in New York between [the newly elected PM] and the U[S] Secretary of State of the day... The notes, released to the Centre for Peace Studies at Auckland University, quote Mr Lange as inviting the U[S] to submit its normal annual request for ship visits to give the Labour Party "something to talk about." Conventional wisdom seemed to be that he should put off facing the issue in the hope it would go away, he was quoted as saying at the meeting... [The Secretary of State] is reported to have welcomed the proposal and suggested the sides keep in touch to try to work a way through the impasse resulting from the [NZ] Government's ban on visits by nuclear-armed or powered vessels... [However, when it came to the U[S]... policy of neither confirming nor denying the presence of nuclear warheads on ships, he said it would be "suicidal" in military terms to disclose such information. Mr Lange said he understood the policy but appeared to rule out any chance of a solution acceptable both to "vociferous" opponents of warship visits and himself unless it could be softened... [F]our months later... the Government... denied a U[S] request to send the nuclear-capable destroyer USS Buchanan to N[Z]. This refusal sparked swift retribution which has effectively frozen N[Z] out of Anzus ever since.

...Hostility stoked anti-nuclear fires... Foreign antagonism united a nation, recalls... the man behind an anti-nuclear policy which became law 10 years ago yesterday... N[Z]'s controversial... anti-nuclear policy might never have become law if the U[S] and France had not reacted to it with such hostility says the former P[M] David Lange... The two nuclear powers' aggressive response to N[Z]'s anti-nuclear stance created a groundswell of support for it... "People were saying... if you give in now to those Americans we'll never dream of voting for you again," he said... P[M] from 1984 to 1989, [he] championed the anti-nuclear debate by declaring N[Z] a nuclear-free zone and banning all nuclear-armed and

nuclear-powered ships from its shores as soon as he took office. The U[S] reacted by suspending N[Z] from the Anzus defence alliance with it and A[US]. France sent secret agents to N[Z] in 1985 to blow up the Greenpeace flagship, Rainbow Warrior. [The former PM] said the actions of both countries exposed the “hypocrisy” of the Western Alliance towards nuclear disarmament and he slammed the Comprehensive Nuclear Test Ban Treaty, saying it wasn’t worth the paper it was written on. “The super powers have never done anything on the nuclear issue that inconvenienced them in the slightest way. They’ve never fixed a date for disarmament but we have always pledged to do it.” ...N[Z]’s stand earned it respect... “It was a matter which enhanced N[Z]’s standing, not in the nuclear power countries but in the rest of the world. Certainly in India, in the Asian subcontinent and in Africa there was enormous support for it. And what has happened since then of course is that there has been an enormous enthusiasm for people to say that they are nuclear-free and anti-nuclear.” ...he was proud of N[Z]’s nuclear-free law, despite the costs... The policy was enshrined in the N[Z] Nuclear Free Zone, Disarmament and Arms Control Act of 1987. - 1997

Traces of radioactivity... have been detected in an Auckland estuary... The caesium-137, produced by nuclear reactions, may date back to 1964. The levels found are too small to be harmful... [T]he National Radiation Laboratory of N[Z] says 1964 and 1965 were peak times for caesium deposits in N[Z] – ...most came from the Soviet Union and U[S] atmospheric nuclear tests in 1961 and 1962 and were deposited through rainfall.

...A senior scientist in France’s nuclear monitoring agency has admitted that the rock of Mururoa Atoll is deteriorating because of sustained nuclear testing. Entire sections of rock in the atoll’s northeast are threatened with collapse, the daily *France Soir* newspaper reported... [The NZ] Disarmament Minister... said last night that the French admission brought it into line with the concerns first expressed by Norman Kirk’s Government in 1973. But N[Z] had known about damage to the atoll since a... report[issued three years ago]. The International Geomechanical Commission added strength to that assessment [a year later] when it reported on plutonium “hotspots” and the risk of part of the atoll collapsing, possibly causing tidal waves. Following those reports, France set up continual monitoring. The admission is the frankest by French authorities on the long-term effects on the atoll... The French Embassy in Wellington did not respond to a *Herald* request for comment. [□ ‘Relations between NZ and France were seriously impaired by the sinking of the Greenpeace vessel, the NZ PM accusing the French of “a sordid act of State-backed international terrorism.” The official French reaction was at first to disclaim responsibility, but in face of NZ’s demands for the truth, and a campaign by the French Press, the French PM announced on Sept 12, 1985, that *Rainbow Warrior* had been sunk by French agents. This followed the resignation of the French Defence Minister and dismissal of the head of the secret service. It was reported that French documents concerning the sinking had been destroyed.’]

...AT ten minutes to midnight on July 10, 1985, a bomb rips through a boat moored at Marsden Wharf in downtown Auckland. That boat, of course, was the Greenpeace flagship, the Rainbow Warrior – and N[Z]ers awoke to the news of the country’s first international terrorist act... [Today, as] France’s first nuclear-powered aircraft carrier, the *Charles de Gaulle*... which took 10 years to build and cost almost 20 billion francs... left port... for sea trials... the Rainbow Warrior lies at rest where she was sunk for the second time, in 1987, off Mātāuri Bay in Northland. There was a final protest: a Greenpeace supporter attempted to chain himself to the ship’s railings in a last-ditch attempt to stop the scuttling. But scuttled she was... Little remains of the Warrior’s superstructure. What is left of the ship’s rails is completely covered with common and jewel anemones. Hydroids grow like white bonsai trees. Her deck has been colonised by a forest of ecklonia kelp. Divers encounter scorpion-fish which, when lit by torch, display their brilliant red colour, and the glaring eyes and erect venomous dorsal spines that indicate a response to threat... The Warrior has become a living ecosystem; part of Northland’s coastal reefs. And a rainbow-hued underwater memorial to a black day in history.

...A book by one of the French agents who sank the Rainbow Warrior claims they planned only to blow off the propeller but were ordered by their political masters to sink the Greenpeace ship. [The s]aboteur... also reveals in his biography, *The Secret Dairies of a Combat Diver*, that before their mission – code-named Operation Satanique – France had tested a “bacteriological weapon” to cripple the ship’s engines. [He also] claims that indirect French actions against Greenpeace dated back to the 1970s, when agents routinely sabotaged protest missions to France’s South Pacific nuclear test atoll, Mururoa... One of two agents captured and jailed in N[Z] after the 1985 explosion in Auckland, [the saboteur] claims to have been horrified by the death of photographer Fernando Pereira, who was killed in the bombing. The agents heard the news hours after the attack and were shocked at the catastrophe. [The two captured agents] were eventually sentenced by a N[Z] court to 10 years’ jail on manslaughter charges. They spent only eight months in a N[Z] jail before being flown to the French atoll of Hao, where they stayed for just 17 months before heading home. In his book, just published in Paris, [the saboteur] paints an operation that was cursed from the outset, thanks to interference by the French Defence Minister... and chiefs in charge of... the French foreign intelligence service, the... DGSE. [The minister], he says, demanded that... the agency carry out the attack quickly. There was, therefore, no time for the DGSE to carry out reconnaissance. There was dismal ignorance of N[Z] within the DGSE and French political circles... “We did not know that in this country you cannot make a move without being observed, that informing the police is a national duty.” In Auckland last night, [the saboteur]’s version of events was condemned by... the Rainbow Warrior’s second engineer, who cheated death by going for a walk minutes before the bombing. The Dane said she felt insulted by claims that the French never intended to kill anyone. “When you plant two bombs on a manned ship in the middle of the night and don’t give any warnings, you expect to kill people... They were terrorists and murderers – nothing more.” [She said the saboteur] had been decorated and treated as a hero for what he did. [‘The Rainbow Warrior bombing isn’t listed as an act of terrorism – it’s listed as a mistake.’] “The only thing that was a mistake in their eyes was that they got caught.” ...One of our “nation of police informants” who helped nail [the saboteur] is proud that do-it-yourself crime fighting still rankles with the French terrorist. In the weeks leading up to the bombing, [the informant], a vice-commandore of the Auckland-based Outboard Boating Club, helped to organise a night vigil to protect boats that were being targeted by thieves. Eagle-eyed volunteers saw one of the French agents come ashore, tie his dinghy up and hop into a waiting van... The witnesses reported the frogman and the van’s registration number to the police. They arrived too late to catch the man, but found an outboard motor and a French military diver’s rebreather tank that the bombers had discarded. “It was a pretty good feeling that our members helped nail those responsible for one of N[Z]’s most notorious crimes... The only annoying thing is that criminals never seem to get properly punished for what they have done.” The boating club incident was one of at least three where vigilant N[Z]ers saw the French agents and later provided police with vital evidence. A rental van receptionist kept [2 agents] talking while she called police, and in Northland a forestry worker suspicious about a car driven by agents from the saboteurs’ yacht, *Ouvea*, also told investigators of their movements.

...A gruff individual, [the]... French Defence Minister... was pushing for France to react swiftly and punitively against terrorists or groups that threatened its interests. Political demands for quick results... had already caused the DGSE... to foul up an operation in 1983, when French agents tried to blow up the Iranian Embassy in Beirut in reprisal for a terrorist attack in Lebanon. The truck bomb did not go off and an attempt to ignite it with a rocket-propelled grenade also failed, leaving behind equipment with the DGSE’s insignia. No one in the agency heeded the warning signs, and it was against this backdrop of meddling and incompetence that Operation Satanique... was conceived... [T]here was no satanic or cult significance... all operations at that time were codenamed to start with the letters S and A after the agency’s Service Action, which carries out undercover operations abroad... There were no meetings to coordinate work between the various units... [The author of the] book, *The Secret Dairies of a Combat Diver*... [who was] full of misgivings, was in charge of planning the attack itself, using a three-man team that arrived in Auckland on board the yacht *Ouvea*. Neither [he nor the] agent... who was in charge of logistics and getting the team out after the bombing, had any first-hand knowledge of the situation on the ground before their arrival... [in “]an insular country, distant, withdrawn, which does not think for a second that it will get caught up in the turbulence of the world,”... the “little Switzerland of the Pacific.” ...The saboteurs left plenty of clues for the locals to discover... For reasons that [the author] says he cannot fathom, even today, the... heads of the DGSE... insisted that the [bombs]

carry a four-hour timing delay, instead of the usual 24 to 48-hour delay that enables agents to make their getaway. Service Action... took every precaution to prevent loss of life. It acquired copies of the builder's drawings of the Rainbow Warrior and made special charges for parts of the hull where there were no cabins. It also timed the attack to occur late at night, when there was less likelihood of many people being on board. But... [a]fter the first blast, Fernando Pereira went back to recover his photographic gear, just as the second charge went off... At that point, according to [the author]'s version, the DGSE cruelly abandoned... the two key operatives... to their fate... No help or guidance is offered... [when, h]oled up in a Hamilton motel, they make a distress phone call to the DGSE... and their case officer is, inexplicably, unavailable... Paris' disavowal of the officers was... the work of [the Defence Minister], who brushed aside an appeal by the DGSE chief... for France to make a clean breast of things with Wellington. Back in N[Z], the two agents... discuss whether to take shelter in the French Embassy in Wellington or disappear into the N[Z] countryside and live rough. They decide in the end that their best hope is to use their fake Swiss passports, which they used to enter N[Z], in the hope that the authorities will not check them. It proves a vain hope... The entire responsibility for the operation fell to them. Charged with murder, they were facing life imprisonment. Only when the scandal became public in France did the [French] Government accept responsibility. [The Defence Minister] quit on September 20, 1985, followed by [the DGSE chief] six days later. The charges [against the captured agents] were scaled down to manslaughter... [The author] gives an insight into the supposedly top-secret negotiations between Wellington and Paris over the transfer of the pair to Hao... The deal was announced to great fanfare on July 7, 1986 – but... he had known of it as early as June 24, when he was asked to sign a document agreeing to his expulsion from N[Z]... The motive for his book is clearly anger at his former bosses and at what he sees as a whispering campaign among erstwhile colleagues that he botched the operation... He retired in 1995 with the rank of colonel and now, at age 48, lives on a pension, making adventure trips to exotic locations such as Arctic Canada and Madagascar. He says the Rainbow Warrior affair deeply marked him, especially the loss of his secret identity. Because of his brief encounter with fame, he is suspicious of people who seek to befriend him. The former secret agent says he was treated fairly and decently by N[Z] at every stage. His book shows no remorse for the attack, though he openly admitted to... [t]he French daily *Liberation*... that Pereira's death was a matter for his conscience. "If that hadn't happened, the business would have ended quite differently. We could have had a good laugh about it as time went by. But now, we never will."

After serving part of their sentences in a NZ jail, the two agents were handed over to French authorities in return for a meaningless promise not to oppose NZ requests for increased exports to the EEC (NZ's request was 'blocked by Ireland' instead) and some fines.

The *Peace and Disarmament Education Trust (PADET)* was established in 1988 with a fund of \$1.5 million, part of the money paid by the French Government in compensation for the sinking of the *Rainbow Warrior*... The *New Zealand-France friendship fund*, also established with *Rainbow Warrior* compensation money, is largely used for exchanges of young people between France and N[Z].

New, happier chapter in relations with France... Rows over nuclear testing and the Rainbow Warrior bombing were put to the side yesterday as France and N[Z] embarked on a new diplomatic and political relationship... N[Z] was an ally long before French nuclear tests started at Mururoa... This long friendship was remembered during talks between [NZ's PM] and the French P[M, who]... said France had as a souvenir the N[Z]ers who... lost their lives saving French liberty 80 years ago... He told reporters the "misunderstanding" between the countries was a thing of the past. [However, 'military links between France and NZ have still not been fully restored' – although a French frigate is due to visit NZ.]

...A French Navy frigate, La Nivose, broke N[Z] maritime law yesterday by sailing from Wellington without a pilot, who was five minutes later than expected... [The] Harbourmaster... issued an urgent warning to other ships on the harbour... The Maritime Safety Authority director... was appalled. Sailing without a pilot could endanger other ships, including ferries, he said. "Pilotage is not there for fun. It's there for assisting mariners who are unfamiliar with restricted and potentially dangerous waters..."

...A British warship will plough N[Z] waters over the next fortnight as part of a demonstration to Asian and Pacific nations that Britain is not bowing out of the region... [following] its withdrawal from Hong Kong next month... The guided-missile destroyer HMS Gloucester will leave a Royal Navy task force exercising in Asia and arrive in Auckland on Monday... The Gloucester will be the first British warship in N[Z] since 1995, when the frigate HMS Monmouth and a naval tanker broke a decade-long freeze associated with this country's ban on nuclear ships. Nuclear weapons are no longer normally carried on any British surface vessels, as opposed to submarines, nor are any of them nuclear-powered... The British High Commission defence adviser... said Britain hoped to send large fleets on exercises to the region every four years and make ship visits to N[Z] and AUS every second year... N[Z] is still barred from military exercises with the U[S], which remains miffed that its nuclear-powered ships are banned from... [NZ waters. Incidentally, t]he family of a New Jersey woman killed in the 1983 downing of a Korean Air Lines jet by the Soviet Union, has been awarded \$US2.1 million... the largest jury award yet against KAL in the crash. - 1997

The recent bombing of the Rainbow Warrior and the resulting death of a crewman has clearly illustrated the lengths to which France will go to protect its nuclear test programme. Shocking as the bombing was, the incident involving the Korean airliner, KAL 007 (surely that number is the sickest of the CIA's 'jokes'), and subsequent deaths of 269 mainly innocent people, surely dwarfs the Rainbow affair. But the public, it is said, have short memories and as further evidence comes to light of the full horrific details no doubt many will have forgotten what the initial point of the exercise was. At present a civil suit for damages on behalf of the victims is proceeding in the US District Court in Washington. The latest evidence of an official air traffic control tape from Anchorage... suggests radar operators knew a full four hours before the jet was shot down that the jet was off course and failed, for whatever reason, to warn it. Possibly more evidence will come from this court case, but as the following article... [b]y... a fellow of Magdalen College, Oxford... points out, the immediate objectives of the Pentagon have already been achieved *An airliner is sacrificed to get [US] missiles into Europe*... The tragic fate of its 269 passengers and crew brought anti-Soviet feeling to a new pitch throughout the West. Once KAL 007 went down there was little doubt that the emplacement of Cruise and Pershing would go ahead, come what may... Early in 1983, as the fateful date of the Cruise-Pershing deployment nears... an unexpected threat to the... deployment surfaces in the shape of the growing peace movement in Western Europe. [Many Europeans were unhappy that US nuclear missile bases meant their neighbourhoods were targeted by Soviet nuclear missiles.]A number of governments – those in Norway, Denmark and Holland – already seem very wobbly under the pressure and there could be a domino effect if even one refuses Cruise... It is touch and go. What would be really convenient would be one of the periodic displays of ruthless brutality the Russians are so well capable of – something which... would horrify even Left-wing Western opinion... By this stage KAL virtually suggests itself. South Korea is a pliant client State, a dictatorship where secrets are kept. It also has a plentiful supply of anti-Communist fanatics willing, as was evident from the Flying Tiger days on, to fly virtual kamikaze missions for the cause. Its airline not only flies the right routes but is closely linked with the Korean CIA (which was set up by the CIA in 1962). So KAL 007 makes its fateful flight, equipped with surveillance equipment. As it diverges from its proper flight path into the airspace prohibited areas clearly marked on all aviation maps, it radios repeatedly back to base that it is on a different, legitimate course. An RC 135 shadows closely, partly to survey Soviet reaction, partly to confuse it and, perhaps, to receive in-flight transmissions from KAL's surveillance net so that the precious fruits of the flight will not be lost in any event. As it crosses the Kamchatka Peninsula it runs across the Soviet net of radio beacons at Kabaru, Kikutan, Lopatka and elsewhere (all of which would allow it to correct its course even if its flight computer were out of action). An added bonus is that the Russians are apparently planning to launch

their new PL5 missile into the Kamchatku test-ground that very night (report on 'Panorama,' BBC television, November 7, 1983). Soviet MiG 23s and Sukhoi 15s scramble. Their pilots face the death sentence if they fail to shoot down an intruder (and executions have apparently taken place). If the intruder is a military plane it will be destroyed in minutes. But to their horror the pilots find a 747 Jumbo. It makes no response to their repeated radio signals so they go into the standard international routine of visual signals, making close passes with undercarriage down... The Russian dilemma is acute. It is not made easier by the way RC 135s keep blipping on and off their radar screens. Apart from possible confusion as to which plane is which, something is up and it's not clear what. Finally, the decision is reached: The USSR simply cannot afford to jeopardise the security complex below, on which the country's whole strategic future depends. KAL 007 must be shot down... KAL 007 is crippled but flies on, losing height fast. The pilot at last breaks radio silence to report that he is hit and going down – thus confirming the worst Soviet suspicions: His radio is working... The U[S] publicity machine goes into top gear... Tape-recordings of the Soviet radio traffic are produced with great éclat proving that the... pilots made no attempt to make radio contact with KAL 007... It is this version of events which receives saturation publicity world-wide... No mention is made of the RC 135... The way that the [US version of] the story comes apart at the seams receives less notice. It is several weeks before it emerges that the tape transcripts so proudly produced by [the US President]... were in fact heavily doctored to support their version... A few days later news of the RC 135's presence leaks out. Then an editor of 'Defense Science' admits to reporters that KAL airliners 'regularly overfly Russian airspace to gather military intelligence' (San Francisco 'Examiner', September 4 1983). The U[S] version's credibility is, however, enormously aided by the fact that the USSR maintains a complete silence for six days, refusing to admit it shot down anything... The most telling fact of all is that the USSR makes no apology. Had the massacre been an accident it would have been the only sensible thing to do; indeed, it would have been even more sensible if it was not an accident. The real reason for the failure to apologise is that the Russians feel it was the U[S] that put KAL 007 in jeopardy and then threw the blame on the USSR. *Pravda* shows what it thinks by surfacing a story that ex-President Nixon had been warned off by the CIA from booking a flight on KAL 007. The one indubitable fact is that a lot of innocent people are dead. For many this is enough and a great gale of anti-Soviet fury sweeps through the West. The President is quick to exploit the mood and immediately pushes the MX missile proposals through Congress and even manages to get the Senate to agree to his plans for the development of chemical warfare and nerve gas. In Europe the peace movement is dealt a crushing blow. At every stage in the debate over Cruise and Pershing, the KAL tragedy is endlessly cited by the Right-wing politicians, and the Left has no answer... It is impossible to say the scenario is true. It is only possible to say that it fits all the known facts and that the official U[S] version of events fits almost none of them. The fact that we have been lied to seems indisputable.

U-2 incident, the popular name given to the affair stemming from the shooting down on May 1, 1960, near Sverdlosk, U.S.S.R., of a U.S. aircraft... The shooting down of the plane was announced by [the]Soviet Premier... on May 5, who claimed that the plane was engaged in photographic reconnaissance of Soviet rocket bases. The U.S. promptly denied the charge, saying the plane was engaged in weather research and had strayed off course. On May 7, the Soviets announced that [the pilot] had been captured and had admitted that he was in the employ of the Central Intelligence Agency and had made previous intelligence-gathering flights over the U.S.S.R. in the U-2 plane flying at extremely high altitudes... Thereafter, the U.S. government admitted to the substance of the Soviet charges, saying that they were necessary measures designed to prevent the possibility of a Soviet surprise attack on the U[S]. The pilot]... was released by the Soviet Union, Feb. 10, 1962, and permitted to return to the U.S.

Francis Gary Powers, [who]... was captured in the Soviet Union... after his high-altitude spy plane was shot down... on May 1, 1960... will be posthumously awarded military honours on Monday... Officials said Powers' family would be taken to an Air Force base north of Sacramento and presented with the Prisoner-of-War Medal, the Distinguished Flying Cross and the National Defence Service Medal in recognition of his service to the country... Powers was held in prison for two years until... he was exchanged for [a] Soviet Colonel in the most dramatic East-West spy swap ever to occur in Cold War Berlin. Criticised when he returned home to the US for not ensuring the revolutionary plane was destroyed or killing himself with poison, Powers was cold-shouldered by his former employers at the C[IA]. He died in 1977 at the age of 47 when a television news helicopter he was piloting crashed in Los Angeles. [His son] said a belated recognition of his father's contributions to US Cold War security occurred... when officials finally stated that his mission had been a joint operation between the CIA and the Air Force. "Before that my father was seen as a civilian pilot... and the Cold War was not a recognised conflict,"... "We are working to preserve Cold War history, which his is a part of, and this will help gain honour and acknowledgment for all Cold War Veterans[.]" an Air Force official said. '45 pilots died flying U2s during the 50s and 60s', and 'what happened to most of the US pilots shot down over the Soviet Union before the U2 flights began still hasn't been divulged by either side', but] Powers'... downing over the Soviet Union in 1960 became a pivotal event in the Cold War...

The incident is historically important for a number of reasons, including its scuttling of the scheduled summit conference between [the respective leaders]... It also threatened the integrity of the spanking new National Aeronautics and Space Administration, which at... the American [President's] explicit request was to have been dedicated to peaceful research in science and technology. The U-2... it turned out, had no equipment for analysing the atmosphere, but... the Soviet Premier... displayed some of the equipment that [the pilot] acknowledged bringing with him – including a pistol with silencer, a poison capsule to swallow if captured, 7,500 roubles in Soviet currency, French, West German, and Italian money, three watches, and 'seven gold rings for ladies.' [The Premier] asked: Why was all this necessary in the upper layers of the atmosphere? Or maybe the pilot was to have flown still higher to Mars, and was going to lead the Martian ladies astray.

Greenham Common was a catch-word throughout the 1980s of women's stance against nuclear weapons... [I]nitially 10, then at times thousands of women... demonstrated against a U[S] air base with its nuclear missiles on what had been an English common. For five years [they] lived in makeshift camps... set up around the seven gates. Their tents were knocked down... [so] they built what they called "benders," which were frames made from hazel saplings spread with plastic and lined with blankets. Eventually police evictions prevented any structure at all and the women slept on [open] ground. "I always re-made the decision each autumn about whether to stay on,"... [said one of the original 10, who is in N]Z... as an official guest of the Public Advisory Committee on Disarmament and Arms Control... She was one of the famous three who got into the base's air traffic control tower. It was about 6 pm and dark, on December 27, 1983. Unnoticed, the three women cut through layers of fence wire, reached the tower that was covered in scaffolding for repairs, and climbed to the top. "It was pretty scary," she remembers. "I looked down and saw a bunch of American soldiers below us but they didn't hear us." The tower was empty so they broke in and hung a huge banner outside saying "Peace on Earth." (It was Christmas, after all.) Hours later, when they were tired and hungry... they finally attracted attention by flicking the tower's lights on and off – and two soldiers burst in, guns out. [She] spent 30 days in jail that time... [She] did dozens of stints of two weeks to 30 days... "Deep down I believed we would succeed, and we did." Success came with the 1987 Reykjavik Treaty to remove Cruise, Pershing and SS20 missiles from Europe. It is not hard to see that the actions of the Greenham women contributed. In December 1982, 35,000 turned up from all over the world to form a human chain encircling the base's perimeter fence.

...The job of US President comes with the burden of 200 years of America's twin aspirations – to be invulnerable and to be able to realise its imperial ambitions... By the turn of the century America had the wealth, the power and the means to chart its own foreign waters, irrespective of Britain. And now, at the end of the century, the world is America's oyster... With a military whose fire-power has no peer, supported by a budget

more than the military budgets of all the other industrial nations combined, the temptation to work outside U[N] authority... is doubtless difficult to resist... The danger of such power is... [in flying] too close to the sun. To believe that what is good for America is good for the world is to set America up, in the due course of time, for an equal and opposite reaction... The arrogance of power, long in the making, has to find the route to humility.

...*Uncle Sam seeks a hand to defend its global interests*... The old continent is being made an offer by the US which it may find hard to refuse – a grandiose vision of a far more ambitious Nato alliance and a wider partnership designed to assert and defend Western interests around the globe... “Prosperity and security, political freedom and economic freedom – all on a global scale” are the goals of the proposed Grand Alliance... It would mean Europe developing its own version of US military capabilities including air-mobile units and aircraft carriers and being ready to share responsibility for securing strategic regions such as the Gulf. European nations were warned last week that the American alliance and US military engagement were likely to wither unless they agreed to sign up. “...As an alliance, we are living on borrowed time... Why would the Europeans go for this when the current situation is so favourable for them? After all, we bear the bulk of the risks and the burden for defending our common interests,” said... [a] former senior director for European and Eurasian affairs...

When weapons get larger and larger... I got only a quick look at... the... [year] 2140... but it is certainly impressive... The United Civilised States battles the Eurasian Dynasty for control of a climate-ravaged Earth... The UCS has... armoured units... [that] stomp along on hydraulic legs. They range from quick but lightweight Raptors, to awesome but slow Hellmakers... [A]ir and sea battles include the devastating plasma bomber, which is... fun to use. The ED may be more ruthless politically but it cannot match the advanced technology of the UCS, and relies on the tried-and-tested tank... and... ground units... made up of androids implanted with the human brains of “volunteers,” and these can be very effective, even against armoured units... [By the way, s]ecurity... comes in many guises. But it only takes the presence of a couple of diverse communities to recall that... [if you] strip away all the theory... it’s really about “us and them.”

...“Since the Soviet collapse it seems some people around here need a new enemy,” says [a U]S... congressman... When the U[S] surveys the globe these days China is the only potential rival on the horizon. If its recent growth rates persist the world’s most populous country will overtake Japan to be the second largest economy by 2010 and could be the largest, displacing the U[S], by 2020.

...As the century ends the U[S] faces no adversary, nor the imminent prospect of one, which can threaten the physical existence of the U[S] itself. Thus, it] is not surprising that there are contradictions evident now in America’s stance. On the one hand there is manifest desire to remain the premier global power but on the other an evident aversion to bearing the costs of the role. Priority emphasis is placed on American trade and economic interests and there are disclaimers about pursuit of an American peace for the world... The importance of the international rule of law is proclaimed. Yet the primacy of American law is asserted in trade and other areas. The cause of human rights is robustly declaimed; but the U[S] declines itself to sign up to key international human rights conventions. There is a profound ambivalence about the U[N], and the International Court of Justice; and a preference to meet actual challenges by means of American led coalitions of like-minded states... In the past ten years American diplomacy everywhere has been significantly affected by resource cuts. In the current year the budget is 50[%] lower, in real terms, than ten years ago. At the same time... the U[S] defence budget has escaped significant reduction from Cold War levels.

...Success in the Cold War and its robust economic performance in the 1990s have made the U[S] the only unchallenged world power in modern history... an American mandarin... told an audience at the Centre for Strategic and International Studies... “Our triumph in the Cold War has undermined our judgment.” It has led to “an arrogance of power” in America’s dealings with the rest of the world... Except for rogue states such as Iran and Iraq, foreign nations will not declare that they are out to limit American leadership. They may be uncomfortable with that leadership, but there is no clear alternative at this point.

...The US-led North Atlantic Treaty Organisation won the Cold War and has begun transforming old enemies into fast friends... Over two months and on two continents, the institutions of world order are changing. The Denver [G7] summit ended at the weekend... [by] adding Russia to its ranks... after... [the current US] President... lobbied to give Moscow a permanent seat... [amongst] the world’s richest nations. Russia also has a permanent voice at the centre of Nato... In July, Nato, like a giant amoeba, will absorb another chunk of the old communist empire... [–] Poland, Hungary and the Czech Republic... [–] into the centre of western security... In the shadows of the eight-nation Denver summit, officials will privately say that America sits clearly atop the global economic pile, holding forth its successes for all to examine, admire and emulate... Rarely has a single nation so dominated world affairs as the U[S] today... and would-be rivals are in no position to argue... “The major goal of all countries now is to have good relations with the U[S].” ...The \$US7 trillion... US economy accounts for 22[%] of world output, almost double the European members of the Group of Seven. By comparison, annual Russian economic output is one-tenth the size of US output. “There is one country... which decides everything,” a high-ranking Frenchman said of the US. Sighed another European diplomat: “Thankfully that dominant country is a friend.” ...“The world is a global village, and the band leader is the U[S],” said a European official, scrambling his metaphors... The 15-nation European Union could be a friendly counter-balancing force, and surely hopes to become one. But the organisation had a disastrous summit in Amsterdam last week where member countries failed miserably in their effort to reform the organisation’s basic charter... Whether or not this US dominance is a good thing has yet to be judged. While American leadership is appreciated... it can also be overbearing, sometimes seen as bullying... Nonetheless, some leaders are reluctant to swallow American solutions.

...The head of the Russian Communist Party warned the West yesterday that expanding Nato to include former Soviet allies would be the worst mistake since... W[W2. He]... said Russia was “in a difficult phase right now” and threatened no one, making expansion of Nato totally unnecessary... [An alternative i]s to give certain unspecified “conditions and promises” to Eastern European countries. Eastern Europe would then serve as a “bridge between the West and the Russian Federation, which would enhance co-operation and secure stability in the region.” ...A US official said even... the head of the Russian Orthodox Church, had raised Russia’s opposition... In Vienna yesterday, Nato officials presented a proposal for big conventional arms cuts to a body dealing with the 1990 Conventional Forces in Europe treaty... The arms cuts are intended to address Russian fears that Nato could pile up weapons on its borders.

...Never one to stand on protocol, [the Russian President] – who had just signed a Russian-Nato partnership accord – returned to the podium for a second, unscheduled speech to announce an unexpected arms proposal. Puzzled U[S] officials sought an explanation [while] the stunned Russian delegation flew into a panic. Only later did a spokesman clarify [the President’s] comments. Although the Kremlin chief had said Moscow would remove the warheads from all missiles targeted at Nato states, what he meant was that the missiles would be targeted away from those countries.

...NATO’S military chiefs finally agreed to enlarge the alliance last week, but their new central European allies will be unable to contribute to their own defence, let alone fight... As a senior Nato official put it, the Polish, Czech and Hungarian forces were respectively, “a mess, a bigger mess and a total mess.” Ageing Russian equipment, public mistrust, professional incompetence and a dire shortage of experienced non-commissioned officers have left the central European military floundering and Nato wondering how to cope. Its problems extend to almost every aspect of military life. In Hungary, the ancient radar system is so ineffective an intruder could cross the country before aircraft were scrambled to intercept it. The Czech Air Force is so run down pilots complain they rarely fly their old MiG-23s. The few hours allowed are taken by senior officers too old for combat duties. Budget cuts by impoverished governments have also taken toll on the three armies. Some Polish officers have been buying ammunition with their own money, while troops in Hungary exercise with tin cans rather than practice grenades. Czech conscripts have complained they fired a rifle only once during their 12-month service. Western officers and military attaches in the region are generally

sympathetic. They stress the progress made by all three armed forces by reorganising into Nato-style brigades, by contributing to the alliance-led force in Bosnia and by attempting to improve foreign language training. But when it comes to serious soldiering, it is a different story. Although... central European... armies exercise with... Nato... under the Partnership for Peace programme, they are excluded from advanced training. Asked why the Poles were excluded from large-scale British Army manoeuvres in Poland, a Nato official said: "Because the Brits are scared of friendly fire. I don't think they're willing to risk the casualties."

...A [BRITISH] SOLDIER who was shot after being mistaken for a target has won more than £250,000 damages... [A] colleague's tragic split-second mistake... [during war] games... put paid to his career... The Ministry of Defence has agreed [to pay] the huge compensation because [the] ex-Corporal... suffered Post Traumatic Stress... and spent six months in a psychiatric hospital before a medical discharge... [In related news,] a dozen warships, their broken hulls jutting awkwardly out of the sea, lie rusting in a watery grave [at Petropavlovsk, the] military outpost on Russia's Far Eastern frontier. This is home to Russia's nuclear submarine fleet and a base for the Pacific fleet. But the graveyard provides a poignant symbol of Russia's decaying armed forces as the Defence Minister... embarks on reforms to create a crack fighting force... In the name of efficiency, the number of troops will be slashed from 1.7 million to 1.2 million by the end of 1998, and 30,000 sailors will lose... jobs. Old ships will be scrapped and replaced by modern equipment... Just over 300 years after it was founded by Tsar Peter the Great, Russia's navy is starved of state funds for maintenance, fuel and spare parts. Only 10 years ago, a total of 480,000 navy personnel manned a force that comprised 370 submarines (50 of them nuclear), 290 main warships and 700 minor attack boats. Personnel is now down to 270,000, submarine numbers have been slashed and the main fleet of warships is estimated at 150... Disillusioned servicemen, who face poor housing, intolerable conditions and delays of several months in receiving pay, are waiting to see how the [new] cuts will affect them. Many servicemen and their families live in ugly, squat apartment blocks in a military village above the town. Locals recall how young officers used to parade proudly through the city in their naval uniforms. Now they see only sadness and resignation in their eyes. One officer said things were so bad that he had been given the job of identifying anyone under his command with suicidal tendencies... [Russia's] President... has promised to pay all overdue wages to servicemen by September 1, with the Far East a priority area. But military morale has also been hit by unprecedented levels of theft, fraud and corruption. Facing criminal charges are... [the] former commander of the Pacific Fleet; ...[the] former commander of the submarine division; and... [an] ex-commander of the Kamchatka flotilla.

...With the end of the Cold War, American analysts and politicians have increasingly shifted their attention from... the Soviet Union... and the military balance of power to economic issues... To a certain degree the very success of American economic policy creates new dangers in the international system and, unless the U[S] and the world finds ways to cope... the history of the 21st century may be more tumultuous and bloody than we hope... [L]iberal capitalism, the American goal, is a profoundly destabilising achievement. It accelerates change and increases stress in the international system... [C]ommon... is the political backlash against capitalism that occurs when industries, regions and economic sectors are devastated by rapid change. - 1997

cold war, hostilities short of armed conflict, consisting in threats, violent propaganda, subversive political activities or the like...

The expression "cold war," which has been used to describe the period of international tension following W[W]II, has encompassed the entire spectrum of human conflict short of all-out nuclear war, including the Korean conflict, 1950-53... [which] was classified... as an "international police action" primarily on the grounds that there was no formal declaration of war by either side.

Only once has the U[N] attempted to make peace, rather than keep it, and that was in June 1950 at the time of the Korean War. In response to the communist invasion of the South, the U[N] followed up its order to the North Koreans to withdraw with a decision to dispatch a UN force led and funded by the U[S]. The Soviets were not present when the vote was taken as they had walked out in protest against the [US] refusal to recognise the Chinese People's Republic. Fifteen governments eventually contributed to the force; many others made contributions of non-military equipment. When UN forces reached the frontier between the two countries, the 38th parallel, the U[S] and the UN Secretary-General took the view that unless UN forces crossed into North Korea, the fighting might break out at any time; that it might be better to deal with the problem once and for all by overthrowing the [North Korean] government... rather than acquiesce in the permanent division of Korea. To this end the Americans introduced a resolution which was subsequently adopted by the [UN] General Assembly, recommending that all necessary steps should be taken to ensure peace was enforced throughout Korea, a measure which enabled them to prosecute the war more vigorously. In the event, of course, the decision to cross the 38th parallel merely precipitated Chinese intervention and prolonged the conflict for another three years. Never again was the U[N] to pay the price of making the peace, in part because it had proved so dauntingly high. In the three months during which the U[N] found itself in occupation of the larger part of North Korea, 100,000 citizens were "executed" or killed. More bombs were dropped on the North than had been dropped on Germany in five years of war. UN-prisoner-of-war camps were so badly run that the inmates and guards often found themselves engaged in pitched battles. The cost of making the peace seemed higher than the cost of keeping it. The U[N] was seen as backing a brutal and relentless conflict on the part of a government that in retrospect seemed almost as bad, in the opinion of many, as the government of the aggressor... *One of the most worrying developments of the modern age has been the willingness of a country's political opponents to resort to the tactics of terror. Exploiting the advantages which arise from the growth of international travel and communications, they often attack innocent victims, particularly in the liberal democracies of the West, in an effort to force political change...* The use of terror as a political instrument – as a way of "persuading" people to support a particular point of view – is not new. Throughout history, if governments or individuals found they could not gain support by reasoned argument, violence was always an alternative option, inducing fear in the minds of its victims and forcing them to accept new ideas. Nor should this be surprising: the use of terror is often very easy, and the results are usually immediate, particularly if fear spreads rapidly through an affected society... During the last 20 years the threat of terrorism has grown dramatically. There are a number of reasons why this should be. First, the period since the late 1960s has seen a vast proliferation of terrorist groups, embracing a wide variety of political and ideological beliefs. In very general terms, terrorist groups have emerged from three distinct sources – the nationalist demands of ethnic minorities or dispossessed peoples, the revolutionary activities of predominantly Marxist groups and the so-called "New Left" – although some terrorist activities, 'like the Armenian attacks on Turkish targets in Western Europe, are historical reprisals for the killing of millions of Armenian people in 1915, an event which had been forgotten by the rest of the world'. The nationalists, covering groups such as the Palestine Liberation Army (PLO), Irish Republican Army (IRA)... Quebequois separatists... Kurds fighting against Iranian and Iraqi rule alike... Sikh zealots wishing to secede (break away) from the republic of India... and *Euskadi Ta Askatasun* (ETA Basques), have used terror... as part of their campaigns to achieve political recognition and the right of self-government... By comparison, the revolutionaries were often forced to adopt terror when their preferred tactics of rural-based guerrilla warfare failed in the mid-1960s. They saw the use of fear as a means of undermining government authority... This happened in Latin America... Finally, as a separate phenomenon, "New Left" groups such as the West German Baader-Meinhof Gang, the British Angry Brigade, the French *Action Directe* and the Italian Red Brigades, evolved out of the student protests of the late 1960s determined to destroy existing political structures, creating a wasteland out of which new ideas would emerge. The latter were different in that they did not seek political power for themselves (instead, they saw themselves as the "sacrifices" essential for creating the mood for change within society), but they still fitted the general pattern of using terror to force "revolution"... The second reason for the spread of terrorism lies in the nature of our interdependent world, for one of the

most worrying factors in recent years has been the way that different groups have co-operated, pooling their resources and using the advantages of modern society to extend their attacks worldwide. A few commentators see such co-operation as part of a Marxist plot to weaken the "Free World" prior to general revolution or invasion, but the reality is probably less dramatic. Many of the groups, particularly of the "New Left", are small and short of the essentials of a terror campaign – appropriate training, money, arms and explosives – while others, particularly the long-established nationalist organisations, are large, experienced and rich. Among the latter may be included the PLO, organised as a "government-in-exile", with ready access to money from Arab states, training facilities in refugee camps and equipment easily purchased on the world markets... The rising level of terrorist activity since the late 1960s is graphically illustrated by a single statistic: of the 25,181 terrorist attacks recorded since 1968, nearly 70[%] have occurred in the six years since 1980. This increase has been due to the fact that terrorists now help each other, but more significantly to the effects of international publicity. Television and newspaper coverage has enabled terrorist ideas to travel from country to country as easily as the terrorists are able to do themselves... Television no longer merely reports events, it can be used to further them as well... During the hijack of a TWA Jumbo jet in 1985, hijackers at Beirut airport were able to broadcast their demands on the evening news. Television cameras followed the hijacking story even when the[plane's] captain... was being threatened[with a pistol]... The modern terrorist is largely a creation of the mass media... Not only have the groups helped and inspired each other, they have also copied the methods of other organisations. The hijacking of aircraft was a regular occurrence within the Soviet Bloc until the late 1950s. In the early 1960s it began in the West, reaching a peak of 82 incidents in 1969 alone. The kidnapping of the US ambassador in Brazil... in September 1969 was copied by many groups around the world when it succeeded in effecting the release of convicted terrorists from Brazilian jails. Between then and 1975 there was an attempted kidnapping of an American diplomat once every three months and a successful kidnapping once every five... Several characteristics distinguish present-day terrorists from that of the past. To begin with, terrorists have tried to exploit the technological vulnerability of the modern world. It is now very easy for a group or even a single individual to inflict great damage on society at relatively little cost to themselves. Reservoirs can be poisoned, electricity power grids put out of action, trains carrying nuclear waste derailed. Offshore oil rigs, natural gas pipelines, computers storing government or company records are all examples of targets which are particularly vulnerable to attack. In 1985, terrorists assaulted electrical power generation installations and transmission lines, petroleum and water pipelines and telephone switching/transmission systems 364 times worldwide... So far, none of the world's major terrorist movements has tried to bring social life to a complete standstill, but it could actually happen. One group which tried... was the Revolutionary Action Movement (RAM), operating in the U[S] in the early 1970s. At the height of its activity, RAM carried out a series of attacks, from bombing public buildings to scattering nails at the intersections of motorways during rush hour traffic. Like many other militant black groups, including the Black Panthers, RAM believed American society to be so vulnerable that it would fall apart under stress... [T]he Weathermen in the U[S] tried to bring down the entire capitalist system by directing 4,300 incendiary bombs against banks and private property in the 15 months before April 1970... [A]s the IRA bombing of the Grand Hotel in Brighton, England, in October 1984 showed, governments themselves may well be the target. In that particular case[Britain's PM, who was staying in the] hotel during a Conservative Party conference, was lucky to escape: as it was, four people were killed and 32 injured in an attack, which, if successful, could have paralysed (albeit momentarily) the British government... Those who joined the... ["New Left" organisations] were for the most part intelligent, student radicals from middle-income families. The Baader-Meinhof Gang was a classic example of a group of disenchanted young people from a privileged background... Very few such terrorists, in fact, have truly working-class origins despite their claims and aspirations; none of them succeeded in forming a lasting relationship with any mass movement, not even Western Europe's communist parties, which tended to denounce their activities. As their own political isolation increased, they became increasingly more desperate and violent... [R]ecently the main perpetrators of hijackings have been militant Sikhs, who were responsible for the worst single incident of air piracy in June 1985, when over 347 people lost their lives in a mid-air explosion... The two most devastating truck-bomb attacks were carried out on 23 October 1983 against the command posts of the US and French peace-keeping forces in the Lebanon. Some 241 US servicemen and 58 French soldiers were killed. Often these [suicide-]attacks have been carried out by 15-year-old children, whose video-taped messages relayed on television or broadcast on the radio networks reveal a depth of religious fanaticism, which many secular Arab governments, not to mention the non-Muslim world, find almost impossible to understand. The willing sacrifice of such terrorists does have one thing in common with older forms of political violence – a feeling that their deaths are justified by circumstances of repression and exploitation. This was summed up 20 years ago by... [the person who] wrote... "At the level of individuals... violence is a cleansing force. It frees the native from his inferiority complex and from his despair and inaction; it makes him fearless and restores his self-respect." ...What... has been the success of terrorism in the past 15 years? Although it has claimed perhaps less than 7,000 victims, it seems to have had a much wider impact than those numbers would suggest. In the absence of reliable data, of course, it is impossible to offer an estimate of the economic costs of such violence. What we can say is that the material losses involved in the hijacking and destruction of civil aircraft run into millions of dollars every year. The cost of deterrence is also mounting. Screening against bombs at airports in the U[S] alone cost the airport authorities in the late 1970s nearly £130 million over a period of three years. Although these costs are high, they are not excessive. It costs the state less every year to deal with the victims of terrorism than it does in compensation for industrial accidents or the prevention of deaths on the roads. Terrorism is still newsworthy because it is not an everyday occurrence... Its psychological costs are more difficult to assess... Despite all the costs, terrorism still affects relatively few people, far fewer than the 20,000 people murdered every year in the U[S], a country which has learned to live with a level of violence which would have been regarded as unacceptable 50 years ago. However there are signs that terrorism is on the increase and that people are losing confidence in their own government's ability to deal with it. At present, there are over 40 counter-terrorist companies in the U[S] and many others around the world, offering a variety of special services. Another disturbing development could be that the more extreme terrorists might turn to new technologies involving the use of chemical, biological or even nuclear weapons. Several incidents have already occurred, although none with significant consequences... Most states using nuclear weapons would be vulnerable to a counter-attack and would also be answerable for the consequences of their own actions; terrorists usually are not, as the police seldom identify or locate them. This fundamental imbalance in the use of force between state and non-state means that it is impossible for the state to restrain a determined terrorist. Ultimately, a terrorist group intent on using nuclear weapons may not necessarily be deterred... To this extent, modern terrorists differ from the bomb-throwing anarchists of old in wielding power far in excess of anything their predecessors could have imagined... New technologies... place within the terrorists' reach... the ability to create even greater uncontrollable and irreversible events. Even so, there is cause for optimism. So far, few terrorists have displayed such suicidal tendencies. The modern political terrorist does not feel that he or she is fighting a totally hopeless cause; by and large, their aim is to win political legitimacy... By mounting attacks using the ultimate weapon, they would completely forfeit public support. The death of too many innocents would end in complete alienation rather than intimidation, a constraint that could prevent an uncontrollable spread of the terrorist threat... But this is not the only constraint, for since the emergence of "international terrorism" in the early 1970s... the countries under threat have not been idle. In response to the danger, such countries have adopted policies designed to protect vulnerable targets or, in situations of extreme threat, to counterattack the terrorists or their base. Although the results have not been universally successful, enough has been achieved to make the task of the terrorist more difficult and much more dangerous. In a society which allows freedom of movement... the terrorist can travel... with relative ease... Presented with such a situation, the liberal democracy faces a dilemma, for if it takes the obvious steps to curtail these freedoms, it could end up becoming repressive and forfeiting the right to be called either liberal or truly democratic. Indeed, this may well be part of the aim of the terrorists, forcing a democratic society to change by driving a wedge between the

government and the ordinary people. If freedom of movement were to be controlled, for example, it would inevitably affect everyone in the society... As ordinary people were forced to accept a greater degree of government control through identity checks or vehicle searches, they might well feel alienated and refuse to give their support to the anti-terrorist campaign. Eventually, a "climate of collapse" would emerge, out of which the terrorists could gain their political demands. To a certain extent, this seemed to happen in West Germany in the early 1970s, as the government responded to the threat posed by perhaps no more than a dozen active Baader-Meinhof terrorists; it certainly happened in Uruguay in 1971, where government actions against the Tupamaros led to public alienation that was only curtailed by a military takeover of the state and the introduction of an extremely repressive system under which public opinion no longer mattered... The government has therefore to be extremely careful in its reaction to terrorism... So long as its actions have the backing of the majority of the people, as expressed through their representatives in Parliament, laws can be passed to cope with the problem. In Britain, for example, the public revulsion at the Birmingham pub-bombs in November 1974, planted by the IRA, allowed the government of the day to rush through Parliament the Prevention of Terrorism Act. This act gave police wider powers to deal with terrorists and all but suspended *Habeas Corpus* (the right of individuals to be released from police custody in 24 hours unless charged with a specific crime)... In such an atmosphere of public support, governments can go further, using selective violence in direct response to terrorist acts. Most Western states now have specialised military or paramilitary units, trained specifically for counter-terrorist operations, which they are prepared to use to rescue hostages even outside their national boundaries. The Israelis began the process in early July 1976, when elements of their parachute forces flew all the way to Entebbe in Uganda to rescue Jewish hostages seized in a plane hijack by members of the Popular Front for the Liberation of Palestine... and Baader-Meinhof Gang. Landing by surprise in long-range C-130 Hercules transport aircraft, the paras not only freed the hostages but also killed the terrorists guarding them and fought a gun-battle with Ugandan soldiers protecting the airfield. It was a dramatic and successful operation... A similar mission was carried out by members of West Germany's *Grenzschutzgruppe Neun*... at Mogadishu in Somalia in October 1977, during which 87 passengers and crew were rescued and three terrorists killed. In this particular case, the commandos were helped by men from Britain's 22nd Special Air Service Regiment (22 SAS), and it was they who, three years later, carried out the most public anti-terrorist operation to date. On May 5, 1980, in the full glare of television cameras, SAS men in black balaclavas stormed the Iranian Embassy in Princes Gate, London, to free hostages being held by Arab extremists intent on gaining the political recognition for the Iranian province of Khuzestan. In the aftermath of this operation, it began to seem as if ruthless yet selective counter-violence was the answer to the terrorist threat... But this was a false presumption. As early as March 1978, elements of Egypt's Sa'Aqa ("Lightning") commando group had failed to rescue hostages being held on board a hijacked aircraft on the airfield at Larnaca in Cyprus (they had failed to co-ordinate their actions with the local authorities and were, quite understandably, fired upon by the Cypriot National Guard as they approached the plane). Indeed, the record of Sa'Aqa is a salutary one, for their attempt to storm another hijacked plane, this time at Luqa in Malta, in December 1985, left 59 hostages dead as the terrorists opened fire. Nor should it be presumed that the Western democracies are universally successful: in April 1980, only weeks before the SAS operation at Princes Gate, the American rescue mission to Tehran (Operation Eagle Claw) ended in disaster in the Iranian desert as helicopters proved unable to cope with the extremes of climate and terrain involved... The precarious nature of such a use of counter-force, coupled with the obvious effects that failure will have on the credibility of the government in the eyes of the people, means that countries must look to other approaches if they are to minimise the impact of terrorism. One possibility is... the negotiation of bilateral agreements to counter the worst of the problem, and here the record is comparatively good. If this can be used as a basis for more general agreements, leading eventually to international responses, terrorism may yet be defeated. - TERRORISM AND CIVIL STRIFE

IRAN'S GLOBAL HAND OF TERROR... A GENTLE, soft-spoken man, Mohammed Hussein Nagdi worked tirelessly to persuade the West that Iran was a terrorist state. From his experience as a former charge d'affaires in the Iranian embassy in Rome, he knew that it was. He headed the Italian chapter of the National Council of Resistance of Iran, an organization dedicated to overthrowing the Teheran dictatorship. In July 1992 he got more than 400 members of the Italian Parliament to propose an oil and arms embargo on Iran. Nagdi knew he was high on the Iranian Government's hit list. "But I can't let up," he'd say. In March 1993, Nagdi was on his way to the office with his driver when two men pulled alongside his car and shot him in the head and stomach. He died on his way to hospital. Nagdi's story is the latest in the series that has been repeated over and over again. Nearly three years earlier, his colleague Kazem Rajavi had been assassinated in Geneva after his successful campaign to convince the Swiss government to isolate the Iranian regime. Indeed, across Europe, Asia, the Middle East, Africa and now North America, assassinations and bombings are being carried out by radical fundamentalists directed, financed or inspired by Iran... In January 1993, 250,000 Turks poured into the streets of Ankara to grieve for Ugur Mumcu, a crusading journalist who was killed when his car was blown up. His crime: opposing the religious fiats imposed by Islamic fundamentalists in Turkey. Hours after his death, the Iranian-funded and trained Islamic Liberation Organization claimed credit for the attack. Mumcu's murder was one of more than 150 assassinations and bombings carried out in Turkey in the past three years by Iranian-sponsored groups. "Iran operates a veritable 'Murder Inc.,'" says a former Iranian diplomat who now lives in Europe... Says... [an] author and leading French authority on terrorism, "the assassination of Iranian dissidents throughout Europe has become a top priority." ...an Iranian journalist active in the Iran Nation Party, outlawed by the mullahs following the 1979 revolution... was imprisoned and tortured... [f]or his "illegal" activities... According to various estimates, 50,000 to 150,000 political prisoners have been executed[, but the journalist was released. In 1988 he] fled Iran to serve the cause in exile. In August 1992 [the journalist] was attacked in his apartment in Offenbach, Germany, by a pair of knife-wielding Iranian hit men. It was only because a German neighbour was alerted by the noise... that... the terrorists fled before they could slit his throat. Six months later [he] was alerted by German media that his name was No. 2 on an Iranian government death list. Such attacks have demonstrated the ability of the Islamic fundamentalists not only to gather extraordinary intelligence on their opponents but to enlist local Muslims to do the killing. For, while Iran also uses its own agents, the majority of its terrorist operations have been carried out through local Islamic religious figures, traditionally immune from Western surveillance or suspicion, or through other local volunteers. Most European intelligence experts agree with... [a] former head of FBI investigative and intelligence operations: "The... Iranian-inspired terrorist threat is much less structured than similar frameworks we faced in the 1970s and 1980s. It is very difficult to get a handle on." ...A top-secret CIA estimate concludes that Iranian-style fundamentalism now poses the greatest threat to Western institutions and Arab regimes for the foreseeable future... Iran's ability to recruit terror cells in faraway places was confirmed in March 1992, when a car bomb detonated in Buenos Aires across the street from the Israeli embassy. The three-storey structure and surrounding buildings were virtually levelled; 32 people were killed and more than 250 wounded, including scores of schoolchildren. According to US and Israeli officials, the Islamic Jihad, a terrorist group closely linked to Iran, was behind the bombing. American experts concluded that the design of the bomb was a carbon copy of the one that blew up the American Marine compound in Beirut in October 1983... Teheran's area of greatest expansion in recent years has been Africa. Sudan, with over 1000 Iranian Revolutionary Guards permanently stationed there, has been turned into the world's largest terrorist base. In recent years, American... intelligence officials have uncovered more than 30 Iranian-run training camps, from which thousands of terrorist operatives have been dispatched... As the leader of the Arab world, Egypt, Sudan's northern neighbour, is a prime target. Iranian- and Sudanese-backed groups have worked with local fundamentalists in murdering scores of Egyptian officials. The assassin who killed Egypt's speaker of parliament, Rifaat al-Mahgoub, in 1990 most likely received his training in Sudan... The West's misguided belief that "moderates" in Teheran will listen to reason has blunted its reaction to Iranian terror. Says... [the] chairman of the Department of International Relations at Britain's University of St Andrews and

director of the London-based Research Institute for the Study of Conflict and Terrorism: "The very weakness of Western response to Iran's acts of terror has led it to conclude that it can continue its terrorist game without paying any political cost." ...In April 1993... a senior official of the People's Mujaheddin Organization of Iran... told US congressional representatives: "The terrorist operations carried out in Paris, Rome, Geneva and New York are intended to scare off the West from reacting to the regime's atrocities at home and expansionism abroad. We ask the U[N] Security Council to impose an arms and oil embargo against Iran." Such action is long overdue. Here is what must also be done: • Stop the flow of high technology to Iran. In 1992, for example, Germany approved 80[%] of export-licence applications for Germans seeking to sell sophisticated equipment to Teheran. Japan has reinstated a multi-hundred-million-dollar aid program for a hydroelectric project. And... France agreed to guarantee a \$658-million loan to finance Iranian purchase of French goods. Last year the World Bank approved 17-year loans worth about \$840 million, which... an expert on Iran and senior fellow at the US National Defence University in Washington... notes, lets Iran divert its own money to weapons production... • Cut off the huge flow of weapons to Iran from North Korea, China and the ex-communist states. The U[S] and its European partners should force these countries to stop selling to Teheran under penalty of an economic embargo. Getting the West to act in concert towards Iran will not be easy... Nevertheless, the multi-nation consensus achieved against Iraq in 1991 demonstrated that a united front is possible. The security of the West and the lives of thousands of... Iranian exiles are at stake. - 1994

Leaders of the world's top industrialised nations have ended a summit meeting that was short on drama but long on serious attempts to impose some order on the complex forces buffeting their own countries. They weighed the challenges of the international aspects of terrorism, the risks of a meltdown from frantic round-the-clock financial trading and the insecurity stemming from rapid economic change. The leaders of... the G7... came up with no instant relief for their 23 million unemployed... But, with bomb attacks on American soldiers in Saudi Arabia and a British army base in Germany adding urgency to the talks, the three-day conference did produce a 40-point international action plan to combat crime and terrorism. "It's not the Cold War, it's not... W[W2], but it's an important part of our struggle to make this a civilised and sane world, and we have to continue to do so," [the US]President... said at a closing news conference. [He intends to 'ask Congress for \$US1 billion to help combat terrorism.']Foreign and interior ministers will meet in Paris next month to flesh out how to combat what the British P[M]... called the "international virus" of terrorism... The leaders also gave weight to the environment and the spread of Aids. Joined by Russia for the political leg of the summit, the... leaders dwelt on... Mexico's financial crisis, the collapse of Barings [Bank and the] \$US1.8 billion in copper trading losses by Sumitomo Corp of Japan...

World powers gathering in Paris for a summit on terrorism are expected to come up with a tough plan of action to highlight their determination to fight indiscriminate violence. The meeting comes... less than two weeks after a suspicious explosion downed TWA Flight 800 off the Long Island coast. On the agenda of the meeting, originally scheduled after a bombing last month in Dhahran... that left 19 U[S] servicemen dead, is a 40-point package of measures... set out... in... Lyon... Many of the G7 nations have pressing reasons to bolster anti-terrorist action. Britain is experiencing a new upsurge of sectarian violence in Northern Ireland, Japan has been thrown off balance by last year's subway nerve-gas attacks, France is still seeking the Islamic fundamentalist suspected of perpetrating a string of bombings last year, and Germany has been the scene of political violence by Turkish extremists. Meanwhile, in Washington, [the US President]... was to meet congressional leaders to press them to strengthen an anti-terrorism law he signed in late April... [He] wants expanded wire-tap authority for the FBI and other law enforcement agencies, and chemical markers – "taggants" – placed in all explosives to make terrorist bombs easier to trace. Congress has previously rejected both ideas... In New Orleans yesterday, the [US] President... urged the international community to slap "strong sanctions" on countries which he said were engaging in or supporting terrorism – naming... Iran, Libya and Sudan.

...The U[S] House of Representatives, ignoring European objections, is set to approve a bill to punish firms that invest in Libyan or Iranian oil and gas fields. Aides said yesterday that House Republican and Democratic leaders had cleared the way for a vote on a Senate measure to expand provisions passed by the House last month, obliging [the US]President... to slap two sanctions out of a list of six on any company that invested \$US40 million... or more in one year in oil and gas projects in Libya or Iran... The sanctions bill is an attempt to draw European countries, Japan and others to join U[S] efforts to isolate Iran and Libya, considered by Washington to be supporters of terrorism.

...The Pentagon yesterday lifted a veil on its military research priorities, revealing an emphasis on... computerising the battlefield of the future... and... defences against terrorism... [Although] obviously inspired by recent events, like the June 25 truck bombing at a U[S] military housing complex in Saudi Arabia[, t]he Pentagon is increasingly worried about chemical and biological weapons in the hands of terrorists, so it has devised a programme to find a way to automatically detect and identify biological threats to air bases and port facilities by 1998.

...TERRORIST activity has risen sharply this year and the Centre for the Study of Terrorism based in Scotland says terrorist groups are becoming far more effective at killing people... The latest figures show that more than 27[%] of terrorist acts now result in fatalities, compared with just 13[%] in 1991... And the present trends are deeply disturbing... The last year for which the centre has completed a full analysis is 1994. In that year there were 350 terrorist acts... That compares with 1980 – the first year in which analysis was completed – when there were 277 terrorist acts... While the early 1990s showed a slight decrease in the number of terrorist acts, 1996 represents a serious and worrying turnaround... In 1968 there were only 11 identifiable terrorist groups. Latest indications suggest there are more than 49 with an additional 34 other sub-national entities... AND not only is the world of terrorism becoming more deadly but it is changing its targets in line with modern day political sensitivities. Random terrorist acts are on the decrease and terrorist acts which target key economic centres are increasing... [Examples] are the... destruction of the central business district of Colombo by Tamil Tigers in Sri Lanka[, which]... killed... 86 people... and... injured... 1400... and the... attempt... to destroy the World Trade Centre in New York... In the U[S] in particular, there is a growing sense that terrorist groups are out of control... Experts in the U[S] are pointing to... a further new development in the world of terrorism. THIS is the rise of what the experts call "nihilistic terrorism" or terrorism that hasn't got specific political or economic objectives. It refers to acts of violence committed by groups with grievances who are just intent on creating harm and generating publicity. Examples of this sort of terrorism include the... activities of the recently-charged Unabomber... and the... 1995 Oklahoma City bombing, which killed 168 people... [Incidentally], the *New York Times* reported yesterday... [that] chemists at the FBI lab in Washington had found traces of PETN, a chemical in plastic explosives, on wreckage retrieved from the cabin between rows 17 and 27... of TWA Flight 800... But PETN was found in many bombs and surface-to-air missiles, making it impossible to know which type of device was involved in the July 17 crash that killed 230 people.

...WASHINGTON is drawing up plans for military strikes against Iran to punish the Islamic regime for backing terrorist attacks against American targets. [The]US Secretary of Defence... has already briefed the British and French governments in general terms about the plan of attack – expected to be a missile and bombing strike on carefully selected targets. But hawks in Washington, eager to seize the opportunity for a crippling blow to Iran's growing military power, are pushing to annihilate the entire Iranian navy and... nuclear weapons programme. The severity of the attack could depend on the outcome of the investigation into TWA Flight 800... Pentagon officials are already convinced that Iran was involved in the bombing of a US barracks in Saudi Arabia in June... The U[S] last December allocated \$27 million to the C[IA] to overthrow Iran's government. The effort has yet to begin but Iran has committed \$30 million to counter it. Washington dissuaded Israel from mounting air raids on Iranian targets earlier this year in response to a series of suicide bombings in which Iran was implicated. Now, with the American election only three months away, Iran provides a tempting target... FBI agents say they are actively looking to see if there is a link between the Dhahran

bombing and the mid-air destruction of the TWA aircraft. Any shred of evidence that indicated an Iranian role in the disaster would provoke a ferocious response...

