YOU HAVE THE RIGHT... The power is in your hands... Never underestimate the power of PlayStation... you're not going outside anyway...

LET US PLAY... On the eve of its N[Z] release, a NZ Herald journalist[gets to grips with PlayStation2... IT WAS LATE on the second night that the P[S]2 finally made sense. I'd had a test model – a "debugging unit," which unfortunately meant no DVD player... – on loan from the previous afternoon. The first evening and the day off had delivered a few hours of videogame mayhem... It had been fun, but pretty much the same kind of fun. Certainly not the revelatory experience when I'd brought my original PlayStation in 1997 for a wallet-worrying \$500, and been hooked into the joys of *WipeOut 2097*, *Crash Bandicoot* and various other first-generation games. We'd come home late after a movie, a meal and enough drinks to leave me fuzzy around the gills. There stood the P[S]2... doing its best to complement the decor. It was going back in the morning, so one last go before bed... Through the dim light of the lounge and lagged eyes, the rich graphics created by the PS2's powerful "Emotion Engine" chip finally made sense – it was just so easy to focus into the far corners and beyond... despite my own emotion engine running a bit rich. A possible advertising line came to mind: "P[S]2 – even better when you've had a few." Oh, and kids, don't try this at home. Coincidentally, Sony is pitching the \$999-priced console and its game to 18 and ups and have relaunched the PlayStation – or PSOne – as a smaller, curvier, kid-friendly unit with a new batch of games to match, including *Muppet Monster Adventure* and... *Disney's Jungle Book Groove Party*. Adult gamers will be lining up this Thursday to buy the first PS2s to arrive in N[Z]. We're getting the units at the same time as Australia and Europe... [W]hat will it mean for the future, culture and design of gaming? It's hard to tell with the limited number of titles on offer so far. But last words go to... the English writer of a... recent book about gaming aesthetics, *Trigger Happy – The Inner Game of Videogames*. "A hint of what might be the ruling approach in the future is provided by the fact that the central processing chip in Sony's P[S]2 console is called an Emotion Engine. This is more than just a good marketing coinage. It also implies a more thoughtful approach – not towards something like an interactive novel, of course, but certainly towards videogame software that will take more chances to make the player stop and think. Videogames' loss of innocence can only be a good thing, aesthetically, as developers increasingly try to create new ways of seeing and playing in their imaginary worlds."

...Japan has slapped export controls on Sony Corp's new, hugely popular PlayStation2 because the machine is so sophisticated it could be used for military purposes... Military analysts cited the example of a Tomahawk missile that needs to "see" where it is going until it strikes its target and must process graphic material at high speed to keep to its target. P[S]2's graphic processing capability is fast enough to enable it to be used... The Japanese Government has become increasingly wary of the possibility that products meant for civilian use could be diverted for weapons use[.

although PS2]... is the first game console to face export controls under the Foreign Exchange and Foreign Trade Control Law... The law requires the Trade Ministry's approval for the export of restricted products worth more than 50,000 yen... [Because each PS2] is priced at 39,800 yen... [t]he export of more than two consoles would be controlled... The export restrictions are the latest in a string of problems that have plagued P[S2]. Sony Computer Entertainment said this month that users could illegally manipulate the machine to copy DVD movies to videotape. Last month, it said the game players could be used to watch DVD software sold overseas in breach of a worldwide agreement among DVD player makers.

...A Taiwan carpenter bought a porn DVD only to find secretly taped motel footage of his wife having sex with his friend, whom the husband later stabbed, a newspaper reported yesterday. The husband... divorced his wife... In... [local news, c]inemas in provincial centres could be doomed if a proposed parallel importing policy becomes law, the industry warns. The president of the Motion Picture Exhibitors' Association... said the Commerce Ministry apparently had a proposal for a three-month window between the time a film had its first cinema release worldwide and when it could be parallel imported to N[Z] in DVD or video. [The president] said in Nelson on Friday that such a proposal, if adopted by the Government, would... [not only mean provincial centres will] no longer be viable for cinema exhibition, but DVD and video sales would suffer, as would film-making in N[Z] itself... At present, N[Z] does not impose a specified period between the time a film has its international release for screening in cinemas and when it can be parallel imported in DVD or videotape. [The Government's] election campaign policy was to introduce a two-year window so DVD or video parallel imports could not undermine cinemas... A window was needed, [the president] explained, because N[Z] distributors mostly provide "rejuvenated used prints" when releasing films to provincial areas and main centres. It took three to six months to get such prints, which cost one-tenth the price of new film prints... If there were to be only a three-month window on DVD and video parallel imports, films could be available in those formats before, or simultaneously with, the release of the film to N[Z] cinemas. The cinema industries in most countries had self-imposed windows of three to six months... The exhibitors association wants a one-year window.

...In a leap away from Imax's science and education films, *Alien Adventure* brings meaningless entertainment to the big, big screen. And it's in 3D. The film follows the fortunes of the Glagoliths, aliens searching the universe for a new home. They stumble on Earth and, being a bunch of interstellar idiots, decide to explore what they think is an Earth city. Only it's a new high-tech theme park not yet open to the public. And, yes, they explore the rides. What makes this so cool is that the rides are superbly created... Try looking away from the action – the detail is just as impressive in the farthest corner of the screen. There are 103,680 frames of high-resolution images, which took 12 CGI animators 180,000 hours to produce. Minor quibbles? The 3D headsets are bulky and, at barely 40 minutes, the film is short. But it's still worthwhile. Made in Belgium, the Glagolith language is in fact ancient Walloon, so for any Walloon-speakers, this is the movie of a lifetime. For anyone else, it's a hell of a lot of fun.

...The Imax experience is over after its giant screen and three-dimensional effects left Aucklanders largely glassy-eyed. Lack of interest in the film format, which uses screens 10 times larger than traditional cinemas, has led Force Corporation subsidiary Cineforce to close the Queen St Imax Cinema... Despite its initial appeal and novelty factor Imax had not been a viable enterprise in the long run and was losing money... [I]t had also been difficult to find the sort of commercially popular products that drew crowds. "In the end, it did not have enough appeal for the general audience," said the... company secretary... But a self-confessed film buff... felt Imax was too expensive at about \$15 an adult and \$9 a child... Imax cinemas in Adelaide and Perth had also closed within the past year because of similar problems. But the Sydney Imax cinema was quite successful... Imax in the U[S] owned the equipment, which would probably be reclaimed. Force was investigating alternative use of the space. Any outstanding pre-paid tickets can be exchanged for admission to other movies at the Force Entertainment Centre... [The secretary] said yesterday... the closure did not affect the rest of the Force Entertainment Centre, which includes... Planet Hollywood, 12 bars... 11 shops[and a games arcade].

...*Gamer drops MA studies for action role*... When [a student] dropped out of doing an MA degree in psychology to play computer games, [it] knew people would be sceptical. "N[Z]ers just can't see gaming for what it is overseas... They don't understand that gaming is now a professional occupation in Korea or the U[S]." Now that the gamer] has won the \$10,000 first prize at the Impact Extreme Chinese national *Quake 3* tournament in Beijing, the 21-year-old helpdesk administrator from Waterview in Auckland hopes people will realise just how big *Quake* is... *Quake 3* is a futuristic 3D action game requiring tactical thinking and quick reflexes, played over the internet or a local network. Players can collect bonuses giving them extra strength or power, and win by killing their opponents more times than they are killed... *Quake's* "bad reputation" as a violent game is undeserved, says [the 21-year-old]. "You can't infer from the fact that someone kills a person and plays *Quake* that *Quake* players kill people." ...After obtaining a BA degree in psychology and philosophy from the University of Auckland and enrolling for an MA, "I dropped out of university to play *Quake*. I saw the amount of interest and prizemoney *Quake* has generated, and decided to try to become the world's best player." [The 21-year-old] now works 20 hours a week for an internet service provider and spends about 40 hours on *Quake*... [The 21-year-old] is among the top 20 players in the world... but wants to "push it into the top three in the next six months." ...Following his victory in Beijing, [the 21-year-old] plans to compete in the World Cyber Games – "the Olympics of computer games" – in Seoul, Korea, next month. It carries \$US300,000 in prizemoney. As well as looking for sponsorship, [the 21-year-old] is negotiating a deal to train Hong Kong players for the Korean competition... A[nother A]uckland... placed second at the Impact Extreme tournament, winning \$5000.

...*Unreal win gives gamer star status*... [A west Auckland youth] is a celebrity in Korea where children flock to him for his autograph. Back home in Henderson the 18-year-old looks forward to relaxing after coming third playing the computer game, Unreal Tournament, at the World Cyber Games. The competition was held in Korea... and involved about 500 computer gamers from 45 countries. The games, complete with opening and closing ceremony, were televised in Korea. [The 18-year-old] was one of nine N[Z]ers at the competition and the only competitor from the southern hemisphere to win a medal. [The 18-year-old] also won \$5000 US... [The 18-year-old, who] has played computer games since [it] was five... spent many weekends practising with his friend... and two weeks training with [a]fellow team member... in Christchurch... [The nerd] started getting serious about the sport when... [aged] 13 and began playing a strategy game on line, winning the championships three times. [The nerd] started playing Unreal Tournament just for fun and soon became serious about it... "You have to think. You have to have a good brain if you are going to play properly. A lot of people think [of computer games] as a fun leisure thing to do sitting on the couch... But people shouldn't just knock it off as an activity that can't be a professional sport. A lot of people don't understand it can be just that," says the former Liston College Student. For now, [the 18-year-old] is relaxing and playing for fun. But... [it plans to take] part in qualifying competitions to make it to next year's world games.

...Gamers can be compared to actors – they become the face of the game... [– and t]he gaming industry is worth more than Hollywood now[('NZers spent over \$40 million on computer games in 1996')]. A computer game makes more than a film like *Gladiator*.

...IT HAS been 40 years since Hollywood producers attempted a sword-and-sandal epic. Maybe they shouldn't have waited so long. The genre is gloriously revived in *Gladiator*, which took only three weeks to recoup at the [US] box office the \$US103 million it cost to make. So far it's made \$US379 million worldwide. And... made a marquee star of [the lead actor. The film's d]irector... (*Blade Runner*, *Alien*, *Thelma and Louise*) joked even before the movie came out that [it] wouldn't be able to afford to hire the N[Z]-born actor for another film... [The AUSn-raised actor] stars as fictitious Roman general Maximus, who falls from grace when the Emperor, Marcus Aurelius... dies and his jealous son Commodus... takes power. Maximus becomes a slave, is sold to a gladiator trainer in North Africa, and then finds his way to Rome as a starring attraction at the Colosseum. Oliver Reed, who played the gladiator trainer, died in Malta... [– where] huge sets recreating landmarks of Rome in AD180 were erected [–] ...during a drinking binge before his scenes were finished. But computer-generated imaging (CGI) enabled [the]director... to marry existing shots of Reed and new footage of a body double to complete the actor's performance a little earlier in the story than planned... *Gladiator* is moviemaking on a grand scale... The film starts with a bloody battle between the technologically superior Roman legions and fiery German barbarians. [The

director] flew to Bratislava, Slovakia, to scout a forest location for the battle and then balked at the logistics of moving a huge crew over there. So [it] returned to England, went to the British Forestry Commission and asked: "What have you got that you want to get rid of?" The answer was: Bourne Wood in Surrey... [So a]n English forest standing in for the Roman Empire's German frontier was burned down... [16,000] flaming arrows were fired by... Roman soldiers and burning clay pots were launched from catapults at the... [barbarians] in the trees... CGI magnified the effects by multiplying both the arrows and... players. "I... only had about a thousand troops. But with careful shooting, you could what they call tile, just keep moving the same group of Roman[s]... across the shot and, panning several times, blend it with CGI so it looks like there's 20,000..." The biggest effect in the film is the Colosseum, itself, built on Malta at a 17th century Spanish fort that had been converted to a barracks by Napoleon's troops. The film-makers couldn't afford to create a complete replica of the three-tiered Roman landmark so... built a fragment of the first tier and [CGI] completed the structure, as well as creating 33,000 spectators to sit and cheer with the 2000 extras. The real sets and people were blended... so seamlessly that when the camera pans around the stadium you can't tell what's real and what's not. But the technology, the sets and the scale of the film haven't upstaged the acting and the story. It's a compelling tale of a good [guy] who, through no fault of his own, loses everything except his dignity and earns a crack at redemption... ["]Ordinarily I make a decision based on a script[,]" the star says. "But t]his time I made a decision based on a concept. They rang me and... said, 'We're not gonna let you read the script first because we don't believe that you'll have a positive response to it, but here's the concept: [The director of *Aliens*], AD185, and you begin the movie as a Roman general.' That was enough for me to say, 'Yeah, I'd like to have a conversation... about that, because it just got into my imagination and I couldn't let go.'[" They were right about]... the initial script, which was "too modern, too cynical. It had gags about advertising. It just didn't make sense to... [have] such a facile set of dialogue and scenes." In the reworked script, his character is offended by having to kill to entertain the crowds. But are today's audiences in multiplexes and sports stadiums much different from those in the Colosseum? "Oh, I think a lot of things have developed over the years... The vehicles have changed: we've gone from the chariot to the Ferrari... and we've got a bit more efficient in piping violence into our homes. We don't have to go out for it now. But human relations and the broad range of what human emotions and... desires can be, I don't think they've been adjusted at all..."

...IT IS difficult to believe that millions of people were entertained by watching brutal fights to the death as depicted in... *Gladiator*. But they did. For almost 500 years, from about 150BC, gladiators fought to the death in the amphitheatres of every major city in the Roman Empire. The film which depicts these public spectacles is... extremely violent. The fights that take place inside the packed Colosseum arena, recreated in North Africa, are certainly bloody – severed heads and limbs flying across the screen – and usually involve the death of almost everyone except the hero... The film depicts only gladiatorial combat, which was only one part of the day's entertainment. In the morning there was a display in which exotic animals – including panthers, giraffes, ostriches and zebras – were pursued and killed. Emperor Hadrian (AD117-138) for instance, organised games in which 11,000 beasts were slaughtered over 120 days. Every corner of the empire was scoured for animals, a process accelerating the elimination of species in Europe and Asia. Tigers were among the first to disappear. Until Imperial times they were common around the Caspian Sea. During lunch, audiences would be entertained by the public execution of criminals. The punishments were designed to inflict maximum pain and humiliation. Emperor Nero (AD54-68) had Christians clothed in animal skins and then thrown to wild dogs, who tore them apart. Mosaics from North Africa depict [people] tied to posts, which were then wheeled in front of starving bears and lions. Criminals were sometimes castrated. Seneca, Nero's tutor, mentions a mode of crucifixion in which the victim was impaled by his genitals – the slow agony of "ordinary" crucifixion was not thought amusing enough for the crowd... [Someone] named Meniscus, who committed some trivial offence against Nero, is reported to have "furnished a great spectacle to everyone by being burned alive." Burning alive was one of the favoured methods of execution, partly because animals could not always be relied on to do what was required of them. Late-night spectacles were sometimes lit by human torches. Considerable ingenuity was expended on thinking up refinements of cruelty. There were punishments based on re-enactments of mythological stories. In a grotesque parody of the story of Europa – in which the god Zeus disguised himself as a bull to have sex with the girl – [gals] condemned for sexual offences were said to have been raped to death by bulls. This was apparently achieved by smearing the [victims] with secretions emitted by cows. Clement of Rome wrote that [gal] Christians were killed by being attached to the horns of a bull and gored to death, in imitation of a mythical punishment meted out by... two stepsons in revenge for a plot against their natural mother... On one occasion the arena was flooded. As musicians began to play on an island in the middle, the spectators started booing, thinking that it had been decided to replace blood with music. Then they noticed that crocodiles had been released and that the island was starting to sink. The gladiatorial combat that followed must have seemed relatively restrained... Gladiators, who... were usually slaves or prisoners of war... [and] spent several years in training, seldom surviv[ed] more than four or five fights... The film... *Gladiator*... recreates a pitched battle between two groups of gladiators. Such battles happened, but on a far bigger scale than the film depicts. In the movie there are only about 20 fighters on each side. But when Emperor Claudius (AD41-54) staged a naval battle on Lake Fucine to entertain Roman citizens, [the emperor] used 19,000 "soldiers" – and insisted that there should be no survivors. To prevent desertion there was an outer ring of ships [carrying] the Praetorian Guard, as well as ramparts and catapults... The "forces of order" were frightened of gladiators, and for good reason. The biggest slave revolt in Roman times – led by Spartacus in 73BC – started in the gladiatorial school where Spartacus was training. It was because [Spartacus] and his colleagues knew how to fight that they were able to terrorise southern Italy for several years before being defeated. Spartacus and other survivors were crucified along the Via Appia. Although *Gladiator* has no value as a guide to the political history of Rome and is wrong in many details of gladiatorial combat, it certainly recreates the excitement of the arena, and if you want to experience something of the thrill that pulled Romans into the Colosseum, this film will provide it.

...For centuries, the greatest theatrical spectacles in the world could be found at the Colosseum of Rome... Italian and German archaeologists have concluded that under the wooden floor were an array of lifts, pulleys and 24 giant trapdoors. The trapdoors and lifts allowed the dramatic change of painted backdrops and the sudden appearance of hundreds of actors and exotic beasts. Though some contemporary reports suggest that the Colosseum might have been flooded to recreate naval spectacles, many archaeologists say that the network of tunnels and rooms under the floor would have meant that full-scale flooding of the arena was unlikely. The Colosseum was commissioned by the Emperor Vespasian in AD72 and was opened by his son, Titus, in AD80. It... measured 200m by 160m and stood 60m against the skyline. Inscriptions on stonework reveal how the seating reflected Roman society. The marble seats closest to the arena – the Latin word for sand, which covered the wooden floor – were reserved for the emperor's family. Then came the horse[soldiers] and senators. Above them were important citizens, then the middle-classes, slaves and foreigners. Right at the top was space for the poor... [A] professor of Latin at Harvard University, believes that one of the most impressive parts of the design was the system of tunnels and passageways that enabled spectators to go directly to their seats and not mingle with different classes... The arena was open to the sky but could be covered by awnings to keep out the rain or sun... Events were arranged every time the emperors needed to win public support and the Colosseum was one of the few places where the public could see their rulers... The last gladiatorial games were in AD404. As centuries passed, the building was raided for construction stone and by medieval times it had become the wreck it is today. But there is still life in the Colosseum. A wooden arena floor similar to the original was built and this week it became the setting for productions of tragedies by Sophocles performed by Israeli, Iranian and Greek theatre groups. Maximum audiences are 1500, as opposed to 75,000 in its heyday... Now the giant amphitheatre has been returned to its former glory in *Gladiator* with the help of computer-generated special effects... [■ Tomorrow's] *Weekend TimeOut*... looks at the... Kiwi actor... [who the] high-tech epic... has catapulted... into the top echelon of Hollywood stars.

...[the d]own-to-earth... Kiwi star of the new movie *Gladiator*, who jetted home only a week ago to visit his ill uncle... says [it] knows there is life after death. In fact... when people die, their souls take wing – and [the actor] has personal proof of it... What turned him into a true believer was an

experience [the actor] had with his late grandfather... a cinematographer who received an MBE from the Queen for his services as a World War II photographer in Japan. "...on the day [my grandfather] died, I was in the kitchen of my flat in Sydney. Suddenly a kookaburra flew in the window. It just looked me in the eye – and I knew my grandfather had died. I phoned home and my mother confirmed it..." Then, one day last year, [the actor] had a dream [it] was holding his mother[, who]... was crying... woke up alarmed and called home. "My mother said a [perso]n who had worked closely with my grandfather had come to visit and, without prompting, had told her a story that shattered my mum and reduced her to tears. [The visitor] said that on the day my grandfather had died a kookaburra had visited her, too. With all this talk of angels, maybe they're just birds sent to us by those who have crossed over... but I'm... not... the smartest fellow in the world,"... In the film... [it] plays a Roman general who dreams that one day [it]'ll be reunited with his loving wife and young child, who... met brutal deaths... Hollywood insiders believe *Gladiator* will turn him into a megastar... And [the actor is already] working non-stop... currently playing a hostage negotiator in *Proof of Life*... [The AUSn-raised actor] will be in Sydney for the Olympics and soon after will start shooting *Flora Plum*[, in which the actor]... plays a circus freak... and will be barely recognisable.

...MUCH confusion has been created by the world media as to whether [the actor] is a Kiwi or an Aussie, so at a recent interview to talk about his upcoming drama *Proof Of Life*, [it] tries to set the record straight. "I grew up in both countries and I have an equivalent love for both countries... Clearly, A[US] is home but... I do tend to get hassled less in N[Z]. They might know you[re] in the room but they don't take it upon themselves to say giddy, whereas in A[US], like America, they immediately come up and say, 'Hello, mate,' and want to have a conversation and an autograph and a photo and after a while, I'm thinking, 'That's why I live in the bush in A[US]!'" His view is probably coloured by the blinding media attention [it]'s received since bringing [his] new love interest... [-] his *Proof Of Life*... co-star [- home]... to visit the family farm in northern N[SW].

...While plenty have been bagging [the actor] here and overseas, *Gladiator*[s] producer... was never in doubt about who should win the best actor gong at the Oscars. [The producer] said the Kiwi-born Aussie was the saviour of a sometimes nightmarish shoot. "...[that actor] was the right choice... Some actors are good at meetings, but not the work. [This actor] only cares for the work... [It]'s not into perks or vanity, not demanding a second trailer for his cousin..." ...[□ The star of *Gladiator*] and other foreign actors may not have to worry too much about the possibility of an actors' strike. In fact, not being a US citizen may turn out to be a real bonus for stars looking for work at that time. According to a loophole in the Screen Actor's Guild contract, actors... who are not US citizens can work in movies shot and financed outside the country during the strike.

...There's one performance [the]Oscar-winning *Gladiator*[star]... doesn't want shown publicly. It's... a video of him biting a chunk out of the ear of a club bouncer during an A[US]n brawl some years ago. The Internet's buzzing with details of the security tape – which, so far, no one's seen.

...A[n acid-tongued US actress says *Gladiator*'s Oscar-winning star] is the worst person to have made it big in Hollywood [the actress – who has worked in Los Angeles since before the Oscar-winning star was born – ha]s ever met: "[That guy]'s a nasty, evil, arrogant SOB. I can't even look at him. I know of stuff that [it]'s done to people who can't answer back that will shock you." *The Beautiful Mind* star's reps refused to comment.

...the Disney movie *Dinosaur*[- opening]... nationwide... on Thursday[- is] a PG-rated film which is a breakthrough in the merging of ...CGI... and real backgrounds, and the first film to come out of Disney's new digital studio. It taps into an obsession that has been growing since 1841, when the British scientist Richard Owen named these awe-inspiring creatures "Dinosauria" – Greek for "terrible lizard." *Dinosaur*, which has been in the works on and off for 12 years and has cost \$US127.5 million... is more than just Disney's latest summer movie. The House That Mickey Built aims to show the world, and its competitors, that it can be as dominant in 3-D digital animation as it has always been in traditional two-dimensional formats... *Dinosaur*... offers a peek at where the revolution in CGI could be going – to a day when it will no longer be possible to tell photographic reality from illusion. Just as in... *Gladiator*, in which it was impossible to tell which part of the Roman Coliseum was built in real space and which in virtual, the obviously fantastical *Dinosaur* takes us a playful step closer to this unnerving future. The timing for Disney's movie couldn't be better. Dinomania – stirred to a fever pitch by *Jurassic Park* back in 1993 – is raging again. At the beginning of this year the BBC's *Walking With Dinosaurs* drew big ratings worldwide. The genesis of Disney's *Dinosaur* actually predates the[1993] blockbuster... At its peak, *Dinosaur* employed close to 900 people. But computer-generated animation was such a new field that "the world didn't have 50 A-list senior CG animators," says [the]co-producer... Disney had to hire traditional animators and spend a year-and-a-half training them. Much of the software had to be invented from scratch. Technology, to some extent, dictated the movie's story, which kept getting rewritten according to what the animators could or couldn't pull off. Once it was decided, early on, that the dinos would talk, certain liberties had to be taken with scientific fact: iguanodons, for example, had to acquire lips. "We had a joke," [the]producer... recalls: "Oh my god, next they'll sing!" That never became a real threat. If it had... "people would have walked." Some may still choose that option: dino fanatics flooded the Internet with angry posts when they discovered... the realistic (and silent) beasts they had seen in an early trailer spoke English. However, this movie's early [US] box office (\$US80 million after two weeks on release), would indicate it's on the way to paying off Disney's huge investment. In the process, it should fuel the fantasies and nightmares of a whole new generation of dinophiles.

...Computer lead not PC... IN an unprecedented move that has made many actors very nervous, the director of an upcoming live-action feature film has decided that [the film's anti-heroine]... will be entirely computer generated! In the film *Simone*, the character Simone becomes a movie star overnight and struggles with how it changes her life... [The director – whose] debut *Gattaca* and his Oscar-nominated script for *The Truman Show* [have already marked the] Kiwi-in-Hollywood... out as One To Watch... [- said it] decided to computer generate his... protagonist after failing to find a young actress suitable for the role. The first computer-generated character in a movie will be seen later this year in *Final Fantasy: The Movie*...

The... X factor... When [the]11-year-old... accepted her Oscar f[or Best Supporting Actress] in 1994 and turned to the audience, dumbstruck and terrified, it was tempting to think... [t]he angry little girl... had a dreadful life in store. Surely [the NZ-raised actress] would spiral out of control... the second-youngest Academy Award winner in history, would be mobbed by reporters, agents, directors and drug-dealers. There would be cigarettes and booze, ill-advised relationships, rehab. Perhaps [it] would be like [the *Riding In Cars With Boys* star] and fight her way back. Or maybe... be like... the youngest-ever Oscar winner, and fizzle out. But [the Kiwi] has not spiralled or fizzled. [Today the teen] is in a Manhattan hotel ready for an interview about her latest role... in *X-[People]*, a comic-strip sci-fi movie that took \$US54 million at the box office in its first weekend. It's her first blockbuster. [The Kiwi] plays Rogue, a dark, sultry girl who is not quite innocent, her usual role, in fact, and one [the Kiwi] does very well because it's her... [The Kiwi] doesn't think much about acting, [but] just does it. When Rogue touches or kisses someone, [this] practically kills them. You see the life force draining out. [The Kiwi] sees her character as "the ultimate adolescent, frightened of being really close to others." How was her adolescence? ...[the Kiwi] has tried to grow up normally and be a film star at the same time. If [it] hasn't quite succeeded, [it]'s come pretty close... Her mother... is an English teacher from Wellington; her father... is a physical-education instructor from Canada. [The actress, who] was born in Winnipeg... has a sister... and a brother... two and five years older respectively. Both are academic achievers... [Their little sister] was "the one that no one particularly noticed." Everyone noticed her in *The Piano*[, in which the girl] scowled and raged beautifully. There seemed to be a dark monster inside this little creature. What [the girl] discovered at the age of 9 was that [it] liked pretending to be somebody else in this intense way... After the Oscar win [the Kiwi] returned to N[Z] and tried to return to normality[and] didn't appear in a film for two years... When... 15, [the Kiwi] moved to Hollywood with her mother... – ...her parents split... when [the girl] was... in Canada filming *Fly Away Home* – ...and began acting out her most intimate teenage moments in public... [The Kiwi] made new friends in Los Angeles but misses the ones in N[Z]... "You're definitely shaped by the culture you've been brought up in... Even though I couldn't tell you exactly what it means to be a N[Z]er, I think

I've been influenced a lot by that culture..." I ask her what [it]'d like to be doing at 40. "Forty?" ...It's a concept at the edge of her understanding. "I don't know. I probably hope that I have a family and, if I still want to be... that I'm acting." It seemed highly unlikely, but it looks as if [the Kiwi]'s just about made the transition from child star to adult actress. Who knows – [the Kiwi] might have quite some career ahead of her... [Incidentally, p]arts of Sydney are to be closed off to allow a low-flying helicopter chase scene to be filmed for *The Matrix Reloaded*. [The]New South Wales Premier... says large areas of the city's central business district will have to put up with such distractions if Sydney is to maintain its reputation for being a trendy filmmaking destination. Streets and office buildings will be evacuated for two days next month in order to accommodate the block-buster sequel...

Every year Hollywood studios quietly dump movies, even ones with top \$10 million stars, that are not worth the money to distribute in theatres. Marketing costs are spiralling higher but the main reason for not releasing a film is usually simple – it stinks. [The h]unky... younger brother of *Red Dragon*[']s star... became a Hollywood hit after... starr[ing] in such movies as *Elizabeth* and *Shakespeare in Love*. But now his latest movie with[the] *Austin Powers* sex bomb... looks set to stay on the shelf. An erotic thriller, *Killing Me Softly* is directed by... the... acclaimed Chinese director... behind *Farewell My Concubine*. One reviewer described it as 'two hours of Chinese torture'. There are not even any plans to send it to video... [The movie] *People I Know* has turned into something people don't want to know about. The movie... looks set to be either put on video or go straight to pay TV. Movie company Miramax had great trouble selling it. Miramax is one studio with a cupboard full of orphaned movies... Another Miramax movie, *Shiner*... has gone straight to video. Miramax has also had problems with the movie *Daddy and Them*... It was just recently sold to cable TV after sitting on the shelf for several years. Miramax is also the distributor of *The Third Wheel*, a romantic comedy that... [o]ne internet review of a... test screening called... 'A laugh-free comedy,'... [that] was 'excruciating to watch'. Even [the]Miramax boss... admits *The Third Wheel* would be better off as a video release... [The Miramax boss] admitted: 'Sometimes you have to face the fact that some movies are better off on TV or DVD than in a theatre. You're asking a lot of an audience to pay \$10 or so to see a movie, so you don't want them to feel cheated.' [In related news, the entertainment giant TimeWarner has just posted a quarterly loss of '\$US100 billion – the biggest quarterly loss in the history of US business'.]

...Don't be surprised to see German troops in the middle of Henderson this weekend. They'll be members of the Historical Re-enactment Society taking part in a mock World War II battle. About 50 military enthusiasts will play troops from N[Z, the US] and Germany as part of the annual Auckland arms fair. [The society's] president... says the group wants to keep history alive without glorifying violence... "We don't glamorise. I think this is the only way to have a battle – without anyone getting hurt... We aren't going to gloss it over and pretend it never happened... [P]eople are losing touch with the sacrifices... W[W]II... soldiers made for us,"... Members will set up camp on the field next to the Waitakere City Stadium on Friday afternoon before staging battles at 2pm on Saturday and Sunday... The 15-minute fully-choreographed display will cost about \$4000 to stage, with half that being spent on ammunition. "At first the police thought we were a bunch of gun nuts but because we're an incorporated society we have to set standards... We are nuts but no more nuts than someone who collects cars. It's a hobby but it's become a way of life."

...Motu Moana Scout camp was transformed into an army base over the weekend as hundreds of enthusiasts re-lived battles from the pages of history. The event was hosted by a west Auckland-based group which recreates the exploits of the 3rd Cohort Batavi, a heavily armoured Roman auxiliary unit active in the fourth century... "This is an opportunity for all the clubs to get together and beat the crap out of each other, have a drink and do some wenching," says... [a] Cohort centurion... of Green Bay... playing his role to the hilt. They recreate battles which would have taken place during the Roman and medieval periods wearing armour and wielding swords, spears and pikes. "The weaponry is safe... All the edges and points have been taken off but otherwise it's totally authentic. I enjoy it because of what I learn. I think some people there know more about the Romans than some university lecturers..." ...[hi]s group is only seven members strong at the moment. But [they're] aiming to boost membership by persuading people the group re-creates battles for the same reason other people collect stamps. "It's a hobby... Some people call us a bunch of nutters but generally there is high interest... Generally the... reaction is very good." For more information about the club... phone 021 212-6017.

...Ever wondered about the person behind your weekly crossword? ...meet... the king of Kiwi crosswords. Or perhaps that should really be the royal family... – ...[hi]s wife... engineer son... and... teacher... daughters... are also involved in an enterprise which sends puzzles and crosswords to publications in countries as diverse as N[Z, AUS], England... Botswana, Spain, India, Korea, Japan and South America. Local papers and magazines bearing the [family's] touch include the *Herald*, the *Listener* and more than 50 community papers around the country. The Puzzle Company, based at [their] Raumati Beach home, produces 37 puzzles a week... and provides [the]m with a comfortable living. But don't think it's a cruise: 15-hour days and seven days a week are not uncommon. Even when on holiday, [the parents]... keep laptop computers handy for recording useful trivia. It all started... 15 years ago, when [the husband] realised that none of the crosswords [it] did ever came close to home. "The crosswords I used to do came from English culture – there was nothing about N[Z] in them." ...start[ing] small, contributing crosswords with a local flavour to Kapiti's local papers and doing the job part-time around his business – making stove black for pot bellies... [– the husband has fashioned] a full-time living out of compiling crosswords and other brain-bamboozlers... The company's catalogue... offers theme and novelty crosswords, logic puzzles and mazes as well as imported comic strips and spot-the-difference and trivia cartoons. These days the business has long been sold... But the business will only ever be a family affair... "You couldn't really teach someone else to do it." Compiling a crossword involves filling in one of 10-odd ready-to-go grids – "they're like faces after a while" – then finding appropriate clues and making sure that it all works... Any legitimate word is a candidate – unless [hi]s dictionary defines it as... slang. [His wife], who works full-time with h[im]... does each crossword and makes suggestions. [The husband] describes his job as a pleasant lifestyle, adding that [it] was always home for his kids when they were school-age. "I still enjoy doing the crosswords as much as I did 15 years ago,"... But like the cook who never goes into his kitchen at home, [the husband] no longer does crosswords for fun... B[y the way, according to his personal observations, B]rits like a wider crossword vocabulary than Kiwis... [and] Greeks love logic games...

[The communistic Maori social system, combined with the absence of a graphic system to conserve their ancient lore, and provide recreation, caused them to carefully preserve their unwritten literature, and to rely much on games, pastimes and vocal music as a means of passing winter evenings and other periods of leisure. Thus it was that considerable prominence was given to all means of recreation, in many of which adults took part, while even old guys sometimes participated – or would spend much time in the manufacture of toys for children and certain paraphernalia employed in adult games' (*Games and pastimes of the Maori*). 'At night they loved to assemble in one of the larger huts and there pass the evening in conversation, story-telling, and amusements. Their naturally cheerful disposition caused them to enjoy social pleasures' (*The Maori as it was*). 'Swimming was a popular pastime with both sexes...

The Polynesian rat was here before Europeans, but, because it lived on berries and roots, was not a pest like the Norway rat' (*The coming of the Maori*)...

'Common rats feed on an incredible assortment of foods, and because of the versatility of their feeding habits and the enormous numbers which rat populations reach they are extremely destructive. At one time they were beneficial to some extent, acting as scavengers, but as hygiene has improved rats have become mere parasites. Their main food is grain, either in fields or in stores. They will also attack root crops, and are a serious pest of sugar beet in East Anglia. Rats eat more flesh than most rodents and, where they live in meat stores, eat little else. All manner of animals are captured; the remains of house mice, the skins turned inside out, are often found near rats' nests. They will attack poultry runs, often carrying eggs away to their burrows, and even ducklings are not safe because common rats are expert at swimming and diving. There is little or no courtship before mating and a bond never forms between the pair. When the home range is in an environment that alters little throughout the year, like a wheat rick, breeding takes place all the time. A girl

rat begins breeding when about 80 days old and can then produce anything up to 50 young a year. This figure is never reached in practice because mortality, especially of young rats, becomes very high when the population is large. As many as 99% will die before they are adults, and most adults do not live for more than a year. This very rapid rate of reproduction and turnover means that rats are very difficult to control. With such a high natural mortality even a very determined onslaught with poison and traps will have very little lasting effect on the numbers. They will only remove rats which are shortly going to die anyway. Tawny owls, foxes, stoats and weasels all hunt rats, although even a champion killer like a stoat may have difficulty killing a healthy full-grown rat.

...*The ferret is a well-known hunter that is an albino of the polecat which is said to have been brought to Europe from North Africa by the Romans. Its early history is, however, in doubt. The name was taken to North America where it was applied to a native member of the weasel family, the black-footed ferret.* The black-footed ferret has been described as the rarest mammal in North America. It is one of whose habits little is known. Fears have been expressed that it may become extinct before a proper study can be made of it. The reason for the reduction in its numbers is that its main prey, the prairie dog, is now considerably less plentiful owing to the advance of agriculture and the practice of poisoning prairie dogs. The main interest in the ferret is its history which depends entirely on written records dating from the 4th century BC. Aristotle, about 350 BC, described an animal that could have been a ferret. A hundred years previously Aristophanes used the same word as Aristotle (*ictis*) in one of his comedies. As there were no rabbits in Greece then, the ferret may have been used for destroying small rodents. Although the animal to which the name was originally given is sometimes described as domesticated it is probably nearer the truth to call it semi-tame. It readily reverts to the wild state and the book *A Highland Year* tells of ferrets being released on the Hebrides island of Harris to get rid of the numerous rabbits. They not only got rid of the rabbits but also the ptarmigan' ('a bird of the grouse family').]

...*Ferret owners get trousers in a twist...* Tasmanian devils, elephants, crocodiles and polar bears have been officially banned as pets in New York City. But it is the ban on ferrets that is raising a ruckus. The city's Health Department released its official list of banned animals yesterday, a list that includes gila monsters, venomous centipedes and anaconda snakes. Such animals had already been generally prohibited, but the city's health code had never specified them by name. The clarification sparked controversy when owners of ferrets objected to the inclusion of their pets on the list of animals deemed "wild, ferocious, fierce, dangerous or naturally inclined to do harm." ...Health officials expressed concern about instances in which ferrets have attacked and seriously injured infants... "This department is trying to malign... domestic... ferrets unfairly," [one owner] said.

...The clatter of little paws was heard outside Environment Waikato yesterday, as... about 20... ferret owners protested against the negative publicity that has dogged their pets... [They] paraded their pets... waved placards that demanded a fair go for domestic ferrets... and sang their praise to anyone who would listen, including the deputy chief executive of Environment Waikato[, who]... declined a cuddle with the wriggly and playful animals... [The deputy chief executive] stood by his council's concerns that ferrets were carriers of bovine tuberculosis and parasites and highly destructive to native birds... Earlier this month the regional council declared that it wanted to stop ferrets being kept as pets and on Monday an escaped ferret savaged a sleeping 2-year-old Palmerston North boy. The attack prompted the Royal Forest and Bird Protection Society to call for pet ferrets to be outlawed... One ferret breeder... said the Palmerston North incident was a case of irresponsible owners, and people should think carefully about whether they could properly care for a ferret before buying one... [T]he ferret got into the... house through a cat-door... [The two-year-old's] mother... said: "The screams were blood-curdling..." ...The ferret, wearing a collar and bell, bit her finger nearly to the bone before it was put into a cat cage. Then they found... their... [son's] right arm had been extensively scratched and bitten and [was] bleeding profusely... The ferret had also bitten him twice above his right eye, on his other arm and several times on his body... The same ferret had visited the family two weeks... [before the attack], and they had scared it out. "It's... not acceptable to have an animal like that roaming around at night." [Their son] is still too rattled by the fright to sleep in his own bed... [T]heir eldest son slept right through the fuss, as did their 10-month-old... "Imagine if it had chosen to get in with the baby,"... A council animal control supervisor... said the ferret had been destroyed, at the owner's insistence.

...[a] Bay of Plenty regional councillor... says... young boys... with a "nasty streak" could be paid bounties to kill... [w]ild or escaped ferrets... blamed for spreading bovine tuberculosis and... preying on native wildlife... The regional council, Environment Bay of Plenty, [also] wants private ownership of [the] pests banned... The Department of Conservation is reviewing regulations on the farming, breeding and sale of ferrets.

...The Department of Conservation is considering prosecuting the owners of five ferrets found on environmentally sensitive Great Barrier Island. DoC's Great Barrier area manager... was flabbergasted to get a phone call last Sunday from an island resident to say ferrets on leashes were being exercised on a local beach... [The manager] rushed to Smokehouse Bay to see the sight for himself. "My heart was in my mouth." [The manager] and another staff member boarded a boat moored in the bay to find the ferrets caged there. Those on board said they did not know they were contravening the Biosecurity Act and Wildlife Regulations. [The manager said it] was told the ferrets were desexed, but... was horrified to think of the damage one ferret could do to wildlife if it escaped... The boat owners received a formal warning last Monday. They left the island that day, although they had apparently planned to stay for a week. The Auckland Regional Council issued a notice of direction to the boat owners, and is now investigating options for legal action. [The]ARC parks and heritage chair[person]... said the incident was extremely alarming[, adding that]... the protected status of the Hauraki Gulf had been well publicised and "ignorance was no excuse". Because of its isolation, Great Barrier Island is free of major introduced predators such as possums, ferrets, hedgehogs and Norway rats. As a result, native species such as the brown teal, black petrels and the extremely rare chevron skink have thrived... [The a]cting Auckland conservator... said the incident almost defied belief. A discussion document on the future of ferrets in N[Z] had been under discussion for two years... "I find it distressing that pet owners, members of a recognised club, apparently claim not to have been aware of regulations governing the keeping of these potentially dangerous animals." [Auckland's acting conservator] said DoC strongly advised people not to take pets to sea with them. "Experience has shown time and time again pets do escape."