TERRORISM'S HIGH FLYERS THE charred and twisted remains of TWA flight 800 dredged from the Atlantic seabed have so far failed to... [confirm] the cause of the crash. Hopes of an early conclusion to the July 17 mid-air explosion now look increasingly remote. Theories abound as to the cause of the blast which ripped through the fuselage of the ageing 747... 45 minutes into the seven-hour flight to Paris. Even as jet fuel smouldered on the coastal waters off Long Island, experts were speculating that flight 800 had been brought down by international terrorists. Worse still was a suggestion the aircraft might have been hit by a surface-to-air missile launched from American soil. While mechanical failure could not be discounted, experts "gut feelings" dictated that technical failure was the least likely of the three possibilities... The discovery of traces of... PETN on two pieces of wreckage further raised the spectre of terrorism. Investigators quickly established, however, that the aircraft had been used as a troop carrier during the Gulf War. The possibility that explosive traces were left behind by servicemen could not be discounted. If it is established that flight 800 was brought down by foul means, it will be the third murderous act of terrorism in the U[S] in as many years, following the World Trade Centre and Oklahoma City bombings in 1993 and 1995. And if that proves to be the case, it could indicate the return of terrorist attacks on civilian aircraft on a scale similar to that of the late 1980s. These included the Libyan bombings of Pan Am flight 103 over Lockerbie in 1988 and of a French DC-10 over the Sahara Desert a year later; and the 1985 bombing of an Air India 747 by Sikh extremists off the Irish coast. In all, 770 people were killed... Before Lockerbie, airport security was primarily aimed at defeating hijackers. Counter-measures consisted mainly of x-ray screening devices and metal detectors. The finding that Pan Am flight 103 was blown up by plastic explosive raised the ante: nothing in use then was capable of detecting the explosive. As a direct result of Lockerbie the U[S] Congress ordered the Federal Aviation Authority to develop machines capable of detecting plastic explosives and install them in American airports. So far only three U[S] airports have scanners which are capable of detecting small amounts of plastic explosives. The problem is cost. Airport companies are reluctant to buy them at \$1 million each... Given that TWA 800 set out from Athens on July 17, flying to New York, and then departing for Paris, investigators say it is possible a bomb was left on the aircraft by a departing passenger at New York. While America waits and watches for more clues from the deep, the public may well wonder just how effective airport counter-terrorism methods really are. For geographical reasons, aviation authorities in N[Z] are somewhat luckier than their U[S] counterparts, says Aviation Security Service[']s manager. N[Z]... six international airports are literally at the ends of the earth in terms of world aviation. And that, he says, is a major plus-factor in safety terms, given that N[Z] is neither a terminating nor an originating destination for U[S] carriers. In most cases American flights departing N[Z] are in transit, and are on N[Z] soil for no more than... four hours. But that is not to suggest that N[Z] is immune from or complacent about the threat of international terrorism. "Quite the opposite... N[Z] boasts one of the most effective aviation security services in the world. It has a lot to do with our psyche – if a job's worth doing it's worth doing right." N[Z] is one of 190 contracting states to ICAO, the International Civil Aviation Organisation – the controlling world-body on aviation standards and procedures. As a contracting state, the Government – not the airlines – undertakes to meet minimum requirements... N[Z]s aviation security service] was the first of its type in the world to be accredited with the ISO 90002 for quality management systems and, as a holder, is audited every three months. "After the Lockerbie bombing we decided to concentrate on human factors. The debate will live on as to whether the airport screener could have detected the bomb or let it slip on through carelessness. Because of that we... introduced an intensive training programme. Staff can be audited at a moment's notice." [The manager says N[Z]... has a proud record and has detected many items missed by their overseas counterparts. Items include a fake bomb containing three sticks of mock gelignite, a clock, detonator and a nine-volt battery bought by an A[US]n passenger in the U[S] and carried on to a flight leaving Los Angeles without detection. Similarly, a loaded fully automatic pistol left on a chartered 747 winged its way around the world for three weeks until discovered by N[Z] authorities, who]... have some of the most modern detection equipment in the world – the most recent bought as part of security measures for the Commonwealth Heads of Government Meeting in Auckland last year.

Seventy-nine people were hurt, seven of them critically... Police chiefs drafted in 400 riot police and troops to put a security plan codenamed Vigipirate back into force immediately... No one[] has claimed responsibility, but the target, the timing and the type of bomb echoed attacks last year by Muslim fundamentalists fighting against Algeria's French-backed military rulers... The blast at the junction of Boulevard Montparnasse and Boulevard Saint-Michel occurred just two stops away from the St Michel station, where eight people were killed and 86 wounded in an attack blamed on Algerian extremists in July 1995... [France's President called the latest] attack "a barbaric and terrorist act" and vowed that France would do everything in its power to fight terrorism... [In related news,] Americans who sue European companies doing business in Cuba face counter suits in European courts, now that the EU has vowed to retaliate against a U[S] law it deems unfair... The U[S] law was passed after Cuban MiG fighters shot down two civilian planes piloted by Miami-based exiles in February. The shooting stirred up American sentiment against Cuba and put pressure on the U[S] Government to isolate the [Cuban]regime further... The... European... legislation... is intended to discourage European companies from settling out of court in the U[S]. The... new law also strikes back at U[S] legislation allowing Washington to slap trade sanctions on foreign companies investing in the oil sectors in Libya and Iran. - 1996

[The US President, who was] seeking to pre-empt congressional action, imposed sweeping new sanctions on Sudan yesterday for alleged sponsorship of terrorism... [Meanwhile, Pakistan has] put police on high alert... and tightened security at foreign missions after warnings of further possible attacks in the wake of a daylight ambush that killed four U[S] oilmen... [during the] morning rush-hour... on Wednesday... the first [attack]on expatriate employees of a US multinational in the country... could be a revenge strike for the conviction of [a]Pakistani... for the 1993 killing of two C[IA] employees... at CIA headquarters in Langley, Virginia...

[Yesterday, at the USs'] biggest ever mass murder trial[, the]... prosecution accused... the... Oklahoma City bombing defendant... of being a right-wing extremist who thought the deadly blast would trigger a second American Revolution... In an opening statement laying out the case against the 29-year-old Gulf War veteran, [the prosecution declared: "The defendant]... liked to consider himself a patriot... [but o]ur forefathers did not fight innocent women and children... They didn't plant bombs and run away wearing earplugs." ...But [the defendant]'s attorney... sought to counter the Government claim by saying he would prove it had accused the wrong man of blowing up the Alfred P. Murrah federal building... on April 19, 1995... He described the bombing as "the largest domestic terrorist act in the history of this country." But he also quickly added "did they get the right man? Millions of innocent people fear and distrust the Government[.] The defendant's]... one-time Army buddy [has told the media that his] hatred of the [G]overnment may have led him to sacrifice 168 people... [The defendant,] who has pleaded innocent and who could face the death penalty if convicted, took copious notes during the opening statements[, which included the suggestion that he was]... out to avenge the 1993 Government assault on the compound of the Branch Davidian religious cult in Waco, Texas, which ended in the deaths of 80 people... [The prosecution alleged the defendant's] co-conspirator singled out the Oklahoma City federal building for attack because [the defendant] believed,

wrongly, that was where the order for the Waco raid originated. [The co-conspirator] is to be tried separately... [The] former Army buddy[, who is to be the trial's]... star witness... has pleaded guilty to four felony counts in return for testifying that he knew about plans for the bombing but did nothing to stop it. He is in federal prison awaiting sentencing and faces up to 23 years in prison... Security was heavy around the federal complex that houses the courthouse in downtown Denver... In Oklahoma City, about 125 bomb survivors and relatives of those killed attended a special telecast of the opening arguments... on an 8m wide screen.

...Relatives of those who died in the Oklahoma City bombing greeted the guilty verdict against [the defendant] yesterday with cheers, jeers and calls for the death penalty. "There was only one verdict..." said [one person] whose 23-year-old stepdaughter died in the blast. "There is only one penalty..." His sentiment was echoed across the nation... [After sitting through 11 weeks of court proceedings t]he jury deliberated for 23 hours over four days before finding [the defendant] guilty on 11 charges... including the murder of eight federal agents. Oklahoma authorities now plan to file state murder charges on behalf of the 160 other murder victims... Outside the courthouse in Denver, where the judge had moved the trial because he believed that [the defendant] could not get a fair trial in Oklahoma, some [people] hugged and clung together for support and others gave v-for-victory signs... [The] trial's sentencing phase... starts tomorrow... But many... of the victims' relatives... concede that even... the death penalty... would not be enough to ease their pain.

...the conviction of [the defendant] may become another symbolic date that extremists will want to mark with violence... Anniversaries are symbolically important within the militia movement. It was, after all, the anniversary of the federal agents' April 19, 1993, raid on the Branch Davidians... that prompted the bombing of the federal building in Oklahoma City two years later. Yesterday's guilty verdict... will be seen by a small group of hard-core, violent extremists within the movement as a further Government crackdown against them, according to several organisations that monitor militias... "It's a small percentage of people, but they are committed to using violence. This is where they could possibly turn [the defendant] into a hero."

...Thin, tall and clean-cut, he looks like an all-American boy and he grew up playing Little League baseball and joining the Army, just like millions of others. But a Denver jury found that... [he is] the "All-American Monster." After promising in pre-trial interviews that he would testify, [he had] remained silent in his defence with his thoughts and actions described by reluctant witnesses for the prosecution. Even they had nice things to say about him. "If you don't consider what happened in Oklahoma, [he] was a good person," said [the] star prosecution witness... who testified against [his former Army buddy] in hopes of avoiding a lengthy jail term for himself and any jail time for his wife. The monster's sister... told the court of his obsession with *The Turner Diaries*, a racist... novel in which extremists blow up FBI headquarters to start a second American Revolution. [Her brother] was once a promising young soldier who won a Bronze Star in the Gulf War... He excelled in the Army, where his obsession with neatness and fitness impressed commanders. But his life seemed to fall apart when he left the Army soon after he failed to get into the elite Special Forces. He also grew increasingly obsessed with the Government... He found work as a security guard in Buffalo. He showed his frustration with the Government in a 1992 letter to a local newspaper that said: "Do we have to shed blood to reform the current system? I hope it doesn't come to that! But it might."

...THE FAMILIES of [the Oklahoma bomber's] victims applauded the death sentence handed down against him yesterday and said they hoped the anti-government paranoia that inspired the attack would die with him... "You don't want to celebrate someone else's death," said [one relative]... "But my dad didn't have a choice to live or die and I don't think [his murderer] should either..." ...Behind him, a small group of victims sang *God Bless America* as they unfurled an American flag and draped it over the fence that surrounds the field where the Alfred P Murrah federal building stood before it was blown apart... [Someone] who was injured in the blast and lost a friend, said any other sentence would have allowed [the defendant] to promote his cause from inside prison... But there were some voices of dissent. [A person] whose daughter... died in the bombing, has been a staunch critic of the death penalty... "How can you receive peace from yet another death?..." Moments before [the] US District Court Judge... sentenced him to death... [the defendant had broken] the silence he kept, except for a few words, throughout his 11-week trial. In a low tone that had a packed court straining to hear, [he] read a one-sentence quote from the late liberal US Supreme Court Justice Louis Brandeis: "Our Government is the potent and omnipresent teacher. For good or for ill, it teaches the whole people by its example. That's all I have to say," he added, standing ramrod straight and dressed in prison garb... His lawyers said they had filed a notice of appeal. Under federal rules, when all appeals have been exhausted, [the] US Attorney-General... would turn [him] over to the federal marshals and an execution date would be picked by the director of the Bureau of Prisons.

...[The Oklahoma City bomber has told television viewers he has no regrets about his actions. Asked whether it was right to use violence against the Government, he told the CBS programme *60 Minutes*: "If the Government is the teacher, violence would be an acceptable option. The US Government uses violence all the time." In related news, t]he guru of the Japanese doomsday cult accused of masterminding the nerve gas attack in the Tokyo subway... said yesterday he was not guilty, and... [i]n his first clear statement in a year-long trial... accused his followers of carrying out the... March 20, 1995, attack... "I ordered [my] top disciple... to stop on the night of the 18th and I ordered [my] senior follower... to stop on the 19th but it turned out I lost against them." ...[However, m]any other top followers have said... [that the] leader of the Aum Shinri Kyo (Supreme Truth) sect... ordered the subway attack and other murders. After his statement in Japanese [the leader had] switched to incoherent English... [He] has been repeatedly removed from court for interrupting the proceedings with incomprehensible statements.

...Never one to mince words or acts, the world's once most wanted terrorist "Carlos the Jackal" coolly described himself on his 1994 arrest as a "professional revolutionary." He faces life behind bars if convicted by a Paris Assize Court in a trial which begins today. The trial for the 1975 killing of two French policemen and a third man will be the first of six court cases for the Venezuelan-born guerrilla leader who terrorised the world in the 1970s and 1980s. [He was n]abbed in hiding and flown out of Sudan by French agents in a swift and surprise operation three years ago... Carlos, whose years on the run from police began in 1970 as a radical pro-Palestinian fighter, hit the public spotlight with the most audacious coup in his two-decade covert career – an attack on a meeting of Opec ministers in Munich in 1975... [His] six-man commando – Arm of the Arab Revolution – took 70 people hostage, including 11 government ministers... Three people were killed and the terrorists were given a ransom of \$US50 million... [Also i]n 1975, two French officers and a third man were shot dead in Paris as they tried to arrest him – the case he is about to stand trial for... In a long interview from somewhere behind the Iron Curtain 18 years ago, he confessed to these and other attacks to the Arab-language weekly *Al Watan al Arabi*. He has since denied he told the truth. His next appearance in the Western world took place in 1982, when French police arrested one of his lieutenants along with [a] German Red Army Faction member... whom he later married. Carlos sent a handwritten letter to the French interior minister... demanding their release within 30 days. A bomb exploded on a French train the day the ultimatum ran out and another killed one person and injured 63 the day [the lieutenant and Carlos' mistress] went on trial. [His] mistress was released in 1985 and joined Carlos in Damascus, where the couple the next year had a daughter. Carlos left Syria in 1991 and set up home in Sudan in 1993, living under one of his many aliases... and marrying a young Jordanian woman. But the... French interior minister[, who was] gearing up for presidential elections in 1995, had agents on his heels, and the Sudanese authorities, keen to restore the nation's international image, agreed to help with his capture... [Incidentally,] ETA separatist rebels struck with deadly force for the fourth time in a week in Spain yesterday, killing a policeman with a car bomb... in the northern Spanish city of Bilbao. The explosion was just metres from a high school of 2000 students, none of whom was hurt... [In other attacks this week, a] Supreme Court judge was gunned down outside his Madrid home, a car bomb killed a civilian airbase worker in Granada, and a Basque businessman was shot and killed. The Spanish Government had feared a surge in separatist

violence this year as ETA tried to reassert itself after a string of setbacks in 1996... ETA... has killed 800 people in its 29-year drive for... an independent Basque state encompassing parts of northern Spain and southern France.

...Fierce clashes between supporters and opponents of the... ETA erupted in Pamplona yesterday, hours after a young politician kidnapped and shot by the rebels died of his wounds. Witnesses said hundreds of angry Spanish youths attacked a small group of ETA supporters and tried to burn the headquarters of the separatist group's political wing, Herri Batasuna. Police in riot gear with their faces masked tried to break up... the... clashes... When the... anti-ETA demonstrators... tried to storm Herri Batasuna's headquarters, police opened fire with rubber bullets. They also kicked protesters and used batons to beat them back... When the clashes erupted in Pamplona, the city was packed with tens of thousands of visitors participating in the world-famous running of the bulls festival that began one week ago. The annual festival was suspended yesterday for the first time in 19 years and had not yet resumed... ETA abducted Mr Blanco on Friday and said he would be killed... unless the Government changed its policy on prisoners. But Government officials said they would never give in to blackmail.

...The public backlash against... ETA led to sporadic violence overnight in the Basque country, where 29-year-old Miguel Angel Blanco was laid to rest in his hometown of Ermua. In San Sebastian, more than 1000 anti-ETA protesters hurled eggs and rocks at offices and a bar used by the rebels' political wing... The people inside retaliated with Molotov cocktails, police said. At least two youths were injured. In Bilbao, police reportedly had to intervene to prevent the "lynching" of two ETA sympathisers... More than two million people took to the streets yesterday in Madrid, Barcelona and other regional capitals in one of the largest nationwide demonstrations in Spanish history... Millions stopped work at noon to observe 10 minutes' silence. Traffic came to a halt. Flights out of Madrid's international airport stopped... [I]n a rare television address to the nation, [Spain's King] praised the Spanish people for their "condemnation of terrorism" and urged them to "continue fighting in this endless struggle for democracy, liberty and human rights." ...The killing... [of] Mr Blanco... has marked a turning point. Basques who once whispered their opposition to ETA in private are now screaming it in public. In one telling moment, some members of the elite anti-ETA units of the Basque police defiantly stripped off the masks they normally wear to protect their identities and avoid retaliation.

...Facing unprecedented condemnation and the threat of a Government crackdown... ETA is likely to respond the way it has in the past – with more violence, experts say. The kidnap and slaying of a... popular... young Basque town councillor produced the strongest backlash against the separatist rebels in memory... Basques, once intimidated by ETA, have set fire to several of its political offices... In official circles, the latest killing was seen as a sign of ETA's weakness and desperation. A wave of bombings and killings this year had failed to win any Government concessions... The Government has not budged on one of the group's key demands – to transfer about 500 inmates scattered around the country to prisons in the Basque country... ETA's choice of a low-level, unpaid official from the ruling party showed it was not capable of penetrating the security shield surrounding more prominent figures or of staging a high-profile attack in Madrid during last week's Nato summit, analysts said... The Government in Madrid refuses to talk to ETA unless it first renounces violence. Though Basque's nationalists share ETA's goal of an independent state, they reject violence. ETA's support has waned since... dictator Francisco Franco repressed any expression of Basque nationalism... and Herri Batasuna now has about 12[%] of popular support in the Basque region... Officials estimate the hard core of ETA, those who actually participate in bombings or kidnappings, is only 50 to 100 people organised into six to eight commando cells... ETA is primarily financed by the collection of a "revolutionary tax" from Basque businessmen under threat of reprisal. It also demands ransoms in some kidnapping cases.

...It has been several years since... [one of the people who] helped to found Eta... in 1953... picked up a rifle and pulled on a balaclava in the name of Basque nationalism. In those days, he would hold up Guardia Civil convoys "with the aim of eliminating a maximum number of men," or would "go into a bank to raise funds"... Defined by the struggle to "free the Basque Country from the Spanish and French empires," his political conscience was never clouded by concerns about human life, nor by the prospect that the three million people of the Basque Country might achieve independence through a negotiated settlement. Now aged 65, he works in a respectable lawyer's office in Bilbao, but his opinions have changed little... He is scornful of the prevailing view that the recent anti-Eta demonstrations mark the end of... Eta... [The 65-year-old], who spent five years in prison, said the killing of Mr Blanco was a "major mistake," and showed that the Eta leadership was out of touch. But he believed Eta would renew its ideological fervour: "One day, the French and Spanish Governments will have to negotiate over the Basque Country, and it will be Eta that does the talking."

...Spanish security forces [a]re on alert for retaliation by Basque guerrillas after 23 leaders of the rebels' political wing were jailed for seven years... [yesterday. Incidentally, NZ's] police special tactics group[was f]ormed in 1977 as the anti-terrorist squad[. T]he group's name was changed 15 years later in recognition of its increasing deployment in other roles, including robberies and surveillance on commercial cannabis growers... "I don't think we've ever been called out to deal with a terrorist," says [one group-member]... It is a demanding job which offers the low-profile, high-firepower squads little recognition outside police circles... Police are reluctant to give much away about the elite group, which selects members from armed offenders squads around the country and consists of three sections based at Auckland, Wellington and Christchurch... [The] officer in charge of the operation support group responsible for the squads, is... tightlipped: "We don't deny their existence, but for security reasons we do not give staff numbers or details about firearms." He says the members of the group are highly trained in counter-terrorist techniques, attending five week-long courses a year and sectional training sessions once a month. The police have prime responsibility for dealing with terrorism in N[Z] but can call on the armed forces for help. Military training with the group is generally limited to exercises with the Iroquois helicopters it uses for logistical support.

...Crack police and defence squads took on a bomb-happy... doomsday cult in Wellington yesterday... Police, soldiers and other agencies descended on a remote Cook Strait farm... as part of Exercise Guardian, a three-day operation to test the country's preparedness for terrorist attacks... So far the cult's evil minions have taken over the former Wanganui computer centre at gunpoint, exploded a bomb in the carpark of a Wellington computer firm, planted another in a city high-rise and sparked a bomb search in the Porirua police college. As the forces of good closed in the cult leaders took a hostage and holed up at the Oteranga Bay substation. They threatened to cut a Cook Strait cable, plunging part of the country into darkness – not to mention killing the hostage – unless their anti-computer demands were met.

...MISSION FOR MISSION, international terrorism has become the most efficient instrument of modern warfare. It fulfils every military commander's definition of effectiveness: it damages enemies in their own countries or wherever they are found; it is low cost, using minimal armed forces; it causes almost no casualties in the field and none at all to its bases, supply lines, economy or leadership. How has terrorism become such a powerful and pervasive tool of war? The answer is plain and shameful: the passiveness, in-decision and suicidal moral attitudes of its main target – Western Democracies. In Libya are two men... accused by the U[S] of bombing Pan Am Flight 103 over Scotland on December 21, 1988 – an act of mass murder that killed 270 men, women and children... Libya's... dictator... refuses the demands from America and some of its allies to turn the two men over for trial. The U[S] takes no steps to punish the Libyan security detachments that guard these men or the armed forces that help the dictator defy the world... The idea that he is not as guilty as the other two Libyans is evil comedy... All the while Libya gets supplies from America's allies – openly as well as surreptitiously. Companies in Germany, France, Italy and Japan have supplied Libya with goods that can be used in warfare or for manufacturing weapons. They have even delivered components that could make it possible for Libya to build the world's largest underground chemical weapons facility... International terrorism is not a matter of lone bombers or isolated killer squads. It is a new form of organised guerrilla warfare with world reach. Terrorists realise that sudden deadly strikes at civilians in faraway places serve to magnify the importance and power of the guerrilla. It could happen to anybody, any place. And they no longer routinely announce the responsibility for

terrorist strikes. They have learned the un-named mass murderer's fear value... Almost all the terrorism [is] directed against the U[S]... Last year... the... director of Harvard's Centre for Science and International Affairs, wrote to me claiming it is only a matter of time "before a terrorist detonates a nuclear device in America." ...[But] America... has failed to develop a military, political or economic response to terrorism. Every time a new terrorist outrage takes place against America, the country's government looks around as if it had never taken place before. For a while bureaucrats rush about building more fences. Then, sure as the morning, they set out on pilgrimages to terrorist nations, and... sidle up to make [business] deals. Terrorists know trade is becoming the highest moral value of the West, and they count on that to protect them from retaliation. TO DEFEAT terrorism, two things are essential: "National will and the moral courage to exert it." So stated a 1988 presidential commission on terrorism that concluded: "While a law enforcement approach must always be a part of our responses to terrorism, this commission finds unacceptable the idea of holding ourselves in all cases to a criminal standard of proof before we act... The commission recommends planning, training and equipping for direct preemptive or retaliatory action against known terrorist hideouts in countries that sanction them." ...[By the way, n]ewly disclosed evidence "points to a missile" as the cause of the explosion that killed all 230 people aboard... TWA Flight 800... last year, a Californian newspaper reported yesterday... The *Press-Enterprise* said... information from FBI and National Transportation Safety Board documents and investigative sources indicated the plane might have been a victim of... "friendly fire" – a US navy weapon gone astray. The FBI repeated that it had no proof of a missile... In Washington, navy officials reiterated their denials that any missile test was conducted off eastern New York at the time of the crash.

...The FBI has announced it had found no evidence that a bomb or missile caused the 1996 crash of a TWA flight that killed 230 people... The Paris-bound jet exploded without warning... 11 minutes after take-off... 244 eyewitnesses... thought [they saw] a projectile striking the jumbo jet... "All the witnesses saw events that happened after the centre tank blew up," said [the] FBI assistant director... [He] painstakingly sketched out the course of the investigation, addressing such theories as "friendly fire" by noting no military training activities could have been responsible... The FBI announcement, which accompanied the formal closing of its criminal investigation, leaves mechanical failure as the most likely cause... But investigators have not determined precisely what mechanical catastrophe occurred... Investigators recovered [from the Atlantic Ocean 96%] of the aircraft, amounting to nearly one million pieces of debris. - 1997

U[S] investigators are joining an inquiry in Pakistan after a man was reported to have confessed to planning the twin U[S] Embassy bombings in Kenya and Tanzania... [10 days ago], which killed 257 people... Meanwhile, U[S] officials have information "tentatively linking" [a] fundamentalist millionaire... to the bombings, the *New York Times* reported. [The millionaire], a Saudi Arabian exile living in Afghanistan, has been on the top of the list of suspects since the August 7 blasts... Witness accounts in Nairobi have identified... "....an associate" of [the millionaire]... who was inside the truck carrying the bomb that wrecked the embassy in Kenya. The U[S] officials described the suspect as "a relatively low-level member of [the millionaire's circle]." The millionaire, aged 41, comes from a family of wealthy Saudi construction tycoons. He is an outspoken anti-American... and has allegedly bankrolled many anti-US attacks. In Nairobi, the head of the intensive FBI-led effort... expressed confidence it was on the right track towards learning the terrorists' identities... Five people remained in custody in Nairobi... according to police. In Tanzania, two foreigners were still being questioned for assistance but were not among "the perpetrators of the offence," said [the local] director of criminal investigations. For the first time since the bombing, a television cameraman was allowed into the devastated embassy, recording hints of the terror those inside experienced immediately after the blast. Bloody handprints were smeared on a hallway wall, presumably those of a survivor trying to stagger to safety... Funerals were held at the weekend for victims of the Kenyan bombing. In keeping with tradition, most of the dead were buried in their villages... At one funeral, beneath a eucalyptus tree in a Nairobi cemetery, mourners sobbed at the grave of a 36-year-old woman who was working in an office tower overlooking the embassy when the explosion occurred... The U[S] Secretary of State... was due to leave yesterday for the two bomb-hit capitals... [after] shelving... holiday plans...

F[B]I agents and Kenyan police[have] raided a hotel that housed four people suspected of bombing the U.S. embassy... The FBI confirmed that... agents gathered evidence from two rooms in the... Hilltop Hotel, where[the] four... stayed between Aug. 3 and Aug. 7. One of the suspects... was detained in Pakistan and is under arrest in Nairobi. One FBI official said... the FBI remains confident [the suspect] was involved in the Nairobi bombing but added the suspect has yielded little information to investigators... "They're still picking up a lot of people," [he then] said... A Nairobi newspaper, the *Daily Nation*, reported the bomb was made in the hotel from 800 kilos of TNT. The newspaper also reported... [that the suspect] worked with five accomplices – three of whom were killed in the blast and two who remained at large... The explosion killed 247 Kenyans and 12 Americans. Meanwhile, the World Islamic Front for Jihad Against Jews and Crusaders, a group formed by [a Saudi millionaire], issued a warning to the U.S. in Al Hayat, a respected Arab-language newspaper based in London. "The coming days will guarantee... that America will face a black fate... Strikes... [against] American interests... will continue from everywhere..." Separately, the... government in Afghanistan, where [the millionaire] is based, reiterated that it wouldn't hand over the Saudi dissident even if he is proved to have been behind the bombing.

...*American Forces Hit Alleged Terrorist Bases*... [The US] President... ordered missile strikes against terrorist training camps in Afghanistan and a suspected chemical-weapons factory in Sudan, both linked to [a Saudi millionaire]... "Today, we have struck back," the president declared in announcing the attacks. In an address to the nation later yesterday, the president cited "convincing information" that [the Saudi millionaire]'s operatives were involved in the bombings two weeks ago of U.S. embassies in Kenya and Tanzania... [The] President... also said there was "compelling evidence" that [the Saudi millionaire]'s network was planning further attacks against American embassies and other facilities overseas. U.S. officials said intelligence indicated that those attacks might involve chemical weapons. From the first day of the embassy bombings, [the] President... vowed that those responsible would be tracked down and punished. But the speed with which he acted was surprising – especially before the U.S. had presented public evidence of [the Saudi millionaire]'s culpability... U.S. Navy ships fired about 50 cruise missiles against the camp... near the Pakistan border... and an additional 25 against the chemical plant... in the industrial suburbs of Sudan's capital, Khartoum. Sudanese officials said the factory produced... ['60% of Sudan's] medicines. H]igh-explosive munitions were used in the Khartoum raid, while a mixture of explosives and anti-personnel cluster-bomb warheads were fired against the terrorist base. Other U.S. attacks may be planned... U.S. officials insisted that [the Saudi millionaire] wasn't personally targeted, and a[n]... official in Afghanistan said yesterday that [the Saudi millionaire] was safe. By using cruise missiles, the U.S. eliminated the danger that any planes or pilots might be lost. Still, the decision is fraught with risks for both [the president] and the country. U.S. officials are already bracing for what could be even more furious terrorist retaliation... [from the millionaire]. Saudi Arabia, which stripped him of citizenship in 1994, has linked him to a 1995 bombing of a U.S. military training site in Riyadh. The Egyptians accuse a group linked to [the millionaire], as well as the Sudanese government, of trying to assassinate [Egypt's] President... during a 1995 visit to Ethiopia... Yesterday's strike was similar to the 1986 bombing of Libya by the [40th US Administration after]... terrorists bombed a nightclub in Berlin frequented by U.S. soldiers... At that time, the U.S. had extensive intelligence information – its own and from French and Turkish sources – that Libya had declared a kind of unconventional terrorist war on the U.S... The response seemed to work; after a period of continued tension, Libya's sponsorship of terrorism has appeared to decline. By contrast, the U.S. didn't respond when terrorists blew up the U.S. Marine barracks in Lebanon in October 1983... [The person] who then was U.S. coordinator for counterterrorism... says the U.S. didn't act because it was never sure who masterminded the attack. But that inaction was followed by a decade of hostage-taking by terrorist groups, who viewed attacks on U.S. targets as risk-free. How this latest response will play [out around the] world is unclear.

...Americans around the world are braced for possible retaliatory attacks after U[S] missile strikes on bases in Afghanistan... kill[ing] at least 15 people... and Sudan... Sudanese officials said several people were killed and 300 were missing after the Khartoum attack... And the head of state in Sudan... said his country would take the simultaneous strike on Khartoum to the U[N. An Afghan]... official said... the... attack... [was] “callous”...

A U[S] cruise missile fired at guerrilla camps in Afghanistan has been found unexploded in southwest Pakistan and a bomb-disposal team has been sent to the site... A district official said the Tomahawk cruise missile, clearly marked “Made in USA,” made a crater around 4m deep.

...The 75-odd cruise missiles fired... from U.S. Navy ships at terrorist-related targets in Afghanistan and Sudan illustrate the weapon’s importance in the U.S.’s gunboat diplomacy in the 1990s. U.S. officials were unusually tight-lipped about the raids, partly because, officials indicated, they may have to hit related targets in coming days... Officials later indicated that the missiles were launched from two Navy ships in the Red Sea and four surface ships and an attack submarine near the mouth of the Persian Gulf. The missiles... must have flown over Pakistan, but U.S. and Pakistani officials declined to discuss whether permission had been sought or granted for that overflight... Comparing yesterday’s attacks to the Gulf War... the chairman of the Joint Chiefs of Staff... said that with this campaign against terrorists, “We’re in a different ballgame...”

...Behind[the] attacks on terrorist installations in Sudan and Afghanistan is a more ominous threat, one that has its roots in the closing years of the Cold War and which the U.S. played a role in creating. After Soviet troops invaded Afghanistan in 1979, tens of thousands of young Arab volunteers flooded into the country from all over the Middle East to fight alongside the Afghani resistance, the mujahedeen. Volunteers and draftees were armed by the CIA, paid by Saudi Arabia and trained by Pakistani intelligence services. The support given the mujahedeen and its Arab partners has long been considered a signal foreign-policy achievement, one that may have accelerated the demise of the Soviet Union after its troops were routed from Afghanistan. But in recent years, the mujahedeen’s “Arab Afghan” allies have become a source of increasing concern to U.S. and other intelligence agencies as they turned up as guns-for-hire in conflicts raging from the Middle East to the Balkans to central Asia and Africa. Intelligence analysts say the fighters[’ objective is]... to extinguish American influence in Saudi Arabia and the Persian Gulf and to make prohibitively high the cost of American support for Israel... And they have made clear that those Arab and Muslim governments that cooperate with Washington will pay a price... Virtually every major airport has stepped up security measures... and many worried [US] companies told executives to curtail trips abroad, as they also increased security at foreign sites and at home.

...The apparent owner of a Sudanese factory destroyed... last week... by U.S. missiles is a westernized Saudi Arabian banker with no known ties to Islamic extremists. [The owner], believed to have bought the Ashifa factory in March, has some connections with the Islamist regime in Sudan, but also with a group of Sudanese exiles opposing the regime, according to Sudanese dissidents... U.S. officials said they have hard evidence that the factory... was making a key ingredient for the VX nerve agent, but they haven’t specified the ingredient or the evidence. A U.S. official said on Friday the U.S. believes the Ashifa factory is owned by the Sudanese government or military. But Sudan said... [the] 46-year-old Sudan native... owns the pharmaceuticals factory outright. Sudan’s version is backed by the original Saudi owners, by a British former employee, and by a dissident lawyer in Khartoum... That lawyer... told the Associated Press that [the factory’s owner had] never met... the... Saudi-born dissident... targeted in the U.S. attacks, and that [his client] may seek \$50 million in compensation for the plant’s destruction. The [US] Administration’s choice of targets is at least likely to raise concern among the U.S.’ Arab allies... [The owner] is a financial adviser to Saudi Arabia’s largest bank, National Commercial Bank, which has strong ties to the royal family... The Ashifa plant, opened in 1996, was originally a 50-50 venture between a Sudanese businessman... and a Red Sea shipping company in Jidda... In an interview yesterday, [the]... owner of the Jidda company... said the plant was supplying malaria tablets for children and veterinary medicine for cows and cattle, using equipment from India, Switzerland and the U.S.

...The American designer and Italian supplier of a pharmaceuticals factory in Sudan cast further doubt on U.S. allegations that the plant, destroyed... by U.S. cruise missiles, was a well-guarded nerve-gas plant. [The Italian], whose Milan company supplies powders that generic-drug makers form into pills, said in an interview he was given the run of the plant in long visits in February and June... “I didn’t see any equipment – and there wasn’t even the space – for any production of chemicals... The availability of tools in the factory was close to zero... To imagine [it as] a plant that makes chemical weapons is absolutely incredible.” ...Sudan wants a public apology from Washington for its missile strike... New details also emerged about last Thursday’s raids[in Afghanistan. The]... vice chairman of the Joint Chiefs and the [US] military’s second-highest ranking officer, was sent to Pakistan to ensure that the launch of missiles from U.S. Navy ships in the Arabian Sea didn’t inadvertently start a war in the subcontinent. U.S. military planners feared that Pakistan might have misinterpreted the cruise missiles heading to Afghanistan as a surprise attack from India... Meanwhile, huge questions remain about whether the [US] administration will be able to sustain its offensive against terrorism. Among other things, the administration’s attention and energy could be distracted by... looming foreign crises with Iraq, North Korea and... tensions... mounting in the Serb province of Kosovo. [The]Serb leader... has a history of making aggressive moves when the U.S. and its allies are focused on other crises. Indeed, Serb artillery yesterday fired on ethnic Albanian villages a few miles south of the province capital of Pristina. There were reports of another attack on Albanian separatists about 20 miles west of the city.

...Senior U.S. intelligence officials said they secretly acquired in recent months a soil sample from the Sudanese factory the U.S. bombed last week that buttressed longstanding suspicions that Sudan is trying to acquire chemical weapons. The officials said that the soil sample contained O-ethylphosphonophioic acid, or EMPTA, a chemical precursor of deadly VX nerve gas. The intelligence officials added that the chemical isn’t used in any commercial chemical process, doesn’t occur naturally in the soil and isn’t a byproduct of other chemical processes... Sudanese officials say [a Saudi millionaire] had no connection with the facility... But yesterday, the intelligence officials asserted that when [the millionaire] was working in Sudan in the mid-1990s, he was working with officials at the facility on research and production of chemical weapons and dispersal of gases. They added that he funded a number of research efforts and still owns a farm in Sudan. They also... acknowledged that the plant made medicines... Separately, the chairman of a Sudanese company that produces gum arabic, one of Sudan’s biggest exports, said in a letter... forwarded to U.S. importers of gum arabic... that the company doesn’t have any ties to [the Saudi millionaire]... News reports over the weekend suggested that [the Saudi millionaire] may have a connection with companies in Sudan’s gum-arabic industry. Sudan produces 70 % to 90 % of the world’s supply of the ingredient, which is used in such products as soft drinks, candy and pharmaceuticals. Coca-Cola Co. and PepsiCo Inc., which use gum arabic mostly in citrus sodas... for emulsion purposes, said they buy the ingredient from third-party brokers. When the U.S. imposed economic sanctions on Sudan last year for supporting international terrorism, U.S. companies received one-year temporary licenses to continue importing gum arabic to meet contractual obligations.

...Doubts about the U.S. government’s rationale for its cruise-missile strike against a factory in Sudan are provoking a debate within the [US] administration about whether to release more evidence to support its claims. German magazines and a newspaper reported yesterday that Germany’s ambassador to Sudan had told his Foreign Ministry that the El Shifa Pharmaceuticals Industries Co. facility didn’t make chemical weapons... The Organization of African Unity over the weekend also backed a call by the government of Sudan... for the U[N] Security Council to launch an inquiry into a U.S. claim that... the plant made or stored chemical weapons... In addition, some foreign officials have quietly hinted that the U.S. should have hit a different Khartoum factory for which there is far better evidence of involvement in the manufacture of chemical weapons. A U.S. official dismissed that argument yesterday, saying that the other facility is located in a residential neighborhood. If nerve gas were stored there, a U.S. official said, the missile attack could have killed thousands of people.

...A bombing in South Africa killed one and injured 24 at the Planet Hollywood restaurant in Cape Town. A little-known Muslim group said the attack was prompted by U.S. missile attacks on Sudan and Afghanistan... [In related news, two] suspects in the Nairobi embassy bombing... have

been extradited to the U.S. to face trial for their roles in the deadly attack... [The] Director... of the F[B]I... said... U.S. investigations into the almost simultaneous bombings in Nairobi and Dar es Salaam... was the largest in history, measured by the 500 agents deployed overseas.

...A suspected bomber of the U[S] Embassy in Nairobi was... charged yesterday with murdering 12 US nationals among 253 people killed in the attack 20 days ago. The defendant... threw a grenade at embassy guards when the vehicle carrying the bomb drove into the Nairobi mission's parking lot seconds before the blast... according to the prosecution... The US is... [still searching for someone who] is described as an explosives expert and a "key player" in the Kenya bombing. He is wanted on 13 murder and murder conspiracy charges and one count of using weapons of mass destruction.

...The US State Department offered a record \$US5 million reward yesterday for information leading to the arrest and conviction for the US embassy bombings in Africa that killed 263 people and other attacks on Americans... Meanwhile, the U.S. as expected, proposed holding a trial for two suspected Libyan terrorists before Scottish judges in the Hague, a move [the US] Secretary of State... called "another effort to bring terrorists to justice." The administration previously had insisted that the two men, who are Libyan intelligence agents charged with planting a bomb on flight Pan Am 103, should be tried in the U.S. or Britain.

...THE U[S] and Britain have warned Libya it has 30 days to hand over two suspects in the 1988 Pan Am jet bombing... but neither country says what will happen if Tripoli refuses... Libya's UN envoy... noted the full Security Council had not issued an ultimatum. He said his country still wanted UN sanctions lifted rather than suspended in exchange for any surrender of the suspects... [Incidentally, h]undreds of people have fallen ill following a plane crash in Amsterdam... on Oct. 4, 1992, [when an]... El Al cargo jet... plowed into [a] 10-storey... apartment building... killing 43 people and igniting an inferno that covered the... district with a cloud of black smoke. Since then... residents and rescue workers... have come down with unexplained illnesses that they believe were caused by the burning plane and its cargo. In what has become a Dutch version of Gulf War syndrome, many sick people are seeking answers from a government they claim has been stonewalling them... [B]ut until there is a comprehensive examination of these sick people and a full accounting of what was aboard the plane, the link is impossible to verify... The basic facts surrounding the accident are not in dispute. The Boeing 747-200F, carrying three crew, one non-commercial passenger and 114 tons of freight, took off from Amsterdam's Schiphol airport at 6.21 p.m. en route to Tel Aviv. Seven minutes later, both starboard engines ripped loose from the wing. The pilot circled back toward the airport to attempt an emergency landing, but the crippled craft came down in the predominantly immigrant neighborhood of Bijlmer. In an October 1994 report, the Netherlands Aviation Safety Board blamed the crash on mechanical failure due to faulty engine mountings. But if the cause now seems clear, troubling questions remain. The case has all the elements of classic conspiracy theory: a missing cockpit voice recorder, incomplete cargo records, depleted uranium used as ballast, unconfirmed accounts of mysterious figures in white protective clothing combing through the wreckage and persistent rumors that all the sniffer dogs used by emergency workers were dead within six months... Last month, parliamentary investigators heard a phone conversation taped half an hour after the crash in which an El Al official told a Dutch air traffic controller that the flight had contained explosives, flammable materials and toxic gases. At the Israeli's urging, the controller promised not to make the information public. [The incumbent Dutch PM], who says he "nearly fell out of [his] chair" when he learned of the exchange, immediately moved to suspend the three controllers on duty that night... Despite their close ties to the Jewish state... [-] El Al... has long enjoyed a "special relationship" with Schiphol, its European hub, whose officials have been tolerant of cargo shipments that do not always follow standard procedures... [-] Dutch officials have sharply criticized the Israelis for withholding information. "As a friend of Israel, I am deeply disappointed," [an ex-Dutch PM]... told the investigators last week. "It is incomprehensible that they did not inform us" about the complete contents of the plane.

...An Israeli... plane which crashed in Amsterdam in 1992 was carrying chemicals that could be used to make the nerve gas Sarin. A spokesman for El Al, Israel's state airline, confirmed that the plane was carrying a shipment of... 190 litres of... dimethyl methylphosphonate... and the cargo originated at a U[S] factory... El Al told Dutch authorities about the chemical cargo at the start of the investigation into the crash, he said.

...AS THE DUTCH PARLIAMENT WAS PROBING THE 1992 El Al crash... last week[, international]... attention focused... on two terrorist bombings that left a total of 440 people dead in Scotland and Niger. In Paris, a special court found six Libyan agents, including the brother-in-law of... [Libya's ruler], guilty of murder for their role in the crash of a UTA DC-10 over the Tenere Desert on Sept. 19, 1989. In Cairo, where [Libya's ruler met the] Egyptian President... the Libyan ruler seemed to be inching toward a deal that could lead to the trial of two Libyans suspected in the explosion of Pan Am flight 103... on Dec. 21, 1988. The Paris trial was open-and-shut: the defendants were convicted in their absence after a three-day recital of the charges against them. The... [charges followed a lengthy] investigation, which established a trail from twisted shards in the sand to the highest echelons of Libya's intelligence services... The seven-judge panel took only three hours to return a guilty verdict and sentence all six to life imprisonment. Though the convictions have no immediate practical effect, diplomatic sources say Libya might be prepared to pay damages to the victims' families. In the Lockerbie case, negotiations have been underway since last summer that would send two Libyan suspects to trial in the Netherlands (under Scottish law), in exchange for a suspension of the U.N. economic sanctions imposed on Libya in 1992 for refusing to cooperate with the investigation... [The Libyan ruler] has been given an informal deadline [that ends later this week] to hand over the suspects or face a possible tightening of the costly sanctions.

...The two Libyans accused of the 1988 bombing of a Pan Am jet over... Scotland are expected to be handed over this weekend amid great secrecy. [A UN] legal counsel... is due in Libya, which has pledged to surrender the two men by Tuesday but no public statements are expected until the two have arrived in the Netherlands... Barring any last-minute change of heart by Libyan leaders, [the counsel] is expected to ask a Security Council sanctions committee for authorisation to waive a UN flight ban over Libya at the last possible moment.

...Scottish police have formally charged two Libyans with the 1988 bombing of a Pan Am airliner... the first move in a complicated legal process which may take at least six months to bring the men to trial in open court... The suspects have been committed for further judicial examination, probably next week, and will be held on remand. After that, lawyers on both sides have 110 days to prepare their case, but this is expected to be extended to allow the defence more time... Both men deny the charges... Yesterday's brief appearance before the judge signalled the men's transfer from police custody to a makeshift prison... The detention facility on [a] former US military airbase... has been renamed Her Majesty's Prison, Zeist, complete with royal coat of arms. Scottish officials joked it was the smallest prison in the world. The men will be held there until the permanent facility, to be housed in the bomb-proof underground section of the base's former medical centre, has been completed... UN sanctions imposed on Libya over the past seven years were suspended hours after the men arrived in the Netherlands, but Washington said it planned to maintain its own sanctions.

...The trial of the two Libyans... began at Camp Zeist in the Netherlands this week... But those who expect that the trial... will get to the bottom of the matter are in a minority... Perhaps the only indisputable truth about Flight 103 is that at 7.02 pm on December 21, 1988, the Boeing 747 exploded 9500m above Lockerbie. All 259 passengers and crew, and 11 people in the town, were killed. Countless theories have been produced about what happened and why. Some say the explosion was the work of the Libyans, in revenge for... [the 40th US President]'s 1986 attack on Tripoli. Others say it was Iran avenging the accidental shooting down of one of its airliners by the USS Vincennes in July 19[8]8. Still others blame Palestinians trying to eliminate a CIA team preparing to rescue Western hostages from Beirut. Lawyers for the defendants say the bomb was planted by [a] convicted terrorist... who is now serving life for an attack on a Copenhagen synagogue... [The] Palestinian... member of a Syrian-based group with links to Iran, was the original suspect. But in November 1991, American and British authorities said they were indicting the two Libyans... What is certain is that if the two Libyans... were responsible for the bombing, they did not act alone. But built into the trial are factors

that may stand in the way of such inquiries. The deal under which [the]Libyan leader... agreed to hand over the suspects... included an assurance from [the UN]Secretary-General... that witnesses would not be asked about “any other operations or situations” involving Libya. Also in doubt is how open the intelligence services of various countries will be when their operatives listed as witnesses are called to give evidence. Of particular interest is whether the US had warning of a possible attack on Flight 103. Officials spent £12 million converting the 40.5ha Camp Zeist into a prison, court and a barracks for the armed Scottish police officers who guard it... It is the first time a Scottish court has convened on foreign soil, and it is the first Scottish murder case to be heard without a jury – three judges, with one reserve, are taking their place for the year the trial is expected to last... For Lockerbie, the tiny town whose name has become synonymous with the disaster, the physical scars are few but the horror remains seared in people’s memories... It is hard to find anyone in Lockerbie who was not involved in that night and its gruesome aftermath... [A s]earch and rescue dog-handler... found two teenage girls... on [a] sheep-covered hillside... just outside the town... where many of the bodies of the passengers were strewn after their 9km plunge from the sky... Still strapped into their airline seats, the[teenagers] clutched each other, fingers crossed, as they fell for 150 seconds to their deaths... The bomb that blew the jumbo jet apart sent the fuel tanks ploughing into... Sherwood Crescent... turning it into a furnace and obliterating whole families... Some bodies were never found. They were vaporised in the explosion... Looking out from the picture window of his bungalow[, a]... community councillor... watches a stoat chasing a rabbit through fields in front of his home and wonders if the trial can offer what the people of Lockerbie want – a return to normality. “We recognise that if a crime is committed, justice has to be seen. Many of the relatives will probably never get peace until there is the trial. But the tendency of the people of Lockerbie is that we’re not terribly interested in the trial. We’re always trying to put it behind us...”

...CBS television said yesterday that a senior Iranian intelligence service defector had claimed the [Lockerbie]bombing... was masterminded by Iran and not Libya. The defector, now in protective custody in Turkey, told a producer of the *60 Minutes* programme that he had documents to prove Tehran was behind the... bombing... [The defector], who coordinated all of Iran’s overseas acts of terrorism for the past decade... [then] told the CBS producer he was responsible for the Lockerbie attack... “He... said... that he proceeded by bringing in a group of Libyans into Iran and training them at a special site... for 90 days and he was very proud to also mention that the bomb was so very sophisticated that it required that kind of intensive training... If his story can be confirmed it would not only disrupt the trial of the two Libyans charged with that bombing, it could interfere with the [US] Administration’s efforts at relaxing and improving relations with Iran,” the programme[’s producer said. A]... former CIA terrorism expert... who worked on the CIA’s Lockerbie inquiry, told CBS: “He’s the only person that has tied Libya and Iran into Pan Am 103... This is the first authoritative source that I’ve ever heard... There were pieces of solid evidence that Iran was planning to shoot down an American airliner, but none of it was absolutely conclusive. And then once the forensic evidence was found on the ground which pointed at Libya the prosecutors and investigators were forced to drop the Iranian angle and look at Libya instead.” ...Iran vowed the skies would “rain blood” after the USS Vincennes shot down an Iranian Air flight... killing 290.

...Canadian police have arrested two men believed connected with the Sikh extremist movement for the 1985 bombing of an Air India airliner over the Atlantic Ocean that killed 329 people in the deadliest act of aviation sabotage. The Royal Canadian Mounted Police said... [the Sikhs] are also accused of a related 1985 bombing that killed two men at Tokyo Narita airport but was intended to destroy another Air India flight with 177 people on board... The 1985 bombings were thought to be intended, in part, to avenge the Indian Army’s 1984 storming of the Golden Temple at Amritsar – Sikhism’s holiest shrine. Authorities have said they believe both bombs were built in British Columbia and placed in luggage originally put on planes in Vancouver. The western Canadian province has a large Sikh community... Canadian police said the investigation[, which is estimated to have]... cost the Canadian Government \$US20 million... was complicated by the number of countries and witnesses that had to be interviewed... More arrests are expected, police said.

...the campaign to ban landmines... greatest champion[is] Diana, Princess of Wales. Now another royal has stepped into the breach –[the] Queen... of Jordan has vowed to do everything she can to stamp out the scourge of landmines. Her approach is said to be more intellectual than Diana’s... But if her approach is different, her style is similar to Diana’s judging by a visit she made to a mine-strewn site in the Jordan Valley this week after announcing that her country would sign the Ottawa Convention, which bans landmines... The Queen witnessed de-mining work by Jordanian military experts, who for the last five years have been clearing the area north of the Dead Sea that forms Jordan’s border with the Israeli-occupied West Bank. Officials say about 10 Jordanians are maimed by mines every year... More recently... serious research... found that there were 8000 mine victims the Government did not know about... Jordan hopes to finish mine-clearing before tourists arrive to mark the 2000th anniversary of Jesus’ birth. “If, in recent years, Jesus were to have spent his 40 days in the wilderness, or Elijah to have crossed the River Jordan, or John the Baptist to have proclaimed his message of repentance, they would have had to survive not only the ancient tests of hunger and thirst but modern threats of minefields,” said [the Queen. By the way, a]... combat boot with 13 layers of shock-absorbent aluminium and steel, designed to protect soldiers from landmine blasts, goes into mass production in Singapore next month. The Blast and Fragment Resistant (BfR) boot... is being tested by the US military. The boots cost \$US168... and a dollar will be donated to charities for landmine victims for each pair sold.

...[veterinary workers have attached] a splint to the left front leg of... a four-tonne, 38-year-old cow elephant, which mangled a foot after stepping on a landmine in the jungle in Burma... [A] vet at Lampang hospital in northern Thailand, plans an Internet appeal to help to save the elephant. [The vet] said it would cost more than a million bhat... to amputate the elephant’s... leg and replace it with an artificial one.

...Elephants weep when one of their young is killed, if they lose a friend or they are in pain. [A 38]-year-old Asian elephant... is no exception. Tears coursed down her leathery face when, her front left foot blown off by a landmine, her mahout (the traditional term for a logging elephant’s owner, handler and keeper) led her from the jungles of war-torn Burma into Thailand. The agonising 10km trek took three days. She arrived barely able to walk and still losing blood, and was trucked to Thailand’s elephant hospital... Unique in Thailand, The Elephant Hospital offers help to the ill and injured of the country’s 4700 elephant population. [However, u]ntil Motala hobbled in... the hospital had not dealt with the shattered bones and mangled horror of a landmine injury... Two-thirds of the flesh on Motala’s foreleg had been shredded and 10 bones completely destroyed... [A] team of... veterinarians... anaesthetists and nurses cleaned the horrific wound then amputated the mangled flesh where the elephant’s foot had once been. Although Motala had been given enough anaesthetic to floor 70 humans, she started to come around before the three-and-a-half-hour operation was completed. For three days it was touch and go whether she would survive. Motala bled profusely each time she tried to stand. Eventually the wound began to heal and... a leg cast of stainless steel and plastic was fitted, enabling her to distribute her weight more evenly and relieving pressure on her swollen right foreleg. Once the stump is fully healed, Motala will be fitted with an artificial foot that will allow her to move freely without pain. But she won’t be moving far. The Elephant Hospital has offered her a permanent home in the bush and forest nearby.

The Princess of Wales... [was d]ubbed the “princess of peace” this week after she met crippled casualties of Angola’s 20-year war[. S]he condemned the “horrific injuries” and urged countries to adopt an international ban on the “hideous weapons.” But... her comments... upset some British ministers who feared it could interfere with Government policy... “Britain is one of the goodies on landmines and we are helping to draw up a sensible worldwide compromise package. We do not need a loose cannon like her,” an un-named minister told *The Times* newspaper. Diana’s visit on behalf of the Red Cross to highlight the problems of the landmines in Angola, which still has nine million mines and the world’s highest rate of

amputees, had been sanctioned by the Government... Though Diana is little known in Angola... her importance was obvious to all who saw the hordes of journalists following her.

...The Princess of Wales said yesterday she was only trying to help when she called for a worldwide ban on landmines during her visit to Angola, a plea which unleashed a political storm back home... The Princess, on a four-day visit to one of the world's most heavily mined countries in support of a British Red Cross campaign to ban anti-personnel mines, later visited deminers at work in a minefield and detonated a live mine. In Britain, a prominent member of... [the PM]'s Conservative Party rounded on the... Prince[ss]... for being "very uninformed." "The parallel of nuclear weapons comes to mind... This is an important, sophisticated argument. It doesn't help simply to point at the amputees and say how terrible it is," said [the MP], who is on Parliament's defence committee. Her call for an international ban on the "hideous weapons" has caused a stir because Conservatives believe it could be read as endorsement of the policy of the opposition Labour Party, clear favourite to win Britain's forth-coming election. The Government backs a ban on most anti-personnel landmines but says it must be international to be effective. In contrast... Labour [wants] the Government to declare a unilateral ban and to destroy all its existing stocks.

...Having the Princess of Wales' name attached to a cause may be of debatable value: it rather conjures up images of friction, doesn't it? But campaigners against land-mines would wish that supporters of the weapons production, sale and use followed in her recent footsteps. The Red Cross has dabbled more in politics than is its wont in taking the Princess to Angola to publicise the land-mine issue. Tory reaction shows politics is what it's all about... American defence and political communities are resisting Canadian efforts to fast-track moves to ban land-mine production, export, use and stockpiling. Ottawa wants an agreement that, signed by sufficient countries, would, as one advocate put it, establish a moral authority. Washington's preference is a slow-track trip through the U[N] Conference on Disarmament, with an eventual deal acceptable to all states. Well, we have already seen where that idea leads. Last May, Governments meeting in Geneva agreed to a revision of the international protocol that managed somehow to differentiate between good and bad land-mines. The protocol provides examples of the language Governments use to defend the indefensible. Article 3, number 3: "It is prohibited in all circumstances to use any mine, booby-trap or other device which is designed or of a nature to cause superfluous injury or unnecessary suffering." So the mine must know only to take off a little toe, not a whole leg? ...Try this one. Same article, number 8: "The indiscriminate use of weapons to which this Article applies is prohibited." This is a mine, for goodness sake. It sits waiting to be triggered. It does not discriminate. As in so many recent international policy shifts, the U[S] holds the key. Where will it deploy its weight? Some Pentagon minds subscribe to the military strategy that mines are crucial in "channelling" enemy troops and are an irreplaceable early warning against enemy approaches. They seem to be living in a different world from that American troops have served in recently. The Pentagon argument becomes even thinner when the orchestrator of the Gulf War land operation... joins other combat commanders in assessing that mines were not essential in Iraq and that American forces can be protected by other weapons and tactics. In fact, the Desert Storm was an aberration... The modern shift towards civil conflict means intervening forces are deployed among civilians, automatically rendering mines strategically ineffective. Ironically, American troops serving overseas are more likely to be at risk from mines exported by American manufacturers than they are to be protected by deploying their own.

...[to protect its own personnel from its own land mines, the US spent a billion dollars developing the Smart mine – a self-arming land mine that can be dropped from an exploded missile'. Incidentally, c]iting statistics compiled from a variety of sources, [a researcher has estimated there are]... 120 million land mines scattered across 71 countries... [The researcher also said 70%] of war casualties since... W[W2] have been civilian. In the 1990s, the figure has increased to 90[%]. In 1995, Unicef released a report that said 'in WW1, civilians accounted for only 14% of those killed. They made up 67% in WW2. Between 1945 and 1992, the world saw 149 major conflicts in which some 23 million people lost their lives and more than a million children were orphaned, while 10 million children have been left with psychological scars which take years to heal. "It is the singular characteristic of warfare in our time that children suffer most." War has also claimed the lives of two million children in the past 10 years and left four to five million others crippled for life. Furthermore, there has been a "frightening escalation" in the use of children as soldiers. Boys and girls aged less than 16 had taken part in conflicts in 25 countries, notably Cambodia and Liberia. "In 1988 alone, they numbered as many as 200,000," the report estimated. It pointed out that child soldiers were "easier to intimidate" and "in long-drawn-out conflicts, children became a valued resource" due to the fact that as they grew up they continued fighting because they had known no other life.' Then there are the millions of]... mines, waiting for the innocent footfall of a child collecting firewood.

...a 6-year-old Afghan boy... [walking] with the aid of a leg support at the Red Cross Orthopaedic Centre in... northern Afghanistan... is an exception... as his leg is affected by disease rather than a mine explosion... [M]ore than 5000 war victims have been treated and fitted with artificial limbs... at the centre... since 1991... Over 10 million landmines lie waiting in the... countryside and about 20 to 25 Afghans are maimed every day.

...[the boy says he] was 14 years old when a mine tore his right leg off. "I was working in our fields and I went to get some water from the stream that was used by the whole village..." His story is not rare... Some 400,000 Afghans have been killed or maimed by mines... Afghans are paying the price for living in one of the world's most heavily mined countries... [R]ecent estimates are that 80[%] of Afghanistan's population are dependent on the land for their income... "Afghanistan has been totally destroyed economically due to land-mines and unexploded ordnance. The land cannot be utilised in the economy, and land is very important in Afghanistan." ...But it will take years and millions of dollars to clear Afghanistan of the mines that have already been laid, not to mention the problems posed by the continuing... civil war... "According to our survey, about 500 sq km are affected... We can clear 25-28 square kilometres a year," said... the U[N]. "There are over 150 square kilometres... that directly affect the lives of people, stopping them cultivating their fields or moving back into their homes." Each mine has to be detected, uncovered and destroyed manually. A two-man team – one with a metal detector and one with a mine probe – can clear about 10 sq m a day. Each piece of metal that sets off the detector has to be treated as if it were a mine and carefully excavated with the probe... On the once-fiercely contested frontlines a team may have to remove hundreds of pieces of shrapnel for every mine found. The intense concentration required means that the teams can only work part of the day... There is on average one accident a week among the 4000 mine clearers in Afghanistan. Two have been killed this year. For an impoverished and war-scarred country such as Afghanistan the costs of clearing mines are prohibitive... [The UN] programme in Afghanistan was budgeted to cost some \$NZ33.41 million in 1997, but is running desperately short of money... [and] the programme would have to be cut back unless more funds were found... Globally, the problem is huge. "It is estimated that... [to clear the] 100 million land-mines in the world... will cost \$33 billion. If you spent this sort of money on the poor you could provide most of their requirements in terms of hospitals, schools, etc," said... [the] regional manager of U[N] mine-clearing operations... The International Committee of the Red Cross says that mines violate human rights. "Mines can be described as fighters that never miss, strike blindly, do not carry weapons openly, and go on killing long after hostilities are ended... In short, mines are the greatest violators of international humanitarian law, and laying them is a monstrous form of terrorism."

...campaigners for a worldwide ban on landmines said tens of thousands of landmines had been planted in Zaire, mostly by mercenaries... [The] head of... London-based Human Rights Watch, said: "The minefields are killing people... there are injuries as we talk. They were not marked. There were no warnings to local people. Basically the pattern of minefields around Kisangani is completely against all international norms and conventions..." Although it was too early to discuss clearing of landmines in Zaire, [he] said: "International aid will have to be used... There will need to be rapid deployment patrols when there are reports of landmines to clear." It costs on average \$US2.50... to make a landmine and around \$1000 to clear one... Zaire had been until 1995 one of the few countries in Africa free of landmines... Southern Africa is the world's most heavily-mined region with an estimated 20 million mines, of which just 400,000 have been removed since serious mine clearing began in 1991... Mines are the subject of a conference in Johannesburg... this week... Anti-landmine campaigners from 20 countries are... attending... Only South Africa and

Mozambique have officially banned anti-personnel mines, although many governments in the region have called for a total ban... [In related news, a NZ] inventor who built a mine detector out of a microwave in a university laboratory hopes his creation will help to clear the world of lethal plastic landmines... [The] engineering lecturer at Auckland University, was yesterday given a \$14,000 cheque from World Vision International... to continue with his invention. He is the first N[Z]er to be awarded such a grant... [The] marketing manager for World Vision in N[Z], said he had just returned from Cambodia where [‘it is estimated that 25% of the world’s landmine victim cases currently occur’ and] squads of people took about three months to clear an acre of mines with sticks. “This device is a real example of Kiwi ingenuity... It’s great to be supporting a home-made project like this which could help millions of people.” ...[the] device... heats water molecules in the ground. The landmine stays cool – like a plastic bowl in a microwave – and the cold spot is found using an infra-red detector... It could be a couple of years before his invention is tested in a minefield.

...As... an Auckland[er] continues the development of his invention to detect plastic landmines that are already in place, the battle to ban the production and use of the weapon has won some unlikely supporters... 50 members of the [US] Senate, a majority, have signalled that they are prepared to support legislation to ban the use of anti-personnel mines by American troops. That is strong stuff given the Senate majority’s being held by a party more given to supporting the military... However... there may be some self-interest... The *New York Times* in an editorial suggests mines are a low-cost way for less-sophisticated armies to endanger and kill American troops... It would be nice if American politicians showed more concern for the effect of the weapon on innocents the world over rather than on their own fighting forces... [After] delegates settled on a mines protocol to the Convention on Inhumane Weapons last year... the... call [went] out to all nations to meet in Ottawa in December[this year] to sign a comprehensive international treaty... The message to Washington is clear: you may be the big boy on the block but put all the little boys together and we outnumber you. And on this moral high ground, we embarrass you... Well, the message is not getting through to... the American President[– even though, ironically, he became ‘the first leader to call for a landmine ban back in 1994’]. Early this year, in the face of pressure... to... support [the] Canadian initiative to fast-track a comprehensive landmine ban, [the US President] stayed with the slow-train route through the U[N] Conference on Disarmament... And, on this one, the President is storing up points with the military... Despite scepticism from those who have been there (such as [the USs’ military leader during the] Gulf War...) about the effectiveness of mines for American strategy, the Pentagon is continuing its support for the so-called smart mine option... [The] Canadian initiative... is not about to convince such holdouts as Russia and China[either,] but... a... global ban by a majority of the world’s states is a start... Zaire has provided a reminder that mines continue to be deployed. [Unfortunately, estimates] that worldwide mines kill 800 people and maim 1200 every month... from wars long past, might suggest that the horse has bolted.

...The P[M] of Finland yesterday spelled out his country’s clear reservations to a unilateral ban on land-mines, which play a significant role in defence for Russia’s... neighbour. “Why aren’t they proposing a ban on Kalashnikovs? They are killing more people – have killed more people,”...

More than 100 countries are meeting[in Oslo] today to begin drafting a treaty for a total and immediate ban on anti-personnel mines, which is due to be signed in Ottawa in December... It is estimated that more than 110 million anti-personnel mines[– ‘designed to protect anti-tank mines’ –] are at present deployed in 62 countries. A similar number are stocked by producing countries. The main producers are China, Italy, Russia and the U[S]. Britain, Germany, Sweden and Switzerland also manufacture the weapons, as do Chile, India, Pakistan and South Africa. Anti-personnel mines kill or maim some 26,000 people a year – in other words, one person every 20 minutes... [– about 80%] of them civilians... The U[S] wants self-destroying “smart mines,” which destroy themselves after a pre-set period, to be excluded from the negotiations. Washington[also] said last month it would support the Canadian initiative... provided the Korean peninsula was excluded.

...the American public want the U[S] to be seen to be against mines... [and, when] the Vietnamese Veterans of America [published] a report based on information from U[S] Army archives that Americans in the Korean War were in more danger from their own mines than they were from the enemy’s, they [blew] another hole in the mine defence... So the [President’s] Administration has done an about face... [by announcing] that the U[S] would take part in the Ottawa talks... Of course, nothing is ever simple. There are conditions... So, in a world of contrariness, many who have been trying to press the President into joining the Ottawa initiative now suggest that... its presence [means] the White House wants to be on the inside to weaken the final treaty. They might have a point. As the State Department spokesman who announced the conditions the U[S] would insist on explained: “The problem isn’t American land-mines. The problem is land-mines in other countries.” Sounds like the private who, in self-righteous indignation, insisted that he wasn’t out of step, all the others in the squad were.

...The U[S] fails... to get enough support at an international conference in Oslo for a compromise solution it put forward on outlawing land-mines.

...Japan and Russia have joined the U[S] in criticising the draft of a treaty to ban land-mines... However, Japan has indicated that it will sign the treaty anyway... Several other major countries, including... China, India, Pakistan and Israel, have had no formal part in the so-called Ottawa process... Russia, which attended the[Oslo] conference as an observer, said the convention could not be considered universal because it had been worked out without the participation of states holding nearly two-thirds of the world’s population. But... [the] president of the Oslo conference, said... “Who are these two thirds? We are talking China, Russia and the United States... that population owns nuclear weapons, can we then say we must all own nuclear weapons? I am sure no child tramples on a mine in New York, but I am sure that hundreds of women in Mozambique, Angola and in the Congo, trample on these mines. Those are the lives we need to protect, not the lives that are already protected.”

...As much as 30[%] of land cleared of mines by international organisations in Cambodia has been seized by military strongmen, according to Cambodian Mine Action Centre (CMAC) sources. Donors provide between \$US20[million] and \$US30 million... each year for de-mining in Cambodia on condition that land cleared of mines be handed over for the resettlement of tens of thousands of people forced from their property by years of civil war... “[On one occasion] land was seized by a senior military officer who then sold it to the highest bidder,” Britain’s ambassador... said... “We can spend anything up to \$3 a square metre to clear land of mines and it is certainly not the intention of donors to spend money so that generals can become richer,” another foreign de-miner said...

The International Campaign to Ban Landmines and its coordinator... were awarded the Nobel Peace Prize yesterday... After six years of quietly working towards a ban on anti-personnel mines, the U[S]-based campaign[burst into the public’s consciousness with... Diana, Princess of Wales, the cause’s most visible supporter... The... Princess... drew attention to the... effect... of land-mines... on a visit to Angola... [and] criticism in London for the implied endorsement of a policy contrary to that pursued by the... British Government... The prize, worth 7.5 million Swedish kronor (\$[NZ]1.57 million), is to be divided equally between [the coordinator] and the campaign... The Norwegian Nobel Committee... said in its citation that it hoped the prize would push the treaty process forward.

...A[US] said yesterday it would sign a... treaty outlawing anti-personnel landmines and would destroy its own stockpile of 60,000 mines... Russia is[also] ready to join[the] ban... after finding a substitute for anti-personnel mines it uses to guard nuclear and other military installations, the Foreign Ministry said last night.

...about 120 nations yesterday began signing an ambitious treaty intended to rid the world of anti-personnel landmines... Canada was to be the first nation to sign, a tribute to its role in rallying other nations to team up with non-governmental agencies in support of a ban. Many leading activists were on hand for the ceremony, including several who lost legs in landmine blasts. The treaty will come into effect six months after 40 of the signatory nations ratify it... The treaty commits countries not to make, use, stockpile or transfer mines, and also commits those with mines in the ground to remove them within 10 years if possible, with international assistance if needed... Canada’s Foreign Minister... told the conference that in 36 hours there were[aid] pledges of \$US500 million... But... [at current clearance rates it] will take 1100 years [to complete the job...]

The US] President... yesterday refused to sign a treaty banning landmines, but he ordered the Pentagon to develop alternatives that would make the devices obsolete by 2006... [Incidentally, South Africa's] President... has branded the U[S] Government dull and arrogant for criticising his planned visit to Libya.

...South Africa's] President... has defended his visits to Libya and lashed out at whites who criticised his foreign policy... "Why should anyone question my relationship with [Libya's leader]? He is our friend because he helped us when many people who are now trying to lecture to us not to go there were helping the apartheid government of this country," he said... in a broadcast by the CNN television network... Asked whether he thought... the leader of... Libya... was "an honourable man," [the President] praised his record during 27 years in power in raising the living standards of the Libyan people... [The President] was criticised mainly by the U[S]... Earlier in the day, a spokesman for... South Africa's Foreign Affairs department denied... that a planned sale of \$US640 million... in arms to Syria had been approved. A tender for the controversial proposed deal... would only likely be issued between 1999 and 2000, if at all, the [spokesperson said, before adding]... that in any case, before such a sale could take place, South Africa's cabinet and the National Conventional Arms Control Committee... must approve it... The South African arms firm had been given only provisional approval to market its products in Syria... [but] South Africa was "a sovereign country and would go ahead with the sale if it benefited South Africa." ...[a US] State Department spokesman... described the proposed sale as "a very bad idea," hinting that the U[S] could suspend its aid programme to South Africa if it went ahead.

...The U[S] has threatened to cut aid to South Africa if Pretoria follows through with reported plans to sell arms to Syria... South Africa, a major U[S] aid recipient, is due to receive \$US120 million in 1996-97... "We are deeply concerned about these reports. It would be extremely serious if these sales actually occurred," said [a] State Department spokesman... "both the foreign operations and foreign assistance acts... prohibit certain forms of U[S] assistance to governments which supply lethal equipment to Syria or any other countries listed by the U[S] as state sponsors of terrorism. We would certainly analyse any potential sales in the context of our laws..." Officials in Johannesburg said on Sunday that South Africa was considering selling weapons systems, including tank firing systems, worth three billion rand... [or] \$US641 million... to Syria... [The South African President], angrily rejecting U[S] warnings... said yesterday that South Africa would deal with anyone it wanted to, regardless of outside pressure. "We will conclude agreements with any country whether they are popular in the West or not... The enemies of countries in the West are not our enemies... We will never allow any support or assistance from any country, no matter how powerful it is, to dictate our foreign policy, nor allow any country to violate our sovereignty and undermine our national pride;"... It would be immoral to abandon countries that supported him in the anti-apartheid fight "on the advice of countries that were friends of the apartheid regime." South Africa, like others, would sell weapons to countries even if they did not share the same values. "The only provision we make is that our arms should not be used to disturb the peace in any part of the world," he added... He said South Africa's smaller friends used discreet diplomatic channels to sort out differences: "They don't rush to the mountain tops and start dictating to other countries." ...The [officials] had said any deal for what [is] termed "software" was not likely to be concluded before 1999, and that South Africa was not alone – three European countries were also bidding for the business... Military analysts said any major Nato power had the technology to produce the aiming equipment, which reportedly would make tank firing many times more accurate – something that has raised the fears in Syria's arch-foe and neighbour, Israel.

...*The deal: we sell you the guns, then you shoot us...* In the Middle East arms bazaar, billion-dollar deals are commonplace – and so is treachery. The weapons of war you sell to friends today may be aimed at you by your enemies tomorrow. Take a recent incident in Lebanon. On October 18, an Iranian-backed Hizbollah guerrilla crept up to a Merkava battle tank in Israeli-occupied southern Lebanon. Billed as virtually indestructible, the Merkava is the pride of Israel's arms industry. But as his partner videotaped, the guerrilla steadied a lightweight anti-tank missile on his shoulder and blew off the turret, killing the driver. The tape is being broadcast across the region – an embarrassment to the Israelis, who are trying to sell 2000 tanks to Turkey as part of a \$NZ50 billion military upgrade. A Lebanese intelligence source says... the missile... was among the weaponry that the U[S] and Israel supplied to Tehran in the early 1980s. Arms merchants call this the "boomerang effect." The U[S] and Israel are just starting to grapple with its implication: there is so much high-powered military hardware out there these days that it is impossible to keep track of it all. With the end of the Cold War, the sense of urgency in controlling arms sales has diminished, and the logic of the free market has overtaken the arms trade along with everything else... The U[S], responsible for about 64[%] of the global weapons trade, has led the way... [and the] Middle East is just too lucrative a market to pass up. According to London's International Institute for Strategic Studies, sales to the region accounted for \$25 billion of the \$66 billion global arms trade last year. Middle East sales could top \$100 billion by the end of the century... Now South Africa's arms manufacturers appear to be biting the hands that once fed them. During the apartheid era, although the U[N] prohibited arms sales to Pretoria, Israel helped the South Africans develop everything from bullets to jet fighters... Now Pretoria intends to become a major arms exporter, especially in the Middle East. [South Africa's] President... personally pushed a \$2.6 billion arms-for-oil deal in Saudi Arabia last month. Another \$1500 million deal with Kuwait is in the pipeline. It was only after American and Israeli pressure that Pretoria gave up plans to upgrade Syria's tanks... As long as there are buyers, the trade will grow ever more deadly. According to the Israeli magazine *the Jerusalem Report*, Iran is trying to buy Pretoria's atomic expertise... [In related news, a] long-sought deal providing Russia with American help to convert... Russia's three remaining... nuclear weapons fuel plants to... production of uranium for civilian power plants... has been concluded. Besides putting an end to plutonium-producing reactors in Russia, the agreement places a cap on U[S] and Russian stockpiles of nuclear weapons-grade plutonium... It also would prohibit Russia from using recently produced plutonium in nuclear weapons... Clinching the conversion deal has been a Washington priority since June 1994, when the two sides signed an agreement to shut down the reactors... The Russians never allowed that accord to take effect because there was no alternative for providing heat and electricity to[the Siberian regions of] Seversk and... Zheleznogorsk... After feasibility studies and more talks, the sides agreed on a joint plan... with... [an estimated cost to] Washington... of... \$US150 million...

THE PENTAGON, IT TURNS OUT, IS A building so well defended that even urgent messages that the cold war is over have failed to breach its barricades. At a time when budget zealots are attacking everything from Medicare to corporate wealth to whole Cabinet departments, the U.S. military has presented Congress with a plan to spend as much on new warplanes over the next decade as it did during the huge defence buildup of the 1980s. If Congress decides, as a growing number of experts have, that the proposal to spend a grand total of \$415 billion over the next 35 years is unjustified, the task of balancing the federal budget could suddenly become a lot easier. The shopping list is right out of the cold war. The Air Force wants 438 F-22 fighters at \$160 million apiece. The Navy plans to buy 1,000 advanced F-18Es. The Army is counting on 1,292 Comanche helicopters. And the services together want 2,978 more Joint Strike Fighters. That's 5,708 planes; this mere slice of Pentagon spending will cost as much as all federal environmental programs for the next 17 years. To make their case, the generals and admirals needed to do some creative salesmanship while avoiding some basic questions, like Will they work? Are they worth it? Do we need them? And so it was that... [the] Vice Chairman of the Joint Chiefs of Staff, has been presenting lawmakers with charts showing the deployment of warplanes around the world and the threat they present to American security. What [the Vice Chairman] doesn't point out is that this ominous global collection of nearly 6,000 advanced warplanes includes those of Britain, France, [and] Canada... Nor does he mention that many of the warplanes on his chart rolled off U.S. assembly lines... Critics... point to the luxuriously indiscriminate quality of the shopping list. The... exception to these profligate rules is the Marines. In most cases, they're modifying existing aircraft with new engines and electronics, saving taxpayers gobs of money. Congress may also want to take a lesson from U.S. allies who are stretching their defence dollars. In Europe four nations recently began cracking open 300 F-16 jet fighters like eggs and stuffing them with new electronic components that turn them into the hottest fighters in the sky. At the same time, the U.S. Air Force has sent

nearly 400 of those very same \$20 million planes to its Arizona junkyard, never to fly again... Many defence experts contend the Pentagon is suffering from a cold war hangover. The General Accounting Office, the Congressional Budget Office and the private Centre for Strategic and Budgetary Assessments have suggested dramatically paring back – and in some cases, killing – the programs. They point out that the Pentagon conceived the F-22, its superstealthy fighter, more than a decade ago to counter two 21st century Soviet warplanes then on the drawing boards. But U.S. officials concede that the Russians have scrapped one of the planes, and that only a few of the second are likely to be built.

...The U[S] has bought 21 advanced Russian-made MiG-29C warplanes from the Republic of Moldova and brought them back to America to keep them away from “rogue states, including Iran.” The U[S] Defence Secretary... said... that Washington had agreed not to reveal the price tag of the high-performance jets, among the world’s most advanced... fighters – capable of launching nuclear arms... He called the agreement “another successful milestone” in the U[S]’s Cooperative Threat Reduction Programme with a number of former Soviet states... He referred specifically to the de-nuclearisation of Belarus, Kazakhstan, and Ukraine, all of which earlier shipped their nuclear warheads back to Russia. He also noted that Kazakhstan had previously agreed to the removal of some 600kg of highly enriched uranium to the U[S] for safe storage away from terrorists or would-be nuclear states[. Incidentally, ‘a US Marine pilot was acquitted yesterday of the deaths of 20 people killed when his jet sheared ski-lift cables during a low-altitude training mission through the Italian Alps. An 8-man jury found the pilot not guilty of involuntary manslaughter, destruction of property and dereliction of duty. The jury rejected allegations he was “flat-hatting” – flying recklessly low and fast – when his jet caused a gondola to plummet about 109m to the ground. Everyone aboard was killed. Based in Aviano to fly Nato support missions over Bosnia, Marine Prowler pilots were under standing orders to maintain a safe speed and a 610m altitude on low-level flights over ski villages in the alps. However, defence lawyers said the 6.4km cable system didn’t appear on military maps, and the defendant wouldn’t have risked a pending transfer to fighter-pilot school by flying recklessly. The pilot, who could’ve been sentenced to up to 200 years in prison if convicted, faces a separate trial on conspiracy and obstruction of justice charges for allegedly hiding a videotape shot during the early legs of the flight (manslaughter charges were dismissed against his navigator for destroying the videotape – but the navigator was dismissed from the military). The verdict has sparked outrage in Italy and renewed calls to end foreign military flights over the country’]...

RAF pilots have been flying a dog-leg round Switzerland en route to Bosnia for more than a year – because someone forgot to tell the Ministry of Defence that the Swiss had lifted its ban on military planes... and ammunition over its airspace. Swiss neutrality meant that even one soldier wearing one bullet in his belt was banned from over-flying the country... Hercules C-130 transport aircraft have been adding about 30 minutes extra flying time to their route at a cool fuel-cost of \$250 per minute because of the oversight. And the Labour MP who uncovered the error believes the extra costs incurred could have amounted to \$3.6 million in fuel alone. Now... the hunt [i]s on to find out whether it was a British official who failed to pass on the critical information... A Ministry of Defence spokesman said: “You will probably find the number of flights is minute.” An RAF source said it was impossible to estimate the number of flights since December 1995... [By the way, w]e should use the momentary lull in Bosnia... to resolve what it is that seems to have caught a grip on the post-Cold War world and delivered it a degree of ethnic strife and population displacement not seen since the nazis turned Europe on its head... As wars have... become more blood-curdling, more no-holds-barred, particularly when it comes to women and children, [they] have produced proportionately more refugees than previous eras of conflict... – almost double what it was in the 1960s – [and the trend] shows no immediate signs of diminishing... One reason, not to be welcomed, but often overlooked, why Europe, ex-Yugoslavia exempted, is now so relatively stable is that the redrawing of Europe’s borders after 1945 and the subsequent movement of millions of people (far greater numbers than today’s grand total of refugees) created more homogeneous countries than had ever existed in Central and Eastern Europe. This should remind us not only how few years have passed since the West made refugee mayhem but also that nation state creation has never been straightforward... But... why are there so many more refugees in the last 20 years? The only argument that bears scrutiny is the one that fingers the proliferation of modern arms... [A]utomatic rifles, nail bombs and anti-personnel mines so easily available these days do ratchet up the scale of conflicts. The rising and all too rarely checked power of arms merchants with their close ties to members of the Western, Russian and Third World political class added to the existence of post-Cold War surpluses from the great powers, in my opinion, are the single most identifiable culprits... [F]or those who seek a simple answer to the rise of refuge flows... [the m]ost sensible... one... is... to restrict arms trafficking... - 1997

After millions of soldiers had been cut down by killing machines during... W[W1], perhaps the most hated people in the world were the arms dealers. Merchants of death, they were called... For the first time in history, armies of common men died in a four-year maelstrom of madness. No one has fully understood why but afterwards common people knew that those who made the killing machines were the only ones to profit. And they despised them as a result... [The arms dealers] became shadowy figures beyond the pale of decent society. How things have changed. The other day I read that the largest single category of goods exported by Russia, the one that sustains its ailing economy, is armaments. The U[S], Britain and France among others export arms worth billions every year. In the days of the Cold War, the rationale was that you armed those countries that would confront communism, no matter how otherwise amoral their Government might be. It was a sad, threadbare argument then but even that has gone. Manufacturing corporations within these developed nations – with the complicity, even the encouragement, of their Governments – sustain [t]he ragged, nihilistic armies rampaging through Africa; and enable dictators and fanatics to maintain their bands of righteous killers; enable casually evil men like [the Serbian President] to arm their psychopaths with the latest of technology. The British have made the oppression of the East Timorese especially lethal with their guns... Extraordinary, isn’t it, that people tut-tut at the lack of gun control in the U[S] when some kids pick up on the violence of our culture and use guns for the job they were designed for... But no one is horrified that their fathers and mothers – suits around the boardroom table – make and market sophisticated weapons of mass destruction for anyone who wants them. The business is so huge that curtailing the activities of these latter-day corporate merchants of death would affect the standard of living in developed countries. The stock exchange would be depressed and export receipts would fall. Family men would have their incomes reduced if arms exports were stopped to bring peace... Princess Diana – a simple woman with insufficient political acumen to know it was impossible to attack the power of the multinational armaments corporations – caught them momentarily off guard over land-mines. She had somehow gathered a constituency of millions of ordinary people who supported her. The British Government was aghast at what it would do to export earnings... When the last shot is fired in the Balkans, the Serbs... the Kosovans... the Macedonians, the Albanians[and] the Montenegrins will have lost... Only the armaments corporations will have won. Billions of dollars worth of bombs, shells and bullets will have been expended and tested, and will be developed and replaced. The corporations will make record profits... Whacko for the free market, for completely free trade. In the aftermath of... W[W1], the indignation of millions of simple people seemed enough. Nowadays, cynicism and a sense of political impotence are so pervasive, decent people have lost even the ability to identify moral causes.

...Canadian sailors have dramatically seized control of the U[S]-owned ship GTS Katie, ending a standoff in which hundreds of millions of dollars of Canadian military equipment had effectively been held hostage. The armed sailors were dropped from a helicopter by cable on to the deck to take over the vessel in the North Atlantic, the commander of the naval operation reported. There were no injuries to the sailors or the crew of the cargo ship, which had been embroiled in a dispute between its owner and the Canadian firm that chartered the vessel... [In related news, the US] is the world’s largest supplier of weapons, providing \$US7.1 billion... worth... – up from \$US5.7b the year before... [-] even though demand has been

slumping worldwide, according to a US congressional study... Germany ranked second, with \$US5.5b in new sales, and France third, with \$US3b. The value of all new arms sales worldwide was \$US23b...

The international arms trade... makes strange bedfellows... No one is an outcast at the global weapons bazaar. Countries with little in common, or even on opposing sides of alliances, come together in the arms trade, whether they do so openly, under the table, or – as in the case of an intercepted missile shipment from North Korea to Yemen – hidden amid a cargo of cement. With all but the most advanced weapons, if you have the cash, you can get what you want, say arms experts. And their only surprise when the transaction between North Korea and Yemen was uncovered was that the U[S –] ...the largest arms merchant by far, delivering almost half the weapons bought on the world market... [–] did something to stop it.

Broke, so sell some fighters... Did [the US President's] need for quick cash influence his decision to sell nine F-16 jets to Indonesia's dictatorial regime? The honest answer is "yes,"... The driving force in this sale is the need of [the]President... to unload those warplanes to Jakarta for about \$200 million to replenish U[S] Government coffers... The Indonesian deal would have sailed through uncontested had the Lippo scandal not surfaced and the Nobel prize committee not decided to award its 1996 peace prize to human rights activists in East Timor. The Republicans are demanding an investigation... A public inquiry after the election might break the conspiracy of silence that both parties observe about the weakening of government and of American leadership abroad because of their misdirected budget priorities and fiscal timidity... In a speech he gave last Tuesday on expanding Nato into Central Europe, the President barely touched on what it will cost the U[S], an issue that will dominate Senate hearings and headlines next year. [The President] avoided any estimates of the costs, which a recent... study says could run between \$US14 billion... and \$US110 billion for the alliance over 10 years. The costs of cost-cutting are already apparent in Iraq, where the Administration's failure to come up with \$US2 million for ceasefire monitors contributed significantly to the eruption of civil war between the Kurds. Embarrassed by that fighting, the State Department is now belatedly trying to get the Kurds to agree to a new offer of ceasefire monitors. If the Kurds agree, the price is going to be much higher. In any event, the Administration has already spent 20 times the \$2 million the peacekeeping proposal would have cost on ineffectual missile attacks on Iraq... America cannot conduct an effective foreign policy on a misshaped shoe-string. The Administration and the Congress that take office in January must honestly examine the budget priorities and change those that make it impossible for the U[S] to exercise leadership except by bombing before breakfast... or by selling warplanes to one unsavory regime instead of another... The F-16s that the Administration plans to deliver to Indonesia beginning in 1997 were originally ordered and paid for by Pakistan in 1989. Delivery of the high-performance warplanes was halted when Pakistan's nuclear-weapon development programme became unmistakable.

...The Ukraine's sale of more than 300 tanks to Pakistan shows it can exploit the huge military complex inherited from the Soviet era to outscore rivals on international arms markets. "This is a victory... The fact that Ukraine won this difficult tender... shows our technical and intellectual capacity." ...The \$US550 million deal to supply the... tanks was signed on Tuesday. It circumvented sanctions imposed by the U[S], which accuses Pakistan of wanting to become a nuclear state. Ukraine is seeking out customers for its armour to haul its economy out of crisis. A deal was announced last month to supply a new 6.5-tonne military truck to India – Pakistan's arch rival with which it has fought three border wars since becoming a nation in 1947. Last year Ukraine supplied 300 10-tonne trucks to India, long a traditional purchaser of Soviet equipment. - 1996

Today more than 64[% of India's] public revenue is spent on military defence. The hostile relations... [with] Pakistan are held responsible. - 1951

[One beetle species] sprays formic acid, which is a potent irritant[also 'utilised by ants'], and it sprays it at 85% concentration. That's about as strong a concentration of acid as is produced by an animal in nature. 10% of its body is actually formic acid. [The species] has an incredibly high defence budget. I love Bombardier beetles... here's an animal that produces a fluid at boiling hot temperature. It never uses it aggressively, it uses it purely for defence. Shouldn't we learn something from that?

The demand of the war machine for 'food' in the form of a large and growing proportion of the available resources of the world (the 'world product') is reminiscent of nothing so much as a cuckoo, pushing its foster siblings out of the nest and exhausting its foster parents with its demands. Just before... W[W1], with rearmament proceeding apace, about 3 1/2[%] of the total world output was going to military uses; by 1968, the proportion had more than doubled, rising above 7[%]. In... the late 1970s, the spending on 'defence' around the world amounts to the equivalent of: The combined production (Gross National Product) of all sixty-five countries that make up Latin America and Africa; or the total worldwide expenditure by governments on education; or twice the total worldwide expenditure by governments on health; or about fifteen times the value of all government aid to the underdeveloped countries combined. Hardly surprisingly, the rich nations dominate this picture of a militaristic world. In 1975, expenditure by the US and USSR made up nearly two thirds of the total world military 'budget', with the allied members of the NATO and Warsaw Treaty groups contributing a further fifth. But, in contrast, the rate at which military expenditure is growing has been greatest lately in the poorer countries – a highly significant burden on nations already struggling to 'catch up' with the rich... The logic is simple. In the case of the rich countries, at least, a highly militarised future world must be a low-growth world. The counter-argument, that military spending stimulates demand and boosts the economy, really doesn't stand up to close inspection, and it would be a pretty weird system – thoroughly deserving of discontinuity! – which could only gear itself up for action by wasting a large fraction of its resources.

By 1980, world military expenditure amounted to £500 billion a year. That was fifty thousand times as much as WHO expended annually in its successful ten-year campaign to eradicate smallpox from the world. In global arms trade, about three-quarters of all transfers of major weapons are to the Third World – guns instead of bread. - THE FUTURE OF A TROUBLED WORLD

Today the World Bank estimates that there are 570 million people who are undernourished, 800 million who are illiterate, 1,500 million who have little or no access to medical services and 250 million children who do not go to school. Every year 15 million children die of starvation. Amidst the terrifying statistics, official development aid amounts to \$[US]20 billion – world military spending to more than \$450 billion. - 1984

Global arms spending of \$1 million every thirty-five seconds needs to be seen for the madness it really is.

...While worldwide military spending is more than one billion dollars a day, more than... thirty-two... people die of starvation... every minute, most of them children. Developing countries spend more than three times as much on armaments as on healthcare. Thirty-five percent of humanity lacks safe drinking water, while nearly half of its scientists and engineers are engaged in the technology of making weapons. - 1990

In 1989, the worldwide military budget was \$[US]1.035 trillion, of which the U.S. share was 29.4%... In 1990, the U[S] was the world's second largest arms exporter, next to the Soviet Union. Of the world total in arms trade of \$45.43 billion, the Soviet[s] accounted for \$19.1 billion the U[S] for \$11.2 billion... Despite the end of the Cold War, [US] defense outlays are still climbing, reaching an all-time high of \$341.1 billion in 1992 after modest declines in 1991... and 1990... However, as a percentage of GNP, defense accounts for less of the GNP today (5.2%) than it did in 1968

(9.6%)[, and is estimated to get down to '3.9% in 1995']. Its share of the total Federal outlays (20.8%) is also less than at the height of the Cold War in 1960 (52.2%).

'1995 defence budgets in \$US billions for the southeast Asian region were: China (7.48), Indonesia (2.57), Malaysia (2.41), Philippines (1.00), Singapore (4.02), South Korea (14.36), Taiwan (9.93) Thailand (4.00) and Japan (53.8') – thus Japan managed to spend more than the other eight nations put together!

"The real value of Japan's military budget is about... seven times larger than China's. In terms of population and size Japan is much smaller, and people... ask 'why does Japan have such a large military budget?'"

...How much does Japan spend on defence? The official defence budget has long been estimated at around 1[%] of GDP. Since Japan is a rich country, that small-sounding burden buys some business-like Self-Defence Forces... According to figures published by the International Institute for Strategic Studies, Japan's official defence budget in 1995 came to \$[US]50.2 billion... The amount... says the *Economist*... is probably much more than that... [M]ost Nato Governments use a common standard that includes not only research and development but also pensions and much else, in a way that makes their spending figures comparable with each other. Japan's, however, have always been added up differently... [M]easure Japan's total defence spending in the same way as, say, Britain's or France's – and last year's spending comes to a rather larger 1.6[%] of GDP... Making Japan's defence spending more comparable has a value... Japanese officials have long pointed to the modest share of their GDP that goes to military spending to reassure neighbours that Japan poses no threat... Japan's defence spending is exceeded only by America's, Russia's and possibly China's... [The Chinese] seem to spend amazingly little on defence. But that is because they deliberately hide some costs, including military research and development, under other headings in the national budget, or else do not include them at all.

China's defence budget for 1997, up 12.7[%] on last year, represented only [part] of the true amount spent on the world's largest Army, Western experts said yesterday. In past years the budget for the three-million strong People's Liberation Army has risen 13 to 14[%] annually and spending for 1997 has been officially set at 80.57 billion yuan (\$[NZ]14.14 billion)... "But it is only the tip of the iceberg; the rest is extremely difficult to piece together."

...Japan plans to slash spending for major weapon systems by 6 to 7[%] next year as part of the Government's austerity budget measures... the *Yomiuri Shimbun* newspaper said, quoting Defence Agency sources. The plan is... [to curtail] total expenditures of 25.15 trillion yen (\$[NZ]333.25 billion) for the 1996-2000 defence plan by 920 billion yen... The agency also planned to cut financial support for U[S] forces in the nation... [Earlier this year,] Japanese military analysts... [had declared that] China's defence outlays, despite a sharp increase this year, pose[d] no major threat to its neighbours, except for Taiwan...

Rivalry between China and Japan has flared... over some tiny islands. It is a rivalry with serious implications for the whole region... Behind issues of sovereignty and national pride lie major oil and fish resources. Earlier this year Japan angrily protested at the operations of a Chinese oil-exploration ship within waters claimed by Tokyo. In turn, Taiwan disputes Japanese sovereignty and takes about 40,000 tonnes of fish a year from the islands' waters... The Senkaku/Diaoyu Islands encapsulate the difficulties facing this new great power triangle.

...Japanese patrol ships yesterday expelled five boats of Taiwan and Hong Kong activists trying to land on a chain of disputed East China Sea islands... Tokyo's claim dates to 1895, when Japan defeated China and seized Taiwan and other Territories. Beijing and Taipei say Chinese claims go back centuries but... Taiwan and China have been bitter rivals since a civil war split them in 1949 and the Republic of China Government, defeated by the communists, took refuge on Taiwan.

...South Africa has abandoned its attempts to have diplomatic relations with two Chinas and announced it will ditch ties with Taiwan in favour of Beijing... [When] asked what had happened to his goal of ties with both Chinas, [South Africa's President] said: "Beijing made it clear they would not tolerate that." ...[● A] Hong Kong lawmaker said yesterday that China should go to war with Japan over a group of disputed islands in the East China Sea if the row cannot be settled through diplomatic negotiation... Japan has... refused to acknowledge that the dispute is open for discussion.

...China's economic relationship with Japan has forced it to tread warily in the East China Sea islands dispute... Japan is a major aid donor, trading partner and investor, say analysts... Tokyo has agreed to grant \$US5.27 billion... in low-interest loans to Beijing over a three-year period from April [1997], making it difficult for China to bite the hand that helps feed it. While China does not want to be perceived as weak or unpatriotic, it faces the challenge of avoiding too many squabbles with too many diplomatic partners at the same time... Many Chinese have been slow to forgive and forget Japan's 1931-45 invasion of China. By Beijing's count, 35 million Chinese died under Japanese occupation. Attempts by Japanese politicians to whitewash Japan's atrocities... [has] only added insult to injury... Beijing and Washington have squabbled in recent years over Taiwan... "If we go to war against Japan, we will fall into the trap of the U[S]," a retired Chinese diplomat said of calls for China to send warships to the islands.

...More than 5000 people demonstrated in Taipei yesterday against recent moves by Japan to assert sovereignty over the Senkaku/Diaoyu Islands... The demonstration was the latest in a series of protests in Taiwan, China and Hong Kong over the islands where a group of Japanese nationalists has built a makeshift lighthouse and a war memorial. In Taiwan, the Provincial Council has called for a boycott of Japanese goods.

...The Taiwan provincial assembly voted yesterday to exclude Japanese firms from local contracts to protest against Japan's assertion of sovereignty over a chain of uninhabited East China Sea islands... Calls for boycotting Japanese goods and other anti-Japanese protests have mushroomed in recent weeks after Japanese coast guard ships repelled private Taiwan vessels nearing the Diaoyu islands... Taiwan's central Government has appealed for calm and has vowed to resolve the dispute with Japan through negotiations on fishing rights... [Meanwhile, f]ierce gun battles raged around some disused coalmines in South Korea yesterday as troops hunted down the remnants of a group of infiltrators from the North who came ashore on a submarine this week... So far, 18 are confirmed to have been shot dead and one captured alive... Three were cut down by automatic fire as they crouched by a stream to drink water... On Wednesday the bodies of 11 North Koreans were found huddled together on top of a mountain close to a beach where they landed. All had been shot through the head in an apparent mass suicide... South Korean authorities have described the most serious infiltration since the 1960s as a military provocation... North Korea yesterday accused South Korea of taking "provocative action" earlier this week but made no reference to the infiltrators... In South Korea, the public has reacted with anger and anxiety... Some blame the Navy for failing to detect the 34m submarine and worry the country is vulnerable to attack from its arch-enemy... South Korea and the U[S] are trying to entice Pyongyang to talks, along with China, to work out a peace pact to replace the armistice that sealed the division of the Korean peninsula in 1953. - 1996

Twelve armed North Korean soldiers crossed into the southern half of the... demilitarised zone separating the two Koreas... just before midday... yesterday... seized a man and a woman in a rice field and took them back to the northern side, the UN said. But North Korea's official Pyongyang Radio said its border guards on routine patrol duty seized the farmers found in the northern half of the buffer zone. The farmers were "under

investigation”... The North Koreans initially promised to return the farmers within 20 minutes... But they later refused to commit themselves... The abducted farmers... had been working in a field with three companions, but broke away and climbed a hill apparently to pick chestnuts... In a similar incident in 1975, North Korean guards crossed into the southern side... and abducted a South Korean farmer, according to UN officials. But North Korea has never released him, saying the man defected of his own will.

...the daily newspaper *Tokyo Shimbun* said [a]defector... told Japanese officials... [that] North Korea wants \$US10 billion... in reparations from Tokyo... as compensation for the 1910-45 colonial rule... atrocities... and... in exchange for normalising ties... Japan normalised relations with... South Korea in 1965 but has yet to establish diplomatic ties with... North Korea. [The defector] was quoted as saying that North Korea wanted to use the cash to buy food.

...North Korea was gripped by a mood of war and was preparing to attack South Korea... to unify the divided Korean peninsula under communism... the North’s most prominent defector said yesterday... “North Korea talks about peaceful unification only in words... What they trust is only the military and arms... North Korea’s war preparations are beyond imagination...,” he said... The defection... dealt a humiliating blow to Pyongyang and gave an intelligence coup to its capitalist rival, Seoul... The... former member of North Korea’s highest decision-making body, the Central Committee of the Workers Party... and an aide... arrived in Seoul... [after] a 67-day ordeal that began with their escape to South Korea’s consulate in Beijing. Their defection created a diplomatic dilemma for China, which found itself caught between long-time ideological ally North Korea and newly found economic partner, South Korea.

...South Korea’s Defence Ministry wants every resident of the capital, Seoul, to buy gas masks as protection against any North Korean chemical warfare attack...

No Southern casualties were reported in the bombardment that... ended after about 50 minutes when the Southern side broadcast a ceasefire proposal... [T]he incident began when a group of North Korean soldiers crossed the Military Demarcation Line... After... South Korean troops fired warning shots into the air [the]North Korean forces responded by aiming 70-80 rounds of rifle fire at two guard posts, which responded with a similar burst of fire. [● ‘The remains of two US soldiers killed in the Korean War have been exhumed from a national cemetery in Hawaii and taken to an Army laboratory for possible identification using DNA taken from relatives of missing servicemen. The Department of Defense authorised the forensic analysis, clearing the way for tests on 50 to 70 of the 866 unidentified soldiers buried at the cemetery’. The war cost ‘2 million lives, including 400,000 civilians’ – some of whom were ‘refugees fleeing the communists that were allegedly massacred by US forces in case communists were among them’ – and ‘cost the US \$22 billion, not including rebuilding programme contributions.’

...‘No Gun Ri, the story the US Army didn’t want to hear, is now the story the Army itself is telling – in an 80,000-word report on a year-long investigation into the Korean War refugee killings. But through the haze of 5 decades, of traumatised memories and missing records, the story of what American troops did to South Korean farm families outside that hamlet in mid-1950 leaves many questions unanswered. Survivors estimate 300 people, mostly women and children, died in the tunnels under a railroad trestle and another 100 in a preceding air attack. Korean officials have compiled a list of 248 names of reported dead, wounded and missing. US Army investigators said they believe the number was lower. US commanders and their troops, retreating before the North Koreans, feared enemy infiltrators among South Korean refugee groups such as the one the 7th Cavalry stopped at No Gun Ri. Various orders had been issued across the war front to “shoot” or “fire on” refugees. The survivors’ allegations were repeatedly dismissed by the Army with little investigation’. ‘A declassified report reveals US officers observed their ally secretly execute thousands of leftist prisoners without trial in 1950.’

...‘For 40 years after 1950, the world lived in the shadow of the Korean War. The shock of Korea crystallised the Cold War standoff between the great powers. Said Winston Churchill in 1953: “Korea does not really matter now. I’d never heard of the bloody place until I was 74.” Its importance lies in the fact that it has led to the rearming of America. The war came at a nervous time for the West. In 1948, there was a communist coup in Czechoslovakia and the Soviet Union blockaded West Berlin. In 1949, Russia exploded an atomic bomb. China went communist. The conflict stemmed from the division of Korea along the 38th parallel after the Japanese surrender in 1945. Russian troops occupied the north until 1948, and Americans ran the south until 1949. North Korea tried to reunite the country by invading the south on June 25, 1950. They took the southern capital of Seoul on June 28 and pushed quickly south. At America’s urging, the UN Security Council condemned the invasion and urged all countries to help South Korea. NZ sent two frigates and decided to recruit 1000 volunteers. Over 6000 Kiwis fought in the war’ – ‘of whom 33 died in active service, 79 were wounded and one taken prisoner.’ ‘The Korean War led to a substantial increase in demand for, and price of, wool. The result was a major upswing in the terms of trade in favour of NZ until 1951’...]

The Koreans: where the Cold War won’t thaw... The U[S] Army bus trundles on, bringing another party of reporters to see the 45-year-old stalemate that Washington regards as the most dangerous flashpoint for the security of East Asia and the Pacific... Certainly there is all the tension of unfinished war... Elsewhere the Cold War has been consigned to history. Here they are digging in... Drive for less than an hour north of Seoul, South Korea’s prosperous modern capital, and you enter a time warp. Barbed wire barricades appear on the banks of the Han River; every few hundred metres a gun post looks over the water... Inside and outside the South Korean soldiers strike strange frozen crouches as they eyeball the enemy just 100m away... A little further and minefield warnings appear on one and sometimes both sides of the road... Double electrified [fences and]... tank barrages abound... where the two sides occasionally meet... usually to discuss a firefight, as they call the skirmishes that occur within the patrolled “demilitarised zone.” ...As far as anyone can tell North Korea is collapsing... Yet... [we] hear that North Korea could still mobilise quickly and effectively. More than half its old but rugged artillery is concentrated within 65km of its southern border and official minds in Seoul and Washington are haunted right now by the possibility that a desperate regime might go for broke. That is not to say it could overrun the south. The prevailing view in American or South Korean circles is that... air superiority would enable the south’s forces to defeat the north on their own. But the north could inflict death and damage on Seoul and the South Korean economy on a huge scale before its firepower could be stifled... In addition, North Korea has Scud ballistic missiles capable of reaching Japan and is believed to have chemical warheads. Ominously its forces can be seen training for action “in a chemical environment.” The fear is of some sort of strike designed to secure a ceasefire on terms that would alleviate North Korea’s internal crisis... Its economy has been shrinking since 1990. Its industry is thought to be running at just 20[%] of capacity. About 80[%] of daily necessities are obtained from black marketing, much of [it] across the border with China.

...A Sino-Russian declaration signed yesterday by [the]Chinese President... and [the]Russian head of state... ended a dispute over border demarcation that has soured ties dating back to the days of the tsars... Tracking winding rivers that freeze in winter, mountain ranges and thick forests, the... 4300km frontier... between Siberia and the Chinese province of Heilongjiang, formerly Manchuria, has proved almost impossible to map... [thereby serving] as a fault line between the two giant empires... just one of many border spats China has had with neighbours... China’s land border with Vietnam has been a source of frequent friction. A brief but bloody border war in 1979 killed 20,000. Intermittent skirmishes lasted until the early 1990s... Beijing and Tokyo both claim a cluster of islets in the East China Sea. Japan was handed control of the group – called the Senkakus in Japanese and Diaoyus in Chinese – after... W[W2]... While the dispute has not led to military confrontation, nationalist passions flared in Chinese communities around the world... when Japanese right-wingers built a makeshift lighthouse on one of the uninhabited islets... Beijing and New Delhi contest part of China’s Tibet region. China and India fought a brief border war over the patch in 1962. The conflict is unresolved, but the two nations signed a pact in 1993 to ensure peace along their 4000km border.

...Fifty-four Indian and Pakistani soldiers died... as the two Armies locked yesterday in one of the heaviest battles on their... 1200km... Kashmir border [in recent years]... Each side blamed the other for starting the battle... India and Pakistan dispute the ownership of Kashmir, a picturesque Himalayan region, and each holds parts of the state... Relations between the two countries have never been easy since at least half a million people were killed in bloody riots accompanying partition. Six million Hindus and Sikhs fled to India and as many Muslims went to Pakistan... A Muslim separatist campaign raging since 1989 in the Indian [portion] of Kashmir has claimed more than 20,000 lives. India accuses Pakistan of arming and training the militants. Pakistan denies the charge.

...The P[M] of Pakistan... offered yesterday to open talks on a non-aggression pact with... India in what he said was a bid to end a bitter dispute over the territory of Kashmir.

...Kashmiris linked hands in a 56km "human chain" to protest against Indian rule as two people were killed in a bomb blast in the troubled Himalayan region... [where m]ore than a dozen guerrilla groups are fighting... [for] either merger with neighbouring Pakistan or independence.

...Thousands of Indians gathered at the border between India and Pakistan early yesterday to seek friendship with Pakistanis and found silence, emptiness and barbed wire on the other side... Not a single person waved back at the sea of faces on the Indian side... [The] Indians, who had braved a mild cane charge by harassed policemen and kilometres of traffic jams to light candles and torches for an intended spiritual reunion... were disappointed. "Pakistan has badly snubbed us. I think it was very stupid on our part to think that they will come with the same enthusiasm to stand in amity with us," said... a civil engineer from the nearby town of Amritsar... [Meanwhile, in] New Delhi, the Indian P[M]... declared that there would be no negotiations with Pakistan over the disputed Kashmir region... [He also reiterated] that India would not back down over its refusal last year to sign a nuclear test ban treaty unless the superpowers first agreed to dismantle their nuclear arsenals... [In related news, t]he first Russian warship to visit Japan in more than 100 years berthed at a Tokyo pier yesterday... The... visit comes just a day after Moscow formally informed Tokyo that its nuclear missiles no longer targeted Japanese cities, but also one day after Japan... lodged a protest with Russia after a Russian patrol boat opened fire at a Japanese trawler in waters near disputed islands, called the Northern Territories by Japan and the Southern Kuriles by Russia. Two Japanese fishermen were wounded... the Japanese coastguard said. The row over the islands, seized by the Soviet Army at the end of... W[W2], has prevented Tokyo from signing a peace treaty with Moscow... Japan has fought Russia four times this century and during the Cold War regarded the Soviet Union as its greatest military threat, with the attention of its armed forces focused on Vladivostok, home of the Soviet, now Russian, Pacific Fleet... Last July, [a]Japanese destroyer... visited Vladivostok to honour the 300th anniversary of the Russian Navy. It was the first Japanese warship to visit a Russian port since 1925.

...Russian border guards opened fire on four Japanese boats that entered Russia's territorial waters near disputed islands off northern Japan... the Interfax news agency said yesterday.

...The Japanese P[M]... says he and [Russia's]President... have agreed to make efforts to sign a... W[W2] peace treaty by the year 2000... [Meanwhile, h]igh-level arm twisting... has forced the mayor of a small Okinawa city to allow construction of a controversial U[S] offshore heliport... The [Japanese PM has]... dangled the prospect of 150 million yen... in sorely needed economic assistance to Okinawa, the poorest of Japan's 32 prefectures, in return for support for the heliport... The Nago mayor made it clear he was giving his approval under protest and told reporters that he planned to resign because his position had become untenable... The heat from Tokyo came on after Nago residents last weekend voted overwhelmingly against building the floating heliport in a non-binding referendum. "We don't want any more U[S] bases – of any kind – on Okinawa," said [a]local protester... More than 20[%] of Japan's southernmost main island chain, strategically placed just north of Taiwan, is occupied by U[S] bases. The archipelago was only returned to Japan in 1972... Opposition to the [heliport] runs smack into the vested interests of Japanese construction companies, which... are clamouring for a project carrying a price tag of over \$US1 billion... Agendas began to clash mightily in Okinawa after a 12-year-old local girl was raped by three U[S] servicemen in 1995. Residents called for the withdrawal of the bases, citing a growing incidence of crimes involving the U[S] military. Ironically... Tokyo and Washington decided last April to build the offshore heliport... [after planning] to shut down the Futenma Air Station in Okinawa as part of a blueprint to reduce the huge US military concentration there.

...A new security pact with the U[S] sets the stage for Japan to challenge its pacifist constitution and play a bigger military role overseas... Article 9 of the U[S]-drafted constitution bars Japan from using military force to settle any international dispute. The constitution also stops it entering into collective security arrangements... Under the new programme, Japan will take part in naval blockades and minesweeping. Japan also agreed in principle to give key military support to U[S] forces in an Asia crisis, but maintained its ban on offensive military might... In an apparent move to avoid fierce responses from China and other Asia countries, the new guidelines did not say which geographical areas would be covered.

...The smiles and exchanges of goodwill when [the]Chinese Premier... visited Tokyo this month could not mask the anger Beijing feels at Taiwan's inclusion in the recently-extended security alliance between the U[S] and Japan... While the rewritten alliance does not specifically name Taiwan, the implied inclusion of the island in an extended area of national interest – reinforced by remarks by senior Japanese military figures – confronts one of China's most fundamental policies. Reunification is an objective that goes beyond simple territorial arguments, with its roots deep in a national psyche still scarred by more than a century of humiliation by Russia, Japan and the West. "China will bear any cost to prevent [Taiwan's independence]," said [a spokesperson for] the China Institute of Contemporary International Affairs. "...We will use military force. There is no doubt." ...China's position has not changed since last year's crisis, when it staged a massive military exercise close to Taiwanese territory to warn the island against voting for independence candidates in the upcoming election. Washington responded by sending two aircraft carrier battle groups through the strait to demonstrate its readiness to fight China in defence of Taiwan.

...*Taiwan aims war games at China*... Commandos made clear... that the drills had everything to do with China and that nation's intensifying drive to... bring... Taiwan... under mainland rule... Bolstering Taipei's message of defiance, [the President of Taiwan's] inspection tour of his nation's newly-strengthened arsenal was aired live on Taiwanese television... ensuring that the message would project across the Taiwan strait to the mainland... [The inspection revealed] a host of high-tech imported arms, including American F-16 and French Mirage 2000-5 jet fighters, AH-1W attack helicopters and OH-58D surveillance helicopters... [The President, flanked by the] Vice-president... and military brass, nodded in satisfaction as he passed the drab green... American-made Patriot antimissile missiles... which at \$US1 million... each were not scheduled to be fired in today's live-fire war games. Also on display were some of the 300 ageing M60A3 tanks that Taiwan bought on the cheap from the U[S] – only to upgrade them with the latest electronic anti-aircraft systems... Beijing, which views Nationalist-ruled Taiwan as a renegade province, has warned other countries against arming the island...

[Taiwan, 'known internationally for little else other than being the place where everything is made' – with the exception of weapons – 'will make the procurement of US-made Aegis warships its top priority, to counter the missiles of arch-rival China. Experts said the highly computerised destroyers, which were designed to defend US carrier battle groups against saturation missile attacks, could have some capability to shoot down ballistic missiles. The reports, which were published in the *China Times* and *Liberty Times*, came shortly after a Pentagon report that China was building a major force of ballistic and cruise missiles near its seacoasts. The assessment, sent to Congress last week and released at the weekend, did not suggest that Beijing was planning to launch an attack against Taiwan. But it stressed that China had refused to renounce force against Taipei and could overwhelm Taiwan's missile defences and superior air force with sheer numbers of weapons in 2005 if a conflict erupted. US law permits sales of defensive arms to Taiwan despite Washington's shift of diplomatic ties to Beijing in 1979 and China's opposition to any arms sales to the island. Washington has already sold F-16 warplanes, Patriot missiles and other advanced weapons to Taipei, inciting Beijing's anger.'

... 'Don't think that Beijing's international bullying is limited to parking chartered buses in front of Christchurch Tibet supporters. That was the entree before China's President decided whether his dinner date with NZ's PM was on or off. Auckland has seen a mini glimpse of the effect of Beijing's paranoia, too. It happened when the Governor-General was guest of honour at Howick's annual Asian day in the park. As Auckland firemen, who had flown to help in the Taiwanese earthquake aftermath, were invited on to the dais to receive certificates of appreciation, the GG and his wife went down another set of steps. It was literally a diplomatic move. The reason: The GG apparently could not be seen anywhere near an event involving Taiwan for fear of nasty repercussions from Beijing. The word from Wellington is that the process of monitoring our doings didn't stop there. Apparently, people like the Foreign Affairs Minister more recently got a rocket from the President's minions because he and NZ had the cheek to congratulate the new president of Taiwan on his election. The election process is, of course, something that China's President and his lot are not over-familiar with. To them it's probably a quaint bourgeoisie, capitalist custom – like freedom of speech, and fair public trial.' By the way, 'China has built 2 fortress-like "fishermen's shelters" on the Spratly Islands, where the Philippines has a military presence.'

...*Asian war games preview flashpoint...* FOR TWO weeks at the end of April, the sea and air around the Malay Peninsula throbbed with the kind of activity that only 36 surface warships, a pair of submarines and 138 aircraft in war-simulation mode can provide. The occasion, an exercise called Flying Fish, was the most ambitious staged under the aegis of the Five Power Defence Arrangement, a collection of countries concerned about the defence of the peninsula. N[Z] is part of this arrangement, as are A[US], Britain, Singapore and Malaysia... It might be argued that something like Flying Fish offers no more than the chance for some spectacular sabre rattling. Yet one of the scenarios for Flying Fish involved a hypothetical power using force to annexe a hypothetical island. Thinking of Hong Kong? Try again. To the north of where Flying Fish was taking place lies another contentious group of islands named the Spratlys. The Spratlys would be an undesirable piece of geography – most of them are just above the water-line – were it not for the fact that explorations have revealed the area to be rich in hydrocarbons. Hydrocarbons mean oil, which explains why six countries – China, Taiwan, Vietnam, Malaysia, Brunei and the Philippines – have territorial claims over some or all of the Spratlys. Following the FPDA Defence Minister conference before Flying Fish, N[Z]'s Defence Minister rated the chances of an Asian war over the Spratlys within the next 20 years as "moderate to low"... Just how volatile is the area? Two schools of thought exist. One says that ASEAN countries are too interested in enriching themselves to fight over anything. The other suggests that economic expansion will provoke the kind of jostling for new markets and resources that may result in war. Adding to the mix is that ASEAN is in love with being well-armed. Though much of their equipment is obsolete, it is being upgraded at a pace, with defence items being replaced by offensive ones, such as ballistic missiles, long range strike aircraft and missile-carrying submarines. N[Z]'s defence attache to Singapore, Malaysia and Thailand... estimates that within eight years arms sales to Asia will exceed those to any other region in the world... [NZ needn't be concerned about a direct military threat. To date, NZ]'s lack of arrogance has ensured popularity in the area... N[Z]ers are not... prescriptive, perhaps because militarily we are not in a position to do so... [However,] South East Asia is economically important to N[Z]; it takes about 8% of our exports; it invests heavily here; it sends fee-paying students; much of our trade travels through it.

...The N[Z] public has never had more than about three months' warning for going to war. If eight wars and about 15 peace-keeping missions are a reasonable trend... from our 100 years or so of warfare... then we could be involved in another war by late July this year... N[Z] has maintained a fairly constant theme for sending the troops off to wars in foreign lands – to protect our interests... In the 1920s and 30s we knew we had won the Great War but had very little idea of why it had really started and why we had lost a generation of men fighting in yet another European civil war. No one had yet told us that our lads at Gallipoli landed just before lunch, not at dawn, on the wrong beach and... [there] were 40,000 men... crammed into... 40 acres, about the size of a golf course. Let us not forget that the myths and falsehoods about Gallipoli have been corrected only in the past 20 years, in part because we quickly lost interest in what had really happened and never sought to question the authorities. I wonder what our reaction would have been in 1939 if we had asked more about why we had done it in 1914.

...*Minister sounds alarm at level of defence budget...* [The AUS]n Defence Minister... has begun in earnest a campaign to reverse the declines in his nation's defence spending. With the military budget in proportional terms nearing the... levels of 1938 [he]... is worried that within two years defence outlays will fall to 1.8[% of GDP]... In the coming budget, defence spending will remain at the \$A10 billion level proposed in forward estimates 18 months ago, but [he] believes this is rock-bottom and should be pushed back up above 2[%] of GDP at least... He is, however, expecting the same kind of fight his N[Z] counter-part... will face with his intention to hold defence spending this year and follow up with a series of "modest" increases. "My guess is that the N[Z] population might be a little less eager to up the defence budget than the A[US]n population," he said.

...A[US] has set in place a programme of intense political pressure to persuade N[Z] to increase defence spending, says a secret document revealed in a... leak yesterday... It also implies that a backdown on defence would pose serious implications for the transtasman relationship, particularly if any cost was added to A[US] through bearing a "disproportionate share of the bilateral defence burden."

...The Government did not need a "deluge" of leaked documents to know there was international concern about N[Z]'s defence capacity, the Deputy Secretary of Foreign Affairs... said yesterday. He was getting the same message, albeit in "much more muted" form, from around the South Pacific and East Asia... [In 1990 'a UN defence review required NZ to start "building back" its defensive capabilities' – the country 'only has four tanks, all Scorpions, which are fast but lightly armoured']. However, NZ still spent only half what A[US] did on defence as a proportion of [GDP]. The NZ defence budget is \$1.6 billion – or 'a net \$1.034 billion this financial year after paying back GST and capital charges to the Government'] - 1997

It's foolish to believe we have no enemy to fight... For a visitor to N[Z], the extent of the defence debate in the country is striking, especially given the propensity of successive A[US]n governments to urge N[Z] to do more in its own defence. For all that, the debate has echoes of that in A[US] in the early 1980s, almost as though the nuclear issue simply diverted attention away from a more fundamental question of how to defend... [NZ. AUS] has taken more than a decade to develop a reasonably sophisticated approach to security... From the perspective of an organisation which has struggled for two decades to define defence, the N[Z] discussion seems to begin from the wrong premises. It is simply wrong to regard national defence from the standpoint of how much money can be spared. Similarly the notion, beloved by many participants, that nothing needs to be done until a threat has been identified misses the key point of national security, especially for a small country. By the time a threat is or can be identified, it is simply too late to do anything about it. Defence is just one element of a national security policy. This ought to seek to prevent threats by building political, economic and military relationships which deter potential aggressors so that the first time a shot is fired in anger, the first battle has been lost. Of course, the challenge then is to ensure that the last battle is won and that the nation's military forces in conjunction with allies have the resources to do so... As the very first paragraph of A[US]'s 1976 defence white paper stated: "The first responsibility of Government is to provide the nation with security from armed attack..." ...Defining a national security policy and the role of the military in supporting such a policy is a fundamental task... Traditionally, protection from armed attack is seen to be protection against invasion. Perhaps because of their history of involvement in distant wars throughout this century, both N[Z and AUS] have understood that their security depends upon a broader definition than mere territorial defence. With some 40[%] of its economy directly dependent on overseas trade, N[Z] has an overwhelming interest in its protection. That protection certainly cannot be achieved by N[Z]'s own efforts but it ought to be able to demonstrate an ability and willingness to do so in conjunction with allies and trading partners. Similarly, both A[US and NZ], as relatively small peace-loving communities, have a traditional and overpowering interest in developing an effective system of international law enforcement. Whether that be called peacekeeping, peace enforcement or preventive diplomacy, an essential element is the availability of competent military power working under realistic rules of

engagement first to impose order and then to build or rebuild peace... [B]oth countries have skills and traditions which are superior to most and ought to be devoted to the cause because it serves our interests to do so. The so-called globalisation of many aspects of politics, economics and social behaviour is simply a product of a communications revolution which has shrunk the world to a degree incomprehensible to the first Anzacs. That means we are involved in the world whether we like it or not. As just one example, the Korean peninsula, arguably the world's most critical trouble spot, is incomparably more important to A[USn and NZ] interests today than it was in 1950 when both countries committed forces to oppose North Korean aggression against the South. In consultation with their electorates, Governments need to define the range of their security interests before their military advisers can propose the sorts of defence forces needed to support those interests. Then, and only then, can a society decide whether it is able or willing to put up the money to pay for what is needed... [The Labour PM responsible for NZ's nuclear-ships ban] once told an ABC journalist during his prime ministership that as long as A[US] was secure, N[Z] is secure. Are NZers]... content with that complacent view... - Executive director of the AUSn Defence Association

The Defence Ministers of N[Z and AUS] last night agreed on a joint deal for the Anzac frigates to be recommended to their cabinets next week... [NZ's Defence Minister] was asked whether N[Z] would be paying more up front, or as the ships are delivered. "We have got an agreement that is based on the earlier understanding," he said. "The amounts of money that were being talked about to bring the project forward were too large for N[Z] to consider in the light of its other defence commitments." Pressed on the cost each year, he said: "Much as we planned before – on average, around \$100 million a year for the term of the project but it will be less at the start and more later on." - 1989

Frigate prices rise \$336m in 7 years... The cost of the two new frigates being built for the N[Z] Navy has gone up... since they were ordered in 1989. The frigates have had a big impact on an already strained budget and are the reason the... Government has foreshadowed a boost in Defence spending from 1998. The Defence Ministry deputy secretary... said the latest assessment to the end of June had put the cost of the frigates and shore equipment at \$1263 million. In 1989, they were estimated to cost \$927 million... Escalations in the cost of materials and labour had raised the price \$215 million and foreign exchange movements had cost an extra \$120 million... N[Z] had foregone the option next year to order two more Anzac frigates on similar terms. - 1996

The Minister of Defence... has hinted at the Government deferring a decision on buying extra Anzac frigates. He said yesterday that the oft-quoted November deadline for a decision on buying one or two more frigates was not absolute. The "November option" was simply to buy two frigates at a fixed price within the... Anzac ship-building programme. The unit cost for an extra frigate is about \$470 million in December 1996 dollars. N[Z] is contracted to buy two Anzac frigates, one of which will be ready for delivery in May. The other is under construction. The Government can expect to come under pressure from A[US] to stay within the fixed-price timetable for a decision on extra ships... [The minister] personally favours buying more Anzac ships...

The Minister of Defence... could see clear benefits from continuing with the frigates programme... [while] the Minister of Foreign Affairs... said a decision should be made in November, when the option to buy the ships for a fixed \$585 million... [each expires. The AUSn P]M... is expected to apply renewed pressure on his N[Z] counterpart... while he is here for a three-day visit, beginning on Saturday.

...The [NZ P]M... last night gave strong support to the Anzac frigate project, and indicated that the Government would not reduce the size of the planned fleet of four... "My Government believes... that a blue-water nation needs a blue-water Navy," he told a Tradenz dinner in Melbourne, in a speech that also emphasised the value of the project to N[Z] industry... with ship contracts worth \$500 million already placed with local companies.

...N[Z] companies are reaping substantially more than the \$503 million in direct contracting work promised by the Anzac frigate programme... The Minister of Defence... has estimated this will climb to \$800 million by the time the programme is completed... [while defence] exports... that were worth less than \$10 million before the project are now estimated to be worth more than \$90 million... 420 N[Z] companies are involved... either directly or indirectly... [As] a result of the defence work... [the] companies... are now able to compete for high-quality manufacturing and technology contracts in a wide range of business sectors... A[USn] shipbuilder Transfield won the contract to build the frigates, which stated 80.8[%] of the work... must go to A[USn and NZ] companies, with N[Z] firms getting 20[%] of that amount.

...Two A[USn] sister companies at loggerheads over contracts for the Anzac frigates are turning the yards of a Whangarei subcontracting firm into a battleground. Transfield Defence Systems staff raided the Whangarei company this week. They used bolt-cutters to open and remove a gate and a fork-hoist to take away a frigate superstructure module. Non-union employees of Transfield Whangarei retaliated by welding a 20-metre beam across a second module to prevent it being taken. It is believed that the second A[USn] company involved in the row, Transfield Construction, ordered Transfield Whangarei not to let the modules out of its yard, and that it was considering legal action to prevent trespass. The modules... are destined to be towed to Melbourne by the Sea-Tow 4 barge, which is in Port Whangarei... The marine fabricators at Transfield Whangarei are as confused as anyone about the situation... and feared redundancy... Transfield Defence Systems, Transfield Construction and a third company, Transfield Technologies, are said to be nearing the end of a "de-merger" which began 18 months ago... [Incidentally, a] long-delayed... military spending decision, expected today, is seen by diplomats and defence officials as the litmus test of the [NZ] government's commitment to defence issues... [C]abinet will... decide on the purchase of... new helicopters [that] are needed urgently if the Navy's new frigates are to be fully equipped.

...The cabinet yesterday decided to follow A[US] and buy Sea Sprite helicopters for the Anzac frigates... Two helicopters were in contention – the American-made Kaman Super Sea Sprite and British GKN Westland's Super Lynx. But A[US]'s decision to go with the Sea Sprite tipped the balance as compatibility of equipment is considered important... It is understood N[Z] will buy four Sea Sprites compared with A[US]'s 11. Figures released last year put the price of each machine at around \$41 million.

...N[Z] will pay up to \$274 million to replace the Navy's obsolete helicopters, but the deal includes four second-hand machines as well as four new versions... The Government confirmed... that it had chosen the... Seasprite helicopters... for its new Anzac frigates and HMNZS Canterbury and HMNZS Wellington... Four new G-class Seasprites will not start arriving until 2000 so Kaman will supply four second-hand machines of its earlier F-class to tide the Navy over as it scraps its 1960s-era Wasp helicopters. The F-class helicopters will be bought for a total of \$2.26 million... The... package includes spare parts... and... 12 Maverick missiles... [The Government also] disclosed... it is considering buying a fifth[G-class]. This will depend on... commitment to a [third Anzac frigate], but officials expect a fifth airframe to cost less than \$50 million... A senior Ministry of Defence official said that there could be no comparison with the \$US150 million [(NZ\$240m)] which Egypt is believed to be paying for 10 G-class Kamans, heavily subsidised by the U[S]. Meanwhile... Defence Force... briefing papers made public yesterday... [said that a]rmed services already beset by low morale and rapid rates of staff attrition... [- a]ttrition averaged 15 to 20[%] in recent months, with higher losses in some crucial trades... [because] armed forces' salaries and conditions have not significantly improved since December 1990 and are not competitive when compared with both private sector and other state sector employment... [-] are facing a \$68 million funding deficit in the 1997-98 financial year...

[A NZ] cabinet minister... says the Government should consider scrapping the military's fighter planes, the Skyhawks[– which 'have never seen real action' –] if that was the price that had to be paid to buy one or two more frigates. [He] said bringing the two squadrons of 30-year-old Skyhawks up to date would be too costly. Instead of maintaining a fighter aircraft capability, it was more important for the defence forces to

concentrate on a well-equipped navy, a modern army and an air force that contributed to maritime surveillance and air transport... Government sources say the future of the Skyhawks is in question as part of a far-reaching defence assessment, which goes to [the] Defence Minister... at the end of the month. [‘14 Skyhawks were bought for \$24 million in 1970.’ Today t]he air force has 19 Skyhawks in two squadrons, with one of the squadrons based permanently in A[US]. An air force spokesman was not able to give a total figure for the cost of staffing and operating all the Skyhawks, but said the A[US]n-based squadron was costing N[Z] \$46.9 million a year. The fighter planes themselves have a current value of \$114m. With the defence forces projected to go into deficit next financial year and a decision due later this year on whether more Anzac frigates should be bought from A[US], the expensive Skyhawk operation is in the firing line. [The] Defence Minister... is lining up to defend the Skyhawks, saying they make an important contribution to joint defence arrangements with A[US]. The NSW-based Skyhawk squadron allocates two-thirds of its flying hours to supporting the A[US]n navy. “I don’t think there’s clear evidence the change should be made... [P]eople... often overlook the need for a close relationship with A[US]... If you just look at N[Z] by itself, the squadron of Skyhawks might not be a particularly high priority, but if you look at working in with the A[US]ns it can give a completely different picture,” he said. [● ‘The pilot of an Air Force Skyhawk taking part in a low-level navigation exercise cheated death yesterday when his jet severed a 110,000-volt power line. The unhurt flyer was forced to make an emergency landing about 1 pm after hitting the line 68km southeast of Nelson, damaging the jet’s tail. The national grid line crashed down in the Buller Gorge, causing a fire’...

‘An Air Force Skyhawk ditched into the ocean off Western AUS last night, the second NZ fighter jet to crash across the Tasman in a month. The 25-year-old pilot ejected from the aircraft at 1524m moments before it plunged into the Indian Ocean. The accident brings the number of crashes to seven in the years the RNZAF has operated the fighter jets, and comes just one day after a Skyhawk severed a high-voltage power line west of Murchison, in the South Island.’