...Present penalties... [for a]nyone caught releasing a pest in a nature reserve... are "pathetic" and the Cabinet has agreed to increase them,[the] Conservation Minister... said yesterday. Anyone releasing a stoat in a nature reserve like Codfish Island, as had been threatened, was liable at present to a maximum one month in prison or a \$500 fine. "Plainly, this penalty is pathetic compared with the severe consequences such an action could have for world famous conservation sanctuaries the N[Z] taxpayer has spent millions of dollars developing," [the minister] said. The Government planned to introduce legislation before the end of the year to increase the penalty to a maximum of one year in prison or a fine of \$100,000. "Doing so will bring conservation law more into line with other environmental legislation, notably the Biosecurity Act, which already carried tough penalties for the illegal release of unwanted organisms, such as pest fish." ...[people] prosecuted... under the Biosecurity Act... could face fines of up to \$100,000 and five years in prison... The new penalties... under the Reserves Act, the Conservation Act and the National Parks Act... would also apply to individuals caught illegally releasing wild animals into conservation areas... In January, a group claiming to be the Biodiversity Action Group threatened to release possums or stoats on predator-free Codfish Island and Stewart Island.

...Millions of dollars will be poured into stoat control research over the next five years to help save the kiwi... [The] Conservation Minister... yesterday announced in kiwi-populated bush near Whangarei that \$6.6 million would be allocated in this year's Budget... to find the best-integrated pest-management solutions, including new poison baits, biocontrol, immuno-contraception and improved trapping... [T]he initiative represented the most significant extra conservation funding since \$30 million was allocated to strengthen structures after the Cave Creek tragedy. [The minister] said stoats were killing... about 15,000 chicks a year... [but the DoC] had only in the past decade come to realise the significance of the stoat threat... to the kiwi, whose population was halved every decade... [to the point where there are n]ow just 70,000 left... It has been estimated that before human arrival, seven million kiwi were roaming N[Z].

...*Time running out for our national symbol...* Seventy-five years ago, just under five million kiwi roamed the forests... Within seven years, numbers would... have dropped to 50,000... [However, s]cientific research and careful monitoring of birds through the Kiwi Recovery Programme is providing vital information on incubation, rearing chicks, lifestyle and predators... There is also research into genetics, breeding and habitat requirements... The BNZ has just extended its multi-million-dollar sponsorship of the Kiwi Recovery Programme and Operation Nest Egg for three years. The bank contributed almost \$3 million in the past three years... People... work day and night to keep track of kiwi... [The] head of the Kiwi Recovery Programme... has been there since the beginning in 1991, one of eight fulltime-equivalent people paid through the programme. So has his dog, a yellow Labrador named Ollie. [The DoC scientist] started training Ollie to find kiwi using a bag of feathers at home. Then Ollie graduated to trips to Kapiti Island with his aunt Lucy. "When Lucy found a kiwi, Ollie would get rewarded too. One day [Ollie] found one for himself and... has never looked back." Ollie, who works from the top of Northland to Stewart Island, now has more than 1000 kiwi to his credit... At night tapes and whistles imitating a kiwi call are used as well as dogs. But these can skew a survey... because they attract a disproportionate number of adult [cocks]. "They think there is another kiwi on their patch and come to beat up on the intruder." ...[the head] is confident that Kiwi Recovery can halt the decline in numbers. As long as the work continues, [the head] expects kiwi numbers on the mainland to remain stable and numbers on protected islands to increase... While the brown kiwi is still widespread in areas... [above] the central North Island, only a handful of the Okarito brown... remain in the South Island... Around 1000 little spotted kiwi live on Kapiti Island, off Wellington, with small populations newly established on Hen Island, Red Mercury Island and Tiritiri Matangi Island in the Hauraki Gulf. The other three varieties of kiwi – the great spotted, Southern Tokoeka and Haast Tokoeka – are confined to the South Island or Stewart Island.

...Kelly... has been fighting a rare blood parasite for the last two months, affecting her plumage and growth. The six-month-old kiwi is one of four brought in to Auckland Zoo from the wild, where they are thought to have picked up the parasite from ticks, says [the zoo's] veterinarian... The zoo is currently working with the DoC on a survey to determine if the blood parasite affecting the kiwi has spread to other birds... But Kelly is now on the mend, thanks to some recycled medical gear that would otherwise have been thrown out by Waitakere Hospital and others... [O]ut-of-date stock like catheters, tubes and petri dishes are regularly delivered to the zoo's wildlife health centre, where they are ingeniously adapted to suit anything from a chimpanzee to... chameleon lizards... The equipment is no longer sterile, so can not be used for humans, but is still suitable for non-sterile purposes like stomach procedures... Animal lovers need not fret, [the vet] says, because "when it comes to surgical procedures it's the same rules as for humans." ...The scheme has been running for more than four years... saving the zoo thousands of dollars each year... [T]he zoo also donates some of its hospital equipment to wildlife rehabilitation centres in Thailand.

...Mercy Hospital has come to the aid of some of Auckland Zoo's fussiest eaters. The hospital has donated two boxes of old surgical instruments which the zoo is using not only in veterinary operations but to feed its 25 adult Jackson's chameleons. The colourful African natives demand a fair amount of attention. Locusts, flies, crickets and grubs are let loose in their enclosure, but they dislike each other so much they will not search out dinner if another chameleon is close by. "They're a husbandry nightmare," says [the zoo] reptile manager... Auckland Zoo has earned a worldwide reputation for breeding chameleons and the reptiles are on its surplus list... Obsolete surgery instruments are usually donated to [Last] World countries, says Mercy Hospital's communications manager... But a staff member came up with the idea of giving them to the zoo.

...A west Auckland [resident] says people need to know when wild animals can be treated free by vets... [The westie] took a hedgehog that had made its home under her house to her vet. All its quills had fallen out because of mange and it had given birth to a litter... [T]he vet charged her \$30 for a consultation fee and \$5 for the mange injection... [The westie] was a little taken aback and was later told vets shouldn't charge to treat wild animals. But [the] Veterinary Association chief executive... says... "In the veterinary code of conduct there is [only] a requirement to treat wild animals for first aid when there is an emergency." ...emergency treatment now includes euthanasia following changes to the Animal Welfare Act. [The chief executive also said that] many veterinary surgeries are linked to the SPCA and charge reduced rates for wildlife... [so] someone who finds an injured wild animal should contact the SPCA... [first. The chief executive claimed that] vets do about \$7 million of free welfare work each year.

...[a family of] baby hedgehogs have had a prickly start to life – their parents have been killed by garden equipment. Hundreds of hedgehogs, which spend their days hiding in the long grass and undergrowth of people's gardens, are being killed by the garden strimmer, a machine which cuts grass with high speed rotor blades. In many cases, baby hedgehogs have been forced to fend for themselves with little chance of survival. However, the [family of] little orphans are the lucky ones. They were taken in by the Farthing Wood Wildlife Hospital in Surrey, England, where they will be hand-reared until they are big enough to be released into the wild. This season, the hospital took in 45 babies in one month alone. [The h]ospital manager... says [it]'s alarmed by the rise in numbers. "Perhaps people are leaving their grass to get longer," [the manager suggest]s.

...Although in theory hedgehogs could live for seven years, N[Z] research indicated they lived for only 18 months or two years in the wild here – with disease and lung problems affecting them... The hedgehog could also carry diseases such as tuberculosis and the food poisoning bug salmonella, which [some people] had contracted from... hedgehog[s]. Now the hedgehog may have to... join the ranks of the bad boys of the native forest predator gang – possums, wild cats, rats and mustelids such as stoats and weasels... [H]edgehogs were already "implicated" in the loss of eggs from ground-nesting threatened shore-birds such as the N[Z] and banded dotterels[, but a]... study based in the 450ha Trounson Kauri Park... as part of [an] Auckland University student's... master's degree thesis shows the seemingly innocuous hedgehog may be one of the more harmful invaders... There appeared to be large numbers of hedgehogs in the park, with more than 500 caught by DoC staff in the past two years... "I think they are quite cute and cuddly around the towns but in an area like Trounson they could be a bit nasty." His research – which includes fixing radio transmitters to about 20 hedgehogs to track their movements – showed their diet appeared to favour two introduced species, an A[US]n cricket and an African grass grub. "The problem is those beetles are turning up in kiwi diets in other studies so potentially they [hedgehogs and kiwi] could be competing for the same food." ...hedgehogs – which had no natural enemies in N[Z] – aren't... fussy eater[s]. They... consumed many species living or dead... [The masters degree student] had already discovered a mangled native kauri snail in one hedgehog burrow, indicating they ate that, too.

...*Kiwi share in \$200m rescue...* Next week's budget will include... \$200m to be spent over the next five years to protect N[Z]'s natural environment... \$10 million [of that total will] be spent... on the creation of special "kiwi zones." The sanctuaries, thousands of hectares where intensive predator control will be put in place, are seen as crucial to saving kiwi and other endangered species from extinction on the mainland. The *Herald* understands next week's Budget will also include a DoC funding boost of \$18 million... rising to \$50 million by 2005-2006. [Last year t]he department's budget was \$157 million. The \$50 million... is close to what conservationists say is needed to implement the Government's biodiversity strategy, Our Chance to Turn the Tide. Released with a degree of fanfare earlier this year, the strategy attracted criticism from some groups because it contained no costings. But many of its recommendations are expected to be put into place after today's announcement.

...As N[Z] prepares to] enter... a new millennium, our habitat faces a sobering dawn. This country is home to more than 10[%] of the Earth's endangered birds and 9[%] of its threatened plants. N[Z] is classed as a global biodiversity hotspot... by the Washington-based Conservation International organisation and is the only [First World] nation whose entire landmass is considered a danger zone for endangered species... Scientists say that if not enough is done to maintain or restore the biodiversity of N[Z]... coming generations will grow up among fewer and fewer species... Another risk is that, without continued vigilance, whole ecosystems could be overwhelmed by new waves of insect pests or marine invaders... But the cost of fixing the problem is high. Just to halt the decline in our biodiversity has been put at nearly \$1 billion over 20 years.

...a new conservation report... says... [introduced] pests are scrambling around the countryside on a \$440 million vandalism spree... And it's costing the Government and private companies another \$400m a year to get rid of the critters. The first comprehensive look at the economic impact

of pests and weeds... shows the country is losing... close to 1% of [its GDP]... Topping the report's list of eco bad guys... [by causing] an estimated \$165m loss each year... is the Argentine stem weevil, which... has infested the nation's pastures, lowering pasture quality and increasing animal health problems such as rye-grass staggers, facial eczema and bloat. Rabbits and possums are the next most expensive, [respectively] inflicting annual losses of \$50m and \$40m... "No doubt those who introduced them thought they were doing the country a favour and never contemplated the disastrous consequences their action would have..." the report's co-author... said then added that... "...the insurance premium for security from pests is border control." ...[recent] border scares have included the discovery of an Asian rat at the Port of Auckland and water infested with Asian tiger mosquitoes in second-hand tyres and a cement mixer. The southern saltmarsh mosquito was discovered near Napier... "Clearly, there is room for beefing up security at the border," said [the co-author, whose] report... suggests the DoC should eradicate tahr, wallaby, chamois and some populations of deer, at the expense of recreational hunting[, and]... also recommends boosting spending on scientific and technical support to enable NZ to exercise its right to "safe trade" under international agreements... Prosecution is recommended for corporates bringing contaminated goods into the country. Containerised trade is identified as one of the many growing threats, along with ballast water.

...Border control is certain to be tightened after an extensive investigation into the number of alien organisms entering NZ. Changes could include contracting private companies to carry out some of the Ministry of Agriculture and Forestry's work, which includes policing the 420,000 full and empty containers that arrive each year. Maf biosecurity has been the subject of critical reports and an Auditor-General investigation over the past few months, all showing flaws in the sea container system. Last year Maf inspected 24[%] of high-risk containers and randomly selected a further 5-10[%] for internal inspection, where an officer puts his head around the door and has a look inside. In the survey, and for the first time, the ministry did a thorough re-check of containers already door-inspected and the results were predictably worrying. Five live, alien spiders and three insects were discovered in the 1517 containers during door inspection. In the re-check, the numbers shot up to 124 spiders and 71 insects. For seeds and plant material, the figures were 19 and 179. Detection rates during door inspections were around 4[%] for spiders and insects and 10[%] for plant material. "That is just way, way too low," said [the RFBPS biosecurity spokesperson]... "Maf has been pussyfooting around the importing industry but it's time to get tough..." ...But [the spokesperson] for the 300-member Importers Institute... said his organisation was a "convenient target" for those calling for tougher border control. [The institute spokesperson also pointed out that:]"Increased biosecurity means increased costs to the public." ...A spokesperson for the Biosecurity Ministry... said the funding... to protect the nation from pests and diseases, including screening aircraft and mail... had increased at least \$20 million since... last year... The estimated cost of screening all sea containers was \$90 million.

...All passengers flying into NZ could have their bags x-rayed under new plans to fight a surge in the smuggling of banned plants and animals. The deluge has prompted the Ministry of Agriculture and Forestry to consider beefing up border defences. [Latest figures... show seizures of banned goods have jumped 150[%] in five years. And more than a quarter of items seized had not been declared on arrival cards... [The] quarantine services general manager, said his officers made 51,000 seizures in the six months to last December 31. Of those, 14,000 had not been declared... "It does not occur to some people that NZ has a very unique environment that needs protecting... Some of it is deliberate organised crime, there are people who do not understand the quarantine rules and there are people who are just careless." Most of the illegal goods were fruit... The Government has given approval for MAF to study the costs and benefits of x-raying all arriving luggage, although nothing would be introduced without consulting airlines and airport companies... The Tourism Industry Association said yesterday that it understood the need to protect the country's biosecurity, but it hoped law abiding passengers would not be further delayed. The average delay for someone diverted to the baggage x-ray is 1min 15sec. The Board of Airline Representatives said airlines would cooperate. Airlines already show videos and published warnings in their in-flight magazines, said the board's executive director... Late last year, [the] Biosecurity Minister... announced a range of measures, including a multi-lingual information programme, surveillance and new ways of detecting contamination in sea containers[(which could include blanket screening of sea containers – although the Importers Institute says 'it is impractical to screen all containers'). The minister] also gave MAF the authority to impose instant fines of \$200... on people carrying undeclared fruit, plant or animal products...

The Parliamentary Commissioner for the Environment has stepped up his call for the Government to clamp down on alien pests and diseases... [The commissioner] wanted to see biosecurity given the same priority as national defence. The independent environment watchdog first put the Government on notice over its priorities for biosecurity in a report, *NZ Under Siege*, in October[last year. The commissioner says]... that of the \$103 million to be spent on biosecurity in [the next financial year], just \$86,000 would be spent on public information and awareness campaigns – down from \$500,000 in 1996-97. In contrast, A[US] would spend \$2.86 million. "We try to get through very clearly that biosecurity has to be part of the national psyche, which means we've all got to understand it... [Y]ou've got to invest a lot in publicity, empowering people – getting it in front of them." The commissioner would like to have permanent telephone hotlines and rewards offered for information. "It's [kids]... gardeners and people mucking around clearing [up]... who find these things... not official agencies." ...Biosecurity services could also look at other ways of managing pests and diseases that made it past the border... NZ biosecurity systems had no ready-reaction fighting fund. "MAF has money only to find out what [the threat] is, not to immediately initiate smart control operations." Next month... the commissioner will formally ask the Government what it has done in response to his recommendations. [The commissioner] has already indicated to Parliament, including the primary production select committee, that there will be an annual biosecurity audit. "It's a way of saying it is that important. We're going to keep the heat on."

...You could be forgiven for suspecting there was a plague on our house... Nearly every month news has come that some fresh, foreign invader has stormed through our borders. How fragile are these borders? How open to all-unwelcome-comers is this isolated little nation? In a word, very. As an island country with unique flora and fauna and large, economically important agricultural, forestry and horticultural industries, NZ has much to protect. Yet our long coastline and dependence on trade and tourism – combined with modern transport – mean we cannot seal ourselves in. The gates must remain open; the business of business must go on. So it falls to the gatekeeper to protect us, our environment, our farms and our fruit. It is the job of the MAF... Quarantine Service to keep at bay as many of the world's bugs as it can. Some threats, such as foot and mouth disease and tephritidae fruitfly... are well-known bogies in many neighbouring countries, including A[US]. Others are little known, though equally threatening. One is the giant African snail, which can grow as large as a brick and lay as many as 6000 eggs in a lifetime. It has been recorded attacking 500 types of plants and can pass on disease to humans. But it is just one of many. The service's task, then, is immense... [T]he quarantine... system, for commercial importation, begins overseas with import health standards and assessments of the risks associated with products and their ports of origin. All imports must be inspected by an official export authority in the country of origin and when they arrive in NZ the service takes a biometric sample for analysis. If something is found, diagnostic work is done. If treatment is needed, the service treats it. If an item needs to be reshipped, the service arranges for it. If it has to be destroyed, the service orders it. "So the commercial pathways are very tight... But with passengers and mail you are virtually dealing with a global audience. We don't know who is going to travel to NZ and they don't necessarily know a lot about NZ or what the quarantine risks are." So if the Quarantine Service cannot keep 100[%] of the pests out of NZ, how must we measure success and failure? [The service's general manager] points to the fact that NZ doesn't have fruitflies but that in every country surrounding NZ – perhaps with the exception of Norfolk Island – they are established and there is no prospect of controlling them... "With the many things you hear about getting in, you would think they are failures, but they are actually not. They mean the system is working. If the system didn't work, we would have fruitfly and so on... We don't have foot and mouth disease either, and we... are one of the very few countries in the

world that's never had foot and mouth disease. We don't have swine fever, or rabies, or citrus canker and we don't have Asian gypsy moth. We had an outbreak of tussock moth and that was dealt with..." But the... 1996 infestation of eastern Auckland suburbs by the white-spotted tussock moth required a \$12 million eradication project, which included low-level spraying of properties in a 40 sq km area.

...THE PAINTED apple moth may be in west Auckland to stay because MAF says there's not enough money to eradicate it. [The h]ead of forest biosecurity... says the M[AF] has funding until November to contain the pest, but that's not enough to wipe it out. The painted apple moth is a threat to some fruit and native trees and has been found in Glendene, Avondale, Kelston, Titirangi and, most recently, in Waikumete Cemetery... Evidence points to it having arrived here in a shipping container... [The head] says a grid trapping survey is being carried out to determine how far the moth has spread and what resources are needed to eradicate it. A technical advisory group will use that information to advise the Government on long-term options for dealing with the pest. [The head] says they'll report to the Government in November when funding for the containment programme runs out. "The Government will need to respond to what additional advice we have at that time," [the head] says. But that's angered a west Auckland entomologist and an orchardist who want the Government to provide more funding to get rid of the moth. [The e]ntomologist... says funds are needed now to wipe out the moth before it's too late. "I think if they had a proper campaign it could be eradicated,"... [The entomologist] says MAF's programme hasn't worked and... thinks they should admit that. "I think it's awful, they have got to get their act together." [The] Auckland Pipfruit Growers Association president... fears it won't be long before the moth reaches the west's fruit orchards. "It's an imported pest and if the Government can't make funds available there's something wrong,"... But [the head] says it's premature to be going back to the Government for more resources until they have the results from the trapping grid. [The head also] says the containment programme may contribute to eradication, as in Mt Wellington where only one painted apple moth has been found in the past year. MAF's containment programme has involved weekly checks of known infested sites, property surveys, and introducing a caged [girl moth] trapping system that attracts [boy] moths.

...AN INDEPENDENT review of plans to rid the west of the invasive painted apple moth is long overdue, says [a]west Auckland entomologist... The M[AF] commissioned the review after criticism of its programme to contain the moth[, which] was first discovered in Glendene... The moth... has since spread to [surrounding suburbs]... The review has recommended aerial spraying as a last resort to eradicate the A[US]n pest. Other recommendations include establishing another colony to supply more [girl moths] for a caged trapping system, and developing a communication strategy to ensure interest groups are consulted. [The entomologist] says the recommendations are good but a little too late. The moth should have been sprayed when it was confined to a smaller area... "[Now i]t's in at least 10 times the area. The money must have gone up in the time being and that must be a public concern." ...MAF[']s biosecurity group director... says several processes would have to be completed before a decision is made to spray the area... "The Government would then have to agree,"... [The group director] says such a spraying programme is likely to cost about \$5 million but can't be finalised until the delimiting survey is complete. Spraying is unlikely to start before October.

...The Waitakere Ranges are not negotiable. Any threat to our unique bush and wildlife from the painted apple moth will not be tolerated, says Waitakere City Council. The council has requested monthly updates from ...MAF... as the pest continues to spread throughout west Auckland. Some 94... properties are still known to have the painted apple moth... and the population will start to increase as we approach warmer weather. Though little is known about it, the painted apple moth is a native of A[US] that belongs to the same family as the white tussock moth... If aerial spraying using Btk... get[s] the green light, MAF hopes to contain it within a very localised area in November. "It's more likely to be by helicopter than the DC6 approach that was necessary during the white tussock moth programme," says [MAF's head of forest biosecurity. The head] defends the control measures already in place – [which include]removing the moth's preferred food sources and... restrictions on the movement of vegetation...

M[AF]'s director of forest biosecurity... says the spraying of specifically targeted areas will be designed to stop the... painted apple moth... spreading to the environmentally sensitive Waitakere Ranges... [The director] says the ministry is not considering blanket spraying by aircraft, the controversial method used against the white-spotted tussock moth in the eastern suburbs of Auckland. But the pesticide... will be the same... [One c]ouncillor... condemns the ministry for not taking action sooner, saying it knew the painted apple moth posed a problem two years ago. [The] Waitakere Ranges Protection Society president... blames both the council and the ministry. [The president] believes a lack of action from both groups could see the moth spreading to the Waitakere Ranges by summer. "Once that happens it will be too late to eradicate it,"... says [the president. However, the president] also opposes aerial spraying, claiming it will kill native insects and butterflies crucial to the feeding chain of birds.

...[a letter-writer] of Birkdale has an idea to get rid of the dreaded moth: "Do what the Chinese did when they wanted to rid themselves of a plague of flies. A jar was given to every child and when it was full they took it to school and were given \$1 and a new jar to fill. They were fly-free in a very short time, and it cost very little and no pollution..." [● Unfortunately, the Chinese method had a negative side – 'the lack of flies led to a lack of birds.'

...The MAF says it is powerless to stop thousands of painted apple moth caterpillars munching their way through a marine reserve... managed by the D[oC. MAF's director]... of biosecurity... says [the ministry] has known about the moths on Traherne Island in the Pollen Island Marine Reserve for several weeks. The reserve, beside the northwestern motorway at the end of Rosebank Rd, is the only habitat of the bactra moth and home to rare and endangered birds... [M]inistry contractors can't tackle the problem because the area is too difficult to reach... [A c]ommunity relations officer... admits the spread of the [painted apple]moth is a concern[, but]... believes other species affected by the aerial spraying will eventually regenerate. But [a local]entomologist... disagrees... and... fears the ministry's inactivity is leaving west Auckland on the verge of an ecological disaster. [The entomologist says painted apple] moths have also been found in traps on Gum Rd on the fringes of the Waitakere Ranges...

Let us spray, says Govt THE waiting is over. Newly released plans reveal hundreds of homes and businesses will be subjected to aerial spraying as the Government steps up its bid to destroy the painted apple moth. A helicopter will spray the organic pesticide Btk... over about 800 properties near the areas of highest infestation. The \$11 million campaign will focus on Waikumete Cemetery, Traherne Island... the edges of Whau River, Wairau Creek and a waterway in... Te Atatu. The M[AF], which recommended the plan, believes Btk is harmless to people, plants, animals and all insects except caterpillars. It admits some residents suffered "minor respiratory irritations" during Operation Evergreen... in... east... Auckland...

Government officials are being accused of botching publicity about plans to spray insecticide over hundreds of properties... Letters about the plan carrying Wednesday's date were sent to 46,000 west Auckland addresses. But many arrived on Tuesday – before the afternoon meeting when the strategy was revealed to the ministry's own community advisory group. M[AF]... is disappointed and... is investigating the situation... [A] subsidiary of N[Z] Post, was given strict instructions not to deliver the letters before Wednesday... [T]he principal of Glen Eden Primary, the only school in the spray zone... found out about the campaign from a newspaper. Yesterday morning [the principal] was still waiting to hear from the ministry... "My beef with the whole thing is that we've never been consulted at all... That's not good enough. The children could well be affected..." [A MAF spokesperson] says confidentiality issues prevented the ministry contacting affected organisations before Tuesday. But [the spokesperson] accepts the school could have been contacted on the day the plan was announced. "...in hindsight... I think that's probably a very valid point..."

...FAILURE to get permission for low-level flying has grounded the aerial spraying campaign to destroy the painted apple moth. The M[AF] says it didn't realise it needed special approval to fly helicopters below 300 metres. [MAF's f]orest biosecurity director... says the blitz has been stalled until January at the earliest by an "obscure rule" in the Waitakere City Council's district plan... The council isn't happy with her explanation. [A spokesperson] says the council informed the ministry two weeks ago that it would need a resource consent for low-level flying if it wanted to avoid

using special powers under the Biosecurity Act. “The ministry has known for two years that some level of aerial spraying was possible and if it had started consent proceedings back then it could have had the consent by now,”... The delay comes as the moth appears to be spreading its wings.

...The Government will declare a biosecurity emergency in West Auckland so it can blitz a moth pest from the air. [The]Biosecurity Minister... says [it] will declare the emergency so targeted aerial spraying for the painted apple moth can start as soon as possible... [The minister also] said it was “extra-ordinary” that neither local nor central Government knew about flying restrictions under Waitakere City Council’s district plan...

AT least one west Aucklander with health problems attributable to Btk... has been evacuated by MAF. But M[AF] officials refuse to confirm any relocations have taken place – citing patient privacy... Critics of... [the] spraying welcome the news and urge MAF to go public... [The] founder of the Community Coalition for the Painted Apple Moth, says officials have repeatedly claimed spraying is safe... [The founder] wants MAF to offer the relocation option to more residents affected by spraying – even if residents can’t prove the link. “It is near impossible for anyone to provide clinical evidence showing the spray is making them ill... But I still believe people should be given the facility to be evacuated – and the ministry should pay for it.” ...many other[residents are] phoned between 3am and 4am on scheduled days to be told whether spraying is going ahead.

...Re: Letter to the editor, Thursday, [which]... asks if those complaining about the aerial spraying... would pay for the damage if the... painted apple moth... became established. As current feeding trials appear to show that our native trees are mostly resistant to painted apple moth, it is likely that the only truly susceptible hosts will be the forests of mono-cropped, cloned pine trees. As these forests are privately owned, why are we, the taxpayers, paying \$11 million to spray our own citizens, so that these investors can have a free eradication programme? Why aren’t they paying for it... as they will be the ones reaping the benefit? PS – ...Where are the leaders of west Auckland? Where do they stand? Where can we go to protest? Who can we actually talk to other than MAF? I thought west Auckland was supposed to be GE free. N[Z] was made nuclear free by a strong and caring nation – where are those people now? I cannot see how, after so much protesting against the U[S] with the nuclear issue, we now allow them to give us a chemical that the public is not allowed to know what it consists of? We have a right to know what is being sprayed all over us, don’t we? Or should we let American companies walk all over us? ...When I call [MAF’s] 0800 969 696 number... to protest and ask questions, they ask me where I live and when I tell them they say that’s not in the zone so I don’t have to worry. But my daughter goes to school in the zone.

...Health concerns are mounting among some parents of schoolchildren as the M[AF] plans its third round of painted apple moth spraying in west Auckland. Stage two of the programme finished earlier this week after high winds stopped plans to have the school areas sprayed during the weekend. The schools were instead sprayed during the week. At least five mothers are angry, saying their children were exposed to the spray while walking to school. [A]Kelston mother... says too many inconsistencies surround information being released by the ministry... “Either it’s safe or not...,”... The ministry’s community advisory group chair[person]... agrees residents are worried. “People are being sent conflicting information, creating unnecessary panic,”... Spraying resumes in three weeks.

...The Auckland Regional Council is backing calls for blanket spraying in a bid to wipe out the painted apple moth. Its recommendations will be included in a M[AF] briefing paper due to be considered by the Cabinet... A blanket approach will see the existing 3000 hectare... spray zone extended up to 50,000ha throughout the Auckland region. Areas likely to be included are parts of the North Shore and Central Auckland where moths have been found. [The]Painted Apple Moth Advisory Group spokes[person]... says the decision shows how serious the apple moth infestation is... The A[US] native... is considered to be a \$48 million threat to forestry and horticulture... But [the spokesperson] is concerned that blanket aerial spraying will create widespread health problems. An unknown number of west Aucklanders are already listed on a medical register maintained by doctors commissioned by the ministry to handle complaints. Five are relocated when spraying is underway and accommodated at motels, courtesy of taxpayers. [The spokesperson], whose group is also contributing to the briefing paper, says more emphasis should be given to ground Btk spraying to avoid health problems. “There also needs to be quarantines on plant movement inside and out of the affected areas... The removal of weed host species... needs to be a priority and more resources need to be given to support both public and private programmes to develop a synthetic pheromone. We are overdue for a new approach”... The next round of... spraying starts in west Auckland [in five days time].

...Mass spraying of the painted apple moth starts [next month]... The Government has approved the \$90 million expansion of its aerial operation which will target about 40,000 properties over 7836 hectares, mainly in west Auckland. A Fokker Friendship aircraft, light plane and helicopter will be used to carry out up to 40 sprays over the next three years. A new vegetation control zone will be sign-posted around the spray borders reminding people not to spread the moth by taking infested vegetation out of the area. The [MAF] estimates the moth could cost \$58m to \$358m in lost forestry export orders over the next 20 years if it spreads. Scientists say the latest campaign has a 60 per cent to 80 per cent chance of success.

...A community group established by the Government to consult on painted apple moth issues in west Auckland fears it may be disbanded. The advisory group was set up by the M[AF] along with a technical advisory group and health team. All three are about to be independently reviewed and the advisory group’s chair[person]... has had no communication from the ministry despite repeated requests for meetings since... [MAF’s] forest biosecurity director... resigned... [However, the chairperson] says members will remain actively interested, even if the Government cuts ties... Health issues are still high on members’ agendas, especially the \$90 million Government approval of expanded aerial spraying... from next month.

...Waitakere City will take a medical and economic battering as adverse side effects of the painted apple moth campaign begin to kick in, says[a councillor and]... member of the M[AF]’s community advisory board, w[ho w]as initially blasé about the Foray 48B aerial spraying until [it] started experiencing health problems which [the councillor] believes are directly related. [The councillor] says the ministry hasn’t taken into account a number of issues with its expanded operation which starts next month. “Do they think [people’s health] is going to be better?” [The councillor says it] gets sick with breathing complications and nose ulcers during spraying and worries about the long-term implications. [The councillor also] believes the health issue will impact on the economy... “...what about the loss of hours in people not going to work...?” The ministry’s independent health team has always maintained the caterpillar-killing insecticide Btk has been used for 35 years without causing any major health problems.

...I strongly urge... some thorough research on health effects that have been reported by people who have been sprayed by Foray 48B. In east Auckland... in West Auckland and overseas the symptoms are all the same and include: burning throats and eyes; conjunctivitis; breathing difficulties; asthma; chest pains; mucus in lungs; severe cough; severe headaches; flu symptoms; swollen glands; extreme tiredness; skin rashes; diarrhoea; premature births and miscarriages. I have experienced several of these symptoms after the... spraying operations. I would like to make it very clear that I am usually a very healthy person, that I have no food allergies and that I am not imagining any of these symptoms. There have never been any studies done to prove the long term safety of Foray 48B! What are the effects of repeated longterm exposure to the spray? Why has MAF never carried out a properly researched and funded study? I would like to know why it is more important to protect some manufacturer’s “secret” mix of chemicals and bacteria than the human rights of your citizens?!

...Waitakere City Council is using the Official Information Act to find out what ingredients are in the spray used in the painted apple moth campaign. The council’s environmental management committee chair[person]... says a request has been forwarded to the M[AF]. The ministry has 20 working days to respond. The council can go to the ombuds[person] if dissatisfied with the ministry’s response. The full list of chemicals used to make Foray 48B has been kept secret, because of patent laws protecting the U[S] manufacturer’s right to withhold certain information relating to its products. Foray 48B contains only 2.1[%] of the caterpillar killer Btk. The rest consists of inert ingredients, designed to help the spray’s dispersal. [One c]ouncillor... says spraying should not proceed unless all ingredients are disclosed... The ministry says the chemical compounds of Foray 48B are registered for use in cosmetics, medicines and/or foods. It claims the spray is safe and its ingredients are known to a select number

of health officials who have cleared its use in N[Z. But the] Green Party biosecurity spokes[person]... continues to hunt down the full list with a view to making it public knowledge. [The spokesperson, who] says doctors should know exactly what chemicals to look out for in allergy or sensitivity tests if people get sick during the spraying... has obtained a list of ingredients used in a Canadian version of the spray named Btk Foray 48B, which has been tabled in Parliament. Prepared by independent analysts, the Canadian list, featuring 40 chemicals, was not organic. M[AF] scientists say the spray used in west Auckland is an organic insecticide.

...Opponents of the Government's \$90 m... West Auckland spray campaign have released what they say are the secret ingredients of the pesticide. An [anti-spray] campaigner... said the ingredients were obtained from data contained in papers released under the Official Information Act. "It is completely unacceptable the Government has denied people the right to know what the chemicals in the spray are,"... said [the campaigner. A]... Dr... who has written a book on pesticide use in N[Z], said the surprise ingredient was a chemical called propylene glycol, a food preservative also used in anti-freeze. It could be absorbed through the skin and lungs. It was used in a range of health supplements. "Research overseas shows it causes adverse reactions in children, yet the amount in supplements is probably less than that being inhaled by people in West Auckland."

...WEST Aucklanders in the painted apple moth zone are being sprayed with a new mix of Foray 48b. Fourteen-thousand litres of the altered concoction... applied at the rate of 5 litres a hectare... have [already] been used in the aerial operation... [The] Biosecurity Minister... discussed the change in formula following questioning by [the] Green Party biosecurity spokes[person. The minister]... says the registrant applied for approval of an alternative formulation of Foray 48b. The Environmental Risk Management Authority approved the revised mix after finding it "to be sufficiently similar to the previously registered formulation"... The Government refuses... to release a full list of ingredients... citing commercial sensitivity. "The public right to know about the ingredients is greater than the intellectual property rights of the spray's owner," [the spokesperson says. Another anti-spray campaigner... agrees and also wants to know why Foray 48b's formulation has changed. "If they've changed it, why isn't there a new health risk assessment? I think it goes back to [a former PM]'s legal opinion that we're being scientifically experimented upon,"...

Opponents of MAF's painted apple moth aerial spray campaign are angered MAF has pulled the plug on a proposal for a free health care plan for residents affected by aerial spraying. [The] Aerial Spray campaign director... told Waitakere and North Shore councillors last Tuesday the Ministry doesn't have an open cheque book – despite 10[%] of the project's budget being earmarked for health matters. [The director] said... people affected by the spray can go to their GP for assessment at their own cost, and if the GP agrees, the Ministry will pick up subsequent treatment costs. But [a] Painted Apple Moth Community Coalition member... says... "GPs don't want to be caught in the middle over deciding who's symptoms are adequate enough for MAF health funding."

...*The alternative to spraying... is just not an alternative...* The Painted Apple Moth is a voracious and serious pest – make no mistake. So far we know it will happily eat more than 60 different tree species including natives like Kowhai... But there's also a very ugly side to this caterpillar. The... hairs can give most people, and especially children, an itchy rash causing significant distress. And that's not all. Because the Painted Apple Moth caterpillar sheds the hairs which become airborne and could give you or your child a serious reaction. In fact, in the Northern Hemisphere, they are forced to close parks and forests because of this health threat from its cousin – the Gypsy Moth. Since it lacks natural predators in N[Z], this Aussie invader could spread rapidly. The [girl moth] lays up to 700 eggs at a time, so it doesn't take much to imagine how quickly it will go through the country. So spray it we must... For further information call 0800 96 96 96 or visit our website www.maf.govt.nz/painted-apple-moth...

West Aucklanders protesting against the expanded painted apple moth spray campaign say they want the Government to take their concerns seriously. Last Saturday's march, organised by the Sprayfree Coalition, was the first in what could turn out to be a string of protests planned by the group. More than 500 people made their point with signs and shouts followed by several speakers including [the] Waitakere Mayor...

Tarpaulin-covered gardens could be the next protest step against the... extended painted apple moth aerial spraying campaign. The idea follows a public march by hundreds of people last Saturday... [The] Sprayfree Coalition co-ordinator... says west Aucklanders concerned about their vegetable gardens, swan plants and prized flowers could cover them with tarpaulins during the spraying. "From the air it would look awesome. It's not unlawful and it would certainly hack MAF off,"... The coalition is also looking at private injunctions against the ministry... • [The]... extended operation, due to start yesterday, was postponed until this morning because of bad weather.

...Guardians of... Pollen Island Marine Reserve... [-] the last remnant... of saltmarsh on the Waitemata Harbour... [and] the only habitat of the rare bactra moth... [-] want it excluded from the... extended painted apple moth spray zone... "It would be so easy to miss Pollen Island... MAF hasn't found the painted apple moth there, so why spray it?" ...[but the DoC]'s community relations officer... says the bactra caterpillars feed inside rush plants where they should be protected against the spray.

...POLLEN Island, home to one of the world's rarest moths, is being sprayed with Foray 48B despite intense opposition by environmentalists... It is being sprayed as part of the expanded painted apple moth aerial campaign, which began on Wednesday. Environmental groups asked the M[AF] to exclude the island, fearing the bactra moth might be wiped out. Officials refused saying the moth should be safe... [In international news, when a] butterfly defender... walked the mountains of the monarch reserve in southern Mexico in the 1970s, [it] found "a blanket of green." The last time [the defender] went, some tourists wore paper masks against dust rising from deforested land. A study of aerial photographs taken over the past 29 years shows damage or destruction to 44[%] of the fir forest that serves as wintering grounds for the monarch butterfly in its annual migration from the U[S] and Canada. "I think it's having an impact on the monarch now," says... a zoologist and expert on the 4800km migration that takes successive generations of butterflies back to the same wintering grounds. The cool shade of the forest in which the monarchs drape themselves like a spectacular orange-and-black carpet is a [also a] necessary piece of their migratory puzzle. But it is being cut down piecemeal by locals and logging companies. "We are starting to see colonies breaking up earlier," and heading back north... potentially exposing them to lethal late frosts in the U[S. A forestry]... expert... says the logging could eventually affect the monarch's delicate metabolic balancing act. The reserve, a Canadian-type fir forest that has survived since the Ice Age on mountain tops in the tropics, serves the monarchs as a blanket against temperature extremes.

...A cold front that wiped out millions of monarch butterflies in central Mexico last month may reduce next year's migrations... the World Wildlife Fund Mexico director... said yesterday. "This is not about the extinction of the species, although we cannot know for sure what is going to happen." The WWF said as many as 250 million monarch butterflies might have been killed by a massive cold front that swept across Michoacan state... [A] specialist in monarch butterflies, said "this was the worst episode of butterfly mortality" [it] had seen in 25 years... The cold snap killed as many as 80[%] of butterflies in certain colonies at the... Monarch Butterfly Reserve in Michoacan... but it was not clear how many... survived...

THE definitive word on the monarch butterfly drought from... a lepidopterist (someone who studies moths and butterflies), at Landcare Research in Mt Albert: ...monarchs are "in between broods". The larvae are probably out there feeding up ready to become adult butterflies. Monarchs are not native... and are likely to recolonise quickly even if numbers are hard-hit by spraying [for the painted apple moth]. They are widespread and therefore there is not the same concern within the spray zone. [The lepidopterist] has also just discovered the rare bactra moth in the Waitakeres – a big relief for conservationists worried that the moth would be wiped out by the spraying on Pollen Island, previously thought to be its only home... "They've probably always been [in the Waitakeres] but have just been overlooked," [the lepidopterist] says. "They're quite a small greyish moth." ...the [Waitakere Ranges] moth will have a different name to its Pollen Island counterpart. The name will identify it as living in a different habitat.

...Moth experts are more determined than ever to keep aerial spraying of the painted apple moth away from the Waitakere Ranges. Their strengthened resolve follows the discovery of the rare bactra moth in the Titirangi-Huia area. Its discovery there is good news, though the location is perilously close to spraying. [An e]ntomologist... says the spray would probably also kill the bactra moth[s]... by rupturing their insides... A

range of moth species are endangered by the spraying. Among them are numerous native varieties... Other species, like the monarch butterflies... which come from the Pacific Islands... are of less concern... "I would be absolutely concerned if the ranges were sprayed,"... says... a... Titirangi lepidopterist... [who] is using traps to monitor the effect of the spray on native moths[. and] will also check on their recovery when spraying is over.

...Scientists working to seduce the painted apple moths are one step closer to creating the perfect aphrodisiac. HortResearch staff are developing pheromones to use in traps throughout moth-infested areas. Live [girl] moths are currently bred and used in traps. But they don't live long enough to give accurate results. Pheromones will be quicker to produce and more efficient. Trap results are crucial to the eradication campaign. They give... a better idea of moth numbers and show spray co-ordinators where they should be concentrating their efforts.

...THE M[AF] is reviewing its spray technique after a controversial start to its expanded painted apple moth aerial spray eradication campaign over west Auckland. Officials want to improve deteriorating relations with the public after widespread discontent with... [last week's] operation, which saw spraying carried out for about 11 hours. Co-ordinators hailed the operation a success, making the most of low winds after earlier erratic weather postponed the start by several days. But west Aucklanders inundated the ministry's information line with complaints when spraying continued for most of the day... Most complaints involved the low-flying Fokker Friendship aircraft, which was compared to London's wartime blitz by many older residents. Civil aviation rules allow the plane [(that, to residents' added dismay, is 'piloted by a septuagenarian')] to fly at 45 m...

West Aucklanders with allergies to Foray 48B... are being shouted a free breakfast in so-called "safe spots" – and MAF is picking up the tab. The Government body... move[s] people living in the... spray zone to selected cafes across Auckland and give[s] them brekkie before sending them off to work. However, phone calls to MAF's 0800 information line revealed staff are stumped about the latest offering in the controversial campaign.

...48b causes car yard havoc... Frustrated car groomers are working overtime cleaning Foray 48B spray off their stocks. The spray... has become such a problem that MAF has employed a paint specialist to investigate if the spray is causing any damage to paint work... [The owner of a yard] in Pt Chevalier says his car groomer... spent all of last Wednesday frantically cleaning the yard's 30 cars, a job that normally only takes him half a day... "You actually have to scrap it off rather than just washing it,"... [A groomer at] West Auckland Motors in New Lynn, says the spray is harder to get off the longer you leave it. "On the first spray day the sun sort of baked it on... It sort of crystallises." ...a paint specialist is looking at ways to remove the spray "without the extra elbow grease"... [but] the spray is water soluble and can be hosed off easily if you can get to it before it dries.

...Thank you for your article on Foray 48B [and car yards]... It proves that the spray puts a poison coating over everything in the spray area including on soil where our vegetables... grow and where children play. This affects every resident and visitor in the spray area... MAF must pay substantial compensation to all residents/land owners who are being sprayed. MAF is guilty of poisoning private land needlessly. They must change their methods urgently. They must inspect the land and spray where they find the moth. They inspected my land years ago, they found no moth. They never did any public inspection since then, but of course we were sprayed... MAF tells us that the spraying is a... business[worth \$ms]... It is interesting to see that MAF describe themselves as "business" operators. But they certainly do not include the community cost in their accounts!

...A PROPERTY expert says real estate prices in west Auckland won't be affected by bad press surrounding the painted apple moth aerial spray campaign... Continued debate over the programme and its impact on human health has prompted speculation about a possible reluctance to buy in west Auckland. [A p]rofessor... from Massey University's Department of Finance, Banking and Property, doubts potential buyers will be turned off Waitakere City... But one real estate agent... knows of people selling their homes to move out the area for fear of being adversely affected by... 48B.

...As biosecurity authorities prepare to expand an aerial operation against a moth pest... they are not ruling out a bigger campaign against the pest. The latest expansion, an area of 1400ha... around Hobsonville, pushes the total spray zone to more than 10,000ha, just 2000ha shy of the limit allowed under the Biosecurity Act. But M[AF's] painted apple moth project director... said yesterday that [it] was not worried about breaching the 12,000ha limit set by the Government when the \$90 million operation was approved... Birkdale, Beachhaven, Herald Island... and the eastern side of Whenuapai will [also] be included in the next scheduled aerial blitz... [-] the first time any part of the North Shore has been... in the spray zone.

...We need new ways of beating the moth... As the moth spreads and public opposition to aerial spraying... over the homes of 200,000 people in infested areas of Waitakere, Auckland and North Shore... mounts, some solutions that seemed acceptable a year or even six months ago are no longer workable. The M[AF] must work with the community to develop an approach that can succeed... Blanket spraying was adopted because it was seen that if the goal of eradication was abandoned, there were no effective control measures to limit the moth's spread and the damage it could do. Blanket spraying is successful in killing off moths. But as well as creating major health issues, it is also failing because killing nearly all the moths is not enough... [-] a handful surviving will allow rapid reinfestation. Not only are moths being found outside the spray zone, but they are still being trapped within the zone. I suggest two main reasons for this. First, the layering of the vegetation means it is difficult for the spray to penetrate below the upper canopy. Second, it has been difficult for the [MAF] to find ideal weather for spraying. It has been hampered by rain and high winds, and has been forced to spray on calm days when the wind has not allowed the spray to drift into its target. It is time for the Government to reconsider the community option... One cornerstone of the option is to immediately get rid of all unwanted wattles from the Auckland region. This operation would target wattles in the rail and road transport corridors that are contributing to the spread of the moth. Ministry figures show more than 85[%] of larval finds are in wattle trees. Removing wattles would reduce the ease with which the moth can spread and its ability to thrive, buying valuable time. Experts have assessed the cost of wattle-removal at \$3 million, with a further \$1 million for replanting. Given the part wattles are playing in the development of the problem, this seems a small slice of the ministry's \$90 million budget. The second and most essential building block for a successful operation is developing a synthetic pheromone. The ministry has put resources into developing one but will not support the parallel programme of... [the] Dr... responsible for successfully developing a synthetic pheromone to combat the white spotted tussock moth. Using his own resources [the Dr] has made good progress on developing a pheromone for the painted apple moth... Almost every household would be keen to support this programme... [but if only] one household every 500m agreed to have the spray in a tree, there would be a good chance of eliminating [boy] moths... Safe eradication is not yet unattainable but if the ministry does not change its approach, getting rid of the moth will be impossible and the cost to public health will have been in vain. ■... The National Radiation Laboratory in Christchurch is irradiating batches of [boy] painted apple moth larvae to make them sterile. The work... is... contracted through HortResearch... Painted apple moths mate only once, so the sterile insect technique could, in theory, help wipe out the species in N[Z]. The release of sterilised [boy]s to mate with fertile [girl]s has worked with other insects such as screw-worm in North America, the tsetse fly in Zanzibar, the Queensland fruitfly in Western A[US] and the Mediterranean fruitfly in Mexico... [The lab's] scientific adviser... said... [e]ach batch of 50 insects received five hours and 45 minutes of treatment using 100 grays of radiation. That was 20 times the amount needed to kill a human, but insects were much harder... "They don't know anything about it." The level of radiation was... enough to kill or impede their mating flights, which can cover more than 6km. The treated moths will soon be released...

STERILE [boy] moths are being used as the latest weapon in the battle against the painted apple moth. The plan is backed by [the] Titirangi entomologist... who first discovered the pest in Waikumete Cemetery... "The idea is to release thousands of them so when the [girl moths mate, they] get... dead sterile sperm... It's a cunning technique but it works only if the sterile [moths] outnumber the virile ones." ...[MAF's p]roject director... says sterile moths, which are not affected by the spray, could not be introduced at the height of the infestation when they would have been outnumbered by virile moths. "This time last year there were about 1350 moths and this time we're down to 30. That's extremely good news."

...AN auditor general's report criticises the M[AF] for its handling of the painted apple moth crisis... EVERYONE accepts that mistakes have been made in dealing with the painted apple moth. That is history and while it is important to learn lessons, what is important now is to constantly re-evaluate where we are and how we should go on... The moth is only one of up to 35 undesirable species to enter the country in recent times.

...M[AF] officials working towards the next round of painted apple moth aerial spraying are also trying to stop several other pests munching their way to west Auckland... [The] MAF... is working hard to contain other pests found in recent weeks and is anxious to avoid further air operations. Newly discovered unwanted visitors include the fall webworm, a member of the tiger moth family [that]... is a native of North America and Mexico which... has been found in Mt Wellington, and the Asian gypsy moth[, which was found] in Hamilton. Both are regarded as major threats to N[Z]'s forestry and horticulture... The Asian gypsy moth, a relative of the painted apple moth, is a menace to at least 500 tree and plant species and is a prolific breeder. Another A[US]n invader causing concern is the gum leaf skeletoniser which attacks eucalyptus trees and was first found in Mt Albert last year. The pest has spread to south Auckland where efforts are being made to wipe it out using pheromones [sex attractants]. Meanwhile, efforts continue in the Kaipara region north of Helensville to kill the southern saltmarsh mosquito, an aggressive daytime biter.

...The... \$30 million programme to try to wipe out the southern saltmarsh mosquito around Kaipara Harbour... involve[s] aerial and ground spraying, using the insect growth regulator S-methoprene, which stops mosquito pupae hatching into adult[s, and]... also... the biological spray Bti.

...Helicopters and biosecurity officers are scouring east Auckland for signs of a... mosquito that's already been found near Helensville. Two southern saltmarsh mosquito larvae... were found in Turanga Creek at Whitford, in a routine check by biosecurity officers. That is the first time the mosquito, *ochleratus camptorhynchus*, has been found in east Auckland. It has already settled in the Kaipara Harbour, Napier and Gisborne.

...An aggressive, potentially disease-carrying mosquito... poses a risk to the health of Aucklanders... It is not known how the insects got there, but... populations of the exotic mosquito were... first found... in Napier. The unwanted organism, thought to be the main carrier of the debilitating Ross River virus, was also found around Gisborne... and in Porangahau and the Maungawhio Lagoon several weeks later... Surveillance programmes had been in place since December 1998... In 1997 the Ministry of Health concluded that N[Z] was at risk from new mosquito-borne diseases, but predicted the first cases would be in Auckland or Northland... An eradication programme in Napier had been progressing well, as had the containment programmes under way... in Gisborne, and Porangahau and Mahia in Hawkes Bay. The public has been asked to take any mosquito specimens to their Public Health Service, and also report any incidents where they suspect the presence of southern saltmarsh mosquito.

...Technical experts advising the [MAF] want all aircraft leaving Gisborne sprayed in a bid to stop the spread of the... southern saltmarsh mosquito... to the rest of N[Z]... It was not immediately clear what sprays would be used on up to 14 commercial aircraft a day departing Gisborne Airport. And health officials have not said how they plan to disinfect the large numbers of light aircraft which operate from the airport. The mosquito... can spread the devastating Ross River virus. The virus causes a disease known as epidemic polyarthritis, and in some patients can cause chronic fatigue and lethargy for up to a year. The virus is not yet in N[Z], but if the mosquitoes become established they could easily pick it up from an infected visitor, such as an A[US]n tourist. The virus could then be transmitted to animal "reservoirs" such as feral possums or farm livestock, and become almost impossible to eradicate.

...it's a muggy... New York... day. The atmosphere is made even more unpleasant by the virus-carrying West Nile mosquito which has invaded the city. "It's not so much the virus which is the worry, but the damned spraying that tends to occur every other night," [an expat British rock star (r:p1640, ln14)] mutters through clenched teeth... [● The southern hemisphere summer] is not too far away and the new Phantom disappearing screen doors and windows are ready for the... flies and mosquitoes... Phantom Roller Screens is importing a model which retracts to let... fresh air through when screening is not needed... An alternative, also on display at the Home Show, is the Ecomist, an automatic dispenser of natural pyrethrum, for an insect-free environment. Ecomist Sales and Services says it is safe for asthmatics, allergy sufferers, children and warm-blooded pets like cats...

Catfood lure fails to tempt heavy wasp population The battle to control wasp numbers in the infested Tasman District in the north of the South Island has had a setback this year. A new poisoning method using catfood and... fipronil poison... has proved unsuccessful and far fewer wasps have been killed than was hoped... said... [t]he coordinator of the Rotoiti Nature Reserve Project... The poisoning programme, run in the low-lying 300ha of the 825ha "mainland island" nature recovery area, achieved a 55[%] reduction in the wasp population, compared with 99.87[%] last year and 74[%] the year before that. The coordinator... also said trial grids of 200m by 200m, used over half the 300ha block, were proving to be less effective than the old 50m by 100m grid pattern... [T]he programme had been a great success over the past three years and the overall number of wasps in the area had dropped dramatically. This has meant the honeydew and insects have been able to thrive, providing food for native birdlife. There has been a striking number of native birds, such as bellbirds, kaka and parakeets, returning to the area recently. [In related news, 'Hawke's Bay orchardists want to introduce an alien wasp to fight an alien bug with no local predators that they claim is costing them \$10 million' in annual profits.]

...A family of tiny wasps which were probably buzzing around in the dinosaur age has been discovered by N[Z] scientists. The native wasp, smaller than a ladybird but as old as the tuatara, is found nowhere else in the world, says the Auckland Museum curator of entomology... New species of wasp are regularly discovered around the world but finding a whole new family is "a bit like finding a lost tribe in the jungle,"... The wasp family has been named *Maaminga*, which in Maori means puzzling, mystifying or trickster. That's because the origins of the wasp have bamboozled international bug experts for nearly 20 years... It was not until a Canadian colleague visited Waipoua forest in Northland with [the curator in the early 1980s] and captured some of the tiny insects that a concerted attempt began to identify them. But even with four entomologists on the case, the puzzle took years to solve. "Even a colleague in Moscow who specialises in fossilised insects had never seen anything like it before... They seemed to be composite of two unrelated wasp groups, having the front end of one and the back end of another." The wasps live mainly in leaf litter, have very limited flying ability and are a "nondescript brown." ...The wasps, which are stingless, probably evolved in isolation along with other unique plants and animals when this country broke away from the supercontinent Gondwana about 80 million years ago, [the curator] says.

...*Sting in the tail...* IMAGINE a wasp being so rare that it made the news. Well, just 45 years ago, wasps were hot. [I]n... 1954, Wellington's *Evening Post* detailed a city council flamethrower attack on a colony of German wasps "whose presence had been unsuspected"... German wasps first appeared in 1944 [- 'having arrived with cargo at the Te Rapa Air Force Depot' -] and were widespread by 1978, when they were overtaken by another new immigrant, the European common wasp. In the Nelson Lakes district today, endless swarms feed voraciously on the lace-like excrement of the scale insect, which clings to the trunks of beech trees. Picnics at St Arnaud are hell. Wasps are so thick there the combined mass of all their little buzzing bodies is often greater than all the native birds and pests such as rats, mice, stoats, ferrets and hedgehogs put together... For their part, the wasps sting birds to death, compete with comparatively wimpy native wasps and bees, and eat larvae of various moths and butterflies. They are hard to get rid of. Experimental poisons are being developed to see if just 300 hectares at Nelson Lakes can be made wasp-free... Note the pests all arrived courtesy of Maori and pakeha since our arrival during the millennium now ending... "We, Maori and pakeha, have arrived face to face for the last time with a pristine, untouched ecology, which did not co-evolve with people,"... [the] Environment Minister... says. "There's this extraordinary sense that we arrived just five seconds after Eden disappeared." There are weird twists in this new age of concern for the mass extinctions which are flowing from our waspishly voracious appetites for food, shelter, warmth and McDonald's Happy Meal toys. As we found out last week, N[Z] is a haven for a bumblebee lost to Britain. Having introduced them here in the first place, the Poms now want some back. [Perhaps they can send us some of our native worms (r:p2420, ln38) that were accidentally introduced to England and are causing concern there 'due to

their voracious appetite for common garden worms'?) ...We will see more of these trends as new science does battle with the damage wrought by old science... In the middle will sit an increasingly confused majority in the First World who like their cars, houses, airconditioning and steaks. They'll know they should be doing something more than recycling plastic bags, but won't be sure what. For this tale of the birds and the wasps is about more than biodiversity – a bureaucratic word for the richness of life which countries everywhere recently agreed to try to preserve. It is about the way that change creeps up on us. As a child of the '60s, wasps were always the norm for me. Will my kids regard hotter summers, wetter, harsher storms, and disease-bearing mosquitoes, such as those just blitzed in Napier, as their norm in 40 years time? In all probability, they will... [●] When Wellington's city council attacked the colony in 1954, they used fire because they couldn't find any DDT at the depot. Those were the days, eh?

...A[US] drops 'Big Nuke' on fire ants The South American fire ant... will cause an environmental catastrophe if allowed to spread, Queensland state authorities warn. The ants, first spotted in Brisbane earlier this year, have already been found at 730 sites and could colonise A[US] in the next three decades. They destroy \$3.4 billion of crops every year in the U[S]. Horrified by the discovery of a pest that they regard as worse than the infamous cane toad, scientists at the Department of Primary Industries have begun a \$170 million eradication programme nicknamed "the Big Nuke". Over the next three years, 500 volunteers will blanket the area with bait laced with a chemical that inhibits reproduction. The tiny, reddish-brown ants, which are thought to have arrived in Brisbane on board a container ship, attack humans, livestock, pets, native animals and crops. An aggressive and resilient species, they sting repeatedly and in concert, causing pimple-like spots and an intense burning sensation – hence their name. In rare cases, the sting provokes an allergic reaction that can kill. In the southern U[S], which has been infested since the 1930s, 84 people have died. The ants represent a threat to A[US]'s outdoor way of life. Activities such as camping and barbecues are out of the question in affected areas; even sitting in the back garden... can be a painful experience. In some American states, schools, parks and sports fields have had to be closed... "This is one of the meanest, most evil creatures that God ever put on Earth. It hates every other living thing, and pours out of its nest ready to fight. If it can't be stopped in Queensland, it will be in the backyards of Sydney and Melbourne in the near future."

...Biosecurity authorities have stopped a tiny nasty in its tracks through a programme designed to catch another of the same species. The M[AF] has treated two sites at Auckland's port infested with crazy ant (Paratrechina longicornis) and yellow crazy ant (Anoplolepis gracilipes). The finds, on Jellicoe and Freyberg Wharves, were made during intensive surveillance work for another, even nastier pest, the red fire ant... Red fire ants, discovered at Auckland Airport last year, cause blisters when they bite. They are aggressive and voracious feeders and could displace native ants... Crazy ants are named for their rapid and erratic movement. They are an environmental pest and feed on a wide range of plants including fruit, honeydew and household foods. Although they do not bite humans, they can swarm over animals, causing severe irritation. On-going monitoring will determine if any more of the ants have breached the border, but MAF is cautiously optimistic the infestation has been wiped out.

...An invasion of foreign ants is threatening the lives of kiwi at one of N[Z]'s premier coastal forest reserves beside the Whangarei Harbour. The ...DoC... is undertaking a... four-day... poisoning programme to try to eradicate the argentine ant (*Linepithema humile*) from the area around the Bream Head Scenic Reserve... The active ingredient in the bait is Fipronil, the same substance used in flea collars. It has proved successful in battling argentine ants on Tiritiri Matangi, an island in the Hauraki Gulf. DoC's technical support officer... said argentine ants were a major environmental and household pest. "They eat invertebrates and nectar and are therefore in direct competition with kiwi, other native birds, and lizards." The ants have also been known to swamp nests and kill chicks. Although the honey-brown ants are not poisonous, they do bite people. The infestation at Bream Head is of particular concern because of the high ecological value of the area, [the officer] said. Currently about 25 kiwi live in the reserve, and there are plans to restore the area to recovery level and introduce more native species, such as the North Island robin and the kokako. DoC's biodiversity threats ranger... said the infestation started in houses in the area and was moving up paddocks towards the bush. "At the moment we're lucky they are not in the main bush block yet... Once these argentine ants get established they could jeopardise the whole recovery project." [The technical support officer] said DoC hoped to eradicate the ants in three years, but the long-term success of the project would depend on the local community. "The ants can't fly so they can only move great distances by people moving them – through bark or soil or plants."

...Argentine ant finds success in tolerance... Billions of ants from Argentina have created the Earth's biggest "super organism" in Europe, a network of communicating worker ants spanning more than 5760km. The invading ants are in millions of nests in a supercolony stretching from northern Italy, through the south of France to the Atlantic coast of Spain, in what is thought to be the largest co-operative unit of individual organisms... entomologists ha[ve] ...ever... recorded... The argentine ant appeared in southern Europe in the 1920s and wherever it went it managed to push out the 20 or so indigenous species of European ant. Now scientists think they know why. Ants of the same species from different nests are usually highly aggressive towards each other, but the Argentine invader does not seem to share this aggressiveness between neighbouring ants. For that reason, an unprecedented degree of co-operation between worker ants has grown into a fully fledged supercolony... The Argentine immigrant has thus been able to concentrate on fighting its indigenous rivals with great success. The Argentine ant, *Linepithema humile*, has become one of the most persistent pests in southern Europe, raiding domestic kitchens and protecting crop pests such as aphids against chemical attack. "People have tried to treat them with pesticides but the best you can do is limit their numbers,"... [a] professor of ecology at the University of Lausanne in Switzerland... said. There is one ray of hope. A second, smaller supercolony of Argentine ants has been identified in the Catalan region of Spain around Barcelona and the Lausanne scientists say these Argentine ants are happy to make war on their compatriots. [They] hoped to identify the signals that triggered aggression between Argentine ants to foment strife and insurrection within the main supercolony.

...Argentine ants are here to stay... Pest control officers say the highly destructive argentine ant... first spotted in central Auckland during the late 1980s... is spreading throughout the west. The ant is classed in the top 100 most invasive species by the World Conservation Union.

...Redback spiders take on the world... A[US]'s humble redback spider seems poised for world domination, authorities warn. [A v]enom expert... said yesterday that what were believed to be A[US]n redbacks had been discovered in Japan and as far away as Belgium. Live redbacks are regularly discovered in N[Z]. Two were found separately in Bluff this year and a nest was discovered in Auckland last year in a bus imported from A[US]. The redback was responsible for at least 13 deaths in A[US] before anti-venom was developed in 1956... [The] director of the A[US]n Venom Research Unit at the University of Melbourne, said... redback spider egg sacs carried hundreds of potential spiders and were virtually immune to quarantine chemical spraying... [I]t was extremely likely the spiders had also made their way into other nations around the world, but were yet to be discovered. "The spiders have proven themselves to be resilient to most weather types and can thrive almost anywhere,"...

They don't come right out and say it, but Americans think we're being just a tad fussy over the odd black widow spider... And they say they don't know what more they can do to prevent the venomous hitchhikers getting here. "Our growers have been working very hard to make sure we are only shipping grapes and not spiders," said... [the] president of the California Table Grape Commission. "They have done more for the N[Z] market than any other and frankly they are not interested in doing anything further." ...N[Z] represented only a small portion of the world grape market for Californian grapes... N[Z]'s MA[F]... has suspended trade in Californian table grapes after four black widow[s]... were found here in as many months. The latest... spider was found in a Nelson supermarket last week... 43 container loads of grapes are still on their way to N[Z]. AUS... extended a ban on the grapes this year amid fears they could bring in the glassy-winged sharpshooter, a carrier of the vine-killing Pierce's disease.

...A Henderson [resident] is launching a support group to help people bitten by venomous spiders. [The resident] says the most common are white tail spiders, which can cause an allergic reaction. "For a spider they can cause a lot of damage... I myself have been bitten three times and have the scars on my legs to show for it." ...[the resident] was asked to start the spider bite recovery support group by the president of a similar organisation in A[US]. "I feel very strongly about it because I believe people must be alerted to the fact that this spider is here and here to stay..." Adult spiders

can be as big as a 50 cent coin. They are black with red legs, have small white spots across their backs and a large white spot on their tails... [A] Crown Research Institute arachnologist... says the species was introduced from A[US] about 120 years ago... [B]ites have been reported in larger numbers over the past five years but the white tail spider population is probably not increasing... “I don’t think people should panic about this,”...

The death of a 20-year-old... who was bitten by a white-tailed spider weeks before [it] died is being investigated by... forensic scientists. Charlotte Appleton... died suddenly in Palmerston North Hospital’s intensive care unit [a fortnight ago]. About a month before [Charlotte died, the]... Massey University extramural student... told friends [it] had been bitten on the stomach... [and] had an internal abscess the “size of a golf ball”, which a doctor had treated her for... Charlotte... had worked at her cafe job until the week before [her death], but took some days off sick... MidCentral Health... said no comment would be made on... [her] death until results of an autopsy were known... [However, the hospital’s] infectious disease specialist... said a death from a white-tailed spider bite was rare... “It would be... like dying from shaving...” ...[the specialist] was not aware of any fatal white-tailed spider bites, but said death was possible if the bite became infected... “There could be a very unusual sequence of events, but it wouldn’t be the bite itself [that was fatal]... [I’ve] heard of the bites leading to finger amputations and rotting skin needing to be cut out, but... [90%] of the people referred to me because of ‘white-tailed spider bites’ do not recall seeing the spider, so I am not convinced there ever was one.”

...A... baby was bitten between the eyes and doctors feared infection could affect his brain. [It] was hospitalised and successfully treated with antibiotics... [An Oamaru resident] (49)... was bitten while cleaning out a chiller in her dairy and had a severe allergic reaction that landed her in intensive care... Nurses found a squashed white-tailed spider... in her cardigan... [The resident] now carries anti-allergy medication everywhere in case [it] is bitten again... Te Papa[’s] spider expert... says white-tailed spiders are sometimes blamed for problems caused by other insects.

...Waitakere City has its fair share of nasties when it comes to spiders... [A local e]ntomologist... says one of west Auckland’s most common poisonous spiders is the A[US]n white tail... [I]t likes to feed on grey house spiders that live outside, but moves indoors when numbers get low. [A CRI a]rachnologist... says the white tail is a hunting spider that doesn’t build webs, but sets up house near likely food sources... N[Z] is lucky to have only three varieties of poisonous spider. “There’s the katipo that’s found on beaches and there used to be a big population on Muriwai Beach but you really have to search for them now,”... [Y]oung children and the elderly are more likely to react to a katipo bite with stomach cramps and chills. All hospitals carry an antidote. The slater spider is also poisonous, with stronger venom than the white tail’s. A bite from this spider is uncommon. It lives close to slaters, under stones and damp pieces of wood. [The arachnologist] says people who don’t like spiders and want to dispose of them humanely should catch them in a glass jar and place it in the freezer. “They’ll cool down and go to sleep and die without pain.”

...A spider hunt has been launched in east Auckland after a large, hairy A[US]n was found in a Bucklands Beach home. The Sydney huntsman spider (*Holconia immanis*) is the size of an average hand-span and was identified late last month. A familiar sight in A[US]’s largest city, it is not welcome here... Their bite can cause painful swelling but is not seen as a serious health threat. The huntsman has a bad reputation in its homeland because of its imposing size and ability to move fast, but is mostly shy and nocturnal. A voracious feeder, it ambushes prey by hanging upside down on trees and can walk across walls and ceilings... “We can’t speculate as to how it got here but it has the potential to impact on our native spiders and geckos,” said a biosecurity spokes[perso]n for the M[AF]... The spider was caught by a family member as it was heading into the house from the garden. [The CRI arachn]ologist... who identified the huntsman, is most closely involved with its close relation the Avondale tarantula.

...There’s no room for inacey wincey spiders at New Lynn Primary. Only huge tarantulas and Avondale spiders are allowed, following a visit from a[CRI a]rachnologist... An environmental group is working to save the Avondale spider... mostly found in four colonies in the Avondale and New Lynn areas. But at least two colonies are in danger of extinction because of development and tree-felling associated with the painted apple moth eradication campaign... Both species rely on wattle trees to survive... Friends of the Whau wants the Waitakere City Council to save one colony by creating a spider sanctuary at New Lynn’s Olympic Park... The... harmless to humans... [(t)hey earned themselves an undeserved reputation in the film *Arachnophobia* in which they were portrayed as [hu]man killing monsters from the jungles of Venezuela...() AUS]n Huntsman, which has made Avondale its home for the past 80 years, crawled over pupils brave enough to hold out their hands... During visits, the [arachnologist]... shows a specimen of a tarantula and talks about the different parts of the spider’s body before the Huntsman is brought out. “The teachers are the ones who usually chicken out,”... [An e]ntomologist... shows the pupils N[Z] insects during the visits, which are funded by the Science and Technology Promotion Fund. [The entomologist] has specimens ranging from the smallest moth, a leaf minor which has a 2.5 millimetre wingspan, to giant wetas. “They seem to like the moth which disguises itself by looking like a fresh bird dropping the most... I get a lot of gasps when I bring out the wetas.” [Speaking of those ‘ancient members of the cricket family’, a central North Island patch of the invasive weed ‘gorse has been given official protection because a colony of endangered wetas has adopted the plants as their home – gorse’s spines protect the wetas from their predators’.

...‘The tuatara’s diet consists largely of spiders and other insects, although snails and earthworms are also taken. Contrary to the popular image of bird and reptile living amicably together, the tuatara – which can go for at least an hour without a breath – sometimes eats petrel eggs and chicks, even an occasional adult bird. Although good-tempered when handled gently, a tuatara will scratch and bite in self-defence. Its voice is a harsh frog-like croak’.]

...As the world’s sole survivor of a particular reptile group from the age of dinosaurs, the tuatara is widely acknowledged as a very special creature. But living fossils from other N[Z] animal groups deserve similar recognition, says [a DOC spokesperso]n... Most, including our four species of native frogs, pepeketua, are largely overlooked. But the department aims to raise the profile of these primitive amphibians in an awareness campaign launched at the Auckland Regional Council’s Arataki visitor centre, in the Waitakeres. It is hoped that this will lead to better protection for all surviving colonies and possibly to the discovery of a few more remnant populations in parts of the country where they have yet to be recorded... Being small, well camouflaged and nocturnal, native frogs are hard to find but are easily distinguished from the more commonly encountered introduced frogs – all three from A[US] – by their size, by having pupils that are round rather than slit shaped and in having no round, external eardrum behind the eye. Unlike most frogs our native species do not have free-swimming tadpoles. They combine the tadpole stage within their transparent eggs and emerge as walking juveniles that, in three of the species, are cared for by their fathers until they become independent. From fossils and other preserved skeletal remains, it is known that until between 1000 and 2000 years ago N[Z] had at least seven different species of frog. Three are now extinct and the distribution range of the four survivors has shrunk dramatically. Hamilton’s frog is now found only on Stephens Island in Cook Strait where there are only about 300 individuals. The Maud Island frog was similarly restricted until some were recently transferred to another island for species security, and Archey’s frog – our smallest at just 37mm long, smaller than the diameter of a golf ball – is only known from the Coromandel’s forested peaks and one site near Te Kuiti. The most widespread species, Hochstetter’s frog, is found at several sites around the top half of the North Island. It appears to require wet conditions... and is the only native frog with webbing between its toes.

...Wanted: dead or alive. But preferably alive. That’s the native Hochstetter’s Frog which is proving increasingly difficult to find in its usual habitats in the Waitakere Ranges. [The]Friends of Arataki president... is worried... [The president], who’s been watching the... 4 centimetre-long brown frogs... for the past three years, hasn’t seen one in the past six months. “I think one of the reasons for the decline is likely to be climatic,”... [T]he frogs... like a humid but wet climate... It’s not the first time concern has been expressed about the species’ population base in the ranges. Back in 1995, [the president] persuaded local contractors... to build a tunnel under Scenic Drive so fewer frogs would meet an untimely death.

...Watch out for ‘bonking’ frogs Bioscientists are asking west [Auckland]residents to listen out for the musical sound of frogs ‘bonking’ in the night. The illegally-introduced banjo frog makes a distinctive ‘bonk’ noise in the peak of its breeding season... They are aggressive predators and pose a threat to native wildlife, including the native endangered Hochstetter frog... [F]rogs native to N[Z] do not make any sounds, so any frogs

which do will be introduced species... There are at least five other A[US]n frog species in N[Z], which were not identified as pests early enough and so escaped eradication. The banjo frog is toad-like... A large pale yellow gland at the mouth's edge... secretes poison, which deters would-be predators. Creatures of the night, they burrow under the ground at day. In A[US] they are abhorred by gardeners, who often dig them up with the weeds... Since finding... banjo tadpoles and froglets in a stream near Huia last year... ARC and MAF staff have set up a monitoring project to see if there are any survivors... But... they have not yet decided how to eradicate the pests... It is unknown how or why the frogs were introduced. One theory is that they may have been introduced for the pet trade... • People who hear or spot a banjo frog should contact the ARC, D[OC] or MAF.

...The distinctive "bonking" sound made by... banjo frogs during the mating season is being used to track the illegally introduced pest. M[AF] staff, along with A[RC] scientists, have set up recording equipment at Huia... which imitates the frog's distinctive mating call. The calls sound like a banjo string being plucked. The equipment will then record for nine seconds to see if any answering calls are made by banjo frogs in the vicinity... "We are hoping not to hear any,"... Despite months of searching, the scientists have had no luck tracking the frogs since tadpoles and froglets were found at Huia last year... They are toad-like with a rough and warty body and range in colour from pale grey to dark brown or black.

...The search for a toxic "pobblebonk" frog between Muriwai and the Manukau Harbour may not yet be over. No more of the A[US]n eastern banjo frogs have been found... but the [MAF]'s National Centre for Disease Investigation may make further checks this spring as a precaution... "The question is whether it is likely some of the froglets survived but were not mature enough to respond to the monitoring programme mating calls,"... the [centre's]... general manager... says... The frog can excrete a white, sticky skin toxin, but it isn't considered a threat to people.

...[a strange form of "precipitation" is the Star-Slime or Rot of the Stars, a whitish jelly-like substance that used to be found lying on the ground, especially in the autumn. This was investigated by a zoologist in 1926. The zoologist found it was the remains of girl frogs. The frogs had been eaten in vast numbers by various animals, but the glands had passed through undigested. Then, becoming wet, the jelly in the glands swelled up and burst to leave a slimy mess that did not decompose easily. Every now and then there is a story in the newspapers about a storm bringing not only rain, but showers of animals. The Romans recorded rains of fishes. On the 17th August, 1921, the streets of London were carpeted with little frogs, and other parts of the world have been showered with toads, crabs, worms, mice and winkles. The explanation for some of these phenomena is that the animals were lifted by a whirlpool or waterspout and carried up to the clouds and deposited, some distance away, with rain. Rains of frogs have been reported more often than of other animals but this is because of the behaviour of the young frogs. Froglets wait in the shadows of ponds, and heavy rain might occur at the same time as their emergence. In the days before the filling-in of ponds and their pollution this was a spectacular sight, for the ground becomes alive with frogs. This naturally led people to think that they had arrived with the rain, but less credulous and more observant people noticed that they were coming from ponds, discredited the idea and went on to affirm that this was the basis for all stories of rains of frogs.]

...THEY come by night, led by the giants of their species, pouring in their hundreds along remote roads in an undulating, toxic mass. The scouts move ahead, picking their way along creeks and waterways or hitching rides in unsuspecting cars and trucks. There is no halting the invasion. As surely and as unstoppably as they spread north and south from the canefields of Queensland, the cane toads pressed across the Gulf of Carpentaria and deep into Northern Territory. Now they have reached Kakadu National Park, a World Heritage-listed biological wonderland that for decades has resisted the sieges of other alien invaders. Kakadu rangers discovered two small adult toads and several juveniles in a remote corner of the park, confirmation of their worst fears and a mere inkling of what will inevitably follow. [Girl cane toad]s lay up to 30,000 eggs a month in long, jelly-like strings that are fertilised by [boy cane toad]s with libidos so powerful they will attempt to mate with anything vaguely resembling a toad, living or dead. Within three days the eggs hatch into black tadpoles that swarm into waterways and begin their own devastating cycle, spreading across the land in densities that in the waterholes of the gulf country have reached as high as 5000 toads a hectare. Not even the huge saltwater crocodiles that line the banks of Kakadu's Alligator River and slip through the water lilies of the floodplains will be safe. The venom of the cane toad is lethal, able to kill smaller animals within 15 minutes. For the pessimistic in a park where such clichés as pristine have real meaning, the toad is environmental Armageddon. Others, including many experts in the field, believe it is not the end – ...[t]he evidence suggests that most susceptible species will bounce back within five years as animals learn to avoid the toads, says [the]Parks and Wildlife Commission acting director... [-] but that Kakadu will nonetheless never be the same again. Nor will other, equally beautiful and important parks surrounding Kakadu. Last June the toads appeared in Nitmiluk National Park, joined by the spectacular Katherine Gorge to the vast wetlands of neighbouring Kakadu. To the north, environmental agencies are investigating proposals to build a toad-proof fence across the neck of the Cobourg Peninsula, home to Gurig National Park, the first area in the world to be granted recognition under the global convention on wetlands of international importance. The toad's extraordinary adaptability, the lack of natural predators and parasites, its fatal defences and its toughness – sink your boot in, whack it with a cricket bat, so what? – have made it one of the A[US]n environment's most formidable foes. This is a plague the nation brought upon itself. In 1935 the Queensland sugar industry introduced the Venezuelan toad to control the greybacked cane beetle. The toads were a disastrous failure: fat, heavy and poor climbers, they ate only the beetles that fell to the ground. Instead they picked easier prey, gathering around waterholes, sitting under street and porch lights at night to snatch swarming insects, and stealing from dog bowls. Breeding at a staggering rate, they spread rapidly north, south and now west, moving... as far as Sydney, Adelaide and Perth (though not yet colonising so far abroad)... They move at a rate of about 30km a year, limited only by cold and lack of water. As they spread, the toads created both an industry of their own and a bizarre mythology that drew hippies to smoke or lick them for a reputed hallucinogenic high, a faddish spell as pets, and the production of an offbeat documentary that still enjoys a cult following. The more enterprising have turned toad skins into leather, sold stuffed toads as souvenirs and milked their venom for pharmaceutical companies and traditional Asian medicines. You can buy toadskin baseball caps with a toad leaping from the front, toad legs as key tags or an entire toad as a shoulder purse. Beyond the fun, tens of millions of dollars have been poured into finding answers to the plague... For a while Venezuelan viruses looked promising – until... scientists found they also attacked native frogs, threatening the same disaster that followed the toads' release. The focus now is on gene technology, and the prospect of an engineered gene spread among tadpoles to block their sexual development. In the meantime the toads keep marching on... In their march across the gulf they left a trail of dead freshwater crocodiles, goannas, snakes, tree frogs and even domestic chickens, killed by eating toad eggs. Kakadu is bracing for a similar assault...

The cane toad... is having a devastating impact on... Northern Territory... wildlife. A report by the Government agency Environment A[US] says the gnarly-skinned toads... are killing off native frogs, snakes, lizards and mammals at an alarming rate. The toads, scientific name *Bufo marinus*, present a double threat. The smaller ones are eaten by marsupials and snakes, which are poisoned by the toads' toxic skin. The larger ones turn predator themselves, gobbling up small lizards, rodents and insects. Among the animals affected are northern quolls, a cat-sized carnivorous marsupial. During the... northern dry season[two years ago], biologists trapped 41 quolls in Kakadu National Park... [A]fter cane toads had invaded Kakadu, not one quoll was caught. Several dead quolls found appeared to have been poisoned as a result of eating cane toads. The population of several other rare animals, including a species of gecko and the pale field rat, also declined... Cane toads were introduced to A[US] in 1932...

A warty, venomous toad is on the loose in Henderson. Residents have been asked to be on the look out for the unwanted visitor causing havoc across A[US]... A suspected juvenile cane toad may have entered the country last month on luggage... from Fiji... [The] co-ordinator of the M[AF] exotic animal response, says that as only a single toad has been released it is highly unlikely that it would become established in N[Z]. But there is a risk that it may have carried new pests and diseases that could threaten our native frog[s]... The toad... produce[s] a secretion that can cause eye and skin irritations... and a slowing of the heart if ingested... [P]eople attempting to capture the toad should wear gloves and protective glasses.

...The M[AF] defends its initial decision to keep news of a cane toad's arrival in west Auckland under wraps. Residents were told to keep an eye out for the pest two weeks after the ministry learned it was on the loose in Henderson. The... [m]inistry... learned of the toad's presence... when a resident reported finding it in luggage. The toad escaped soon after being found... The ministry won't give the exact location of the toad's escape but is asking residents to remain vigilant... [A MAF spokesperson] says the ministry is not overly concerned at the time lapse as the cane toad is considered a low biosecurity risk due to its age and the high chance that it has died... [already. The spokesperson] says it took time to co-ordinate the release of information from her organisation, the Department of Conservation and the Ministry of Health... [Incidentally, b]ird protection groups want the Asian community to stop releasing caged birds into the open... [H]undreds of domesticated birds have died unnecessarily and the practice is placing a strain on overworked rescuers. "These birds need food and shelter... They can't cope if they are released and die. They sit on roads injured, and nest under parked cars for shelter. It's very sad and very cruel." The releasing of caged birds is a Buddhist tradition believed to bring good luck and prosperity. [But an]International Buddhist Trust spokes[person]n... says the practice is only followed by a small minority of Buddhists, who do not realise it is harmful. "[These Buddhist p]eople believe you are freeing something that is not free... You are not killing it, or creating problems. It is a way of remembering to be kind to people and animals around us." ...The birds are usually released on beaches and in parks. Over the winter months most... die... "The Animal Welfare Act says it is illegal to let loose domestic birds. It's called abandonment."