...N[Z] defence chiefs face a huge spending hump from a need soon to replace the Skyhawks and Hercules transport fleet. It is understood defence planners would prefer to buy new-generation Hercules, for between \$460 million and \$735 million, leaving the Government with an agonising choice between frigates and combat aircraft... [T]he pressure is piling on N[Z] to buy two more warships and satisfy what allies consider to be its international obligation to defence... The bill for a squadron of F16 fighters would come in at \$400 million-plus... Auckland’s Air Force base... could be doomed to close if N[Z] sacrifices its air strike force and instead opts for more frigates... The tally for armoured personnel carriers – a priority for the Army – would be about \$150 million. The complete shopping list totals around \$3 billion.

...Kiwi ingenuity and determination have resolved an expensive dilemma for the Air Force... [F]orward thinking... means its Orions will be “re-winged” for \$100 million... The six aircraft, mostly bought by the N[Z] Government in the mid-60s, are worked hard by the Air Force. All are fatigued and corrosion damaged... The U[S] Navy is the major user of the Orion and, while there are dozens being flown in other countries, N[Z]’s fleet has been in use the longest. Corrosion in the wings means large pieces have to be removed and replaced occasionally, taking up thousands of man-hours of delicate and exacting work. The heavy maintenance programme also takes its toll on the availability of the aircraft which are often grounded for lengthy periods... Their primary role is anti-submarine warfare, maritime strike direction (providing targeting information for Air Force Skyhawks) and joint naval operations, although it is their search-and-rescue role that they are known for best... The ageing aircraft scour the oceans every time there is a maritime search and rescue operation in the Pacific... Also used for fisheries protection, they patrol N[Z]’s Exclusive Economic Zone, checking on the legality of vessels in our area... Wing fatigue... is like bending a paper-clip backwards and forwards several times. “It will break eventually, and that is what can happen to an aircraft’s wings.” ...under certain circumstances wings can and do drop off – it happened to a Hercules aircraft in the U[S] in the late 1980s. There were no survivors... The re-winging of the 30-year-old Orions is an international first... [A] team... put the idea to Lockheed, the American-based manufacturer of Orion aircraft, that the re-winging was technically feasible. It took some doing to get the cautious company onside, but after studying the RNZAF plans Lockheed agreed it could be done... “Just because something hasn’t been done before, doesn’t mean it can’t...” [W]e will eventually have six airworthy aircraft, capable of a further 20 years of service, for the price of buying two... new Orions...” ...The project is expected to take four years, with the first of the re-winged Orions back in service by mid-1998.

...Senior cabinet ministers are embarking on a quiet campaign to coax N[Z]ers into accepting that more money will have to be spent on defence despite tight constraints on new Government spending over the next three years. It is understood that both the Minister of Defence... and the Minister of Foreign Affairs... want to build a wider constituency among voters for defence and turn around what one Government source describes as a “hostile climate” to more spending. They want to make N[Z]ers realise they cannot expect to separate foreign policy and trade from defence because the country’s credibility and influence is measured by what other nations think about its willingness to commit money to defence spending... It is understood ministers have been heartened by the absence of any public backlash against this week’s decision to spend \$274 million on... helicopters for the Navy’s frigates... [In related news, ‘the Royal AUSn Navy will have to limp along with its sole remaining submarine – a 30-year-old boat due for the breakers’ yard – while it tries to get its new, \$A5 billion, fleet working. Serious faults with the four Collins-class submarines in the water were confirmed yesterday in a damning report ordered by the Defence Minister. The report found that the Swedish-designed, AUSn-built submarines have combat systems that do not work, their engines are defective, their periscopes vibrate and provide poor vision, the communications systems are faulty and there are “numerous” other problems. The report recommends that the combat system be dumped and replaced with an “off-the-shelf” system.’

...‘AUSn authorities are investigating how a 130kg dummy missile fell from an FA-18 Hornet aircraft, landing in a Darwin panelbeater’s yard and destroying a ute. A Defence Department spokesman said there was no way the devices could be released by the pilot. “We are mystified. This has never happened since these devices went into service in the late 1980s.” The owner of the yard, who was cooking his dinner in the nearby workshop, said he felt lucky to be alive.’ Incidentally, Indonesia’s Government has scrapped its planned purchase of F-16s (r:p170, ln10) because of] **growing irritation over US criticism of its human rights record.** [The planes have now been offered to NZ...

‘The complete bill for leasing and then buying 28 F-16 jet fighters from the US could be more than \$700 million, according to cabinet papers. When the Government first indicated it would like to sign up for the planes, the Government stated the 10-year lease would cost \$125m. It also confirmed a start-up package, including spares, training and refurbishing the aircraft now in storage, added a further \$238m. But the documents released yesterday under the Official Information Act reveal that buying extra equipment to allow the aircraft to be deployed into “hostile environments” like Kosovo, plus a “structural integrity maintenance system,” would cost an extra \$42m. Outright purchase of the aircraft after 10 years – an option under the lease deal – would add a further \$287m. On top of that is additional operating costs of \$2.8m a year compared with the ageing A4 Skyhawks. But the Minister of Defence said the lease agreement would save \$350m compared with buying new aircraft next century when the Skyhawks end their useful life’...

‘Feathers are flying over the government’s indication that it may bale out of leasing F-16 jet fighters from America. Critics say such a decision will leave our air force a turkey, without a modern strike force. On Monday the government said it might not lease the 28 F-16s – which have notched up just 5 to 9 flying hours each – because it will cost \$1 billion over 10 years. But a journalist who visited the top-secret Arizona desert base where the decade-old jet fighters were to be regenerated, says you can buy used F-16s there for as little as \$6000 each. The journalist – who asked not to be named for security reasons – joined Pentagon officials for a tour of the Davis-Monthan air force base last September. This is the vast air base where America keeps its old planes. Everything needed to create your own Top Gun academy is here and for sale at \$1 a kg. The journalist suggested the NZ air force go on a shopping expedition there. He said a B52 could be bought for about \$180,000 and Huey choppers just \$2000. There are about 5000 military and commercial planes at the base. They sit silently in long lines covered in a special paint coating that protects the planes’ bodies and engines. The Pentagon says most planes are

sold either to private buyers, scrap dealers or foreign governments. There are 384 of the 6350kg F-16s at the base. The F-16 is the workhorse of the US air force, navy and coastguard. And despite being up to 25 years old, they still sell like hot cakes – except, perhaps, in NZ. They sell new for \$60m.’

...a former PM, who’s now the Opposition] foreign affairs spokesman... wants a “modest” boost in defence spending, arguing that deficiencies in N[Z]’s military capacity are handicapping its leverage in the Asia-Pacific region... He also said the defence portfolio should be kept in the hands of a senior-ranked cabinet minister, not given to a junior minister as had often been the case in recent years... While he strongly supported [the] anti-nuclear policy, “there is a difference between being anti-nuclear and anti-military. There is a difference between an independent foreign policy and unilateral pacifism.” ...the defence debate needed to go beyond simplistic arguments [like] how many frigates to buy, focusing instead on our wider regional interests and what other countries expected of N[Z]... While overall spending limits mean this year’s budget may not increase funding much in real terms, the budget may signal more in coming years to appease A[US] and other allies worried that N[Z] is not pulling its weight.

...The [NZ P]M... has joined other members of his Government in beating the defence drum... His office has denied a report that defence chiefs are being asked to find \$100 million in savings next year, after a cut in net funding of up to 37[%] since 1988... weighing into the debate in a speech to the Institute of International Affairs, [the PM] said only an “irresponsible” Government would accept that no defence capability was needed... “In a political or economic debate, hospitals win over guns every time. The easy way would be to subscribe to the view that with no immediate territorial threat facing N[Z] we need no military capability. I, and the Government I lead, do not share that view.” ...[he] said public opinion polls carried out for the Ministry of Defence showed 70[%] of NZ’ers believed it was either fairly important or very important for the country to have strong defence forces. The polls also found 78[%] supported NZ’s UN]-sponsored international peacekeeping roles and more than 80[%] thought the security of the Pacific region and in particular A[US] was fairly or very important to N[Z]... He said that... the growing economy meant it was possible to meet N[Z]’s defence responsibilities without sacrificing investment in health, education and social outcomes.

...[the P]M... told an audience that included A[US]’s P]M... and Defence Minister... that some of the core assets of N[Z]’s defence forces were nearing the end of their operating life... “Later this year, following our deliberations, will start to flow the decisions on a significant programme of investment,” he said. Defence spending would have to be carefully weighed against social spending, and major purchases could be spread over time... [His] comments were designed to both reassure A[US] that NZ] was prepared to increase its defence spending and to prepare the ground at home for the expensive programme of capital spending defence wants... [NZ’s] Foreign Affairs and Trade Minister... openly joined the push for a bigger defence budget, saying... “Our defence spending is right on the margins of where it can be taken seriously.”

...N[Z]’s Army is run-down and in crisis[, causing]... an assistant chief of general staff at Army Headquarters in Wellington... [to] question... whether the depleted armed forces had the ability to defend N[Z]. “...The regular Army has been run down to the point where it is barely capable of carrying out the day-to-day activities required of it... We have forgotten that twice this century war came with no more than four months’ notice and that all of a sudden young N[Z]ers in their tens of thousands were being sent overseas badly trained, poorly equipped and, in many cases, poorly led. The price was paid in blood for the complacency of those pre-war years... It happened for the same reasons it is happening again now.” Cuts in Government spending and unattractive wages and working conditions had turned young people away from Army careers... He urged the Government to put aside political point-scoring and provide the necessary resources to ensure “the protection of all N[Z]ers.”

...Defence is in the news again. Equipment is falling apart, staff are poorly paid, recruiting is tough work and some... costly decisions have to be made fairly soon. Senior officers of all services have presided over a lengthy period of reduced funding, trying to do more with less in every area of their activities... The latest cries for relief have been greeted with a public yawn. Why spend money on our forces? Where is the enemy? ...Well... there is... a ruthless, unforgiving and remorseless enemy... that will strike at the least expected hour, the most inconvenient moment and tear our comfortable world apart. The enemy is well-known throughout the world but seems always to retain the huge advantage of surprise. There is nothing... we can do to prevent the next hammer blow... overseas and we should know that our turn is inevitable... The enemy beneath cannot be contained or defeated. We can only seek to recover from the inevitable attack and resulting chaos with the minimum of confusion and casualties. Speedy, dependable reaction is essential. The defence forces... can[’]t... be allowed to crumble... away in the... mistaken belief... we have no enemy...

The Defence Minister... is shaping up to be a strong advocate for a well-equipped Defence Force and is ready to take on the peace brigade... Having a well-equipped force was “an insurance force.” ...[the minister also] said the white paper’s commitment to... \$663 million of extra spending over the next five years – \$300 million of which is in capital expenditure... [-] would go a long way to removing the negative view A[US]ns had of N[Z]’s commitment to defence... “...it is not locked into the psyche of N[Z]ers that that is a necessary part of peace. I think the average A[US]n thinks NZ] tends to be a bit of a free-loader on these issues in spite of the fact that for our size, we have more people around the world contributing to peace-keeping initiatives than any other country...”

...Increased defence spending on hold... The Minister of Defence... has sought to dampen any remaining expectations of extra defence spending in [this year]’s budget, telling N[Z]’s allies to wait for next year... [His announcement comes as ‘speculation is mounting that NZ’s closest neighbour and military partner is preparing to ask Washington for Tomahawk cruise missiles for its new fleet of super-silent, long-range submarines. Stand-off weapons – read Tomahawks – have been official policy for the ruling Coalition Government since 1993. But there is considerable resistance to the idea of AUS – already the most powerful and capable nation in the immediate region – gaining a strategic strike capability leaps ahead of anything else in neighbouring armories. According to some analysts, the appearance in the AUSn arsenal of a weapon allowing sudden attack from a Collins-class submarine 500km from its target risks starting a full-scale arms race in a region already spending huge sums on warships, state-of-the-art strike aircraft, and other weaponry. AUS’s determination to tighten the Anzus knot with Washington in the wake of NZ’s exile has not passed unnoticed in Asia. Proposals to pull the knot even tighter with Tomahawk missiles disturbs analysts such as the director of the NZ Centre for Strategic Studies, who notes with disquiet the revitalisation of a number of military alliances, including Nato and the US’s alliance with Japan. “This is quite unique in recent history,” he said. “There is no country – or countries – identified as the adversary or potential adversary. And yet military alliances are continuing to be polished up. It’s against that background that weapons acquisitions programmes need to be looked at. If there are no identified adversaries and this process goes on, sooner or later paranoia is going to set in in some quarters. People will begin to think: ‘My God. This must be aimed at us.’” Similar concerns exist in AUS, where a number of senior and respected analysts have publicly opposed the proposal. However, the proposal is part of a debate over the shape and role of the nation’s military forces as the region shakes off the dust of the Cold War and enters an era of new uncertainties. The ambitious re-equipment programme launched in the late 1980s has run against economic realities. The Army faces reshaping, the Navy is debating the future of its surface fleet, the Air Force is buying new transport aircraft, there is an urgent need for airborne early-warning aircraft and more helicopters, the F-111 force ordered when war with Indonesia seemed imminent in the 1960s will be retired from service early in the new century, and a lot of other equipment is on the shopping list. The cruise missile lobby argues that at \$A1.5 million apiece the Tomahawk is a highly accurate, far cheaper and less vulnerable option. The Government says it has no plans to acquire the missile’.

...AUS] would be “completely outside the N[Z] defence planet” if it bought cruise missiles, says the [NZ Opposition] leader... “It makes no sense to us and I don’t think it makes any sense to A[US] either, but it is indicative of the different way their thinking has developed.” ...Canberra... [announced] this week that it was considering buying the missiles... which can hit targets 1500km away...

A[US] yesterday announced that it would slash... desk jobs from its defence force as part of sweeping reforms to boost front-line operations. “We’re going to shift expenditure from the bureaucracy of defence into the front line of defence,” said the P]M]... “There’ll be more money to spend on equipment and on the sharp end, the front end. So it’s fewer bureaucrats and more soldiers.” [The]Defence Minister... said about 8000

support jobs would go as part of the defence review aimed at shifting 10[%] of the defence budget... into weapons and training. The A[US]n Defence Force has about 57,000 active personnel and some 49,000 reserves. About \$A6 billion... of the \$A10 billion defence budget goes to the Navy, Army and Air Force, the remainder is spent on administration. [The minister said the AUS]n defence force had to become more efficient as defence spending... [as a % of GDP] was falling... in the post Cold War world... The author of the defence review... said A[US] also needed to strengthen its defence front line as economically booming Asian nations boosted their military strength. "Not that long ago, we were a mini-superpower in our own region... Our economy was substantially larger and the amount we bought for our defence dollar was substantially larger than anyone else around our region... That's changing and changing very quickly... the economies around the region are growing rapidly and all of those countries are now in a position to acquire the sort of things that only we could afford a few years ago."

...[NZ's] Army chiefs are considering pulling the headquarters for their 2800 or so operational troops out of Auckland in a "teeth-to-nail" savings drive... to cut administrative costs and so free up scarce money for new military equipment, allowing the Army to catch up with technological upgrades in allies' forces... At the moment, two chains of command reach throughout the Army, with each camp divided along these lines... The Army says decisions on where to locate a single command will be made later, once the overall structure is sorted out.

...At least 110 soldiers and civilian staff must vacate the Army's Mt Wellington barracks[in south Auckland] by the end of June, but their future home remains uncertain. Many of them are likely to be posted south to the Trentham military camp[in Wellington], after the Army's entire 100-strong Land Force Command is transferred there from Takapuna[, on Auckland's North Shore]... A further 180 soldiers based at Hobsonville[, west Auckland's Air Force base,] will also move south, to the Linton camp near Palmerston North, leaving only the Special Air Service close to Air Force operations. The Army expects to move about 20 fulltime soldiers – employed at Mt Wellington in support of territorial units – to the headquarters of its 3rd Auckland-Northland territorial battalion at... Grey Lynn[(Auckland central)]. These headquarters will have to be refurbished to accommodate them and their equipment, including a field ambulance and about 30 other military vehicles now stored at Mt Wellington... The need for most existing support services from Mt Wellington, including workshops and accounts administration, will disappear south but the unsold Papakura military camp still needs to be maintained. That camp has cost the Government about \$5 million since it was closed in 1992. Land tenure problems are still holding up its sale and leases to private tenants have raised only \$670,000. Renting the Mt Wellington barracks, one of a number of sites housing the diaspora of soldiers displaced from Papakura, had cost the Army a further \$1 million a year. Soldiers have no trade union but the Public Service Association, representing civilian staff, is upset at not being consulted about what it says has been an order issued from Wellington to disestablish the barracks. An Army spokeswoman... was unable to confirm last night whether there had been such an order but said there was no way the Army would have intentionally neglected to notify the union and its members.

...[Big money in the private sector is attracting highly trained Air Force personnel and threatening Defence Force budgets. A spokesman for the Air Force said skilled personnel were being wooed by pay packets as much as \$40,000 more than they are currently earning. "It's very hard to argue with that." Telecommunications and flying staff were particularly sought after, he said. "The classic example is Air New Zealand. I think we train half the pilots for Air New Zealand. We give them a very expensive, very good training. Perhaps initially they don't offer any more – but very soon, when they become a captain on a 747 or something like that, they earn more than the Chief of Air Staff." The Air Force was losing about 21% of its trained staff a year. "If we're spending on training, we can't spend it on front-line operations." The RNZAF base in Auckland was short of around 54 air crew, about 30 of them pilots. "We just stay about 30 pilots short. We can only train 21 a year and they are wasting out at easily that sort of rate at the moment so we don't get any better. And that's similar in many trades." Firefighters at the RNZAF base in Auckland started out at \$10,000 less than their civilian counterparts.')

...Staffing problems have forced the Air Force in Auckland to rely largely on civilian firefighters... The Whenuapai air base has just 13 firefighters left from an establishment level of 28, meaning there are only enough hands to offer crash protection for aircraft. Housefires and other general blazes have to be left to civilians from the Waitakere fire station. The shortage is seen as a symptom of the high staff turnover in the Air Force... And the base has barely managed to attract enough technical staff to restore 24-hour coverage in its communications centre, which was forced last year to run day by day... [Mean]while a Navy recruitment drive has made little headway... The Navy, with an annual turnover of 18[%], resorted this week to an hour-long paid broadcast on Radio Pacific's 26-station network to coax qualified technicians to sea... It was tough competing with outside industry in times of relatively low unemployment, but the Navy was able to offer job security through contracts of two to four years for those wanting to try something different. The Navy is particularly short of weaponry engineers, especially with the looming arrival of its two new frigates. It hopes to fill the gaps with sailors from ships soon to be retired – the... survey vessel Monowai... and... frigate Waikato...

It's on its way. Te Kaha... is Auckland bound after leaving its Melbourne birthplace yesterday... for a four-day passage across the Tasman... 150 wellwishers gathered ashore during a sombre farewell in which the ship's 30-strong cultural group invoked blessings from the Maori god of the sea, Tangaroa... [The wellwishers included] one or two A[US]n fiances of sailors among several to become engaged during their long months of training... Below decks, [the] Petty Officer... and Warrant Officer... were revving up the ship's engines from banks of spotless electronic consoles merely by pointing a computer mouse... They and many other crew have followed Te Kaha's captain... from service with HMNZS Waikato – now languishing at Devonport at the end of its life. [The] Commander... admitted some nostalgia in forsaking the oldest frigate of the fleet for the newest. Te Kaha... with its highly automated systems [requires] 80 fewer crew than the older ship's company of 239.

...After N[Z] signed in 1989 for its first two Anzac frigates, a politician quipped that the gestation period of an elephant had produced a pair of grey mice... [The then Labour PM] was anxious to defuse rebellion in his party by emphasising how lightly armed they would be. Highlighting their long range for routine patrols through the Pacific – ...using half the fuel... [and] doubling the range of the existing Leander frigates to more than 11,000km – he said they would come with "a peacetime configuration and price tag." ...Even the peace movement acknowledged that the frigate Te Kaha – Maori for strength or prowess – is very lightly armed. And the Navy's new chief admits he would like to see "lots more" offensive weaponry on board... "As a professional, of course I would like to see lots more offensive weaponry, like surface-to-surface missiles and the newest generation of information technology, but we have to be realistic." ...His... candour comes as the A[US]ns prepare to beef up their eight Anzac frigates with long-range missiles and leading-edge radars. They have dumped the Anzac concept of fitting frigates "for but not with" offensive weapons, believing it would be too dangerous to wait until a military threat emerged before fitting armaments and training sailors to fire them... [The incumbent Rear-Admiral's] predecessor... called for N[Z] – as a maritime trading nation dependent on clear sea lanes – to act as a responsible member of a regional "neighbourhood watch group" by maintaining the ability to project naval power. [However, the] Campaign Against Militarism says moves towards global free trade mean nations have more to lose now by going to war with one another, and argues that the Anzacs are obsolete even before they are commissioned. The group claims that... they are inadequate for high-tech warfare, and accuses the Navy of dishonestly trying to soften their image with publicity handouts emphasising fisheries patrol and rescue roles. [The group's s]pokesman... said frigates were almost never used for fisheries protection, and had little room to carry people from danger zones. "In effect they fall between two stools." His group cites taunts made by senior National MPs against the former Labour Government when it decided to buy the first two frigates. The world's most expensive fisheries patrol craft was what [the current PM] called them from the Opposition benches... The admiral said a lack of firepower should "not necessarily" make his new 3600-tonne frigate and its half-built sister ship Te Mana more vulnerable in confrontations. They would "within limitations" be adequately protected with 15km-range Sea Sparrow missiles, fast-firing Phalanx guns on their top decks... a big-punching 127mm [cannon which 'can fire \$15,000 shells at the rate of 20 per minute']... on its bow to provide fire support primarily for ground troops; torpedoes; ...Kaman helicopters, able to fly over the horizon from the frigates to fire missiles or torpedoes at long-range targets... a

powerful hull-mounted sonar to listen for submarines; ...air radar to 450km... and... radar-jamming systems... [Indeed,] sensor and communications equipment account... for 37[% of each frigate's]... cost... The... infrared camera... in trials... was able to catch an Air Force Orion... from about 20km... [T]his is probably only a modest indication of the camera's full potential, because of moist conditions and the fact that the propeller-driven Orions do not emit as much heat as jet aircraft. - 1997

Engine exhaust is the main contributor to an aircraft's infrared signature.

To escape detection in the infrared spectrum, stealth aircraft were not equipped with large, heat-producing afterburner engines. This rendered them incapable of supersonic flight... Ever since radar-directed defences began taking a toll of bomber formations in W[W]II, aircraft designers and military aviators had sought ways to avoid radar detection. Many materials of the early jet age were known to absorb radar energy rather than reflect it... The existence of a Stealth program... was announced by the U.S. government in 1980. The first aircraft employing this technology, the single-seat... F-117A ground-attack fighter, became operational in 1983. The second was the... B-2 strategic bomber, which first flew in 1989.

Blending and faceting give the F-117A a hump-backed, reptilian appearance... The aircraft has been described as "flying better than it looks," but this could be a case of damning with faint praise... According to a report in *Time* magazine, the F-117A is nicknamed the Wobbly Goblin by its pilots... Its acceleration is not sparkling, and because of its wing loading and configuration it becomes unstable... at high speed and low level... A total of fifty-nine F-117s have been ordered, of which seven remained to be delivered in November 1988... The total production may be less than the original plan, for a number of reasons. The aircraft is believed to be expensive... The entire program is said to have cost \$[US]7 billion, including research and development... It is also highly specialised, with a small weapons load... In terms of range, however, the F-117A may yield to few aircraft of its size. In 1987, *The New York Times* reported... a plan to use the F-117A in a strike against Libya's [President]. (It was vetoed by the Joint Chiefs of Staff on the grounds that the F-117A should not be risked on such a mission.) [The plan] apparently proposed that the F-117A be ferried to Rota, near Cadiz, for the attack. It is approximately 1,200 nautical miles over water from Rota to Tripoli... This impressive range is made credible by the F-117A's large internal fuel capacity... Three of the aircraft have been lost in accidents... By the nineties, some of its missions could be undertaken by the B-2 or the US Navy's A-12, which represented a newer range of... technology. - STEALTH BOMBER

The B-2... has been a costly and controversial program[that is 'becoming quite an embarrassment for the US'].

The B-2's first flight... had been delayed... by a fuel system malfunction... Block 2 testing began in October 1990, investigating the... characteristics of the 'real thing'. These flights provided the first signs that all was not as advertised with the stealthy B-2... Problems with the B-2's performance [- 'the aircraft aren't as invisible as claimed because the reflective paint wears each time they're used and is also affected by the weather' -]have not aided it in the battle for funding on Capitol Hill. The original target was for a fleet of 133 airframes, including prototype, but by 1991 this had been cut back to 76... After the original six aircraft, ordered in 1982, three more were funded while the B-2 was still a 'black' project. In 1989 money was allocated for a further three, followed by two in 1990 and two in 1991. Congress then froze acquisition at 16 (15 for the USAF). The USAF claims it cannot provide effective operational capability with less than 20 aircraft, and five more were subsequently approved by 1993. This approval came with the caveat that the type's... problems must be rectified before any production occurs. Unit costs per aircraft (flyaway) have risen to \$2,220 million. Original 1987 estimates for a 75-aircraft programme stood at \$64,700 million (in total), although it is not beyond the bounds of possibility that some of the huge budget dedicated to the B-2 has been spent on other 'black' projects[- which 'have an \$US11 billion budget for 1997']. The FY1995 budget included \$793 million for support equipment and provision for the closure of the production line. - Encyclopedia of World MILITARY AIRCRAFT

Stealth aircraft were originally considered 'cheaper to produce than the ground equipment necessary to defend against them.' However, radar and infrared systems have become more sophisticated and, relatively cheaper, since the 1980s. Furthermore, *heat-seeking missile* technology also continues to improve. It might not be long before the decreased heat emissions of stealth aircraft are no longer able to compensate for their lack of speed. And heat-seeking missile systems are much cheaper than stealth aircraft - even NZ can afford to have them!

The... Army will get its new missile defence system off the ground with a live firing exercise next year but is still investigating safe sites... The three areas being considered were in Northland, the Wairarapa and the Mackenzie Basin... Training for the \$23 million heat-seeking missile system has begun at the Linton Army camp... with the arrival of a computer simulator and two launchers. Ten launchers will arrive next year... The Army has not had an air-defence capability since a... W[W2] gun and searchlight battery disappeared in the 1950s. The new "fire and forget" missile system is produced by a French-British joint venture... A detachment of four soldiers can carry the system - and assemble and fire it in two minutes. The missiles have a 5.5km range and a 93[%] hit rate is claimed. The missiles lock onto the heat signatures of targets and are said to be almost immune to countermeasures... Live firing exercises would be restricted to one a year because of the cost of the missiles... [In related news, NZ's defence] manufacturers fear their fledgling industry could be torpedoed by secondhand U[S] warships... Cash-strapped defence officials are heading for the U[S] in a last-minute search for cheaper warship alternatives to more Anzac frigates... The U[S] has 50... surplus guided-missile frigates... in the... class to which the N[Z] officials are turning their gaze in a bid to retain a four-frigate fleet... It is not known what price the Americans might seek... but observers were quick to point to heavier running costs from larger crews. Costs would also be duplicated in running two classes of warship, since each would require separate spare parts and training programmes. Although the two classes have the same type of gas turbine engine, they have vastly different weapons systems, with the American ships designed for long-range and costly anti-surface Harpoon missiles... [However, the NZ] Navy could probably buy two American ships at a fraction of the... cost of each new Anzac vessel... Defence accountants have valued the... Te Kaha, at \$563.4 million for GST purposes since it arrived in N[Z] last month.

...Without firing a shot the new frigate... has sunk N[Z]'s trade surplus for July. The... warship turned what would have been an \$81 million surplus for the month into a \$483 million deficit. The merchandise trade statistics recognise an import when it crosses the frontier...

It's that "F" word again. I know everyone's sick of it but it's got to be said - "frigates." I recently arrived in Auckland... and the pathetic appearance of our new frigate... hit me like a slap with a wet flounder... I was raised with a love of warships, a pride in the Achilles action and an unshakeable belief that Britannia ruled the waves. I was enthralled with the stories of Nelson's brilliant victories. Lately I have come to realise that since Trafalgar the British Navy has never won another victory[- excluding, perhaps, the defaulted 'Battle of the River Plate' in which the NZ ship *Achilles* fought. (During 'October 1939, two German pocket battleships - huge vessels with powerful armament - were operating in the Atlantic inflicting heavy damage on Allied shipping. One, the *Graf Spee*, was tracked south to the mouth of the River Plate, a wide stretch of water between Uruguay and Brazil. Though outgunned, the cruiser HMS *Achilles* and the RN cruisers *Ajax* and *Exeter* attacked, and in a running sea fight inflicted severe damage on the pocket battleship. The *Graf Spee* took shelter in Montevideo harbour, but Uruguay, a neutral country, gave the ship only 72 hours to make emergency repairs. At the end of that time she had to leave or be interned. When the time expired, the *Graf Spee* put to sea where the *Achilles* and the other ships were

waiting. Rather than risk battle, the Germans abandoned the ship immediately outside the harbour and blew her up.' 'Captain Langsdorff believed the propaganda of Winston Churchill that a substantial British force had assembled outside the port to wait for its escape bid.' 'In fact no nations have had much luck with their navies. In... W[W1] the German Navy (submarines) successfully blockaded Britain and the Royal Navy was powerless to stop them... It was a case of the Allied armies just managing to win the war before the Navy lost it for them. Germany started... W[W2] with a small Navy, built submarines and again successfully blockaded Britain. The Royal Navy had not learned its lesson from the first war. [It did, however, learn how to use submarines to sink unmarked cargo ships – including at least two holding 'Commonwealth prisoners of war. The 162 NZers killed on the two ships (117 on the *Nino Bixio* and 45 on the *Sebastiano Venier*) accounted for a third of all NZ POW deaths in WW2.] When the Japanese entered... W[W2,] Churchill sent Britain's two prize battleships and an aircraft carrier to stem the advance. The carrier never got there and the two battleships were sunk by Japanese aircraft without effectively having fired a shot. Most of the American Pacific Fleet anchored in the "safe haven" of Pearl Harbo[r] was sunk, solely by aircraft. In the one-sided Falklands conflict the Royal Navy learned that... [the] weapon that took out its latest prized vessels was a relatively small French missile rumoured to have been fired from the back of a land-based truck. What is a frigate? Nelson regarded his frigates as the eyes and ears of the fleet. They were small, fast vessels compared to ships of the line (battleships). They relied on their speed to make up for their lack of firepower and to keep them out of trouble. Is our frigate fast? No. In today's world it's a snail ([with]... a top speed of over 28 knots... [it's] about five knot's slower than the old Achilles... [- although t]he... 30,000hp... LM2500 gas turbine... derived from an aircraft jet engine... has a number of advantages over the steam turbines used by older ships, including quick starting and ease of repair[; and the]... frigate also has two diesel engines with cruising speeds of up to 18kts... [D]oes it have the latest and greatest weaponry and systems? No, it doesn't. I'd like to see any ranking naval officer state that it does without blushing. If it is such a lemon why have we spent billions on two of them and why are our politicians surreptitiously looking to buy more? ...The decision on whether to buy the frigates was given to... [the then Labour PM]. He said he would listen to the wishes of N[Z]. A poll showed 70[%] of the people didn't want the frigates... [The then AU\$N P]M... and the N[Z] Navy wanted them. They won; we lost... The most prosperous nations are those that don't overspend on defence and don't build up outmoded navies. The most stable and prosperous period in English history was the reign of Elizabeth I. She kept taxes very low and refused all sorts of pressure to build any sizeable Navy or Army. In fact, she could be said to have invented privatisation, especially as regards the Navy. The King of Spain did the reverse. He spent the nation's wealth building the largest Navy ever. The Armada bankrupted the world's wealthiest country and achieved nothing.

...Painted big, bold and black on the grey sides of the... frigate Te Kaha is F77. The F (for frigate) is easy enough but why 77? Why not 1...? ...numbers stemmed from the British Admiralty's numbering system for Royal Navy and some Commonwealth fleets... A[US] withdrew from the Admiralty-Commonwealth numbering system several years ago and set up its own... Ship or pennant numbers necessary for visual identification at sea are determined largely by what numbers are available when a ship is commissioned. Numbers become available if a ship is lost or broken up on completion of duty. So, HMNZS Otago became F111 in 1960; HMNZS Taranaki F148 the following year; HMNZS Waikato F55 in 1965; and HMNZS Canterbury F421 in 1970. Because of delays in ordering the Canterbury, the Royal Navy frigate Blackpool was hired by N[Z] for a couple of years. Coincidentally it was F77, the number Te Kaha bears today... Te Mana... will carry F111.

...TWO WEEKS from now, the top guns of the N[Z] and AUS[n] military establishments will huddle on a chilly Melbourne dockside. Looming over them will be the grey hulk of Te Mana, the second of the \$585 million Anzac frigates, straining at the hawsers before it slides into the water. As the brass band plays and streamers fly, the question hanging in the crisp... air will be whether Te Mana will be the last of the Anzac frigates for N[Z]... In question is whether N[Z] can afford a third or even fourth frigate... [The] Defence Minister... has been joined by [the] Foreign Affairs and Trade Minister... in a military-style pincer movement... to push up defence funding. "The first thing we have to acknowledge is the defence vote has undergone substantial reductions in 1996 dollar terms since 1989," says [the Defence Minister]. "It's the view of the government that there should be no further reductions in the defence force and we can see in the future at least modest increases." ...Just how much more money [the minister] will be seeking will become clearer after he receives the long-awaited defence assessment, a major head-scratching exercise looking at what type of defence role N[Z] can afford... Since lobbying for increased defence spending began late last year, some commentators have talked of a real cut in defence spending of a third... [The minister's] own figures show that since the financial year ended 1988, defence spending has fallen a total of 7.5% in real terms, over a period when many government departments have experienced funding cuts and restructuring. There is also debate over whether defence spending has, or should, keep pace with the growing economy... So has defence spending been slashed relentlessly as its advocates claim? In short, no... Depending on the measure used, estimates of current defence spending are anywhere between 1.1% and 2% of GDP. One reputable international comparison released recently... showed N[Z]'s spending had dipped from 1.9% in 1990 to 1.7% in 1995. It showed N[Z] spends less as a proportion of GDP than countries such as A[US], the US, Malaysia, Singapore and Thailand... a similar amount... as Italy, Belgium... and Denmark... but more than Japan, Indonesia, Canada... Ireland... Austria... and China. Defence's slice of the total Government cake has actually increased, from 4.8% in 1988 to 5.8% in the current year. The defence forces still represent the fourth largest departmental vote after social welfare, health and education. However, the area in which the armed forces are undoubtedly suffering is from the costs of maintaining or replacing aging weapons, aircraft, ships and vehicles. If there is a case to be made for increased defence spending, it is not so much to turn around previous cuts as to embark on a major programme of capital spending of which the frigates are a part.

...It took the Maori Queen... two attempts to crack the bottle of champagne... [when launching NZ]'s second new Anzac-class frigate... on Saturday... "I name this ship Te Mana. May God bless her and all who sail in her"... [By the way, Te Mana and Te Kaha have] been equipped with eight Seasparrows, but these will be replaced by 32 faster and longer-range missiles under a major weapons upgrade... The newer Seasparrows will fly at twice the speed of sound, giving the Anzacs more survival chances against multiple attacks – at about \$500,000 a shot... Navy chiefs did not let their disappointment over [the prospect of reduced] ship numbers spoil the pleasure of successfully test-firing a new missile yesterday.

...the question that has hung over the Navy since the two [frigates] were ordered in 1989... remains: will there be any more? ...Although [the Defence Minister] supports a fleet of four Anzac frigates, the Government may opt for an alternative, ranging from a politically-comfortable indefinite deferral of a decision to smaller corvette-sized patrol vessels, or more second-hand frigates... Beyond this is the larger question of what place defence will occupy in N[Z]'s national persona, and how this in turn will be viewed by the people we most want to impress into the new millennium... Further afield is the nation's credibility in Asia, where new links are being forged with Singapore, Malaysia, the Philippines and China... The immediate concern is A[US], which has consistently criticised the steady decline of defence spending in N[Z]... With its own severe cost pressures, Canberra wants N[Z] as a solid defence partner able to keep up with A[US]n forces... But this depends on how much N[Z] is willing to spend... [A NZ] defence efficiency review... aims to brutally prune costs and inefficiencies from the soft rump of the military, and pump them into the sharp end. The first real benefits of this, however, are not expected to flow until 1998-99... [T]here is a good case to argue that since the Anzacs split N[Z]'s forces have become far more versatile and effective. Rapid deployment capabilities have increased, and their reach and endurance have been increased by the addition of the fleet tanker Endeavour and the Charles Upham. ● 'The Government has been forced to spend an extra \$41 million on a deal for new light-armoured vehicles for the Army. When the Government said last year it would buy 105 new personnel carriers, the cost was put at \$611m. But it was revealed yesterday that the price had been pushed up to \$652m by the fall in the NZ dollar and changes to the contract'.

...A further \$8 million will be spent sorting out the botched purchase of a \$23m missile system, currently useless for combat as it cannot tell friend from foe. The Defence Minister said the government would buy the targeting equipment needed – but not purchased with the missile system – to make the

French-made ground-to-air missile system ready to use with allies in combat. Papers released to the press under the Official Information Act show the project has been a debacle since 1994 and joins the list of botched defence acquisitions including the light armoured vehicles tender and the Charles Upham ship¹.

...Defence chiefs are faced with a \$30 million bill to turn their only cargo ship into an effective military vessel... Necessary modifications to the HMNZS Charles Upham, which was ordered out of routine service in August[1996] because it was so unstable, will cost more than twice its \$14.15 million purchase price... The ship made two naval voyages before being temporarily withdrawn from service after breaking down in heavy seas in the South Pacific, rolling dramatically and laying many of its crew low with seasickness... earning it the nickname of "Charles Chuckam." ...its captain during the Pacific voyage had concerns for its safety... Although the project is seen as crucial for the mobility of N[Z]'s armed forces, it is being held up by a major Government rethink of defensive policy. The conversion project should have begun by now but all new capital decisions are on hold...

While the Army wonders whether it will have a proper troop ship, politicians are considering splashing out on new jetliners for VIP and other transport roles... [T]he Government... is understood to have in mind Boeing 737-700s, which sell for a basic price of about \$56 million, or up to \$64 million with fittings for VIP configurations. Boeing has just produced its first business jet based on this model, saying it can build in "bedrooms, boardrooms or whatever" within the upper price limit... They will be [replacing the]... four remaining Andover transport planes... all that are left of a once-proud fleet of 10... Andovers... [bought] secondhand for \$1 million each... from the Royal Air Force in 1976... It is the only military Andover fleet left in the world... [T]he 30-year-old Andovers have... seen service in Africa and the Middle East as well as the Pacific. They have carried royalty and heads of state, supported U[N] peace-keeping efforts, and used their short-landing capabilities to run countless hurricane relief and search and rescue missions... [In related news, t]urbine blade cracks have struck the Air Force fleet of Aeromacchi jets again, shrinking the number available for pilot training. The Air Force confirmed yesterday that only six or seven of the 17-strong fleet which the Government bought in 1991 for \$266 million would be available until the engine manufacturer, Rolls-Royce, fixed the latest problem... The cracks follow a major redesign project by Rolls-Royce to make the Macchis' jet turbine blades more tolerant of foreign objects, which were believed to have caused two crashes. One Macchi was painstakingly rebuilt after a crash at Ohakea in 1994 but another was written off after ditching in Northland a year earlier. Just under three years ago the fleet's flying hours were reduced after cracks appeared in... blades facing the engine air intakes, but the restriction was lifted after the redesign project... [T]he latest cracks were restricted to the second series of blades.

...Privatisation is gaining ground in the armed forces with word that contractors will take over major aircraft repairs and a Waikato firm will provide training planes.

...A military contract is spurring a Waikato aircraft manufacturer to hire up to 50 more staff. Pacific Aerospace is expanding its factory at Hamilton Airport... to build the Air Force a fleet of 13 CT4E aerobatic airtrainers for about \$500,000 each. The planes will be leased rather than sold to the Air Force, for beginner pilots and the Red Checkers aerobatics team. Pacific was rescued from financial strife two years ago when it was bought by Aeromotive Ltd... [Meanwhile, 14] more workers will be laid off from the Devonport naval dockyard in the face of dwindling defence and commercial business... This will cut the workforce to about 345 from the 650 employed there when the British-owned... private sector operator... took over the dockyard in 1994, under a 10-year management contract to the Ministry of Defence. [The operator] is contractually bound to retain 316 workers to meet naval strategic needs but... [that] was before the Government... deferred... refurbishing the troop ship Charles Upham...

Three years after joining the Navy, the would-be troopship HMNZS Charles Upham is to be leased back to civvy street... if a taker can be found... After spending \$22 million buying and making initial modifications... the Government is stalling for at least another two years a decision on a \$34 million long-term upgrade... [including] a helicopter flight deck, accommodation for 150 troops and storage for equipment such as armoured vehicles and disaster relief supplies.

...From the acquisition of HMS Philomel in 1913, successive N[Z] Governments have often resorted to equipping the Navy "on the cheap." And all too often the Navy has suffered in the eyes of the taxpayer by being expected to get maximum performance from the inferior hardware provided. The Philomel was already 22 years old when the Admiralty agreed to lend her as a seagoing training ship to form the nucleus of the N[Z] Division of the Royal Navy. While the Admiralty still owned the ship, N[Z] paid for her day-to-day running and upkeep... Government penny-pinching ruled again when her successor, the light cruiser Chatham... a coal-burner... [at] a time when oil was the latest thing in naval propulsion... was made available by the Admiralty... The two ships which followed... in the mid-1920s were much more modern. Launched in 1918 and 1919 respectively, the Dunedin and the Diomed were oil-burners, a change which saw the tanker Nucula transferred from the Imperial to the N[Z] Government. Twelve years passed before the Admiralty replaced these cruisers with first the Achilles and then the Leander and by then the threat of war in Europe muted complaints about unnecessary expenditure on the Navy... W[W2] brought the creation of the Royal N[Z] Navy and with it the nation's responsibility for its own maritime defence... But when peace returned it came hand in hand with parsimony. The cruisers Bellone and Black Prince came from Britain on loan, and then, in 1949, the Government bought six Loch-class frigates from Britain for £1.5 million. Their 16 years' service proved them to have been a good buy. N[Z]'s next four warships, the minesweepers Inverell, Kiama, Echuca and Stawell, were a gift from A[US]. With the exception of the Echuca, all served... in training and fishery protection roles. The last cruiser, HMNZS Royalist, was a further example of miserly thinking. Originally to be one of three ships of her class to be modernised by the Royal Navy, she became an orphan when plans for the other two were scrapped. The change of plan did not stop the Government from buying her for £4 million against the advice of the N[Z] naval liaison staff in London. The buoyant economy of the early 1960s and the purchase of two new Rothesay-class frigates, Otago and Taranaki, and a Leander-class, the Waikato, gave the Navy new heart, but a slump in 1967 meant the order and delivery of another Leander, the Canterbury, was deferred and she was not commissioned for service until 1971... Possibly N[Z]'s worst buy was that of fast patrol craft for fishery protection duties in the 12-mile limit of the day. The Navy wanted six, the Government said four, and the British... supplied the smaller batch at a cost of \$7 million in 1975. From the outset the craft suffered from serious engine vibration problems and from sea-keeping qualities described... as ranging from "unsatisfactory" to "vile." Quite unsuited to patrolling the 200-mile exclusive economic zone, declared in 1977, these patrol craft became a liability... In 1974, the survey ship Lachlan, borrowed from A[US] 25 years earlier and bought outright in 1963 for £16,000, was finally retired. Her replacement was another "off-course substitute," the former Government-owned Pacific Islands trader, Moana Roa. Converted for survey duties... [in] Scotland, she began working for the Navy in 1978. She is to be replaced next year by a seven-year-old ship bought from the U[S] Navy for \$31 million and named Resolution. The cost of frigate replacements loomed in the early 1980s, when first the Taranaki and then the Otago reached the end of their useful lives. Rather than order new ships, the Government went to the Royal Navy's second-hand lot and bought two ships that were already older than the Canterbury – the Bacchante, completed in 1969, and the Dido, completed in 1963. They were renamed Wellington and Southland. The Southland has since been taken out of service... the Wellington [was] expected to serve into the next century after a... \$10 million... reconstruction and modernisation that took three and a half years. But... [now she] is to be sold in 2000... [However,] surely the biggest "lemon" of all was the Government's purchase of the Danish container ship, Mercandian Queen II, with the stated intention of making her a sealift vessel for soldiers. The... [ship that is now] named after N[Z]'s most famous soldier... became a nightmare... - 1997

...born in Christchurch, [Charles Upham] was widely regarded as the outstanding[NZ] soldier of W[W2], earning the... Victoria Cross and Bar... the highest British decoration awarded to members of the NZ armed forces... for outstanding gallantry and leadership in Crete in May 1941, and at Ruweisat Ridge, Egypt, in July 1942. He is the only combat soldier ever to win the VC bar, although two medical officers achieved the honour during W[W1]. Upham became famous among his comrades not only for his daring but for his tightly controlled skill at out-thinking the enemy at close quarters, and for his implacable determination to kill as many German soldiers as he could. After being severely wounded at Ruweisat Ridge, Upham was captured by the Germans and recuperated in an Italian hospital. He began a private war with his captors and ended the war in Colditz Castle with other 'dangerous' allied prisoners... Upham volunteered for service at the outbreak of war at the age of 30, quietly proclaiming as his reason a desire to fight for justice.

...Because of its small population and the high cost of the military equipment which it must import, NZ has tended to rely on small professional military units backed by a citizens' army in times of crisis. Mutual defence treaties have forced governments to keep the armed forces' numerical strength and technological performance up at a basic level even in times of relative economic hardship. NZ armed forces have fought no military actions at home since the land wars of last century but historically have responded immediately to British Commonwealth problems... The Commander-in-Chief of the N[Z] Armed Forces is the Governor-General, the Queen's representative, and this effectively places the services under the control of cabinet... The N[Z] Army has evolved from the Volunteers set up by the Militia Act of 1858 which, as a citizens' force, supported both the Regular Force set up by the Colonial Defence Act of 1862 and the Armed Constabulary Act which superseded it in 1867. The Volunteers were re-organised during the 1880s in response to what came to be known as 'the Russian scares', and which led to the fortifying of NZ's main ports. Ten contingents of mounted rifles (from the Volunteers) went to the South African War in 1899. The Defence Act 1909 replaced the Volunteer force with the Territorial Force recruited by compulsory military training. During W[W1] the... Territorial Force continued to function but only volunteers were accepted for overseas service until the Military Service Act of 1916 made service compulsory for all males, between the ages of 20 and 46, who were called up. Throughout W[W1], a total of 124211 were mobilised for active service with the Expeditionary Force, representing 11.5% of the total population and more than 50% of the male population of military age... Of these, 100444 embarked for overseas service. About another 1500 N[Z]ers served overseas with British units or the nursing service... The official death toll on active service was 16554. ['In financial terms, the war had cost NZ more than £81.5 million to 1921.' During WW2], NZ Army units – briefly on a volunteer basis and then compulsorily – served in the Middle East, Italy and the Pacific in substantial numbers, and with some as individuals in every theatre of war. Surprisingly, service figures are much less reliable than during W[W1]. One official estimate is that 194000 men entered the armed services during the war (about 67% of the male population between 18 and 45)... The official figure for killed on active service was 11625 with 46 declared 'missing'. After the war, the Territorial Force, based on compulsory service for ten years from 1949, was integrated with the regular army. Since [1945], NZ soldiers have served in Japan as an occupation force... as part of a UN force in the Korean War... as part of a British force against Communist insurgency, in Malaysia, and in South Vietnam... Units... have been based in Singapore, since the termination of active service in Malaysia in 1966.

Singapore, with just over 3 million people[– or about half-a-million people less than NZ –] has 54,000 under arms compared to N[Z]'s 9500. - 1997

The first professional soldiers to officially serve in NZ were those sent by Britain after 1840 to quell Maori resistance to the theft of their land (*the land wars*). 'By the time the British Army arrived in NZ it had already conquered a quarter of the world.' However, many British soldiers (including commanders) were unprepared for what awaited them at the other side of the world.

The N[Z] wars between 1845 and 1870 were remarkable for the rapidity with which the Maoris adapted to European warfare and the difficulties the British experienced in subduing them... WARFARE in N[Z] was a widespread seasonal activity in pre-European times. It had become endemic by the time the Europeans arrived. Feuds and fighting were built up round an elaborate potential for insult or injury requiring *utu*, which in one form demanded vengeance in the form of physical retribution. This penchant for warfare developed with the more settled horticultural life of the later period of Maori settlement as a result of increasing population and pressure on the availability of good quality land. The earlier moa-hunters had been a relatively peaceful culture. This change is consistent generally with developments in other parts of the world – hunting societies are more peaceful because men can show their manhood on the hunt and because the quality of the land on which settlement takes place is not critical... Maoris formed war parties (*taua*) for raids on other hapu and their conduct was rigidly controlled by rituals and superstitions. Fighting was hand-to-hand with no use of bows and arrows or slings and limited use of throwing spears. The most common weapons were clubs... The use of clubs was carefully taught to boys and young men and required as much drill and skill as swordplay... Behaviour in battle was a source of much mana ['respect', 'integrity, charisma, prestige'] – or shame... Maoris seemed to have little fear of death, firm in the conviction that they would return to Hawaiki, their spiritual homeland. As a result they fought with ruthlessness and little compassion for the defeated including women and children... Deceit and deception were also employed by warriors as part of battle strategy and tactics.

Pre-European warfare was small in scale, involving extended families or sub-tribes rather than major tribal groupings. To help ward off attack, groups began building defence works such as simple palisades that in time developed into complex fortified pa utilising high fences of wooden stakes, raised fighting stages and double rows of ditches. The majority of NZ's pa were built in the period from about 1500 to the first half of the 19th century, and were concentrated in the northern half of the North Island. Here, it has been estimated, there were between 4,000 and 6,000 pa, with 500 in Taranaki alone. Only about 100 pa are known to have been built in the entire South Island. Some pa were used only once, but many were occupied many times over several centuries. Each building or re-building of a pa was a major event in the lives of the people involved. Often pa were built in expectation of an attack that never eventuated, but many were attacked and some were sacked... [During October 1769, Captain] James Cook and the crew of the Endeavour first made contact with Maoris on the banks of the Turanganui River, the present-day site of Gisborne in Poverty Bay. Cook responded to Maori curiosity, challenges and growing hostility by ordering the firing of muskets in three incidents. At least five Maoris were killed and a number wounded... Attempts by Cook's crew to trade with Maoris in the Hawke's Bay area[south of Poverty Bay] were not greatly successful... On his second visit to NZ, Cook found the Maoris in Queen Charlotte Sound eager to trade for iron. For trade goods, they also offered their female relatives to be exploited by seamen. Venereal disease was observed... ['Sex was the biggest industry in NZ during the early 1800s. Indeed, the US consul of the time was moved to say that "New Zealand is a brothel."' The Far North] Maoris were quick to see that possession of European firearms would give superiority in war, and muskets, powder and shot became major items of trade. Even missionaries, dependent on the Maoris for food, were forced to barter with firearms.[The Far North tribes mostly 'obtained their guns from US whaling ships calling into the Bay of Islands port settlement of Kororareka (now called *Russell*), which in those days was better known as "the hellhole of the South Pacific" – the town had its own vigilante law enforcement group but the worst crime they could come up with was debt collecting. The captains of US whaling ships would trade guns for supplies while their crews would trade guns for sex. One gun was worth three weeks with a Maori woman' (alternatively, 'one gun could be traded for a *mokomokai*' – preserved Maori head).] The success of two major *taua* (fighting expeditions) from the Bay of Islands in 1818 was attributed to European weapons... Maunainia village and Mokoia pa at the present site of Panmure, Auckland, were taken

in 1821... by... [a huge... Northland... taua... An estimated 2,000 slaves were captured... The pa Te Totara near the present site of Thames was taken in 1822; the Waikato pa Matakaitaki was also taken, where 1,500 were estimated to have died... The[se taua]... escalated the trade in muskets and intensified tribal warfare which did not diminish until the early 1830s when a balance of firearms among hapu was reached in the North Island... [T]he first attempt by British forces to discipline Maoris... [occurred on October 1, 1834, when, a]fter a bombardment, the crew of HMS *Alligator* attacked the pa... [of] chief Hongi Hika... at Waimate... [In March 1845 t]he sloop HMS *Hazard* was sent to the Bay of Islands[, after]... Hone Heke... attacked Russell.

[Hone Heke] was a... Ngapuhi chief whose defiance, in four times cutting down the British flagpole above Kororareka, has earned him an honoured place in the history of NZ. He and his tribesmen, although greatly outnumbered, outfought the British sent to stop them, and their rebellion was, in the end, only crushed by subterfuge. Heke's birthdate is unknown but is believed to have been around 1810. He was educated by missionaries and is said to have acquired a deep knowledge of the Scriptures, which he used in argument against the expansion of British interest in later years. He was a nephew of HONGI HIKA, another great Ngapuhi warrior, and married Hariata, a daughter of Hongi, which gave him the added mana that he needed because he was not himself of the highest rank... Heke and his fellow Ngapuhi resented the withdrawal of the seat of colonial government from Kororareka to Auckland which had resulted in an economic decline in the north. Heke focused his annoyance on the symbol of the British presence in NZ – the Union Jack. On 8 July 1844, after praying to both the Christian and Maori gods, he led a war party to... cut down the flagpole. Heke claimed that the flagstaff was his property because it had been cut from the forest of his people. Troops were sent to the Bay of Islands but for several months there was no further trouble. Twice in January 1845 Heke led a party to cut down the new flagpole. It was re-erected, a blockhouse built and garrisoned with soldiers and sailors from the *Hazard* and £100 was offered as a reward for Heke's capture. Two months later he attacked the blockhouse, ejected the garrison and the whole town of Kororareka was emptied in a panic. The European settlers went to Auckland and claimed that Heke, reinforced by another chief, Kawiti, planned to attack the new capital. The exact details of what followed are somewhat confused, but it seems that Heke and Kawiti built a pa at Okaihau, expecting a retaliatory strike by British soldiers and the settlers. In May about 800 fighting men, half of them troops and sailors and half friendly Maoris, arrived and attacked the pa. They failed. Then Heke charged out of the pa and attacked the friendlies. He was wounded and retired to establish himself at Ohaeawai. By the middle of June, 630 professional British soldiers and marines with artillery were assembled at Waimate, together with a strong force of friendly Maoris. They attacked Heke's pa with its 250 men, all armed with guns, on 24 June. By 3 July Heke was still holding out and had, in fact, made one rapid sortie against the Maoris fighting with the British, had captured a Union Jack, and several British staff officers narrowly escaped death. On 3 July, Heke announced a truce to enable the British to carry off their dead (44) and wounded (66). On 10 July, it was found Heke had evacuated the pa. George GREY arrived for his first term as Governor at the end of 1845 and immediately went north to control the Heke rebellion which had abated. The Maori leader had gone back to his pa to plant crops to ensure he would be well supplied during the following winter. He was held in his pa by a feint attack, while the British forces with nine big guns were marshalled before Kawiti's pa at Ruapekapeka. The British force consisted of 1173 soldiers and sailors and 450 Maori allies. On 2 January 1846 Kawiti attacked from the pa but was driven back and on 10 January the artillery made two small breaches in the palisade. It was, ironically, Christianity, which the pakehas had brought to the Maoris, that was the Maori downfall. The 11th January was a Sunday; Kawiti retired to the back of the pa to rest and Heke's reinforcements were in the bush close at hand holding a religious service; British scouts discovered what was happening and quietly took possession of the pa with minimal resistance... and forced Kawiti to flee... This ruse which brought about Heke's defeat consequently diminished his mana, and although he remained an intractable dissident, he made no further attempt at revolt... [T]hese disturbances... were followed by other outbreaks of violence in the Hutt Valley and at Wanganui. But in 1860-61 there was a more serious confrontation between Maoris and British troops in Taranaki, where government attempts to force a purchase of land at Waitara provoked Maori anger... [Sir Duncan Alexander Cameron] was a British professional soldier[who had] served in the Crimean War and came to NZ in 1861 as a Major-General to command the Imperial forces against the Maoris in the Land Wars... He fought in the Waikato and in Taranaki but later came to disapprove of the war which he believed was being deliberately waged for the benefit of land-hungry settlers. Consequently, in 1865, he resigned and returned to England... [Cameron is best-remembered for 'bypassing Paterangi Pa where the Kingites were offering battle, instead taking the town of Rangiaowhia by surprise (women and children – who had been sent there for safety on Cameron's suggestion – were among the dead'), and his attack on] GATE PA...

When the Government sent troops to the Tauranga district in January 1864, the Ngai-te-Rangi built a series of fortifications to withstand the expected attack. As soon as Waoku, the strongest of these, had been completed, [the Ngai-te-Rangi chief] Rawiri Tuaia sent General Cameron... a letter announcing the fact and adding that his people had built a road up to it from the harbour – a distance of 10 miles – “so that the soldiers would not be too weary to fight” when they arrived. When it became apparent that this challenge would not be accepted, the Ngai-te-Rangi decided to move to a position nearer Tauranga. In April 1864 they occupied a strong position on the Pukehinahina ridge about 2 miles from Tauranga. The site chosen was at a gate in the boundary fence between European and native land and, from this circumstance, it has come to be called “Gate Pa”... [Today the road which passes beside the site of the pa is named after Cameron. His] force comprised a Naval Brigade from the *Esk*, *Miranda*, and *Falcon*; elements of the royal Artillery 43rd and 68th Regiments; and a movable column... drawn from the 12th, 14th, 40th and 65th Regiments, making 1695 officers and men in all. [This force ‘outnumbered the Maori defenders by eight-to-one.’] On the evening of 28 April, in order to cut off the Maoris' possible line of retreat, Cameron dispatched the 68th Regiment, under Colonel Greer, to occupy the narrow neck of land between two swamps, in the rear of the pa. At daybreak on 29 April Cameron began shelling the pa and, by 4 p.m., had opened a breach in the defence works. He mounted a strong assault through this breach, but his men were repulsed with heavy losses. As it was too late in the day to consider a further assault, Cameron decided to renew the engagement the following morning. During the night, however, small parties of Maoris, taking their wounded [and ‘about 100 guns from the killed and wounded British soldiers’] with them, slipped through Colonel Greer's lines to safety. British casualties in the engagement were 111 killed and wounded while the Maoris lost 25 killed and an unknown number wounded. The significance of the Gate Pa engagement was that it was the scene of the strongest artillery barrage mounted during the Maori Wars.

The British had ‘17 cannons, including one of the largest used anywhere in the world during the 19th century, and each fired about 100 rounds’ – a barrage which is said to have been ‘greater per square metre than any piece of ground at the Western Front during WWI.’ Another *significance of the Gate Pa engagement* was that ‘Cameron became convinced of the futility in attacking such fortifications’ – many of which were based on the model of a Kawiti-designed pa that was ‘circulated among other Maori tribes (a second model was taken on a tour of Britain’).

The Far North Maori tribes had ‘expected to run their own affairs with the colonial government looking after European affairs – but the English thought differently.’ Hone Heke had on numerous occasions informed the British that ‘God gave this land to the Maori’ and warned them against taking more land than had been allocated. However, other Maoris were opposed to Heke because they feared that ‘the British (and their trade) would be scared away.’ The first time the British (and their Maori allies – kupapa) marched against Heke and Kawiti they were forced to ‘retreat after the two Maori leaders split their warriors and used guerrilla tactics to attack the front and rear of the column.’ A primary concern for all Maoris was that the British had artillery and other modern weapons (e.g., ‘rocket guns’). A standard pa and open field was no match for such weaponry. This led Kawiti (a ‘veteran of the gun wars’) to

design and build a new type of pa – Ohaeawai. This pa is described as being the site where ‘modern trench warfare was invented’, due to its having ‘the world’s first anti-artillery bunkers.’ The British were able to hold positions on hills overlooking the pa and ‘pounded it for days’, but when their leader Lt Col Despard decided (‘against the advice of his officers and the local kupapa chief Waka Nene’) it was safe to launch an attack on the pa – after assuming that few defenders would have survived the bombardment – his force suffered a large number of casualties. Not only had the pa’s trenches and bunkers protected the inhabitants, but it had two defensive walls. The flimsy and undefended outer palisade was designed to ‘slow down and entangle the British advance long enough for the defenders to shoot and reload before the attackers reached the second wall – made of rocks and through which the British could see nothing but gun barrels.’ The pa was also designed to enable the defenders to slip in and out unnoticed – which is how they *evacuated the pa*. In order to attack the pa at Ruapekapeka with artillery, the British had to ‘cut their way through the bush at a rate of 1km per day.’ Kawiti is believed to have ‘known that the British wouldn’t honour the Sabbath, because they hadn’t in the past’. The Maoris had, apparently, ‘planned to allow the British to enter the pa then chase the defenders into the bush, where Heke’s warriors were waiting, but, after leaving the pa, some of the defending warriors became worried that Kawiti was still inside and attempted to rescue him – thus spoiling the ambush and resulting in both sides gaining a similar number of casualties.’ ‘Kawiti requested peace in a letter. Both chiefs were eventually granted a free pardon.’

KIWI BATTLEFIELDS IF you’ve been blaming the education system for your ignorance of the wars which raged in N[Z] in the middle of last century, you’re about to run out of excuses. Lots of us know more about America’s civil war, for example, than the warfare which erupted between Maori and Pakeha, between a small tribal people and the world’s greatest empire, but here comes your chance to right that embarrassing imbalance. TV One’s *The New Zealand Wars*, a five-part series written and presented by [an Auckland University] historian... details that 30-year struggle for British sovereignty over mana Maori... While there are no re-enactments of battles in the \$1.3 million series, paintings, photographs, animations and – most importantly – [the historian]’s words should deliver us a proper understanding of the bitter and bloody battles fought between our Maori and Pakeha forebears... [The series]’ director... says the... wars – which loom larger for many Maori than for most Pakeha – were a particularly sensitive subject to tackle. “For every tribe, they view these histories in particular as being tapu and very special and certainly not something one trifles with... particularly with respects to going to certain areas where there may have been events of import or... perhaps massacre.” ...There remains within Maoridom special sensitivity over kupapa... But there are little ways – probably more noticeable to Maori than others – that allow the story of kupapa to be told without demeaning the mana of a particular tribe... • The[first of the] five episodes... is...: The War that Britain Lost...