...The cost of eliminating rainbow lorikeets from the wild has been put at \$245,000 over three years. The D[oC] has drawn up a plan "to achieve and maintain zero density" of the A[US]n parrot, which is now spreading beyond Auckland after specimens were released on the North Shore by a rainbow lorikeet fancier. The department considers the bird a threat to wildlife and the country's horticulture industry. One on one, the bird may not push a solitary native tui around but rainbow lorikeets form large aggressive flocks, which dominate other bird species. Some of the birds were caught in Birkenhead in February in a trapping operation overseen by the Minister of Conservation... Since then the operation has slowed due to conflicting legislation and opposition from bird lovers to the department's killing the parrots. Hundreds of people telephoned the Auckland office of the department after the February operation. The lack of action has angered conservationists, who fear that rainbow lorikeets may invade Hauraki Gulf island wildlife sanctuaries... The... chair[person of the]... Conservation Authority, the country's statutory public watchdog on conservation issues... said urgent action was necessary to capture the Auckland birds now inhabiting parts of Auckland City, Waiheke Island, Henderson, Howick and Clevedon. There are reports that the birds have been seen in Tauranga. Their spread and the rising population are two reasons for the high cost of removing all the birds from the wild. The department's draft plan... aims to clarify the status of the birds, protected under the Wildlife Act but able to be declared a pest under the Biosecurity Act, to minimise adverse public reaction to live trapping or poisoning and... ensure that future releases of the birds into the wild are stopped. However, the department is willing to [sell]captured live birds... It does not want to undermine commercial breeders[, but] hopes... selling captured birds... [will help] to recover some of the costs... The department rules out taking them to A[US] because of the cost, quarantine issues and the logistics of releasing them into the A[US]n wild.

...The... A[US]n native parrot that has been living around Auckland for several years, will come off the protected species list from [next month. The] Conservation Minister... said the lorikeet had been protected by default under the Wildlife Act, despite being a threat to native birds.

...Conservationists have split with an[]animal welfare head... after an argument about an imported A[US]n parrot... The ...SPCA... chief executive... worked closely with the... D[oC]... for six months on conservation projects, including the need to keep imported parrots in cages. But... [it] put out an unexpected press release late last month criticising the [DoC] for trapping wild rainbow lorikeets. This followed an announcement by [the]Conservation Minister... that the birds have been added to the fifth schedule of the Wildlife Act 1953, so they are no longer protected.

...The cost of eradicating a flock of illegally released parrots has risen to more than \$1500 a bird after an injection of cash by [the]Conservation Minister... The... [minister] has approved \$106,875 to be added to the \$245,000 already set aside by the D[oC] for trapping rainbow lorikeets in Auckland... Despite the department capturing only 57 of an estimated 200 A[US]n native parrots o[ne]... lorikeet trapper... has defended DoC's strategy... [The trapper] said the lorikeet breeding season had started, which made the birds more difficult to catch because they did not flock but pair off... A[n]area manager... said as part of a review last month that the birds would be shot or tranquillised only if trapping failed. Getting rid of the rainbow lorikeets continues to be controversial. [The trapper] said the public still approached him to defend the birds. "But I always manage to turn people around." [The]Birkenhead lorikeet fancier... who was charged by DoC with releasing the birds seven years ago but was not convicted, said the extra spending on eradicating lorikeets was "crazy." [The fancier] disputed DoC's claim that the parrots attacked and displaced fellow nectar-feeders such as the native tui. "DoC is taking money away from endangered native birds, which is where it should be spent,"... [] 26] Codfish Island kakapo have been shifted to another southern island haven as the D[oC] gears up for a massive rat eradication programme. The leader of the National Kakapo Recovery Team... said the transfer operation had cost about \$60,000. Only two of the flightless birds[on the island] had eluded the team. A kakapo named "Bonus" had not got a transmitter and was "leading us a merry dance." "Nora" was also proving elusive. And there was a possibility that four m[or]e kakapo which were shifted to the island some years ago were still there but unaccounted for. The team would search for them during the next few weeks. Rare fernbirds from Codfish were moved from the island last month and bats will be transferred to... an island in Port Pegasus at the southern end of Stewart Island in [a couple of months]... The rat poisoning... will start [about a month later].

...A kakapo has slowly been nursed back to health at Auckland Zoo after... lead poisoning... One of the original 24 founder... kakapo from Stewart Island... Lee, was found to have lost a significant amount of weight during a routine check when... moved from his home on Codfish Island... The lead, which may have come from a fishing sinker or shotgun pellets, appeared to have been excreted but... contaminated Lee's blood.

...After being successfully treated for lead poisoning and regaining his weight, a kakapo due to return to Codfish Island yesterday has died. The... kakapo... Lee, died from heart failure at Auckland Zoo... after a three-hour emergency operation to repair a small tear on the side of his crop.

...Superdad Ox – who fathered three kakapo this year – was taken off Little Barrier Island yesterday but his partner Lisa proved a little harder to catch. The national kakapo team flew five of the endangered birds to Codfish Island... but Lisa – who was "lost" for 13 years before... [being] found with her eggs recently – evaded all attempts to catch her... "[Lisa] was up in the top of the trees and we tried climbing up to get her, but [Lisa] kept going higher," said... [the] senior technical officer with the team... Ox and Lisa's offspring hatched [two months ago] and, with another that hatched at the same time, took the kakapo population to [over]60 for the first time in 20 years... 26 of them... [are hens. The officer], who took Ox to Little Barrier Island from Stewart Island in 1982, said the Hauraki Gulf island was too large and rugged to properly look after the birds and get them to breed. After a "horrendous trip" by helicopter yesterday from Invercargill to Codfish Island, [the officer] said Ox and his friends were quite happy with their new surroundings. [The officer] hoped Lisa, believed to be the last kakapo still alive on Little Barrier, would be caught in about six weeks and taken to... Maud Island in the Marlborough Sounds... Also moved at the weekend... were three takahe, from Kapiti and Mana Islands, northwest of Wellington, to Maud Island. A fourth takahe living on Maud made the reverse trip, to Mana... The takahe recovery team leader... said the takahe move was a way to stop in-breeding and mix up the genetic stock of the birds on the islands... About 2000 adult takahe are left, the majority found in Fiordland... [● The kakapo's smaller cousin (46cm long as opposed to about 62cm long)], the kea, has given new meaning to the phrase "bird brain." The troublesome native parrot, which can cause havoc with the rubber trim on cars, has been shown to be as clever as some of the smartest animals on the planet. In some intelligence tests... kea have outscored gibbon... Not only did kea take to the tests with gusto, they solved the set problems by thinking them through... N[Z]'s baddest bird... [k]ea (Nestor notabilis) are a category B endangered species and are fully protected[('it was claimed for many years that the bird used its powerful beak and claws to kill lambs, and it was treated accordingly by farmers; it is now accepted that it rarely attacks healthy, live animals but will feed on dead carcasses')]. Their curiosity and ingenuity often bring them into conflict

with humans, particularly at South Island skifields, where they fill up on food litter and spend the rest of their time looking for trouble. The D[oC] has had to smooth ruffled feathers in the tiny South Island town of Fox Glacier after frequent complaints by residents over “hoon gangs” of kea.

...N[Z]'s conservation agency is facing its most serious extinction crisis in two decades as a rare bird jumps to the top of the critically endangered list. Orange-fronted parakeet numbers have plummeted 75[%] in just three years, to between 100 and 200 birds, due to predation by stoats and rats. Unlike others at the top of the endangered list, such as the kakapo, black robin and takahe, the orange-fronted parakeet has no safety net because transfer to an off-shore island is at least five years away. The bird's last stronghold is in two South Island valleys and attempts to breed it in captivity have been unsuccessful... The orange-fronted parakeet was only identified four years ago as a separate species from its close relatives the yellow-crowned and red-crowned parakeets... [■ Like many NZers,] I also found... TV1[’s locally-produced comedy]... *Willy Nilly* enjoyable. My only complaint was a recent episode where the shopkeeper's wife shot native birds – kakapos, kiwis and others. I didn't find it amusing and feel the case in Christchurch the day after that episode, where a pea-brained person shot several wood pigeons, was more than coincidence.

...Pigeons are falling from the sky in central Auckland after a poison drop to cull the bird's population. [Like 'London's Trafalgar Square – where the pigeons are under threat of a permanent cull' (note that scientists claim sparrows in the)... UK are dying because unleaded petrol is killing off insects] – Auckland's CBD]... is a popular roost for pigeons and some companies use pest control to limit bird numbers. [Someone] who works on Hobson St... says three pigeons, a... seagull and some sparrows fell into the staff's... courtyard last week. “...They are falling on to the ground and gasping for air, and it's so traumatic;”... [The worker] found a further three pigeons dying in a nearby park and called SPCA inspectors who confirmed the birds had been poisoned. “I've noticed... we really have no bird life in town. I just think it's shocking that they are killing off our bird life...” Pest control companies do not have to notify the Auckland City Council or S[PCA]... of a poison drop. The council's parks and street-scapes manager... is not aware of any bird poisoning in the central city[, but] says the council notifies the public before it poisons birds. The birds are culled to prevent diseases, such as salmonella, spreading, and also to prevent damage to buildings. [An] SPCA senior inspector... says poisoning birds should be the last option... [as] poisoned, dead birds are a risk to other animals, which may eat them... But... pest control companies usually leave the poison out at night and pick up dying birds in the morning. “It's legal, but it has to be used responsibly... It's a bane for us because it's slow-working, people see these birds struggling around and naturally feel sorry for them.” ...Pest control companies often shoot the birds instead.

...Trendy house sparrows flitting suburban nests for inner Takapuna City roosts are driving their human neighbours to thoughts of murder most foul. Suggestions of poisoning, gassing, freezing, trapping, starving, nest busting and building cat walks in the treetops were heard when the Takapuna Community Board met last week. Members pondered what measures would be the most effective – and publicly acceptable – to control a plague afflicting the city's premier shopping streets. The problem is that pohutukawa trees planted to beautify the central business area provide cheep-and-cheerful nesting pads for sparrows, with streetlights providing central heating. At dusk – after a day earning a crust in the city's parks and outdoor cafes – sparrows flock in their hundreds in shady, rowdy hangouts handy to the city's bar and cafe scene. By the dawn chorus, seats for shoppers, footpath and parked cars are iced with bird droppings that fall like snowflakes. The birds are not to blame... “They are trying to find a new home because infill housing has meant their trees in backyards have been chopped down.” [The North Shore] Council parks and environment officer... told the board that a daily clean up after the birds would cost \$35,000 a year. All the birds could not be wiped out... but they could be culled to respectable numbers... [However,] the North Shore's “Bird [Gal],” said sparrows should not be destroyed just because they made a mess below nesting trees. “The council pays people to clean up after graffiti artists – so why can't they [employ people]... to clean up sparrow poo?!”

...A catchment pond at [Waikumete Cemetery] is being drained and refilled following an outbreak of avian botulism. Several ducks are dead and a number are being nursed back to health by Waitakere City Council's animal welfare service following the bacterial poisoning. The pond, at Glendale Rd... Glen Eden... will be drained in a bid to get rid of the problems and bacterial levels will be closely monitored each day once it is refilled... The same retention pond was drained last year after a similar outbreak killed numerous ducks. Animal welfare's service manager... says people feeding ducks bread in the pond can help spread the bacteria because of the wet bread. “The best way to feed a duck is to feed them wheat on dry land. Ducks ingest much more water in the bread.” Sick ducks can be brought to the animal welfare service at The Concourse, Henderson.

...Children in Ashburton have been injecting ducks with petrol and trying to set them alight, a local animal welfare inspector says.

...Westies are cruel says bird carer... A volunteer who cares for orphaned and injured birds says Waitakere City is the cruellest part of Auckland... [The bird carer ha]s taken in more than 160 ducklings, pukeko, plovers and bantams in the last three months – 90[%] of them from west Auckland. The Kelston [resident says it] was recently called to a service station where seven ducklings were sleeping in the sun. “A car came in for petrol but when the... driver spotted the ducklings, [it] jaimed his car and just drove over one. I had to scrape up the mess... In Brains Park recently five carloads of kids, accompanied by their parents, were throwing eggs and killing ducks with sticks and stones.” [The Kelston resident says it] started looking after birds after moving to Auckland 18 months ago... After paying for [the birds' needs] and their own living expenses... her family is left with \$100 a week. “I'm not doing this for sympathy... I just really want to emphasise to parents how much they need to educate their children. If these children are doing this to birds, how are they treating other animals like cats or dogs? If they treat animals badly what are they going to do when they have kids?” [Auckland's] SPCA... says they've had no reports of bird cruelty in the Kelston area, but backs [the bird carer]'s plea. “We would certainly like to support her comments about better education,” [the SPCA's]... marketing manager... says.

...A Kelston [resident who] rescued eight chicks from children raiding bird nests in Archibald Park... says the youngsters were part of a group of adults and children who arrived at the park in about 15 cars and vans. [The resident] was walking with her daughter when [they] noticed the children going through tall bushes collecting nests, blue eggs, baby tui and blackbirds. “They were playing with them and moving them around... We tried to explain to them that it was cruel and not fair that the mother comes back and finds her babies gone.” [The resident]... asked the children if [it] could speak to their parents but the group quickly returned to their vehicles. “They just stared, they wouldn't speak... I kept... trying to explain it to them. Before I knew it they all cleared off... like they were scared.” [The resident] picked up eight chicks, two eggs and three nests and phoned the SPCA who told her to put the eggs and chicks on a hot water bottle and take them to a bird sanctuary in Panmure... It's the second report of cruelty to birds from the Kelston area in less than a week. [A local v]olunteer... who runs a bird sanctuary from her home, says [it saw supervised children killing ducks in Brain's Park. Yet the SPCA's]... marketing manager... says the organisation hasn't received any reports about bird cruelty in Kelston. But [the marketing manager] says it's up to parents to make sure their children don't damage nests, eggs and baby birds.

...Parents are warned that they face stiff penalties for letting their children kill ducks. The warning follows reports of youngsters using home-made spears to impale birds on the Whau River at Shadbolt Park in Blockhouse Bay. [The] Friends of the Whau treasurer... says a group of teenagers herd[ed] a mother duck and her brood together before stabbing them with three metre spears last month. Last week a different gang was stopped before they could spear any birds. The first group headed for Portage Rd on skateboards and the second [group] [disappeared towards Blockhouse Bay. [The SPCA's] senior inspector... says the use of spears indicates the culprits planned the attack. “It shows a large amount of malice,”... [The inspector] is surprised by the level of brutality. “I'm afraid it's the sort of thing that happens at school holidays but that's taking it to a new level,”... Bird killers can be fined up to \$50,000 and jailed for three years. [The inspector] says youngsters can't be prosecuted – but their parents can if they know what their children are doing. “Children might be exempt but that doesn't mean we view the offence any less seriously... If these kinds of incidents are reported to us we will investigate and talk to the children and their parents to make them aware of the seriousness of their actions. One of our big aims is to try and ensure the next generation has more respect for animals than the current one. The situation is improving and that's why incidents like this are so distressing.” ...[the inspector i]s investigating how to put up signs warning would-be offenders...

Auckland Zoo[’s] flamingo-keeper... cried when [it] discovered one of his birds had been attacked with rocks, forcing the zoo to put it down. The 18-month-old [hen] was found in the flamingo enclosure around 10am on Monday with one leg badly shattered and the other broken. Three rocks were found nearby that had not been there when zoo staff checked the birds earlier that morning... The flamingo enclosure was quite far into the zoo grounds and all keepers would have been fairly busy at that time... [The zoo’s] director... said staff were devastated by the attack but were left with no choice but to destroy Madiba, the first of the great flamingos to hatch in England before they were brought to the zoo in the middle of last year. “A flamingo’s legs are its lifeline, so there was no way it could have survived... It’s inconceivable that someone would do such a cruel and senseless thing.” [The keeper] spent three months in England overseeing the incubation, hatching and rearing of the birds before accompanying them to N[Z]. The keeper... had searched the zoo for the culprit after the attack. “I wouldn’t have been working for Auckland City any more [if [the keeper]’d found them] and I don’t think anyone would have blamed me.” Flamingos were beautiful birds and each had its own distinct personality, [the keeper] said. The rest of the flock would have known Madiba was badly hurt... World-wide, greater flamingos... [–] the largest... of... the... five species of flamingo... [–] are listed as vulnerable, but in some areas of Africa, numbers have declined by almost half over the past 25 years. [On a positive note, the ‘young bird which flew away during a “free flight” display – after being spooked by seagulls – has been located and returned to the zoo.’]

...It’s a right carrion... A vulture that disappeared from a British zoo six days ago has taken up residence on the roof of a village vicarage, causing fear among neighbours that their pets may become lunch for the meat-eating bird. Residents of the village of Reydon in Suffolk have locked their pets indoors to keep them safe from the vulture, known by zoo keepers as Foster. But... [the] head falconer at Banham Zoo, in the neighbouring county of Norfolk, from where the vulture escaped during a display, tried to reassure villagers that their pets would not be harmed. “Unless a cat was lying dead ...the vulture... wouldn’t be interested,” [the falconer] told Sky News television. Foster is drawing crowds of spectators and media eager to catch a rare glimpse and a photograph of the Ruppell’s Vulture, a species native to central Africa... “[Foster] does displays at Banham Zoo every day so [it] didn’t escape, we actually let him go... Unfortunately, on this particular day... we had some very warm weather and [Foster] rose on a thermal very, very high, couldn’t figure out how to get back down again and drifted off.” ...Keepers tracked the bird to Reydon on Saturday, but attempts to tempt him down from the roof have failed. Even dead baby chicks, his favourite snack, have not lured Foster down from his perch.

...English... called to arms for squirrel hunt... Prince [of Wales] has joined the call for the grey to be wiped from these shores... But calling for the “elimination [of greys... – imported American bruisers which comprehensively out-punch British red squirrels...] in order to save the red squirrels and ensure their future in [Britain]” is a tough ask. Grey squirrels already outnumber the diminutive reds by about four million to 150,000 or so.

...The British Government is considering wiping out one species of duck to save another... The Government and the Royal Society for the Protection of Birds say the ruddy duck – imported to Britain from the U[S] 50 years ago – is threatening the white-headed duck by breeding with it in its Spanish habitat. Some conservationists believe the hybrid species will eventually replace the white-headed duck. A call last year of 2600 ruddy ducks did not stop the problem. Britain has about 6000 ruddy ducks. The Government says there are only about 2700 white-headed ducks in Western Europe – all in Spain – and 10,000 in the world. The Department for Environment, Food and Rural Affairs said it had approved eradication of the ruddy duck in principle, but would carry out more research and consultation before taking any action... Animal welfare groups labelled the plan to cull the country’s entire ruddy duck population “obscene” and “grotesque”... Animal Aid, said... “Mating with the robust ruddy duck is the white-headed’s means of survival... Conservation should be about protecting habitat, not killing... in the name of blood purity.”

...Should a population of a healthy native species be reduced to save another on the brink of extinction? For the D[oC] that decision is looming. Landcare... says the future of the native brown teal is “circling the plughole.” The birds have one tiny home left in the wild, the Okiwi wetland on Great Barrier Island... But even on the Barrier, free from voracious predators... their future is grim. Since 1989, numbers have more than halved on the island, to between 500 and 600. It is unlikely they will survive a further 10 years if they continue dying at the present rate... [A team of Landcare scientists] is studying the teal and will make recommendations to the department next month on an intensive management programme for the birds. Among those recommendations is one that will undoubtedly be controversial – possible eradication of some pukeko. Pukeko numbers have boomed on the island in the past 10 years and pukeko are known to prey on teal ducklings... A trial removal of pukeko from Okiwi is one option but [one scientist] does not rule out “euthanasia,” as [the scientist] diplomatically calls it... [The scientist] describes brown teal as “rubber-ducky ducks,” the cute, real-life version of the yellow plastic bath toy. They are slightly smaller than the common brown duck and are reluctant flyers, another factor that makes them vulnerable to predators... [The] release of 1700 captively bred teal into the wild since 1968 has been “like putting petfood out for predators.” Of N[Z] native teal, brown teal have suffered the most since European settlement. They were once found all over the mainland and on offshore islands. They are now restricted to Great Barrier, tiny populations on Kapiti and Little Barrier and captive breeding programmes. And pukeko are not the brown teal’s only problem on Great Barrier... an increasingly popular holiday destination. The introduction of a car ferry service has brought more cars to the island’s... roads – and fewer ducks. “We were there for three days last month and a duck was found dead on the road every day,”... One solution being looked at is “duck tunnels” or culverts under the roads. Signs warning motorists will also be put up... The dead ducks’ stomach contents are being examined to find out what teal eat in the wild. Lack of food could be another reason for their failure.

...N[Z]’s unique, river-dwelling duck is in serious trouble says the World Conservation Union in its latest extinction ratings... produced by a network of 7000 experts working in almost every country in the world... According to this year’s redlist of threatened species published by the union, the blue duck (whio) has jumped from threatened to endangered. There are thought to be about 400 pairs left, with a very high proportion of [cocks] – a gender skew that leaves the birds vulnerable to extinction. Whio populations were severely fragmented, said the union, and they had disappeared from former habitats in the Tararua Ranges, Pirongia, Mamaku Plateau, Central Otago, Kaikoura and the Richmond and Kaimai Ranges. “We are losing the battle to save whio...,” said [the RFBPS] conservation manager... “Unless there is concerted action in the next few years to save whio, the remaining populations will disappear.” Whio are one of N[Z]’s ancient native birds, and share their river-dwelling lifestyle with just three of the world’s waterfowl species. The... [cock]’s characteristic whistling sound means they are sometimes dubbed the whistling duck. While other duck species leave raising the young to the [hen], the blue duck [cock] helps to guard the ducklings and whio probably mate for life.

...When predators are about to pounce on a N[Z] dotterel’s nest, the bird’s only hope of saving its chicks is to pretend to have a broken wing and limp away. The bird’s attempt to make themselves look like easier prey than their young is a clever ploy, but not particularly successful. Fewer than 5[%] of the endangered birds are able to raise chicks without human intervention to protect their habitat. And nowhere are the benefits of giving them a helping hand more evident than on Matakana Island, where a committed group of... landowners, businesses and local authorities is allowing the dotterel to breed in relative safety. The picturesque island, just 3km from Tauranga’s port, is the most successful breeding site for the birds in the country. When the D[oC] launched a nationwide N[Z] dotterel recovery programme 10 years ago, just 15 breeding pairs were on Matakana... With no protection from humans... only five chicks were fledged... and three-quarters of the nests were destroyed... Last season, 460 predators... were trapped, dramatically reducing to just 38[%] the nests lost. As a result, 34 breeding pairs were able to raise 39 chicks and this season... is likely to produce a record number. The [DoC]’s officer for protected species and islands... says the birds... total just 1500 nationwide... “Unfortunately, what is a good beach for N[Z] dotterel breeding is also a good recreational beach for people... Most activities such as sunbathing, picnicking and fishing take a number of hours and if near to a nest, the incubating [hen] could be off the nest all this time and the eggs either cool off or overheat in the sun.” N[Z] dotterel eggs are the colour of wet sand and are often trodden on or driven over by 4WD vehicles on beaches elsewhere in the country[(local councils in ‘Canterbury are beginning the process of introducing bylaws that will ban or limit the use of 4WD vehicles on

the district's beaches'). The bird's plight has led local Bay of Plenty organisations to donate money, goods and services to help turn Matakana... into a dotterel haven... Locals, particularly schoolchildren, are fiercely protective of the birds and warn visitors to keep clear of the nesting sites. Even keen fisher[s] bypass Matakana's best fishing spots so as not to disturb any newcomers... [One] local... who is employed by the department... to monitor the birds and keep pest numbers down... was thrilled to think future generations would also enjoy the island's N[Z] dotterel's.

...*Saddlebacks riding higher* The endangered North Island saddleback returned to mainland wilderness for the first time in more than a century, thanks to its haven on Tiritiri Matangi Island. Forty of the glossy black native birds... which ha[ve] several distinctive calls... a chestnut back saddle and orange-red wattles at the base of its bill... were transferred from the island to Wellington's Karori Wildlife Sanctuary yesterday.

...The North Island robin has gained a new sanctuary, thanks to the work of several hundred people re-establishing bush on Kakepuku Mountain in the south Waikato... The robins... have not been seen... on the mountain... for several decades... [but 15] of the native birds have just been released following a five-year effort by volunteers... Kakepuku's reserve covers almost 200ha, some of it in mature forest with other parts in scrub, which acts as a nursery for regenerating bush... [However, until] a committee of local residents... [was] formed... in 1994... to do something about the animal pests... [such as r]ats... goats and possums... regeneration was seriously reduced... [One of the] dairy farmers on the eastern side of the 450m mountain... [said:] "People were complaining about the appearance of the mountain, that the bush was looking really bad, so we decided to get rid of the rats and possums to start with... For the people of the Waikato, Kakepuku is the same as Rangitoto Island to the people of Auckland – it can be seen from all over the region and we want it to look good." The... Hamilton field centre manager for the D[oC], says... "The release of these birds on the mountain is something that was not a priority for the department and this is a good example of a local group of private residents doing something positive to improve their own community. We're more than happy to assist in situations like this. It was an ambitious project and it's been a success." ...the track to the summit of Kakepuku is one of the most-used walks in the Waikato region... Kakepuku[, which]... is distinctive because it juts from the undulating plain between the Waipu and Puniu Rivers... is of considerable cultural and spiritual significance to Waikato Maori and several pa sites are known on its slopes. The remains of a major pa, complete with trenches and terraces, are still visible on the summit.

...Pressure is on the A[RC] to reintroduce the sweet song of the nectar-eating bellbird to the Waitakere Ranges. Conservationists called on the council yesterday to establish a mainland "island" in the ranges where threatened native birds could survive, protected by intensive pest-control programmes... They spoke of the mighty subtropical rainforest of the ranges, yet of a disappointing silence in the bush caused by the absence of birdlife... [except for] tui and fantails... The bellbird has been extinct in Auckland since a sudden, mystery die-off of the species throughout the country nearly 150 years ago. Populations recovered elsewhere but not in Auckland and Northland... The goal of a mainland island would be to reproduce as closely as possible the environment found in the ranges before human habitation and the arrival of introduced pests... The cats in the ranges could be a problem but bellbirds don't feed on the ground so, like the tui, they should be successful... Once established, the bird would move down from the ranges and its melodious, bell-like song would be heard in the parks and gardens of Auckland, said the conservationists.

...Songbirds around towns and cities are losing their tunes because increasingly heavy traffic is making them tone deaf. N[Z] ornithologists say some birds are imitating fire engines, car alarms and even mobile phones as humans increasingly encroach on their habitats. But the biggest worry is that bird populations may diminish... Their fears reflect a British study which shows birds living near busy roads made harsher cackles and had problems attracting mates and defending territories... Some of the worst affected species in Britain include the song thrush, starling, chaffinch, greenfinch, goldfinch and blackbird – species which have been introduced to N[Z] and whose numbers are now dwindling. Now local experts fear other indigenous species like tui, fantail, grey warbler and silvereye could suffer a knock-on effect because they cannot distinguish different birdsong. An Auckland University bird vocalisation expert... says... "Any songbird learns a song like we learn a language and they are liable to get it garbled if they cannot get proper feedback when practising. Studies on budgerigars have shown they raise their voices in a noisy environment like we do at parties, which suggests their hearing cells are being damaged." ...[a member] of the Ornithological Society of N[Z], said: "...Starlings here imitate various traffic noises... One theory is that birds are able to fool neighbouring birds into believing there are more birds in their territory than there actually is. If they pretend there's a mobile phone nearby it might scare off potential rivals." [Editor's note: 'Birds from different parts of a country have different dialects. Consequently, when members of a bird species are brought together from different regions – in order, for example, to improve the gene-pool of breeding programmes – they have trouble communicating with each other']

...One of the mysteries of birdsong has been solved by scientists trying to understand why some birds learn new songs while others are stuck with the sounds they are born with. Three of the 23 main groups of birds can learn to sing, or even "talk" in the case of hummingbirds, parrots and songbirds. All three groups have been found to possess seven brain structures that enable them to perform and remember complex vocalisation. The seven brain facets appear to have evolved independently in each group, while they have not evolved at all in the remaining 20 orders of birds for which calls, such as the cock's crow, are genetically "hard-wired" from birth... [T]he fundamental requirement for seven specialised regions of the brain may shed light on how mammals... learn to vocalise. Besides humans, only whales, dolphins and bats can learn how to "sing."

...The mystery of the weka on Waiheke Island seems to have been solved... Since a weka was found dead near Whakanewha Regional Park last week, four sightings of living specimens of the rare flightless bird have been reported on Waiheke... le[ading] to speculation that the birds may have swum from nearby Pakatoa Island or been moved by somebody from Kawau Island. But [a]Waiheke Islander... admitted yesterday that [it] released a pair of weka on the island after a family holiday in Paihia 20 years ago. "...There were hordes of them. As we were packing, they came into the house so I just trapped a pair and threw them in a box and we motored home the same day... We had a 10-acre... block. We were doing the self-sufficiency thing. We had one of everything... including my pet pukeko. We threw the weka into an old chook run, settled them down... then let them go." ...a conservationist who helped organise a [RFBPS] project to transfer weka to Pakatoa in 1996, said... the once-common birds might have survived because the North Island weka – unlike the cheeky and inquisitive South Island variety – had developed timid characteristics as it neared extinction. Their timidity was probably helping the remaining 3000 to survive[, although the Paihia]... population was now extinct.

...A small nocturnal seabird thought to be extinct for more than 100 years has been seen in the Hauraki Gulf and off the Coromandel Peninsula... Scientific confirmation... is still awaited... One of the birds was seen in January and last month two British ornithologists saw a flock of up to 20... near Little Barrier Island. The rediscovery of the N[Z] storm petrel, or *Oceanites maorianus* ['also known as the "Jesus bird" because of the way it appears to walk on water']], has set the bird-watching world alight because finding supposedly extinct birds is so rare. In recent years such rediscoveries – the takahe in 1948 and the Chatham Islands taiko and Campbell Island teal in the 1970s – have attracted great excitement.

...The endangered taiko has had its most successful breeding season and D[oC] staff hope it marks a turning point for the world's rarest seabird... found only in the southern forests of Chatham Island... DoC's taiko team had high hopes for a record season this year when they caught 14 birds and located more than 20 new "prebreeding" burrows... For the past two years scientists knew of only two breeding pairs. The sea-based birds... only... return to land... [– flying] in and out... during darkness... [–] to breed in burrows where they are vulnerable to rats, cats, pigs, possums and weka... [However, 92] wild cats have been caught in the taiko breeding area this year a[nd, consequently, a]... record six chicks had been born this season... [Five have] been successfully fledged... "Now we are just holding our breath for the last one to do the same." The department was also developing a predator-proof fence to secure a safe breeding area for the taiko, [whose]... world population... is estimated to be... 100 [to] 150.

...A bloody weka cull... is under fire from an Act MP. [The]Conservation Minister... is defending his department's annual cull of the birds but [the]Act MP... calls the cull "outrageous". Written parliamentary questions... revealed that last year around 400 eastern buff weka were bludgeoned to death on the... Chatham Islands... by DoC staff. The birds, which were trapped and then bashed on the head, are killed by DoC to

protect two critically endangered species on the Chathams, the taiko, one of the world's rarest seabirds, and the Chatham Island oystercatcher. The eastern buff weka is extinct on mainland N[Z] and is a distinct species from its North Island cousin which is a category B threatened species along with the native wood pigeon (kereru) and the alpine parrot (kea)... While hundreds of the weka are eaten every year by islanders, DoC says that doesn't keep numbers low enough... [By the way,] Pacific Island states are being asked to choose which of their most endangered birds should be given a helping hand from [NZ and AUS] aid money. Hard decisions will face delegates at a workshop to be run jointly in the Cook Islands this week by the 26-nation South Pacific Regional Environmental Programme and Birdlife International. Conservation experts say at least 12 and possibly as many as 30 Polynesian bird species are under threat... But limited resources... [- NZ] had committed \$180,000 and A[US] was contributing \$82,000... [-] mean the... delegates will have to rank them and pick just two or three for high-priority rescue efforts. The environmental programme's avifauna officer... feared the Samoan moorhen might have vanished already, while survival chances were running out for the Samoan wood rail and, in French Polynesia, the Polynesian ground dove and Marquesan imperial pigeon. However, a prime reason for holding the workshop in the Cooks was to highlight the success of a conservation programme that had boosted numbers of the Rarotongan flycatcher, or kakerori... "The idea is to show Pacific Islands delegates that you can turn things around," said [the officer], who is seven months into a three-year appointment while on unpaid leave from the D[OC] in Wellington. "We are not just casting a total story of doom and gloom."

...N[Z] is likely to take in some of the inhabitants of a tiny Pacific island nation whose homes are being swallowed by rising sea levels – unlike A[US] which has shut them out. The Tuvaluan Government last year appealed to A[US] and N[Z] authorities to provide permanent homes for at least 3000 people, and possibly its whole population... [of] 10,500... within the next ten years. [● 'The islands of the central and western Pacific, or (more usually) the easternmost of the three great groups of these islands, including Samoa, NZ and Hawaii,' are collectively known as *Polynesia*. The title comes from the Greek words *nesos* (island) and *polus* (much or many), but is a phrase that might become redundant if the ocean-level continues to rise; and could already be changed to *Polyextinctia* because, like Samoa and NZ, 'Hawaii – a strand of jewels once protected by 2000 miles of ocean – is under assault. Its plight is embodied in a species of plant that clings to life on the tallest sea cliffs in the world. Something is supposed to pollinate this bizarre plant species, but the natural pollinator may be extinct or so rare – it has never been seen – that the plants need help. A moth could easily flutter from flower to flower but for the field biologists who are now the pollinators, the task is not so easy – they have to abseil from flower to flower. The very fabric of this tropical paradise ecology is unravelling. One quarter of all US endangered species are now found in Hawaii. 70% of Hawaii's native birds are already extinct.'

...Like NZ], Hawaii was once a water encircled haven for birds. Even when Captain Cook arrived... 215 years ago, 79 forest birds were recorded. Since then 31 have become extinct and another 25 are endangered...," says... [the person who] labels Hawaii as "the endangered species capital of the world"... [and] recently set up the Society for the Protection of Hawaii's Native Flora and Fauna. "Someone's got to do it," [the conservationist] says with a veiled jab at the government... Many plants are threatened by aggressive exotics such as bamboo, rising in some areas to 40 metres... The native birds are retreating into the higher and densely forested mountains but some are still found near... trail[s]. Sometimes hikers see the crimson ibiwi, a stunning native bird battling for survival on Oahu... ● [Another of Cook's destinations – AUS]... – ...is pressing for international action to save... one of the world's most majestic sea birds... [S]peaking at an international meeting in Hobart on how to protect the birds, [AUS's]... Environment Minister... warned that without changes to longline fishing, some of the 24 species of Southern Hemisphere albatross could soon be wiped out... Longline fishing had killed an estimated 250,000 sea birds, many of them albatross, in the past... [3 years. AUS] is working with its fishing industry to introduce new longline technology and to limit the periods in which the lines are set... [But the minister] was disappointed that Japan, which had just stymied A[US]'s move to establish a South Pacific whale sanctuary, had not attended the conference... Another big Southern Ocean fishing nation, Spain, was also absent. However, conference sources said it was sympathetic to the plight of the albatross. A[US] was... working to eradicate the feral cat population on Macquarie Island, where breeding pairs of wandering albatross had declined sharply... Pollution and loss of habitat are also contributing to the birds' decline... But because the albatross ranged for thousands of kilometres, there were limits on what any single nation could achieve, said [the minister, who confirmed that the]... giant petrel was a[nother sea bird] at grave risk.

...A campaign to save the albatross has been launched by the R[FBPS]. A spokesperson for the society says NZ]'s albatross and petrel species have declined by 90[%] in 60 years, mostly because of long-line fishing.

...Some guests just don't know when to leave. A[n]... exhausted... young albatross... had hitched a ride on a container ship off the west coast, remaining on board when it docked at Onehunga... The... [bird spent] a week at the SPCA's Panmure bird recovery centre[, where]... volunteers worked shifts to help feed the hungry albatross which was checked by a vet to ensure it was ready to fly again. [A DoC] ranger... released the huge bird at Muriwai on Wednesday. The albatross, however, was reluctant to leave the comfort of its cage for the cliff-top in biting wind and rain. After it had been tipped from the cage it headed not for the ocean but a sheltering bank. Retrieved, the bird spread its wings in promising fashion and promptly sat in a gannet's nest while media crowded around to record the moment of flight. Hours later the bird was still there.

...Seabirds are dying in droves at west coast beaches. At Muriwai, 2260 dead seabirds were recovered on Saturday, one of the largest counts in nearly 30 years. Most are a kind of petrel that breeds prolifically on islands off the coast of N[Z]. The deaths are attributed to storms and poor feeding conditions... "The small birds will sometimes battle through stormy weather and reach the coast too exhausted to survive, let alone feed themselves,"... says... [an ARC] natural heritage scientist... A ute full of birds was collected by volunteers from the Ornithological Society of N[Z], South Kaipara Land Care and the D[OC], in a 40 kilometre sweep along Muriwai Beach. Bodies were identified, counted and buried.

...Fifty-six blue penguins died in an attack... on Saturday night... at the Oamaru penguin refuge in the South Island... [A] wandering dog was... believed... responsible. About a third of the casualties were chicks... and other chicks would starve to death because their parents had been killed.

...A penguin colony facing extinction is likely to get its last chance at survival when a U[S] icebreaker arrives on Thursday. Two large icebergs... have blocked the sea ice around Ross Island and McMurdo Sound, cutting the Adelie penguins of Cape Royds off from direct access to the sea, and food. This has destroyed the penguins' breeding season and skua seabirds are now plundering the survivors... The southernmost Adelie colony, next to a base built by Ernest Shackleton in 1908, has been a highlight for visiting explorers and dignitaries for nearly a century. A US logistics official said US Coastguard icebreaker Polar Star had entered the pack ice in Ross Sea and was carving a channel through to McMurdo Base... The channel would be kept clear and, as it passed close to Cape Royds, it would dramatically improve short-term prospects for the penguins... Last week the University of Auckland... said... that only the icebreakers or a strong southerly storm pushing out the sea ice could save the colony... But [a]... Californian ecologist... said last week that the chicks were hatching too late and there was little chance they would survive the onset of winter.

...Trapped penguins need a storm A U[S] Coastguard icebreaker making its way to McMurdo Base... is unlikely to provide an escape route for thousands of penguins cut off by icebergs from the sea – and their food. Yesterday, the 120m Polar Sea, making its annual visit to the US base, was still days away... [The] manager of N[Z]'s Scott Base, which is near McMurdo, said the icebreaker would not make much of an impact... "There's nothing anyone here can do other than hope for a decent-sized storm in the next few weeks – or next few days would be better. But that is not likely at this point." The Cape Royds colony of adelie penguins, said to number 20,000 to 30,000 breeding pairs, has been cut off from easy access to the sea by two huge icebergs. The birds have to trek 15km to 20km over the ice before they can reach their fishing grounds. The colony... has suffered at least two poor breeding seasons since the icebergs blocked them in... Scientists are crossing their fingers that the colony will manage to survive.

...Nature has finally come to the rescue of... Antarctica's Adelie penguins... The... ice... has... broken up enough to let open seawater in as far as the southernmost... colony at Cape Royds... 2000... pairs... are now nesting... where... their ancestors have returned to breed for hundreds of years.

...At least two-thirds of the world's African penguin population are endangered by an oil spill following the sinking of a Panamanian oil tanker off Cape Town [last week]... The spill has struck hard on Dassen Island and Robben Island, the world's first and third largest colonies of African penguins... More than 40[%] of the estimated 150,000-180,000 African penguins have either been soiled or are threatened and must be evacuated, say conservationists. Environmental officials have asked the South African defence force to help capture birds on the two islands.