HERE’S [the Auckland University historian] again, waving his arms in a paddock. It was on this spot, he tells the camera, that the British were alleged to have won a great military victory over the Maori. Actually, it was a great Maori victory/a pyrrhic British victory/a draw/a British fraud. [The]Professor cleaves the air with his hand, happily butchering another national myth. A bloody business, this, and all done on national television: no wonder it has caused trouble. *The New Zealand Wars* provokes questions in living rooms everywhere. How dare he say Maori women sold sex in exchange for muskets? How dare he talk about our British ancestors like this? Were Maori really that clever? Were the British really that dumb? Above all: can [the professor] open his mouth without biffing his arms about? The Auckland University historian, though jet-lagged after speaking at an academic conference in Britain, is not short of answers. Letters to the editor complain that he portrays the Maori as noble non-savages and military geniuses, the British as bigots, cowards, and nincompoops. His reply is dry. “If you’re looking for something to make pakeha look good... the N[Z] Wars aren’t a great pick. The fact is, as a Maori leader said, it wasn’t the Maori who went over there... It’s a hard fact of history that it tended to be the pakeha who did the invading. But... I don’t think it overstates the pakeha crimes, and it certainly mentions Maori ones as well.” [The professor]’s description of Te Kooti’s attack on Matawhero, for instance, describes the appalling slaughter of defenceless settlers, including women and children. It was butchery, he says: “That’s how I saw it and that’s how I called it. Sometimes that suits pakeha, sometimes it suits Maori.” Maori heroism and British cowardice? In some ways, he says, you find more raw courage on the British side. It was the British soldiers, typically, who had to cross the deadly no-man’s land in front of the Maori fighting pa. They were “assaulting into massed volleys” of musket-fire. The modern pa, with its carefully concealed trenches and bunkers, proved a formidable weapon against the British. The trenches launched deadly fire upon the attackers; the bunkers inside the pa sheltered Maori from the rain of artillery fire; and hidden escape routes enabled tactical retreat. “The whole characteristic of the Maori warfare that I’ve tried to portray is not so much that it was heroic – although sometimes it was – but that it was clever and determined... In a sense, you know, the Maori took the less heroic option of seeking to win battles.” But it is true, he says, that “we’ve got a David and Goliath story here. The British Empire was a lot bigger than the Maori people. That’s a hard fact of history.” British stupidity? “It’s not me who said the British commanders were fools... It’s... the people who write letters to the editor [complaining about the series].” Pakeha settlers scorned the top brass. In the early 1860s, [a prominent settler] said: “There does not seem to be an ounce of brains among the officers. The utter incapacity and monstrous stupidity of almost all at the head of affairs becomes daily clearer.” ...In fact, says [the] Professor... the British commanders were “good – but not quite as good as the Maori”. It is this that provides one of the paradoxes of the series. The viewer is shown a series of battles and typically told that the claimed British victories were no such thing. So how come, splutters the pakeha viewer, we won the war? Or is [the] Professor... telling us we didn’t? His reply, given in the series, is: of course the pakeha won, “but it was not a knockout. It was a narrow victory on points... the remarkable thing about the... wars was not the eventual Maori defeat, but the degree of their success along the way.” The pakeha victory was not because of superior military brain-power or greater weaponry: “In the final analysis the pakeha won because of their overwhelming numbers.” If this upsets pakeha preconceptions of our history, [the] Professor... has also upset some Maori versions of the past. He hopes to rehabilitate, at least to some degree, the kupapa – ...who are still reviled by some Maori today. “I’ve become aware that the role of the kupapa is within some tribes a major obstacle standing between Maori and their history. Actually, these people in their own terms were anything but traitors,”... The Te Arawa kupapa, who proved devastatingly effective against Te Kooti’s troops, did not see themselves as fighting for the Government. “As far as they were concerned... the Government was fighting for them.” For kupapa, in a sense, the pakeha were just useful troops in their struggle against old tribal foes. Academic historians, unlike the ordinary viewers, have said little in public about... [the] show... A hard lesson for academics [is that] books reach only a minority; for many, it’s real only if it is on TV. N[Z]ers, says the] Professor... know little about their history, and what they do know tends to be shut away from their real lives, as in a glass case. On television, [the] Professor... tried to break the glass and put history on the street... The surprisingly high ratings for a show “with a professor throwing his arms around in a paddock,”... suggests that he has got the point across. N[Z] history, in turn, can throw a light on world history. [The]Professor... has claimed, controversially, that the Maori invented modern trench warfare. Critics, who point to the trenches dug around Roman camps and other soldiers’ holes in the ground, miss the point, he says. Modern trench warfare means being “based on interactive trenches, firing trenches and anti-artillery bunkers, as exemplified in the Western Front of 1915 to 1918”. British generals, says [the] Professor... forgot the lessons in trench warfare they should have learned in N[Z]. General Cameron... was later governor of Sandhurst, where British army officers were trained. He trained the generals who fought W[W1. NZ]... showed him that “it’s basically no use launching assaults against fully completed modern trench systems... [I]f you’d looked at the history of the assault on the Gate Pa... for example, you wouldn’t have attacked in the Somme.”

...Why do we take such little notice of history? Remember “Kaore e mau te rongu ake ake!” (“We will never surrender, never!”) the legendary cry of Rewi Maniapoto? Where and when was that? Bet you don’t know. Same day, same place, the British soldiers asked that the Maori women and children be allowed to leave the pa and a woman stood up and shouted back: “Ki te mate nga tane, me mate ano nga wahine me nga tamariki” (“If

the men die the women and children die also”). Have you heard of Ruapekapeka? ...Where is Gabriel’s Gully, and who was Gabriel Read...? These are names and events that have left their mark on our map as well as our history and which could enrich our sense of identity and, more materially, our tourism industry if only they were exploited. The U[S] as a national entity is less than 70 years older than we are if you match their War of Independence and Constitutional Convention with our Treaty of Waitangi, but their sense of historical identity is light years ahead of ours. Each summer, millions of Americans and foreign tourists visit their heritage sites... and the many museums and battlefields (Yorktown, Gettysburg, and others) around the country... This is an industry – and I mean industry – that not only heightens the sense of America’s national roots and feeds its modern identity but employs thousands of people and contributes enormously to the domestic economy... Many of the most precious heritage sites that milestone our history and our emerging identity are only vaguely acknowledged or totally ignored... The demand is there. Books on local history sell, per capita, better than anywhere else in the world, and [the recent] television series on the New Zealand Wars scored high ratings... So let’s imagine a reconstruction of Orakau Pa near Te Awamutu... from where Rewi Maniapoto defied General Cameron’s troops back in April 1864. And Ruapekapeka – close to other major tourist attractions in the Bay of Islands – a battlefield that interests historians around the world, reflecting as it did the genius for military engineering of the great fighting chief, Kawiti. Military experts have visited the remains of the pa, examined drawings of the fortifications and noted the extraordinary use of dugouts and trenches, the first in the world known to be used in warfare and grimly prophetic of what was to come in... W[W]I. Was Ruapekapeka taken by the British because the newly Christian Maori left it to attend Sunday service...? Or is that unsupportable myth? A great story, anyway. These and many other heritage sites lie mouldering in the countryside, trampled under the dilatory feet of apathy and ignorance... We are making the same mistake nationally we make individually when we omit to note the stories of grandparents, great aunts and uncles and even parents – and regret it so deeply after they’re gone... [Incidentally, *The New Zealand Wars*] series was first conceived... back in 1993, soon after [its] producer saw a documentary on – you guessed it – the American civil war.

In the American Civil War, field fortifications emerged as an essential of warfare, with both sides employing entrenchments to an extent never seen before... Field mines and booby traps were used... and trench mortars were developed to lob shells into opposing trenches... Two notable sieges, that of Vicksburg, Miss., in the west, and Petersburg, Va., in the east, were characterized by the construction of... continuous trench lines that foreshadowed those of W[W]I. In the Cold Harbor, Va., campaign, when General Ulysses S. Grant sent his troops against Confederate earthworks, he lost 14,000 men in 13 days... Petersburg, an important rail centre 23 miles... south of Richmond, was a strategic point for the defence of the Confederate capital. In June 1864 the Union army began a siege of the two cities, with both sides rapidly constructing fortifications 35 miles... long... By year’s end... General Robert E. Lee still held Richmond and Petersburg. But mostly due to mismanagement and inefficiency, Southern railroads had broken down or been destroyed. Thus the Confederates were ill-fed to the point of physical exhaustion, and the lack of draft animals and cavalry mounts nearly immobilized the troops. Hunger, exposure, and the apparent hopelessness of further resistance led to increasing desertion, especially among recent conscripts... After Lee’s plan to join with General Joseph E. Johnston was thwarted, he surrendered to General Grant on April 9... 1865... The lesson taught by accurate, long-range fire from entrenched positions in the American Civil War was lost on European commanders. Even the bitter experiences of appalling losses in the Crimean, Franco-German, and Boer wars failed to lessen an ardour for the theory of the offensive that was so fervent... in the field. Few took notice of the immense casualties the Turks inflicted[at Gallipoli]...

Trench warfare is resorted to when... superior firepower... compels the... defence... to “dig in” so extensively as to sacrifice... mobility in order to gain protection. A trench system may begin simply as a collection of foxholes hastily dug by troops using their entrenching tools. These holes may subsequently be deepened so that a soldier can safely stand up in one of them, and the individual foxholes may be connected by shallow crawl trenches. From this beginning a system of more permanent trenches may be constructed. In making a trench, soil from the excavation is used to create raised parapets running both in front of and behind the trench. Within the trench are firing positions along a raised forward step called a fire step, and duckboards are placed on the often muddy bottom of the trench to provide secure footing. The tactical ancestor of modern trench warfare was the system of progressively extended trenches developed by the French military engineer Sebastien Le Prestre de Vauban for the attack of fortresses in the 17th century. Trenches remained merely a part of siegecraft until the increasing firepower of small arms and cannon compelled both sides to make use of trenches in the American Civil War (1861-65). The trench lines of the Petersburg-Richmond theatre of operations in the final months of that war were the foremost example of trench warfare in the 19th century. Trench warfare reached its highest development on the Western Front during W[W]I... when armies of millions of men faced each other in a line of trenches extending from the Belgian coast through north-eastern France to Switzerland. These trenches arose within the first few months of the war’s outbreak, after the great offensives launched by Germany and France had shattered against the deadly, withering fire of the machine gun and the rapid-firing artillery piece. The sheer quantity of bullets and shells flying through the air in the battle conditions of that war compelled soldiers to burrow into the soil to obtain shelter and survive. The typical trench system in W[W]I consisted of a series of two... or more trench lines... Each trench was dug in a type of zig-zag so that no enemy, standing at one end, could fire for more than a few yards down its length. Each of the main lines of trenches was connected to each other and to the rear by a series of communications trenches that were dug roughly perpendicular to them. Food, ammunition, fresh troops, mail, and orders were delivered through these trenches. The intricate network... contained command posts, forward supply dumps, first-aid stations, kitchens and latrines. Most importantly, it had machine-gun emplacements to defend against assault, and it had dugouts deep enough to shelter large numbers of defending troops during an enemy bombardment... The defenders’ artillery was posted to the rear of the main line of trenches. Each main line of trenches was fronted by fields of barbed wire intended to slow down and entangle attacking infantry. As W[W]I progressed, both sides, but particularly the Germans, developed trench systems... [with] greater depth and strength in order to ensure that the enemy could not achieve a breakthrough at any particular point... By 1918 the Germans had constructed some trench systems that had a depth of 14 miles... Throughout most of W[W]I, the opposing armies... tried to break through the enemy’s trench system by mounting infantry assaults preceded by intense artillery bombardments of the defending trenches. These attacks usually failed, partly because the preliminary bombardment alerted the defenders to the imminence of an attack, thus allowing them time to bring up reserves for a counterattack, and because the bombardments themselves turned the “no-man’s-land” between the opposing sides into rough, shell-pocked terrain that slowed down the attacking infantry. The crucial elements in attacking a trench system, surprise and overwhelming numbers of infantry, were thus almost impossible to attain. The Allies’ increased use of the tank in 1918 marked the beginning of the end of trench warfare... since the tank was invulnerable to the machine gun and rifle fire that were the trenches’ ultimate defence. Relatively little use was made of trenches in the mobile warfare of W[W]II... Classic trench warfare did, however, reappear in the Iran-Iraq War... in which such mobile weapons as tanks and aircraft were in short supply.

US and other non-NZ historians may be correct in stating that *the trench lines of the Petersburg-Richmond theatre of operations in the final months of that war were the foremost example of trench warfare in the 19th century*; or that entrenchments were used during America’s Civil War *to an extent never seen before*. At 35 miles long they certainly were more EXTENSIVE than Maori trench systems! However, one system of three connected pas constructed in 1863 south of Rangiriri in the Waikato has been described as ‘more sophisticated than anything developed during the American Civil War’ – and, because of an indiscrete act by its architect, another Maori military engineering ‘masterpiece’ was never tested.

TITOKOWARU... was a famous Maori guerilla warfare leader... a member of the Ngati Ruahine tribe... reputed to have lost his right eye fighting in a HAUHAU war party in 1864. The victories which made him famous were at his pa, Te Ngutu o te Manu, deep in the forest near Hawera; and at Moturoa. On both occasions, in 1868, he inflicted heavy defeats on government forces. The Prussian mercenary... VON TEMPSKY, was killed during the attack on [his pa]. Titokowaru's mana declined as he grew older, according to one claim, because of an illicit relationship with another chief's wife... In his later years he was associated with the pacifist, TE WHITI, often leading demonstrations of passive resistance.

Another Titokowaru pa was 'abandoned the night before battle because his followers believed his loss of mana might bring him bad luck.' After inspecting the pa, the 'veteran British officer who led a Colonial Army against it decided that an attack was unlikely to have been successful.'

One reason for the general lack of recognition afforded to Maori military engineering might be due to the world's greater interest in what was occurring in America during the early 1860s than on the other side of the Pacific. Another reason could be the British habit of exaggerating their feats after taking pas (even abandoned ones) – although this behaviour is understandable if the possible reaction around the world to news that the might of Britain's military was struggling to defeat a *small tribal people* is taken into consideration! Whenever the British succeeded at defeating Maoris it was usually due to superior numbers or the assistance of *kupapa*. To add to their embarrassment, British forces were made up of professional or 'full-time soldiers whereas the Maoris were part-timers' – who still had to look after crops and other 'economic activities necessary for the survival of their families.' This was a problem for individual villages but when tribes united under the Maori King Movement used a series of pas to effectively lay siege to the European settlement of New Plymouth, 'groups of about 150 warriors would spend a while at the front then, as each group returned from action in order to plant crops and gather other supplies, they would be replaced by another group.' In his attempts to dislodge the pas, the commander of British forces in New Plymouth used de Vauban's method of trench warfare known as 'slow sapping (digging deep trenches up to the palisades of a fort which were then breached with explosives)'. However, his methods were largely ineffective because 'the British would return to their trenches each morning to find the Maoris had filled them back in, and as each sap trench neared a pa the Maoris would simply abandon it for another.'

The final engagement of the New Zealand Wars took place at Mangaone, south of Waikaremoana on the East Coast of the North Island[during February 1872]. Arawa troops loyal to the government fired on the retreating forces of Te Kooti whose rebellion against the government had started when he was wrongfully arrested and deported to the Chatham Islands in 1865.

Although *the final engagement of the New Zealand Wars took place* in 1872, the final 'shooting in the NZ Wars occurred during 1916 when the last Maori stronghold was attacked by armed police – an act that united the Maori tribes and split the settlers off from England.'

Police and descendants of one of the[20th] century's most controversial Maori leaders, Rua Kenana, are secretly negotiating an "acknowledgment" that the Crown was wrong when it jailed him in 1916. Kenana, a Tuhoe prophet born in the Ureweras, was sentenced to 12 months' hard labour and 18 months' reformative treatment after he was convicted of treason, sly-grogging and resisting arrest. Now, [over 80] years later, a representative of Kenana's family... has confirmed that the gunpoint arrest – in which Kenana's son was killed and his daughter raped – is being scrutinised... The N[Z] Herald understands that the Kenana affair is one of several Maori grievances standing in the way of a bid by police nationwide to put bad relations behind them... But the issue does not have unanimous support among all Tuhoe people. A prominent member of the tribe... said an acknowledgment would be lip-service only and would come too late. As a result of visions, Kenana preached a Maori millennium – everlasting life for Maori who would follow him – and eventual removal of Europeans from N[Z]. As a prophet, Kenana believed he was the brother of Jesus Christ and the leader who another Maori rebel, Te Kooti, had prophesied would arise to succeed him as the head of the Ringatu Church. From 1905, Kenana began to carve a "new Jerusalem" out of the rugged bush of Maungapohatu. Within three years, he had attracted more than 1000 Tuhoe, Ngati Awa and Whakatohea followers. His community and preachings were regarded with distaste and suspicion by European and Maori leaders... He identified the Maori people with the Israelites [– 'declaring himself a messiah and his people a lost tribe of Israel' –]and interpreted Scripture accordingly. Pressure was brought to bear on officials when it was discovered that Kenana was supplying alcohol to his followers... – he claimed alcohol enhanced his spiritual visions. When he refused to appear in court, police were sent to arrest him. Kenana, believing he was being persecuted, refused to accompany the officers. He made provocative remarks about the Germans winning the war in which N[Z] was engaged, and a charge of treason was added. It all came to a head in April 1916 when a force of 70 armed men converged on Maungapohatu to arrest the prophet. In the confusion, shots were fired from both sides. When the shooting ended... two of Kenana's followers... were dead and three wounded. Four policemen were injured. Kenana's descendants saw the death of his son and rape of his daughter as far more serious than the charges against the prophet. The trial at the time was the longest in N[Z]'s history. Kenana never recovered from the loss of mana after his arrest and his community disintegrated. [But] Kenana continued to lead a smaller group of "Iharaia" (Israelites) until his death... in 1937.

During W[WI, Maori] tribal and religious leaders, such as... Rua Kenana... urged neutrality on their followers. [But]Pakeha-educated leaders... were eager for Maoris to go to war to show they were as capable as Europeans. Contingents of Maori Pioneers left for Egypt in Feb and Sept, 1915 and Feb, 1916. Then the Pakeha-oriented leaders were successful in arguing that Maoris should not be restricted to garrison duties and on June 26, 1917, Maoris became liable for conscription[– which Kenana 'told his people to defy']. A fighting unit was formed, known from Oct, 1917, as the Maori Battalion... [On Oct 9, 1939, r]ecruiting began for 28 (Maori) Battalion. Enlistment for Maoris was voluntary throughout W[WI]II.

The story of the Maori Pioneer battalion is seldom told. No oral recorded history exists and written material is also scarce. It wasn't until the early 1990s that a piece of the battalion's history was recalled, following the discovery of an old flag in storage... Unfortunately, none of the original battalion's 2227 members were alive to see the flag restored and presented to veterans of its military successor, the 28th Maori Battalion, in 1993... The battalion was formed midway through W[WI] to provide for the large number of Maori wanting to serve overseas. Support for the idea was initially low among N[Z]ers of European ancestry and the Government also dismissed the idea, saying Maori had no role to play in a war between two white races. It revoked the ruling after learning that Indian and Algerian troops were fighting the Germans in France. Officially, the battalion was regarded as a labour force... – digging trenches, laying railway lines, repairing roads and dragging heavy equipment... through waist deep mud and battlefield carnage[–]...and was not issued with firearms. Unofficially, its members picked up weapons dropped in the heat of battle... [– a]rchival evidence suggests some carried concealed Mausers or Luger pistols taken from German corpses... [–] and joined their European counterparts during assaults on enemy lines... "Few people probably realised the bravery... the battalion showed when they were sent to the front line armed only with shovels... That same bravery was passed down to a second generation of Maori fighting with the 28th Battalion in W[WI]II."

...Family and... veterans of the 28 Maori Battalion are experiencing mixed emotions as they visit the Italian sites where many comrades were killed during... W[WI]II. The 150-strong group, on a 19-day tour to lay to rest the spirits of relatives and friends, spent Sunday in Cassino, with the hardest stop being the railway station. There, B Company suffered the greatest losses when wounded soldiers, waiting to be evacuated, died... "The

officers and men who died... were the lost generation of future leaders....” said[a] 73-year-old veteran... [who believes that] the Cassino cemetery, where many Maori Battalion members were buried, was an appropriate resting place.

...For God, King and country... Maoridom is still paying the ultimate price for N[Z] citizenship after an entire generation of young leaders perished on foreign soil more than five decades ago. *He Rau Aroha*... traced the spiritual pilgrimage to Italy of veterans from the legendary 28th Maori Battalion... Alongside the epic stories of bravery and heroism was the appalling casualty rate in Africa and Italy with 70[% of the]... 3600-strong battalion... either killed or seriously wounded. C Company (or the Cowboys as they were known) contributed the largest number of soldiers from six major East Coast tribes – and suffered the greatest losses... Highlights... [of t]he hour-long documentary... included an audience with[the] Pope... mayoral welcomes and tributes from Italian war veterans and citizens who were freed from Fascism and Nazism. Lest we forget, this documentary reminded us that these ageing warriors had never been treated so well in their own homeland.

An oral and pictorial history of... the Maori Battalion will feature at a national conference in A[US] this week... The... project was for the Maori ancestors who paid the ultimate price of citizenship in N[Z]... Within the collection is a letter written by a young German... *“Mother, I am still alive, which I do not hope to stay another day. We are having a real hard time and are feeling the strain... They are always throwing something at us and... mortar is going all day. We are told how safe we are, but there is always ‘but’... We are once again confronted by the masters of close quarter combat, the dreaded Maori of the N[Z] division. Warriors all and feared fighters... [W]hy do they fight? How were they ever led to oppose us? Millions more questions, but duty calls. A longer letter next time maybe, I am sleeping with my Bible.”* No one knows what happened to the German soldier.

...For Kiwis in the N[Z] Second Division slogging up Italy during W[W]II, Christmas, 1943, was a time to forget... [413] lay dead and over 1000 wounded from the recent Orsogna and Sangro battle, and progress had been blunted by the Germans’ 88 anti-tank gun... and... tanks... The pressure became so intense that for what appears the only time in action in this war, Kiwi soldiers refused to go into battle... They had been at the forefront of the Eighth Army which had smashed Rommel’s Afrika Korps. Now Italy had surrendered, Rome beckoned and Italian wine was so plentiful that some had filled a water truck with it... [T]he Kiwis had a brigade of spanking new Sherman tanks, fighter bombers in support and high expectations... But the Germans, fighting near the fatherland, got increasingly tenacious. Under Field Marshal Albert Kesselring[– ‘convicted as a war criminal in 1946 and sentenced to life imprisonment until being paroled in 1952’ –] they had the dubious distinction of pioneering antipersonnel land mines and booby-trapped buildings. They also shot civilians after forcing them to build defences. Orsogna was a small, well defended ridgetop town. The Kiwis, under Lieutenant General Freyberg, began attacking it on December 3. At first they pushed the Germans back. One Kiwi intelligence officer... recalled... [having] to follow a heart-wrenching order to get Kiwi artillery to fire on its own men – the few minutes delay gave them time to hastily withdraw. The Germans were “literally obliterated,”... But such short victories were not to last. Kesselring had brought in fresh but battle hardened reinforcements, 334 Division from the Russian front and elite paratroopers who had beaten the Kiwis on Crete. The fighter bombers did not live up to Brigadier Howard Kippenberger’s expectations and many Kiwi tanks were destroyed by hidden 88s or bazookas, especially when advancing single file... 5 Brigade had another go on December 15, and yet another on December 24. This day was long... and particularly sad in 5 Brigade’s history. All but four men in one platoon in 21 Battalion had refused to fight... [A]t their court martial, some of the men claimed to have merely overslept, others were “more candid”. They were convicted, receiving sentences of two years jail. Later these were suspended and the men transferred to other regiments to fight again... The battalion’s commander... was heart-broken and probably blamed himself too much... There was one bright note. “On Christmas morning we were startled to hear church bells ringing in that smitten little town,”... A surprise perhaps, to realise that the other side also apparently believed in the same God, or at least lived among the symbols of Christianity. [■ ‘In the history of Christmases, few events have been as remarkable as the Christmas Truce of 1914 – when thousands of British, French and German troops in the trenches of the Western Front spontaneously stopped fighting and met in no man’s land to engage in acts of celebration and friendship.’]

...So good was the late Major-General Sir Howard Kippenberger’s 1949 memoir, *Infantry Brigadier*, now translated into seven languages, that its seeming to tell all may be assumed to have discouraged any would-be biographer. [But n]early 40 years on... the N[Z] Army’s Military Studies Institute[director] has written... a biography which demonstrates benefits deriving from waiting... for documents to be freed and for death to eliminate legal risks. Published for the first time is an A[US]n corps allegation that, at Pinios Gorge in Greece, in 1941, 21 (Auckland) Battalion “tended to panic” and the... commander was in a “blue funk.” (Of 19 Battalion, Kipp... wrote in a private document of “the dreadful sight of N[Z] troops running in panic at Galatos.”) ...In the disastrous battle at Ruweisat Ridge, acting divisional commander “Whisky Bill” Inglis disappeared for the whole of July 15, 1942. Where Freyberg would have been leading his troops from the front the movements of his stand-in “remain a mystery.” Inglis had “a serious drinking problem,” the book states. In the official histories, controlled by Kipp... such episodes are white-washed.

...HOLDING, as I do, the curious theory that for most N[Z]ers, the world began on January 1, 1946, I am loathe to lift the screen and penetrate into the Dark Ages which were W[W]II. Yet a challenging biography on one of N[Z]’s greatest soldiers, Major-General Sir Howard Kippenberger, cannot be ignored. It is possible to recall that in 1946, most N[Z]ers were persuaded that the 2nd NZ Division which had fought in Greece, Crete, the Western Desert and Italy had unquestionably been the finest of the Allied forces to face Hitler’s armies; and it is therefore challenging to our national esteem to learn... that the Kiwis were not flawless and that, in fact, both “Kipp” and the legendary commander of the division, Bernard Freyberg, VC, between them committed many errors of judgement. The assertion of the biographer... – a Kiwi who served for seven years in the A[US]n Army before becoming the director of the N[Z] Army’s Military Studies Institute at Waiouru – that Kippenberger was at fault in not firing the commander of the 23rd Battalion, Lt-Col Carl Watson, for running away from his troops during the Battle of El Mreir in 1942, ignores the fact that Watson had been awarded a Military Cross during W[W]I. Charitably, one might assume that as a middle-aged man, he had momentarily suffered that disease of war known as “having had it” – body and mind can no longer cope with the strains and demands of battle. Kipp[also] cops it for errors of judgement during the battle of Sidi Rezegh in November 1941. At one stage, he... [made the] mistake of... headed north instead of west... Kippenberger’s war came to an end when he lost both feet to a German schu-mine, a box about three inches square and one inch deep, while climbing Trocchio, a steep peak which commanded the approach to Cassino[(‘NZ’s forces had been sent to the region to assist US forces; after a USAF bombing raid proved tactically unsuccessful – it assisted the Germans – the 6th NZ Brigade and the Maori Battalion were put at the front, suffering 1600 casualties before being moved to the rear during the final advance, but the NZ flag wasn’t among those raised by the Allies after they triumphantly entered Cassino’). Kipp, who ‘was wounded and captured in November 1941, but quickly organised an escape for himself and 20 companions’, should be]... well remembered as a brilliant soldier – having told Field-Marshal Montgomery his eight points of defence, Monty immediately adopted these as his own. Somehow I feel that [the biographer], for all his diligent research, has appraised Kippenberger with the smell of peace in his nostrils. There is nothing, believe me, to compare with the smell of war... If nothing else, [the] book, which methinks carps too much, will renew the well-founded claim that a Maori Lance-Sergeant... should have been awarded the Victoria Cross for his extraordinary leadership in capturing the fortress of Takrouna, near the end of the war in Africa. It was a stupendous feat-of-arms and the reward... of a Distinguished Conduct Medal was an insult.

...Fresh research has found that a committee at the War Office in London downgraded a... Victoria Cross recommendation for... Lance-Sergeant Haane Manahi, to a Distinguished Conduct Medal. Records which may explain the reason the Victoria Cross Committee altered the recommendation have been destroyed. However, research carried out in London confirmed there was a medal-allocating system at the time. Papers

earlier revealed the recommendation... came only three weeks after Lieutenant Moananui-a-kiwa Ngarimu post-humously received the same award, which may have influenced the decision. "No other N[Z]-soldier in W[W]II to be properly and originally recommended for a VC ever had their recommendation downgraded,"... said... [a] research officer for the Manahi VC committee... The recommendation for... Manahi was signed by all senior officers in the chain of command... as well as being supported by Lieutenant-General Sir Bernard Freyberg... and Field-Marshal Bernard Montgomery. It came after... Manahi led a small band of Maori Battalion soldiers up a 300m rock outcrop in Tunisia in 1943, capturing an enemy stronghold... Manahi used his submachine gun to shoot 12 truck-loads of Italian troops, a feat which helped to secure the hilltop town. [The act was described by British Lt-General Sir Brian Horrocks as "the most gallant feat of arms I witnessed in the course of the war".] The Manahi VC committee is headed by a former commander of the Maori Battalion... and has been supported by the Associate Treasurer... who is of the same Te Arawa tribe as... Manahi. In March [the MP] provided the 1943 Army form showing the letters VC crossed out and replaced with DCM. [The MP], who once scolded his Te Arawa elders for being too polite in pressing the Government to recognise... Manahi with the award, said the new evidence justified a fresh approach by the Government and he intended seeing the P[M] to have the case considered... Manahi died in a car crash in 1986.

...[the 'PM has rejected a plea for the posthumous recognition of WW2 hero Sergeant Haane Manahi with NZ's highest medal, following a revamp of the awards system. The PM yesterday unveiled new gallantry and bravery awards replacing the British awards system but retaining the Victoria Cross as the highest award for gallantry in war and war-like situations. The civilian award of the George Cross, which can also be given to military personnel under some circumstances, will be replaced by the New Zealand Cross. The awards must still be signed off by the Queen as head of state. In a letter to the Associate Treasurer, the PM said the Queen had decided it would not be right to review the award after so many years. The MP was disappointed at the decision. "Why did we bother to go to all the trouble of setting up a NZ-based honours system, only then to find we still have to crawl back to Britain when we want to award a medal?"] Incidentally, 'this weekend the battle for Crete is commemorated. Tomorrow NZ's PM, veterans of Crete and a military honour party will gather at Maleme to remember the battle, fought at a time when the British Empire stood alone against Hitler's Germany. Early on the morning of May 20, 1941, Lieutenant-General (later Lord) Freyberg watched in awe as the sky above Crete filled with German transport aircraft. Eight days later, after ferocious fighting, the remains of Freyberg's force of NZers, AUSns and Britons began the evacuation of Crete, leaving behind more than 1700 dead and 11,379 captured, and with 2225 wounded' (NZ 'lost 634 men, had 967 wounded, and more than 2000 were taken prisoner'). '4700 Germans are also buried at Maleme cemetery' following 'the biggest parachute operation in history (and Germany's last because of the heavy losses)'. ● 'The PM will launch the book – A Unique Sort of Battle: New Zealanders Remember Crete – in Wellington on Wednesday.'

... 'Almost every year brings another book about Crete because the wound won't quite heal. Of all the battles Kiwis fought in two world wars it was the only one they perhaps could have won, and didn't. And – insofar as you could bring yourself to blame under-equipped, exhausted men – it was probably because of the NZ command's lack of focus on Maleme airfield. Gallipoli, and the slog back and forth across the face of France in WW1, were unwinnable, and so were the first encounters with the Germans in the African desert and the campaign in Greece. Some say Crete was, too, given the complete air ascendancy of the Luftwaffe, but the niggle of doubt remains. The Battle for Crete was a portentous event: the Germans lost so many men and aircraft they never again attempted an airborne invasion; and General Freyberg remained a field commander for the rest of the war, although that was to the NZ Division's advantage. The general's son spent years researching his father's life and career with the main aim of justifying his tactics in defence on the island. The question always asked was: how much did Freyberg know about the impending German invasion from the detailed intelligence available to the British Government through the Ultra code-cracking machine? And if he knew enough, was he allowed to alter the position of his troops? Wrote the general's son in his biography, published in 1991: "Lord Wavell, the British Commander-in-Chief in Egypt, told Freyberg that there was no question of allowing any redeployment at Maleme to deal with the assault that was to be launched solely from the air." And it was at Maleme that the battle for Crete was lost – at least partly because of bad communications and the flawed deployment of men. Did Lieutenant-Colonel Andrews pull back from Maleme too soon, and did Brigadier Hargest not counter-attack soon enough after the Maori Battalion and others had shown that the German defence was vulnerable? During the 1980s, Freyberg's son would allow nothing to distract him or anyone else from his obsession with righting what he saw as the unfair blame attached to his father for losing a battle that couldn't have been won anyway. Many would agree with him. From El Alamein on, the battle-hardened Kiwis were never again put at such a disastrous disadvantage in terms of air cover and artillery support as they had been early in the desert war and in Greece and Crete. The latest book sums up with: "The fact that Freyberg's strategy successfully defeated the Germans at all landing areas except Maleme is a testament both to his outstanding capabilities as a military tactician, and to the quality and determination of the troops he led." The wound won't stop suppurating for those who fought there and lost hundreds of mates. This book will prove a heart-stabbing reminder of the agonies of a great soldier and his incomparably brave men, and of how they lost so narrowly a battle that would have shown for the first time in the war that the superbly equipped Germans were vulnerable on the ground – just as the Battle of Britain pilots were proving they were beatable in the air', 'thereby frustrating Hitler's preliminary to a planned invasion of Britain.'

... 'The first shots by Allied troops in WW2 were fired not in Europe but in Wellington, says an old Army gunner. Two shells were fired towards "the enemy," an Indian ship sailing into the harbour, more than a day before Britain's declaration of war on Germany at 11 am on September 3, 1939. There were no casualties. No human casualties, that is – one of the shells made a direct hit on an outside latrine on a hill across the harbour. The gunner in the Royal NZ Artillery was part of a harbour defence crew stationed near Fort Dorset with orders to challenge any foreign ship coming into the harbour. "We were on duty at six o'clock in the morning when the siren went off and we ran to our gun. We could see there was a ship, City of Delhi, with a crew of English officers." According to the gunner, that was when things started to go wrong. The signal station radioed the ship, telling it to stop, but the captain either did not understand or ignored the instruction, and the duty artillery officer decided to "put one up the spout because nobody had said to put a blank in." When a second message was ignored, the gun crew fired – straight across the harbour. "The captain still didn't stop so we put a second one up. This time he did stop." The local court fined the ship's captain £56 for "wasting ammunition."

... 'War came to NZ waters on June 19, 1940, when the luxury liner *Niagara*, carrying gold bullion, struck a mine off Whangarei (salvage operations recovered 555 of the 590 gold ingots). On Aug 20, the *Turakina* was sunk in a fierce encounter with the German raider *Orion* 290 miles from Cape Egmont. While returning to Lyttelton from the Chatham Islands on Nov 25, the coastal trader *Holmwood* was sunk by the raider *Komet* which, together with the *Orion*, destroyed the liner *Rangitane* two days later 300 miles east of East Cape. NZ's merchant navy suffered another loss on Nov 11, 1942, when the *Awatea*, serving as a troopship, sank after being bombed off Algeria.' In related news, a 'widow says it's time her husband and the other NZers on HMS Neptune were remembered. "Every Anzac Day I put my own little wreath on the cenotaph but no one else does. It seems like the Neptune never happened." The sinking of the Neptune was NZ's worst naval disaster, with the loss of 150 NZers in the Mediterranean on December 19, 1941. One NZer cannot forget. After being torpedoed while serving on the cruiser HMS Phoebe, he and eight other NZers were drafted to the Neptune because she was supposed to be sailing for NZ. "We thought that was wonderful. Then two of us received a draft to a naval base in Alexandria. We got in a terrible panic attack because we thought we'd miss Neptune and the trip back to NZ." When they turned up at Alexandria they discovered their draft had been cancelled. They raced back to the Neptune. "There was a Royal Marine standing on guard at the jetty and the Neptune was sailing out through the entrance to the harbour. He said: 'Sorry, boys, the last tank for Malta has just left.'" Days later she hit three mines while leading a force to intercept an enemy convoy north of Libya. Three hours later she sank after hitting a fourth mine. Of 765 officers and crew, 16 escaped but only one rating survived six days of thirst and exhaustion after the sinking. Neptune was a light cruiser which, unlike her sister ships Achilles and Leander, remained in the British Royal Navy fleet' – hence her crew was mostly British.

... 'The last of 150,000 Austrian combatants captured by the Soviet Union during WWII has returned home. Weak and ill, but his eyes sparkling with joy, the 80-year-old arrived at Vienna Airport for an emotional reunion with his family, who had believed they would never see him again. A teacher from a working-class family, he joined Hitler's Army in 1940. He was posted to France and later to the Russian front. Taken prisoner by Soviet forces in 1943, he was held in a detention camp in the Russian province of Smolensk until 1950. It was there he met his second wife, a Belarussian whom he married in the forced labour camp where they were both being held. In 1950, Soviet authorities freed him from the prison camp, but refused to allow him to return to Austria, his dearest wish. Instead they gave him Soviet citizenship. ■ This time of year 'holds special significance for a 75-year-old Auschwitz survivor. The Blockhouse Bay man, who is Jewish, witnessed cannibalism, underwent medical experiments and attempted suicide as a prisoner of the Nazis. When aged 14 he was on his way home to his parents and sister when he was arrested by two men outside his Hebrew school in 1942. He never saw his parents again. He was taken from Germany to Auschwitz in Poland by train in February, 1943, and was one of a group chosen from about 10,000 prisoners by the "Angel of Death", Dr Joseph Mengele, for medical experiments in September, 1944. The prisoners were marched back to Germany to the city of Nordhausen in January, 1945. In April, 1945, the USAF mistakenly bombed their camp, Dora, which was next to a German airfield. About 2500 prisoners died.'

...a] Warrant Officer... was prepared to die on foreign soil for N[Z]; in return he expected the Army to look after him... [Having spent] most of his 19 years in the Army as an infantry training officer, [he] won a position in 1994 which was to be the peak of his career – regimental sergeant-major with the multinational force in the Sinai. However, after a medical examination he was told he was not fit for duty overseas. "I was stunned. I was running marathons and started to do triathlons..."... An investigation found that both his kidneys were working at only 40[%] of capacity and were likely to fail within two years. Instead of the usual offer of a further three, six or even 13 years in the Army[he]... was told to leave at the end of his 20-year service period. On the day he left he was offered a further six months, which he declined. But now the Government has decided that if the offer had been made in more favourable circumstances [the Warrant Officer] might have accepted the extra time. It has ordered that he be paid six months' salary as compensation, plus reasonable expenses incurred in putting his case. [The Warrant Officer] yesterday welcomed the Government's moves, but said the compensation was not enough... [By the way, NZ's territorial soldiers] are being paid... \$311.24 a week or \$47.33 a day[which is]... less than the minimum wage... The part-time soldiers are not paid overtime but can receive allowances for dependent family members and gratuities for efficient service. Members of the armed services are not covered by the employment laws that apply to other workers... [This has been] described... as an intolerable abuse of employer power... An average 4.9[%] wage rise for defence force personnel came into force on Tuesday... a long-overdue move against staff losses... It will cost \$23 million a year.

...[the Defence Force's management has] come... in for a salvo of criticism in a string of reviews carried out by the Ministry of Defence... No effective corporate management of Defence Force live-in accommodation was found. The 6837 beds in barracks on eight military bases were valued at \$142 million and cost the force \$32 million a year. It was paid \$1.4 million in rents. Staff paid as little as \$10 a week.

...Armed services staff fear rent rises may wipe out their first general pay rise in six years. The Chief of [NZ's]Defence Force... has served notice of a "modest increase" in accommodation charges throughout the three services... as a step towards market-related rents... A Defence Force spokesman... said last night that he very much doubted whether anyone's pay rise would be eaten up entirely by extra rent. While unable to rule this out absolutely before figures had been determined, he... [estimated] that most staff would still end up paying well under 50[%] of open market rents... He said the increases were not just a way of generating more revenue for the cash-strapped Defence Force, but would allow it to spend more money on accommodation subsidies for a wider range of staff. These include subsidies of about \$50 a week for private lodgings if Defence Force accommodation to which they are entitled is unavailable, although staff on their first postings[– and]... on salaries of little more than \$20,000... [–] are not yet eligible. Only about 5500 of the 9500 or so regular forces lived in military-owned quarters...

Exodus of staff deeply wounds Defence Force... For the year ending in June, 2585 regular and territorial personnel left the [NZ]forces, leaving them with 13,621 – 436 less than at the same time last year[(when 'Defence chiefs singled out up to 280 key personnel to be offered incentives of about \$7000 each to remain at their posts – at the time, an army veteran who served in Malaysia and Vietnam, said throwing \$2.1m at about 280 people in a total force of almost 10,000 was not the solution')]. It meant the recruitment process wasn't keeping pace with losses, placing an extra workload on remaining staff. Of more concern, however, was that a significant number of staff leaving were in the middle management or skill level bracket, a loss that couldn't be immediately replaced by new recruits... The Air Force is short of aircrew, technical, fire and communication staff. It is finding it difficult to recruit, retain and train sufficient personnel. Better pay and conditions are drawing aircrew to commercial aviation... The Army is 895 staff short... [and] had insufficient staff and information systems to adequately manage its operational equipment, which was likely to... become more significant as the Army bought more technologically advanced equipment... The Navy is short of 295 staff... It is increasing the use of civilians on short-term contracts... [However, the combined] losses aren't as high as in previous years. For example, in 1989-90, nearly 4000 staff left.

...We face a dilemma about defence. We are locked into some patterns – like the frigate purchases, the strike aircraft syndrome, and the U[N] peace-keeping infantry demands – which are incompatible with each other and ultimately unaffordable. As someone in the Defence Ministry told me recently, we could no doubt increase the defence budget from \$1.2 billion a year to \$2.4 b... and we still wouldn't be able to afford to buy all the things that our present forces' structure make necessary... And the structure of our forces is perversely designed to make it difficult for us to even think about these issues... At the Ministry of Defence in Wellington we have four different and highly expensive bureaucracies. You have senior service officers and senior bureaucrats, and their assorted levels of juniors, in each of these four organisations. They wear different uniforms, though many of them turn up for work in civilian clothes; they vie for assignments and promotions within their own services; they carry on with their own career plotting while they also engage in inter-service rivalries and even covert political-bureaucratic warfare. It is all unnecessary, as well as expensive... The three services should be amalgamated into a single defence force. Their ranks should be eliminated and simplified and matched with missions and responsibilities. For example, we don't need eight brigadiers when we have no brigades, or 14 colonels when we have no regiments... The tight budgets of recent years have eroded the attractiveness of defence careers. When comparatively low salaries for people in their 20s and 30s are put alongside the high salaries and perks of senior officers, and when the scheming for position of senior officers puts at risk the positive work of more junior officers, it is only to be expected that we will have a fall-out of junior and middle-ranking leadership in our forces.

...A military academy... for a programme focused on training for careers in the armed services... may open in Christchurch next year... Only seventh-form students would be allowed to enter... as students had to realise the importance of general education first... [In related news, t]he Defence Force has now moved to abandon its traditional arrangement of making all ranks retire at a particular age. While all staff may be offered the new retirement age, the shake-out is aimed at longer-serving people in the higher ranks[– which]... were "bloated with too many senior officers." Latest staff figures showed 14[%] more senior ranking officers across the three forces than in 1989... ['From 1992-5 the ratio of officers to other ranks went from 1:4.61 to 1:4.44 in the Navy, and from 1:5.08 to 1:4.32 in the Air Force, but the Army remained steady at about 1:6.'] More than 2000 people fall within the ranks targeted... Redundancy payouts of up to one year's salary will be paid to those asked to leave... The maximum annual salaries of the top band of officers range from \$78,402 to \$103,104. Annual salaries of the second tier of non-commissioned ranks range from \$41,349 to \$52,626... The forces are moving towards hiring staff on shorter, fixed-term contracts, with more performance-related promotion... "Some people may not have a position open to them for the skills they have. A more junior person with prospects for advancement may be better."

...[NZ's] defence is top-heavy – there is now more than one officer and nearly two senior NCOs for every four persons of lower rank... Regular force army battalions are commanded by lieutenant-colonels. The army has two such battalions, but has 65 lieutenant-colonels and 26 more senior

officers... The most outstanding example was in the air force, where there were seven squadrons of aircraft and a total of 176 squadron leaders and 48 wing commanders... Swollen ranks of senior officers and non-commissioned officers, some paid at a rate much higher than public servants in similar positions of responsibility, were the result of "self-serving policies"... Mid-point salaries of colonel-equivalent officers have risen 54.9% over the last eight years – compared with 22.1% for MPs... and... top brass were getting up to \$2500 in club subscriptions paid to them on top of their salaries... An A[US]n efficiency review earlier this year had called for 20% cuts in senior ranks in Canberra and similar measures were required here... [Incidentally, a]llegations of widespread criminal activities by A[US]n Navy personnel would be investigated by the Defence Department's independent Inspector-General, the Defence Personnel Minister... said yesterday. The move follows claims in last week's *Bulletin* magazine that a secret internal inquiry had found naval personnel were illegally importing drugs and weapons, and allowing the theft of millions of dollars in stores from Sydney's Garden Island dockyard. [The minister] expressed outrage that she had not been informed of the secret inquiry...

The Fiji Military Force is under police scrutiny following the discovery of... an M-16 military assault rifle... and bullets outside a Suva supermarket on Monday after four masked men had stolen \$F206,000... of weekend takings... [In local news,] Labour's police spokesman... has called for beefed-up security following revelations the defence forces have lost 24 guns... [– including] two submachine guns... and... three machine guns... [–] in the past five years... [The spokesman] said: "Every employer loses equipment... but when you are talking about a Defence Force and lethal weapons, then one expects that their security measures should be water-tight."

...A boy had all the fingers on one hand and a thumb blown off... last night... The boy, aged 9, is one of three children in Rotorua Hospital after one of several detonators they were playing with exploded. A 14-year-old girl has a metal fragment in her eye and a boy, also aged 9, has shrapnel embedded in his face, but he is not believed to be seriously injured... It is believed the children found the detonators in a shed at the rear of a suburban house... Police... said it appeared the children did not realise how lethal the detonators were and threw them around the neighbourhood.

...For a long time, at Fort Leonard Wood in Missouri, when night fell and the sergeant was away, the soldier boys and... girls did play... Co-ed training at all levels has been the rule in the [US] Army for the last three years, in the Navy since 1992 and in the Air Force since 1977. Nearly 14% of the nation's 1.4 million soldiers, sailors, airmen and Marines are female... Last week... an independent panel... issued a report recommending that the military end mixed gender barracks.

...In Maryland... yesterday... a former drill instructor... [confessed that he had] sex with 11 trainees in violation of U[S] Army rules, but he denied charges he raped eight women under his command... In most cases, he said, the sex was initiated by the women or by both... in his office, his home and at a hotel on another military base... [The] Staff Sergeant is one of 11 instructors charged with sexual misconduct at Aberdeen Proving Ground, about 50km north-east of Baltimore.

...Five female soldiers from the... Aberdeen Proving Ground said yesterday investigators had coerced them to make statements that they had been raped by higher-ranking soldiers... [They held] hands before a press conference where they recanted [their previous] statements... "They tried to make me say 'rape' and I would not do it," [one of the five] told a... representative of the National Association for the Advancement of Coloured People. [The association's] president... said... "There are possible civil rights violations... that ought to be looked at... We think that it [the investigation] borders on illegality." ...Seven instructors at the base have been charged with rape or other sexual misconduct in a scandal that erupted last year and prompted an... investigation into sexual harassment... at American military bases worldwide... Two of the seven took early discharge in lieu of court martials, while the other five await trial.

...The U[S] Army said yesterday it will court-martial... the service's top enlisted man, on sexual harassment charges brought against him by six female servicewomen. No date was immediately set for the trial at Fort Belvoir, Virginia, on 20 counts against... [the] Sergeant-Major... including adultery and indecent assault. The order followed an Army hearing of more than eight weeks during... which [the accused] vehemently denied the charges... All six accusers are white; [the accused] is black... As the Army's top enlisted soldier, [he] is a kind of ombudsman to the military Joint Chiefs of Staff on behalf of soldiers on issues including sexual harassment. He has been suspended pending the outcome of the case... Last month... the first woman to fly a nuclear bomber, was forced to resign after two affairs came to light.

...The [NZ] Navy – already facing the possibility of multiple courts martial over sexual harassment – is now dealing with a new sex scandal... The latest inquiry follows an incident involving a male sailor and two female ratings ashore from the frigate Canterbury in the Solomon Islands late last month... [O]ne of the women is understood to have been flown home in a distressed state while the Canterbury continued a tour of South Pacific states. According to the Solomon Islands police, the woman made a complaint of rape against a private security guard... The view of the... police is that the allegation involving the security guard was false... The trio had wandered from a social function before ending up in the Parliament grounds about 3 am... [T]he guard claimed he had watched the male having sex with both women and that the guard was then given the equivalent of \$NZ20 to \$25 to keep quiet about what he had seen... The Navy's head of personnel and training in Auckland... said the investigation prevented him from discussing the incident, but confirmed that [the] Canterbury... is still on patrol in the South Pacific, having in the past fortnight rescued two shipwrecked fishermen from a reef and been involved in a vice-regal tour of the Tokelaus. [He also] confirmed that he had completed a five-month investigation into allegations of sexual harassment aboard the frigate Wellington during its 1995 voyage to the Gulf [– 'the first major mission for women on an operational NZ warship']. Navy lawyers are now weighing up his findings to decide whether to charge any of the 12 sailors and officers... named by a former gunner... in complaints to the Human Rights Commission[], which has 'deemed the Chief of Defence Force liable under the Human Rights Act for the men's behaviour by not taking reasonably practicable steps to prevent the sexual harassment'... The... female gunner... complained she was regularly... grabbed by her buttocks and breasts and subjected to indecent suggestions... [C]onstant references to parts of her anatomy and what at least one sailor wanted her to do to a part of his anatomy are among the harassment claims... [When she] became a gunner she expected a battle or two – but never thought it would be against the crew of the ship she served on. She dreamed of joining the navy, in which both her father and sister have served, and made her first visit to a recruitment office at 14... She [is now] too depressed to continue her studies and was unemployed at present... She said her ordeal was not over yet because she still had to face the accused men in conciliatory talks... The Navy... is understood to have begun trying to reach conciliated settlements over some of [the gunner's] complaints but will not discuss these... [A]bout four of the defendants had left the Navy, but under the Armed Forces Discipline Act they could be recalled to face charges. The possible penalties ranged from fines to dismissal. Sexual harassment complaints by three other female sailors on the Gulf voyage were resolved after informal inquiries. The Minister of Defence... said earlier this year those complaints were dealt with "by way of apology and admonishment."

...Seven Navy staff, including commissioned officers, have been charged over complaints by a rating about sexual harassment. A further four naval staff have charges pending... Courts martial would be held at the Devonport Naval Base and... be open to the public. Each of the accused would be tried separately. ['Their lawyers expect them to all be acquitted.']

...As the [NZ] Navy charges 11 sailors with sexually harassing a female colleague, a gang rape has left the British army with a stain on its character. It stands accused of picking officers who cannot tell the difference between duty and debauchery... What has gone wrong? Are officers no longer gentlemen – if they ever were? Or does this case indicate, as a spate of sex scandals in the American military suggests, that the old codes of self-discipline have proved ineffectual as the barriers between civilian and military life – and the sexes – have been torn apart? ...The [British] incident is altogether more unpleasant. Its sub-theme has been a twist on the true story behind the American film *The Accused*: A loose-living, hard-drinking waitress, raped in a bar while customers cheered, brought her attackers to justice and established that women who seem to be inviting sexual attention have the right to say "no". A young female student, "Miss X", who worked as a barmaid, had been out with an army

officer cadet at a bank holiday fete at Shrivenham military college. Her girlfriend had come along and afterwards, with a couple of other young men, they went to the officers' mess. Drink was taken in no small amounts. Adventurously, perhaps incautiously, the women agreed to join the men in a sauna. In the steamy atmosphere, one woman and one of the men paired off and disappeared. Then the numbers game got out of control. In the young woman's account, as related in the witness box, she was left alone with six men, one of whom, to her horror, urinated on her. When she ran out in disgust to get dressed in the cadet's room, all six burst in, stripped her, raped her in turn and left her, in the words of the defence counsel, "like a piece of meat". Carnal appetite satisfied, it was time to deal with another: They went off for a kebab. Distraught and sobbing, the woman ran to a friend and later saw a doctor to get the morning-after pill. But it was six months after the alleged attack in May 1996 that she reported to the police that she had been raped. In *The Accused* the woman won. In Shrivenham she did not because the judge... doubted her reliability as a witness... [and the] scandal... ended in the acquittal of [all] six... The question of morals had been unavoidable, as the judge made abundantly clear, if only by his repeated insistence he was not taking it into account... In her own words, her sex life was "crowded". She was living with a boyfriend though their relationship was "rocky". So rocky that 10 days before the alleged rape the student also had sexual relations with one of the accused and a friend in his bed at the same time. Initially, when she made her complaint... she failed to tell police that she had slept with these two men. Nor did she initially admit she had consented to have sex with another of the accused only hours before the alleged rape. She feared, she said, that had she revealed the full background, her accusation that she was raped later by six men would not be believed... Before the six... walked free, the judge commented: "If six men think it is a good idea to have sex with one woman, then they run the risk of being accused of rape. I think that they have brought this prosecution upon themselves." The words of... one of the accused, were perhaps more telling. When he was initially questioned by police, he admitted to having urinated on Miss X in the sauna and said he had then joined the others in having sex with her. He admitted no conflict, however, between these actions and his code of honour. "I am an officer, for God's sake – integrity and all that... I would not have done anything to her if she had said anything." ...[another of the accused,] the buffoon of the gang... had had too much to drink to commit the act, but had been charged with rape because he was present and the incident had occurred in his room... Legally the men are innocent, have not a smirch on their names, nor a hole in their pockets since the judge ruled their legal costs be paid. But all have spent weeks in custody, their reputations[are now] in tatters and their army careers in grave doubt. The army is reviewing what disciplinary action it will take; the men face a military tribunal to decide whether they have brought the service into disrepute... But according to... a local... [who] worked as a waitress in the restaurant at the military college... the men at Shrivenham were not entirely to blame. They were in such a majority that some girls took advantage: "A lot of the time it is the girls' fault. There are definitely some there that go out to flaunt it and try to get as many men as possible." ...SHRIVENHAM is a little Wessex town that was until now much-loved by the Ministry of Defence. It lies... in the Vale of White Horse. This is legendary heart-of England territory where visitors hunt traces of King Alfred... - 1997

There was no regular army in Britain for many centuries. In Anglo-Saxon times every man was obliged to train to defend his country, and the name 'fyrd' (Anglo-Saxon for army) was given to the men who could be called. King Alfred (871-901) was the first monarch to mould the fyrd into an effective national force. To fight the Danes, Alfred conscripted every male from 16 to 60. The fyrd were poorly armed, their weapons varying with their social position and wealth... They fought valiantly at Hastings in 1066... but William of Normandy's use of arrows overcame them... A law made by Henry II in 1181 established that each man must have arms suited to his rank, to be decided by a jury. Reviews of arms and armour, provided by the men themselves, were held twice a year. Soldiers raised under national levies frequently served abroad, although legally they were not supposed to be liable for such duty... In 1327 Edward III limited the military duties of... the 'levies'... to their counties, except in the case of invasion... The levies left most of the fighting in the War of the Roses to the personal armies of the nobles involved, while they occupied themselves with keeping rebel Scots and Welsh in check. They could only be used by the King... In the Civil War... the levies, now called militia from the Latin word 'miles',[meaning] a soldier... clashed over whether to support Parliament or King. Bands from large cities chiefly sided with Parliament, but... [the] militia played a big part in the restoration of the monarchy in 1660... William III (1689-1702) had little faith in the half-trained militia and insisted upon a... professional army... In fact the militia, organised on a county basis by... county military officers called Lords Lieutenant... were now very efficient... After 1757 the militia was a compulsory force, chosen by ballot from men aged 18 to 45... But with the French invasion threat of 1794, two voluntary forces appeared – the yeomanry, who were really mounted farmers; and volunteer bands of riflemen... whose task it was to protect towns.

British troops were stationed in N[Z] in varying numbers from 1840 to 1870... The presence of these troops... became a problem for the British and N[Z] Governments. On the one hand, the Imperial Government was extremely critical of various aspects of the N[Z] Government's attitude towards the Maoris, especially over the matter of confiscation of land. On the other hand, differences of opinion developed over the tardy conduct of operations, for the colonists – in theory – were paying £40 per annum for an infantryman and £70 per annum for a gunner. These circumstances led to the adoption by the N[Z] Government, late in 1864, of its "self reliant" policy, the substance of which was to dispense with the services of Imperial troops and to trust... local forces and Maori auxiliaries to carry on the war... For its part, the Imperial Government welcomed the proposal, for it considered the colony with its growing population should be able to fend for itself. [The Imperial Government had also been unsuccessful in its attempt to quell Maori resistance after almost three decades, spending 'millions of £s and losing thousands of men.']From 1866 onwards the gradual withdrawal of Imperial troops commenced...

Compulsory military service has been adopted in N[Z] on a number of occasions... [since] the 1845 Ordinance... that European males should be trained to form an effective military force for the defence of lives and property within the colony. All between the ages of 18 and 60 were liable for service... though on no account could they serve beyond a certain distance from their local police station. The 1858... Ordinance... divided militiamen into three classes – the first class comprised unmarried men and widowers; the second class were married men with dependants; and the third, reserve men, were all men between 16 and 40 years of age. Whenever only a portion of the militia was required, volunteers were first called for and the balance was obtained by a ballot of the first class. Training was set at 168 hours a year, instead of 28 days as prescribed in the 1845 Ordinance... From the Maori Wars... until 1910 the volunteer system provided N[Z]'s principal means of defence... [NZ had been 'the first colony to offer troops to Britain when the South African War was imminent – although each volunteer was expected to provide his own horse, and equipment costing about £25 (the NZ public also donated about £113,000 to the war effort). Of the 6,495 NZers who served in the war, 228 died – 59 in action, 11 of wounds, 25 accidentally and 133 of disease. After the Boers surrendered on May 31, 1902, the *Times History* said of the NZers that "they were by general consent, regarded as the best mounted troops in South Africa."] After the South African War... and particularly after the granting of Dominion status in 1907, colonists began to see international affairs from an Imperial viewpoint. They realised that any dispute involving Britain also concerned her Empire and that this might necessitate N[Z] troops serving overseas. As the volunteer system appeared to have outlasted its usefulness, the Council of Defence – formed in 1907 – advised a return to compulsory enlistment "whereby the burden of service in the defence force will be more evenly distributed". For some years prior to 1908 compulsory military training had been argued in the country and public opinion had been gradually won over. This was due, principally, to vigorous propaganda campaigns undertaken by the National Defence League... The Defence Act of 1909 created... a universal obligation to be trained in: (1) Junior cadets from 12 to 14 years of age. (Abolished 1912). (2) Senior cadets from 14 to 18. (3) Territorials from 18 to 21, later extended to 25 years, when men were posted to the Reserve until they were 30. (4)

Territorials were liable to serve in N[Z] only, but could volunteer for service overseas. For administrative purposes N[Z] was divided into four military districts, each with its headquarters staff. Each district was in turn sub-divided into four areas, each staffed by Regular officers and instructors. Rigorous courses were prescribed and training was... arranged at convenient times. [‘Compulsory military training was abolished in NZ during 1972.’]

...psychology students hoping to establish a pattern of blind obedience among N[Z] soldiers admit to being foiled by Army training. Infantry soldiers used by the four Victoria University postgraduates as guinea pigs in a social psychology experiment showed an obstinate refusal to be influenced by misleading information fed to them by superior officers. The 15 junior rank soldiers from the Manawatu-based 1st Battalion, Royal N[Z] Regiment, proved harder to fool than civilians put through similar hoops. They were subjected to a strong optical illusion in which a light appeared to move in the dark... But the students admitted in the *Army News* that they had not counted on the effectiveness of night training, which taught soldiers to look to the side of a point of light to establish actual movement... An Army spokesman... said initiative and the ability to “perhaps think a bit outside normal lines” were qualities which were encouraged in the service. He hesitated to be drawn on how far this might lead down the path of insubordination... [By the way, ten] years ago, 11 servicemen and two instructors set out on a training trek. Six... would not survive the Army Adventurous Training Centre’s winter basic course. The disaster, one of this country’s worst alpine tragedies, would forever haunt the N[Z] Army Command... A military court of inquiry found that the two course instructors lacked the experience and skills to cope with... extreme conditions. It found the expedition was adequately equipped but criticised the lack of radio equipment... The... young servicemen and t[heir] instructors had left Whakapapa under sunny skies, heading for the summit... [of] Mt Ruapehu... on a four-day... trek. They were to learn basic mountaineering and build snow caves before descending to Turoa on the southern side... [However,] freezing cold and wind gusts of up to 70 knots came without warning and lasted five days... Late on Sunday, with two trainees showing signs of hypothermia, an instructor... and a trainee... set out on an 11-hour trek to find help. When rescuers found the party on Monday, six... frozen corpses were huddled in a trench on the most exposed part of the mountain, just 200m from an emergency hut... The fate of the six, and five other soldiers rescued in varying states of hypothermia, contrasted with that of [a] Japanese climber... who survived by remaining in his snow cave until the weather cleared up... Tomorrow, parents, brothers and sisters of the six who died will mark the 10th anniversary of the disaster with a commemorative service at Whakapapa. The Army will be represented. There will be no recriminations, just lingering, unanswered questions.

...Wearing traditional funeral clothes and holding portraits of their dead sons, South Korean women [sought] answers in front of the Ministry of National Defence in Seoul [yesterday]. More than 100 women gathered to demand an explanation of how their sons died during compulsory military service over the past few years. The women allege hundreds of soldiers die each year while in the military. [Incidentally, ‘the War Cabinet approved the establishment of the Women’s Royal NZ Naval Service in Apr, 1942. 500 women enlisted during the war, performing a wide range of duties as plotters, coders, cooks, stewards, transport drivers, telegraphers, dental assistants. Some were engaged in technical and secret work. The Service was disbanded in 1977 and members were integrated with the Royal NZ Navy.’]

...*Invasion of the gentler sex*... Women are to train for combat roles in the British Army alongside male soldiers in a controversial move that breaks with centuries of military tradition... A panel of experts will submit a report – entitled “A Study of Combat Effectiveness and Gender” – to ministers... [after a series of] tests later this year... The... trials... are expected to test the viability of mixed-gender tank crews, all-women crews, mixed infantry units and all-women infantry units... The[y]ll also examine how... men react to the pressure on the battlefield [if women are around] and compare how each sex copes with the mental and physical demands of combat... The trials are a major step towards having women going into frontline battle... There are 17,000 women in the Army, and only 24[%] of its jobs are reserved for men... It has traditionally been thought that women could not cope with the heavy physical demands of frontline fighting and... mixed-gender armoured units were impractical... Recent trials of women sailors on submarines resulted in the ban on female submariners remaining. However, the Army finds it increasingly hard to recruit, creating pressure for change... Giving women combat roles would bring Britain into line with... Israel... Canada, Holland, Norway and... the U[S]...

The US] President... yesterday signed a \$US288.8 billion... US military budget that... gives troops their biggest pay raise in 18 years [‘in 1993 the basic monthly pay rates for military personnel in the US were \$US769 for recruits; \$1,409 for sergeants; \$2,933 for sgt. majors; \$3,588 for majors; \$7,330 for a major general and \$9,017 for a general’]. The fiscal year... national defence authorisation bill provides military personnel with a 4.8[%] salary rise and increases pensions from next year... It also provides extra pay for high-tech personnel, especially in the Air Force.

...*Uncle Sam wants you: food stamps supplied*... Thousands of American soldiers serving in the world’s most powerful armed forces are so poorly paid that they are having to depend on charity to provide their families with basic household necessities. The spectacle of America’s defenders standing in line at social service offices, or raking through discarded furniture to find beds for themselves and toys for their children, has horrified the nation and is emerging as a presidential election issue. Although military authorities insist that the problem is small, and only affecting young men with unusually large families, soldiers’ wives and welfare organisations say that many more service personnel are struggling to make ends meet – but are too proud to seek the help which they need. “It’s very hard to realise and admit it,” said... a 19-year-old lance-corporal at Quantico, a... Marine base near Washington, who has been receiving food stamps – vouchers that can be exchanged for goods at shops – for the past two months... Food stamps worth \$US142 a month have helped eke out the \$US1000 monthly pay cheque on which [the] Lance-Corporal... his wife... and their two children must live in a small, tin house in the middle of the base... A family of three – with one child and the wife not working – would qualify for food stamps if their pre-tax income is less than \$US873... per month. A two-child family would qualify on income less than \$US1176... rising to \$US2086 for a family with five children... The problem for young recruits to the American forces is that many in the junior enlisted ranks earn only just over \$US1000 a month before tax. Even after allowing for free housing and other benefits, a package that may be adequate for single soldiers puts those with even small families well below the official American poverty line. Military pay has fallen behind the rest of the American economy as a result of budget squeezes over the past decade, and a recent vote by Congress to grant a 4.8[%] increase from January still leaves a wide gap... [In related news,] Britain has lifted its ban on homosexuals serving in the military, accepting a landmark European court ruling, but has laid down a code of conduct to try to ensure the effectiveness of the armed forces is not affected... The European Court of Human Rights ruled last September that four homosexuals were wrongly dismissed from the United Kingdom armed forces after they admitted their sexual orientation to investigators. The code of conduct will complement existing policies in cracking down on harassment, discrimination and bullying.

When I was young I had a twist for punching... and so I thought I would enlist... they taught me how to shoot... it’s just like pulling legs off frogs... so if you’re young and in your prime and fond of every kind of crime... come join the British Army... I promise you a jolly good time... if you’re strong and stupid too a life in the Army [i]s just for you...

...just miles from your doorstep hundreds of men are given weapons and trained to kill. The government calls it the Army but a more alarmist name would be *The KILL-BOT Factory*.

The Army provides expert tuition in firearm use... [- as was indicated yesterday when an 'Iranian serviceman, who had fled his barracks several days ago with a gun and ammunition, shot dead 14 people in the capital, Tehran, before he was gunned down by police' – and killing] in a variety of [other ways. Yet]... Army training seems the favourite solution to escalating crime involving young offenders.

...N[Z] presents a sad spectacle, with all our aimless fussing, complaining, tearing out of hair and general distraction over the rising crime rate. Murders are almost a daily occurrence and property theft is a major growth industry... We pat ourselves on the back on having cut unemployment back to 6% or so of the work force... But 6%... is still far too high, especially as most of the crime is being committed by the jobless. If we give them something to do, they will be too busy to commit crime. If we go further, and give them something worthwhile to do, something that will produce marketable skills, make them feel proud of themselves and self-reliant, most will despise criminals as losers and no-hopers... So why has no person of significance or influence taken the logical step of promoting compulsory military training as a solution? To me it seems the most obvious way of changing the motivation of a growing underclass of young people who feel (a) the world owes them a living but (b) they are unlikely ever to get a job to provide them with it... The right way is to introduce compulsory military training across the board at, say, 17. And none of that silly business the army went on with years ago – a few months playing about doing rifle drill and firing a machinegun occasionally, then back home to mum and dad. What's needed is a full 12 months at least in the services. In the army... of course, because the navy and air force employ highly trained staff to use sophisticated equipment... Having a successful period of military training on your record is an ideal way to convince an employer that you're the sort of person he's looking for. A soldier is likely to have a... readiness to follow... My scheme would have widespread public support, make no mistake. People are thoroughly sick of the huge increase in crime for a start. And a recent (1995) public opinion survey, analysed by the Foundation for Peace Studies as reported by Auckland University's Department of Political Science, showed a surprisingly high majority of respondents – 63% – support the re-introduction of compulsory military training for young adults. Only 24% say "No" outright, with 13% undecided. There are widely varying views on the usefulness of a well-trained army once you've got one, and there are no wars on the horizon, but there's no doubt that N[Z] would be able to speak with a confident voice in world councils if we had a proper defence force. How is this training to be paid for? A soldier is more costly for the taxpayer to keep than a 17-year-old on the dole, but substantial savings elsewhere will offset the cost... Adding the reduced cost of detention and punishment resulting from the lowered crime rate, to what is saved by cutting the dole payout, would go a fair way to financing each year's intake of military trainees... Criminals are enormously expensive for the taxpayer, in terms of damaged property, lost production, victim compensation, police investigation and prosecution expenses, followed by keeping the eventually convicted miscreant in jail at \$1000 a week and upward. - 1997

THE Foreign Legion is a creation only the French could have crafted. They recruit the world's misfits, train them to kill and die, then turn their story into a romance... The... volunteer signs up for a minimum of five years, joining 8500 serving soldiers and 36,000 fallen comrades. Their legend, embodied in... *Beau Geste*, is carefully protected. The Legion employs writers, photographers and artists full-time, and retired legionnaires make statues and memorabilia celebrating the Legion's glory. One French officer, rich in Legion romance... sees the legionnaires as similar to the monks of the middle ages, keeping a spirit of brotherhood and courage alive in a shallow, materialistic world. "We are a bit out of time and space. You realise that we are in a sort of monastery," he explains. Except that these soldier monks kill rather than pray for a living... The Legion seems an anachronism [as we near] the 21st century, but still 100 young men a week arrive in Marseilles from all over the world to join France's army of foreigners. As one soldier says, they are "a bunch of weirdos. If you get a guy who's got his head together, he don't need us." Or as another says, "You give your body to the Legion and they will protect you from yourself." ...These soldiers of an adopted flag sign up to a simple but death-inviting code of conduct: complete the mission at all costs, never abandon your wounded or dead, and never surrender your arms. In return they receive the promise that they will never be alone... They leave their past behind. They take a new name. The Legion will deny any knowledge of them should anyone come looking and will rebuild them as new men... The Legion is their last chance... They come because they want adventure... because of "romantic failure", because... they have money problems... or... they are minor criminals wanting to avoid prison...

...for war's sake you must cherish thieves; for surely... these two crafts agree together... Yet France... is troubled and infected with a much sorer plague. The whole realm is filled and besieged with hired soldiers in peace time (if that be peace)... under the same... pretence that hath persuaded you to keep these idle serving-men. For these wise fools and very archdoltos thought the wealth of the whole country herein to consist, if there were ever in a readiness a strong and sure garrison, specially of old practised soldiers, for they put no trust at all in men unexercised. And therefore they must be forced to seek for war, to the end they may ever have practised soldiers and cunning manslaughterers, lest... their hands and their minds, through idleness or lack of exercise, should wax dull. But how pernicious and pestilent a thing it is to maintain such beasts the Frenchmen by their own harms have learned, and the examples of the Romans, Carthaginians, Syrians, and of many other countries do manifestly declare. For not only the empire but also the fields and cities of all these by divers occasions have been overrunned and destroyed of their own armies...

The Biblical tradition tells us that the absence of work – idleness – was a condition of the first man's blessedness before the Fall. The love of idleness has remained the same in fallen man; but the curse still lies heavy upon man, and not only because in the sweat of our brow we must eat bread, but because from our moral qualities we are unable to be idle and at peace. A secret voice tells us that we must be to blame for being idle. If a man could find a state in which while being idle he could feel himself to be of use and to be doing his duty, he would have attained to one side of primitive blessedness. And such a state of obligatory and irreproachable idleness is enjoyed by a whole class – the military class. It is in that obligatory and irreproachable idleness that the chief attraction of military service has always consisted, and will always consist.

However, not all military personnel are attracted by the prospect of being idle. Those that aren't include the ones called *mercenaries*, or *dogs of war*.

THE dogs of war now have a pedigree. Today's mercenaries... have upgraded... their name, swapping the *nom de guerre* and label "soldier of fortune" for a business card bearing the title "security consultant." Pinstripes replace fatigues, and the camouflage jungle command tent of the past is now more likely to be a suburban corporate headquarters. But when there's work to be done, you can bet that those aluminium briefcases will pop open to reveal not only legal pads but automatic weapons. With the end of superpower involvement in local conflicts and the world community increasingly reluctant to step in, there is a growing fear... that mineral-rich African rulers may spurn diplomacy in favour of a new kind of private army. More than half a dozen companies specialising in guns-for-hire have sprung up to offer such services around the globe... AS reports circulate that... Executive Outcomes, a Pretoria-based company run by former South African soldiers trained in defence of apartheid... is poised to enter the rebel war in Zaire – reports denied by [the company's] chairman... – a debate has intensified over the role of such firms in post-Cold War conflicts. The outfit [which]... has a computer database of 2000 ready soldiers, many looking for work since being furlonged by South Africa's new democratically elected government... is sometimes condemned as glorified guns-for-hire who profit from conflict and prolong it; others credit the firm with aiding stability in Angola and Sierra Leone in recent years... Either way, a major concern is that Executive Outcomes may represent the future of conflict resolution in Africa... Executive Outcomes officials eschew the shady, underworld image of Africa's traditional soldiers of fortune. They deny any tie to the legendary "dogs of war" (the name is taken from Shakespeare) who popped up fighting for the highest

bidder in independence struggles and coups d'état for decades, reputedly having recruited their bands of killer ruffians in seedy portside taverns. That allegedly is the scene unfolding now in eastern Zaire, where a band of 200 to 300 mercenaries is reportedly assembling to help President Mobutu Sese Seko battle rebels occupying border towns and goldmining areas. Allegedly, Executive Outcomes is helping with the recruiting... "Call us whatever you want to bloody call us. We do something entirely different than others who fall under the flag of mercenary,"... [someone who] helped to found Executive Outcomes in 1989... [and now its] senior consultant... says. "We don't just go into any country. We don't work for the highest bidder." [He] says his firm will only work for democratically elected governments, or governments recognised by the U[N]. And, after losing some men in Angola, he says his firm makes it clear its men will fight "in self defence." ...Executive Outcomes' first involvement in Angola was defending an oil installation. When the country's civil war erupted anew in 1992, the company signed an initial \$NZ29 million one-year contract to retrain the Government's army, a contract that was extended twice. The firm sent in 500 men, and soon after they directed a decisive victory to retake the Cafunfo diamond fields in 1994, [the] UNITA rebel leader... agreed to peace talks. This week the Government and UNITA are scheduled to formally join in a government of national unity, though lingering disputes over how to share power and diamonds may scuttle plans. Ironically, many of Executive Outcomes' soldiers have, until recently, been special forces operatives fighting alongside [UNITA's leader] against the formerly Marxist government. With the firm, they were fighting against him on behalf of that government. After Angola, the firm signed a contract with Sierra Leone's Government and helped it to secure the capital, Freetown, and other areas from rebel incursions. When the Government at one point didn't pay the firm and it threatened to pull out, some Sierra Leonans begged them to stay and a group of merchants came up with the money. While still tense and violence-prone, Sierra Leone held elections last year. Even with Executive Outcomes' successes, concerns are raised about how the firm profits and throws its weight around. In Africa, many wars are often directly about spoils, and the firm has been accused of taking its share through a sister company that was awarded mineral concessions in Sierra Leone... Citing a U[N] intelligence report, two European newspapers reported recently that the firm's military activity has branched into a network of shady, spin-off businesses throughout Africa, including Uganda and Kenya. The report alleges secret ties to Government officials and suspected arms smugglers... Analysts also worry that to pay the firm's steep bills, troubled nations might sell off key national assets at bargain prices. Some observers note that multinational corporations also are hiring their own private security forces before working in insecure African hot spots...

Since the cold war's demise, there's been no end to conflict. From Azerbaijan to Zaire, disorganised military forces need help... [W]ith demand for military muscle stronger than ever around the world the market for private military assistance is ballooning... [H]ired guns are going corporate... THE COMPANY LOGO, A METALLIC-blue chessboard knight, rears across the screen and un-seats an opposing king. As the corporate promo continues, scenes of military derring-do flit by and a voice-over extols Executive Outcomes Ltd.'s product line: low-intensity conflict, sniper and special forces training, rapid deployment, tank warfare... A slim, fair-haired 40-year-old... one-time intelligence agent for a South African military unit that carried out assassinations is... [the] chief executive of Executive Outcomes... Holstered on one hip is a cell phone, on the other a Czech-made revolver... He puts a cheery corporate face on one of the world's oldest professions: mercenaries, or "military consultants," as most prefer to be known... [He] calls his employees "privatised peacekeepers." ...From the suburbs of Washington and Tel Aviv to London and Pretoria, a growing number of competitors are scrambling for contracts that run into millions of dollars, hawking their wares using everything from Websites to slick brochures. For instance, contracts worth more than \$170 million for training Saudi Arabia's national guard and air force have gone to Vinnell Corp. and a sister company, both partly owned by [a] Washington... merchant-banking group, whose chairman is [a] former Secretary of Defence... Military Professional Resources Inc., another capital-area firm, won the business to improve the fighting skills of troops in Bosnia and Croatia. "We offer expertise from the greatest fighting force on earth, the U.S. military," says... [a former US Army general who is now] a vice president at M.P.R.I... Topflight mercenaries and military consultants, many recruited from elite military units like the U.S. Special Forces, Britain's S.A.S. and Scots Guards and South Africa's 32 Battalion, can command anywhere from about \$3,500 a month for enlisted men to \$13,000 a month for officers or fighter pilots. That is far more than most of those involved could make wearing a regular-army uniform, and the package is usually topped off with free death-and-disability insurance. But that's cheap compared with the expensive merchandise the firms encourage satisfied customers to buy. Take Levdan, one of a variety of low-profile Israeli firms that have long peddled military assistance. Not long ago, the company completed a three-year mission in the Congo, during which more than 200 Israelis trained the armed forces and the elite guard protecting [the Congolese] President... The Congolese government then agreed to buy more than \$10 million worth of Israeli weapons and military equipment. Not to be outdone, Executive Outcomes has brokered the sale of, or leased on behalf of clients, tens of millions of dollars' worth of military equipment, including the Soviet MiG-23 and MiG-27 fighter aircraft and Mi-17 and Mi-24 transport-and-attack helicopters... Not all military consultants are playing by the new rules. In Zaire, a force of several hundred Serb, Croat and Ukrainian thugs hired by the... dictatorship committed widely publicized atrocities and were then overrun by rebels. Not exactly a performance to attract future employers. But then the new corporate mercenaries would probably not... work... for [Zaire's dictator] in the first place. Their business strategy is to seek out politically correct governments, natural-resource providers or even nonprofit organizations. The Red Cross, which suffered nine dead in conflict zones last year, hires guards to protect some of its installations. Other relief organizations like Doctors Without Borders, which lost three people in Rwanda, could be forced to move in a similar direction... Yet business is not always so good. Sandline International, which is headed by a former British military officer turned businessman, saw its \$36 million contract with the government of Papua New Guinea blow up last month like a mishandled grenade.

Death arrived before dawn at Simbo village, on the troubled island of Bougainville. A patrol of Papua New Guinean soldiers, supported by irregular militia of the locally recruited "resistance" forces, attacked without warning, killing twelve villagers and seriously wounding two others. The massacre... was one among many tragedies in an almost forgotten war that has entered its eighth year with little prospect of peace... This is more than a local insurrection. The secessionist campaign on the island is dragging PNG deeper into a political and economic mire, sorely straining its relations with A[US], and pushing PNG dangerously close to conflict with the neighbouring Solomon Islands, whose territory has been crossed to pursue and attack the... Bougainville Revolutionary Army (BRA)... its supporters, and humanitarian blockade-runners. Last week... the A[US]n Foreign Minister... had... repeated Canberra's long-standing contention that the war had no military solution, and again offered to help in any peace initiative. The offer met an official silence... Earlier attempts to broker peace through talks secured by a multinational Pacific military contingent – supported by A[US] and NZ – had failed miserably. A major drive by PNG troops to flush out and capture BRA leaders earlier this year also met with bloody defeat... The conduct of the conflict has already earned the condemnation of the U[N], and the cost of continuing military operations, the economic blockade of the island, the support of villages moved into "care centres," and the loss of vast revenue from the A[US]n-owned Panguna copper mine are festering problems. This week Port Moresby will also be trying to convince the World Bank to proceed with the frozen second installation of a vital structural adjustment package, the International Monetary Fund is becoming chary of putting more funds into a troubled financial stabilisation package, and the Asian Development Bank is viewing carefully its economic involvement. Beyond this is the human toll, now almost certain to continue unabated... Officially, the toll stands at least 300 killed and more than 2000 civilians dead through disease and medical failures. Two detailed lists... show the suffering is far higher than these bald figures. The lists trace by incident – frequently also by name and village – more than 100,000 Bougainvilleans affected by detention, ambush, destruction of villages and plantations, [or] killed, wounded and tortured by PNG forces... Massacres, assassinations and summary executions have become standard weapons of war, confirmed by

the discovery of mass graves. Confiscation of property, beatings, rape and violent suppression of dissent are commonplace. Roads, ports, airports, schools, and businesses have been destroyed. Supported by medical evidence, [the]lists also detail the pain of the innocent: the soaring incidence of preventable diseases such as malaria, tuberculosis, leprosy and gastroenteritis, and the lack of treatment for others such as cardiac disease. Death rates have climbed alarmingly with the collapse of immunisation programmes for... TB, whooping cough, polio, measles and hepatitis B. - 1996

Fighting for their island... ["GOD protect us from enemy bullets." The chanting prayer grew in intensity as the three boats rocked together under the night sky. Next to me knelt a young... BRA... soldier, his M16 rifle propped against the side of the small fibreglass dingy. It was 3am and we were about to embark on the two-hour ocean crossing from the Solomon Islands to Bougainville Island. On board were civilians and soldiers returning to their homes after seeking medical advice in the Solomons – the only place many Bougainvilleans say they can be treated by doctors without the fear of summary execution by the PNG defence forces occupying many Bougainvillean towns... The Bougainville Interim Government and its armed wing, the BRA... have not been able to push PNG forces from the island and achieve their aim of independence. Their war with PNG defence soldiers has led to atrocities on both sides and an estimated 10,000 people killed since the conflict began... The battle has been complicated by Bougainvilleans turning against one another. The PNG-backed Bougainville Transitional Government controls the island's three main towns which contain about 40,000 of the island's 180,000 inhabitants and are the landing points for all foreign aid and imports to the island... During my three-week visit to the island I had free movement through the villages and jungle in the central area of Bougainville Island. Escorted by BRA soldiers, I saw first-hand the harsh conditions nine years of war had inflicted on a population that once regarded itself as having the highest standard of living in PNG. Economically, the war had clearly devastated the rural areas of the island where paper money is virtually non-existent. In the absence of foreign imports and any real link with the towns, many of Bougainville's 140,000 rurally based people have been forced to rely on their ingenuity to survive. Trucks, generators and motorbikes that once ran on diesel or petrol are now powered by coconut oil. Juice from the white coconut pith is left overnight and oil skimmed from the top with about 20 coconuts needed to provide one litre of oil. The development is not foolproof – cold temperature's in the island's highlands are enough to congeal the oil, forcing drivers to jack up their vehicle and light a fire beneath the engine to melt the oil again. Another impressive development is the adaptation of old washing machines into hydro-electric generators which provide enough power to run a single electric bulb in each of three or four houses. Soap, impossible to find since the war began, has been replaced by the sap of a tree. Despite their inventiveness, villagers in the interim government-held areas said they were desperate for help from the outside world... [However, regardless of whether or not that help is forthcoming,] BRA soldiers and civilians in BRA territory were adamant they would not give up their struggle against PNG until they were independent. They said too many people had been killed and too many hardships endured for the cause to be abandoned... Perhaps most chilling of all were the words of a village chief... repeated again and again by other people in the BRA territories: "We can keep fighting. All the young boys you see around you will be our future soldiers," he said.

...Atrocities on Bougainville have been increasing in recent months, according[to] Amnesty International... Amnesty says the atrocities have been largely ignored by the international community partly because it was assumed the worst of the violence was over and partly because Bougainville was remote with little strategic importance. However, in a report published yesterday, Amnesty said the people of Bougainville had been subjected to illegal executions, torture, rape and arbitrary detention. "At the same time there has been little external pressure on the PNG Government to bring the atrocities to an end," said the report... Between 1991 and November 1993 at least 60 people were illegally killed by Government security forces. Since then at least 62 people had been killed at the hands of the PNGDF or Resistance Force and a further 13 people had disappeared after being taken into custody. Last year 44 people disappeared or were killed. According to the report, the BRA has killed at least 36 people since the beginning of 1993. However, Amnesty argues that the real figures for political killings on Bougainville are undoubtedly much higher. Amnesty blames the Government for much of the trouble. "An appalling degree of inaction by the Government has resulted in only one alleged killing by the PNG Defence Force being investigated since the conflict began while the perpetrators of the violations continue to act with impunity."

...[the AUSn PM] told a meeting of Government parliamentarians... yesterday... that he became aware last week of a plan to use... up to 150 African-based mercenaries... in a "surgical strike" against... secessionist rebels on Bougainville. The P[M]'s comments flew in the face of a declaration by PNG on Monday that it had no plans to use soldiers of fortune to resolve the nine-year conflict... [However, the NZ] *Herald*... on Monday... [reported the PNG] Government had approved a \$A36 million... covert operation to end the rebellion... [The PNG PM then] said his Government had hired Sandlines International, a private military training and logistical group, not to fight themselves but to help train Government soldiers on Bougainville. Sandlines International is a subsidiary of... Executive Outcomes... A report from Port Moresby yesterday said the PNG Government used \$A30 million... from the partial float of Orogen Minerals Ltd last year to fund its "Bougainville Initiative." The... Premier of the Bougainville Transitional Government... has condemned any plan to use mercenaries on the island. "I fear the repercussions such a military operation would have on Bougainville, P[NG] and the international community," he said... Amid fears of renewed violence, hospitals in northern A[US near PNG] were put on alert for casualties from... Bougainville island.

...The Papua New Guinean Government... secretly siphoned more than \$A31 million... in proceeds from the sale of the Government's mineral and oil interests to finance its planned covert mercenary operations on the rebel province of Bougainville. The movement of funds, made on January 23 this year, was publicly denied the same day by the PNG P[M]... However, a letter signed by the PNG Minister of Finance... on January 23 indicates the Government wished to avoid detection by the World Bank and the I[MF], which are both involved in running economic recovery programmes in PNG... In his letter [the minister] spells out... that the procedure was necessary "in order for the Government to implement its plans relating to Bougainville." ...yesterday [the minister] said the letter... he had signed was an internal document with no standing and he rejected claims that the proceeds from the [mineral and oil interests]... were used to finance any new operations in Bougainville. In an interview with ABC Television in Port Moresby, [the PNG PM] said the role of the foreigners was to teach PNG troops to "get" the Bougainville rebel leadership whom he described as "criminals." ...The Government[said it] had tried everything humanly possible to try to get the Bougainville rebel leaders to negotiate.

...When A[US]'s Foreign Minister... stepped out into the sultry air of Port Moresby's Jackson Airport in the early hours of last Wednesday morning he had a smile on his face. Tensions between A[US] and its former colony over the Bougainville crisis were easing, freeing up a bagful of aid money the minister has been dragging round since coming into office... [Last] year... he was forced to deliver as his very first message to PNG A[US]'s absolute opposition to their decision to abandon the defence agreement on Bougainville... This was going to be a good-news trip. But what [he] couldn't see in the sub-tropical gloom were two large Russian-built aircraft squatting on Jackson's ageing tarmac. Like [the AUSn Foreign Minister], the planes, flying under the Bulgarian Air Sofia flag, had arrived in Port Moresby under the cover of darkness. Unlike the A[US]n Foreign Minister, any bags of money they might be carrying would be heading out of PNG's national coffers, not in... By dawn, as [the AUSn Foreign Minister] was being briefed by anxious A[US]n diplomats on the presence of the planes in PNG and what this might represent, the larger of the two aircraft, the AN124, had already crept out of the country. On charter... for \$100,000 a day... to a shadowy foreign entity known cryptically as Sandline International... whose presence in the country has been kept a secret, the aircraft are the most tangible evidence of plans by the PNG Government to use foreign mercenaries to launch a series of covert strikes against hardline rebels on Bougainville. For more than a week, the smaller of the two planes had spent the day-light hours sitting innocently on the tarmac, its Russian crew safely ensconced in the nearby Gateway Hotel. But at night this plane had been carrying military equipment and supplies to the provincial PNG town of Wewak. There, under the cover of the Sepik jungle, between 135 to 150 men have been preparing for what they promise will be a surgical strike against the villages in central

Bougainville... Earlier this year the PNG Government, less than six months before national elections were due, decided to draw off millions of dollars from the nation's revenue earnings to pay Sandline... to solve the Bougainville crisis once and for all. That such a measure could even be contemplated in a country that prides itself on its robust democracy has its genesis in just how much of his own reputation [the PNG PM]... placed at stake when he pledged on coming to office in 1994 to find a lasting solution to the Bougainville crisis. The decision flies in the face of all experience on the ground in Bougainville where PNG troops have managed to inflame secessionist sentiments without ever getting on top of the guerrilla fighters of the B[RA] every time they have gone in hard in the conflict. It also confronts A[US] with the biggest foreign policy dilemma in the bilateral relationship since the days when the merits of early independence for PNG were being debated 25 years ago... The issue is further complicated by the history of A[US]'s complete reluctance to provide substantial logistical support to the PNG Defence Force efforts on Bougainville... Canberra[had] opted to continue to accept PNG's public statements of support for the peace process on Bougainville until the PNG Government told them otherwise... The developments so far have already prompted an urgent policy [review] at the highest levels of the[AUSn] Government... The continuation at existing levels of A[US]'s \$320 million in aid to PNG will be one of the cards on the table, not the least because development aid seems something of an arrogance to a country prepared to devote millions of dollars to employ a foreign hit squad against its own people[– although the PNG Government does 'need to take a harder line on the escalating crime rates that are scaring away tourists'.

...The PM of PNG] and his family reportedly are major shareholders in a security company run by two A[US]ns accused of hiring and arming A[US]n police and former anti-terrorist soldiers to work in PNG... The operations were reportedly against PNG criminals who had threatened to kill businessmen at a gold mine at Ferguson Island, south of Port Moresby, in 1996... and at an oil-palm plantation... in the north in 1995... The *Age* newspaper... says PNG Government records show the A[US]ns were... flown to Port Moresby on tourist visas.

...Looting continued in Port Moresby yesterday as local criminal gangs appeared to take advantage of a... political crisis pitting the country's Government against the Army. Police reportedly opened fire with automatic weapons and tear gas... to repel a group of looters who attacked a supermarket near... the Army's Murray Barracks... A guard inside the supermarket used a machete to cut off a looter's hand... P[NG]'s new caretaker P[M]... yesterday pleaded for unity among his people... [PNG's elected PM] stepped aside last Wednesday, pending the outcome of [an] inquiry, in a bid to defuse the volatile situation... The Melbourne-based *Herald Sun*, quoting sources... yesterday reported that the mercenary leader... will accuse senior Government officials of skimming millions of dollars from the... deal when he gives evidence before the inquiry, due to begin tomorrow... The mercenary leader is being held in P[NG] for trial next month on two illegal firearms charges... [The PNG] Army chief... said... the[other] mercenaries... have been thrown out of the country... Most were put on a charter flight home to South Africa... [The Army chief] said the money paid to Sandline was for a three-month contract but because the mercenaries were likely to [have remained] in PNG for up to 12 months the real cost... would have blown out to \$NZ140 million... Sandline had received half the[initial] \$US36 million contract price in advance.

...A P[NG] military court handed down heavy jail sentences yesterday on five officers convicted of mutiny... [after] holding a senior officer under house arrest... [during] the Army's revolt against the Government's hiring of foreign mercenaries... [The] then Army commander[– who]... was the figurehead for the revolt... [– plus] the major who... rallied the troops behind... [the] General... and drove the revolt[, also]... face possible mutiny charges for their role... [But their trials won't] take place until a second public inquiry has been completed... [Meanwhile, t]he former P[NG]n military leader... yesterday defended his receipt of a \$A70,000... secret payment from... one of Sandline's rivals... saying there was no conflict of interest... "My saving grace about receiving funds from [a British arms dealer] is that, during my term as commander, the defence force did not buy or order any goods from [his] firm," he said.

...The worst crisis in P[NG]'s 22 years of independence started on March 17 when [PNG's] Army leader... turned on [his PM], demanding he quit and expel some 70 African mercenaries flown in by... Sandline International. [The] General... was promptly sacked but [the PM] was unable to control a groundswell of popular and military opposition. Violent street protests saw dozens of people injured... News of [the PM's] departure was greeted with a huge roar of approval by thousands of protesters besieging the Parliament building... [The departing PM] said he had to accept responsibility for the crisis. He had not quit earlier because he wanted to safeguard the constitution and did not want to appear to give in to pressure from the military.

...As the dust settled over Port Moresby, and people embraced the Easter break with some relief, many P[NG]ns were understandably keen to put the best possible complexion on the 10 days of turmoil that shook their young nation to its very roots. Police and[some] senior defence force officers have earned enormous kudos for having conducted themselves and their men calmly and in a highly disciplined manner... That it was the Army's stand which finally forced [the PM's] hand was clear by the P[M]'s apparent lack of concern about public reaction after details of the mercenaries' contract were revealed... in February... [The PM], his Deputy... and the Defence Minister... calculated that they could tough it out, counting on most people's ignorance of the term mercenary and the nation's shared frustration and weariness with the Bougainville crisis. In his first public comments [the PNG PM] also played on P[NG]ns' nascent nationalism, articulating their affront at A[US]'s strident reaction to the plan to use mercenaries... [He] has never acknowledged that A[US]'s reaction was unanticipated... because of PNG's failure to inform the[AUSn] Government of its plans, despite a supposedly close relationship, particularly between the two countries' defence forces... The future for the A[US]n Defence Co-operation Programme is uncertain, although ironically the relationship with the PNGDF, never great, may actually improve with a more confident force on the PNG side. At the political level there is far greater distrust. The A[US]n Foreign Minister... has pointed out that he sat face-to-face with [PNG's Deputy PM plus its Defence Minister] last September at the annual ministerial forum... Nothing was said of the Sandline deal. A[US] had to rely on intelligence sources for information on the deal even after both [the AUSn Foreign Minister] and the A[USn P]M... had directly asked [the PNG PM] about the nature of the contract... P[NG]'s constitution may have survived the past 10 days, but the problem that has undermined the nation's sovereignty for the past decade remains... Under PNG's independence constitution it is the new MPs, not the people, who elect a P[M], so the PM] cannot be ruled out for a third term, although he has moved down the ranks in terms of being considered the most appropriate. Whoever th[e next PM] is, he will still have to face Bougainville – a problem that remains unsolved, despite the fracas surrounding it. [The BRA] leader... is still demanding complete withdrawal of the PNGDF, despite their stand against the mercenaries. But he said yesterday that he was willing to accept a referendum and release five PNGDF hostages if a neutral third party or force replaced the Army... [Ironically, recent rumours suggest] that the Sandline mercenaries were relieved their deal with the PNG [G]overnment fell through, because their mission – killing interim government leaders – would have proved too difficult and would have cost many civilian lives... [Incidentally, AUS has] left open the option of sending troops to P[NG] since AUS's mining giant BHP announced the shutdown of its Port Moresby steel operations and the evacuation of A[US]n staff.

...A[US] should seize millions of dollars of deadly military hardware diverted en route to P[NG], the federal Opposition said... "Under no circumstances should such equipment go into PNG where it could be used in the Bougainville conflict." A spokesman for [the AUSn] Defence Minister... confirmed that a giant Russian-built Antonov transport plane had dropped off its cargo at[an] RAAF... airbase in the Northern Territory. While he refused to give details of its contents for security reasons, sources said it was understood to include two helicopter gunships and two transports, ground vehicles, rockets and heat-seeking missiles, assault rifles and ammunition... part of the former [PNG] Government's ill-fated mercenary contract... [The] PNG Defence Force Commander... said he believed [the equipment] was... obtained in Eastern Europe at prices far below that... charged by Sandline to the PNG Government... Meanwhile, [the departed PNG PM confirmed] yesterday he would contest the June

election and expected to win with an increased majority. He was prepared, he said, to be judged at the ballot box over his controversial decision to hire mercenaries to solve the Bougainville secessionist crisis.

...[PNG's] first Prime Minister after independence in 1975 and a person regarded as the father of the nation, said the mercenary plan was "stupid." ...[However, the departed PNG PM] denied that the original secrecy surrounding the deal with Sandline was aimed at circumventing proper procedures. "We would never want to break the constitution. I mean, that is the last thing I would want to do," he told the *National* newspaper in PNG. "My job is to uphold the constitution. My job is also to ensure that the security of this nation is built up to a stage that it is able to withstand any attempt to break away and any terrorist activity."

...[PNG's incumbent PM declared that he hadn't resigned a few weeks ago after all – he'd merely been 'having a temporary break, but now he was back']]

...*Leadership chaos in PNG as two PMs scrap*... P[NG] sank into political confusion yesterday after two politicians declared themselves to be the country's [PM. The incumbent PM]... who stood down at the height of a political crisis in March, said he had resumed office after the completion of an inquiry into the Government's abortive plan to use mercenaries to quell [the Bougainville I]sland rebellion. "I have at noon today... resumed the full duties and responsibilities of P[M of PNG," he]... said. His announcement... less than two weeks before national elections on June 14, came only one hour after [the caretaker P]M... declared he would stay on in office. "My appointment is legally binding and the prerogative is mine to vacate the office," [the caretaker] said... Speaking at a news conference yesterday, [the incumbent PM], releasing the 125-page final report into the... \$[NZ]53 million... Sandline contract, said the inquiry had cleared him of any wrongdoing. However, [the caretaker]... called for an inquiry into how the Sandline report was released to "unauthorised persons." ...Meanwhile, a member of Parliament campaigning on Bougainville for the... elections had been kidnapped... The former Catholic priest... who represents the island in Parliament... [and] is a strong supporter of the P[NG] Government on the issue of Bougainville... was abducted by members of the B[RA], the Government said.

...P[NG]ns were riveted to their radios on Monday night as they followed ballot-box by ballot-box, the midnight demise of [the incumbent P]M... who lost the New Ireland seat he had held for 29 years... by just 110 votes... [He became] the first incumbent P[M since]... independence to lose his seat... By early the next morning a hastily-made banner... The Monster is Dead... strung outside the... Defence Force headquarters provided a brutal epitaph for the... 30-year fixture on PNG's political scene... It has been an ignoble end to the public career of the A[US]n-educated, mixed-race boy who rose from his Chinese father's humble coastal trading business to become one of the country's first millionaires and smoothest political operators... Rich, arrogant, and, ultimately, isolated from the very people he sought to lead, he had come to personify all that P[NG]ns felt was wrong with their leaders. When secret plans to use foreign mercenaries against secessionist rebels on Bougainville were exposed in February, it seemed... [the incumbent PM] had not really meant it at all when... two years earlier... he had said: "The first thing we have got to do is to bring back trust; trust between the governing and the governed." ...The country's first finance minister, he persisted with a hard kina policy after independence in 1975 which brought a stability to the PNG economy that has been lost only in recent years. He was badly burned politically in 1986 after taking a 7[%] stake in the Pacer Pacific float that financed development of the massive Porgera gold mine in the PNG Highlands. The deal made him more than... \$1 million but nearly cost him his political career... Despite being forced to stand aside for most of the last three months of his prime ministership... he... was convinced that... he would lead the nation again... He remained unapologetic over the Sandline contract to the end, refusing to publicly rule out the possibility that he would revive the contract if re-elected. In an interview at the outset of the election campaign he said: "To tell you the truth, I would have succeeded. Even if 10,000 angels were swearing I was wrong, it would make no difference. I was right, I was always right all the time."

...Time is running out for Bougainville. The hired guns... may have gone[- 'reportedly with more than \$US30 million in compensation from the PNG Government following an award by an international tribunal of three former judges, chaired by a NZer (the tribunal, which ruled that the contract was valid under international law – the new PNG Government had argued that the contract was unconstitutional and illegal – awarded Sandline \$US18 million, the outstanding portion of the company's fee, with costs and interest bringing the settlement to \$US30 million') –] but the time-bomb left... [behind] is ticking away, waiting to explode. More than half the population live in squalter camps, known ironically as care centres, where hundreds of inhabitants each year die from preventable diseases and medical mishap... The care centres are just a new name for refugee camps... These refugees are outsiders, driven from their villages on the mainland by the B[RA]... At least five refugees a month, throughout the camps, are killed by the [BRA]... Food is scarce and human dignity at an all-time low... Before the war, Bougainville had the highest literacy rate in the South Pacific. Now... children sit around all day, there are no books and no teachers... This is not war-torn, famine-ridden, far off Africa, but a country... that was a territory of A[US]. A country that A[US] sends millions in aid to annually. Yet these camps in Bougainville see only \$NZ500,000 each year... That's 2 cents a day for each person, or 70c a week for the average family... It's not even the price of a loaf of bread, in a country where petrol is \$2 a litre and rice \$1.40 a kilo... These people are victims of a political agenda, one they have no control over. Nobody asked them if they wanted the mine, or wanted their lives torn apart. Most of the locals were never consulted or their rights even considered when... mining... came... "We lived peacefully for many years, now our country's torn apart, abandoned by A[US] and abused by big business. CRA came here, started mining, took our copper but left us nothing." ...A[US]'s CRA owned 53.6[%] of the... mine at Panguna... [and] the PNG Government 19.1[%] with the other 27[% being] sold off in a public share, mainly to PNG and A[US]n interests. The PNG Government then took 95[%] of the profit, with 5[%] going to the Solomons. Less than 1[%] of the... millions[made] from the site... went back into Bougainville. Finally, in 1988, the indigenous people formed into a separatist group, closing down the mine by force.

...Warring Bougainville factions will board a N[Z] Air Force plane under official escort at Cairns and together head to N[Z] for peace talks at the Burnham Army Camp in Christchurch... Four groups... [and] up to 60 participants... have been invited by the N[Z] Government in the first peace initiative since... 1995. But the [NZ] Government has no idea whether key leaders... or junior representatives are coming. Nor can it predict the level of animosity among them, but security at Burnham has been stepped up... The N[Z] Government was... paying for the talks but otherwise playing no part.

...Bougainville leaders yesterday signed a historic accord calling for a ceasefire and an end to the bitter war... The Burnham Declaration stopped short of specifying when the shooting would stop... But it called for a U[N] peacekeeping force to follow a... withdrawal of PNG defence forces from the island... [and] oversee the peace process of a period of not more than three years... Its signatories hope to meet the PNG Government in [two months] to develop the peace process.

...as a gesture of goodwill... Bougainvillean rebel leaders have promised to hand over five P[NG]n hostages to a N[Z] Government representative aboard the frigate Canterbury [which, together with]... the Navy tanker ship Endeavour[has] been diverted to the... Solomon Islands... The [NZ] cabinet agreed on Monday to make them available to help to protect about 60 leaders of Bougainvillean factions when they return home from peace talks at Burnham... Although PNG sanctioned the talks, it has a price on the heads of some delegates and its soldiers ambushed rebels as they returned to Bougainville via the Solomons from peace talks in A[US] two years ago.

...[more than 1500 stolen automatic weapons stand between an Anzac-monitored peace solution and the Solomon Islands' warring factions. A reconnaissance team of five NZ police, military and Foreign Affairs officials will join AUSn counterparts in Honiara tomorrow to trigger the process which will see the return of the firearms and the rebuilding of the nation. They will keep their heads low because, despite the signing of the peace deal by the two militia forces in AUS last week, law and order in the Pacific country remains unpredictable. But officials who witnessed the signing of the agreement

remain confident that this is the Solomons' best chance for reconciliation since deadly ethnic tensions flared into violence two years ago. More than 70 people have been killed in fighting that began when Guadalcanal rebels drove about 20,000 Malaitan Island immigrants from Guadalcanal. The reconnaissance team will lay the groundwork for the deployment of international peace monitors, with NZ's contribution likely to be about 15 people. It is understood the unarmed contingent is likely to include police constables and Army sergeants, armourers, warrant officers and soldiers. Their first task will be to ensure the two militia groups, the Malaita Eagle Force and the Isatabu Freedom Movements, stick to the deal by disbanding their forces. But the Act Party leader, who travelled to the Solomons with his wife – a Solomon Islander – said: "The NZ Government has not explained how unarmed NZ police will be more successful than unarmed local police who have been powerless. The force will need to have a ship offshore and a Hercules on standby at the airport." In related news, a) **Bougainville politician involved in... the Burnham peace talks... has been shot dead in what looks like an attempt by a faction of rebel fighters to undermine peace negotiations... Despite the groups agreeing to a peace declaration... there [have] been a number of confrontations... since the rebels... returned home... last month... The PNG Government was not represented at those talks. However... the... [newly elected PNG P]M... supported the Burnham declaration in principle.**

...N[Z] seems certain to host a second round of Bougainville peace talks, possibly early next month. The timing will be one of several issues discussed when the [NZ] Minister of Foreign Affairs... meets the new P[NG] P[M]... tomorrow.

...A[US] is to provide \$A100 million... in aid over the next five years for the reconstruction and rehabilitation of... Bougainville... said the A[US]n Foreign Minister... after meeting the PNG P[M]... yesterday... The new A[US]n aid would be in addition to \$A32.4 million worth of annual aid A[US] already provides to Bougainville... A[US] would also transport PNG and Bougainvillean delegates to the next round of peace talks...

The second round of peace talks aimed at brokering a peace deal in Bougainville will start in Christchurch next week... They are expected to last about eight days... It is not known whether the leader of the B[RA]... will attend. He would not take part in the first round... and has so far refused to support the peace process... saying the P[NG] Government's refusal to discuss independence made a mockery of it.

...Soldiers fresh from jungle training in Malaysia... are spoiling for a return to the tropics... Army chiefs are not saying what contribution N[Z] might make to a U[N]'s peace-keeping force, but the soldiers believe their... training should put them in the front line... "The guys are dead keen to go to Bougainville – they will have been acclimatised and maybe they wouldn't have to unpack their mossie nets," said one non-commissioned officer. Their contingent commander... said... "Soldiers are always keen to go overseas – that's one of the reasons they become soldiers." ...The 108 soldiers from the 2nd/1st Battalion... [also] have first-hand knowledge of [the peace talks being] held under their security gaze at... Burnham...

Emergency purchases of... radios... and... four-wheel-drive vehicles... are seen as essential for any serious N[Z] contribution to peacekeeping on Bougainville. There is unlikely to be any call for the Army's Vietnam War-vintage armoured personnel carriers, which were found woefully lacking for Bosnian peacekeeping... The [NZ Army also] had great trouble keeping its 1960s-era radios going in Bosnia, where it sent two rotations of 250 troops each... Soldiers who might go to Bougainville in a U[N] force, subject to [the] talks in Christchurch... would be unlikely to need armoured vehicles, although .50-calibre machine-guns are in rebel hands. They would have enough flak jackets... [but] the rough Bougainville terrain would call for much more reliable and robust light transport vehicles than [the NZ Army's] dying fleet of 15-year-old Land-Rovers... N[Z] sent 13 soldiers to Bougainville in 1994 to assist a 400-member peacekeeping force from Fiji, Vanuatu and Tonga during a peace conference which led to an 18-month ceasefire...

Hidden by blockade and deep jungle for longer than... W[W2] and almost as long as America's involvement in Vietnam, Bougainville is no petty tribal conflict. Nor will the truce announced last Friday at Burnham... be a small matter for N[Z, AUS] and the rest of the region... After Burnham there is hope. But... [similar] hopes collapsed after talks brokered in 1990 by N[Z] aboard HMNZS Endeavour[, after]... the 1991 Honiara Declaration, and again in 1994...

A[US] is to host a third round of talks to end the conflict on... Bougainville... [O]fficials said the talks would be held in the north A[US]n resort of Cairns next week...

Any decision to send armed forces to Bougainville would be made only after an approach from the P[NG] Government, a spokesman for the [NZ] Minister of Foreign Affairs... said last night... It is believed troops from Linton Army Camp... are preparing to go to the island for peacekeeping duties... [However, the] Defence Force headquarters press officer... declined yesterday to comment on the likelihood... "It's a matter of contingency planning. We do not discuss contingency planning." ...Meanwhile, the Navy is understood to be readying a frigate to take a truce monitoring force to Bougainville... N[Z] officials returned just days ago from a preparatory trip to Bougainville with officials from A[US] and PNG.

...N[Z] has scored a diplomatic coup over A[US] after being asked by the P[NG] Government to lead a 150-strong Truce Monitoring Group to Bougainville... The A[US]n Minister of Foreign Affairs... sought to downplay the issue in Canberra yesterday, telling journalists there was nothing... [in NZ] being asked to command the group. He said that at the end of the Sandline crisis it had been agreed between the two countries that N[Z] would be able to play a bigger role than it had in the past... "I think it really is time we started putting these little games about A[US] and NZ behind us. I mean we've got to learn to work with each other in a mature way." N[Z] is sending between 80 and 100 unarmed military and civilian personnel[, including engineers]... and medical staff... A "small reconnaissance group" will leave... today or tomorrow with the remaining personnel due on the island by the start of December... The Defence Force is also sending the frigate Canterbury, the supply ship Endeavour, the dive support ship Manawanui, Hercules aircraft and three Iroquois helicopters... The [NZ] Minister of Foreign Affairs... said the group would stay until February 28[, although] the truce-keeping exercise would be reviewed in January. He put the cost of the exercise to N[Z] at "several million dollars." [NZ has already 'spent \$5 million on the talks at Burnham.'

...N[Z]'s mission to Bougainville has an operational name the military's top brass want all its troops to live up to – belisi – pidgin for peace. It also meant calm or relaxed... A shocking-orange colour scheme being applied at [the] Hobsonville... paint shop... to helicopters bound for the troubled territory is designed to rub out any connotations of a warrior past... Although white is traditionally associated with peace, that is... out because it is the official colour of U[N] missions and Operation Belisi is strictly a regional initiative... Traditional camouflage colours are... also... out for truce-monitoring aircraft, especially since Iroquois helicopters given as A[US]n aid to P[NG] some years ago were turned into gunships and used against Bougainville rebels. The N[Z] helicopters will be unarmed, as will the... soldiers they support... A crash course in pidgin, or tok pisin, is part of the training for the... soldiers... Although there are about 19 dialects of pidgin on Bougainville alone, a broad Melanesian version of the language is generally understood. Phrase books will be essential for the unarmed soldiers... [Meanwhile, the] travel-weary crew of the frigate Canterbury left for Bougainville yesterday on a promise that the Navy will try to get them back for Christmas. The ship has already spent almost 200 days away from its Devonport base this year, including 140 days at sea... Sailors... are... using brushes and rollers to turn their shipboard Wasp helicopter orange... on their way north. They had no time to do the job before sailing... [T]he main party of A[US]n truce monitors is [also] on its way to Bougainville. The 82 A[US]n Defence Force Personnel left at the weekend aboard the supply ship HMAS Tobruk and are expected in Bougainville in a week. They will combine with [NZ's] troops...

The N[Z] military's largest overseas mission since the Vietnam War faces enormous challenges as monsoon rains finally hit... [the] troubled territory of Bougainville... Unarmed N[Z] troops... will have less self-protection than P[NG]n police... Both the PNG Government and Bougainvillean groups have asked the N[Z]ers to leave their guns at home... A former senior Army officer with service in Vietnam and Malaysia noted last night that P[NG]n police would not venture out in many parts... without side-arms. "I think it is crazy to ask soldiers to go in there

without any protection at all – if I was their commanding officer I would be losing sleep.” But a serving officer with extensive peacekeeping experience said the lack of firearms would help the N[Z]ers build trust... However, [a] ...ready reaction force will be stationed off Bougainville on the frigate Canterbury in case the unarmed Truce Monitoring Group become targets on the war-ravaged island... [The mission’s] commander... said malaria posed the biggest risk... 9800 Japanese soldiers died from disease during their occupation of... Bougainville in... W[W2]... compared with 8500 killed.

...Government officials insist the security of unarmed soldiers on Bougainville remains paramount, even though the frigate Canterbury is due to head home today... [Still] giving support to the truce monitors are two tankers from [the NZ and AUS]n navies... As with any naval ships, they would be carrying limited numbers of small arms, under lock and key... The full truce monitoring force is now on Bougainville with the arrival from Whenuapai yesterday of 21 more soldiers, taking the number of N[Z]ers involved to 226, excluding naval crews. There are also 147 A[US]ns, including 20 civilians, and 17 truce monitors from Fiji and Vanuatu.

...An unarmed N[Z] soldier stands... among the ruins of Bougainville’s main airport and turns to see a waving child. He waves back... It was not like that when the troops first arrived a little over two weeks ago, he says. “You couldn’t get a smile out of some of them at one stage. Now, they’re so friendly it’s almost getting to my head. Kids suddenly jump out of the bush to say hello. They are hungry for peace now.” ...To kick-start Operation Bel Isi... military intelligence picked up on an important aspect of Bougainville protocol – the payback system. “The way it works here is ‘You kill my pig, I kill one or two of your pigs,’” said the operation commander... “You kill my brother and I kill your brother. And so on...” The operation planning centred on the positive side of that system, along the lines of “you be good to me and I’ll be good to you.” When truce monitors... arrived, guns on the island were still very visible in the community... The soldiers went unarmed. After a while the locals, too, put their guns away... The truce monitoring force always maintained that no arms was the only way, although risky... Their most potent weapons, however, were distinctive patches worn on the shoulders of their uniform. One was... a skilful sketch based on a passage from the *Bible* – a white dove with an olive tree branch in its beak, the signal from the Heavens to Noah that the storm was now calm and that a new, peaceful beginning was on the horizon. The locals, predominantly devout Christians, relate well to that... [One revolutionary guerrilla said he] did not believe he would ever walk unarmed and remain alive along the... main streets of Arawa. Over the past nine years, it has been mandatory for a fighter to carry at least one firearm and perhaps a grenade or two... [After a] memorable walk along Simba St, where the... Arawa... town council building stood before it was destroyed by a homemade bomb... [he] said... “Not long ago, I would have been shot. I thought I was dreaming... No one had a gun, not one shot was fired... just people busy working...” ...Before everything else, the soldiers had to labour in the... 40-degree heat... and high humidity to help clear the debris and repair the essentials such as roads, wharves, electricity and water supplies... The locals gave the soldiers every assistance they could... The dangers of war are no longer evident on Bougainville, though an air of uncertainty remains... The Panguna copper mine, one of the largest open-cut mines in the world... is likely to remain closed. Observers say it may cause more problems if it opens too soon. In 1972, landowners... demanded higher compensation for the use of their land by the A[US]n mining company CRA. Sabotage and disruption of the mine erupted into violence in the late 1980s and people took sides. The Government soldiers, the Bougainville Transitional Government, police and resistance groups took one side, and the B[RA] and its political arm, the Bougainville Interim Government, took the other. Although fighting for the same cause, the BRA split internally. One group... led by... [the man who led the landowners in 1972, still hasn’t] come to the party.

...The head of the Bougainville rebels... says he is opposed to N[Z] and AUS]n troops being in the truce-monitoring group... [He argues AUS]’s role in setting up the P[NG]n defence forces... means A[US] is not neutral. He cited the role of N[Z] pilots who flew A[US]n-supplied Iroquois helicopters as gunships as evidence that N[Z] is not neutral either... [Incidentally, PNG’s new P]M... moved yesterday to rid his Government of the stench of corruption, although it is largely constituted of members of the old guard who entered into an improbable alliance to keep power.

...Newspaper biographers describe P[NG]’s new P]M... as a former Raskol, one of the thugs who terrorise the streets of Port Moresby and contribute heavily to the perception of a society close to anarchy... [The PM’s] knowledge of life on the edge will be crucial to the future of his country... Increasingly, the issue of law and order is of pivotal importance to PNG in its efforts to attract foreign capital and kick-start its moribund economy... At present, PNG is anything but attractive to foreigners... Violent robberies, payback murders and rape are far more frequent than in neighbouring countries. The annual crime rate is 10 times that of A[US] and six times that of Fiji – a nation with a number of socio-economic similarities... So prevalent is crime that [it] accounts for an estimated 15[%] of urban employment. It is also the business with the highest profits and least risks, with the probability of arrest for theft of 3[%], the probability of a subsequent conviction 55[%], and a 50[%] chance of escaping jail.

...The P[NG]n P]M... allegedly authorised the payment of \$A1900... in bribes through a senior minister, according to video tapes... secretly filmed by a former Government adviser... and... obtained by the ABC... after [the adviser had] a falling out with senior members of [the PM’s] party over prime ministerial influence... In a revelation that will rock the already shaky Government coalition, [the PM] is shown talking to his former adviser... about a payment to[the] Internal Affairs Minister... last month. [The adviser] is later shown telling [the Internal Affairs Minister] that the P[M] told him to give the minister 2000 kina... so he could look after the local media... [The former adviser also alleged that the PM authorised other payments] to ministers and backbenchers... totalling \$A25,650... [However, the PM said, “The former adviser is] a bloody crook. AMID fresh allegations [that the new PNG] leader... was involved in murder, [a]former PNG P[M] yesterday said the new PM]... should step aside pending the results of a full inquiry. On Friday night, it was revealed another secretly recorded video tape apparently identified [the PM] as the country’s chief crime lord. The footage allegedly features the embattled leader admitting he is the “godfather” of the notorious Rascal gangs[, although]... the video has poor visual and audio quality. However, a man identified by the ABC as [the PNG PM] can be heard admitting involvement in violence. The man says: “If I tell my gang members to kill, they kill... [He] was staying in Brisbane but could not be contacted for comment.

...[the beleaguered PNG PM] claims two of his own cabinet ministers were... behind the two recordings. “They made me drunk; they made me talk bullshit... It is our way, we get drunk to say all kinds of things,”... He also claimed the tapes were edited to incriminate him.

...Organisers of a planned rival anti-corruption rally scaled down their protest yesterday after claiming there had been threats of violence from [the PM’s] supporters... Melanesian Solidarity... had... decided that a small group would hand [the PM] a petition at [a local stadium]. However, when they arrived they found that about 500 people – mainly youths from Port Moresby squatter settlements – had gathered and were chanting support for the PM.

...PNG’s P]M... held on to office yesterday, maintaining... his... delicate... four-party coalition... in the face of... corruption allegations... [after mustering] enough numbers in the 109-seat Parliament... The... [PM] has dismissed the... [allegations], using what local politicians called the “Johnnie Walker” defence – claiming he was drunk... On Monday night, [the PM] apologised for his drinking. “I let PNG down... but I have learned a lesson. I am a sinner, but I was saved by the grace of God [from] people who plotted to work against me.” - 1997

The populations of NZ and PNG (pop. 'estimated at 3,752,000 in 1991') are approximately the same, as are the number of seats in their parliaments (in comparison, Fiji – where the population is about five times less, 'est. 748,000 in 1992' – has a '71-seat Parliament'). Up until 1996, NZ was divided into 99 electorates of approximately equal population. Every adult NZer who didn't have a criminal record could put their name on the election ballot-paper of their local electorate. During an election, citizens got one vote with which to select a candidate (who may have stood for a particular party or been independent) to represent their electorate in Parliament. Whichever party won the most electorates – or was *first-past-the-post* (FPP) – became the ruling party and its leader the PM. Because NZ politics was traditionally split between the National and Labour parties, electorates normally went to one or the other – thus ensuring that either major party gained a majority of seats while smaller parties usually gained none despite having significant support nationwide ('in 1984 the New Zealand Party polled an impressive 12.2% but won no seats – although Social Credit, which received only 8% of the national vote and whose leader lost his seat, won two electorates'). Dissatisfaction with this system – particularly amongst the smaller parties – led to a 1993 referendum which resulted in the country adopting a Mixed Member Proportional (MMP) system. The system chosen (from the four put forward – with the other three being a 'Supplementary Member Voting system; a Single Transferable Vote system; or Preferential Voting') gave NZers two votes – one for a candidate to represent their electorate and another for a party to represent the nation. Furthermore, the public was informed that MMP meant there needed to be '60 General Electorates, 5 Maori Electorates and 55 *list MPs*.' Each party created a list of its candidates by ranking them in order of authority (starting with the party's leader). Theoretically, if a party obtained 50% of the *party vote* it would be allocated half of the seats in Parliament. Therefore, if a party is allocated 50 seats but only wins 40 through the *electorate vote*, it gets to add 10 members off its list (starting with the highest-ranked candidate who wasn't elected and proceeding downwards).

But remember: ...a party must win at least 5[% of all] party votes OR at least one electorate to get a proportional allocation of seats. [However, to be registered for the election, political parties only need 'to give evidence of having at least 500 members.']

...Drumming up 500 members obviously has not proved too difficult. Winning the party votes of those 500 plus a further 99,500 people will prove a more testing challenge. On the 1.9 million voter turnout of 1993, about 96,000 votes would be enough to pass the threshold, but given expectations of a higher MMP turnout about 100,000 is seen as a realistic target. The other way of beating the threshold is to win an electorate seat, something more of the little parties are beginning to pin their hopes on. That is something small parties have struggled to achieve in the past and while some voters may feel they now have greater discretion with their electoral vote, it will remain a huge hurdle in the 60 enlarged MMP electorates... Meanwhile... the latest business opinion report from the Manufacturers Federation... says... the upcoming election [i]s generating uncertainty, especially among larger manufacturers. New spending was being put on hold and the country was gripped by a "wait and see" attitude.

...Twenty-two political parties are seeking Electoral Commission approval for time and money to run election advertisements on radio and television. By law, parties are not allowed to spend their own funds... only what they are allocated from a \$2 million pool held by the commission. ['26 parties were registered for the 1993 elections' but a number of smaller parties have merged since then. Amongst the more unusual new-comers is the]... **Natural Law Party**[, which promises to] maintain a group of 1,000 Yogic Flyers to create an indomitable influence of harmony and positivity throughout the country by enlivening the Unified Field of Natural Law in national consciousness[(although the party doesn't explain why it is necessary for them to win the election BEFORE such a group is established!)]. As harmony and positivity rise in national consciousness, all problems of the nation will disappear, as darkness disappears with the onset of light... Yogic Flying demonstrates perfect mind-body coordination and is correlated with maximum coherence and integration of brain functioning. The practice of Yogic Flying produces bubbling bliss for the individual and generates coherence, positivity, and harmony throughout the environment... This will prevent negative trends within society and protect the nation against destructive influences from beyond our borders... The Natural Law Party will eliminate crime by removing the root cause of crime – the inability to think and act in accord with Natural Law... Extensive scientific research has confirmed that a group of Yogic Flyers dissolves collective stress, as indicated by decreased crime, violence, and sickness and improved economic indicators. Studies have shown that the larger the group, the greater the influence... Over a 7-year period, violent deaths were less in Canada & USA during weeks when groups of Yogic Flyers exceeded a threshold of... 1% of the population... A group of Yogic Flyers was set up in the Liverpool metropolitan area, Merseyside. Over three years crime in the area came down by 15%, while in the rest of Britain it went up by 45%... Election is the time to create a better government. The... *Natural Law Party can create not only a perfect government, but also a perfect individual and a perfect society...* The Natural Law Party will step outside of parliament and its own membership to invite N[Z]'s most expert, renowned, and respected national figures to serve the nation as the cabinet... *Being freed from the poison of party rivalry, they will be able to act according to their consciences and serve the nation as a whole rather than just the party in power... Don't waste your vote on failures...*

Your vote probably counted for little at the last election. Unless you lived in a marginal seat, all you probably did was add one more vote to the already-sufficient majority of an MP from one of the two old parties. Or you ticked in favour of the inevitable loser. Or you may have cast a defiant, but wasted protest vote for a third party. Under first-past-the-post, "tactical" voting was usually confined to byelections. Now, with two votes and a myriad of parties scrambling to reach the 5[%] threshold, voters may be tempted by the allure of a range of "pick-and-mix" combos. You will be told in seats like Auckland Central that a "tactical" vote cast in the right combination will give you two MPs... You might think that casting your party vote for Act N[Z] and your electorate vote for National will ensure National stays in power. Act has been trying very hard to make you think that. But watch out: what looks like attractive or sensible combos could leave you feeling queasy when results roll in on election night. A recent *National Business Review-Consultus* poll suggested four out of ten voters were "very likely" or "fairly likely" to split their votes. The trouble is that less than half of these vote-splitters understood the primacy of the party vote in determining how many seats each party gets in Parliament. This is of major worry to National and Labour. They look like winning the bulk of electorate votes – but fear voters will take their party votes elsewhere or try to vote in a coalition they want... Some politicians predict personal voting will help high-profile incumbents considered to be doing a good job, giving them even bigger majorities. Likewise, poorly performing MPs will be punished because voters can still be loyal to their party with their other vote. The risk for Labour and National is that MPs will not be loyal. Politicians know they are going to run into voters in the coming weeks who say they like them, but not their party. Do candidates try to talk those voters around to their party, or just quietly nod (and wink), knowing that 1200 or so personal votes like that may be the difference between personal victory or extinction? In Germany, MPs are sometimes more brazen. They publicly suggest that voters from other parties give them their electorate votes, but not their party votes. This annoys party bosses who argue they are being selfish and it is their party that needs every vote... "Stimmensplitting" is the German term for vote splitting. But the phenomenon is largely confined to smaller parties. Traditionally, more than 80[%] of those backing the two largest parties... have cast both votes the same way... [Incidentally, a retired] judge investigating electoral bribery in Queensland has quit, again focusing attention on the commitment the state has to fighting corruption. The affair raises the spectre of practices that brought the conservative government of [its NZ]-born premier... to its knees in 1988.

...[the] Pakistani President... sacked [Pakistan's P]M... yesterday, accusing her Government of widespread corruption and nepotism... [She] had been in power since general elections in October 1993, her second spell as P[M after a previous] President... sacked her for similar reasons... in 1990.

...[the 'President of Turkmenistan won the right yesterday to rule his gas-rich country for life. Only on Monday, the 59-year-old former Communist leader, who has ruled the country since 1991, had urged officials to stop praising him and not to ask him to be President for life. He changed his tune when

Parliament passed a law altering the constitution to allow him to rule indefinitely.' In other international news, the US President] is in Denver today, kicking off a three-day campaign trip to the West Coast... The trip has two purposes: raising funds for the November 5 election and lavishing time on California, the nation's most populous state... A... campaign official said the President was expected to raise... a total... of... \$US4.5[million] to \$US5 million during the three-day trip, which includes no less than eight fundraiser drives.

...*Corporate jet comfort for National elite*... The National Party is feeling sensitive about the P[M] being pictured using a corporate jet on the campaign trail. While the N[Z] First and Alliance leaders travel by bus, and the Labour leader... takes scheduled flights, National has chartered a... jet... which costs... \$3500 an hour. The P[M]'s office yesterday pointed out that the charters were at no cost to taxpayers, unlike [Labour]'s...

Silence was the clue yesterday to working out who has done best out of the carve-up of \$2 million of taxpayers' money reserved for election campaign advertising... [T]he loudest complaints... came from N[Z] First and the Alliance. Their grump? They got around \$250,000 each. The figure is well short of what National got... \$534,000... And Labour's \$432,000. But not a lot more than the \$93,000 set aside for the likes of the less than popular United N[Z], The Act Party (whose 'president is a former Labour Party minister' who introduced the unpopular *Rogernomics* economic reforms during the 1980s)... and the Christian Coalition – parties... likely to be National's coalition partners if they crack the 5[%] threshold... In 1993, only seven parties were scrapping over the same \$2 million... N[Z] First missed out completely in 1993, even though it fought that election. But National and Labour got just over \$700,000 each... Working out who gets how much is done according to weightings given to the following: number of votes at the last election, byelection votes, number of MPs, party membership and opinion poll results between February and August this year. The \$93,000 is deemed sufficient to buy one 30-second and two 60-second prime-time television spots a week for four weeks. All parties will also get "free time" in varying quantities for their opening and closing addresses on Television N[Z] and Radio N[Z]. Of the remaining parties, 'six were allocated \$35,000, six more received \$22,800, one got \$15,000 and another \$5000.'

...We] spent \$108,333 on electing each of the 120 MPs required under last night's first MMP general election... With 2,385,598 people registered on the country's 65 electoral rolls up to last week, each vote would have cost \$5.44, assuming that everyone voted – and not everyone ever has.

...*MMP passes first big test*... N[Z]'s first MMP election had several outstanding features. The [most obvious feature] is that no single political party won a majority in the House. On election night figures the biggest party – National – had only 44 seats out of 120... [The remainder were shared by five other parties – 37 for Labour; 17 for NZ First; 13 for the Alliance; 8 for Act; 1 for United.] (The Natural Law Party polled less than 3000 party votes.)] As the three largest parties in Parliament begin negotiations to try to form [NZ]'s 'first true coalition since the 1930s', anyone who asks, "Is this what we voted for when we chose MMP?" can only be answered with a resounding "Yes." ...No one should have been surprised. In 1992 the Electoral Referendum Panel... stressed that under MMP "minor parties are likely to be represented in Parliament" and that, as a result, "coalitions or agreements between parties may be needed to form governments." ...[Furthermore,] the Royal Commission which recommended the proportional representation system for the country almost exactly 10 years ago... noted that "no voting system can fully meet the ideal standards set by the criteria." It also pointed out that "some of them... are mutually incompatible." Nevertheless... the... number of Pacific Islanders elected to the House of Representatives trebled (from one to three), and Pacific Island Polynesians are now in Parliament in rough proportion to their population. Is there anyone in N[Z] who does not feel especially pleased about... the country's first Asian MP? And the proportion of women in the House... shot up... from 21.2[%] to 29.2... There has been a dramatic increase in the number of Maori MPs. There are now 15... one in eight MPs... and they are represented in every party in Parliament with the sole exception of United (which is also the only party without a female MP)... This year only 7.3[%] of NZ's electors voted for a party that didn't qualify for seats in Parliament. In contrast, 48[%] of the votes cast in 1990 were wasted... On election-night figures, National got 34.1[%] of the party votes and won 36.7[%] of the seats... Compare those figures to the last two elections. National won 47.8[%] of the votes and 69[%] of the seats in 1990. Three years later it won 35[%] of the votes and 50.5[%] of the seats. Clearly – and utterly unsurprisingly – MMP has led to greater fairness between the parties... While ensuring that different views are represented in Parliament, an electoral system ought to encourage all groups to respect other points of view. [However, we] cannot say for sure that this has already occurred or that it will definitely occur under MMP... so we can't say whether or not future governments will, in the words of the Royal Commission, "have the ability to act decisively" as well as have "reasonable continuity and stability."

...[negotiations between the three largest parties] could take anything from two weeks to two months... The negotiations will be behind closed doors, but the agreements will have to be made public to give the public and the Governor-General[(who has just]... received an 8[%] pay rise, taking his tax-free salary from \$106,000 to \$114,500)]... confidence in them [– especially since 45 of the 120 MPs are new.