...Conservationists have begun evacuating an entire colony of 55,000 penguins on... Dassen Island to save the birds from oil leaking from a sunken ship. They say the relatively small spill... has caused the world's worst coastal bird disaster... Authorities had hoped the evacuation could be avoided... [but] 400 tonnes of heavy fuel has seeped from the bulk ore-carrier *Treasure* despite attempts to stop the leaking. The... oil is toxic to the birds and has already killed about 30. [However, the toll will rise because 'chicks have to be left behind']... About 16,000 birds had by last week already been rescued – mainly from Robben Island... home to about 20,000 of the threatened African penguins... Three penguins were being put into each box, with the clean birds being evacuated first... 200 people were crowded on to the island and handing the boxes to six small craft and [a] helicopter, to be transported to the west-coast town of Yzerfontein, about 10km [away]... Once on the mainland... contaminated birds would be cleaned and rehabilitated. "The uncontaminated birds will be transported to Port Elizabeth, 800km away... where they will be released into the sea to swim home... Hopefully, by the time they reach [their islands] the situation won't be so bad." In the past week about 300 oil-free birds have already been released in Port Elizabeth... [Meanwhile, f]ears of a major ecological disaster along Spain's northwest coast heightened as huge waves swept the first oil from the stricken tanker *Prestige* onto the Galician shoreline. And in a further blow to hopes that this ecologically fragile landscape would be spared the ravages of the oil, experts said the *Prestige* could succumb to the incessant pounding it has been receiving and snap in two. This could increase the chances of even more of the 77,000 tonnes of oil on board escaping to suffocate the coastline's fragile and beautiful environment even more... Oil has so far washed up along about 40km of shoreline between Roncudo and Cape Tourinan... The World Wildlife Fund... has already reported that oil-covered birds were reaching the shore, known as the "Coast of Death" for its many wrecks over history.

...A new oil slick has been seen at the site where a tanker sank off the coast of Spain, raising fears that the country's ecological and economic woes from the disaster are far from over. Authorities in neighbouring Portugal said a glistening pool of oil was seen over the spot where the vessel *Prestige* sank last week after breaking in two... [T]he new slick was situated about 50km off the Portuguese coast but... winds were likely to push it towards Spain or France within the next two days... The observation... was confirmed by Spanish officials, who up to now had expressed hope that more than 60,000 tonnes of oil on the tanker had... solidified because of the near-freezing temperature and pressure at the depth of the *Prestige*'s wreck, 3500m underwater... Previous slicks that had already washed ashore on Spain's northwest coast have soiled 400km of shoreline... Yesterday, hundreds of volunteers participated in a co-ordinated clean-up operation on some of the more than 100 beaches blackened by the toxic goo... Spain and Portugal are to call for shipping lanes along their coasts to be moved farther away at an European Union summit next month.

...A huge new wave of oil from the sunken tanker *Prestige* was expected to hit Spain's "Coast of Death" today, despite desperate efforts by clean-up ships... from France, Germany, the Netherlands, Britain and Belgium... to keep it at bay... The bulk of the slick was last night 500m from the coast, and smaller patches were between 1.6km and 4.8km away. A map on the Galician regional government's website also showed a large slick entering the Bay of Biscay... The slick, containing up to 11,000 tonnes of fuel oil, threaten[s] to inflict more environmental and economic damage on northwest Spain, which is struggling to clean up from a first onslaught of oil... The new slick is far bigger than the initial oil spill of around 5000 tonnes... That spill fouled beaches with an evil-smelling bed of tar, killed or coated hundreds of seabirds and caused untold damage to Galicia's renowned fisheries... and... shellfish... Some 400km of coastline have been declared off-limits to fishing, putting thousands of people out of work.

...The tortuous and distressing process of cleaning birds caught in oil spills may soon become much easier thanks to magnets... Instead of scrubbing oily feathers with detergents that can destroy their waterproof properties, scientists at Victoria University of Technology in Melbourne say they can be dusted with fine iron powder. Combing them with a magnet will then remove both the oil and the iron. "We were quite amazed by the efficiency of the cleansing process... Iron powder is cheap, plentiful and both non-toxic and non-irritant." ...[the scientist]s devised the new dry-cleaning method after discovering that oil sticks to iron powder more readily than to feathers. The process is quicker and less stressful for the birds, taking only a matter of minutes. In laboratory tests on duck feathers, one combing with a magnet removed 88[%] of light crude oil and 60[%] of other types. After 10 combings, 97[%] of all types of oil were removed... When the researchers examined the cleaned feathers under a microscope, they found their barbules, or tiny threads, were neatly rearranged in place and drops of water rolled off them easily. By contrast, the barbules of feathers cleaned with detergents were tangled and showed reduced ability to repel water... The research team is working on a portable field unit so that birds can be treated immediately at the site of an oil spill... [A spokesperson for the AUSn branch of the RSPCA] welcomed the development, but said many severely oiled birds were coated with a dried residue like tar, which may resist treatment with iron powder... [□ The seabirds r]escued... at the Uruguayan resort of Punta del Este [are heading] home. Last month 150 of the birds turned up, covered in oil, on the beaches. There was no explanation for the spill but environmentalists have been feeding and cleaning the birds and yesterday let them go.

...A harrier hawk whose wings had been deliberately clipped was obviously abandoned when its "owners" got tired of it, a bird rescue volunteer says. [The volunteer with] SPCA Birdwing, said it was the first time in her 18 years with the organisation that [the volunteer] had seen one of the big birds of prey with clipped wings and the find had appalled bird rescue staff... [The volunteer] guessed someone had the hawk as a chick, then "chucked her back into the wild" when the bird became too aggressive. [The volunteer] said the birds were naturally aggressive and could not be tamed... Australasian harrier hawks are a protected native species under the Wildlife Act. They are members of the raptor family which also includes the rare N[Z] falcon and the morepork. It is illegal to kill or confine them... The young [hawk] was thought to be about a year old... The hawk's wings would eventually re-grow and the bird would be released, but only after a re-training programme.

...the Canadian artist who really did teach geese to fly, was the inspiration for *Fly Away Home*, the... movie on TV2 at 7.30pm, Sunday. The fictional story begins in Auckland where Amy... opens her eyes in hospital to learn her mother was killed in a car crash. [Amy] is bundled off to live with her estranged father... in Ontario where [Amy] finds some orphaned goose eggs. [Amy] nurtures them until they hatch and, since geese imprint on whoever they first see, Amy becomes Mother Goose. Then, using a motorised ultra-lite which looks like a giant goose, Amy teaches them to fly. In real life... [the Canadian and two colleagues], working together on Operation Migration, proved that wildfowl can be imprinted to ultra-lite aircraft and taught new, safer migration routes. [The Canadian] says migration is not instinctive with birds and has passed on from one generation to the next. But if a species is wiped out in an area, the migration route is lost to them. "In 1993... [we] raised a flock of 18 geese and tried an experiment to fly them to Virginia, and it was successful,"... Their widely-publicised success with Canada geese offers hope for seriously endangered species.

...[NORTH AMERICAN] SCIENTISTS have developed an information service to keep them up to date on plant and wildlife endangered species. More than 11,000 species are nearing extinction... [- including many from NZ, where the DOC is] losing... the... battle to save[the] rarest species...

A global endangered species list has 231 N[Z] species on it... The World Conservation Union's... red list of threatened species lists the North Island Hector's dolphin subspecies as critically endangered and the South Island Hector's dolphin as endangered. It is the first time the dolphin has made the list, which was last compiled four years ago... Another big entry on this year's list was the albatross. Sixteen species of albatross are listed as threatened, compared with three [on the previous list]. Longline fishing is the biggest threat to the albatross, which mate for life and often breed only once every three years, says N[Z]'s Department of Conservation species protection officer... N[Z] has 42 plants, 93 birds, two frogs, 37 mammals and 16 reptiles classed as endangered or critically endangered on the red list... Globally, [a]... total of 11,046 species of plants are listed as

threatened[, while the]... total number of threatened animals increased from 5205 to 5435... [T]he number of critically endangered mammals increased from 169 to 180 and birds from 168 to 182, according to the IUCN... One in four mammals on the planet is listed as threatened, as are one in eight birds. There are about 1.75 million known species of plants, animals, reptiles, birds and invertebrates on Earth... The Switzerland-based IUCN... says that with many more species yet to be discovered, the red list only scratches the surface in assessing the extinction risk.

...If we are really concerned about preserving endangered species... [- which, in NZ,] include 145 out of 202 bird species, 19 out of 45 freshwater fish and all four frogs... [-] a Landcare scientist at the Mt Albert Research Centre, says... we should look beneath our feet... A new D[oC] report on N[Z]'s threatened species lists 50 fungi among 360 mostly better-known creatures, such as the North Island Hector's (now Maui's) dolphin...

What's in a name? For the North Island Hector's dolphin, a new name means a new identity. The endangered mammal... has been renamed Maui's dolphin. [The]Conservation Minister... says the dolphin has been classed as a separate subspecies from its South Island counterpart... Department of Conservation and Auckland University scientists believe the Maui dolphins differ from the 7000 South Island Hector's dolphins in body form, skeletal features and DNA... Researchers say there are fewer than 150 Maui dolphins left and the species... is threatened by set-netting.

...A threatened population of the rare Hector's dolphin along the west coast of the North Island is about to get help. The Northern Inshore Fisheries Company, which looks after the interests of coastal fishers, is about to launch a conservation mission to reduce the impact of commercial fishing on one of N[Z]'s most endangered marine mammals. The move anticipates, and therefore may influence, eventual regulation by Government agencies for greater protection of this dolphin. The population has fallen to a dangerously low level of about 100 individuals... The Hector's dolphin is special because it is found only in N[Z] waters and is the smallest dolphin in the world. Adult [cows - which]... live for about 20 years but... do not start breeding until they are 7 or 9 years old and then, at best, produce a single calf only every two to three years... [(y)oung dolphins swim alongside their mothers... for up to three years, but scientists could not work out how the youngsters managed to keep up[- n]ow the secret is out: the calves swim so close to their mothers that they are sucked along, says... an aerospace engineer at Technion, the Israeli Institute of Technology) -] ...seldom reach 1.5m and [bull]s are smaller. Their attractively marked, grey, white and black bodies are unusual in having short, rounded dorsal and pectoral fins rather than the longer, curved, pointed fins of most other dolphins... Most dolphin species are far ranging and cruise the open seas, but Hector's is confined by its natural behaviour to shallow coastal waters, especially the slightly turbid areas around harbour entrances. It is therefore much more vulnerable to threats associated with human activities in these busy waterways. Most threatening is the risk of drowning if they become entangled in gill nets set by commercial or recreational fishers, although it is also suspected that some, especially juveniles, are killed by boat strikes and that their health and fertility are affected by industrial and agricultural chemicals flowing from harbours... The plight of the Hector's dolphin became known in the late 1980s, when set netting restrictions were enforced around Banks Peninsula, where most of the[South Island] population reside. The... new code of practice for commercial fishers... requires [them] to keep more detailed logs of fishing effort and catch results, along with reports of sightings of dolphins. It also establishes new closed and controlled fishing areas. In addition to closed areas of a 2-nautical-mile-radius around each harbour mouth, inshore waters out to 4 nautical miles from the entrance to Manukau Harbour to Taranaki Point near Aotea Harbour will be closed to set netting. From the Manukau Harbour north to South Kaipara Head restrictions on net height and deployment are proposed that will eventually include the attachment of sonic warning devices (known as "pingers") to nets to alert dolphins to their presence.

...Set-netting will be banned along the North Island's west coast in an effort to save the endangered North Island Hector's [(or Maui) dolphin. The] Fisheries Minister... announced the ban yesterday. It applies within 4 nautical miles of the coast over almost two-thirds of the North Island, from Maunganui Bluff, north of Dargaville, to Pariokariwa Point, north of New Plymouth. The ban comes into effect next month... Three[Maui dolphins] have already been found dead this year - most likely drowned after snagging in set-nets, [the minister] said. At that rate of attrition, the dolphins would almost certainly become extinct... [A RFBPS spokesperson] said the prohibition on set-netting was "very positive"... The ban applies to both commercial and recreational fishers. It does not apply to areas inside harbour entrances... [A]bout 23 commercial fishers would be affected by the ban. [The minister] hoped they would "restructure" their operations by using other methods of fishing or switching to other areas... [T]rawling and Danish seine vessels, which are thought to pose a lesser risk to the dolphins, would be closely monitored to ensure they were not responsible for... dolphin deaths. Each vessel fishing in the banned area within the next five years would have an independent observer on board.

...A Muriwai fisher... wants... compensation for the loss of his \$200,000-a-year livelihood. The commercial rig (dogfish) fisher... is devastated by the Minister of Fisheries' decision to scrap inshore set-netting to save the endangered... [Maui]'s dolphin. The ministry... says about 40 commercial fisher[s] are affected by the closure. The Muriwai fisher... who fishes up to one nautical mile from the coastline between the Manukau and Kaipara harbours, says [it] stands to lose his business and \$300,000 Muriwai Beach home. His brother, an employee, will also lose his \$40,000 a year job and his mother, who makes his nets, will be out of work. The fisher... says his employer, who has about \$1 million worth of rig quota, is out of pocket, and local supplies of rig, gurnard and lemon fish will be affected. [The fisher, who] has spent... \$2000 consulting with the Government to try to find a solution where [it] and the dolphin could co-exist... is now seeking legal advice and says experienced fisher[s] like himself are suffering for the dolphin's alleged decline. [It] states that no [Maui's] dolphins - or any other dolphin or seal - has ever been caught in his small-mesh nets in the five years [it] has been using them. The net is set on the bottom, and is weak enough to be broken with bare hands. However, inexperienced fisher[s], usually from out of the area, are known to use inappropriate gear that might put the dolphin at risk. During consultations last year with the ministry, the Muriwai fisher... supported net size restrictions, pingers, keeping log books and barring inexperienced fisher[s]. The ministry rejected this. In a letter to fishers explaining his decision, the minister said... fewer than 150 [Maui]'s dolphins are left in the area, and losing one every five years could see them wiped out. The minister says some commercial set-netters have admitted catching [them] by accident in the past...

The High Court in Auckland has scrapped a government ban on set-netting on the west coast... The ban's implementation was awaiting the outcome of the court hearing... The ban was announced... by[the] Minister of Fisheries... in a bid to protect the endangered... [Maui's] dolphin. The judge] has ruled that [the minister] was "wrongly advised" by his officials about the dolphin... not being able to sustain one death in five years... "The ministry, and in turn the minister, made a clear mistake of fact in understanding the science,"... That science relates to the use of the MALFIRM calculation, a scientific formula used to predict growth of a species over time... "The ministry and minister used it as a way of predicting probable extinction. This was a clear mistake," says [the judge]. The... decision is a setback for environmentalists pushing for a west coast marine park in the area in which the ban was proposed. Commercial set-netters are now free to fish under their proposed management plan.

...Concern is mounting about the impact tourism is having on whales and dolphins around N[Z]'s coastline. An international eco-tourism conference in Dunedin yesterday heard that many of the whales and dolphins popular for tourism were endangered. [A speaker at the conference from] Massey University, said the potential to disturb their natural behaviour patterns had attracted "much research effort in recent times". "Some research has suggested close approach by tourist boats for watching and in some cases swimming with dolphins and whales had altered the behaviour of the animals. It has been suggested this could be detrimental. One view is that the use of whales and dolphins as a tourist attraction can be seen as another form of harmful exploitation of these marine mammals." ...One study on short-beaked common dolphins said the dolphins appeared to be "fed up" with the constant presence of a boat nearby... Studies of bottlenose dolphins in the Bay of Islands found they had become "sensitised" to swimmers and were avoiding people and boats as tourism levels increased. Another report on Hector's dolphins in Akaroa Harbour reported a potential increase in boats hitting young dolphins... In Fiordland, 7[%] of bottlenose dolphins had been scarred by collisions with boats... Eco-tourism was growing at such a rate that it could have a significant impact on the natural attraction, [the spokesperson] said. By June last year,

75 eco-tourism operators had permits to watch and swim with whales and dolphins. The N[Z] Tourism Board estimated that in 1996 14[%] of visitors participated in dolphin watching and swimming activities... Whale-watching off Kaikoura attracts up to one million visitors a year.

...A dark shape bobbed on the surface of the ocean as the sun slipped behind Norway's Blue Mountains. Then the object moved, twitching its tail and sending water into the sky. On the shore, [adults]... and children cheered. Keiko, the world's most famous killer whale, was alive. But for how long? In the latest chapter of an extraordinary story, the 10m-long orca has made a remote Norwegian fjord into what could prove his final resting place after a journey involving thousands of kilometres, endless controversy and a taste of Hollywood stardom in the 1993 hit film *Free Willy*. Keiko, who has spent all but two of his 24 years in captivity, arrived in Skaalvik Fjord last week, frolicking in waters surrounded by jagged mountain peaks. By yesterday [Keiko] was less energetic, prompting fears that the latest attempt to reintroduce him to the wild would end in his death. "[Keiko] is very listless," said... the Icelandic in charge... Keiko has redeveloped a "captive mentality" after people started swimming with him last week. The threat to his welfare forced the Norwegian Government to announce an emergency ruling that made it an offence to swim within 23m of Keiko or to feed him. Since slipping into this narrow fjord after almost 70 days in the wild, Keiko has again been revelling in human contact, unravelling the biggest attempt to rehabilitate a creature into the wild. So far, it has cost \$42.6 million. The fears over his health [are valid as] the whale has stopped feeding because [it] apparently believes people will provide him with fish... [After being] captured by a trawler off Iceland[, Keiko]... had a brief career on show in aquariums in Iceland and Canada before spending 11 years in a Mexico City amusement park. After Keiko's appearance in *Free Willy* – the story of a boy fighting to liberate a whale exploited by unscrupulous [owners] at an aquarium – more than a million people wrote to demand that [Keiko] be set free. Eventually, [Keiko]... was flown to Iceland's Westman Islands, where efforts began to reintroduce him to the wild. After more than 60 unsuccessful attempts to reunite Keiko with free orcas, [Keiko] joined a wild pod on a 3000km journey across the Atlantic. But his apparent integration into the wild went wrong when [Keiko] followed a fishing vessel into Skaalvik Fjord.

...Whoops Willy... Keiko, the orca whale better known as *Free Willy*, is finally free himself... However, his sense of direction could do with a bit of work. [It] recently risked being turned into whale steaks by swimming into the Skaalvik Fjord in Norway. Norway is the only country that allows commercial hunting of whales but, thankfully for Keiko – whose name means "Lucky One" in Japanese – Norwegians only hunt minke whales.

...A whale of a problem The US Humane Society is opposing a call to put down Keiko... A whaling expert at Norway's Institute of Marine Research said, because of the whale's difficulties adapting to life in the wild, Keiko should be put down. The US group is one of two responsible for monitoring the whale in the wild and its spokes[perso]n... says all indications are that the whale is doing very well... Now plans are under discussion to move Keiko to a secret location in Norway, far away from the human adulation the whale craves – and may not be able to live without.

...Keiko... has died, his caretakers said yesterday... [Keiko, who] did not bond with other whales, a[nd a]pparently feared swimming under ice... died after the sudden onset of pneumonia in the Taknes fiord in Norway... [V]eterinarians had monitored his progress, but the whale died quickly.

...A young orphaned... killer whale living for months in a busy shipping channel near Seattle was returned to Canadian waters yesterday and scientists hope [it] will reunite with her family pod... It is one of the first attempts to reunite a wild orca whale... with its family pod... Orcas rarely separate from their family pods so how... [t]he 2-year-old... got to the Seattle area, where her pod has never been seen, is a mystery.

...A young... killer whale rescued near Seattle swam to freedom yesterday to join her relatives in what scientists hope will be a permanent and ground-breaking reunion. Scientists said it was too early yet to declare their effort a complete success because it remained to be seen how long the whale known as A-73 and her family pod would remain together. The whale, nicknamed Springer, had clearly been anxious leaving her holding pen off Telegraph Cove on northern Vancouver Island after [it] was transported from the US Puget Sound[. As the whale] waited in the pen, [it] pressed her nose up against the net, looking at the open water. Then when a group of related whales swam close to the pen the two groups began communicating. "They were clearly vocalising," said [a spokesperson for] the Vancouver Aquarium... Springer [clearly knew it] was in home waters.

...A juvenile orca... was found stranded at Whatipu... A rescue team worked to keep it wet throughout the night but conditions were deemed too rough for a release off the west coast. Instead the whale was moved more than 40km on a trailer... to Takapuna Beach[on the east coast]. But it was seen by kayakers up Henderson Creek shortly after being put to sea and had to be guided to the Hauraki Gulf. There have been no sightings since... The D[o]C... hopes it has joined a pod of... 15 killer whales spotted off Martins Bay earlier this week... [■ A] US researcher who is visiting N[Z]... says... small whales... and dolphins are being driven to strand themselves by bursts of... military... ship sonar that sound to them like hunting orca...

When the mayday call came about a stricken humpback whale caught in lines off the Kaikoura coast, Tom Smith raced into action. On two earlier occasions the 38-year-old fisher... whose wife... is pregnant with the couple's third child... had responded to a roped whale and both times... had managed to free them... ma[king] headlines around the world... Mr Smith is now presumed dead after being hit by the giant tail fins of the creature [it] was trying to save. [30] tourists... on a whale watching adventure watched the tragedy unfold... Last night, the whale was still trapped in the crayfish line as DoC staff were unable to cut the rope... Mr Smith once described saving a humpback whale as "a real once-in-a-lifetime encounter"... [Mr Smith] donned scuba gear and made eye contact to let the whale know [it] was there. "As I swam up I could see [the whale] drop its head and I thought it was going to dive, but what it did was to lift its tail and lay dead still while I cut off the float and the last of the rope." After the whale was freed, it came up right beside the boat, where it stayed for a few moments, before lifting its tail and slowly swimming away.

...A diver who disappeared while trying to save a trapped whale should never have gone near the creature, conservation experts say. The coastal town of Kaikoura is mourning Tom Smith... who has been missing since... [being] hit by the tail of [the] humpback... The whale escaped from the nets and swam free. Last night a friend... said the line was from one of Mr Smith's own crayfish pots... Yesterday the D[o]C said it could not condone the diver's action. "There are strict rules about how close the public can get to whales," said a[n a]rea manager... DoC guidelines say to stay at least 50m away from whales or dolphins... Since 1840... 5000 strandings of whales and dolphins have been recorded around N[Z]'s coast.

...A whale found dead on a Taranaki beach this month was one of the most ex[c]iting recent finds in marine mammal science... The almost two-tonne whale... believed to be the first of its species to wash up on N[Z] shores, the third in the Southern Hemisphere and the 20th in the world... has already attracted interest from scientists in A[US, the US] and Japan... "Almost nothing is known about the ginkgo-toothed species," DoC... said.

...One of a dozen dead sperm whales beached on Auckland's west coast has been butchered for its jawbone despite a 24-hour security operation to deter poachers. D[o]C... said teeth from the jawbone could be worth up to \$200 each... The whales, stranded over a 5km stretch... between Karekare and Whatipu... drew a crowd of about 1500 people yesterday. It is not known why the pod... became marooned... but it was "a significant stranding event" of sperm whales, the like of which had not been seen for 20 to 30 years... "Sperm whales are deep-water animals rarely seen close to the coast, but once a family member gets distressed they seem to follow the herd leader,"... Their weight meant they were often crushed to death on land. "Once they are on the beach, it's all over." ...The animals, some... 10m long and weighing... 12 tonnes, would be buried in the dunes... Two teams are now removing the remaining jaw bones before burying the huge mammals... The jawbones will be handed to Te Kaweraw A Maki, the Maori subtribe recognised by Waitakere City Council as the area's original inhabitant[s. A]... Maori carver... says the distinctive bones are the "ultimate material" to work with... [-] many traditional ornaments, pendants and musical instruments in museums are made from whale jaw bone. [The carver] says the weekend stranding is the largest in the area for about 100 years and a sign of good things to come, in spiritual terms.

...For the Indian fisher[s] who catch it, the whale shark is just one source of a meagre livelihood. For connoisseurs in Southeast Asia, shark fin soup is a symbol of wealth and privilege. These connoisseurs have suffered a blow now that India, one of the countries that supplies whale shark, has decided to give it the same protection as the... Indian tiger. Known as the "gentle giant" of the sea because it has never been known to attack a human, the whale shark is... mainly... hunted... in the state of Gujarat. The relentless slaughter has vastly diminished its numbers, hence the

decision to make the whale shark the first fish to be added to India's Wildlife Protection Act. A sharp rise in demand in countries such as... Taiwan, Singapore and China, where the soup is served at wedding banquets, corporate events and lavish dinners... [- i]n the old days of Maoist austerity, the official Chinese attitude was that shark fin soup was politically incorrect as it constituted an unacceptable display of wealth... [-] is endangering this species of shark, whose gargantuan size and feeding habits resemble those of the whale. The largest accurately measured whale shark... caught off Bombay in 1983... was... 12.5m, with a mouth measuring 1.4m and fins that were 2m... In western India, the whale shark had been hunted for its liver oil long before fisher[s] became aware of its overseas value for shark fin soup. The liver oil is used for waterproofing boats. In fact, one exporter of shark meat and fins in Gujarat said: "Fisher[s] used to catch it for liver oil anyway and then leave the shark lying around. We decided to make money by using the carcasses for export." ...The New Delhi branch of the W[WF] estimates... 300 tonnes of whale shark meat, besides dried fins, are exported every year. "These animals have slow reproductive rates so wiping out the entire population is very easy,"... Traffic, a watchdog body and a division of the W[WF], estimates... seven sharks are killed every day in Gujarat alone... Globally, 100 million sharks may be caught every year. Ignorance about whale sharks has hindered the efforts of conservationists. Some people believe the fins are gathered from already dead sharks. Others actually believe the fins grow back... For the moment, the Government is advising local officials to go easy on arresting fisher[s] because few of them know that taking whale sharks is now illegal. Another reason is that it is a sensitive matter. The fisher[s] who catch the shark – often risking their lives because the beast is so huge and their boats so small – are poor and hostile towards directives affecting their income and emanating from city liberals. The focus will be on raising awareness among fisher[s]. "Since the whale shark is so beautiful, we may also try to encourage tourists and this will help compensate the fisher[s] for any loss of income,"... If India succeeds in protecting the whale shark, it will be helping the world's oldest fish: sharks have been around for more than 400 million years – long before the first dinosaurs... [By the way, v]ets have force-fed Nari the dolphin... [-] one of a pod of 11 wild dolphins attending a nightly hand-feeding event at the Tangalooma resort... on Moreton Island off Brisbane... [- as t]he 12-year-old... recovers from surgery on a gaping wound left by a shark.

...Water lovers can breathe more easily. Jaws has finally met its match. An A[US]n company has invented a small electronic device which protects wearers from the most dangerous sharks. The makers claim their invention will at last help us overcome our collective fear of the last of the great untamed predators. The new deterrent couldn't have come at a more appropriate time. On average one person is killed in A[US]n waters every year. But in the past six months there have been five victims... Throughout the world last year there were 79 reported attacks... Surfers account for 70[%] of all recorded shark attacks... Of the hundreds of different species of shark, only a few pose any real threat to humans. *Jaws* perpetuated the myth of an aggressive creature which hunts people down, but the reality is somewhat different. Feeding sharks will usually only bite someone who comes into [their] path. Curiosity of the shark and its razor sharp teeth often proves fatal for its soft-fleshed victim. Every year sharks account for 12 human deaths globally. Humans kill around 100 million sharks in the same period, mainly to satisfy a craving in Southeast Asia for the fins, which are eaten as a delicacy. An effective shark deterrent has been sought for decades. After the Second World War, when many s[ailors] lost their lives floundering in oceans after their ships sank, the British and U[S] Governments came up with chemical and sonic repellents – which didn't work. The idea of an electronic repellent stretches back to the early 1960s, but Shark Safe is the first company to develop a unit small enough to be used by anyone in the water... When it goes on sale in A[US] later this year the device will cost around \$1000... The rechargeable batteries last two hours... The unit weighs less than 1kg and... establishes a repulsion field of around 3m... but doesn't harm either party.

...Fisher[s] and scientists are debating the exact size of a monster great white shark caught off Waiheke Island. The shark is just the second pregnant great white caught off N[Z]'s coast and the fisher[s] whose set-net it drowned in swear it was 7m to 7.3m... – ...great whites [grow] up to 9m... The fisher[s] saved two baby sharks by cutting the mother open and holding the youngsters in the water until they swam away.

...Sea monsters up to 4m long are inflicting painful stinging wounds on swimmers. The potential killers are known... as the long "stringy stingy thingys" and appear to be drifting along the Northland coast towards the Hauraki Gulf. The pink organism is only... 1cm in diameter and... can contain hundreds of... mouths, stinging tentacles and reproductive cells... The organism corkscrews through the water and can stick like glue to swimmers causing instant pain and throbbing. Welts from the stings can last for weeks... If swimmers become wrapped up in their tentacles and succumb to panic, shock or the toxic stings they might drown... A visiting [US] scientist who is working on an outbreak of sea bathers' eruption says the creatures are kinds of hydromedusae... [T]he organism was not a true jellyfish. It belonged to the siphonophore family and of its type was highly developed and specialised. It had no brain, just a nerve net, and fed on plankton as well as fish and worm larvae... [W]orking at the University of Auckland's Leigh marine lab[, the USer] has been tracking a pinhead-sized and relatively common creature responsible for itches and rashes suffered by Auckland bathers this summer. [It] says the mysterious bigger creature's stings are worse, especially for people with allergies.

...Hundreds of swimmers were warned to stay out of the surf yesterday after thousands of stinging bluebottles washed up on northern beaches. Two people needed urgent hospital treatment after suffering an allergic reaction to stings while swimming at Long Bay and Motuihe Island. The bright blue jellyfish, also known as Portuguese [perso]n-of-war, littered the sea and sand and left many swimmers nursing painful welts... Bluebottles were usually dead by the time they were blown on to shore, but could still inflict a painful sting... Standard jellyfish stings were best doused with vinegar or salty water... Bluebottles are not uncommon, but constant northerly winds have washed unusually large numbers on to beaches on both coasts of the upper North Island... The bluebottle's sac, which was full of gas and floated on the water, acted as a sail. The jellyfish caught prey with tentacles up to several metres long, which were drawn up and let down like a piece of elastic. The dead catch, anything from small plankton to fish, was then drawn up to the stomach and digested. [By the way, an 'Edinburgh study has found that fish feel pain'.

...The DoC] is asking visitors to the popular Goat Island Marine Reserve n[orth of Auckland] to stop feeding the fish. [The local c]ompliance coordinator... said that although the public enjoyed feeding the fish and getting close to marine life, scientists believed it upset natural behaviour. The reef became littered with bread and other food on which the fish gorged themselves. Bottom-feeding species such as snapper were changing their natural behaviour by rising to the surface for food provided by many of the thousands of swimmers and divers who visited the reserve every weekend... [T]he department was printing pamphlets and signs would be erected asking visitors not to feed the fish. It wanted to educate people rather than enforce the Marine Reserves Act, which allowed for fines of... \$10,000 for interfering with marine life. "People have been feeding the fish for 20 years, so you can't suddenly come down heavy on them,"... [Incidentally, a] National Institute of Water and Atmospheric Research... team returned to Wellington yesterday from its... [s]ea seeding trial... [in] Antarctic waters... A Californian oceanographer, the late John Martin, theorised in 1995 that the ocean's microscopic plants... needed iron in order to take nitrogen and phosphate from seawater, just as farm crops need trace minerals such as zinc and manganese. Tests of the theory off the Galapagos Islands triggered a 30-fold to 40-fold increase in phytoplankton. The research was initially viewed in terms of restoring fish stocks to levels of a century ago, or 10 to 20 times the present amount. But further research by Britain's Plymouth Marine Laboratory and University of East Anglia has shown that a 30-fold increase in phytoplankton, over 500 sq km, cuts levels of dissolved [CO₂ 20%], effectively locking... 9000 tonnes of the gas away from the atmosphere. The iron filings also caused a three-fold increase in dimethyl sulphide particles, which have a key role in cloud formation. Although the waters of the Southern Ocean are rich in nutrients, phytoplankton numbers are low because of an absence of iron. The scientists say if the fertilisation could be done on a large-enough scale in the Southern Ocean, it could produce significant climate cooling, reducing atmospheric [CO₂] concentrations between 6... and 21[%]. The research ship Tangaroa set out [last month] to test the theory by fertilising... [a]n initial area of 55 sq km... about 60 degrees south... with 36,000 litres of seawater and iron mixture... The patch was refertilised three times over... 12 days. Surface currents spread the fertilised water over about 150 sq km... [The] Niwa... regional manager, said the studies had been extremely successful and scientists were excited by the preliminary results.

...*Plankton in overdrive after a dose of iron* N[Z] scientists who sailed into the Southern Ocean... to tip a small truckload of iron solution into the sea say analysis of the experiment shows they triggered a startling phytoplankton bloom. The... experiment... was partly to test the idea that low-availability of iron limits the growth of phytoplankton in some oceans... Remarkable images from a Nasa satellite show that six weeks after the fertilisation, the... 150km long... phytoplankton bloom had grown to cover 1100 sq km. But although there have been controversial proposals to widely fertilise the Southern Ocean with iron to help slow the pace of climate change, some scientists are calling for caution in manipulating ocean-atmosphere mechanisms about which little is known... The... experiment... led by the N[IWA]... followed work done... by [a US] oceanographer... who... proposed that in the past, changes in the amount of iron might have prompted changes from ice-age to present-day conditions.

...A National Institute of Water and Atmospheric Research marine scientist... says it now appears that the... elusive giant squid... [– which] have a maximum size of 12m and can weigh 300kg... [(t)he popular belief that the squids... were up to 21m long... [can be blamed o]n literary epics such as Jules Verne's *Twenty Thousand Leagues Under the Sea*() –] ...come to N[Z] waters for breeding... For more than a year, N[Z] has been the subject of intense international scientific inquiry. This stepped up after last year's finding of 23 giant squid, when only 50 had been reported found in the previous 20 years. No live specimen is known to have been caught, but dead ones have been washed up on beaches or found in fishing nets... [Last year]'s big catch might not have been out of the ordinary because more specimens were being brought [back] as the fishing industry became increasingly aware of scientific interest in them. But since 1995 the captures have been recorded only in certain months of the year, which suggests that the squid do not live in N[Z] waters all year round. Adults appeared off [Kaikoura on] [the east coast of the South Island and on the Chatham Rise from December through to early March, and off the West Coast from June to early August. The data suggested that there were at least two distinct populations or species... "It appears to be an animal of the water column, not one that lives on the sea floor. Neither does it appear to be a particularly deep-dwelling species, as the average depth at which a total of 80 specimens have been captured is 498m." Meanwhile, the influx of squid specimens was straining storage space... They took up to three days to defrost and required up to 150 hours and 1000 litres of formalin to fix.

...An emergency ban on taking shellfish has been imposed along part of the Kaikoura coast following the spill of rat poison after a truck crash. Crown Public Health has warned people not to swim in the area from South Bay to Barney's Rock or eat seafood taken from that area until further notice. But preliminary results from seawater samples have revealed barely detectable traces of the poison's active ingredient, brodifacoum, although scientists said the poison was barely water soluble so it was hardly surprising little had dissolved... Asked whether 18 tonnes of rat poison would have a dramatic impact on sea life around Kaikoura, [the]... research team leader at Landcare's Centre of Environmental toxicology... at Lincoln University, said... the vast expanse of water would certainly have a diluting effect... [The active ingredient –] a very potent second-generation anti-coagulant rodenticide... [–] was stored in... vertebrate animals... liver tissue and would be only slowly eliminated from the body over many months... Scientists monitoring the impact of the spill would be looking for seals, fish and seabirds suffering from lethargy and bleeding... about the mouth, anus and... eyes, [the] toxicology expert said... [The] Environment Canterbury regional enforcement officer, said test results on mussels and seabed sediment taken from near the truck crash site are not due for another week. Landcare Research scientists have recommended continued sampling of mussels, paua and crayfish along with large and small fish... At the same time as tests are continuing, one of Kaikoura's leading tourist operators... Dolphin Encounter... is calling for an inquiry into transport firms'... cartage of hazardous substances and the[ir] driving practices...

Once-abundant shellfish beds around Auckland are in a sorry state, with numbers not significantly increasing eight years after harvesting bans were put in place... Ministry of Fisheries surveys of 18 beaches in Greater Auckland... including a stretch of coast at Ngarimu Bay in the Firth of Thames, show the emphasis on cutting bag limits and prosecuting poachers has not improved shellfish stock. A ministry survey five months ago of the huge cockle population at Umupuia Beach, on the eastern coast near Clevedon, found it had halved in a year – from 400 cockles per sq m to 200 – but over-harvesting was not to blame. "Although we are concerned about harvesting levels there, there are millions of cockles. It's just not possible for humans to have halved that population," said [the ministry's] policy analyst... Two years ago, a study at Okura, north of Long Bay, showed that 2cm of clay washed into the tide killed cockles in a week, said [an] Auckland Regional Council scientist... [– who, together with the policy analyst,] presented a report on shellfish depletion to the Hauraki Gulf Forum, a grouping of city and district councils and Government agencies charged with looking after the Gulf... The National Institute of Water and Atmospheric Research was studying the effects of sediment on marine life and [an] Auckland University doctorate student... was completing a thesis on cockle health and populations near urban areas.

...N[Z] immigrants of a different kind are making their mark in A[US]. At last week's Molluscs... conference in Sydney, delegates were concerned at the spread of the N[Z] screw shell, *Maoricolpus roseus*. Introduced to Tasmania about 70 years ago, the... filter-feeding mollusc has established itself in vast beds in northern Bass Strait and off the coasts of eastern Tasmania, Victoria and N[SW. An]... ecologist at CSIRO Marine Research... estimates the species now covered an area of sea floor about the size of Tasmania... It is not clear how it arrived in Tasmania, but many think it came in the dry ballast of stones gathered in N[Z]. Another possible source was the trans-tasman live oyster trade, which was common at the time. Scientists are concerned about the screw shell's impact on other mollusc species, including scallops and the native A[US]n screw shell... [The NZ] screw shell threatens other species because it breeds so prolifically, smothering the sea floor to a depth of 80m along the Continental Shelf... It seems the Kiwi variety is a particularly tough nut to crack for eating and has few predators. This affects shellfish-eating fish species, and the food chain that depends on them... The screw shell is one of an estimated 200 marine species intentionally or accidentally introduced to A[US]n waters...

The illegal release of exotic fish into Waitakere City's largest lake means it may eventually be too polluted to swim in. More than 14 hectares in size and 15 metres deep, Lake Wainamu... near Bethells Beach has long been a favourite spot with swimmers and boaties. It is possible that recreational fisher[s]... were responsible for the release of perch, rudd and koi carp into the lake, not realising it would tip the natural balance of the lake's delicate eco-system. The A[RC], which monitored the lake alongside seven others between 1992-98, has just released a review of its programme outlining a potentially grim future for Lake Wainamu unless the coarse fish are removed – a difficult and time-consuming task which "may not be completely successful"... In 1995, ARC tests revealed a large increase in the amount of phytoplankton and the amount of turbidity in the water – hence its increasingly murky appearance... The lake's murkiness is the result of the fish digging up the aquatic plant life and stirring up the lake bed as they forage for food... "Aquatic plants are there to absorb the lake's nutrients, but when that stops occurring, the nutrients are instead taken up by the small plant organisms... which cause the murkiness... [T]he fish stirring up sediment, creat[es] extra nutrients for the phytoplankton, which then increase in number." ...Even North Shore's Lake Pupuke has a higher water quality rating, despite being surrounded by urban development... The ARC is looking at options to control or remove the exotic fish... These include netting, introducing a carnivorous fish such as trout... and preventing further illegal releases of coarse fish through education and public watchdog schemes.

...thousands of the bright orange fish... Koi carp[, which can grow]... up to 80cm long, were stranded on fields around Lake Waikare when floodwaters receded. The fish have a reputation for tasting like mud, [so local farmers] will use them for bait or fertiliser... [A] local resident with one of the few D[OC] licences to catch carp, has also collected about 500kg for bait... Koi carp were introduced in the 1950s, but became a pest, silting waterways by eating the vegetation.

...*DOC pest on Asian menus*... A fresh water fish high on the D[OC]'s hit list of unwanted pests is also top of the dining charts with west Auckland's Asian community. Koi carp sometimes fetch up to \$20 a fish and are popular among Asians who believe the fish brings good luck if eaten. The fish is less popular with other ethnic groups due to its many fine bones... [M]any Asian people also like to keep the carp in their garden ponds... D[OC] staff battling to rid it from the waterways of Auckland and Waikato would rather see the prolific breeder destroyed than left to

dominate all other fish species... “They’re a significant issue and it’s difficult to get rid of them, once they’re established they’re near impossible to remove[.]”... says... the... Auckland area manager... [The DOC manager] says it is illegal to rear, raise, hatch or release the fish and offenders can face fines up to \$5000. Recreational fishing is allowed in some infested areas to stop the fish spreading. But all koi carp must be killed when caught.

...It may be a highly prized fish overseas but in N[Z] the noxious koi carp is hunted down and killed – with a bow and arrow. It is an unusual method of fishing but that was how it was done in the Waikato, where 60 [adults]... and children gathered for this year’s Bowhunter’s Carp Competition. Armed with camouflaged bows, arrows and waders, the hunters spent the weekend in knee-deep water searching for a slippery creature that looks like a giant goldfish... [T]he competition not only helped remove... three tonnes of... an unwanted pest from Waikato waters but also provided the country’s 300 bowhunters with a fun weekend away fishing. The heaviest koi this year was 9.55kg – not quite making it to the N[Z] record, which stands at 12kg... The annual competition was supported by the D[OC] to raise awareness about koi... Signs are now mounted at boat ramps warning anglers there is a fine of up to \$100,000 or five years’ imprisonment for anyone caught releasing, spreading, selling or breeding the pest. The exception is for a few commercial operators who have permission to catch and sell dead carp for fish bait and berley.

...The dreaded koi carp is spreading through Waitakere City waterways... Koi carp are considered a good omen to many in the Asian community[, but]... they are bad news for nature... [A] Waitakere City councillor... who is involved with the new Twin Streams Project at Oratia and Opanuku... suspects some people may dump the fish down their drains instead of killing them when getting rid of them or cleaning ponds. “If only we could teach people not to release them. We’re not being kind to release them as they’re destroying our environment... People think they’re a pretty fish but they rip everything up by the roots destroying the ecology of the stream... Our kokopu [native fish] has no chance against them.”

...A COMMON household cleaner has killed two-thirds of a treasured rare fish colony in Henderson. [A local, aged] 79... found 10 banded kokopu fish dead by his property beside the Opanuku Stream... The biggest kokopu killed was about 10 years old and six inches long... [The 79-year-old] has regularly fed fish in the area for six years. The contamination was traced to a neighbouring property where household cleaner was used to scrub a stain off a driveway... “This is the third time in five years fish have been killed,”... says[the 79-year-old. The ARC]’s pollution control officer... says it takes years for local fish colonies to recover from poisoning. But [the officer]’s confident the Henderson colony will soon get back to full strength...

Unique little battler survives against the odds... One of N[Z]’s rarest native fish has been rediscovered in the Waitakere Ranges after scientists had presumed for decades it was extinct around Auckland... [due to] habitat loss, dams and the general degrading of their environment... The shortjaw kokopu (*Galaxias postvectis*) might not be the prettiest of fish with its undercut lower jaw and uniform brown colour. But the D[OC] says it is a category A threatened species... “It’s a very, very significant find,” said [a] DoC technical officer... “We will be looking over the area carefully and seeing what we can do to protect it.” Three shortjaw kokopu were found in two streams in a remote area of the ranges last week by [a] Massey PhD student... who has been studying N[Z]’s native fish for six years. “They’re pretty underrated by most Kiwis... People don’t really know we even have native fish but these guys are found nowhere else in the world...” The Waitakere discovery was part of a nationwide 200-site survey...

[‘There are some 40 species of freshwater fish in NZ, 10 of which have been introduced from other countries. The native species are contained in 11 families. They are believed to have evolved from marine ancestors during NZ’s geological history; in fact, most of the families still have species which inhabit or can tolerate salt water at some stage of their life cycle. The eels are represented by two species, the long-finned eel and the short-finned eel’...

‘EELS of over 30 species in 11 families are found throughout NZ in rivers, coastal waters and in deep water off the continental shelf. Their eggs develop into larvae shaped like leaves and remain in that state for up to 3 years. Their slimy bodies grow up to 1.5 m long and can weigh as much as 10 kg.’

...Did you know that a ‘breed of NZ eel – the world’s largest – can live up to 120 years; and that after 75 years, the girl eels swim to spawning grounds in Samoa – yet only their young return to NZ’? The elvers innately follow an ancient trail that presumably goes via Tonga’s islands and the Kermadec group]...

Navy staff had some demanding passengers on board during their latest supply run to the remote Kermadec Islands – three tropical green turtles. The turtles needed watering every three hours on the two-day trip aboard frigate HMNZS Canterbury from Kelly Tarlton’s Antarctic and Underwater World in Auckland to N[Z]’s biggest marine reserve. The trio, named Bones, Jade and Michelle, spent more than a year recovering from injury and disease before the 1000km trip back to warmer waters. [The aquarium’s c]urator... said Kelly Tarlton’s divers would not miss the occasional nasty turtle nip, but [all the staff were] sad to see them go. “You get pretty attached to them over a year but it’s where they belong so it’s good.” Tropical green turtles, listed as threatened under a United Nations charter on illegal trade in endangered species, are occasionally found off Northland and Auckland but no one knows why they drift so far south. “They’re usually at death’s door by the time we find them,” [the curator] said. Bones was emaciated, hypothermic and had a severe bacterial infection when rescued near Rangitoto Island and it seemed unlikely [the turtle] would survive. But after a high-protein herring and squid diet, all three turtles... [– who] were probably aged between 10 and 20... [(g]reen turtles can live up to 90 years and measure up to a metre in diameter when fully grown[–] ...were in excellent health by the end of their stay, with the heaviest weighing 44kg. Navy staff hauled them aboard inflatable boats and reported the turtles swam quickly away as soon as they were released.

...After making her way to shore, Leo the sick leopard seal lay on the beach to die in peace. But her final hours were anything but peaceful. On Gisborne’s Midway Beach on Saturday afternoon, up to six drunken young [people] with pieces of driftwood repeatedly beat and kicked the helpless mammal... “You could see it was trying to move, trying to get back in the water,” said [a witness to the attack... The beating has outraged locals and... D[OC] staff, and prompted police to hunt for the [offenders]... Leo, first thought to be a [bull], became a celebrity in Gisborne when [the seal] came ashore two weeks ago. Leopard seals live in Antarctic waters but sometimes stray north in winter and rest on beaches. But scientists advised DoC staff that the emaciated 3m-long mammal probably came ashore because [it] was sick and dying. It was decided to let Leo die naturally rather than put her down. But on Saturday afternoon, as [the witness] walked her dog, [they] came across the group... attacking Leo. “They were all [gals]... all well-dressed, all well-spoken.” [The witness told the attackers] – thought to be aged in their late teens or early 20s – to stop, pointing out that the seal was sick and dying. The group insisted the mammal was already dead, but [the witness told them]... Leo would have been taken off the beach if that was the case. The [attackers] backed away from Leo, but as [the witness] continued her walk, they resumed kicking and hitting the seal... [The witness] immediately contacted DoC staff, who went to the beach but the [group] had left. The seal did not appear to be in pain, but died on Sunday morning... An autopsy last night found the seal had reproductive tract, pancreas and mouth tumours and probably died from a cardiovascular problem. There was recent bruising consistent with being beaten, but these injuries would not have caused her death... A... DoC spokes[person]... said... “It wasn’t like [Leo] was disturbing anyone, so it just seems so unnecessary that these stupid people behaved in this way. It didn’t appear to be in any state that it could have got away. It’s just horrible.” Registration plates of vehicles parked in the area on Saturday have been given to police. Under the Marine Mammals Protection Act, people who injure, harass or disturb a marine mammal, whether it is alive or dead, can be fined up to \$10,000. Massey University’s wildlife health centre director... who carried out the autopsy, said... “[Leo] was going to die anyway but that doesn’t make what happened to her any less horrific... It’s just beyond me how people could do something like that.”

...A baby seal suffered horrific injuries... after three youths beat it with a piece of wood. A Foxton Beach [resident] walking his dog on Saturday saw the youths hitting something with a piece of wood. When [the dog-walker] went over, they ran away. The [dog-walker] found a seal with one eye poked out and its body crushed and smashed. The Department of Conservation, police and Massey University’s veterinary department were called and they decided to destroy the seal. Police are urging people with information on the incident to come forward[– although, much like the group who attacked Leo the leopard seal on Gisborne’s Midway Beach, if caught the offenders would probably just be ‘let off with a warning’!]

...Russian scientists deliberately exaggerated the threat to 200,000 baby seals, falsely claiming they were dying of starvation on ice floes in the White Sea, as a ploy to get extra funding, says the International Fund for Animal Welfare. The claim that the baby white seals were marooned on drifting ice, unable to return to their normal feeding grounds in the Barents Sea, led to a costly rescue effort earlier this month. A Russian ice breaker prepared to set sail from Murmansk to scoop up the seals in nets. Television companies hired planes and helicopters to look for starving seal cubs. They never found them... "The situation was absolutely normal for this time of year." Only about 5000 seals turned out to be in trouble.

...The bodies of 15 sea lions have been found in Ecuador's Galapagos Islands with their teeth and sexual organs extracted, presumably for sale in Asian black markets as aphrodisiacs. The carcasses were discovered after Galapagos National Park officials received a tip that 25 mutilated sea lions had been left on the southern shore of San Cristobal, the easternmost island in the remote Pacific archipelago... The islands' sea lions have no natural predators on land and generally do not fear humans... Investigators believe the animals were dumped in the ocean after they were mutilated and washed up on shore. Police said they found what they believed was the poachers' abandoned camp site, littered with soft drink bottles and leftover food. Hunting is prohibited and fishing is limited in the Galapagos Islands, 965km west of the [South America]an mainland.

...A... [South America]an Government has ordered the slaughter of thousands of crocodiles... which... were considered an endangered species. "We don't have a choice," said... an official with Paraguay's Environment Secretary office... [The crocodiles are] starving after a major river was diverted... Government officials estimated that more than 40 or 50 of the crocodiles were dying every day... Insisting many of the animals were now certain to die, authorities had allowed farmers to hunt... about 2500... of... the animals for their meat and hides... "There is only a little water left, and there is no fish for them to feed on... Most of the adult crocodiles have only two to three months to live,"... Fed by the waters flowing from the Andes Mountains, the Pilcomayo River was diverted 11 years ago to help improve water irrigation for Argentine and Paraguayan farmers. However, that move, coupled with a prolonged drought, left many of the lakes and swamps with stagnant water[, and m]any crocodiles... caked in mud... Paraguayan officials said they wanted to rescue many of the younger animals, but plans to move hundreds of them to other waters had been postponed... They were hoping a forecast of rain might help ease the animals' plight. Government plans to have Paraguayan soldiers assist in the hunt were also delayed as soldiers underwent training on ways to safely capture the crocodiles. On one recent evening the hunt was left to around 30 Paraguayan farmers drawn by the promise of \$US2.50... for each animal recovered... As part of the sanctioned killing... the... Paraguayan peasants [were] plying the waters in wooden canoes or wading through chest-high waters with sticks crudely fashioned into spears and brandishing poles and clubs... Once they brought a crocodile within reach, others joined in with axes and machetes for the kill. "Although the crocodiles are weakened, some still have strength to bite," said... a farm owner in the area where many of the hunts were taking place. The animals were hauled in canoes to be skinned on land. Bathed in salt, the hides are then laid out in the sun to dry. The meat is sold or used to feed the younger crocodiles.

...The parents of a 7-year-old boy who broke into an A[U]S nouthack zoo and fed a string of small animals to its resident crocodile are likely to be sued after police said the boy was too young to be held responsible... Security camera footage at the Alice Springs Reptile Centre showed the smiling youngster also bludgeoning to death a small blue tongue lizard and two... thorny devils during a half-hour of breakfast-time havoc...

Remains of 5-year-old Jeremy Doble were found in the stomach of a 4.3m... crocodile trapped in the flooded Daintree River near where the boy vanished... Meanwhile, a taxi driver has run over and killed a... 1m... freshwater crocodile... on the Leichhardt River crossing... in Mount Isa.

...Crocodiles can dive for hours on end because of a unique set of teeth in their hearts, scientists have discovered. The teeth-like valves... divert blood away from their lungs, allowing them to stay underwater for extended periods. [A]University of Queensland Zoology and Entomology lecturer... says the valves are controlled by the amount of adrenalin in their bloodstream... The valves are also present in other members of the crocodile family, including alligators. [Editor's note: 'Crocodile eggs need a temperature of 27 to 34°C to incubate (eggs incubated below 29.5° C hatch into girls). Only 1 to 2% of baby crocodiles survive. Crocodiles have a vocabulary of 18 sounds – making them more like mammals than reptiles' ...

'Mammals first appeared during the Mesozoic Era (the Era of Reptiles). They were small, warm-blooded animals with hair, that looked very much like the reptile from which they descended. Toward the end of the era, Earth gradually began to change. The climate became colder and swamplands, covered with thick green vegetation, began to disappear. Over a period of thousands of years, mammals gradually developed which were able to survive in these new surroundings. Their warm blood and hair protected them from the cold. Their larger brains and ability to move quickly made it possible for them to escape from enemies and to catch food. They developed special teeth and more efficient digestive systems. Instead of laying their eggs on the ground and forgetting about them as dinosaurs did, they were live-rearing animals that carried their fertilized eggs inside of their bodies until they had developed into baby animals. After their babies were born, they fed and cared for them until the young animals were able to take care of themselves. These changes made it possible for more mammals to survive. During the end of the Mesozoic Era and the beginning of the Cenozoic Era – the period in which we now live – the ancestors of modern mammals appeared. Some present-day mammals, such as the *opossum* and *rhinoceros*, look very much like their prehistoric ancestors. Others, such as the horse, look very different. The family began with an animal the size of a fox called the *dawn horse*. It had four toes on its front feet and three on its hind feet. The first camel, *Protylepus*, looked like a baby goat. The first flesh-eating mammals, called *Creodonts*, looked like weasels. The *Barylambda*, an ancient mammal eight feet long, ate both plants and small animals. During the middle of the Cenozoic Era, there appeared dog- and cat-like animals. The *Hyaenodon*, a hyena-like animal, lived during this time. Later in the era the ancestors of the elephant developed. The family began with a small piglike animal with two large front teeth. It was called a *Moeritherium*. As its descendants grew bigger, they developed longer legs, and necks, a trunk and tusks.'

...a] hint of skulduggery is in the air as the world's conservationists prepare once more to battle over the African elephant and its precious tusks. The battleground will be the Convention on International Trade in Endangered Species... conference in the Kenyan capital, Nairobi... So bitter has the debate over ivory become that some... Western wildlife activists... [have accused] states such as Zimbabwe [of] manipulating facts and failing to honour commitments to protect elephants made at the last CITES meeting in 1997. Then, southern African delegates... were celebrating victory in what they saw as a struggle pitting the poorer states of the world – with elephants – against elephant-less rich countries wanting to keep Africa as some kind of wildlife theme park. A secret ballot among the delegates from 139 countries allowed Zimbabwe, Botswana and Namibia to sell tonnes of stockpiled ivory to Japan on an experimental basis under strict conditions. Two conditions... were to halt trade immediately if poaching escalated and to plough the revenue from ivory sales into elephant conservation. Now the ivory has been sold and both sides are assessing the impact ahead of the Nairobi meeting, where the three African states will press for permission to continue sales. There is widespread consensus in Zimbabwe that poaching has increased, with Government media reporting... 84 elephants were slaughtered last year. However, the same media and Government officials have suggested that anti-ivory-trade activists hired [people] to shoot elephants and thus tarnish Zimbabwe's name. While the idea might appear preposterous, respected independent conservationists refuse to rule out the possibility... [T]he Zambezi Society conservation group says: "Some fringe groups of animal rights activists have sent parcel bombs and blown people's hands off..." But the... Government often resorts to conspiracy theories to explain away unpalatable facts... [The society, which] supported the ivory sales... in 1997, is now having second thoughts. "Part of the trade-off was that the money raised would be used for... improved field protection for elephants, but that hasn't happened."

...My sister and I have just watched *Savage Season* (TV1...). We couldn't believe what we were seeing. An orphaned baby elephant... attempt[ing] to suckle the tree with its mother's scent on it and... being spurned and battered by other elephants, weak, bewildered, dehydrated, starving, and then (at this point I turned the TV off) the hyenas moved in. We just cannot understand how the camera crew could stand by cold-bloodedly filming without stepping in. What is the difference between these people and ivory hunters? Don't they both benefit financially from an elephant's death? So much for conservation... [(although a] herd of 30 elephants will be flown... [from] South Africa... to Angola as part of a wildlife relocation

programme[])... We kept hoping they would help and could not believe they did nothing, especially after the commentator had said it was like watching a child being badly abused... The baby elephant would have been better off being shot and left to hyenas, rather than helplessly fighting for its life, in absolute terror, while so-called human beings watched and recorded it... To use the excuse that people should not interfere in the machinations of nature is feeble and totally unacceptable when you consider how we do, in fact, impact on the lives of the animals on this planet.

...[‘There are six factors which control the balance of nature. As long as all of the factors stay the same in an area, the balance there will remain stable. As soon as one of the factors changes, the balance is upset and changes occur to make it even once again. The 1st of these factors is *climate*. The 2nd factor is the *topography* of the land. The 3rd factor is the type of soil that plants and animals exist on or in. Soil is one of the most important of the six factors. This is because a *climax community* – one in which there is a sufficient number of producers, consumers, and disposers – cannot exist until an adequate amount of soil is built up in an area. Water communities do not have soil. These communities differ by whether the water is fresh or salt, and whether it is stagnant or free-flowing. The 4th factor is the *dominant vegetation*. This is dependent upon the previous three factors. The progression of plant species in an area changes until there is one general type which outnumbers the other kinds. For example, grass is the dominant form of vegetation in the prairies of the central US. The 5th factor is the type of plant life in the area. This determines the number and kinds of animals that can exist in a given environment. Not all plant-eating animals will eat any kind of available plant. The 6th factor, destructive external forces, does not help to maintain the balance of nature, but instead contributes to upsetting the balance. Examples of this factor are erosion, fires, plagues, parasites. Introduction of foreign life into a region will also upset the balance of that region’s environment. This is true even if the foreign life is introduced with the intention of improving the existing life situation. An area cannot achieve or maintain a balance if it is interrupted by a destructive force. A region completely devastated takes hundreds of years to become stable enough to provide an equilibrium of living organisms. The most important change taking place is humanity’s awareness of its role in maintaining the balance of nature. Only when human beings learn to live in harmony with other organisms can a true equilibrium of life on earth be achieved.’]

...Problems when nature left to keep its balance... In 1986... a writer, stood before a piece of ground in Yellowstone National Park which had been grazed... “as smooth as a golf fairway.” [The writer] turned to a scientist. “Is this range damaged?” ...“What is truth?” the scientist replied rhetorically. “You and I look at this scene and see range damage. The National Park Service sees nature at work.” As Yellowstone enters its 30th year of “natural regulation” it finds itself in the middle of a deepening dilemma: should it go on letting nature take its course, or not? Critics have questioned natural regulation ever since its inception, and the policy now has fewer friends than enemies. When 800,000 acres... – more than a third of the park – went up in smoke in 1988, patrons, furious at seeing wildfires left to burn, bombarded politicians, who then called for the head of the park superintendent... But similar storms erupted when nature was not left to regulate itself: 1084 bison were shot during the winter of 1996-97 as they left the park looking for forage. A judge in Montana has just ruled, despite a petition from environmentalists, that bison can be shot this winter, too. Now Yellowstone’s estimated 18,000 elk sit in the political spotlight. Park scientists once thought there could never be too many elk; there could be temporary overgrazing, but the range, they insisted, would spring back as soon as the elk died from starvation, revealing a natural equilibrium. This has not happened. The numbers at which the elk population would theoretically stabilise have kept rising, well beyond what the scientists predicted. Population ecologists... of the University of Wisconsin at Stevens Point, say that winter and wolves will eventually take care of the problem. The cold and lack of feed that drove bison out of Yellowstone [in 1996-97] also killed a[bout]... 6000 elk. But wolves are a different story. They have killed about 360 elk since they were reintroduced to the park in 1995; last month a federal judge ordered that, being a “non-essential experiment,” they should be removed again... Last February... an assistant professor of political science at Utah State University... produced (and showed to Congress) a striking series of photographs of different parts of the park at the turn of the century and now. These showed that, over the years, elk have stripped the park of its aspen and willow stands. [The political scientist] claims that aspen in particular have suffered a 95[%] decline since the [‘first national park’ not just in the US but also ‘the world’] opened in 1872 – a serious development because beaver rely on aspen to build their dams, which in turn are vital to keep wetlands going. Park officials say that elk are only partly to blame. In their view, a hotter and drier Yellowstone caused the moisture-loving willow and aspen to disappear... And [the political scientist] himself admits that aspen groves have been deteriorating throughout the west of the country. The feeding of elk outside the park complicates the issue. Only two of the nine Yellowstone elk herds winter in the park. The rest migrate to feed. Herds in the southern end of Yellowstone head for the Jackson Hole Elk Refuge where the state of Wyoming feeds each of them 3.5kg of hay a day. How can the number stabilise at a low level if they are fed? One biologist... once flung up his hands at the folly of it all. “It seems to be academic... to talk about maintaining the balance of nature. The balance of nature in any strict sense has been upset a long time ago, and there is no such thing to maintain.” Yellowstone, pulled and tugged by changing policy manuals and over-bearing politicians, has a history of reactive management. When attacked by critics, the faithful tend to circle the wagons, only to capitulate as soon as some scientific school of thought convinces them that disaster is imminent. Yet that may change. Yellowstone is part of a new experiment in park fees. Last year the entry fee was raised to \$20; the park will keep \$8. Will visitors really pay to see dying elk and meadows nibbled down to the roots? Keeping part of the gate receipts may give the park more autonomy, and push politics further out of the picture. It would be even better if the park’s managers used their new freedom to come up with a consistent set of principles on which the park could be run.

...America’s biggest landowner and the founder of C[NN], has authorised electric-shock collars to be fitted on wolves captured from the wild in an experiment aimed at “training” them not to kill farm animals... The federal Government-backed research will be carried out at [h]is Flying D ranch in Montana. The 61-year-old... Republican with strong pro-nuclear, anti-immigration views, is also a staunch conservationist and heads [an] Endangered Species Fund, which has taken a keen interest in the fortunes of the endangered grey wolf... The collars will be fitted on four wolves from a pack in the Greater Yellowstone area... The wolves, captured after being sedated with darts, are being kept in pens on [the] 243,000ha ranch. Calves will be brought into the pens, and if a wolf goes within a couple of metres of a calf the collar will emit a noise followed by an electric charge. The collar will deactivate only if the wolf moves away from its prey. If the shock therapy works, the wolves will be returned to the wild, wearing radio tracker collars but not electric-shock collars. If they start attacking cattle again they will be shot. The experiment, called the “aversion conditioning programme,” was devised after a controversial Government-supported project to reintroduce 31 wolves into the Yellowstone Park area in 1996 went wrong because the[y]... started attacking livestock... The project, due to start in two weeks, has provoked outrage... [T]he Fund for Animals, said it was “an exceedingly cruel experiment to try to change the wolves’ natural predatory behaviour.”

...A wolf expert is howling at the moon around a British stately home to encourage a pack of timber wolves to breed. As dusk falls at... the wildlife sanctuary... in Wessex, [the expert] creeps up on the eight-strong pack... and imitates the noise of a lone wolf[while h]is colleague... plays tapes of wolfpack noises... to kid the pack into believing there are larger packs prowling around and make them more competitive breeders. The pack’s dominant [bitch] was spayed this year after losing three cubs at birth. Now the second-ranked [bitch] is being encouraged to take her place.

...Saddled with the unenviable, some would say undeserved, reputation as the continent’s most savage predator, Africa’s wild dogs have been hounded to the brink of extinction by human hunters and the loss of their natural habitat. Now, thanks to the efforts of dedicated conservationists, these animals are making a comeback. “We hope these ones make it in the wild,”... a field ecologist at South Africa’s Pilanesberg Game Reserve, said as [it] cast his eye over a group of wild dogs in an enclosure encircled by an electric fence. The nine dogs – three... raised in captivity, a wild [bitch], her four pups and another wild [bitch] – have spent several months in the enclosure to allow them to get used to each other ahead of their release this week. Their distinctive white, black and tan splotches have earned them their Latin name – *Lycaon pictus* – which means “painted wolf.” If the pack survives in its new home, it will be the first time in decades that the wild dog has roamed this part of South Africa’s North-west Province. An extremely adaptable animal, wild dogs once occupied virtually every habitat in sub-Saharan Africa. Today, there are believed to be

only about 4000 of them in the wild, most in northern Botswana, western Zimbabwe, the Selous Game Reserve in Tanzania and South Africa's Kruger National Park. Farmers had a negative attitude towards the wild dog when it preyed on their livestock and its killing methods were reviewed with revulsion. Hunting in pack formations – wild dogs lack the claws of a cat and weigh 18 to 36kg – the animals frequently snap at their prey, especially in the abdomen area, with the intent of disembowelling their intended meal. It is an effective way to kill and also very swift. However, like the wolf in North America and Europe, the wild dog's reputation has undergone a metamorphosis as biologists recognise the role it plays in Africa's diverse eco-systems. Field studies have shown that wild dogs are social animals that care for and dote on their young like few other creatures in the wild. [The field ecologist] hopes the wild dog can be snatched from the jaws of extinction but there are no guarantees. "They have been suffering from domestic dog diseases like canine distemper and rabies as [hu]mankind encroaches on their habitat,"... The Pilanesberg relocation is fraught with problems. For one thing there are the resident lions. "Lions will kill a wild dog every chance they get,"... The [bitch]es are the only members of the pack with hunting experience, and both appear to be pregnant. "The[y]... have to transfer their knowledge of how to hunt and avoid other predators like lions before they give birth in about two months' time,"... To keep tabs on the situation, two of the [dogs raised in captivity] – one of whom has claimed dominance over the pack – and the alpha or dominant [bitch] have been given radio collars.

...[The 'DINGO or Warrigal, is a feral variety of the domestic dog *Canis familiaris*, regarded by some zoologists as a distinct subspecies, *C. familiaris dingo*. It is one of a group of wild or semi-domesticated dogs from the tropical regions of the Old World and its closest relatives appear to live in the vicinity of Thailand. The weight of evidence from palaeontology and studies of Aboriginal prehistory indicated that it arrived in AUS as recently as 4000 years ago, but this figure may be a slight underestimate. Certainly there is no evidence for the widely held belief that it was introduced by Aborigines, who have occupied the continent for 40000 years. A more likely hypothesis is that it reached AUS in a domesticated state, accompanying Indonesian or South-East Asian fishers who visited the northern coast of AUS. It entered AUS from the north and it is significant that it failed to enter Tasmania (which became separated from the mainland about 14000 years ago). Fossil and subfossil remains from caves and fissures also indicate that, as it moved southward, the dingo displaced the marsupial thylacine, which previously had been the largest mammalian carnivore in AUS: the survival of the thylacine in Tasmania is almost certainly due to the dingo's absence. Dingoes are rather solitary, each animal inhabiting a home range and not moving far beyond this. When small prey are readily available, they hunt as individuals but a number of animals may co-operate to hunt larger animals. This co-operation is based on a loose social organisation with a dominance hierarchy among the members. If raised from pups, dingoes make pleasant affectionate pets. But wild dingoes are wary of humans and do not attack unless cornered. Nevertheless they will approach camps in the bush on the lookout for food or perhaps out of curiosity.']

...A... National Park ranger[']s televised]... shot to the head of a dingo on Queensland's World Heritage-listed Fraser Island has ignited a furious debate over conflict between tourists and A[US]'s native dog. Conservationists are taking legal advice on action under federal environmental laws, and the Ngulungbara people, the traditional owners of part of the island, are planning to seek a High Court injunction against the shooting of dingoes. The dingo killed... was the first to die under a new policy to clear the animals from campsites on the island in the wake of the fatal mauling on Monday of 9-year-old Clinton Gage. The two dingoes believed responsible for the killing and for an attack on Clinton's 7-year-old brother... were shot soon afterwards as opposing sides gathered their forces for a debate that has been running for decades. The killing has also been used by [her] supporters of... proof that [a NZ]-born mother did not kill her baby Azaria at Uluru (Ayers Rock) in August 1980. Fraser Island is home to up to 200 dingoes, which have been growing increasingly bold because of tourists disobeying laws against feeding them. Excluding the Gage children, dingoes have attacked at least five people in the past three years – most seriously in 1998, when a dingo dragged the 13-month-old daughter of British tourists from a campsite before being scared off. Clinton Gage's death and a cull ordered by Queensland[']s Premier... have sparked a new row between conservationists who oppose the killing of wildlife in a World Heritage area and people who believe humans must always come first. Calls, e-mails and faxes flooded the... nation's biggest talkback show... at Sydney-based Radio 2UE... with a slim majority opposing the cull... And across A[US] the debate became the third most-discussed news item in A[US], behind the latest scandals to hit [the AUSn PM]'s embattled Government... The Queensland Conservation Council... does not oppose the killing of rogue animals[, but a] coordinator... said the new policy was a knee-jerk, populist approach and was not responsible environmental management. "We need to work out what is the best way forward here with cool heads and implement that, and not in a sense seek a form of retribution against the dingoes... It is humans that have created the problems."

...TV's *Crocodile Hunter*... has leapt to the defence of the pack of dingoes that live on Fraser Island off the Queensland coast after a pair of wild animals killed a 9-year-old boy and badly injured his brother... [The international celebrity] has slammed the Queensland Government for shooting the dingoes in a culling frenzy. [The Crocodile Hunter] says killing off some of the wild dogs could make them more dangerous by disrupting their social pattern... [The Crocodile Hunter] said humans needed to respect the dingoes in their own environment. The attack was the first ever dingo-related death that has been proved... [The] Crocodile Hunter... wrestles crocodiles and juggles with snakes in his hugely popular television series.

...Nearly 1000 snake charmers held a protest in eastern India yesterday... demanding the right to perform with live snakes. Shows featuring cobras and other live snakes have been banned in India since 1991 though they are still a common sight, especially in tourist areas and in small villages. India has about 800,000 snake charmers, according to its Snake Charmer's Federation. The technique of charming the snake out of a basket is often handed down from father to son and charmers say their traditional way of life is threatened by the Wildlife Protection Act... Animal rights activists say snake charming is cruel because the snakes sometimes have their mouths sewn shut, fangs removed or venom glands pierced to protect their handlers. Snakes are deaf and their "dancing" movement is a self-defence response to vibrations they see as threatening.

...It was meant to reveal the strength of the minister's fundamental beliefs. But when the Alabama cleric picked up the timber rattlesnake in front of his congregation, the reptile promptly bit him. Within 10 minutes, the [cleric] was dead. The minister's death, in 1998, may not seem surprising. But doctors were startled, for rattlesnakes rarely deliver fatal bites. On average, only one in 500 of their human victims has died... particularly after the development of anti-venom made from horse serum. But now something strange is happening to America's rattler population. The ability to deliver life-threatening bites, once restricted to only a few subspecies such as the deadly Mojave rattler, has been spreading rapidly. "Doctors must now use much more anti-venom to treat bites," says... [a spokesperson from] Staten Island University Hospital, in *Natural History*. "Whereas five to 10 vials used to suffice, patients today don't seem to improve until they have been injected with between 30 and 70." Some scientists argue that America is simply witnessing the rapid molecular evolution of the rattlesnake. The ability to deliver powerful neurotoxin bites is being passed from the more deadly species to the less harmful ones. Scientists at the University of California, however, say the snake's enemies have evolved stronger anti-venom defences. To overcome this, rattlers have simply developed more and more deadly venom.

...Rare lizards are expected to thrive after being released on to a rat-free island in Northland – as long as they keep away from the world's last dinosaur, the tuatara. Over the past few months, the D[oC] has released... 100 lizards on to Lady Alice Island in the Hen and Chickens group... that were likely to have been present before the arrival of the Pacific rat, kiore. At 145ha, the island is one of the biggest in the group... "The tuatara population on the island is in the high hundreds,"... [a DoC] officer... said. "They eat lizards, but everything should be alright, provided [the new lizards] get a chance to get established. The damage... tuatara do is nothing compared to the rat." ...thousands of rats [once] inhabited the island... [but it i]s now deemed safe for releasing the new lizards, which [DoC]... trapped using baited biscuit tins on the other islands in the... group... Two endangered species – the Mokohinau skink and the McGregor's skink – were released at opposite ends of Lady Alice Island so they don't compete with each other for food and breeding territory. The other species... released was the more common Pacific gecko. "While the gecko is not endangered, it did exist on the island before the rat, so we[']ve reintroduced it,"... It[']ll be some time before results are known. "These species, like all N[Z] lizards, are slow breeders and their establishment on their new homes will take several years. The newcomers have joined six other species

of native lizards, which survived the kiore. The department also plans to release other rare lizards on to Lady Alice Island – and other islands in the... group will be made lizard resorts once they have been rid of rats. Lady Alice Island is off limits to the public to ensure its rat-free status.

...yesterday[, as details were being provided to the media about]... a \$12 million Waikato project to build a [specially-designed] pest-proof 45km fence around Maungatautari mountain[, the DoC was finalising]... efforts to set up another predator-free home for at-risk species when it was reported a rat had been sighted near Ulva Island. Plans to release saddlebacks on the wildlife-rich reserve off Stewart Island may now be in jeopardy.

...Dogs trained to hunt out possums will be taken to Kapiti Island this week as the D[OC] reacts to threats against the wildlife sanctuary. A group calling itself the Biodiversity Action Group says it has released 11 possums on the predator-free island, home to rare birds such as the takahe, little spotted kiwi and saddlebacks. “I have let eleven [sic] opossums go on Kapiti. More will follow,” said the letter, posted in Manawatu. The group also claims to have spread tahr, wallabies and fallow deer around N[Z] in an apparent campaign against plans to remove the pests. The Minister of Conservation... called the claimed release “gutless vandalism”. [The minister] said yesterday that the threats to release more pests in wildlife sanctuaries were nothing short of eco-terrorism... Kapiti has been clear of possums since 1986. The R[FBPS] has received three anonymous letters from different parts of the country threatening to sabotage sanctuaries – including Kapiti – in the past few weeks. They have been handed to the police. [The RFBPS] conservation manager... said the letters raised opposition to the organisation’s support for ridding forests of deer and alpine areas of tahr, and for aerial 1080 poison drops targeting possums, rats and stoats. “Some of these hunting people want to see our national parks run as big game parks or safari parks. I think most N[Z]ers would consider that that is just not on... Clearly there is a lunatic element in the hunting fraternity that has no concern for N[Z]’s natural heritage. This rogue element is even prepared to threaten kiwi, our national emblem.”

...I am disgusted at the unashamed use of gin/leg hold traps by the D[OC]... Why is this practice still allowed? No animal deserves such pain. Those who oppose that should have one clamped on their leg. Yes, we know all about native birds blah, blah. But it remains that the biggest pest is us allowing burgeoning litters [of cats] and stupid DOC [officers] like the one on *Holmes* with a kiwi who “unfortunately lost a leg in a gin trap”.

...A tasty new morsel is proving effective in the war on the stoat. Freeze-dried rats are being used to bait ten traps in the D[OC]’s mainland island project in the northern part of the Urewera Ranges. The discovery comes after... staff found a high [%]age of digested rat in the stomachs of stoats.

...The Canterbury Regional Council has launched... Target Pest Enterprises Ltd... to tap into lucrative pest control work throughout the South Island... The council-owned company is expected to go head to head with Southern Pest Management Ltd, a company formed 18 months ago by two former Ministry of Agriculture and Forestry livestock officers, and which took over bovine TB pest control in Otago from the Otago Regional Council[’s]... own Regional Pest Services company formed from its pest services division.

...N[Z]’s pest population of 70 million A[US]n possums may be doing more than killing off native forests and spreading bovine [TB], health officials say. The possums are thought to have become a reservoir of infection for a form of typhus fever... Murine typhus – which Auckland Healthcare says kills about 4[%] of hospitalised patients – is caused by a bacteria, *Rickettsia typhi*, and is spread by fleas... N[Z]’s first case had been diagnosed almost by accident. A laboratory technician who had a test kit for the illness tested a blood sample from a patient whose illness had proved difficult to diagnose... [B]lood tests have [since] identified five cases... north of Auckland, and two... in south Auckland. “A feature of all cases was their exposure to possums...”,... Overseas, murine typhus is usually... spread by the oriental rat flea to humans who rub or scratch infected flea faeces into flea bites... In the U[S], where between 30 and 50 cases of murine typhus are reported each year, about 75[%] of the infections are thought to be from cat fleas. [But in the] foothill and orchard areas around eastern Los Angeles, most infections are thought to come from American opossums that are heavily infested with fleas. In N[Z], the main features of murine typhus are headache, fever and muscle pain, with rashes appearing in about half of the cases. Untreated, the illness usually lasts two or three weeks... Murine typhus is different to the more serious epidemic typhus, which has caused the deaths of millions, but is transmitted by lice.

...Genetically engineered carrots and potatoes are the latest weapon in the war against possums. The Environmental Risk Management Authority... has approved an application from Landcare Research to import the modified vegetables from A[US] and the U[S]. Testing will be carried out at Lincoln in Canterbury to see if the carrots and potatoes trigger sterility in possums... The Sydney-based director of the Marsupial Cooperative Research Centre... said the testing would be restricted to a laboratory and it might be five to 10 years before scientists could look at large-scale field trials. G[E] carrots were chosen because there was no chance of their regenerating in the wild... N[Z] scientists are looking at a range of delivery mechanisms for immuno-contraceptives apart from baits such as carrots. The options range from incorporating them in plants that possums eat in the wild and even to aerosol sprays delivered when dominant possums feed at a bait station... Control of the pest is costing N[Z] between \$80 million and \$100 million a year, and some specialists have said conventional controls using air drops of poisoned baits, trapping and shooting will never eradicate possums. ■... The rabbit haemorrhagic disease was smuggled into N[Z] inside a farmer’s socks among other hiding places. [South Island f]armers made several trips to A[US] in 1997 to obtain the virus, then called calicivirus, sources say. They obtained it from a pure strain of RHD being distributed by the A[US]n Government after the virus escaped from contained trials on Wardang Island, off S[A].

...threatened with poisoning and banishment to overseas zoos, some of Kawau Island’s wallabies... [–] brought to Kawau by Governor Sir George Grey in the late 1880s... [–] are in for a dramatic change of fortune. The A[US]n Government wants the wallabies back. In fact, the Aussies are so keen they’re paying the costs of repatriation... Once home, the animals are likely to be taken to a special sanctuary where they will be protected from predators. It’s a far cry from their lowly status in N[Z], where they are regarded as bush-destroying pests. An Auckland D[OC] spokesperson is... delighted the A[US]n Government was helping solve the problem. “It’s a very convenient project from our point of view, they are a pest and we want to get rid of them,”... But not all the wallabies are in for the red-carpet treatment. A[US]’s Department of Agriculture, Forestry and Fishing wants Kawau’s tamar wallaby, a genetic sub-species extinct in its S[A] homeland, and the rare brushtail wallaby. Two other wallaby species – the swamp and the parma – won’t be going home and will remain targets of a campaign to rid the island of the unwanted marsupials... Estimates put Kawau’s wallaby population at about 8500 and some of the island’s residents argue that the marsupials are a unique feature and should stay... Two Massey University scientists have been commissioned... to disease-test a sample of the wallabies before they leave... The deal means the A[US]n Government will meet the costs of rounding the animals up, quarantining them for about three months and flying them home.

...Hunting guides want to fly overseas clients into Mt Cook National Park to shoot Himalayan tahr... Trophy fees, aircraft rental, guides’ pay, and taxidermy charges would work out to more than \$10,000 for each animal killed, giving the [park’s herd of]... between 50 and 100 bull tahr... a total value of up to \$1 million. But the D[OC] plans to spend thousands of dollars eradicating the animals under a plan to empty the park of tahr... Hunters have just finished culling tahr from several spots outside the park, under an agreement with the department. The hunters reached the agreement after complaining that DoC had culled 128 bull tahr last season. This year, the hunters culled only [the cows] and young tahr, leaving the valuable bulls for trophy hunters... [A] Hunting and Fishing master guide... said conservationists were pressuring the department to get rid of tahr altogether. Such a move would be a big loss to N[Z] in tourism dollars and jobs. Tahr were now so scarce that land-owners were catching them live and releasing them on their properties so they could charge overseas hunters trophy fees...