...#7 on Act's list] gives us his early impressions as[a] new MP... The overwhelming first impression of Parliament is its sheer size... Four buildings now make it up... Adding to the sense of size are the subterranean tunnels and overhead walkways that connect the buildings. The walkways and tunnels mean you can move around Parliament without getting your feet wet – and without meeting any real people... And it's not just big but busy... Parliament now has 120 MPs... a fifth more than before. The hope is that the extra MPs will mean a Much More Positive Parliament. It's early days yet. Only time will tell if it's a hope well placed. But the real size of Parliament is not the number of MPs. The great bulk of the place is taken up with the support crews: the caterers, security guards, messengers, cleaners, secretaries, advisers and press officers. Parliament has nearly 1000 staff. The staff all take up space. Parliament has 668 offices. And 1333 telephones... New MPs are disoriented not just in finding their way around Parliament but in who is on their team and who isn't... First-time MPs wander around Parliament wondering out loud where their leaders are and what they are up to. They still don't know whether to carry on criticising the members of the other team as before the election or whether now to embrace them as their new-found coalition buddies... But then the new MPs aren't the only ones confused as to whose team they are now on. Some of the old hands are looking decidedly bewildered... No one knows where the coalition talks are taking place. The talks are too secret even for the insiders who normally know the buzz... Right now... [everything awaits the NZ First leader] making up his mind on whom he will support[(i.e., 'a small party is holding the balance of power')]... It's going to take time... It is to be hoped that voters are patient. Parliament costs over \$2 million a week to run... even... in the absence of elected government... The fuel consumption is the same whether the engine is on idle or full steam ahead.

...Act's[#7 and] finance spokesman... rarely sees a problem without also seeing a solution and is as yet unaccustomed to... political life... [T]hese qualities inform his... proposal... entitled "Let's Bulk Fund MPs \$500,000 Each – And Save Money." "I know \$500,000 sounds a lot... But it's much less than what gets spent now...," he said... The change to MMP will mean the largest increase in state funding of political parties in [NZ]'s [history.

...The cost of running Parliament under MMP is still up in the air. But already... an extra \$13 million is being budgeted... The total cost of MP's salaries and expenses, including travel, research and secretarial support, will jump to \$50,185,000. Added to that is \$22,155,000 for the running of Parliament buildings and keeping the politicians warm, fed and feted... While the sums are described as "somewhat simplistic,"[the] Parliamentary Service general manager... says they work out at \$602,833 for each MP in the post-MMP Parliament... But, as[the] Higher Salaries Commission... chairman asks, who really knows what the end cost will be? The budgeting is "a mere punt"... For example, for the time being we've reduced the personal expenses paid to list MPs... compared to electorate MPs... This differentiation will result in the member representing a constituency receiving a basic expenses allowance of \$7000 a year while the list member will get \$4000... [The chairman] concedes that cutting the basic expenses for list MPs was a guess... Apart from the lower expenses allowance, the list MPs will also not have access to scaled constituency allowances. This means they won't be able to capitalise the first year's allowance, less 10[%], to buy a car... Urban[constituency] MPs will get \$8000 ranging to \$20,000 for those representing the largest districts... The official Leader of the Opposition, based on the single largest party opposed to the

Government, will be paid the same[salary] as a cabinet minister, \$126,000. This represents no change. However, the leaders of smaller parties will be paid on a scale tied to numbers in the House of Representatives, ranging from \$90,000 down to \$82,500. To get the top dollar a party leader must head not less than 25 MPs. They will also qualify for additional expenses scaled to numbers – \$10,000... to \$9000. However, unlike the official Leader of the Opposition, they will not get a house and grounds allowance of \$3500. If a party has fewer than six members there's no additional recompense for leadership above that of an ordinary backbencher. All MPs in the new Parliament get a \$2000 basic pay rise on the present rate, taking them to \$74,500... Old parliamentary warhorses like... one of the Rogernomes of Labour in the 80s now living in retirement in Tauranga, snort at the Higher Salaries Commission line of the "need to recruit and retain competent people" when setting parliamentary salaries and allowances. He'd halve the number of MPs, not increase them, and double the pay to try to attract the right talent. On quitting the House, he growled: "If you pay peanuts you get monkeys." He doesn't think anything has changed... "At \$74,500 the salary isn't much for the most important job in the country – running the country." But it's a bit more than \$74,500. Apart from the salary and direct allowances there is unlimited free travel within the country, which also extends to a wife[husband] or nominated partner, and three return flights to Wellington a year for any children. There's a daily allowance of \$52 for attending the House sittings, committees, travelling on parliamentary business or other official occasions. An allowance of up to \$125 a night is paid for overnight accommodation for out-of-town members while attending the House and other parliamentary duties to a maximum of \$6875 for six months. THERE'S provision to waive this if the member owns or rents accommodation in Wellington and settles for "actual and reasonable costs" negotiated with the Parliamentary Service. When it comes to doing the job, the electorate MP will in future get two secretaries (previously one) paid for by the Parliamentary Service, plus another in Parliament Buildings... They get research support equivalent to \$20,000 provided on a pool basis, free mailing and their Telecom bills paid. One of the real benefits of being an MP is superannuation... It's a great pension scheme[– unlike]... the pension scheme that traps voters... On the basic salary the best rate of contribution is 8[%] of salary which then attracts a 16[%] subsidy. If... MPs put in \$100 each week into their own fund... the taxpayers put in another \$200 tax-free... So long as they last the distance, the young ones will retire with over \$1 million in the bank... Although they are subsidised by the taxpayer, these contributions are not open to public scrutiny... MPs... have an added perk of subsidised non-official travel. The... subsidy ranges [from 'a 25% rebate'] up to 90[%] for MPs who have completed four terms or more... and includes spouses... In the case of former members the rebates begin at 60[%]... through to 90[%]... Spouses of former members have the same entitlements for life. There is a monetary limit on the amount that can be claimed by former members and spouses in any one year. This is fixed on the cost of a return trip flying business-class to London[– currently '\$11,292']. The Parliamentary Services office says rebates for former members and spouses cost \$921,588 for the past financial year... The former members and spouses can also make 12 economy-class flights a year within N[Z] and have free intercity road and rail travel, including the interisland ferry, for life... [Prior to the election the] MP for Nelson... mistakenly circulated a memo he sent to parliamentary officials seeking details about his entitlements if unseated on October 12. Apart from his super, [he would] get three months' salary as "redundancy." He tried covering up the embarrassing memo leak by saying, "It won't be the slightest bit relevant on October 13." [● MPs are also allowed to maintain 'outside business interests' and can gain additional income by giving speeches at private functions. 'The fees for most NZ speakers are about \$1000 to \$3500' per function.]

...Welcome to the democratic new world of MMP... It has long been plain that N[Z]ers had not the faintest idea what they were voting for when casting their ballots for MMP. Most voters still do not understand the new system. Many never will. A cynic might say that this is just par for the course: when have most voters ever been very well-informed? True enough. But it does underscore the fact that to justify bringing in a significantly more complicated electoral system, compelling reasons are needed. And there are few signs, as yet, of compelling reasons for MMP. MMP was billed as a fairer system than [FPP]. It is certainly fairer to political parties... But fairness to political parties is not our ultimate concern. We want an electoral system that is fair to voters as a whole; that is the only kind of fairness that makes sense. And it is far from obvious that the messy business of coalition-forming under MMP... [is] any fairer to voters, or any more democratic... And because responsibilities will be harder to pin down under coalition politics, the whole process of holding governments to account [has] become more difficult. Whatever the merits of MMP, one thing is clear: given the crucial role played by post-election manoeuvring among parties... a voter can have little confidence that a vote for a given party will represent a step in their desired policy direction... Thus even the most informed voters can have little confidence about where a vote for their given party will ultimately lead. Such is our "fairer" system.

...Slowly but surely, the outside world is starting to knock on the door of Parliament's private coalition talks. We are not just talking here about the impatient calls coming from some quarters for the politicians involved in these Byzantine negotiations to hurry up and get on with things. Ignoring the polite preliminaries of the first meetings National and Labour held with N[Z] First, substantial coalition pow-wows have been under way for only two weeks... The day-to-day business of Government, however, is starting to intrude on the coalition talks, simply because decisions require multi-party consultation... A Cabinet Office memorandum released this week declared it "appropriate" for the "routine" business of Government to resume... but sources in N[Z] First and elsewhere suggest that the party might not be in a position to declare a preference for Labour or National – or coalition or minority government – for at least another three weeks. N[Z] First wants to extract all the information it can from the exhaustive tandem talks before taking the options back to its caucus for a decision... One frustration has been [the NZ First leader's] insistence on nailing down everything in advance and getting a detailed, watertight agreement. This is considered unrealistic by some on the other side of the negotiating table who argue governments cannot anticipate everything they will be forced to confront over three years. But the growing feeling is that [the NZ First leader] is far less interested in policy than maintaining his party's leverage beyond the talks. That is inevitable. He must retain flexibility in a coalition or minority government arrangement which keeps his party independent of its bigger partner – and thus its electoral identity... How close we will be to forming a new Government by the time Parliament opens in the week of December 9 is a moot point. But not an essential one. It is understood that constitutional requirements would be satisfied by Parliament sitting for just one day next month to swear-in MPs and elect a Speaker. Neither procedure requires a new Government to be in place. Parliament could then safely adjourn until February. That would leave plenty of time for the new Government to get itself properly sorted out.

...If you believe the stars it's [Labour's leader for P]M... In a spooky N[Z] *Herald* horoscope for coalition-day the Labour leader gets a big celestial nod. For her Pisces star sign, [a]British astrologer... predicts "the most dramatic day of the year for you, one when all you have achieved to date will start to fall into place." ...The heavens are not so good to [National's leader]. The Gemini P[M] is cautioned: "It would not be fair to blame other people for plans which go awry today..." As for [NZ First's leader], his Aries horoscope is as enigmatic as the man himself: "Today's dramatic planetary picture demands that you make a completely fresh start in a business venture. Please be aware, though, that your attitude to money is heavily influenced by a sense of priorities that by now may be outdated and supremely irrelevant." But the truth, as they say, is still out there, at least for another few hours.

...[NZ First has chosen National as its coalition partner – giving the coalition 61 of the 120 seats. National had to make a number of concessions in order to remain in power, with one of the biggest being that the NZ First leader (a former National MP) became the Deputy PM and Treasurer. Prior to the election the leaders of both parties had been "sworn enemies" and the NZ First leader proclaimed that "he would never consider forming a coalition with National." He later told the first National MPs to speak out against their coalition partner that they should "be grateful they're in Government – they could be in Opposition."'] The coalition agreement shows N[Z] First pushed National hard in the negotiations but that National dug its heels in on economic policy. The budget tables attached to the document are those of a Government at the "right" end of centre-right. This is most evident in the aggressive debt reduction programme, which would reduce debt to 18.7[% of GDP] by the year 2000. - 1996

Opposition parties have condemned N[Z] First's latest \$59,000 claim on the... \$563,000... taxpayer-sourced expenses fund for the coalition talks... The Alliance leader... said... it is time the party came clean... it was an outrage that MPs were not being told what the money was spent on. "Public money should not be spent on anything without detailed parliamentary scrutiny." ...If approved, [the sum] would take N[Z] First's total claims to just over \$170,000. Initially a maximum of \$100,000 plus GST a party was approved, but National and Labour have so far indicated they will make only small claims on the fund... National has claimed \$839... Labour would claim just over \$1200 for legal advice on the proposed coalition agreement... The Labour leader... described the N[Z] First claims as "huge" and went as far as suggesting that it might be used to pay off some of the party's campaign debts.

...N[Z] First was the third biggest spender in the election campaign. The latest figures from the Electoral Commission show the party spent \$858,255 – slightly more than Labour's \$848,480. Act splashed out the most at \$1,653,169 followed closely by National on \$1,426,067. The Alliance spent least of the four major parties at just \$558,059.

...The police are [conducting] inquiries into nine candidates and two political parties for possible breaches of the law at the October elections. The most serious breaches relate to possible fraud by two candidates who allegedly failed to disclose significant expenses or donations, one of whom is also under suspicion for not disclosing broadcasting expenses. An assistant commissioner at police headquarters in Wellington... yesterday refused to name any of the individuals or parties under investigation or whether any of the candidates were MPs. But last night, the... president of the National Party... said the party had committed a "very minor" breach of the Broadcasting Act...

This... Government is... [proposing] to spend \$94 million on a new office building for... ministers... To make way for the new building, they have forced Radio N[Z] out of Broadcasting House, a purpose-built facility that... stands for an essential part of democracy – communications. Its two large musical recording studios are unique in N[Z] and have not been rebuilt in Standards House, the office block... into which R[NZ] has moved. The last equipment [was] moved out of Broadcasting House a week ago. Tenders for demolishing the building were called in March. Unless we speak out it will be gone in a few weeks.

...Senior cabinet ministers... are jittery about committing... taxpayer money to a lavish... ministerial building... However, it seems the Government will proceed with the... building simply because it is too late to pull back. The... previous National Government was not satisfied with an earlier \$64 million design and decided, without consulting the public, to dip into the taxpayer purse to spend a further \$30 million on a larger, more grandiose plan.

...A new \$94 million home for cabinet ministers is set to proceed despite a row resurfacing about its cost and whether it is needed... The Beehive [(a nickname for NZ's Government that is derived from the title of a building 'opened in 1977 for the housing of Ministerial offices and the Cabinet room at a cost of \$18.8 million')] plans to release costings to justify cabinet approval today... The proposal, which has already cost more than \$11 million... including \$3 million paid to R[NZ] in compensation for its being forced to move... was reopened last week under growing criticism about how much MPs spend on themselves... It... comes on top of the \$168 million refurbishment of the old Parliament Buildings and a scheduled \$30 million upgrade of the Beehive... Officials were asked to report on alternatives. They include deferring the decision for a year, regarded as the most likely compromise, and extending the lease on the high-rise Bowen House off the parliamentary complex which houses some ministers and other MPs... The decision to proceed with the present design was made in November 1994, just four weeks after approval had been given for a \$30 million building on the same site... A November 1994 Treasury report, released yesterday under the Official Information Act, said the then Deputy P[M]... sought a bigger ministerial accommodation project to that originally approved by the multi-party Parliamentary Services Commission. The original plan was for a new floor on an existing parliamentary wing, and a smaller new block behind Broadcasting House, which will now be demolished to make way for the new, larger ministerial block. The Treasury also recommended independent confirmation of Parliament's accommodation requirements and cost estimates before final decisions – advice the Government rejected... Some taxpayer costs would be recovered by the sale of Bowen House when the new MP accommodation was sorted out... Meanwhile, the National MP for Bay of Plenty... said yesterday that Parliament would not need the ministerial building if the number of MPs was cut by 20, to 100. "Without the burden of office space and other perquisites for 20 extra MPs, we wouldn't need to spend \$94 million on a new ministerial building. Quite frankly, having watched Parliament these past [few] months, many of us – including senior list MPs – are questioning the 120-member sized Parliament." ...Leading the charge is the Act party leader... who said yesterday the four-storey, marble and copper-clad building for 26 ministers was over the top... Until last month the project was humming along with barely a murmur of opposition. The only resistance focused on the design and a low-key campaign to save Broadcasting House from the bulldozer. It was not until [the] Act leader... dubbed the new building a ministerial "palace" on the back of [the #7 Act MP's] "perk-busting" campaign that momentum picked up against the project... Thereabouts... plans for the ministerial building went on public view... and... a Treasury report was released which showed the plan was rail-roaded through the parliamentary process without proper cost analysis... [The Act leader] said a refurbished Beehive – new air conditioning and carpet would be enough – and a smaller number of ministers would solve accommodation problems... [H]e understood some ministers were having second thoughts about such a "scandalous waste of money," [and] [he] would raise the issue with the Treasurer[, who]... was opposed to the building before last year's election, saying it was not needed. [However, the Treasurer's] office said yesterday that he remained opposed on principle but was locked into the decision to proceed which was made in 1995... In a feisty last-ditch attempt to go on the offensive, [the Treasurer dragged up the Act Party leader's] past, blaming him for being part of a Labour cabinet which took the "appalling" decision to build Bowen House instead of going for a purpose-built building for MPs at a cost of \$43 million... Bowen House, commissioned by the Government for \$85 million less than 10 years ago, had a market value last year of \$38 million, a select committee was told yesterday... The building houses 37 MPs and 400 staff and is connected to the Beehive by an underground walkway. It is owned by Government Property Services... The existing net rental was about \$3.2 million... But no matter how loud [the Treasurer] blows, he is the big loser... [after] being part of a cabinet decision reconfirming the building two weeks earlier... just days after his party's U-turn on postal deregulation... Public reaction to the \$94 million plan for a posh parliamentary building has certainly kept MPs on their toes... What's more, public hostility has taken to the streets with an Auckland couple... mounting a petition to stop the building.

...a... 200,000 signature... petition... protesting against the building yesterday swayed the Government administration select committee into opening the matter for submissions – but only for two weeks... The committee... chairman... acknowledged... it was a break with usual parliamentary practice for considering petitions and apologised for the limited time for submissions, but said work had already begun on the site... A[n] A[ct] MP... who sits on the committee, said... "It's clear to me that if the palace was put to a free vote in the House, it would be voted down. Time is short, but I am confident that armed with the facts, and a proper regard to the views of the taxpaying public, the palace will be stopped in its tracks."

...Parliament's accommodation problems may be resolved by completing the original Parliament buildings, the administration select committee chairman... indicated yesterday... Some MPs are contemplating doing what no Wellington earthquake has done – knocking the Beehive off its foundations and moving it... first 100m... [on a runway with] large teflon-and-stainless steel bearings[, rotating it]... 90 degrees, so its main entrance would end up facing the back of Parliament House... then[another] 50m along a second runway to its final resting place... Such a shift would not be a first for Wellington. In 1993, a four-storey hotel weighing 3500 tonnes was moved about 100m on rail tracks at a cost of \$2.4 million... But the... Beehive would be one of the top three buildings to be shifted anywhere, in terms of its 20,000-tonne weight, 12-storeys and the distance moved. A

25,000-tonne office building was shifted on rail bogies in 1955, but it was only 20m high and was moved only 60m. A German single-deck bridge weighing 20,000 tonnes was moved 1.1km in 1982.

...In what some insiders describe as the “bizarre” option, the select committee entrusted with... considering public outrage on a planned... \$94 million ministerial “palace” is keen to test the idea of relocating the seat of power. The Beehive would sit on land set aside for the “palace” and allow the Edwardian neo-classical Parliament Buildings to be completed, 75 years after work halted when money ran out on the project... in 1922... Only the facade would have to mimic the original 1911 plans... If the Beehive was moved it would probably continue to house cabinet ministers – a prospect which might not appeal as many loathe the working environment.

...SUPPORT is growing for a bizarre plan to move the Beehive and complete the old Parliament Building, with [the PM]... saying it “could be the grand millennium project”. [He] said his office had been surprised by the strong public support it was receiving for the so-far uncostered plan... “We have had virtually no criticism coming into the office on this much more expensive plan. People seem to see it as exciting.”... Meanwhile, [the PM] has told one of his junior backbenchers to back off a bill which, if passed, could have delayed the new ministerial building. The National MP for North Shore... said yesterday that he spoke with senior National MPs last week about plans for a private member’s bill to reduce the number of MPs from 120 to 100... [H]e... said that despite what a Royal Commission said about the need for 120 MPs to make MMP work, he had compared the 1996 election results and found that there could be 60 general seats, five Maori seats and 35 list seats without any party being disadvantaged proportionately... A retired Wellington woman, appalled at the “childish” behaviour of the new MMP Parliament, is planning a citizens initiated referendum to reduce the number of MPs from 120 to 99... She said... there were too many list MPs, they were a waste of taxpayers’ money... [S]he was not a member of any political party, nor was the petition aimed against MMP, which she had voted for and still supported... [She wants to] cut the number of list MPs from 55 to 34. She has submitted a proposal with a \$500 fee to the Clerk of the House... If [the Clerk] approves the proposal [she] will have 12 months to collect about 240,000 signatures before a referendum can be held... Anyone wanting to comment must send three written copies to... the [Clerk] at Parliament by August 1.

...yesterday... Labour withdrew its support for the \$165 million scheme to move the Beehive and complete Parliament’s 86-year-old design...

A PLAN to move the Beehive... is expected to cost \$203 million, according to a report due to go to Cabinet tomorrow... It is understood the costings... are within the range [the PM] considers acceptable, but only just... The scheme comes as Government departments have been told to come up with \$400 million more in savings...

The Government will not go ahead with the so-called parliamentary palace but will demolish the vacated Broadcasting House regardless... At a public meeting called to save Broadcasting House, which has Historic Places Trust Category 1 classification, the Act leader said he had information that the Government planned a “secret, rapid” demolition of the building this week... despite being undecided about what to do with the site... “...That means Broadcasting House will be knocked over for a car park.” ...Cash-strapped R[NZ has, meanwhile,] paid \$20,000 to rename its new premises... from Standards House to Radio New Zealand House.

...Workers started demolishing Broadcasting House last night under the cover of darkness by ripping the back off the building with a mechanical digger. No one from Quality Demolition and Contracting Ltd would comment on the... estimated \$1 million demolition contract...

The demolition... has been halted by the Department of Labour because of concerns over asbestos. The Attorney-General... said yesterday that he had been advised there might have been some pipes with asbestos lagging that needed to be removed before demolition continued... [I]t had been originally suggested that the area... did not contain asbestos... [The Attorney-General] was replying in Parliament to the Act leader... who claimed the demolition was illegal... [Incidentally, some] MPs are looking at tightening the rules for claiming expenses after the Audit Office found [they] could collect the maximum \$125 overnight allowance and \$52 day allowance without having to produce a receipt. The office is also unhappy that MPs check each other’s expenses, saying that meant the Parliamentary Service, which is responsible for MPs’ expenditure, was unable to do its job properly... There is no suggestion by the Audit Office that... MPs are fiddling their expenses.

...Act’s “perk-busting” MP... is now pressing for every parliamentarian’s spending... on phones, faxes, meals, accommodation and travel... to be open to public inspection after he revealed that one MP spent more than \$29,000 on taxis last year... [Another] MP spent only \$5 during the whole year. Neither MP was named... [F]igures showed MPs’ spending on taxis has risen from \$454,990 in 1992-93 to \$613,000 last year. That works out at a rough average of \$150 a week per MP, ignoring ministers who can use VIP transport or their taxpayer-funded “self-drive” cars... [The] first-term MP... [said,] “...I have never been in a job where you have unlimited use of taxis. These MPs can’t even practise restraint... It is a culture of spending.” Accountability expected in the private sector had never impacted on Parliament... Parliamentary rules allow MPs to use taxi chits for approved parliamentary business travel between their electorate homes and the local airport, and for travel in Wellington to and from Parliament, the airport and their homes. MP’s spouses may also use the chits for travel to the airport and Parliament, but the rules make no provision for other family members. The owner of a Wellington taxi company... said an MP could only spend \$29,000 in a year if other people such as staff used his or her chits – though he did not know of any doing that.

...Act MPs are to test a controlled credit card system aimed at improving accountability for MPs’... annual taxi [bills]... The new measures have been welcomed by Act’s perk-busting MP... However, the taxi trial may mean he has to stop using a limousine taxi service to get from his home to Auckland Airport – which he said cost the same as a normal taxi – because the driver does not have an electronic card service.

...According to figures from Ministerial Services, \$4,627,290 was spent on limousine travel for the... ministers in the 1995-96 year, up from the \$4,250,003 spent in the previous year... The limo travel is the latest revelation in... [an Act MP]’s perk busting campaign... “It’s an outrageous extravagance. That sort of travel should be limited to the likes of the P[M], his deputy and the finance minister, because there are security issues... The average amount each minister has spent on limo travel is more than their... salary and makes [a Labour MP]’s \$29,000 taxi bill look frugal. Ministerial Services told me there were 50 cars and that a fleet had to be maintained to be ready to go anywhere around N[Z – so they]... are sitting around empty most of the time. And let’s not forget that when these ministers tire of their limos, they can drive themselves around in cars bought for and fuelled up by taxpayers. In fact, ministers spent \$94,709 on petrol last year.”

...Politicians’ penchant for cut flowers instead of pot plants is costing the taxpayer more than \$50,000 a year. The Labour MP for Dunedin North... said... the amount was “over the top.” ...But a spokesman for... the Minister for Ministerial Services, said that when Labour was in power it had a flower bill considerably higher than this Government’s... [Meanwhile, Act’s] perk-buster... has made another bust – this time revealing MPs can use their \$85-a-month stamp allowance to pay their bills at NZ Post shops... [A] NZ First MP... was last month criticised for using her \$85 warrant to register her car, and [the perk-buster asked the] Speaker... to clarify the situation. [The Speaker (who ‘doesn’t have to explain his decisions to the public’ – such as why it spent more than \$29,000 on taxis last year)] replied that because the rules governing the use of the warrants allowed them to be utilised for all services available at NZ Post, MPs could pay their bills with them... “MP’s already get photocopying and postage allowances. [The Speaker] has effectively declared open season on the taxpayers by saying MPs are entitled to use their warrants to pay their bills.” ...But given NZ Post’s expansion of services, the rules were now under revision... [T]he warrants cost taxpayers \$122,400 a year.

...Perk-busting MP on receiving end of lavish spending claims... [Yesterday t]he Act MP... went to a select committee hearing to grill officials about MPs’ perks, only to find himself in the firing line for his own travel expenses. The irritation felt by MPs towards... [his] lone campaign snapped when the Minister of Conservation... revealed [the Act MP]’s fondness for the comforts of business class. He later said that if the Act list MP “practised what he preached” and flew economy class between his Auckland home and Wellington, the taxpayer would save about \$9000 a year...

[The minister] also said that if [the perk-buster] wanted to go the whole hog, he could choose as a list MP to live in Wellington and save the taxpayer \$30,000... [The MP] responded... by saying Act constituents expected him to fly business class. "I'm from Act. I've got to be upfront."

...Do as we say, not as we do message from politicians... Phrases like "self-reliance," "helping people to help themselves" and "reducing dependency" drip regularly from the lips of senior ministers... The blunt fact is... [they] seem reluctant to impose on themselves the one thing they are piously expecting from other N[Z]ers – self-discipline and self-sacrifice.

...Hypocrisy, wrote La Rouchefoucauld, is the homage vice pays to virtue. To illustrate what that means let me explain that A[US]n politicians are hypocrites but N[Z] MPs are not. When the A[US]ns... challenge... each other over abuse of travel perks, they at least pretend... they kn[o]w right from wrong as they slander... each other across their House of Representatives. They acknowledge... standards of behaviour. The question [i]s whether these standards ha[ve] been breached and by whom. Whereas N[Z] politicians... make no pretence at all of setting standards of honest behaviour. They simply say everyone is on the make, everyone gets their head in the trough if they are able, so why shouldn't they... Years ago I was reporting court in a provincial city and got talking to a young man who had systematically stolen small sums from his employer. Any shame he may have had was blanketed by his conviction that everyone was on the take. I told him the old joke: If you steal \$5 you're a thief, if you steal \$5000 you're a businessman, if you steal \$50,000 you're a corporation and if you steal \$5 million you're a government. "Yeah, Yeah," he said, brightening up. "That's what I mean." I tried with no effect to tell him that most of us try to be honest and have... standards. Twenty years ago I was consultant to a firm in which sales reps fiddled their expenses in a way that appalled me. Only one or two held out and they were regarded as nerds. Such was the culture of the company. A recent book on politics... makes the same implication – that decent people in politics are nerds. Such, apparently, is the culture of Parliament. People, it is said, get the government they deserve.

...[an MP] has been lobbying his National colleagues to support him taking a taxpayer-funded visit to see his daughter in London under the guise of a parliamentary tour. And another National first-term... has lobbied colleagues to get on a taxpayer-funded trip to Europe to visit the camp in Poland where his father was a prisoner-of-war... [A third] National MP... and... former cabinet minister... [cited] family ties as a reason to go on an overseas parliamentary trip... to Namibia... [However, the] chief National whip... [who] spends about \$50,000 a year on air travel and \$30,000 on toll calls... said there was a "holier than thou" element to the criticism of the three MPs. It was widely known that many businessmen went on overseas holidays or sports trips using a superficial job-related reason, and then claimed a third back in tax. Such trips were indirectly taxpayer-subsidised... He then went on to imply that because businessmen wangled tax perks for overseas trips it made it okay for our MPs to wangle for perks... He was saying that the Government makes absolutely no claim to moral leadership... [and politicians] have no sense of service to the community that would elevate them beyond the behaviour of businessmen. He was saying they are cynical of such things and have no responsibility to set standards of behaviour because no one else has any either... A confidential report on travel has been prepared for party whips and it is understood that Alliance MPs, on average, spend most on travel followed closely by Act, the party which has campaigned vociferously against travel perks. N[Z] First comes third, followed by National and Labour... There were 12 trips available to those outside the cabinet in the past financial year with 37 MPs taking part... MPs other than ministers usually get only one of the major overseas trips in a three-year term of office... As for [the former Speaker's]... delegation to Kuwait, Turkey and Finland last year, it is difficult to tell whether the \$102,401 spent was worth it. The report has yet to go to the printer and will not be tabled now until next year.

...A week-long, round-the-world trip to Paris and London by a N[Z] First cabinet minister... has cost the taxpayer \$27,261 in air fares. The Minister of Consumer Affairs flew first-class to Europe to attend an international forum on electronic commerce, followed by two days in London for meetings as Minister of Senior Citizens... [She] said the trip had brought real, tangible benefits. "My attendance at the conference will ensure the policy advice and operational programmes that the Government purchases from my ministry are focused on matters that maximise the overall wellbeing of N[Z] consumers as they take advantage of the opportunities of the global market." ...yesterday [she] found her expenses while away part of the probe by Act N[Z] into the perks of sitting and retired MPs... She... sought to respond to the Act question by referring to a 1987 report on a visit to the Chatham Islands by the then Minister of Transport and now Act leader... In the report... [an] opposition MP... questioned whether the taxpayer had a right to know whether public money was being "frivolously spent" after police found [the then Minister of Transport] and another cabinet minister... "in various states of intoxication" during a simulated raid on an Air Force Andover.

...The... trip to Europe... was unwise, says... [the Minister of Consumer Affairs's predecessor, who added that] the OECD meeting... is held every year in Paris and that, in her own six years as minister, she never went. "I wondered at times whether even our officials should go." ...[By the way, air] travel perks for former MPs and their spouses cost... taxpayers almost \$1 million a year – ...and... rail travel... [another] \$10,298... – ...but could rise to \$2 million if all of the 229 people eligible for the subsidised travel used their entitlements... The level of their subsidy depends on how many parliamentary terms they have served – three terms attracts a 60% subsidy, four terms a 75% subsidy, and five or more terms a 90% subsidy.

...No bar on overseas trips for top MPs... [Cabinet members] are entitled to unlimited overseas holidays with taxpayers picking up 90% of costs. Another 16 sitting MPs are eligible to have their overseas holidays subsidised by taxpayers to the tune of 75%, while a further 35 enjoy international air travel perks of 25% or 50%. Taxpayers have shelled out... \$1000 a day... for personal overseas trips for 74 sitting MPs and 68 spouses in the past four years... [However,] Parliament's ruling body has abolished subsidised overseas and domestic travel for new partners of former MPs... [O]ne former MP had passed on the entitlement to five partners and some MPs had even passed it on to non-partners. The commission has closed this potential loophole by defining "spouse" as a partner of an MP who has formed a relationship in the nature of marriage... When [the travel allowance] was introduced in the mid-1970s, MPs had no electorate offices, their spouses and partners usually acted as electorate secretary and the home phone was the office phone.

...MINISTERIAL support staff are the latest... perk-busting... targets... 20 Cabinet ministers have 206 secretarial staff... [and] 21 staff in the P[M]'s department earned more than \$73,000 a year – the same figure earned on average by the ministers' 29 press secretaries... "There are the same number of journalists in the press gallery as there are press secretaries in Parliament – 41... This is an incredible waste. [And w]hy do people like [the Minister of Consumer Affairs] – who have done nothing yet except undertake expensive overseas travel – need a senior private secretary, two private secretaries, a press secretary and a ministerial secretary? God knows how much that costs. I'm not against people having good staff, but... [i]t's time ministers started talking to ministers again, instead of their secretaries arranging everything."

...Attending an international conference in Paris... cost [the] Consumer Affairs Minister... \$27,000... – but Ministry of Agriculture staff will spend just \$110 hosting a 30-day conference with more than 130 participants from 25 countries. Organisers have kept costs down by running the forum over the Internet. Ironically the conference [the minister] attended was on developments in the global electronic marketplace. The MAF conference on setting international guidelines on surveillance of types of animal disease... starts today and has cost \$90 to set up, with \$20 "electronic rent" for the month. A[US]ns, Canadians and [USer]s were quick to sign up for the conference, but Europeans were hesitant, unsure of the... technology...

The Minister of Consumer Affairs... yesterday publicly apologised for her... trip to Paris... She did not know if the apology would help ...he[r] party "but I think it will be good for me. I will feel happier and more at ease. Although I can't bring the money back for the taxpayer [without paying for it out of my own pocket], what I can do is assure them that that sort of cost structure will certainly not go past my desk again." She made the decision with almost no experience as an MP or minister, she said. Her ministry advised her to go. "That was my responsibility as a minister and with 20/20 hindsight I should not have done so. It has continued to weigh on my shoulders even when the media let it go." ...Her statement of public contrition... contrasted with the silence of the N[Z] First Leader... who kept everyone guessing about whether he would apologise over a

finding against him of “unbecoming conduct.” [She consulted him] before apologising for the March trip to a forum on doing business via the internet. But she sees no lessons in her actions either for him or... [another colleague who is being] lambasted for not apologising – at least – for spending associated with Aotearoa Television... She acknowledged her trip had hurt N[Z] First because it was included in the litany of its MPs’ “misdemeanours.” ...It is by no means the first apology by a N[Z] First MP this year.

...a N[Z] First MP’s... survival... may now hinge on his willingness to show contrition and deliver a full apology to colleagues at the party’s weekly caucus meeting tomorrow. After a weekend of consultation within the party, [his] political future was still under question last night following his botched attempt to sell an exclusive interview to television... about his involvement in Aotearoa Television... for \$20,000-plus and his subsequent misleading of his leader... The odds remain on him clinging on, but the party hierarchy is applying the heat and is letting him sweat until the caucus meeting to make him realise how much damage he has done to N[Z] First... Support for NZ First has dropped two points to 5[%] in the latest... poll. Labour and National were both on 36[%] with Labour up two points and National down one.

...HALF A YEAR ago, MPs from the betrothed National and NZ First crowded into Parliament’s quiet, wood-panelled Legislative Council Chamber. Joking, jostling, and in some cases taking photos of each other, they assembled to watch their leaders sign a pact to govern together for three years. Glee was heightened by disbelief. NZ First MPs were amazed they had trapezed into the inner sanctum of government. National couldn’t believe it had made it back... Half a year on, the Government’s policy direction has inched further to the right than it was on coalition signing day. Due to a number of initiatives that were not in the coalition agreement, the Government’s policy stance now sits within National’s home turf... Looking back, one thing that is certain about the country’s first MMP government is that it has been consistent. It has kept screwing up. From boxer shorts to superannuation squabbling, from swaggerers to leadership rumblings, from corridor scraps to apologies never made, the circus has come to town... The leader of NZ First... has failed to impose discipline on his party, setting an example of personal unruliness and arrogance... His erratic behaviour in the personal sphere means no one can be sure the NZ First spills we have already seen will not be repeated... Despite the ruckus, the refrain from the Beehive is never mind the sideshows, it is business as usual on centre stage... The parade of embarrassments that has dominated the public face of this... [Government] has humbled NZ First in the opinion polls and propelled Labour to the top of the polls for the first time in four years... One recent poll saw disapproval of the coalition running at an amazing 75%.

...Support for the old [FPP] voting system is nearly twice that for the MMP system, according to latest polling... [O]pinion poll surveys conducted at the start of June also found overwhelming support for another referendum on the electoral system in 2002. At the moment all that is guaranteed is that a select committee will look at the issue. The polling shows that 54[%] now favour the [previous] system, and 30[%] like MMP. The remainder are unsure. In the 1993 referendum that led to the change... 54[%] voted for MMP and 46[%] for FPP... A week after the election, 42[%] favoured MMP and 31[%] favoured FPP... MMP has been losing support since... the drawn-out coalition talks... The key swing voters... who have moved from supporting MMP... are Labour voters... There was also a significant number of Alliance supporters wanting a return to the [old] system... National voters favour [FPP] by a large margin [– as they always have – with 74%] in favour and only 18[%] supporting MMP. But supporters of National’s coalition partner, N[Z] First, are... the strongest supporters of MMP – favouring it by a margin of 67[%] to 19%. The poll shows that 83[%] of those surveyed believe there should be a referendum in 2002 on whether to keep MMP. There is strong support for another referendum even among supporters of MMP, with 71[%] of them supporting the idea. The poll also shows that 45[%] of those surveyed mistakenly believed there would be another referendum automatically on the electoral system after the 2002 election. Only 38[%] correctly knew that there did not have to be a referendum... [In related news, an] Alliance list MP... went missing without leave last week... She... admitted yesterday that she had been having a tough time as a novice MP. The former community worker and street-kid house mother... was on the unemployment benefit for years before entering Parliament... [Since 1990, she] and her husband and two grandchildren lived on about \$150 a week after bills... [She is] reported to have had a series of family tragedies to cope with as well as the challenges of the new environment... “I haven’t been deliberately staying away from there. I have had leave.” ...She told the N[Z] *Herald* she would be back at Parliament on Monday... [S]he calls... Parliament... a “den of lions” with little “positive korero” for Maoridom... In her maiden speech to Parliament, [she] said MMP had given the “forgotten people” of N[Z] a voice in the House, “a voice which will never again be silent.” ...On the question of whether she should leave the Alliance, she was “on the road now, going out to my people and asking them.” ...her cousin[... who is a NZ] First MP... says... “It’s no good saying she’s out there with the people and the country. The people sent her to Wellington to do a job and that’s frankly where the job is.” He said his attitude was not a reflection on her but about honouring the MMP election result... “She is the senior Maori woman we look up to. We attach a great deal of importance to her. I would hate to see her lost to Parliament... But at the end of the day, the population of N[Z] voted the Alliance to have 13 MPs. She is a list member. She isn’t there in her own right. She is there to represent the Alliance party. And as much as I don’t like the Alliance, they are entitled to have their 13 members.” He said he might not feel the same if... she... had been elected as a constituency member... She... did not[even] have the endorsement of people in her own region, the Eastern Bay of Plenty. She received 1210 votes as the Alliance... candidate. More people voted for the Alliance in the party vote at 1381. [Her cousin] won the seat with 10,647 votes. “In fact more voters... wanted[one] veteran Maori radical... as their MP...” He got 1372 votes... [The] Alliance leader... continued his disciplinarian approach yesterday, saying that if she quit, his party would take her to court for breaking a signed election pledge all candidates took to resign from Parliament if they leave the party... [Her cousin] said yesterday... “Even if I don’t believe that pledge the Alliance MPs signed is worth the paper it is written on legally, morally I’m afraid I have to agree with [the Alliance leader]. If the boot was on the other foot and one of our MPs was looking to go [independent or to another party], I would be calling for that person to resign from Parliament.” A senior law lecturer at Auckland University... said the pledge “looks to be a promise binding in honour only with political consequences for failure to respect it – no more.” [Previous to last year’s MMP election,] Labour’s deputy leader... drafted a member’s bill that would prohibit jumping ship mid-term. Every few weeks it goes into a ballot with other MP’s bills competing for its introduction. He said yesterday that it was wrong that [the Alliance list MP] could “quite unilaterally” lower the vote the Alliance received last election.

...[her] first appointment after resigning from the Alliance last night was to attend a celebration hosted for her by the N[Z] First deputy leader... in Parliament’s Grand Hall. Despite that, [she] has assured the Alliance she will not give her vote to the coalition Government. But a bitter Alliance leader... questioned the value of her assurance. “On the evidence we have at the moment, you would not be able to rely on what [she] told you today to be what actually happens tomorrow.” Last Saturday [she signed a second] agreement stating that she would “uphold her solemn commitment to serve the Alliance and its supporters in good faith” and that she would resign from Parliament if she left the Alliance. “If [her] signature on a document on Saturday turns into a resignation by Wednesday, one has to wonder at the integrity of the people you are dealing with,” said [the Alliance leader]. He was speaking after a 2 1/2 hour meeting in the Alliance caucus room with [her]... The Alliance... had gone into the talks with the impression that [she] would reaffirm her loyalty to the [party]. But that was never her intention as she had written to the Speaker... in advance advising him of her decision to become an independent MP. [She even informed the Speaker that she would ‘give her vote to NZ First’!] [She] had also prepared a press statement which a supporter distributed to the media minutes after the talks ended. It said that she did not intend to join any other party... It also said that she had advised the Speaker that she wished to speak only Maori in Parliament – a condition... the Alliance had agreed to... Previously she has cited a lack of communication and consultation over Maori issues... as a major disillusionment... [She] said her frustrations with the Alliance intensified over two issues: the urban Maori issue and “Maori MP bashing.” The Alliance wants urban Maori authorities to benefit from the Maori fisheries settlement, not the proposed iwi-based settlement [she] supported... And the Mana Motuhake leader

and Alliance co-deputy [leader]... was the most vociferous Maori MP in condemning [a Maori NZ] First MP... over Aotearoa TV spending. Public statements by [the Mana Motuhake leader] on those issues, “put fat on the fire,” she said... Clearly angered by [the defection, the Mana Motuhake leader] said last night: “I didn’t think there was much left in politics that could shock me but I’m genuinely shocked.” She described it a “tragedy” for Maori political representation... “It took a long time to get another Maori woman here with me...” [she] said... before the tears started to well and she had to stop... [In reply, the now independent Mana Motuhake member] said she felt sorry for [the Mana Motuhake leader, but]... she does not believe Maori MPs should criticise other Maori MPs... “[The Mana Motuhake leader] doesn’t know what being a real Maori is all about because she was brought up in the city... She thinks like a Pakeha. I know I have 100[% support of rural] Maoridom... I am their kuia and they respect me for that...” ...Since it joined the Alliance in 1991... Mana Motuhake... has dropped from second placing... in the Maori seats to third placing... [The now independent MP] won the second-highest of Mana Motuhake’s slots [on the Alliance list], a decision which enraged the rest of the Alliance [at the time] because they considered [her] ill-equipped to be an MP... [Her] decision to leave the five-party Alliance to become an independent MP, for reasons that she has apparently found difficult to articulate in English, has been described as a blow to MMP. Party list MPs, MMP opponents claimed, would be unaccountable creatures of their party whom voters had little claim on. [She] has outdone those sceptics, demonstrating she is not even under the control of her party. But her departure has been more wounding for the Alliance than it has for the electoral system... Her resignation from the Alliance has caused \$88,500 to be trimmed from the party’s funding [– including ‘\$4,500 from its leader’s salary’]... While... the debate continues over whether [she] should have resigned from Parliament... the Electoral Commission has sought advice on whether any party would be compensated if she does resign as an independent MP. Its view, backed by a Justice Department opinion, is that under the Electoral Act, the Alliance would be entitled to another MP from its list... [The department] does not have a position on whether party-deserters under MMP should be forced by law to resign... The P[M]... said no distinctions should be made between list and constituency MPs. “It hasn’t upset the balance of Parliament. In other words, the Opposition is still in Opposition and the Government still has a majority. There is no urgency in making any... decision.”

...With the Government limping from one disaster to the next, the search for helpmates in times of crisis has widened... National has been holding secret talks with [an] Act MP... as it looks for backstops for the increasingly wobbly Coalition Government. The talks explored ways for the [Act MP] to join the Government as a backbencher... The... Act list MP... is not ruling out leaving the party he helped form... “I’m in Parliament to implement policies that I think are in the best interests of N[Z]ers... you can’t do anything in opposition... [I]f you really want to achieve things you need to be [a] part of government.” The Act leader... believed... the talks were nothing more than “informal lobby discussions” and it was “just not credible” the MP would quit... [However, National believes a second] Act MP... and possibly a third... could also be recruited... Act has said it is unwilling to join any coalition involving NZ First, and the departure of any of its MPs would seriously damage the party.

...A bill designed to stop MPs defecting from their parties cleared its first serious hurdle in Parliament last night shortly after the independent [former Alliance] list MP... announced the formation of her new party, Mana Wahine.

...The independent MP... yesterday lived up to her promise of addressing Parliament only in Maori, aided by the first interpreter seen in the debating chamber in 60 years. But the translation caused confusion. [One NZ] First MP... a native speaker, and [a] Labour MP... also fluent, argued over the correctness of the translation... [The independent MP] later defended the translation as “beautiful... quite soft.” ...Parliament’s Speaker yesterday gave life to an Alliance move challenging... her... right to be an MP, and the P[M] and Deputy P[M]... could barely disguise their fury. The ruling means the future of the MP who shocked her Alliance colleagues last week when she quit will be in limbo for some time, probably months. [They] persistently questioned the reasoning of the Speaker... in referring the challenge... to Parliament’s privileges committee. [The Deputy PM] was forced to withdraw and apologise – three times because he apologised so quietly – for describing [the Speaker’s] reasoning as “legal gibberish – with respect.”

...[the independent MP] says she should be treated better because several of her relatives died at El Alamein, the... W[W2] battle after which she was named... “That’s something this country ought to think about – my ancestors who went away and fought the country’s war and yet here’s the mokopuna [descendant] being treated like shit.”

...Parliamentary behaviour is often totally unacceptable... We shouldn’t let all the fuss about [a list MP’s] defection from the Alliance deafen us to some of the legitimate criticisms she makes of our parliamentary system. First, the behaviour of politicians in the House must be challenged. Sleeping, rustling papers and yawning loudly while people are speaking is discourteous. Interjecting, name-calling, jeering and racist or sexist abuse are down-right rude and totally unacceptable. No competent teacher would tolerate any of those behaviours in a classroom. How dare adults who are supposed to be our leaders of society behave like this, at our expense, in public? ...One problem is that... rudeness, abuse and aggression are structured into the accepted systems and customs of the House... The second problem is that because the House – the public face of politics – has been for so long a forum for party confrontation... the public see politicians as aggressive talkers more concerned with party point-scoring than with listening, reflection and careful decision-making. Many of the people who enter politics are attracted by the adrenalin-charged atmosphere of a national debating forum. The selection procedures put emphasis on party allegiance and the ability to debate. Thus behaviour is perpetuated from election to election regardless of the type of parliamentary system we have. There are many politicians who do enter the House with a genuine commitment to sensible processes and behaviour. They are often swamped by noisier companions and sneered at as ineffectual debaters. Low-key and thoughtful contributions are usually ignored by the media... Some eventually succumb to the pressures of the environment and join the game, or just give up trying to change things. Now, of course, we all know – in theory – that the House, the great debating chamber, is not where the real work gets done. [(‘The member for Hamilton East sits and knits during question times in Parliament’s debating chamber. “One of my hobbies is actually restoring an Austin A35 and I’ve got a carburettor that needs working on. Is it OK if I bring it in here and work on it?” a NZ First MP asked the Speaker, who replied: “I’m not an engineer. I don’t know what he was meaning. But if he’s reasonable and fair, then of course we’ll allow his request.”’)]But the behaviour of some politicians in caucuses, in corridors and in committees is hardly admirable either. Personally I would rather the country was governed by people who treated their colleagues, partners and families with respect and spent less time in Wellington or in aeroplanes and hotels around the world. If we really want a parliamentary system which is respected by citizens the system itself has to protect respected behaviour. The processes of Parliament were established by rich men from one culture and they are essentially racist and sexist... The whole structure of our political system is little more than an Englishmen’s team sport – and an unfairly bruising one at that... The rules must be changed so that our leaders offer consistent role models of courtesy and cooperative problem-solving instead of daft party-based hostilities.

...The Minister of Women’s Affairs... yesterday called for male politicians, including some of her ministerial colleagues, to drop their “macho” behaviour. Her target appeared to be some N[Z] First members. In a speech to the Remuera Principals’ Association, [the minister] said too often she had heard the system of MMP and coalition Government blamed for poor parliamentary conduct. But the problems she saw had more to do with workplace culture and plain bad behaviour... “...I believe that we need some kind of... urgent remedial action... [like] you take... in your school when it appears that girls’ learning is being disrupted by rude and unruly little boys...” [She] said women MPs were leading the way in working together across political parties, providing an example of MMP at its best... [Incidentally, a former] National Party MP whose anti-nuclear stance was used by Sir Robert Muldoon as the excuse for calling 1984’s infamous snap election... ‘had too much integrity’ to get far in N[Z] politics. Today, the]... university lecturer... who was lionized during a three-month visit to Canada... [i]s virtually invisible in N[Z]... The Canadian-produced film *Who’s Counting*, based on her book *Counting for Nothing*, was voted best film at the 50th Edinburgh Festival. It’s been shown at all the overseas

film festivals that matter: Berlin, Sundance, Paris. N[Z]'s film festivals didn't want it. *Three Masquerades*, her latest book, is a best-seller in A[US] and Canada. You can't find it in bookshops here. Part of the reason for... [her] anonymity in N[Z] is that after she left Parliament, nobody here wanted to employ her. "I was told directly by one corporate recruitment agency that I was too hot to handle... 'People would be worried that if it came to a choice between the company and your principles, you'd choose your principles,' I was told... I don't have any qualms about being politically incorrect when I've got a job to do... [but] I had no choice; I had to go overseas." So off she went, to Rutgers University in New Jersey where she researched *Counting for Nothing*, considered a definitive test on how to put a price on women's unpaid work and why that's important. Since then she's trained Pacific Island women community leaders in how to campaign for – and hold – national political office, and she's led a series of U[N] missions to Asia. Her first UN assignment... [in] Bangladesh in 1989, could easily have been her last, thanks to the uncompromising language in her final report... "[There was]... this young woman who was a teacher. She had this huge old black bicycle[– a]nd, of course, there's enormous resistance[in Bangladesh] to women having ANY mobility... at all, any independence of movement. They were building dikes around the village where she was teaching, and every morning and every night she had to ride along the road on top of the dikes where the guys were building... I watched and as she rode along... they'd pick up hunks of mud and clay and stone and heave them at her. She'd be pelted, all the way, [but]... she just kept going. There wasn't going to be anything that put her off her bike, or stopped her teaching, or stopped her freedom of movement." In a different part of Bangladesh, she saw women protecting themselves against domestic violence. "They were carrying whistles, and if anybody was ever getting beaten they had to whistle, and... everybody came and surrounded the house, because the policemen wouldn't do anything." The U[N] development project tried to censor... [her] final report. "You can't say that," she was told. She said it anyway. Her report to Bangladesh's Minister of National Development, began: "Male violence towards women is the single largest factor hindering women's access to development in Bangladesh." And the [m]inister... said, 'This is very harsh[but also] very true. It is so refreshing to have a consultant who speaks the truth.' The look on the face of the development project chief with her had to be seen to be believed, she says... [After that, s]he led other missions to Thailand, Indonesia, Pakistan, Nepal and Malaysia... [T]here's a village in Pakistan where the women love... [her, but s]he says she's not angry about th[e] lack of recognition at home, and it's not a matter of ego. "It's curiosity, I suppose. Bemusement. Sometimes I think it would be nice to feel that there were more opportunities... [back] here. But I've got to balance that with the fact that I don't enjoy being eaten alive. I'm not public property, and if I'd wanted or needed that I wouldn't have left the other place, would I?" She is, however, getting satisfaction from applying the experience gained in that 'other place' – Parliament – and helping other women learn how to survive in politics.

...Another awful-looking, voter-alienating dimension was exposed on N[Z] First's already tattered facade this week – caucus infighting. The party's 17 MPs have made a point up to now of presenting a united front outside their caucus room even if it has meant suffering collective damage from the silly mistakes of one of their colleagues. But this week N[Z] First exposed its factional and petty personal jealousies in raw form as... [two MPs] engaged in separate and heated stand-offs with the party hierarchy[, which finally said]... "enough is enough" and [moved] to punish indiscipline in the caucus... What this showed is that N[Z] First is a collection of individuals... [who] as new MPs... were unwise and naive... This week's effort was a recognition of the problem, but a bad omen for the future of coalition unity... [I]nstability within this government is likely to get worse before it gets better.

...JUST when National was getting comfy with the idea that coalition disarray could be blamed on wet-behind-the-ears N[Z] First, along came the member for Epsom[, who]... has struggled to master the byzantine processes and strategies ministers outside cabinet have to employ to advance their policies[– although 'it always takes time for ministers to get used to their portfolios']... She would probably say she understood very well the way power worked, but chose not to sip from that tainted cup... [Her] spectacular exit on Thursday from the portfolios of Women's Affairs, Local Government and Cultural Affairs showed that breaking the spirit of new ministers is not a problem confined to N[Z] First. Her scathing critique of the Government's arrogance, lack of vision and poor internal processes will do more damage than a dozen such attacks by the Opposition. She will be listened to and believed by the public... Her staggering 20,642 vote majority... by far the biggest majority in the country... is testimony to her personal appeal. More than 10,000 of her votes were for her personally – they came from people who did not vote for National on the party vote.

...The Epsom MP... appears to have further isolated herself from National caucus thinking after last night saying the P[M] should quit within three months[, because]... it was time for a leadership change... Opinion polls are[also] giving National backbenchers, both from the list and from marginal electorates, nightmares... The disapproval rating for the coalition Government's performance was up seven points to 84[%]... National support is... 36[% and NZ] First down... to 2[%]... Labour rated 45[%]...

The PM] has strongly hinted that N[Z] First will not get three extra cabinet ministers next year if the party remains so unpopular... But NZ First's president... warned that clauses in the coalition agreement were not contingent on opinion poll findings... [Indeed, the coalition agreement isn't even 'a legal document'.] Under the terms of the coalition agreement, National has 15 cabinet ministers. NZ First has five. That is scheduled to change by next October, National's share reducing to 12... That aspect of the agreement has always rankled with National backbenchers...

The ruling coalition's wafer-thin majority is again in question after the Whangarei MP... yesterday said he might quit National to lead the Christian Democrats... filling the centre-right void created by what he described as the "arrogant and ignorant" coalition... The present National leadership, he said, was taking the party "on a one-way trip to political oblivion. I said to the P[M] just the other day that if you lie down with dogs you inevitably come up covered in fleas..." ...These comments add to the doubts about the P[M]'s leadership, although most National MPs do not want a messy coup and hope [the PM] can be talked into stepping down next year... [The PM] said that he had the confidence of his caucus and would not be stepping down... Since divorcing themselves from the Bible-driven Christian Heritage Party, the Christian Democrats have been on the look-out for a new leader... [to] give the party an appeal beyond churchgoers... [The Whangarei MP] said that... he would have to consider his options, which included a burning desire to continue in radio and to work in television... Any action by [the Whangarei MP] to jump ship would wipe out the... coalition's one-vote majority and leave the Government hostage to a number of scenarios in order to survive in Parliament. These include other parties joining the coalition, permitted under a clause in the coalition agreement.

...Put to one side the day-to-day bedlam that has left this Government gasping for credibility... [and consider] one simple question: how should the minor partner behave? Too silent and it is overwhelmed by its bigger partner. Too troublesome and it is accused of destabilising the whole Administration. N[Z] First has committed two cardinal sins in trying to find a balance. It has generated a constant diet of conflict and blunders which the media love; it has displayed an arrogance and disunity which voters distrust. But the party's problem is essentially the same as United's was when that party propped up National last year. The same tension will apply between the Alliance... and Labour, presuming they are[one day] in a position to enter some kind of coalition arrangement. Labour and the Alliance are now thinking about how to make it work, drawing lessons from the present turmoil beyond the obvious: that a tired National Administration made the mistake of lumping itself with a bunch of novices... Yet, all the evidence from overseas was that coalitions were "untidy and difficult" creatures... [The P[M]... had to overcome deep disquiet within his own party – even though he delivered power. Many rank and file never conceived the possibility of a National-N[Z] First Government... Another difficulty in getting acceptance of the coalition was that N[Z] First campaigned on a quite different policy agenda from National. That had to be "narrowed down" in long coalition talks... National and N[Z] First nailed down everything they could during hard negotiation. But coalition ministers have been frustrated that they have not been able to present a perception of direction and momentum... The P[M] is... blunt about N[Z] First's election promises: "The problem of promising a huge dividend in Government is that it is never met." But he also reveals one reason why

N[Z] First chose National. Opting for Labour would have raised voter expectations even higher. [By the way, 'the commission on MMP recommended that a party win at least 4% of all party votes to get a proportional allocation of seats, but National and Labour decided to set the level at 5%.']

...Eggheads were wrong: Majority lost with MMP... WHAT a year that was! Who would have predicted, twelve months ago, that we would have [the National and NZ First leaders] in cosy tandem running the country? Or that it would be so hard now to find anyone who voted for MMP? Those learned members of the Royal Commission that persuasively argued in favour of the [MMP] system subtitled their report, ominously it now seems, "Towards a better democracy". Yet, as we discovered, the first MMP election achieved a result where a party with 13% of the vote could dictate who governed. And, if that were not sufficient source for disillusion, Mr 13% chose not to throw out the people who, only weeks previously, he was saying "were not fit to govern". So N[Z] did not get its first woman P[M]. Nor did it get a grand coalition that might have represented the majority. It's easy then to conclude that the Royal Commission was a bunch of eggheads who didn't know what they were talking about when they argued that MMP would deliver the "fairness" and "equality" missing from [FPP]; and equally they were wrong-headed when they said MMP would ensure the power to make, and unmake, governments is in the hands of the people at an election. Members of the community, said the commission, should be able to endorse the voting system and its procedures as fair and reasonable, and to accept its decisions, "even when they themselves prefer other alternatives" [such as preventing MPs who've been voted out by an electorate – because they are intensely disliked by local voters – remaining in Parliament via their party list!]. A senior lecturer in law at Otago University, writing in *The Press* last week, labelled MMP "a very protestant" electoral system – because faith alone sustains it. "Any actual difficulties can be put down to old-style politicians, to the unfamiliarity of the new system, to carping critics, to the need for more time to make it work, to anything at all. In this way form wins out over substance, and the evil that men do lives after them." Is there any hope, then, that something positive may develop out of this disaster? ...And so who do we nominate as our Politician of the Year? The leader who came back from the dead to be N[Z]'s power broker, the bronze medallist who decided who should have the gold and the silver? Or the Great Survivor, the P[M] who has been written off as National's leader more times than he can remember?

...Labour would be governing on its own without minor party help if a general election had been held last week, according to the latest poll... Labour... has surged from 45.6[%] to 50.2... since... five weeks ago. National... [went to 33.2%. But NZ] First recorded just 1.7[%] support among committed voters... And there is more bad news for the P[M – he has dropped to 14%]... in the preferred P[M] stakes... Meanwhile, the Labour leader... registered 27.7[%]. The NZ First... leader... drifted under the 2[%] mark in line with his party's slide... The poll has a margin of error of plus or minus 3.9[%]. Unfortunately for National, it... is finding that N[Z] First, despite the glaring naivety of its MPs, will not take advice on damage-control... considering it patronising.

...Former MPs worried about the behaviour of parliamentarians are offering their help, says their association president... To help restore the relevance of Parliament and the democratic process in public opinion, a committee of former Speakers will receive suggestions and frame proposals for consideration by MPs.

...Government ethics are being rethought around the world. Spectacular defeats for governing parties in... Canada and France in 1995 were partly attributable to concerns over Government ethics. People the world over are questioning the actions and motivation of their elected representatives as never before... The integrity and authority of government depends not only on the quality of those who govern but also on the degree of public confidence in those people and this institution. Members of Parliament must not only be of high integrity, they must be seen to be so by the public. Recently, in reply to a question from [the Opposition leader, the P[M]... indicated his support for a code of conduct for MPs. He said the standing orders committee should be invited to consider the move. I support this[but w]e should go further. This is now the time for our Parliament to address conflict of interest issues comprehensively with a register of all members' interests. As things stand, ministers declare their interests annually in a report, the most recent of which has just been tabled. Such disclosure should also be expected of all other members... The A[US]n federal House and those of N[SW], Queensland, South A[US], Victoria and the Northern Territory require declarations... on... private activity... from all their members. So does the House of Commons and the legislatures of all but two Canadian provinces... As a British legislator said in favour of general disclosure: "After all, we have always lived in a goldfish bowl so is it not better that the bowl should be clear rather than clouded by myth and rumour?" ...[as the] chairman of Parliament's finance and expenditure committee... I have written to the chairman of the standing orders committee seeking his urgent attention to these matters.

...The public backlash against politicians' behaviour has prompted a parliamentary committee to suggest MPs be seen to be cleaning up their act by writing a code of conduct. Parliament's government administration committee has also raised the possibility of the register of personal financial interests applying to all 120 MPs... Ministers are already required to disclose directorships, shareholdings, gifts and payment for outside activities. But the committee's report argues that [MMP] has given backbenchers more influence and there should be... complementary checks in the system against abuse of power and position... At present, MPs are already subject to laws covering bribery and corruption. They also have to declare a direct financial interest when voting or speaking in parliamentary debates... The... committee is also worried that the increased turnover of MPs under MMP will deplete the backbenches of the senior MPs who impart norms of acceptable behaviour to new backbenchers.

...[Labour's] justice spokesman... has called for a binding referendum to be held after the 1999 election on whether to ditch MMP... A referendum held after the next election would allow two MMP elections to have taken place, giving the public time to judge the... system... The results could be implemented for the 2002 election, he said... The only scheduled review of the electoral system is a select committee inquiry in 2000. There were no plans for a referendum... An independent body such as a Royal Commission would be needed to conduct the review because politicians sitting on a select committee would have a vested interest... [Meanwhile, support] for a petition calling for a citizens initiated referendum on cutting the number of MPs from 120 to 100 is gathering steam... [If it gains over 250,000 signatures, the Government has to hold a referendum.] However, on the law of averages its chances of success are slim. The 1993 firefighters' referendum is the only time a citizens initiated referendum has come to fruition.

...[a 'batling granny has won her fight to change the face of parliament. The 70-year-old from Wellington has gathered enough signatures to force a citizens initiated referendum on slashing the number of MPs. A total of 21 are now likely to be looking for new jobs. The Chief Electoral Officer said the petition needs verification before it can be presented to the House. The Governor General would then set a date for the referendum to be held within 12 months. Insecure MPs can still defer the referendum if 75% of them vote to put it off.]

...[a] well-known writer, spent several years in Germany on fellowships in the 1980s and became an enthusiast for the MMP electoral system. This month... he discussed MMP one year on... On the issue of current numbers of MPs, much criticised by the public[he]... points out that with population growth, the old system would have had 113 MPs and counting by the year 2011, while MMP is fixed at 120[(although, due to 'MMP throwback', NZ may occasionally end up with 121 MPs)]... By comparison... Ireland, with a similar population, has 166 MPs plus an Upper House[– '226 MPs in' total –] and an elected President. Norway, with slightly more than four million people, elects 165 representatives and Denmark, with 5.5 million has a Parliament of 179... He defends the list MPs[who 'don't have to contest an electorate']... As far as he has discovered, Zambia is the only country requiring MPs to leave the house if they resign from a party! ...[He] believed the time taken for negotiation was "only marginally acceptable" as it was the first time the process had taken place here. "We should... make it mandatory that parliament sit, with government in place, not later than 30 days after election results are known." Even with a population of 82 million and a house of 672 members, German results are complete within three to four hours of the poll closing... But... the idea of going back to FPP... "would be like Air N[Z] deciding to dump its Boeing 747s in favour of Short Solent flying boats for international travel."

...A TIMARU couple has decided their political love match is for keeps – they have become engaged... When... [they] met last year, they were working for opposing MPs in the South Canterbury town. Parliamentary Services had asked [him, as the Labour MP's]... electorate agent, to mentor [her] in her new job as... [the NZ First MP's] electorate secretary. The pair ended up falling in love, but their relationship cost... [her the job. The NZ First MP] said the \$10,000 awarded to [the former electorate secretary] by Parliamentary Services was an “appalling” use of taxpayers money for someone who worked 20 hours a week.