[‘Although the tiger has few natural enemies it has been hunted by people from very early times, at first by local people and later for sport. In India especially, the coming of the British and the introduction of firearms was disastrous to the tiger and it is estimated that in 1877 alone 1579 tigers were shot in British India. Today the reduction of game animals and the reduction of its habitat is further diminishing its numbers, and as a result six of the eight races of tiger are listed as being in danger of extinction.’ □ A guy] mauled by a tiger at Wellington Zoo was fighting for his life late last night after nine hours of surgery. The [guy] was attacked after [it] scaled a 5m fence and jumped into the grassed enclosure of the 6-year-old... sumatran tiger,

Rokan. The 110kg tiger pounced, inflicting serious puncture wounds to most of the [guy]'s body. The attack, about 1pm, was seen by the [guy]'s partner and her cries for help alerted zoo staff. The [victim], who is 27, is a Wellington Hospital mental health unit patient. As zoo workers tried to separate the tiger from its prey – using hoses, fire extinguishers and feed buckets as distractions – a group of 20 schoolchildren arrived at the enclosure. The victim was unconscious and had lost a great deal of blood by the time [it] arrived at Wellington Hospital... Wellington City Council's director of community services... said it was not known why the [guy] had scaled the fence... [I]t was the first time a big cat attack had occurred at the zoo. An investigation would be held, but it did not appear the zoo had been at fault and at no time did the tiger leave the enclosure. Nothing would happen to the tiger. One zoo worker went into shock after the attack, and last night the zoo was providing counselling for several staff who needed support. One keeper said the normal behaviour for a tiger in that situation would be to "spot his prey, sink down, stalk him and then pounce and maul". [The keeper] said the cat would not recognise it had done anything wrong; it would have seen the [intruder] as another form of food. [The keeper pointed out that] Rokan had undergone surgery at least 13 times to fix his throat, which was constricted... Rokan can eat only mince... [If the intruder had jumped] into the other tiger's area, "there wouldn't be much left of him"... The animal's mother, Cantik – the only other sumatran tiger at the zoo – fed on carcasses and large pieces of meat... The zoo was closed to the public after the attack while police made inquiries and staff hosed down the enclosure. A shoe from the victim, a CD player and a... CD... were found nearby. [Last year,]Rokan and Cantik survived an incident... when Rokan's 13-year-old father, Jambi, failed to recover from eating meat accidentally contaminated with the animal euthanasia drug pentobarbitone... [(t)wo bottles of [which] were among various pet medicines stolen from... a Massey veterinary surgery... on Wednesday morning... [- p]olice are warning the public to stay away from medicine bottles carrying the trade name Pentobarb 300... [because] if the thieves see the warning... [that if humans] take it they will die... they... [may] discard the drug... in a playground, in bushes or other public places where it could be picked up by children[...]]... and had to be put down. Rokan has sisters Malu, who lives at Perth Zoo, and Nisha, who lives at Auckland Zoo.

...Revelations that the [intruder] mauled by a tiger at Wellington Zoo had absconded from Wellington Hospital's psychiatric unit have sparked calls for tighter security at mental health facilities. Capital and Coast District Health Board, which started an inquiry yesterday into the incident, would not comment on the [patient]'s psychiatric history. However, it is understood [the patient] had been committed to Wellington Hospital's Ward 27 under the Mental Health Act about a week ago... A hospital source said that the [patient] left the hospital without permission... [The] National Party health spokes[person]... yesterday questioned whether the mental health system had failed the victim... [By the way,] Wellington Zoo will get \$40,000 from the petfood supplier of a drugged beef carcass that killed a rare Sumatran tiger last year... [The] manager of the Canterbury petfood company Dogs Delight... [- which had supplied meat products to the zoo] for 12 years... [-] faces 21 charges laid by the Ministry of Agriculture and Forestry. They should be heard next week... MAF regulations for killing animals for pet food specified the animal must be healthy before it was destroyed. "Under no circumstances should an animal to be used for pet food be euthanised... It must have been a huge dose of pentobarbitone to kill a tiger." Jambi, his mate, and [a] lioness were poisoned but because Jambi ate the meat from the spinal area, the concentration of the drug was higher... His mate, Cantik, and lioness Manta... recovered... The "priceless"... tiger Jambi, 13... [- who] arrived at Wellington Zoo in 1992 from Taronga Zoo, Sydney... [(h)is mate Cantik arrived later from Arnhem, Holland] -] ...died... after going into a coma four days earlier... Yesterday [Wellington Zoo's] manager... said the compensation would cover the cost of importing a Sumatran tiger, estimated at \$20,000, to replace Jambi... a 120kg father of six, [who] had been invaluable to the Australasian tiger breeding programme, which is part of worldwide conservation efforts to save the species... There were only 400 Sumatran tigers in the wild and 250 in captivity. Because of the ongoing destruction of the tigers' natural habitat in Sumatra and with the tiger part trade being "bigger than the drug trade", the species was expected to be extinct within five years.

...A Thai official has denied reports that 100 tigers exported to China last year ended up in restaurants specialising in exotic food... [T]he Natural Resources and Environment Ministry[official]... had been assured by Chinese officials that the tigers had not been eaten. Chinese media reports said they were sent to restaurants specialising in unusual dishes rather than their intended destination, the Sanya breeding centre in Hainan.

...Nine pregnant pandas at the Giant Panda Breeding Research Centre in Sichuan are due to give birth in the next few months. Last month a set of twin cubs – pink and almost hairless – made their entry to the world. It has not been an easy road to conception... For nearly three decades vets have resorted to artificial insemination after pandas in captivity displayed a distinct lack of interest in mating. Since the first cub was artificially conceived in 1963, more than 210 have been born in China and 20 overseas. But only half have survived to adulthood. The giant panda, a member of the bear family, survives almost entirely on a diet of bamboo shoots, leaves and stems – they need up to 18kg a day. Pandas generally prefer to keep to themselves and each adult has a well-defined home range. But a [boy panda]'s home range overlaps with those of several [girl panda]s. When they are 4.5 to 7.5 years old, giant pandas reach sexual maturity... In the wild, giant pandas give birth only every two years or more... The giant panda, face of the World Wide Fund for Nature, has been the focus of conservation efforts for more than 20 years. The Chinese Government, with help from the WWF, has established 33 panda reserves, protecting more than 16,000 sq km of bamboo forest. It is also educating the younger generation on the importance of protecting endangered species and the environment. The giant panda is protected by Chinese law but although poachers face severe penalties, some hunting continues. In 1998, the Government banned commercial logging in southwestern parts of the country.

...Chinese scientists have produced an embryo of a giant panda through cloning technology, a breakthrough that could save the endangered animals[. T]he *China Daily* reported yesterday[that] scientists from the Chinese Academy of Sciences had introduced [egg] cells of a dead... panda into the egg cells of a Japanese white rabbit and the embryo was nurtured successfully... [T]he next step was to place the embryo in the womb of a host animal. If the embryo was not rejected, the world's first cloned panda would be created. The giant panda is indigenous to China with just 1000 living in the wild and 100 in captivity. They have a low reproduction rate.

...China's Wolong Giant Panda Reserve has had a baby boom, with six panda cubs... [- including two set]s... of twins... [-] born in four days... Scientists said the cubs were in good health and receiving round-the-clock care at the 200,000ha reserve in the southwestern province of Sichuan.

...A 37-year drive to replace farmland with forest in the Wolong Nature Reserve in Sichuan province has benefited the giant pandas, China's symbolic animal. The number of giant pandas in Wolong, the country's main reserve, has increased as conservation measures taken by the Government including better air and water quality, have improved the... animal's habitat... [The] assistant director of the China Giant Panda Research and Conservation Centre... [(t)he conservation centre, jointly established by China and the W[WF] in 1980, had bred 37 giant pandas in captivity, of which 26 have survived[...]]... said that since the 200,000ha reserve was established in 1963, forest cover in the area had expanded to 70.6[% from 53%] of the land. [The assistant director] did not say how many pandas now lived in the reserve. Only about 1000 pandas are believed to exist in the wild, roaming mountainous areas of Sichuan, Gansu and Shaanxi. They are threatened by human encroachment and the rampant logging that has denuded most of China's forests. The news agency said Wolong reserve, near the Sichuan capital of Chengdu, was home to more than 450 species of wild vertebrates, including 57 types of rare animals under state protection... [In local news, the NZ]er who heads the Switzerland-based invasive species specialist group on the IUCN... [welcomed the Government's] *Our Chance to Turn the Tide*... strategy, but said it was overdue. "We have lost the... moa... [plus] the biggest eagle the world has seen and we have gained the sparrow and the starling." Scores of species are teetering on the brink, despite the well-publicised efforts to preserve favourite birds such as the kiwi and kakapo. Among the unique creatures battling for survival are the black-eyed gecko, which can live in the snow... and... the world's heaviest insect, a weta which... weighs as much as... 70g, was widespread throughout the world 190 million years ago... [and] fills the predator role of rodents... There is... a predatory snail, and a frog which bears live young... [T]here are thought to be... about 27,000 aquatic crustaceans, insects, spiders and centipedes, more than 11,000

nematode worms and 5000 molluscs... Many of the 178 species of native earthworm – some of them even climb trees – survive, alive and wiggling but mainly in undisturbed habitats... [The Cave spider –] the only spider protected by the Wildlife Act[– has a]... 3cm body and 30cm leg span... [and is t]hought to be a missing link between primitive spiders from 350 million years ago and modern spiders[, but is only found in the]... Tasman region... The native flax snail[, that grows]... up to 10cm in diameter and lives for up to 40 years... was originally believed to be extinct until rediscovered at North Cape last year... [Less fortunate was a] 45cm-long... salmon-like grayling[, which disappeared]... in the 1930s... The variety of life in N[Z] which flourished in isolation for 80 million years has in evolutionary terms been suddenly struck by the recent... introduction of alien invader species...

America prepares to stem ‘alien invaders’... The U[S] is being invaded by “aliens” and [the]President... has declared war on them. His counter-offensive, dubbed the X-File order, is an attempt to stop the country being taken over by such invaders as... the walking catfish and the... leafy splurge, a weed from Europe and Asia, [that] now plagues more than 1.2 million hectares in the western prairies... Instead of Mulder and Scully, the President has named three of his most senior ministers to head a new Invasive Species Council... [One member is the] Under-Secretary... Another member, [the]Interior Secretary... said: “The costs to the economy are racing out of control.” Nearly half of the country’s endangered species are being threatened with extinction by the invaders, introduced to the US either directly by gardeners and pet owners or accidentally through trade and travel... [A]n eccentric American introduced 60 starlings to New York Central Park on the strength of their being mentioned once in the works of Shakespeare – in a single line in Henry IV Part I. Now more than 200 million of them plague the country... A Chinese ant is chomping buildings in California. And the zebra mussel, a[also] from Asia, has done more than \$US5 billion... of damage by clogging pipes in 19 states after arriving in the Great Lakes region on board freighters... 20 species of lizards, all brought in by the pet trade, are spreading through Florida, while hydrilla, a popular aquarium plant, is now clogging up nearly half of the nation’s rivers and lakes. The European green crab, brought in ships’ ballast water, is devastating native shellfish in San Francisco Bay. But it is not all one way. North American crayfish are wiping out their European cousins... and the ruddy dove, brought to Britain by [a]naturalist... is killing off a native relative... Grey squirrels from North America have virtually wiped out the native red squirrel in England... Other countries have similar stories of alien invaders. • Guam is a tiny island in west Micronesia that serves as a US Army base. Soon after [WW2] the brown tree snake, a native of the Solomon Islands, [PNG and AUS], arrived via some form of military transport. It grows up to 3m in length, climbs trees, eats birds and their eggs and has been known to attack human babies. It is estimated now to number nearly 4000 per square kilometre and has wiped out nine of the island’s 11 bird species. It also climbs power poles and causes, on average, a power cut every four days. • ...In many coastal areas of South-east Asia, Ecuador and India shrimp farms have been established to provide income for people and compensate for the decline in marine resources caused by industrial fisheries. But the farms have destroyed mangroves and the rich coastal ecology associated with them, as well as drastically altering the lifestyles of the people.

...If you’re arriving at work with serious bags under your eyes there are two likely culprits: hot summer nights and a rowdy chorus of *Amphipsalta*, the largest... cicada native to N[Z]. An]... ecology PhD student at Massey University who is doing the first review of the many studies into N[Z]’s cicadas, said it would be no surprise if *Amphipsalta* were causing sleepless nights. His research is part of a thesis looking at fungal diseases affecting cicadas. One such fungus acts like something from the movie *Alien*, erupting from the cicada’s chest to bond the insect to the side of a tree. *Amphipsalta* is the name given to a genus of three cicada species. Their Latin name means “players on two harps,” referring to their ability to make two distinct sounds at once... [Boy cicada]s were the noisiest... They use tymbals, circular structures on their undersides between the thorax and abdomen, which are vibrated in the same way as crinkling a can several thousand times a second. The noise is amplified by hollow cavities behind the tymbals and within the abdomen to attract likely mates – which in turn attract other [boy cicada]s. The second sound is made by flapping and clicking their wings. These abilities wouldn’t be such a problem, but for one other detail – the noisy *Amphipsalta* are the only N[Z] cicadas to sing at night. They are also the last species to emerge from the ground during the summer and, with a lifespan of about a month, may be around for another few weeks... The adults tend to gather in larger numbers in modified environments – for example, gardens rather than mature forests – where they lay their eggs and feed on the sap of young trees. The *Amphipsalta* then gather in annoying mass choruses to sing. [The student] said their song had been measured at 120 decibels, 40 decibels over the level considered dangerous to one’s hearing. Such volumes are not surprising given that his studies have shown that up to 190 of the big bugs can emerge from a single square metre of soil – and they don’t travel far after they’re out. In terms of biomass, they can reach levels of bug mass per square metre that are higher than the carrying capacity of a large dairy farm. Maori and native Americans share an interesting link with cicadas... While many people do not realise that N[Z] has more than one type of cicada, Maori recognised 12 types based on their song and identified their arrival with... the Dog Star, Sirius, which is at meridian in the summer sky when the nymphs emerge... [Maori named Sirius] Rehua after a forest deity. Cicadas are considered to be his proteges. Various native American tribes have names for the insects that can be translated as Dog Star cicadas. ■ [‘By rubbing rough bodies against wing cages a genus of leather beetle is the most talkative insect of all. Families live in rotten logs & use 14 different signals in courtship, defence & while tending their young.’]

...West Auckland households may soon have a new creepy-crawly to contend with – A[US]n cockroaches. Larger and glossier than our native cockroaches, the [3cm-long AUS]n variety... which have the scientific name *gisenlia*... ha[ve] been found at Mangere’s Otutaua Stonefields by [a]Glen Eden-based entomologist... who believes they may now be heading west. The species has been in N[Z] since 1981 and has been spotted around Auckland, Tauranga and the Waikato. However, [the entomologist] thinks the cockroaches in Mangere may have come into the country on a more recent wave, possibly through the airport. “Until the last two years I haven’t seen them as commonly but now they really seem to have built up,”... says... [the Titirangi resident, although MAF’s] communications adviser... says the cockroaches have been assessed as low-risk... [But the entomologist] says the species may be spreading to other areas and the threat imported insects pose to the country is a worry. “There’s a great concern about biosecurity. There’s the painted apple moth, the saltmarsh mosquito – it seems like we’ve got one of these things almost every month now...”

...[the e]ntomologist... who first identified the painted apple moth in Glendene... is keeping an even closer eye on other insects. The Titirangi resident has completed a study of invertebrates in the Waitakere Ranges for the Auckland Regional Council. The council’s biosecurity manager... says the scientific study provides a database of species living in the ranges that will be used to monitor changes in the area if it is ever sprayed with Btk... to kill the painted apple moth. [The entomologist says it] tested about 30 plants and collected more than 5000 insects at 14 sites.

...A biological symposium being held at the national museum Te Papa in Wellington next month will attempt to list... all living and fossil, native and introduced species and sub-species... of animal and plant... found in N[Z]’s seas, fresh waters and on land... More than 160 contributors, 24 of them from overseas, worked on the checklist last year. About half the known species have so far been described and indexed. The symposium is linked to Species 2000 International, a global programme to index the world’s species as a tool for counting and measuring biological life.

...There is no shortage of N[Z] natural history books but [a recently released] one... THE NATURAL WORLD OF N[Z]... subtitled *An Illustrated Encyclopaedia of N[Z]’s Natural Heritage*, has a novel and useful format that will satisfy browsers and those wanting a ready reference to basic information about our distinctive plants and animals. It is in three sections. The first, “In the beginning,” briefly unfolds the genesis of the country and its unique wildlife and describes the impacts of people on it and the landscape. The last section is a handy, fact-filled revelation of the longest, largest, oldest (and so on) rivers, mountains, e[tc]... The main body of the book is an illustrated alphabetic encyclopedia of 215 items including all the popular icons of our natural heritage... A burden of textbooks that are long on facts is that a few mistakes creep in, and a few are excusable. However, when the subtitle is bold enough to make encyclopaedic claims, there is an expectation of thoroughness and sadly, this book [– which

retails for \$69.95 –]falls short. There are many factual or identification errors – more than 100 in my list – and some sloppy editing. Plates are assembled with crossed captions... [or are] reversed (a kauri snail spiralling the wrong way) and upside down (a suspended (!) glow-worm). The caption “The wrybill, the only bird in the world with a bill which turns sideways... to the right,” lies alongside a graphic illustration showing it (wrongly) turning to the left. Subspecies names are misused as species names and some information is badly out of date: “Of the world’s 1800 species of praying mantis, just one occurs in N[Z].” For 20 years we have had two, with the more recent South African species, now found in both North and South Islands, fast devouring and displacing the original... [Incidentally, many NZ]ers think of snails as slimy garden pests. But [a French perso]n... is breeding them for kitchen use and hoping N[Z]ers will be keen to add them to their menus. The Titirangi resident arrived here from France in 1994 with her husband[, who was] a former rugby league international for both countries. But it was not until 18 months ago that [the wife] decided to hit the snail trail. “I made a bet with a friend over too much drinking to do it... I’m a schoolteacher and I told my students to bring me snails.” Her... one-year breeding programme, designed to fatten snails up to eating size, involves about 500 snails. Each snail lays up to 50 eggs and lives on flour, carrots and lettuce... Fortunately, her three children and husband love eating snails. [The wife] says Auckland conditions are not ideal for snail breeding. They need moisture but not the constant rain of the northern region. [The wife] sells a portion of her snails to restaurants... Snails, known as les escargots, are served in their shells, generally with a liberal dollop of garlic to add to the taste... [The wife], who is originally from Paris, says garden snails are plentiful in both countries, though there are restrictions on commercial use in France. French snails also tend to grow larger and feed on themselves. N[Z garden] snails are not native and were in fact imported from France by immigrants in the 19th century.

...Welcome to N[Z], one of the most invaded places on Earth. This country has more introduced plants and animals than anywhere else... So many plants and animals have invaded N[Z] that the International Union for the Conservation of Nature has come to recognise our expertise... The union was established in 1948. Most countries and many conservation groups are members... [T]he Invasive Species Specialist Group... [- whose chairperson is an] associate professor in conservation biology at the Auckland University Tamaki campus, [where the]... organisation... is... base[d –] ...was set up in 1993 as part of the union... Invasive species are animals, insects or plants that are transported from one country to another via some form of human intervention... Of course, crops and animals have been transported beyond their natural habitats for thousands of years, often for the benefit of humankind. The differences in recent history are, broadly: • The rapid rate and extent of transportation in this era of global trade and increased mobility. • The invasiveness of some exotic species, which gradually change their adopted habitats for the worse... So profound is the problem that some environmentalists refer to it as “smart pollution” because, unlike chemical pollution that cannot reproduce and generally dissipates over time, invasive species proliferate and spread... In February, [the US]President... signed an executive order creating an Invasive Species Council and proposed \$28.8 million extra funding to combat the problem. The US Department of Agriculture has prohibited the import of untreated wood packing material from China because of the risk that it carries the Asian longhorn beetle. The Fish and Wildlife Service will build a barrier in the Chicago Ship Canal to prevent the spread of invasive species between the Great Lakes and the Mississippi River basins. Not all international agreements are helping the cause of keeping organisms at bay. An article in the union’s magazine *World Conservation* points out that two international agreements, adopted under the auspices of the World Trade Organisation and the [UN]Food and Agriculture Organisation... undermine rather than strengthen countries’ abilities to exclude invasive species. The Agreement on the Application of Sanitary and Phytosanitary Measures was negotiated when the trade organisation was being set up, and came into force in 1995. Then in November 1997, revisions were made to the International Plant Protection Convention to bring it into line. Together these two agreements govern the stringency of regulations that countries may enforce... Both require proof that a species will be harmful before the country may prohibit its importation. Otherwise the measures taken can be challenged as non-tariff barriers to trade. The protection convention also requires that the damage be measured in economic terms. The problem with this approach lies in the unpredictable behaviour of many species and the difficulty of providing absolute proof.

...All of the South Island has been declared a “controlled area” for the invasive[North American] algae didymo, which is also known as rock snot... [A]cross... Cook Strait... [a]n alien invasive weed is threatening to crowd out coastline pohutukawa, just as they recover from the onslaught of browsing possums. The plant is evergreen buckthorn, or rhamnus, and the Auckland Regional Council plans to spend up to \$300,000 to stop it... “The main problem is that most people think it’s a native,” [the]... ARC biosecurity manager... said. “It doesn’t look out of place until it’s too late. Before you know it... you’ll just have stands of evergreen buckthorn.” The weed was first recorded in the wild in Auckland in 1930. It has found... Hauraki Gulf islands particularly to its liking, and has been thriving... since 1980... on western Waiheke, where 185ha, including coastal cliffs, are [now]infested... Evergreen buckthorn is a Mediterranean native introduced to N[Z] as an ornamental plant... It [has since been]... declared... a... pest, [which means it is] banned from sale, commercial display, distribution and propagation... [However, i]t is distributed by birds which eat its berries... It can grow to 10m and... sprout anywhere, quickly spreading to completely cover the ground. It closely resembles several native species, including karamu and tawapou, and volunteers helping to rid areas of the weed have unwittingly destroyed the natives.

...White lilies... popping up alongside numerous roads to the West Coast are threatening native plants. Large clumps can also be found at Karekare Beach. [The ARC] ranger... who oversees Karekare, Piha and Anawhata, says they need to be eliminated. “There were a few last year, but this year, there’s a lot more,”... [The lily, which] comes from Taiwan[and] is related to the Easter lily... is already a problem at Whitianga, Kerikeri and Whakatane... [T]he exotic plant could have come from a cultivated garden. Commentators are also worried by an increase in the number of Arum lilies at Karekare. [A member of] the Waitakere Ranges Protection Society says the Arum is a vigorous flower which has pods with up to 200 seeds. “They’re invasive... and I’m alarmed at their spread. Unfortunately people love them as they’re beautiful,”... [An e]nvironmentalist... agrees both lilies are beautiful. “They’re always very popular in churches. But like many other European plants, they’ve done too well here.” [The]Weedfree Waitakere Trust project manager... confirms Arum lilies are on Waitakere City Council’s unwanted weeds list.

...West Aucklanders are asked to look out for the world’s worst aquatic weed, following the discovery of a large specimen at nearby Huapai. Water hyacinth forms dense mats that interfere with navigation, recreation, irrigation and power generation. The mats completely exclude native submerged and floating leafed plants. The plants vary in size from a few centimetres to over a metre... Its lilac flowers are up to 7cm in diameter and found in arranged groups of eight to 10... After fertilisation, the flower stalk bends to submerge the flowers. The fruit, a three-celled capsule, forms numerous, minute, ribbed seeds. These can germinate in a few days, or remain dormant for 15 to 20 years. Water hyacinth also reproduces vegetatively by budding and stolon production. Daughter plants sprout from the stolons, and can double in six to 18 days. Water hyacinth can grow faster than any other plant. It comes from tropical South America and has become naturalised in many warm areas of the world. It was introduced to N[Z] as an aquarium plant in 1914 and had spread to a number of North Island sites by 1950. A major declared plant pest since 1950, it would have a major adverse economic and environmental impact if permitted to spread. The Government pays for and organises all eradication work on this class A noxious plant. Sightings of this plant should be reported immediately to the Ministry of Agriculture and Forestry... or the A[RC]...

Alligators are slinking into west Auckland waterways. The prolific alligator weed has so far been spotted in Rewarewa and Oakley creeks and the Avondale Stream. Environmentalists say if the problem gets out of hand, it could be devastating... The weed forms extensive floating mats which cover the surface restricting the flow, increasing sedimentation and acting as a barrier which collects debris and causes flooding. “It also makes riparian banks more unstable and its matting stops natives from growing up through it. It also affects the fish life by restricting oxygen,”... [the] Weedfree Waitakere manager... says. The... A[RC] lists it as a regional surveillance plant pest. It was introduced from South America and is extremely difficult to control... Waitakere City Council is trying to find methods to eradicate it. [An e]ntomologist... says people shouldn’t attempt

to pull it out because more could fall into the waterways, re-attaching to banks and taking root downstream. [The entomologist] recommends using the vogtia moth or beetle, which has been introduced from South America and has had some progress against the weed in Northland.

...An invasive new weed that forms dense mats on the water's surface has been found growing in Lake Taupo. Environment Waikato wants urgent action to clear pockets of *egeria densa*, a South American oxygen weed, from parts of the lake.

...The islands of the Hauraki Gulf are under threat from... Auckland, officially the world's weediest metropolis. As... [of] this month... the Motutapu Island Restoration Trust is beginning work on a register of weeds... to record their diversity and concentration on private land, parks and coastal areas... The register will cover a 20km radius of Motutapu Island, reflecting the dispersal zone for weed seeds spread by wind and birds. The chair[person] of the trust... hopes Aucklanders will cooperate and allow botanists who carry out the register to survey any weeds on their land... "Despite more than \$1.5 million being spent on weed control by the D[istrict] of C[ouncil], the ARC and the... trust in the last 12 months, weeds continue to flourish on public and private land. It is time for action." ...the Lotteries Grants Board environmental committee, which is supporting the register, says a 10-year window of opportunity exists to tackle the weed problem. Beyond that it will be too late. "For too long the city fathers' focus has been on towers of concrete which are far less significant to Aucklanders who identify themselves with the Hauraki Gulf and its islands." ...weed-management strategies which ban monkey apples from sale are... being undermined by garden centres which sell a different version of the plants.

...A persistent pursuit of weeds in the Waitakere Ranges is getting a hi-tech boost. The A[ARC] is using a computer programme, Geographic Information Systems... to produce survey maps highlighting the kinds of weeds and where they are found. Results are making it easier for park rangers to budget for weed eradication and prioritise problem areas... [O]ne of three rangers in the Cascade/Kauri area... [– where] 37 weeds are found... [–] says the system shows whether staff are winning or losing their battle against weeds... Problem plants include pines and crack willows. Giant reeds (*arundo donax*) are also pests which break off along Waitakere stream[s], clogging up waterways and causing erosion. "A lot of people come up from the city with their weekend garden refuge and dump it over the banks. That's how a lot of our weeds come into the Waitakeres."

...Illegal dumpings of spoil... [is] causing a headache for Waitakere City Council – and introducing noxious weeds to regional parkland. There are about 12 sites in the Waitakere Ranges known as dumping 'hot-spots.' ...[the] A[ARC]... biosecurity officer... says they usually occur where a road has been straightened and there is enough space on the former curve for cars to park up and dump rubbish... 80[%] of new weed infestations on park land originated from intentional dumpings... "It's becoming quite a major problem for us... People dump garden waste material and think it's going to die and become compost, but it doesn't. It just keeps on growing..." ...Under the Biosecurity Act 1993, enforced by the ARC, it is illegal to dispose of or store soil containing plant pests anywhere except in a secure landfill or an approved composting facility. Waitakere City... recently turned up the heat on illegal dumpers by increasing the litter fine to \$500... "They (illegal dumpers) can get away with dumping quite a few trailer loads each year without being caught, saving themselves about \$30 in landfill costs every time... Even at \$500 it's cheaper to pay the fine than to take it to a landfill." ...One hotspot near the Aratiki Visitors Centre has cost the ARC... 100 [labour] hours to clean up... I[ronically, i]n late May, a large pile of soil containing... weed fragments was dumped at a lay-by on Lone Kauri Rd in Karekare... The spoil was left by a... council contractor who had been removing waste material from roadside ditches... Dangerous plant pests like wandering jew had already established themselves when the site was inspected... The contractor has since taken the spoil to an approved landfill, but neither the A[ARC] nor the city council has laid charges.

...Ginger may be nice as a spice, but as a notorious and invasive weed it's a native enemy. Keep Waitakere Beautiful, the Waitakere City Council and the A[ARC] want to make it easy for Waitakere City residents to remove ginger (also known as wild kahili) from their properties. [Throughout this month residents will be] encouraged to dispose of ginger plants in specially-marked waste bins located at Titirangi, Laingholm, the Manukau Coast, Waiatarua, Henderson Valley, Herald Island and Piha – where wild ginger is most widespread. Alternatively, red *Ginger Out!* bags can be ordered free of charge by calling the Waitakere City Council's customer service line... Trailer loads of ginger plants will also be accepted at the Council's Solid Waste Refuse Station at no cost. K[ing] W[ater] B[oard]'s coordinator... says ridding Waitakere City of wild ginger... – which was brought to N[Z] from India as a scented, flowering garden plant... – ...has been an on-going battle... "Unfortunately N[Z] provided ideal growing conditions for wild ginger which, being a prolific seeder, has spread into our native bush where it... smothers other plants..." ...[fortunately] public awareness of wild ginger as a plant pest seems to be increasing. More than 150 tonnes of ginger was collected during [last year's] *Ginger Out!* campaign... – almost double the amount collected [the previous year]. "Either there's twice as much... out there, or residents are getting in there and removing more..." ... *T[here are two] ways to kill wild ginger*: 1. Cut off the flowers before they seed, then destroy the rest of the plant with a herbicide... 2. Dig the entire plant... out of the ground. It is very important to get... the tuber roots... to ensure no re-growth occurs.

...Now halfway through its [2]-year trial... Weedfree Waitakere Trust is making good progress tackling environmental weeds... [like w]ild ginger, jasmine, tradescantia... Mexican daisy, climbing asparagus, mistflower, honeysuckle, plectranthus and privet... around Titirangi... With funding from the Lotteries Commission, the Trust was able to hire three staff to run the weed removal operation and to buy essential equipment. Work and Income N[Z] provided more labour through its Community Wage scheme and local volunteers also offered to lend a hand with the weed removal and replanting work. The Portage Licensing Trust assisted by purchasing a van to carry the workers and equipment, while the Council's Parks department provided large bins and free removal... "U[n]til recently... it was the responsibility of the private landowner to deal with environmental weeds – and there wasn't really a pro-active education programme to inform people about weeds on their property and how to get rid of them," says [the trust's] field officer... "Most of the work we've done has been in parks and reserves – and it's been very successful... We're about to start approaching private landowners to do more work on their properties – which would help connect up the areas we've already weeded to prevent re-invasion." ...The trust... ask[s] for a donation for the work... [that] is kept within the landowner's means and is agreed on before work starts.

...It's taken a bunch of weeds to bind a group of Karekare residents together. Five local[s]... have started the Land Care Group at the beach to keep the area clear of troublesome weeds... [O]ne spin-off is the group doing things with other people in the community. "We are really busy people and we would not get together as often as we do,"... Next month, they'll be planting trees on land residents and ratepayers raised money to buy jointly with the A[ARC]. Shares in the land were sold for \$10 each and every person with \$100 or more in shares can plant a pohutukawa or other native tree on the land... [P]eople from as far away as Japan, Britain, the U[S] and Germany have visited Karekare and bought shares.

...Annual weeds die and renew themselves from seed each year... Therefore it is of the utmost importance that weeds are prevented from producing further crops of seeds... In practice, [however,] some annual weed seeds find their way into the garden each year and the fight to eliminate these pests never ends. The old adage says, 'One years seeding means seven years weeding'. Although the practice of killing weeds with chemicals has made great strides over the last 30-40 years, these are not the end all for eradicating weeds. In small gardens the use of chemicals for weed control can well take second place to older established methods of attack... One important way of keeping weeds under control is to provide conditions that are more suitable for the plants you want to grow than for the weeds. This applies particularly to lawns. Docks, chickweed or sorrel in the turf indicate that soil conditions are not right for growing grass. Killing the weeds will bring temporary relief by reducing the[ir] number... but will not affect the amount of grass... [H]and weeding... when the ground is moist... is most effective in removing young weed plants from among seedling vegetable and flower plants that are growing closely together... Hoeing is perhaps the easiest and most effective mechanical means of destroying weeds. A sharp hoe requires little effort to use... Of course one must take care when hoeing in among young plants that they do not suffer the same fate as the weeds. Regular hoeing... has a twofold effect as the soil around the plants is kept aerated thus providing better growing conditions for the plants. Constant hoeing will also remove perennial weeds... [which] have persistent underground parts that live indefinitely...

Smothering weeds by mulching the soil surface is particularly effective with annual weeds and is helpful with many perennials... Black polythene sheeting can also be used, the only problem being to apply water to plants.

...The war against weeds in Taranaki has taken a new twist with the successful use of natural predators. To date, 11 biological control agents, or plant-attacking insects, have been released, and seven have been found in increasing numbers during the past two years. The most striking progress has been in the control of nodding thistle... [A] South Taranaki farmer... allowed researchers to bring crown weevils and rhinocyllus beetles on to his property in 1990. [At the time] nodding thistles were out of control... despite intensive weed-spraying... [Today], his nodding thistle problems are gone. Paddocks... once chest-high with the prickly weeds are now well covered with feed and the nodding thistle population has dropped to almost nothing. "I told my neighbours that I thought it was the weevil and they didn't believe me, but [the insects] have spread to surrounding properties and started wiping out the neighbours' thistles,"... [O]ther problem plants like... ragwort and gorse have also been targeted with some success.

...Ragwort is a rampant weed which can rapidly reduce pasture growth by competing with grasses. And when eaten it causes serious liver damage to stock. Attacks by six species of insects on different parts of the plant have been investigated in N[Z]... The caterpillars of the cinnabar moth... and the magpie moth... both eat the leaves and flowers. As well as these two there is the ragwort leaf-miner, whose minute larvae tunnel inside the leaves, reducing their ability to make food by photosynthesis and thus make the plant less vigorous. There is also the blue stem-borer, which by feeding inside the ragwort's long stems disrupts water and nutrient flow to the leaves. More important in this regard are the grubs of the ragwort flea beetle which severely damage both the roots and the heart of the leafy crown. The weed's reproductive potential has also been reduced by the introduction of the ragwort seed-fly, whose maggots feed on developing seeds. Though the cost of research and breeding the biological control agents are considerable, they are more than competitive with conventional control techniques. Once well-established, the small and silent insects continue to work industriously – cost-free.

...Denver may be thought of as a high-technology centre, but city officials are planning a low-tech way of fighting out-of-control weeds – goats. Some 50 to 100 Kashmir goats from Wyoming are to feast on weeds that have taken root in open space and wilderness areas along waterways in Denver, according to the city's Parks and Recreation Department. The weeds push out native vegetation and their removal will allow endemic species to flourish and attract wildlife... The weeds are like chocolate for the goats, who, as low-tech lawnmowers, need only a few hours on a patch of land to do their work... The city will lease the floppy-eared goats from the farm of... a weed specialist who hovers over the goats just long enough to let them eat the noxious weeds and leave the good ones. The goats are about the size of a dog, have small horns and are good with people.

...WHEN [a west Aucklander got married it] included his pet Basil in the wedding party. [The westie]'s friendship with the 15-year-old angora goat lasted longer than his marriage. So the west Auckland airline worker was distraught when his mate was mauled to death earlier this month. A stray dog attacked Basil. "Basil was more than just a goat," a tearful [airline worker], 36, told *Sunday News*. "[Basil] was a mate and... was a big part of my wedding." [The airline worker] – who lives in the bush-clad west Auckland suburb of Titirangi – met Basil eight years ago. "I came home from work one day tired and just flaked out on the bed... When I woke up, there was Basil standing in the hallway just staring at me. I rubbed my eyes because I thought I was dreaming. We had been together from that moment." Basil, who had wandered down from a neighbouring property... became a friend and live-in lawnmower. "Basil was a great character... [Basil] was very sociable and I used to take him to parties with me. [Basil] entertained all the guests. It is very sad that [Basil] is dead. I've lost a good mate." ...[hi]s ex-wife – who asked not to be named – had less fond memories of the animal that attended her... wedding. "[Basil] used to butt me! I think that goat was jealous." ...a complaint... has [been laid by the westie]... with the Waitakere city council about stray dogs running around his rural area.

...OWNERS of road-side goats should get off the grass. That's the gruff message from the SPCA over new Ministry of Agriculture guidelines for roadside goat care. They say the rules miss the point – goats should not be tied up, full stop. The guidelines, released this week, remind goat owners they have legal obligations to ensure their goats are adequately cared for... "Goats need shade and protection from inclement weather,"... [a s]enior MAF animal welfare adviser... said. "A suitable hutch should be provided to give adequate warmth and freedom from draughts in winter and coolness and shade in summer." ...However, [an] SPCA livestock officer... said... "It's unnatural for a goat to be tethered. A goat is a wandering, browsing animal and when you tether them they become really frustrated." ...MAF should encourage people to let the beasts loose altogether, and urge them to invest in lawnmowers... [or] trade their goats for roadside sheep... [to control their roadside grass and weeds. In related news, chemical]-conscious Aucklanders will be able to breathe easily... when the city council... introduce[s] organic weed sprays. But the move will triple the council's weed eradication bill to \$2.5 million. The council is trialling the organic herbicide Interceptor in Mt Eden. If controllers approve it during the annual plan process this week the pine oil extract spray will be used throughout Auckland. [The council's] streetscape operations manager... says... [the aim is to be] completely chemical-free by the end of 2001... [However,] the council will have to be realistic about eradicating the two "scourge weeds" that can't be killed with organic sprays – woolly nightshade in overgrown areas and nutgrass in pavement cracks... Non-chemical methods include... weed eaters, infra red and thermal air blowers.

...Every farming gadget imaginable is on show at the 31st annual Fieldays at Mystery Creek, but [the PM]... took a particular shine to one. Hefting a flame-throwing weedburner, [the PM] drew its tongue of fire across the floor, saying, "I could think of some uses for that." Onlookers were left to decide exactly which MPs that referred to, while [the PM] moved on to the next exhibit... – [the] magpie trap, which has a trip-plate trigger mechanism. [Its inventor, a] magpie-hater from Te Puke advises farmers to give trapped birds a sharp and fatal twist of the neck.

...Te Puke's little furry wonder, the kiwifruit, has spread its tentacles outside the orchard gates and joined the alien invasion. Left unchecked, the fruit that earns N[Z] more than \$600 million a year could run rampant and destroy native bush and forests. Although it is not yet on the official list of plant pests, war has been declared on wild kiwifruit in the Bay of Plenty, where about 80[%] of the country's commercial crop is grown. Battle will commence in November with a Taskforce Green pilot control scheme, sponsored by Kiwifruit N[Z]... Environment Bay of Plenty, has just launched an education programme to alert people to "silent invaders" such as woolly nightshade and Old [Guy]'s Beard, and with these aggressors it also warns of untamed kiwifruit vines... [which are] now established in bush gullies, pine plantations and scrub areas, particularly around rural localities where the vines are grown commercially. The council's plant pest coordinator... says the rogue variety springs up mainly from seeds spread by waxeyes, blackbirds and rosellas... Although tasting similar to modern kiwifruit, the uncultivated berries have reverted to the small, round fruit of the parent species... Chinese gooseberry... "We have always been aware there were odd patches of wild kiwifruit here and there, but they didn't seem to be causing too much concern,"... But council staff began to pay more attention from 1995, when they undertook a regional plant pest management plan, which was adopted last year... The real worry, says [a] plant pest officer... is th[at rain]... on the leaf canopy makes the sprawling kiwifruit vines weighty and they drag down surrounding bush. Fast-growing stems can strangle pine trees and have even caused the collapse of large rewas. Mature kiwifruit vines can easily grow up to 20m and as thick as a [hu]man's leg. If chopped down with a chainsaw, they regrow... Sporadic infestations of gnarled vines up to 20 years old are also found in the Waikato and in the Waitakere Ranges...

Unhappy wanderer I belong to a walking group called the Happy Wanderers. Once a week we hike for a couple of hours through the Waitakere Ranges. A couple of weeks ago we hiked up Parekura Peak and much to my amazement saw a goat on a rocky outcrop west of the peak. We hear stories of pigs in the ranges and constantly see ginger. Many of the tracks are becoming overgrown with gorse and steps that were built years ago are eroding away. What is happening to our jewel in the crown?

...Hunters are being accused of illegally releasing wild pigs in the Waitakere Ranges, threatening the safety of walkers and trampers in the popular wilderness area. The A[RC] says it is also worried about hunters threatening its parks staff... The council's policy was that pigs were a

designated pest in the Waitakere Ranges, unlike the eastern Hunua Ranges where pig hunting was “tolerated”... The council, which administers the Waitakeres, is urgently diverting \$20,000 from its parks budget to hire professionals to shoot the pigs. The cull will begin in a few weeks.