...MENTION the words politicians and public money in the same sentence and you're guaranteed to send the nation's blood pressure sky high... And MPs' salaries generate the same degree of passion. Kiwis from Kaitia to Bluff have an opinion of whether MPs... deserve their \$74,500 annual pay packet (more than double the average wage) or whether [the P]M... is adequately paid – at the rate of \$185,500 a year – to run the country. The Higher Salaries Commission determines how much our elected representatives are paid and those salaries are under review, with a decision on any increase due next month. So are our 120 MPs worthy of the money they earn, or should they be rewarded on the basis of performance? Labour's Manukau East MP... an industrial efficiency expert before becoming a politician 10 years ago... believes MPs should be subjected to pay differentials, based on factors such as demonstrated election voter support. “The problem is quantifying an MP's work. No-one seems able to specify exactly what a politician has to do. There's no certain number of bricks to be laid, or washing machines to assemble...” But according to [the chairman of a] human resources company... the answer to paying for performance should be a resounding no. “It wouldn't work. There are far too many imponderables. Who would judge them, and on what... And then there's the question of who is actually doing the work – is it the MP, or is it being done by others on their behalf...?” In the private sector, he said, a chief executive's salary was determined by responsibility, staff numbers, company value and budget. “But... [take] the Health Minister's job. If we applied private sector factors to determine his salary, he'd have one of the biggest jobs in the country and should therefore have one of the biggest remuneration packages. His budget is billions of dollars, thousands of people are employed in the sector and it affects a huge amount of people. So how do you measure that? And he is in the terrible position of having almost no chance of satisfying anybody – so it's likely he'd never be paid under performance-based salaries.” ...He could be right. As one MP said, if he and his colleagues were paid on the basis of public perception of their performance, “we'd have another 120 people on welfare.” [A former P]M... understands how it could appeal to the public... “Some MPs should be paid to say nothing and write nothing because their efforts are an embarrassment.”

...The wage bill for N[Z]'s 39 Government department chief executives may rise... [by] about a third, under a package announced yesterday by the Government. The average salary for department heads is now \$138,000, but the range is from \$90,000 to \$200,000 and cost the Taxpayer around \$6.5 million last year. The Minister for State Services... said the new policy was expected to raise this by around \$500,000 over the coming financial year and by up to \$2 million a year when fully implemented. But departments will have to fund the increase out of existing budgets – a requirement that concerns the general-secretary of the Public Service Association... He said it would mean that any pay increases at the top would squeeze the funds available for remaining staff, and would compound an already serious wage-drag problem.

...The country's MPs may be in for a healthier than normal pay rise this year. The Higher Salaries Commission... said in its annual report it would have to be mindful of the widening gap between top-level public and private pay in future determinations. The widening gap was the reason given on Thursday for a 30[%] pay rise over three years to the 39 Government department heads. The commission chairman... yesterday said he had asked what the P[M] – “the chief executive of N[Z]” – should be paid when [one private NZ company]'s chief executive... was earning \$1.4 million. “I'm not suggesting \$1.4 million for a month of Sundays, [and]... we are not suggesting we will ever close the gap, but it is a factor.”

...MPs go for pay rise despite cash crisis... The Cook Islands cabinet is determined that MPs should have a pay rise even though details of the ...98 budget remains unresolved. Cabinet ministers are reported to be upset that some heads of ministries are on the same salary scales as MPs. “No MP should be getting less than a [head of ministry],” [said the]Legislative Services Minister... In the meantime the Government and its advisers are wrangling over the amount of spending in the budget. The cabinet wants \$39.9 million but economic advisers have said this is far too much. A slashed-back budget presented by the National Development Council recommended \$26.7 million... A number of ministry heads approached their ministers last week for permission to begin effecting job cuts almost immediately.

...[‘some Government ministers in Rarotonga are being forced to reduce working hours from 40 to 30 a week in an effort to meet the 10% cut the Government has enforced to keep within its budget.’ In local news, t]he Higher Salaries Commission yesterday handed MPs a 4.7[%] top-up from the taxpayer, boosting their basic salary... to \$78,000... Cabinet ministers have been treated to a hefty 7[%] pay rise... to \$135,000 – the same increase and salary for the Labour leader... and the Speaker... [M]inisters have not had a pay rise for two years, although MPs received a 2.7[%] increase last year... The pay pump-up leaves the Minister of Health... red-faced for saying health workers should not even get a 1[%] rise... He... did not return calls... last night to say whether he would accept his pay rise... So far the only MP to publicly turn down a pay rise is Act's perk-buster... w[ho will] donate his \$3500 pay rise to... [a school] in Otara. Other MPs were extremely hesitant and nervous about discussing the pay increase, including [the PM and Deputy PM], who together only a day earlier... pledged to “aim to reduce Parliament's running costs.” ...The salary of the Deputy [P]M... rose 7.1[%]... to \$151,000. The... P[M]... will pocket \$199,000... a 7.3[%] increase... All the rises are back-dated to July 1... The [commission also raised the Governor-General's] tax-free salary from \$114,500 to \$120,000 a year... The[commission's] chairman... justified the pay rises... by saying it was the commission's role to look at where the marketplace was, what the job was worth and the “effect on the country these people have.” ...Ordinary workers have seen their wage packets swell an average 3.5[%] in the past year, while top executives have averaged 5.9[%].

...MPs may have received a... pay rise, but their secretarial staff are struggling to get any proper increase at all... [F]our months of industrial talks with parliamentary officials were deadlocked, with... some 380 support staff who earned about \$35,000 each... being offered a nil pay increase for the next three years. Instead, a \$1000 cash payment had been offered to settle the three-year contract. - 1997

“What idiot authorised that?” “You did Minister.” ...“Backbenchers always hate Civil Service pay rises.” “How interesting you should say that. I was just about to make a suggestion... [I]f MPs' salaries were to be linked to a grade in the Civil Service they wouldn't have to keep voting themselves pay rises all the time. Every time the Civil Service got one they get one as well, automatically. And if MPs' pensions were to be index linked as well, it would make them much less hostile to Civil Service pay claims.” “It certainly would... what grade do you think backbenchers ought to be?” “I thought Senior Principles.” ...“What grade should cabinet ministers be?” ...“Well, at the moment you earn even less than I do. Why don't you grade yourself as a Permanent Secretary... after all, this is a partnership.” ...“...you don't want to make a profit out of serving your country, do you?” ...“Yes... Minister.”

N[Z] politicians spend less time in Parliament than those in almost all English-speaking countries – except A[US. The]... office of Clerk of the House said last year Parliament sat for 87 days... The A[US]ns... had just 68 sitting days... The United Kingdom sat for the highest number... with its House of Commons sitting on 153 days. The Canadian House of Commons sat for 145 days and the U[S] House of Representatives 125... The results could give some credence to [a National MP's] claim that he can host a daily morning radio breakfast show without any impact on his work as Whangarei MP... [He also stated that he thinks of himself as being ‘an entertainer.’ (Editor's note: Because ACTS can be ‘scenes from a play,’ Parliament might seem like an appropriate place for entertainers – who can encompass clowns and actors. Indeed, politicians have been likened to

psychopaths as 'both believe they are starring in the film of their own lives.' NZ has many 'Acting Ministers', but it can't match the US for using the theatre as a training-ground for future politicians. Indeed, one former 'B-grade actor' even managed to become the US President. What are actors? People who 'like the idea of taking on a character and portraying the guise of another, dressing up and hiding behind something' – i.e., people who are good at pretending to be something that they aren't!)] **Not that N[Z] MPs actually bother attending Parliament most of the time it is sitting. MP's speeches are usually directed at rows of empty seats during parliamentary "debate" – most of their colleagues have departed by the end of question time... However, when it came to actually getting things done, N[Z] politicians didn't do quite so badly. N[Z]'s Parliament passed 110 acts... compared to the U[K]'s 41, Canada's 48 and A[US]'s 165, but coming nowhere near the huge 473 acts passed by the U[S (where 'the number of measures enacted has declined since 1972')]. - 1996**

The office responsible for drafting laws says it is already stretched and will be under intense pressure this year because of the amount of legislation expected to be passed. Briefing papers for the Parliamentary Counsel Office show... it usually has to draft about 90 bills and at least 300 statutory regulations each year. But the number of new regulations now exceeds 400 a year... And it says any loss of drafting staff may mean the legislative programme cannot be completed. The office[, which]... received \$5.621 million for the... year... has 18 counsel, compared with more than 60 staff drafting central Government laws in A[US. NSW] has 20 lawyers to draft state laws.

NZ's political system was developed after those of AUS, the US and Britain. This presented NZ with a chance to learn from the mistakes of the other three – or to repeat their mistakes! However, despite being one of the youngest countries politically, NZ is one of the oldest geographically.

Although NZ is relatively small in land mass, its geographical history is as complex as that of a continent. Land has existed in the vicinity of NZ for most of the last 500,000,000 years. The earliest known rocks [are] older than 570,000,000 years...

Between 750-925AD the fabled Polynesian navigator Kupe is said to have discovered the islands now comprising NZ. Recent archaeological evidence suggests that regular visits and small-scale settlement began about this time... 1350 According to legend, seven canoes bearing settlers from the legendary 'Hawaiki' somewhere in Polynesia reached NZ about this time. The migrants and their descendants peopled the land, named its features, and founded the Maori civilization... ['1494 The Treaty of Tordesillas sought to control the rivalry between Spain and Portugal by dividing the undiscovered world along an imaginary line. Spain was to have possession of all discovered and undiscovered lands to the west of this line. According to the treaty, the Pacific would belong to Spain.'] 1642 Abel Tasman, the first European to discover NZ, calls it Staten Landt and annexes it for Holland. ['The first recorded contact between Maori and European took place when Tasman's ships, the *Heemskerck* and the *Zeehaen*, anchored in Golden Bay near the tip of the South Island. Two canoes approached the ships and the Maoris called out and blew a war trumpet. Tasman ordered two of his own trumpeters to play in reply. The next day, several more canoes came out, seemingly friendly, but when the *Zeehaen*'s cockboat was crossing to the *Heemskerck*, it was attacked by Maoris in a large canoe and four of the Europeans were killed. The Dutch fired on the canoes, but without apparent effect. Tasman called the area Murderers Bay.'] 1769 Captain Cook lands at Gisborne... and possession is taken on behalf of King George III. Two months later, the Frenchman, De Surville, lands at Doubtless Bay. 1770 Captain Cook... lands in the South Island... and... British... possession of NZ [is] taken again. 1772 Marion du Fresne lands at the Bay of Islands, and annexes NZ as France Australe in the name of King Louis XV of France... 1839 Governor of New South Wales given jurisdiction over British subjects in NZ... 1840... British sovereignty proclaimed... 1841 NZ proclaimed independent of N[SW], and declared a Crown Colony... In 1846 the first authority to establish representative institutions locally was contained in the Constitution Act but it was never fully implemented, and a Constitution Act of 1852 created a two-chamber legislature with power circumscribed by the British Colonial Office and the Governor in [NZ]... 1854 Opening of the first General Assembly, in Auckland... 1855 First members elected to the House of Representatives... 1856... Appointment of first ministry under system of responsible government [and first PM]... 1865 Wellington becomes seat of government... 1867... Act passed by which four Maori members admitted to the House of Representatives, and NZ becomes the first country in the world to allow its native people to vote. [However, the first four Maori members were 'picked from chiefs who supported the Colonial Government in its war against Maori resistance.' Therefore, the first Maori MPs didn't represent the majority of Maori people! (The US allowed 'voting rights to coloured citizens in 1870' 'but it was not until 1948 that the franchise was effectively extended to Indians.')]... 1877 Education Act provides free compulsory and secular education... 1879 Adult male suffrage introduced... 1890 First election under one-man one-vote system... 1893... NZ women become first in the world to vote in a national election [– although the US state of 'Wyoming extended the vote to women in 1869' (the '19th amendment of the US Constitution extended the vote to women from other states in 1920')... 1894 Industrial Conciliation and Arbitration Act passed, making NZ the first country to introduce compulsory arbitration... 1895... Family Homes Protection Act passed[('AN ACT to make Provision for securing Homes for the People')] ...1898 Old-age Pensions Act passed, the first of its kind in the world[('certain states in the US had long provided old-age pensions, but the Federal government only entered the field with the Social Security Act of 1935')]... 1900... Public Health Act passed... 1905 Workers Dwelling Act passed[('AN ACT to make Better Provision for the Erection of Workers' Dwellings')] ...1910 National Provident Fund Act passed[('AN ACT to encourage the Making of Provision against Destitution')] ...1911... Widows' Pensions Act passed... 1919... Women eligible for parliamentary election [– though it was 1934 before the first woman MP was elected]... 1924... Pensions for blind persons introduced... 1926 Family Allowances Act passed[('AN ACT to make Provision for the Grant of Allowances towards the Maintenance of Children by Parents with Limited Resources')]... 1930 Legislation provides for relief of unemployment... 1936... Introduction of 40-hour week... 1938... Import selection and control introduced... 1939... Introduction of social security for hospital patients... 1941... Introduction of pharmaceutical and general medical benefits... 1944 Introduction of A[US]-NZ Agreement providing for collaboration on matters of mutual interest... 1960 Government Service Equal Pay Act passed.

The issue of equal pay for women came to a head in 1956 after... a [female] public servant with five years experience, won an appeal against the appointment of a newly recruited male cadet. Under regulations at the time, all men in the clerical division were automatically senior to all women in status and eligibility for promotion and [the woman]'s salary was reduced to the level of the cadet. A public outcry followed, and [the then P]M... called a meeting of women's organisations to discuss the... case and the general issue of women's salaries and wages. As a result the Government formed the Council for Equal Pay and Opportunity the following year to study the issue and educate the public.

Applying the same pay rate to everyone employed by the State wasn't an intention of the Equal Pay Act – it was only designed 'to make provision for the application (to the Government Service) of the principle that women should receive the same pay as men where they do equal work under equal conditions' ('legislation designed to remove and prevent sex discrimination in pay rates in the private sector was passed in 1972'). If NZ's Government had intended to pay the same rate to every worker in every industry, it would, effectively, have taken politics full-circle – GOVERNMENT in its earliest form was simply a method of organising the equal division of labour and produce amongst members of a community. This initially involved the production of food, construction of buildings and other amenities. The duty of such a government was, therefore, to achieve the combined well-being of its citizens. However, some leaders started to provide only for themselves and, in extreme cases, organised their citizens into armed forces which were used to attack others

communities (or other governments) – to steal crops, loot manufactured products, gain slaves and so on. The other communities responded by organising defence forces, at which point warfare established itself amongst the duties of government. Since then, many governments have focused on the duty of defending citizens against exterior enemies (r:p174, lns63-4) while completely ignoring the duty of defending citizens against lack of food, shelter, etc!

...I've been[trying to] think... of a reason why I should be working for a living... the government takes away part of what you earn and shares it out... some is used for killing and some salvation...

In recent centuries, as the economic system has become more sophisticated, the duty of achieving *the combined well-being of citizens* has gradually been resurrected via the provision of state welfare. NZ's political system was born into this era ("The welfare of the people is our first and constant consideration" – Michael Joseph Savage, 1938'). The youthfulness and size of NZ's system also enabled it to be the first country to adopt some of the latest political theories from around the world. Furthermore, because NZ has never tried to attack another country on its own, and hasn't been invaded by anyone for over a century, Defence hasn't been more of a priority than Welfare for its governments (excluding the brief periods of WW1 and WW2). However, since the 1960s, NZ governments have increasingly adopted the philosophy that the primary duty of a modern government is to DEFEND THE ECONOMY.

In 1960 the National Party... was returned to power, which it retained until 1972. In that year Labour won a huge victory under Norman Kirk; his death in office in 1974 was the prelude to as great a National victory in 1975... The 1970s and '80s were difficult economically for N[Z]. The combination in the early 1970s of high energy prices and Great Britain's entry into the EEC brought about a severe economic recession. Inflation skyrocketed, unemployment soared, and thousands emigrated to A[US]. The response of [the]National government was interventionism on an unparalleled scale: the government borrowed funds from overseas and ran up huge budgetary deficits, in part to finance large industrial developments [that evolved from a policy known as 'Think Big (under which NZ's overseas debt rose from 4% of GDP to over 30%')]; and it attempted to regulate interest rates. Dissatisfaction with this program led in 1984 to the election of a Labour government... The Labour government initiated one of the most sweeping policy reversals in the country's history as, one after another, restrictions on free enterprise that had been imposed progressively over some 50 years were lifted. Among the reforms were the elimination of agricultural subsidies, the reduction of income tax rates, and the lifting of controls on wages, prices, interest rates, and foreign exchange.

Previous to 1984, the year was synonymous with a British science fiction novel.

Orwell, George, pseudonym of... [the] English... essayist, and critic famous for his novels *Animal Farm* (1945) and *Nineteen Eighty-four* (1949), the latter a profound anti-Utopian novel that examines the dangers of totalitarian rule... He was born in Bengal, into the class of sahibs. His father was a minor British official in the Indian civil service; his mother, of French extraction, was the daughter of an unsuccessful teak merchant in Burma. Their attitudes were those of the "landless gentry," as Orwell later called lower-middle-class people whose pretensions to social status had little relation to their income. Orwell was thus brought up in an atmosphere of impoverished snobbery. After returning with his parents to England, he was sent in 1911 to a preparatory boarding school on the Sussex coast, where he was distinguished among the other boys by his poverty and his intellectual brilliance. He grew up a morose, withdrawn, eccentric... Orwell won scholarships to two of England's leading schools, Winchester and Eton, and chose the latter. He stayed from 1917 to 1921... Instead of accepting a scholarship to a university, Orwell decided to follow family tradition and, in 1922, went to Burma as assistant district superintendent in the Indian Imperial Police... Yet from boyhood he had wanted to become a writer, and when he realized how much against their will the Burmese were ruled by the British, he felt increasingly ashamed of his role... In 1927 Orwell, on leave to England, decided not to return to Burma... Having felt... that the barriers of race and caste had prevented his mingling with the Burmese, he thought he could expiate some of his guilt by immersing himself in the life of the poor and outcast people of Europe. Donning ragged clothes, he went into the East End of London to live in cheap lodging houses among labourers and beggars; he spent a period in the French hotels and restaurants; he tramped the roads of England with professional vagrants and joined the people of the London slums in their annual exodus to work in the Kentish hopfields... In 1944 Orwell finished *Animal Farm*, a political fable based on the story of the Russian Revolution and its betrayal by Joseph Stalin. In his book a group of barnyard animals overthrow and chase off their exploitative human masters and set up an egalitarian society of their own. Eventually the animals' intelligent and power-loving leaders, the pigs, subvert the revolution and form a dictatorship whose bondage is even more oppressive and heartless than that of their former human masters. ("All animals are equal, but some animals are more equal than others.") At first Orwell had difficulty finding a publisher for his small masterpiece, but when it appeared... *Animal Farm* made him famous and, for the first time, prosperous. *Animal Farm*... has, however, been overshadowed by his last book... a novel he wrote as a warning after years of brooding on the twin menaces of Nazism and Stalinism. The novel is set in an imaginary future in which the world is dominated by three perpetually warring totalitarian police states. The book's hero... is a minor party functionary in one of these states. His longing for truth and decency leads him to secretly rebel against the government, which perpetuates its rule by systematically distorting the truth and continuously rewriting history to suit its own purposes... Orwell's warning of the potential dangers of totalitarianism made a deep impression on his contemporaries and upon subsequent readers, and the book's title and many of its coined words and phrases ("Big Brother is watching you," "newspeak," "doublethink") became bywords for modern political abuses.

The real 1984 was significant for being the year when Britain promised to eventually hand Hong Kong back to China (Hong Kong could be called the definitive example of a government which is LEAST like the ones described by Orwell, whereas China is a definitive example of a government MOST like them). NZers, however, remember the year for a different reason. Whereas Orwell's fictitious governments wanted to INCREASE their control over the communities they were supposed to serve, NZ's Labour Government of 1984 effectively decided to DECREASE its control over the community it was supposed to serve!

During the early 1980s a group of... new-right... economists slowly came to dominate policy development in the N[Z] Treasury. With the election of the Labour Party in 1984 and the appointment of [a gnome (r:p201, ln11)] as Minister of Finance, their plans... to turn our country into their version of the model free market state... were realised with the introduction of some of the most drastic economic reforms ever seen in a western democracy. - SOMEONE ELSE'S COUNTRY

The... film... *Someone Else's Country*... regarded economic reform as a conspiracy of international capital which, having cut its teeth in Chile, insinuated itself into a N[Z] Labour Government and destroyed the welfare state we knew and loved... "The world's first welfare state became the world's first post-market state."

Having turned NZ into a *post-market state*, the PM declared – prior to winning the 1987 election – that his party intended to return to its welfare roots.

“...and this Government has made its pledge. We addressed the economy in ’84 to 7 and we addressed it big, and in ’87 on we are going right into that whole area of social policy, the duty of the state, in the areas of health and education, to be the dominant funders, the dominant providers.”

Labour’s promises were short on detail but the direction was clear... Meanwhile, Treasury officials were writing a brief for the Minister of Finance, but the brief didn’t suggest ways for Labour to put its promises into effect. It did the opposite, proposing a new right prescription to cut [the Government’s] role in health, welfare and education. Labour’s election campaign was well supported by big business and the multinationals. Of the \$3.5 million dollars Labour spent on its election campaign, thousands came from unions, hundreds from party members and millions from the corporate elite. A new investment company, Equiticorp, contributed \$250,000.

Popular support for the Labour program was reflected in the party’s 1987 general election victory. In the late 1980s, inflation had finally been brought under control, but unemployment continued to rise. [The P]M... began to face substantial opposition within his own party, especially as a result of the privatization of state-owned enterprises, which was initiated in 1987, and over his conflict with... [the Finance Minister, who] was pushing for economic measures, such as a flat-scale tax system and the deregulation of the labour unions, that the [PM considered extreme. The PM dismissed the minister] in December 1988, but in August 1989, with the aim of shoring up Labour’s poor standing in the polls, Labour MPs voted to return [the sacked minister] to the Cabinet. [The PM] resigned a few days later and was replaced by his nominee, [the]Justice minister... In just 13 months, however, [the nominee] was... replaced by... a former minister of foreign affairs, who held on to the position of [PM] for only eight weeks before the National Party’s landslide victory in the... 1990 general election... The National Party had campaigned for reduced government spending on social programs and the elimination of such labour practices as compulsory unionism but pledged to maintain N[Z]’s antinuclear stand.

Academic economists: we were right about reforms... As an observer one has to admire the manner with which quite a small number of individuals effectively changed history although the population at large was not in favour of the change... Economists would agree that much of the change has in fact been for the better. By and large, economists believe that the market mechanism works tolerably well... But one has also to say that the New Right tactics were unacceptable and, for academics accustomed to a more civilised environment, it was difficult to handle... [A] number of academic economists did seek to reverse the policies of the time... In mid-1991, just as the economy “turned the corner,” a group of Auckland University economists warned that [the Government’s economic] policy would not work... Since then it has regularly been alleged that they had it wrong... *June 6, 1991:* ...the open letter of the Auckland University economists... predicts that proposed deficit cutting strategy will make the budget deficit worse and recommends instead that the Government aim to reinforce competitiveness with an adjustment to exchange rate policy. *July 30, 1991:* The “mother of all budgets” forecast a deficit of \$1.7 billion. The actual deficit, revealed a year later, amounts to \$2.5 billion due to depression in the economy and a collapse of revenue receipts – as predicted by the economists... As I write this, there is an eerie similarity to the situation which existed in late 1990 – an over-valued exchange rate doing major damage to the export economy and setting the stage for the recession of 1991-93. There is a difference, however, in that the public accounts are in surplus... to the point that tax cuts are now necessary. That is to say, the budgetary measures taken in 1990-92 which the economists warned against are now having to be unwound.

...The good news machine is being cranked into overdrive. We are told that our economy is a model for the world to follow. Taxes are returned to the more affluent; the Employment Contracts Act is the best thing for employers since sliced bread; the dollar is buoyant; the stock market is up. It was suggested recently that you can see Jesus as a supporter of free markets, and that, so long as you are all right spiritually, a bit of poverty doesn’t matter. That is a credo often heard from those with full bellies... I dare to believe that it’s not God’s gift to us, and that if everyone tries to grab as much as they can for themselves we won’t all be better off as a result. I’ve lived in Manukau for 25 years, much of it in places not particularly socially respectable. I used to be a vicar of part of it, and know and love it well. It is by far the most stimulating place to be in N[Z], with real encounters and sharing among its cultures. In the bad old days, when Governments dared to intervene in the economy, everyone here had a job, and some had two or three. The Pacific Islanders had come to do the dirty work that no one else wanted, and how they worked. As industrial chaplain in an East Tamaki factory I used to worry at the load many of them carried. Otara got bad press, but it was a community of promise. It was an honest place. We lived in its heart and rarely locked doors. Its new town centre supported three substantial supermarkets. A new generation of young community leaders was starting to emerge. The free market closed that factory and many like it. It left whole families jobless, sometimes three generations. It forced them into a survival mode where beneficiary status is the norm. Then the New Right could blame the victims as dole-bludgers and layabouts. None of this is new. Victorian Britain, then the richest country in the world, ran on free-market principles. Its poor lived in unimaginable squalor. My great-grandparents came here to build a better life than that. Now some of the new generation want to repeat the misery here.

...*Strong economy can iron out inequality...* N[Z] has transformed its economy over the past decade. The economy had been in decline since 1960, but is now heading upwards... Some critics claim that economic change has been accompanied by unacceptable social costs. We cannot say with certainty what N[Z] would have been like in 1996 if it had not reformed its economy. It is likely, however, that its standards would have continued to decline... All Western countries are concerned with inequality. Inequality cannot be dealt with by returning to the past. The first step is to ensure that the economy is growing as fast as possible... - 1996

All revolutions need a vizier: In N[Z] it was the man who spent 10 years as]... head of the public service – a decade as chief executioner of traditional bureaucracy... This was revolution from above... [His] job as State Services Commissioner was to order his officials into the cauldron of Rogernomics... [and, thereby, preside] over the destruction of a system which his father, [a]former Defence Secretary... helped build... Brought up in the system himself, the... [son] admired and respected some of its qualities... He joined the public service in 1952, aged just 18, and has worked in it ever since... But he put it to the sword, and is now retiring “with mixed feelings”. He is sure some sort of revolution was necessary. But whether [the result] was exactly right – well, he is unsure. As a historian, he knows it is still too early to reach a verdict. One part of the old system which had to go, he says, was overstaffing... The size of the transformation wrought in the public service during the last decade is best communicated in a single, brutal fact – the reduction in the workforce from 85,000 in the early 1980s to fewer than 35,000 today. And... the number will be reduced further... a product of an international trend towards decentralisation and the idea that small is beautiful. But, while other countries experienced a tide of change, N[Z] was engulfed in a tsunami. An American academic... was commissioned by the State Services Commission and the Treasury in 1995 to evaluate the restructuring programme. He titled his report *The Spirit of Reform*. He might just as accurately have called it *Death of a Culture*... [The American’s report said,] “Government departments in N[Z] are no longer the organisational cocoons many once were... They are not sheltered by special rules, stable career patterns, incremental budgets and ambiguous performance standards. They increasingly resemble business organisations.” He found that the reforms had been generally successful and had lived up to most of the “lofty expectations held for them” but wondered if the “hard-edged contractualism” of the new regime might have diminished the “public regarding values” traditionally expected of the public service... [The retiring] State Services Commissioner... earlier this year... described the public service as “a group of men and women who have, in many cases, made a deliberate decision to work for organisations which are not driven by the bottom line but are, in some direct or

indirect way, contributing to improving the lot of individual N[Z]ers and the nation.” ...he challenged the concept that the “differences between the public sectors are not that great, that they perform similar functions and can be operated in similar ways.” But... this [was]... the presumption behind the reforms... [and they were supported by] his immediate predecessor in the commissioner’s job[(1986-87), who was the ‘Chief Executive of ECNZ (1987-92), Deputy Governor of the Reserve Bank of NZ (1982-6) and’ is] now the chief executive of Telecom... If [his predecessor’s] mission was to throw away what was bad in the old system, [his mission] was to try to salvage what was good. He seems to believe that he had some success in this. But impressions matter, and he was not helped by the scandal of having [a colleague] convicted of embezzlement as Auditor-General... “The enormity of that is only just sinking in,” he says. “World-wide it is an absolute embarrassment. N[Z] on the international league table of corruption has always been either at the top or in the first three [for integrity]... We worked together closely and I liked him. But what he has done is unforgivable.” ...as a result background checks on senior officials now include rigorous scanning of creditworthiness... But... [the retiring commissioner] says any system has its crooks... [T]he Public Trust Office... where both [he] and his father started their careers... was born in the 1870s “when the rip-off merchants – whether accountants, lawyers or confidence tricksters – were out pinching people’s money.” There were scandals and skulduggery and tales of widows left destitute... He... has hard questions about user-pays[, and offers]... the old Department of Survey and Land Information as an object lesson about the perils of making departments raise revenue. DOSLI “went to Kuwait and surveyed the border and helped lift mines between Iraq and Kuwait as a means of raising money to run the department in N[Z],” he says in amazement. “That is absurd. Either you need the department in N[Z], in which case you should pay for it out of taxpayer money, or you shouldn’t have it. Some people say: ‘Why not make a few bob on the side?’ Well, I think making a few bob on the side actually distracts you from the central job. That has happened in a few instances.” Social services are now “very hard to run from within a government department... I feel very strongly for the poor buggers in... the Children and Young Persons Service... I think sometimes they’re virtually being asked to make bricks without straw. The social problems are immense and we’re still expecting them to deliver almost as if it was the stable society of the ’50s and ’60s.” ...The mainstay of the... revolution was the State Services Act of 1988. It took power from the SSC, the central body, and gave it to departmental chief executives. “We changed the act to say; ‘You will now manage your department and by God you will be accountable for it.’” The critics... say there is no such accountability... [Furthermore, for] years now, the public service has been under financial pressure as Governments have refused to compensate departments for the ravages of inflation or for wage increases – and still the search for “fat” goes on. But [the retiring commissioner] says it cannot continue indefinitely and that in some places we have already cut into the muscle. Asked to provide an example, he quotes the under-resourcing of the Statistics Department. This had implications for the economy as the Reserve Bank relies on the information supplied by the department in managing monetary policy... [His] misgivings about some of what has occurred in the state sector emerge obliquely when he is asked if he considers the Treasury is too powerful. “Yes, I think it is,” he says. “Treasury must always be the predominant department but there is a point at which that predominance becomes dysfunctional. You have to strike a balance between strong management and over-weaning authority.” [He] sums up his philosophy in what he calls the “old adage” that a society will be judged by how it protects its poor, its underprivileged and its elderly. It is a statement of support for a welfare state that he acknowledges himself is under threat if not gone entirely. And it is a sobering reminder that with his retirement we have lost yet another important link with what was a kinder, gentler, more humane N[Z]... His father told him when he was a young official the public service “wasn’t just one of the principal constitutional props of the country. It was also a major welfare institution.” As the country’s largest employer it had to employ those “who were in a sense unemployable”. This was an honourable notion, natural to his father’s generation of the Depression. But in the end it was to prove ruinously expensive. When Labour took power in 1984 “the economy was disintegrating... The spectre we had was Argentina. Before W[W]II it was one of the leading countries in the world. By the time their governments had destroyed their economy they were a developing country again... I was the instrument of overturning a great many of the things I felt were good about the country... I guess the only thing that reconciled me to it was that it was inevitable. The alternatives would have been much worse.”

...friends and family are mourning... [a] former head of Treasury... who... died this morning... When [he] took over Treasury in 1968 it was just an accounting department. He turned it into a body renowned for giving independent advice. N[Z] was highly regulated. [He] favoured change... He could see that as we came into the late ’60s and ’70s N[Z] couldn’t go on running itself in the way we had before. National scrapped Labour’s compulsory superannuation scheme in 1975 against his advice. Tired of battling [with the National PM, Robert Muldoon,] he retired in 1976... He was a reformer but [he] didn’t agree with the free marketeers of the ’80s who said there was no other way. “That’s nonsense... There are always alternative policies, lots of them.”

...*Games that politicians love to play – with your money*... You’ve seen those computer games where you build a city complete with all the needs of modern civilisation. It’s an interesting challenge. This one is different. The object is to destroy the economic and moral fabric of a lower-class neighbourhood. See if it works. You have all the resources of the modern state. The budget has no limit... In the final destructive stages of the game the policy arms of Government will be occupied by politically correct socialists, their budgets fuelled by hand-wringing politicians pouting the appropriate platitudes of concern and claiming that the only remedies that will work are those stemming from their power and intelligence and spending a few billion more from the productive sector of the economy. You will know that your game plan is successful when: the state coffers are bursting... tax is punitive and large surpluses are accumulating; welfare spending is astronomical but poverty increases; crime is rampant; you have achieved high levels of fatherlessness; children are almost feral; and unemployment is high but lowly paid jobs are unfilled.

...*Balance sheet ideals make sorry reading*... Under the influence of the market, all other forms of truth have been dissolved in favour of the techniques of the cost accountant and economist. Human activity is measured only in its countable form. If you can’t count it, it doesn’t exist. Welfare “dependent” solo mothers must be forced out to work because raising children, being unquantifiable is not productive. A mother is valued more behind a shop counter than caring for a child... It’s a conveyor belt view of life: Counting the products as they are shipped out from the factory but not the process by which they are produced... People in the workforce are after all only human resources, a living form of raw material... The exploitation of workers, illness caused by occupational hazards, disruption to family life, and the destruction of the environment are irrelevant since they do not appear on the balance sheet... Age and immobility, like economic disadvantage, do not come into the... bean counting. To stand up and be counted was once considered a virtue. In the market, it has been transformed into an inhuman vice.

...N[Z] once glowed in the international praise lavished on our “social laboratory” tag after [the] Plunket Society set standards for the world to follow in the care of children, and the first Labour government enacted social reform legislation in an effort to ensure we did not again face the deprivations of the Depression. Those were the heady days when N[Z] walked tall among the nations concerned with social improvement. No longer. Our record of leadership has long been usurped in child health and as a social reformer. In the past decade or so, it is the economic reformers who have dominated and earned kudos from international economists who see competitive endeavour as the basis for business... Now, it seems, we are discovering what some tried to point out at the time: That economic revolution carried a social cost... The U[N] Committee on Rights of the Child reports those 1980s economic reforms have affected resources available to support children and their families. The report does not see N[Z] as a commendably fair or caring society... N[Z] is developing a social underclass – just as the economic reforms... created our elite of vast wealth. The latter are people with enormous political clout; the former have no real power at all. The Coalition Government is certainly not without information on the seriousness of social issues. What it needs are solutions.

...the coalition Government... exposes the flaw in mixing two policy approaches and thinking the resulting compromise is progress... [P]re-election marketing was targeted specifically at groups which missed out on targeted benefits: those superannuitants who had sufficient income to be

deemed not in need of full support from the state; those students whose parents were deemed able to help to fund their living expenses; those parents who were deemed able to fund their young children's health needs; and – surprise, surprise – significant numbers in these groups prefer to have those expenses shared by other taxpayers rather than borne by themselves... [T]he coalition's policy... would spend \$760 million extra on the top 60[%] of households (by income) in order to get \$178 million additional transfers to the lowest 40[%]. This gives a fair idea on who really benefits from the policy soup the coalition is dishing up... The coalition's populist, middle-class welfare will do little to help the poor, will exacerbate differences between haves and have-nots, and represents the kind of short-term cycle in welfare policy-making which we last experienced during the [1975 to 1984 political] era. On-again, off-again cycles of instability in welfare intervention do nothing to encourage households to improve for self-reliance.

...The [coalition] Government continued yesterday to hint at a tougher welfare regime, while promising A[US] that it will increase defence spending... [The Treasurer] and the P[M]... have been consistently dropping hints of sweeping welfare reforms in speeches over the past few weeks, which Labour calls a New Right code for more cuts... Details of the welfare changes are expected to remain under wraps until this year's budget, which [the Treasurer – who bragged that 'for 17 consecutive quarters we've had economic growth' –] said yesterday would be delivered... [mid-]June... In Canberra... the... Minister of Defence... said... "I think we've done all we can in terms of cutting our cloth to bring about a sensible budget surplus in N[Z]... Now I want to see – and I am sure my colleagues want to join me in this – that N[Z] is able to maintain a credible Defence Force."

...It's a cruel hoax to tell us our 'market' economy is healthy... A real social audit of the lot of the people today would reveal that an increasing majority are suffering more and a decreasing minority are gaining more... [T]he free market policies followed since 1984 have seriously damaged the lives of many N[Z]ers and their families. Chronic unemployment is a social volcano causing much of the crime, domestic violence and lower health and housing standards which are closely interlinked. Senior police officers, judges, social workers and court solicitors know this to be the case and many say so if permitted to speak frankly. Thousands of secondary school children are on low-paid, part-time work while their parents remain at home unemployed. Supermarket and other employers exploit youth and part-time workers in order to cut labour costs so as to market a cheaper product and win more market share. Young and old (if they can get to work) are working all sorts of odd hours to try to get more income and make ends meet. There are many cases of wife and husband working different shifts to keep the home going, which must cause very harsh family problems. Superimposed on these growing problems is the impact of much dearer health costs as the public health system is intentionally run down making the burden of private health costs fall much more heavily on low-income earners. The public education system is being methodically run down. More than 10,000 "exempted" schoolchildren are a dangerous breeding ground for youth crime and may yet be proved to be a factor in our high youth suicide rate. Significant right-wing forces say the state cannot guarantee the future for national superannuation for the elderly. Our water supply, sewerage systems and public transport are being neglected in a number of cities. These services are being prepared for total privatisation. Environmental problems go on largely unserved. Even the police force has a growing crisis but they seem to find time to take action against union pickets when contacted by the employers... Having abdicated much of their economic managerial responsibility to the Reserve Bank, those politicians who believe in the open economy now spend much of their time attacking each other instead of addressing the real economic and social problems of the people... Day by day the great majority of economists pontificate about interest rates, inflation rates and exchange rates... Changes in interest, inflation and other statistics are important but do not really deal with the real core social problems... The well-paid economists and politicians who attempt to prettify the key economic indices avoid any real social audit. They are not the victims of the negative economic and social processes. If they do have any real knowledge of the injustices being suffered, they opt for a cowardly evasion of the realities. Recently a news item reported that the household employment survey indicated that unemployment had gone up by some 10,000 yet, "the markets were buoyant." As long as the markets were reasonably happy it was not so important that some 10,000 more Kiwis were without a job. This is the sort of cruel ideological illogic that drives the majority of our politicians who respond to the market's (Big Business') needs. The basic reason for these most antisocial changes is the alarming growth and power of global capital and the abject surrender to those forces by most politicians and economists. Terms such as the "open economy" and "freeing up competition" are simply code terms for subservience to foreign capital with all its power and ruthlessness... The use of our resources is increasingly being decided in the boardrooms of the transnationals in Sydney, London, Tokyo or New York... Today's... policy is simply an abject surrender of our national interests to the plunder and greed of the global corporations and their local agencies... The question to be addressed by economists and politicians concerned is: why is it that the economy is (allegedly) doing so well yet the low-income people of this country are doing so badly? Should the people serve the economy or should the economy serve the people? ...Every child with unattended glue ear, insufficient dental care and undernourishment is a victim of the misdirection of our resources. Every unemployed person seeking work, everybody looking for... care when elderly and everybody on a hospital waiting list is a casualty of the open economy and the so-called free market... We have had the free-market policies since 1984. We have had the Employment Contracts Act since 1991 and deregulation and privatisation has abounded. How many more years do we need before these so-called "achievements" bring home the bacon in economic and social terms? ...The national wealth created by our workforce and enterprises should be retained in N[Z] and used for the people's welfare, health and education... The cardinal question facing us is whether we are going to own our own country with an economy working for our benefit or whether we are going to be someone else's country with an economy working for their benefit. As the transnationals buy up more and more N[Z] industry and control nearly all of our banking, stevedoring, forestry, communications, rail and other key sectors, we lose more industry, jobs and national wealth. With every container-load of cheap imports goes... N[Z]er's jobs and another container of N[Z]'s wealth to an overseas company and another lift to that importer's bank account... N[Z]ers are faced with the two-headed monster of global capital and national corporate power which is both savaging and despoiling the very social structures our parents and their parents helped to build for our benefit and the benefit of our children and their children.

...Since the deregulation of the financial markets, the economic policy options available to... [the] Government... have become more limited – because any action which alarms foreign investors will be punished immediately with a flight of capital. So perceptions are more important than ever – and right now the mood in N[Z] is decidedly sour. Business sentiment is at its most pessimistic in six years and consumer confidence is fading fast. Basically this situation goes back to mid-1995 when the [N[Z] dollar shot above 60 on the Trade Weighted Index, damaging the competitiveness of our exports and choking off what had been an export-led recovery... The resulting slow-down of the economy began to show in company balance sheets... And the Government felt the effect as the corporate tax take came in 14.2[%] or \$566 million below expectations... Treasury was picking a growth rate of 3.6[%] for 1997-1998 and is expected to cut this back to around 2[%]. But... although the landing is proving bumpier than the Treasury and most other commentators were hoping, the economy's shock absorbers are equal to the bumps – as the Treasurer... and the Minister of Finance... never tire of telling us.

...Evidence that the economy has had a hard landing was confirmed yesterday with the announcement that [N[Z]'s GDP shrank 0.5%] in the March quarter. It was the first quarterly contraction since September 1992, when the winter electricity crisis hit an economy struggling out of recession... Manufacturing activity fell 1.1[%] in the quarter... Activity in the service industries, including retailing and transport, fell for the first time in five years, but housing construction was up. "It is possible some of the effect of last July's tax cuts has gone into improvements to housing rather than general consumer spending," Statistics N[Z] said. Overall, internal demand was flat in the March quarter, up only 0.2[%]. Household spending, after recovering slightly in the December quarter, fell by 0.4[%]... The sluggish internal demand was compounded by a 3[%] fall in exports.

...*Economy tipped to improve soon...* The economy is close to a turning point, the Institute of Economic Research says in its June Quarterly predictions. The indicators have been mixed, it says, which usually means things are starting to change. On the one hand, March quarter inflation – or deflation as it turned out – was well below expectations. Retail sales have been poor and employment has fallen for two quarters in a row... The institute expects employment growth to continue to ease... Unemployment should peak at 7[%] in March next year... The sharp decline in business confidence recorded in the institute's March survey... had come as a bit of a shock.

...a fresh set of statistics show... a worsening in our external trade balance. They also point... to something wrong with the structure of our economy. Since October[1996], imports have shown a trend increase of 10% a year while exports have decreased 7.5% a year. But the economy has been slowing... In the year to December 1996, the economy grew by 2.7%... When the economy slows, imports relative to exports should shrink. This has not happened. More ominously, the latest trade figures show imports of investment goods are lower, but consumer goods are pouring in... If – as the Government hopes – something happens to get the economy growing at more than 3% again, the demand for imports will quicken and further widen the trade gap... The stimulus to build up the momentum is expected to come from government spending... But... precious little spending will be capital spending to lift the country's productive capacity.

...Government spending, it's on track for a healthy surplus with 3/4 of the financial year gone. It took in \$3 billion dollars more than it spent in the 9 months to March. That's... [more than forecast. L]ower Government spending and higher dividends from State companies boosted the surplus.

...The Government is warning that its budget surplus projections will not be met... What a surprise – slumps in economic growth disturb not just business and household plans but ensnare governments as well. That the economy has been in a steadily slouching sag since late last year has been apparent since that time – to all bar[the] Treasurer... So here we are six months later with at last official recognition of the deterioration – only a few weeks since the Treasurer asserted the situation was a figment of private sector imaginations, that the economy was in fine fettle and on course and the grumps should “snap out of it.” ...From... forecasting a surplus of \$6 billion 18 months ago, it was now down to... between \$1.5 and \$1.6 billion... [I]t is a joke that the Treasurer could announce a big drop in the surplus without warning so close to the budget. That showed he was not on top of his job and did not inspire business confidence... Clearly he has much to learn about the nature of expectations and how quickly they can be influenced by changes in policy, political, or overseas conditions... The Treasury is forecasting stronger economic growth over the next three years than all the most optimistic of private sector economists... It's very hard to see how Treasury is picking such a strong pick-up in the economy... The Inland Revenue Department was forecasting slower growth in tax revenue than Treasury, meaning the budget surplus was likely to be lower than the... forecast...

The urgency of the challenge confronting the Treasurer... in today's budget has become more pressing with the release of further evidence of a dramatic slump in business confidence... Companies uncertain about the future do not invest, expand or take on more staff. So [the Treasurer] is anxious to turn the mood around by using his first budget to convince the decision-makers in the economy that his pinstripe suits are not a disguise but an outward expression of his fiscal and economic conservatism. He will not be helped by the fact that the Treasury has had to slash its forecasts for the coming year – halving its projected surplus of \$3.3 billion... and cutting its growth figure back by a third... to 2.4[%].

...We are a government of conservative and prudent fiscal management... the Treasurer... [said] to Parliament yesterday afternoon... The budget forecasts show a surplus of \$1.5 billion in 1997-98, rising to \$2.6 billion in 1999-2000 and take into account amounts for new initiatives in later budgets and tax cuts in 1998-99. Though the surplus is reduced it is still healthy and this confirms the wisdom of aiming for substantial surpluses to ensure continued debt reductions throughout the economic cycle... [For his part, the 'PM said, “This budget maintains direction and adds to it.”’ However, the] credibility of the coalition Government's first budget hangs on a single hook – the expectation that the economy will grow 4.2[%] in the 1998-99 year. ● The Coalition Agreement had promised “\$5 billion in extra spending over three years, with a maximum of \$1.2b coming in the first budget.” The actual figure of \$950m was an increase of between 3-4% over the 1996-97 budget but \$550m less than the projected surplus. Most of the extra spending – part of which will be cancelled out by inflation – went to Health (6.8% more than the previous year) and Education (5.4%).]

...The budget has failed to bring the promised spending boosts to health trumpeted in last year's coalition agreement... Hospital waiting lists and mental health services, both sources of ongoing political embarrassment, are listed as “key health areas.” But yesterday's announcement clearly had fewer health goodies than expected. A spokesman for the Treasurer said the \$1.7 billion extra for health... over the next three years – substantially less than the... new money hailed by the coalition in December... [-] was preliminary. “There were some numbers put together during the nine weeks of coalition talks and we now had the benefit of six months of intensive budget work,” he said. Despite the shortfall, the Minister of Health... was in a positive mood, saying health was a confirmed top priority. “For the first time the health sector will have the opportunity to plan ahead based on realistic expectations of future funding.” ...A spokeswoman for the Minister of Health said the signalled cash was certain, but officially it is not confirmed. How it will be spent is a mystery... Health authority chiefs were almost gloomy last night, predicting the coming 12 months would be the most difficult for the health sector trying to sustain access to publicly funded services. They welcomed the money, but warned that it would be quickly used up meeting growing medical needs... Children have been thrown a few lifelines in the budget but in the eyes of critics the whole package adds up to a cut-price deal... [T]he Commissioner for Children, said... his office needed \$300,000 immediately but instead had been allocated that amount over three years... [He] said the money was not enough to drag the ailing service back on its feet... To cope he would have to restructure his office and review the services he could deliver... “The 95,000 seriously at-risk children identified by the service... are going to continue to be seriously at risk.” ...Absent from the budget is a key coalition document initiative – the establishment of a family service within Social Welfare to co-ordinate health, education, welfare, police and justice agencies... The Minister of Social Welfare... said those aims were being covered in other initiatives. The budget did allocate \$2.225 million for one-stop centres for services targeted to families with children under six... The coalition Government's commitment to education got off to a slow start... with just a third of its promised spending delivered in the budget... More classrooms and schools are planned, truancy programmes will be expanded, and there will be more books in homes... [T]he Children's Agenda lobby group, welcomed those moves but said generally the Government had lost a huge chance to help children... The big loser was the tertiary sector with no mention made of the return to universal student allowances that was signalled in the coalition agreement... Maori weren't expecting much from the budget, and that's exactly what they got... Military volunteer programmes and community projects will be expanded under the budget in a bid to reduce long-term unemployment. The Minister of Employment... predicted that expanding the military[volunteer] programme would provide “personal development and job skills for at least 1250 young, disadvantaged job seekers over the year.” ...But the Auckland Unemployed Workers Rights Centre spokeswoman... said the budget only further abused the unemployed. “Unemployed people... want real jobs, not make-believe, unpaid work.” ...The Government has signalled its intention to beef up the Army's armoured vehicle fleet without providing any money for such a project in[the] defence budget... The elite arm of the military, the Special Air Service, has been allocated \$33 million for counter-terrorist training and operations... N[Z]'s cloak and dagger brigade, the Security Intelligence Service, will have an extra \$70,000 to spend this year. The service vote is \$10.584 million. As always, no details are given of where the money will be spent. All we know is that the service will provide advice to other departments on security and intelligence... The similarly secretive Government Communications Security Bureau has had its budget bumped up \$551,000 to \$19.092 million. It advises and assists other departments on how to deal with classified or sensitive material... Police have been dealt a \$14 million funding blow and are now frantically trying to... win the money back. In the budget books yesterday, the fund for front-line policing was cut from \$782 million last year to \$767 million for 1997/98. Another \$15 million was cut from capital expenditure, giving police less money to spend on land, buildings, vehicles and equipment. Announcing the police share, [the] Police Minister... said

an extra 200 officers would be recruited by the end of next year – the first batch of the 500 promised in the coalition agreement. But it was not clear yesterday how the extra police would be funded... [T]he Police Association was “disturbed” about the apparent funding blow. [Its] President... said police had been dealt a hefty cut at a time when resources had been “cut to the bone.” ...The Opposition [police] spokesman... said the Government had misled N[Z]ers. “The only winners in this budget are the criminals,”... [P]olice would spend less money investigating violence, sexual offences and burglaries and searching for drugs, he said... The war on drugs in prisons was given a \$1.5 million shot in the arm in the budget. The annual allowance is to be spent on testing prisoners for drug and alcohol use once legislation is passed by Parliament next month. The Department of Corrections will test prisoners randomly. The drug-free will be rewarded with extra privileges which will be taken away if a later test is positive... An extra \$3 million would be spent on drug education for schools – including money for schools to “identify and help” existing drug users... The... budget... boost[s] funding for crime-prevention programmes for at-risk youths by \$7.15 million over... three years... More than \$5 million... of the \$8.7 million... will be spent... in the Auckland region...

The board that funds legal aid for court cases is set to go cap in hand to the Government asking for \$6.75 million which the Treasury took away from its annual budget. The money was sitting in the board’s reserves, and the Treasury said it was surplus cash from previous overfunding... But... the board financial manager, said the Treasury had failed to take into account outstanding legal aid claims yet to be settled. [Ironically, government departments in NZ have operated under an annual budget system for much of the 20th century. When a department failed to spend its budget within the allocated period it was assumed that the department was ‘overfunded’. At some stage a civil servant decided that the best way to avoid a budget cut was to ensure every cent was spent, even if that meant a lot of money was wasted unnecessarily (e.g., through construction projects that basically involved getting workers to dig holes so they could refill them; by over-purchasing – creating warehouses full of unused junk), and where that civil servant went many followed. This was one reason why NZ’s Government decided in the 1980s that the country’s economic management system had to be reformed!]

...The Government has bowed to pressure and boosted the police budget by more than \$18 million... after trying to slash it... by \$14 million... However... the... president of the Police Association... said the money gave police little more than they had to spend last year... “We’re grateful but it won’t be enough...” ...The deputy commissioner... said... police had big capital projects – such as a new \$8 million-plus building in Otahuhu to house the Northern regional headquarters... Police... will be forced to work in cramped premises now their new building has again been delayed... [Incidentally, t]he current account deficit for the year ended June was well above market expectations and the largest on record at \$6.03b, said *Statistics New Zealand*... Treasury now sees deficits of \$7.2 billion in the year to March 1998 and \$7.7 billion the year after... SOME forecasters are... foreseeing the... deficit soar as high as \$8.3 billion before it improves...

The Government expects to run a surplus of \$1.5 billion this year... That headline number, the operating balance, is the product of a calculation designed to mimic a company’s profit and loss statement... N[Z] earns plaudits for the transparency and modernity of its fiscal accounts, which are based on generally accepted accounting principles (GAAP). But as with a company, a complete picture requires looking not only at the profit and loss statement but also cash flows and the balance sheet. Not all the money the Government spends in any given year is reflected in the operating balance... Some spending, for example on frigates, roads and school buildings, is capitalised, shown in the Crown’s balance sheet as assets and then depreciated over their useful lives. In the current year \$1.4 billion falls into that category, while the depreciation charge reflected in the operating balance is a more modest \$800 million... But debt has to be paid with cash and according to the budget the amount available to repay debt (net cash flow from operations and investing activities) will be \$498 million this year... The Treasury’s cash flow projections for 1998/99 and 1999/2000 put the amount available for the repayment of debt at \$483 million and \$1.3 billion respectively. Those numbers... are... contingent, of course, on their projections for economic growth. Net Crown debt at June 30 was \$25.6 billion.

...The Government hopes to get better value for money through a review of spending in its departments. “Re-prioritising spending will give us greater headroom for new initiatives and to further work on priorities set down in the coalition agreement,” said the Minister of Finance... “With total Government spending of about \$35 billion [a year], saving just 0.3[%] across the board would facilitate \$100 million of new initiatives without increasing overall spending. This makes the review very worthwhile,” he said... [Meanwhile, s]pending on Government computer systems is ballooning out of control... [F]igures... released... yesterday... showed Government departments expected to spend \$275 million on computer equipment, software and training this financial year.

...The Treasury forecast of a \$1.5 billion surplus is looking more secure after a better-than-expected outcome for the first quarter of the fiscal year. The operating surplus for the three months to September 30 was \$600 million higher than forecast at \$980 million. But the Treasury warned it would be premature to conclude the full-year fiscal position would be stronger than anticipated... [However, t]he Government will not say whether it will have made up its mind about buying more Anzac frigates before the terms of a purchase contract expire on Tuesday.

...N[Z] First will not support buying a third frigate from A[US], the Treasurer and Deputy P[M]... told cabinet yesterday in a showdown over Government spending... Torpedoing the purchase... may not be quite as easy as [he] makes it look. But the National Party is not as united about the need for another ship as it wants to appear... Government sources said the N[Z] First leader also withdrew his party’s support at the meeting for the extension of Parliament House and the shifting of the Beehive – a... project to which cabinet gave its backing last month. The... stance... indicates NZ First... has a renewed determination to stake out its territory in the centre field of politics, as the party with a compassionate edge.

...THE Government is set to exempt itself from the Human Rights Act... [The] Acting Justice Minister said... government departments might be subject to the Act only “where policies and practices, such as employment and access to buildings, are essentially the same as those in the private sector. There would be a permanent exemption for the Government in respect of legislation and the development and implementation of government policy.” [He] said there would be advantages in this approach but gave no indication what those advantages were... When the... government passed the... Act in 1993, it included a clause exempting all legislation, regulations and government practices from the... Act until the year 2000... From then on, according to section 151 of the Act all... government departments would be covered. But the Government has told the Human Rights Commission not to spread its review of legislation any further... The likely backdown has come about because of a mix of ideological opposition, concern over the cost of the exercise and the risk of expensive claims after the year 2000. Cabinet Ministers... believe making the Government subject to the Act would establish a de facto limit on the sovereignty of the Government.

...The Government is under attack on all fronts for appearing to want to pull out of obligations under the Human Rights Act. It was revealed yesterday that a temporary Government exemption to the act has already meant 271 complaints to the Human Rights Commission have gone uninvestigated... Labour’s human rights spokesman... condemned the Government as wanting to stamp out the democratic process.

...The present moves ignore the broader picture – the position of the Crown under the Bill of Rights Act 1990 and under international human rights covenants... It follows that, to exclude Government policies and actions from scrutiny for unlawful discrimination, a Government exception from the Human Rights Act alone will not suffice. The Government would remain subject to essentially the same principles under the Bill of Rights Act. The only difference would be that challenges would have to be heard in courts rather than before the Human Rights Commission and the Complaints Review Tribunal. Thus the proposed exemption seems somewhat futile – unless cabinet is also proposing to exempt the Government from the operation of the Bill of Rights Act, a major constitutional step indeed. Either way, these moves have the potential seriously to undermine and erode human rights in N[Z]. If the Government itself refuses to comply with basic human rights standards... what moral justification can it have for imposing them on private individuals? The private sector will then argue, with some justification, that it should not be bound by standards

which Government itself considers unacceptable as a yardstick for its own activities. To date there has been very little public reaction to these proposals... [But few] if any... N[Z]ers... would find it acceptable that the state was largely exempted from its own human rights laws while businesses and individuals were subject to them... It is now time to shrug off our complacency... A letter of opposition to the Minister of Justice would be a useful first step in letting politicians know what ordinary N[Z]ers think.

...Planning a constitutional challenge over the Government's right to make you save your money? Forget it... [In N[Z]... any such challenge [is] guaranteed to fail because the role of the courts [is] to uphold laws made by Parliament... In fact, the British parliamentary system under which we operate gives Parliament unfettered powers to do whatever it wants – including taking your house and anything else you own... [T]he source of the unbridled power was the 17th century victory of the British Parliament over the monarchy, destroying the royal prerogative and vesting absolute power in the hands of Parliament. "They were fighting tyranny in the person of the royal prerogative. It didn't occur to them that Parliament might become the source of the tyranny,"... [a] constitutional law expert... of Auckland University... said.

...You must do exactly as we say or become impoverished as a nation, say the members of the free trade-global investment school of economists who hold the majority of positions of power in the business world and in the Treasury, though most N[Z]ers do not share their opinions. What they say is that the Government should get on with the "reform," as they call it, which means a whole range of activities that just happen to coincide with the interests of the large financial and trading houses. Among them: crank down as far as possible the cost of doing business, and sell publicly owned assets, as a matter of philosophy, even when these firms face little or no competition and are trading profitably anyway... And the veiled but very real threat is there that if nations, especially those as small as ours, try to inhibit the activities of these corporations then retribution will follow... Central to the belief of these zealots is the notion that the Government has no role in the regulation of society apart from a basic police force to protect the individual's person and property and a court system to regulate contracts between individuals... What is disturbing about all this is not that the reformists don't have a case but that they have become angrily impatient at debating it, have become utterly intolerant of opinions that run contrary to theirs... They never question themselves, nor are they sensitive to other people's wishes so certain are they of their righteousness... They, the righteous, feel they are impeded in their pursuit of the truth by the ignorance of the "mob." This is why they alternate between patronising us and reprimanding us. It's funny watching new right economists, the apostles of rationality, fulminating in their frustration... but it would be nice if they'd swallow their arrogance, dispense with the clichés and platitudes and try debating social concerns, holistically, up here on our level... In 1984, [the Finance Minister] – as he has confirmed many times since – adopted the strategy of moving swiftly ahead of public opinion to ensure that the self-interest groups of which he speaks so contemptuously had no time to regroup and oppose his drive towards a laissez faire economy.

...I am often asked why I seem so positive against a backdrop of headlines about the problems in the economy – the huge compliance costs faced by business, the uncertain political environment, the large pool of unskilled workers unable to compete for the many skilled jobs going begging and so on. I respond this way: Economists focusing on the bad news may be doing their job, and I respect them for it. But the plain truth is that they are "confidence killers." My mission is a different one – I'm solution-based... I, for the most part, seek to point out information and circumstances that highlight trends leading to opportunities... within business that compel me to the view that 1998 will be a golden time for many business[es] and people in business... If 1997 revealed big problems in our economy, it was that we are not managing our opportunities as well as we could. Government still has a huge grip on the economy. It controls about 35[% of our GDP, which]... is... preventing the nation from achieving its potential... The Government's reform strategy launched in the early 1980s had an internationally competitive target of reducing government expenditure to around 25[%]. We have come below 40[%] but have some distance to go to get close to being able to say that we are truly a private sector-driven economy... Successful business[es] looking to secure a long-term future have never depended on someone else's growth strategy.

...The Minister of State Services... is calling for further change in the public sector, saying massive reforms over the past decade have not achieved all the desired results. The number of Government departments was still excessive, despite 55,000 jobs being cut over the past decade... and they always seemed rife with "tinkering"... he told a public service management conference in Wellington yesterday. He said the public service was running out of fresh ideas and becoming fixated on contracts and outputs. The sector had a high reputation internationally, and deservedly so, but... the trend in N[Z] Government... was increasingly fascinated... with methods originally intended to produce high performance but which were now beginning to do the opposite, he said... [D]epartments and central agencies – the Treasury, the State Services Commission and the Department of the P[M] and Cabinet – should show distinct approaches to business planning and budgeting. He also thought the public service needed to hammer out "rational, practical, consistent and straightforward organisational principles."

...Be sceptical, be very sceptical... [-] the Government is making promises. Not just any old... promises, mind. We're talking big, biblical, carved-in-stone pledges. The Government is calling this immutable undertaking The Charter of New Zealand. It's a kind of Government performance contract guaranteeing certain standards of service provided by the state... Initial estimates include set-up costs of nearly \$2 million over three years and annual administrative costs of about \$700,000. It will be a long wait before the ink is dry on N[Z]'s charter, but there is significant political will for the document. N[Z] First's "democracy policy" commits the party and the coalition to introducing the charter, which could be implemented within a year, once approved... If implemented, it could affect the entire public sector, including state owned enterprises and the health and education sectors. It is based on the British citizens' charter, which costs \$18 million to administer and was introduced to widespread scorn. Mind you, the P[M] at the time... had included a pledge to make the trains run on time. As the *Economist* noted, perhaps prophetically, the last man to make the trains run on time was Mussolini. N[Z]'s version may not be so bold. Under the coalition's charter, there may be only six principles the public's employees should adhere to, including setting, monitoring and publishing standards, providing choice wherever practicable and the efficient, economic delivery of service. As the Government has sold New Zealand Rail, there is no mention of making the trains run on time.

...At the Pearly Gates, St Peter tells Alex that Heaven is run by "an all-knowing government." Even in the highly unlikely event of being allowed in, Alex can't stand the thought of such regulation. He determines to return to Earth to await Heaven's deregulation.

...During the road show of a Government taskforce... a woman... asked the members... from a small provincial community organisation... to write down the three most important things to them in their lives. When the last of them had put their pens down, she matter-of-factly said, "now, just quickly put a dollar value next to each of the items you have put down." Of course they couldn't. The most important things in their lives were not things that have a dollar value – it might be family, partner, children or grandchildren, love, hope, faith, happiness, health, community, fairness, tolerance, or a "fair go." What really matters in life is not just what we can buy and sell – in fact those things would be lucky to appear in the top ten. Unfortunately our public policy of late has not reflected that. There are it seems, some who believe "if you can't measure it you can't manage it," and "if you can't buy it, it's not worth having." We have recently been treated to the spectacle of leaked Treasury policy papers advising the Government... [that no] matter what the question, there are only three answers: if the state has it "sell it off," if it doesn't have it to sell, "deregulate" it; and if no-one will buy it, pretend it behaves like a market... We value things that can never have a market value. Some of us would even assert that we are more than just dust and DNA, but that we are made in the image of God. Isn't it time we brought back the balance, so that those things that we truly value are at the centre again? - 1997

NZ's first Labour Government believed that NZers should be provided with State services (e.g., social security, health and education) and infrastructure (e.g., energy, transport and communication systems). It paid for them via foreign exchange earnings, taxation and direct charges (i.e., export profits and

taxation paid to produce electricity plus the power-grid that takes it to homes or businesses, then citizens and companies pay extra to actually use it). Unfortunately, government departments increasingly proved themselves to be inefficient. This suggests that the people responsible for managing government departments (and the people responsible for selecting the managers) were incompetent! The solution was obvious – make the managers both more professional and accountable. However, the last Labour Government decided that the best way to do this was to turn what NZers owned into profit-making corporations and swap free services for user-pays (wherever it wasn't already practiced).

Under new management the State Owned Enterprises' profits rose rapidly, tens of thousands of people were made redundant...

Not satisfied with what it had already done, the Labour Government DEREGULATED industries so its SOE's might get some competition, then started to sell them off (usually to the highest bidder).

"It is more important that we pay off the debt than that we keep the assets." - A former Labour Party PM

When the National Party regained power from the Labour Party in 1990 it continued the State asset sell-off.

The asset sales would proceed regardless of public opinion... [A] most notable effect of the selling of state assets was that they were sold to powerful overseas competitors, thereby minimising competition in the market, rather than increasing competition, thereby creating something that was the opposite of a free market... The national airline would be sold to a consortium including its competitors, Japan [Airlines] and Qantas... Also, on the block were the Maui platform and natural gas reserves and distribution network, the petrochemical fertilizer and methanol plants, the public share of the oil refinery and oil reserves, and the Motonui natural gas to synthetic petrol plant which meets 30% of our petrol needs, all... sold to the N[Z]-based multinational... Challenge. Over half of NZ's banking and insurance sector was publicly owned. All these companies would be sold to their A[US]n and British competitors and... Challenge. The N[Z] shipping line, established by the third Labour Government, would be sold to its European competitor... NZ Steel and the country's iron sand resources eventually ended up in the hands of its giant A[US]n competitor BHP...