...The vision of an open sanctuary in the Waitakere Ranges is moving closer to reality, with the hope of restoring flora, fauna and species long ago pushed out of the ranges. Three possible sites for the \$1m Ark in the Park project have been identified in a report released last week, and now major public funding is being sought to make it happen... (...Sport Waitakere is running a series of guided walks through the ranges... at a cost of \$5 per person... to help raise funds for Ark in the Park...)... “It’s like a kernel in the ranges,” says [the]Waitakere Ranges Protection Society (WRPS) president... “It should expand in time to include all the ranges... it’s quite special and it’s a huge challenge for that very reason, for people to be able to come and listen to the dawn chorus.” The idea of a sanctuary was initiated by WRPS and the Waitakere Forest & Bird Protection Society about 18 months ago. They were later joined by Friends of Arataki and the ...ARC... in setting up a planning committee. A scoping report that has taken four months to produce recommends locating it in either the Huia area, the Swanson area between the Cascade Falls and the Waitakere reservoir, or near the Arataki Visitors Centre in Waitatara. The report examines issues like whether the land has suitable plant and insect life, current predator levels, public access and safety, and the relative ease of laying traps and poison baits for predators. “We’ve got to be responsible and do it properly, otherwise we’re dead in the water,” says [the]Friends of Arataki president... [A] choice will be made over the next few weeks, “but obviously we need the support of the ARC and local iwi Te Kawerau a Maki.” It is expected that at least five pairs of grey North Island robins will be released into the area. The birds have not been seen in the ranges for about 150 years, before the now-regenerating bush was cleared for logging and farmland. At least six similar sanctuaries already exist in N[Z], though none so close to the centre of a city. “It’s just the beginning of a great idea. We want to see N[Z]’s biodiversity enhanced rather than decimated,” says [the WRPS president]... Permanent fencing is unlikely to be a feature of the sanctuary, though some temporary fencing may be needed in key breeding areas. However, WRPS members are concerned that visitors to the sanctuary could create the biggest environmental problem if tourism is not contained. Public support for the project would have to be on the understanding that not all of the sanctuary will have open access, and that the land would be respected.

...Call to respect Waitakere Ranges... The theft of fence poles that surround an historic site in the Waitakere Ranges has ARC rangers concerned. [One r]anger... says someone has taken totara poles from a fence boundary of a cemetery at Spraggs Bush which is thought to be more than 140 years old... The cemetery, formerly known as Waitakere Cemetery, contains the graves of several early settlers, including the Bethells, Colebrook and Russell families. The A[RC] knows of nine graves at the site, thought to have been the only public cemetery in the area before Waikumete opened in 1886... [The Waitakere C]emetery officially closed in 1928 so they expect there are more graves there. [The ranger] says losing fence posts isn’t the only worry. Often people cut down trees and take them from the ranges. “We just get so much vandalism in the park, I don’t think some Aucklanders appreciate what we have up here... The message... we want to get out is that nothing from the Waitakere Ranges should be taken.”

...The Waitakere City Council wants to name a reserve after the late Kevin Lynch, to honour his contributions to local politics and the environment. Mr Lynch, a former... councillor... died last month aged 76. [The council’s] public affairs manager... says the suggestion is a reserve in Green Bay, fronting land earmarked for the Pinesong retirement community... [G]enerally reserves are named after the water they front so the council will have to make an exception this time. Mr Lynch’s daughter... says the family has yet to discuss the offer... Hundreds turned out for Mr Lynch’s requiem mass at St Mary’s in Avondale, also attended by [the]Waitakere City Mayor... and his Auckland City counterpart. Mr Lynch fought successfully against the proposed sewage outfall into the Tasman and a Telecom cellphone tower in Green Bay... was an active member of conservation groups such as Native Forest Action, later the Maruia Society, the R[FBPS] and the W[RPS]. Waitakere’s] Mayor... says Mr Lynch was a “greenie” decades before it was fashionable, and never wavered from old fashioned values of honesty and justice. “I first met Kevin 20 years ago when [Kevin] led a campaign against a radical but extremely ill conceived concept of re-creating the old bush railway line from Whatipu to Karekare. While some saw dollars, tourists amid the romance of steam rail, Kevin quite clearly saw the huge environmental impact that such a project would inflict. His oratory was simply brilliant and of course [Kevin] – and his beloved ranges – won out in the end.” Mr Lynch[, who] was born in Whakatane in 1924... enlisted in the air force at 18 and during W[2] fought in the Solomon Islands... and Europe. [Kevin] met his future wife... at a Catholic University social in Swanson and they married in the Avondale parish in 1951... Mr Lynch... was an avid follower and player of cricket and rugby... A passionate debater from schooldays, Mr Lynch also authored numerous submissions to parliamentary select committees and stood unsuccessfully for Parliament in 1966 in New Lynn. Mr Lynch believed firmly in speaking his mind on anything from economics to welfare... His death leaves the *Western Leader*’s letters pages bereft of one of our most regular correspondents.

...Seeing the charred remains of cars in Waitoru Reserve... on Bethells Rd... after youths have burned them to the ground has stirred two local environmental groups to hold a working-bee to revamp the car park. [The RFBPS’s] Waitakere branch... chair[person says it]... does not know the figures of cars torched there but estimates 12 cars a year[, and] says people do this because the carpark is out of sight. “It has become a place for louts to burn cars... so we’re going to reduce the size of the carpark and make it closer to the road.” ...in torching cars the ground’s tar seal has been burned away, leaving only gravel. The torching is a threat to the environment, as the native bush is on the carpark’s fringe, and has been singed one too many times... The popular walking track’s entrance gets littered with rubbish, and land fill contractors dump[spoil]. The track is a one km loop, and on Sunday... at 9.30am there will be a tour as part of the working-bee. The Waitakere City Council will provide soil and rocks, while volunteers plant flax and ferns. The [RFBPS and WRPS]... are organising this, so bring along friends, a spade, gloves and energy.

...Trees For Babies – an annual community planting event celebrating the birth of babies in Waitakere City – kicks off next month. Since the Keep Waitakere Beautiful initiative began in 1995, thousands of trees have been planted throughout the city. More than 200 native trees and shrubs, donated by the... [c]ouncil, are planted at one site in each of the City’s four wards every year... “New parents and extended families are welcome to come down to their local reserve to plant a tree in honour of a child born in Waitakere during the year,” says K[WB’s] coordinator...

RETURN of the GIANTS AS GRAND gestures towards celebrating the millennium go, none can surely beat the brainchild of [a]retired King County farmer... [who] is set on replanting the great kauri forests of the Coromandel Peninsula. Sounds mad? Well, perhaps just a little. But it’s a madness that has caught the imagination of everyone [the farmer]’s mentioned it to – from the D[oC], which is providing 294ha of reserve land for an initial planting, to [a]local bach owner [(a former Governor General)]who has agreed to be patron... Land is also on offer from the Thames-Coromandel and Hauraki District Councils and... from Transit N[Z,] which has free land beside state highways... [The appeal is that a] mass planting of kauri would be a... permanent gesture, one that would endure until the next millennium. “It started off as a plan to get the local schools to plant trees at Whitianga and Te Rerenga... But the more we thought of it, the more I felt the whole Coromandel should be doing it...” The great kauri forests of the Coromandel were destroyed... by fires and extensive logging, the timber shipped all over the world (it was Coromandel kauri that helped to rebuild San Francisco after the great earthquake and fire of 1906). In some locations, logging continued right up to the 1970s... [The retired farmer’s] love affair with kauri began after the move to the Coromandel... 15 years ago... A holiday trip north to Waipoua Forest, which contains the last vestiges of an ancient kauri forest, was “probably the greatest moving experience[I’ve ever]” had. “I realised what an amazing species they are and how lucky we are to still have some mature forest.” ...officially launched this afternoon at the D[oC]’s Kauaeranga Valley field centre, [the planting]will continue... for decades... How much of the peninsula have they targeted for reforestation? “Well, we plan to leave the townships out,” laughs... [an] organiser and trustee[, who]... says the goal is to plant 3000 trees [during the first year] and then 5000 a year in perpetuity... Special... planting sites are being established near townships so people can go and “hug and inspect their tree’s growth” when they like. There’s also provision for visitors – particularly backpackers – to mark their visit with a tree. School programmes are being organised and

there's even a take-home pack with a seedling, a stamped aluminium marker, fertiliser and planting instructions... Welcoming the project is DoC's area manager, who]... says only a small 200ha remnant of forest at the Manaia Kauri Sanctuary remains of the once-great forest... [T]he old Forest Service planted many thousands of kauri as a rehabilitation exercise before it went out of existence a decade ago, but DoC has not planted any subsequently. There are also "reasonably extensive areas where kauri are starting to re-establish themselves. You'll see kauri from small seedlings up to a metre in diameter, so there are some quite large trees out there." ...[the trustee] is sure that 1000 years from now kauri forests will once again rule over the Coromandel. "The strength of this project is it's community based. We're not just a bunch of dreamers."

...A project to restore... endangered native plants began on an island off the coast of Whakatane yesterday. [400] threatened plants were taken to Motuhora (Whale) Island for an initial three-day planting, started by [the]Conservation Minister... The... Bay of Plenty Conservancy officer... said vegetation on the island had been destroyed by goats and rabbits but [i]t... was now free of pests and had begun to return to its natural state. D[oC] staff believed most of the species replanted... would once have grown naturally on the island... [F]urther species will be planted in the next two years... The planting marked the release of a departmental plan which sets out requirements for restoring [NZ]'s 223 most threatened plants.

...Not being cute and feathery is a distinct disadvantage for N[Z]'s endangered plants. Bird conservation... is well advanced and has a relatively high public profile. But saving rare plants from extinction just doesn't have the same pull on the heart strings... [However, the DoC] has just begun a conservation programme for one of Auckland's disappearing natives – pirita, also known as green or scrub mistletoe... Pirita is a bushy shrub with leathery rounded leaves, a small greenish-yellow flower and yellow fruit that attract birds. It doesn't like shade and is often found huddled on roadsides, vulnerable to weed spraying and traffic. Because mistletoe are parasites, if the host tree dies, they die too. At Miranda, a population of Kaiaua pirita growing on manuka or saltmarsh ribbonwood will be lost unless they can be encouraged to shift to new host trees being planted on an adjacent DoC reserve. Pirita seed will be scattered on the 900 newly planted hosts and it is hoped birds will also spread the seed to help the plant re-establish itself. "This is the first time we have done this so we don't know if it's going to be successful or not," [a DoC botanist] says. The other threatened plant programme under way is the replanting of coastal cress on Rangitoto Island. *Lepidium flexicaule* was once abundant in Auckland but hasn't been seen here for... 100 years. Possums and wallabies on the island ate it to extinction. Now that these animals have been eradicated, the cress... has been taken to four planting sites on the island's northern coast. The seed was collected from the South Island and sown at Auckland's Botanical Gardens. The gardens have played a crucial role in propagating plants for relocation... Nationwide, there are 300 native plants in decline... Auckland alone has 170 threatened plants... In Auckland, 40 native plant species are extinct while, nationwide, 10 have gone for good, including one mistletoe, two native grasses and two types of cress... But despite the low profile, it is not all bad news in the world of plant conservation. DoC staff recently found a mistletoe species, *tupeia Antarctica*, on Fanal Island, just north of Great Barrier Island, that was thought to be extinct in the Auckland region. "...We've now discovered four other plants, so it's just a matter of monitoring them... [to en]sure they survive."

...One in 10 of the world's tree species face extinction through felling, forest fires and poor forest management... "With 77 species already extinct, this [latest]report has now confirmed our worst nightmare," said [the WWF]... The world list of threatened trees details over 8753 of the world's 80,000 to 100,000 tree species as being in danger... The list is the product of a three-year project by the World Conservation Monitoring Centre, which is partly funded by the wildlife fund, and the Species Survival Commission of the World Conservation Union... "If we can't save these elephants of the plant world, then the prognosis for all other species which depend on trees is [gloomy]... The governments... must now realise the sense of urgency to increase forest protection, eliminate illegal logging and improve forest management,"... The list includes several species with just one tree left... China's single remaining *Carinus putoensis*... survives, fenced off, at the edge of a sparse forest, the victim of deforestation.

...The A[US]n Conservation Foundation claims that A[US], one of the world's driest nations... cleared 529,000ha... of trees... [last year. AUS] ranked as the world's fifth-biggest land-clearing nation, trailing only Brazil, Indonesia... Congo and Bolivia in destroying trees. The foundation said that unless A[US] acted to stop the rate of land clearance it faced... \$A1 billion a year in road repairs, loss of farmland, damage to buildings, sports grounds, rusting pipes and so on... [due to s]alinity or salt poisoning['caused by trying to apply European land management practices to AUS']... Large areas have already been lost to agriculture as salt is brought to the surface by the rising water table. The felling of native trees, which require a lot of water, is blamed for the rising water table. The... latest data on land clearing showed a 30[%] rise from the last national figures in 1996-97. "We[']ve never been in the top five [land-clearing nations] before... It's the biggest disaster as a nation we will have to face,"... said... [the] executive director of the foundation[, who]... criticised the... Government's "bushcare" programme which aims to protect and plant native trees, saying for every tree saved 10 were destroyed. "Volunteer planting just can't keep up with the bulldozers....,"... Farmers in A[US]'s tropical state of Queensland, the nation's second largest state, are bulldozing huge tracts of land ahead of new land-clearing laws. Under the planned laws farmers must leave 30[%] of their land under native vegetation. The foundation said Queensland accounted for about 80[%] of AUS's land clearance.

...In a city obsessed with real estate, everyone aspires to own a home overlooking the shimmering waters of Sydney Harbour. Most people can only dream; even a shoe-box offering a minuscule patch of blue from one window sets you back a small fortune. For those lucky enough to live the dream, nothing must spoil it, and that – it must be assumed – explains a recent epidemic of crime in some of Sydney's wealthiest suburbs. The perpetrators occupy palatial water-side homes and the victims are trees that have the impertinence to obscure their harbour views, reducing the value of their properties. Householders have been stealing out in the dead of night to hack, chop and poison the offending vegetation and they are – with good reason – contemptuous of retribution. Last week, two gardeners were fined a total of just \$A1100... for mutilating 8m casuarinas on the instructions of... a socialite and multimillionaire fashion designer. The National Parks and Wildlife Service, which brought the prosecution, has warned it might pursue [the fashion designer too – who] must be quaking... Towering gums, ancient figs, cabbage tree palms and jacarandas have been targeted by the well-heeled vandals. Most of the trees that are attacked eventually die. Local councils, which own much of the foreshore land, are tearing their hair out. Drummoyne Council, in inner-western Sydney, has offered a \$A20,000 reward for information leading to a conviction. Mosman, on the north shore, has introduced a telephone hotline so that residents can inform on their neighbours. Woollahra Council... has lost 35 trees in the past year including a 60-year-old myrtle that was the largest specimen in the municipality... "It's heartbreaking," said... a council spokes[person]. "That myrtle will take two generations to replace. We are extremely concerned about the impact on the environment. The irony is that people move into the area because it's so lovely and green. But if they keep attacking the trees, it won't be beautiful for much longer."

...The nice thing about being semi-retired, or whatever you want to call it, when neither 9 nor 5 means much any more, is that you get to do rewarding things like spending a whole rained-out afternoon on the internet learning about the Wollemi Pine. The what? You are excused for never having heard of the Wollemi. Once, in a great green wave, it covered vast tracts of the A[US]n continent. Then, about 150 million years ago, it took early retirement and has only just been coaxed out of it again. As climate change decimated its numbers, this Rip van Winkle among trees slumbered on in the deeps of time in a single precipitous gorge west of Sydney, its damp sides so sheer you can only abseil into it. Towering to 40m and 3m round, with waxy dark green foliage, the tree is just as extraordinary-looking in its way as some of the other fossils, like the coelacanth, which have sprung back to life, for it is covered in a rich, brown, bubbly bark that makes it look as though it is thickly coated in Coco-Pops. For a complete history, *The Wollemi Pine*... was published this week by Text at \$A27... "The discovery is the equivalent of finding a small dinosaur still alive on Earth," says [a p]rofessor... of Sydney's Royal Botanic Gardens. For the Wollemi Pine provides not only the missing link between our own equally ancient kauri and A[US]'s Norfolk, hoop and bunya pines, but a vivid illustration of the persistence of life. And while the Aussies celebrate their new genus with unqualified delight, what are the citizens of Cambridge doing? An unknown number of them are trying to murder N[Z]'s

finest recorded specimen of the Wollemi's close relative, the rare and quaintly beautiful bunya bunya (*Araucaria bidwillii*) [– which]... was a rich source of food for the Aborigines of south-east Queensland [d]uring the season they would gather in the Bunya mountains near Gympie for great bunya nut feasts every three or four years when the tree fruited[])... I read a report in [a] newspaper last week with mounting horror[that s]omeone, for no reason I or any other sane person could imagine, is drilling holes in its trunk with an auger and pouring poison into them. I have always loved Cambridge for its quiet, tree-lined beauty, the peace and sweetness of its leafy streets. So what exactly is going on behind the pleasant facade of this loveliest of Waikato townships? ...I rang the Waipa District Council's parks manager... Her theory: some unstable individuals feel threatened by large trees in urban areas, even when they're on someone else's land. There are no clues – police are considering a hidden camera – so one can only speculate that it may be some vile-tempered old treephobe whose car got dinged by a plummeting cone. In my present circumstances I am not at all in favour of things dying, for whatever reason, let alone a unique tree which looks engagingly like an illustration out of *Dr [Seuss]*. Why can't Cambridge rejoice in its bunya bunya, cherish it, do something with it, instead of pouring herbicide into its veins?

...One of N[Z]'s most beloved trees, the... puriri[–] known as the N[Z oak –] ...is on a growing list of native plants thought to be dying of the disease killing cabbage trees. Scientists said yesterday that the country's most common native, the coprosma, was being hit by the same disease, carried by... plant hopper insects... accidentally imported... from A[US]. And there are fears the bugs could infest commercial crops – including berry fruit and grapes – as has happened in A[US]. The Government has called on biosecurity and conservation agencies to work with their A[US]n counterparts in a bid to identify the pests. It may be possible to introduce a biological control to attack the plant hoppers once scientists have isolated which of 20 or so types is the [culprit]... Large numbers of coprosma have been dying in Auckland and Northland. About 50 species exist naturally throughout N[Z], with many varieties sold as a popular garden plant... While the cabbage tree and coprosma deaths have been traced to a phytoplasma bacteria carried by the sap-feeding insects, a link between the disease and puriri diebacks and tree fern deaths has not been confirmed. A Landcare Research plant pathologist... has spent 10 years trying to find the cause of declines in cabbage trees... [In international news, a] vandal using a chainsaw has hacked a deep, potentially dangerous gash in the majestic 1000-year-old redwood tree where [an] environmental activist... staged a two-year "tree sit" to protest against logging... [(h)er protest... ended... after Pacific Lumber agreed to preserve the tree and a 66km buffer zone around it in exchange for \$US50,000...)... The Circle of Light Foundation, which has campaigned with [the activist] to save the 66m tree... dubbed Luna, said the attack was discovered over the weekend by visitors to Humboldt County in northern California. "The perpetrator made one deep and precise cut that went through a significant portion of the tree... While the tree is still alive and standing, Luna is extremely vulnerable to a windstorm..." ...An arborist, an engineer, and a forester were trying to come up with ways of saving the giant tree.

...Two wrongs[don't make a right The vandal] who attacked the historic pine on One Tree Hill... said yesterday that [it] was trying to fix what was wrong... [The vandal], aged 23, appearing in the Auckland District Court, was convicted of wilfully damaging the 125-year-old tree after jumping the fence and removing a gauze screen which was protecting the tree from an earlier attack. [The vandal] then drove two wedges into the old wound... [The vandal, who] represented himself in court... was sentenced to supervision for nine months with condition that [it] undergo counselling.

...A pohutukawa is the popular choice to crown One Tree Hill when the historic pine comes down. The coastal native... was favoured by... half the nearly 200 readers who replied to a *Herald* survey on what sort of tree should replace the damaged Monterey pine... "How beautiful it would be to see the bright blaze of red atop one of Auckland's highest and most beautiful focal points," said [a reader]... A totara was the choice of... 50 readers, largely because of its historical and cultural significance. From early in the 17th century until the mid-1850s a lone, sacred totara occupied the landmark. In 1852, "some Goth of a settler," to quote a newspaper of the time, cut it down for firewood. In third place with 11 votes was the puriri... [One reader asked:] Why not have a huge "totem" pole created by N[Z]ers, carved by both Maori and European carvers? ...A handful of readers wanted another pine. More popular than the pine was a suggestion from... the Maori activist who took a chainsaw to the tree, for the ailing tree to be replaced with "[a certain MP's head." A couple from] Warkworth thought... the [MP]'s head could be joined by those of "...Muldoon... and all the others who ruined our beautiful little country." [Another reader] took the opposite view: "[The MP] to do the opening ceremony[; the activist to be] buried underneath to fertilise it." [The MP] said it was nice of that "well-known lumberjack"... to think of him, "but I'm not quite as big-headed as [the activist] thinks..." The Auckland-born leader of Act said since there had been a totara and a pine, "why don't we try... Auckland's tree... – the pohutukawa..." ...[the mayor's] preference was for a pohutukawa because, given the windswept appearance of the pine, it was a native tree that would bear a good resemblance. "And it's our Christmas tree..." The [PM]... said her first thought was a totara because... "It is in Maori proverbs and mythology... but maybe it needs rather more shelter than being put on a windswept knoll on its own. When you think of the pohutukawa it does tend to thrive, even in quite windswept conditions... and it does have the advantage of having a quite beautiful flower..." ...Auckland City[']s arborist... has given the... pine less than three years to live, after chainsaw attacks in 1994 and last September. Needle growth has slowed, foliage loss has accelerated and [the arborist] is worried supporting cables will not stop it collapsing in a storm... [I]t would be possible to plant a replacement tree up to 7 metres tall and up to 12 tonnes in weight, but a smaller tree would have a better long-term chance of survival.

...Some recent reports in the *Herald* on the history of One Tree Hill have been wrong in some details. An article states that "photographs from earl[ier thi]s... century show three pines" on the summit. The same claim has been made on previous occasions. Only three pines remained standing on the summit after a severe storm in the mid-1930s which blew down many trees all over Auckland... Prior to that there were definitely five pines on the summit, as [one person] stated in his column on the subject[– although] three of the five were weak and spindly specimens not worth keeping. However, [the columnist] is wrong when [it] states that the obelisk was unveiled in 1948. As a young teenage boy I climbed the obelisk scaffold to the top when it was under construction. That would have been some time around 1934.

...Axe taken to One Tree myth... The accepted tradition that a sacred totara crowned the summit of One Tree Hill before the lone Monterey pine is a myth. The *Herald* has discovered three written historical accounts which all show a pohutukawa was on the summit at the time of European settlement in the middle of the 19th century... The earliest reference to the tree being a pohutukawa is made by the German-born naturalist... Ernest Dieffenbach, in a two-volume book, *Travels in N[Z]*, published in 1843. In a description of Auckland volcanic cones, [Ernest] wrote of Maungakiekie that "it is overgrown inside with brushwood and trees, and on the top stands an old pohutukawa tree, which serves as a good landmark for ships entering Waitemata Harbour." Sixteen years later, after the tree was felled, Ferdinand von Hochstetter, wrote a detailed description of One Tree Hill in his book, *Geology of N[Z]*. Ferdinand stated that "a single lofty tree (*Metrosideros tomentosa* – a subspecies of pohutukawa), now almost rotted down to the ground, on the highest peak, gives the hill its European name." The third historical reference was made in the *Daily Southern Cross* newspaper on August 14, 1875, when Dr (John Logan) Campbell was attempting to establish a native tree on the summit of One Tree Hill. The article states that "in the earliest days of Auckland a majestic pohutukawa crowned the very summit – the very crater-top – until the fell hand of some Goth on Onehunga's shore levelled the grand mark for firewood's sake!" That act of vandalism occurred in 1852, one year before the firm of Brown and Campbell bought the One Tree Hill farm... [Yesterday, a] prominent Auckland historian... said [it] had changed his former point of view and now believed the tree that was felled in 1852 was a pohutukawa. But [the historian] also believed there was a totara on the summit for a long time[that was cut down 'for fence posts']. "It is clear from 1790 at least, when One Tree Hill was abandoned by Ngati Whatua, who were the tangata whenua, the place was overgrown with trees and shrubs and it may be that a pohutukawa established itself there." According to Maori lore, the totara grew from a stick used to cut the umbilical cord of a boy named Koroki born early in the 17th century. Before it was named Maungakiekie, Maori called the mountain Te-totara-a-ahua, which means "totara which stands alone."

...Seedlings found on pine in hiding... Secrecy surrounds the whereabouts of the five pohutukawa seedlings found growing on the lone pine at One Tree Hill... [The] Auckland City Council parks officer, says the seedlings have been rescued and are being looked after by council staff – but... won't say where. [The officer] won't let the media take photos of the young trees either in case they reveal where the seedlings are. [A c]ouncil arborist... says the seedlings which grew on the southern side of the tree range in height from 5 centimetres to 12cm. They have been planted in individual pots in a nursery and will be transferred into larger containers when they grow bigger... Interest in the pohutukawa seedlings has been spurred by local authorities keen to replant them in place of the 125-year-old Monterey pine which council staff chopped down last week... [The] Hobson Community Board chair[perso]n... says it is "highly significant" the seedlings were growing on the pine. "The pine has swiftly and tragically ended its life by human hands. What better way than to allow nature to dictate the terms from now on,"... [T]he seedlings won't be ready to plant for three or four years because they are too small... It is not unnatural for pohutukawa seedlings to grow on the trunks of other trees because the wind blows the seeds around from other pohutukawa in Cornwall Park, [the officer] says. Totara – another tree tipped to replace the pine – will not grow on other trees because their seeds are spread via cones, which don't blow far... [T]he council plans to lodge a notified resource consent in January or February to plant another tree... Once the consent is made... the public will have three months to make submissions on what to plant before an independent commissioner looks at the case. The consent could go before the Environment Court if objections are made...

I am left saddened by the... loss of one of Auckland's best-known landmarks. It seems unfair that we are... robbed of something that has been part of the view on the horizon for longer than pretty much all of us have been alive. For whatever reason the attackers choose to explain their actions, in my opinion they did not have justification enough and surely there are more effective ways of getting your point across in a positive manner than felling a well-known tree. Nevertheless, we're faced with the task of supplanting one icon with another that will be criticised for as long as this generation lives. On the replacement itself, it could well be that a totara will not grow on the hill because tapu was desecrated when the "Goth of a settler" felled the original. If tapu could be restored to the site by the local kaumatua, then for my money another totara would... be the most appropriate choice... But when it's all decided and there is again a healthy tree in that location, more than likely some idiot will be so offended by something that this replacement too will feel the cold steel of the chainsaw ripping the life from its limbs and we will have to go through the whole saga again... [Therefore,] I think we should make a big abstract totara tree out of steel or aluminium. It would last forever and can't be chopped down and won't need looking after... [● The DoC] has admitted it made a "bad mistake" when it chopped up some ancient rimu trees for firewood on Stewart Island private land. [The person] who owns 180ha on the island, was horrified when [it] discovered the native trees – estimated at between 450 and 600 years old – had been sliced into rings. "It was a waste of a beautiful resource that is in much demand – just to chop it up for firewood, I was dismayed,"... DoC is considering compensating [the landowner] for the timber because it precluded him milling it for his own use or selling it. Part of the island's Rakiura Track runs through [the 75-year-old's] property. Three trees had blown down in a storm and were blocking it... Staff often cut up wind-blown trees for firewood to use at the track's huts... The giant rimu... would have supplied the hut for a year.

...SEVEN native trees were illegally chopped down at three places in the Waitakere Ranges over the weekend. [The ARC's] principal ranger... says [it is] at a loss as to why the trees were just left and not taken for firewood. "It's wanton destruction. It's a real shame to see trees more than 50 years old being cut down for no reason... I can't even begin to understand why people would do that sort of thing." [The ranger] says it looks like the same person felled all the trees, judging by the way they were cut and similar chainsaw marks. The rewarewa, kanuka and cabbage trees were found... at the Fairy Falls car park, the Home Track entrance and on Lone Kauri Rd. [The ranger] says they've never had this sort of problem before though people often illegally take plants and chop branches off trees for firewood. "The worry now is – are they going to keep on doing it?" The felled trees are close to the road and [the ranger] would like to hear from anyone who saw anything suspicious, so the offender... can be prosecuted.

...Waitakere[s] Mayor... almost wept over photographs of native bush destruction for which one of his ratepayers has been jailed... for 20 weeks... [The mayor] denied that his council was being draconian in defence of the Waitakere Ranges. If the bush had been cleared for some good reason, such as to build a family home, "we wouldn't be jumping up and down." ...Asked if [the mayor] was surprised by the jail term... [the mayor] said: "It is about bloody time the environment got a voice." [The mayor] said society had got beyond the point where people could do whatever they liked on their land... A Waitakere City Council spokes[perso]n said the Crown Law Office, rather than the council, prosecuted [the landowner] and his wife... for breaching an Environment Court order to prevent further illegal clearances after they were fined... for similar offences [2 years ago].

...A RECORD fine of \$14,000 has been given to contractors who cut down a rimu tree in Sturges Rd when developing a subdivision... [The contracting company and a company of engineering c]onsultants pleaded guilty to chopping down the eight metre tree 18 months ago, after being taken to the Environment Court by... Waitakere City Council. The rimu was... planted to commemorate the death of a... [soldier] who fought in W[W1]. The j[udge]... says although the council's resource consent wasn't "particularly clear" on the protection of that tree or others on the site, consent was needed to fell the rimu and none was obtained... "I find it almost incomprehensible that a developer, being faced with a lone tree of substance obviously left for a purpose, should assume, in the absence of specific reference to it in a resource consent, that it could be felled,"... [Furthermore,] a works supervisor twice refused to fell the rimu when asked by [one of the consultants]. However, t[hat] supervisor was replaced by someone less experienced who agreed when [the consultant] repeated his request... [The council] says the fine is "definitely at the upper end of the scale for one tree" and should act as a deterrent to others... [The contractors were] fined \$8000 and [the consultants] \$6000, but the judge deducted \$4000... spent by each party on two replacement kauri trees. The fine also covers... a plaque for the soldier... and... two years of tree maintenance...

Bogus tree trimmers are doing the rounds in Henderson, warns a [resident] who paid \$120 for a few branches to be dumped in her driveway. [The resident]... was conned by a couple knocking on doors... asking if [people wanted thei]r trees cut. "They looked like they needed a bit of work and I needed my trees doing... They did some of the work and left the branches in the driveway after telling me they were going to take them all away... I'm not really worried about my money but some people just can't afford it." ...[the victim says it] drove round her Lincoln Rd neighbourhood to see if anyone else had been conned. "I found an elderly couple who had paid \$330. They had barely touched the trees and then cashed the cheque..."

...A Te Atatu South [resident] is warning others to beware after being ripped off by a garden con[-artist]. The 77-year-old... who does not want to be identified... lost "the best part of \$1000". The [resident says it] had an appointment with a genuine contractor who quoted \$600 to prune her trees. About a week later a different [perso]n arrived at the property saying the contractor had sent him round to do the job... [The person] demanded cash up front saying [it] had staff ready to start that afternoon. The [resident]... told him to sit at the table and wait while [it] got her money, but instead the [perso]n followed her. "I was beginning to feel a bit uneasy about it then. I had a funny feeling but there wasn't much I could do about it." The [resident] handed over the money and says the... [perso]n kept asking for more saying the original quote was wrong. The [perso]n left and the [resident] never saw him again. Her son contacted the bona-fide contractor who [said it] knew nothing about the other [perso]n.

...Tree hackers claiming to be council workers are on the increase, says an Auckland City Council arborist... [S]treet trees with glossy foliage... are being chopped and the cuttings sold to florists and markets. Tree hackers face instant \$500 fines if caught.

...A Henderson [resident] is worried more of her plants will go missing after a green-fingered thief stole her prized begonia. The elderly [resident], who does not want to be named... [said i]t's not the first time her plants have gone missing. About two years ago [the resident] returned from hospital after a cancer operation to find her flowering azalia bush had been stolen. Green-fingered thieves also raided... a... garden on Rathgar Rd,

last October, and there have been other plant thefts. A widow's garden was emptied seven times in three months last year. The latest victim urges others to report their losses to police. "If we all complain about it maybe something will be done,"...

Green-fingered thieves are raiding Henderson gardens. At least three properties have been targeted, some more than once. [A]Rathgar Rd resident... is among those who have lost plants. [The resident] planted \$90 worth of plants [last] October... bought... with gift vouchers given to him for his 68th birthday... Most were stolen a few hours later and the rest were taken the following night... [The resident's wife, who is the] co-ordinator of the Rathgar Rd Neighbourhood Support, says the theft was a shock. The couple will not replant... "It's a waste of money. We can't afford it,"...

Plant thieves leave more than hole in garden... Insurers are refusing to pay out on the theft of valuable plants, which are now being stolen in epidemic proportions. Hundreds of thousands of dollars worth of plants – particularly pricey cycads and dracaenas – are being dug from gardens or stolen from nurseries... A co-owner of Enzed Palms... planned to install video surveillance equipment in his Kerikeri nursery after \$20,000 of cycads were stolen this year... Nursery owners are even telling clients to wire valuable trees to concrete blocks in the ground to avoid thefts. Other people are inserting computer chips into trees to identify the plants' origins. Despite the anti-theft measures, insurers do not pay claims unless the trees, often worth \$2000 each, are itemised on insurance policies. One... Maraetai... [resident], who refused to be named, had \$4000 worth of cycads and dracaenas stolen from her... garden last week. Her fury mounted when State Insurance refused to settle her claim – saying her policy did not cover planted trees or shrubs. It would have covered pot plants stolen from inside her house. Tree suppliers say... it was crazy that standard home and contents policies covered indoor pot plants but not outdoor plants. "I find that ludicrous – they're a lot safer in the ground[," a supplier] said...

The Waitakere City Garden Competition is a highlight of our local gardening calendar. Now that the weather is so lovely it is an ideal time for hundreds of keen gardeners to spruce up their flowerbeds, deal with their weeds and have their gardens looking their best for the judges... Very few cities in N[Z] successfully run a regular garden competition. The wide variety of garden sizes and styles is very pleasing. Young and old, novice and experienced, our Waitakere City gardeners pull out all stops. Although we know not everyone can be a prizewinner, every garden entered gives the teams of judges such pleasure to view. Some of the best gardens presented last year can be seen in displays of photographs at Mitre 10...

[F]loating petunias drop anchor for a drink... [in a]n original presentation at the Ellerslie Flower Show... Gardening has blossomed from a genteel hobby to almost a spectator sport... From nostalgic replicas of "home" by the new settlers, the Kiwi garden blazes into the new millennium as an eclectic mixture... [of] Japanese, Mediterranean... and... American... [gardens in which] the tastes of the individual reign supreme. Before... [WWI] the arrival of a new century heralded a time of peace and relative abundance. The... ideal... of the [English] cottage garden as glorified by the arts and crafts movement... still prevailed... The 1920s and 30s saw the rapid spread of suburbia with a corresponding surge of civic pride. Gardening was felt to be good for the health of the nation in that it provided useful outdoor exercise in the fresh air... As the Depression began to bite... garden... clubs mushroomed, along with magazines, as people struggling to feed their families sought advice on gardening methods and cheap supplies of plants. Children were taught basic gardening at school, including a respect for native plants, while factory gardens reached new heights as displayed on the front of the *Edmonds Cookery Book*... Rows of standard roses marching up the path were a hallmark of the safety and security of formality favoured during the 40s and on into the 50s... [when] lawns became more popular than ever as lawnmowers improved and more people could afford them... But rebellion wasn't far away in the form of... a German landscape architect whose pared-down designs transformed the braver parts of Auckland with strongly architectural gardens linked to the house and supported by simple Pacific plants like taro. [The German] and others like him were influenced by... the... new "California style" of garden where indoor/outdoor living was paramount. No longer viewed as the weekend's work, these gardens were for relaxing and entertaining in, complete with swimming pool, barbecue and comfortable patio loungers. Throughout the affluent 60s this leisurely lifestyle became more and more firmly established – pebble gardens were all the rage. In the 70s the demand for railway sleepers and old bricks escalated as they were used to create "natural gardens," full of native plants... Garden tours at home and abroad became a national pastime... In 1994, organisers of the first Ellerslie Flower Show desperately underestimated the number of people who wanted to come to such an event and by 1998 the show had its own permanent venue at the Auckland Regional Botanic Gardens...

Manurewa's \$300,000 Botanic Gardens noise barrier starts coming down today – quietly. The Manukau City Council has imposed noise controls on demolition of the 3.5m by 440m wall which was built [two years ago] to shield the... [g]ardens from noise caused by the Southern Motorway. Because most of the work will take place at night, the contractors must use the least noisy machinery and carry out rock drilling during the day. The acoustic panels will come down over seven nights to meet a court order to tear down the wall... About 50 residents living opposite the wall, some up to 1km away, complained that noise from the steel wall meant they could not sleep at night, hear their t[v]s or sit outside. They won a case in the Environment Court last month when... two commissioners accepted evidence that the barrier bounced noise onto the properties opposite.

...BEING woken by the neighbourhood lawn mowing clubs could be a thing of the past: Researchers at Massey University have come up with a silent robotic lawnmower that can be remote-controlled via the internet. The cordless, rechargeable mower will be able to precision navigate lawns, cutting to the required height. Right now the mower is strutting its stuff in a roped off patch of grass at the University's Albany campus.

...No, it's not an urban myth. A gardening contractor in America has turned the Smart car into a ride-on lawnmower... although it is still fine-tuning the mechanicals. They have equipped the Smart with a laser cutting device, which overcame noise and exhaust emissions from conventional ride-on lawnmowers[and 'renders clippings suitable for fertilising the lawn']. The Smart might be commercially available from next year.

...[when selling a mower there are numerous blade options but basically all cut pretty much the same. However bar blades are not very forgiving if you hit a large rock or tree root. Such an impact often results in a bent crankshaft which may or may not be repairable. A bar blade with flail blade takes the impact and swings away from the obstacle rather than transferring the impact to the crankshaft. A better option is a disc with flail blades. The disc has fans on top of it which creates a great deal of air in a direction that will throw the grass clippings into the back of the catcher resulting in an excellent "fill". Mulch mowers have the distinct advantage of not requiring a catcher. The grass is cut initially and flung upwards. When gravity forces it back down, it is cut again and spread over the lawn in a reasonably even pattern. The major drawback with mulch mowers are that you cannot catch the grass if you want to, you cannot mulch wet grass at all and you can only cut the top third of the grass height. Mulch and catch mowers overcome some of these disadvantages but they are a compromise and will not cut as well as a dedicated cut and catch mower nor mulch as well as a dedicated mulch mower. However some get pretty close to it. If a mulch and catch mower is set up to catch it is simply a matter of removing the catcher and inserting a large plastic bag, provided with the machine, into the rear of the chute thus preventing the grass clippings from discharging out the rear of the chute and allowing them to be cut again.]

...A push to reinstate grass verge mowing back to a fortnightly cycle... has been clipped. Auckland City leaders voted... against reinstating the... berm mowing service back to twice monthly. [But] the council has promised it will look at adjusting the service to cover times during the year when grass... gr[e]w... faster. The move follows hundreds of complaints during... summer when grass grew quickly on berms [due to] favourable weather.

...Unkempt berms rile residents... Auckland City Council fielded 303 calls... from angry residents unhappy with the lack of grass mowing being done on street verges, known as berms. A city council media spokes[person] says call numbers [we]re similar to those of past years but the company contracted to mow berms... had problems providing adequate staffing levels during the summer holidays... [Last year] Auckland City halved its berm mowing service to 12 cuts a year as a cost-cutting measure... The service reduction was supposed to save \$450,000, to be redirected into "covering maintenance costs associated with the acquisition of new assets within the parks and streetscapes services portfolio"... ■ The

arboricultural association... [says k]now your boundary rights... Rows between neighbours over trees sometimes go all the way to the district court. The trouble is... people are selfish when it comes to trees. When a tree from a neighbouring property is bothering them – perhaps it has fallen over the boundary, is shedding leaves in the swimming pool or is blocking sunlight – they object loudly. When it is their tree that is bothering the neighbour the tree becomes sacred and it cannot be chopped or topped. This can enrage the neighbour affected and the next minute the tree is dying – and showing all the signs of having been poisoned... A[n A]uckland arboriculturist... comes across such situations regularly, and often ends up as a mediator... Unless the tree is on their land, councils do not like to get involved... [T]he Consumers' Institute, says boundary disputes are the stuff of legends. "It's just mind-boggling how stupid – how passionate, I suppose is a better word – people become about boundary disputes." Such rows are territorial... "It's something like, 'It's my patch and I can do whatever I want. I can grow whatever I want and stuff you'."

...Like many N[Z]ers, the English are mad about their gardens. But this passion can have tragic consequences... AS HEDGES of contention go, it is an unassuming growth: a privet scarcely 60cm high, separating 16 Webster Close, Lincoln, from No 18. Then again, perhaps it was not the hedge in question. There is also a 4.6m leylandil tree... and it has been suggested that this caused the trouble. But the privet is the likelier suspect, for it had been a sore point for years. As far as anyone can remember, it had been there longer than either of its victims, though neither was exactly new to the vicinity. And now it has outlived them both. The first, George Wilson, who had lived in No 16 for 18 years, died on Friday the 13th. An argument with his neighbour, Robert Dickenson of No 18, had degenerated into a slanging-match – a regular occurrence, according to other residents of the close. Voices were raised, then silence, then, a few minutes later, gunshots. Wilson, 66, died of his wounds in hospital. Dickenson, the second victim, was arrested shortly afterwards, at the end of a brief siege by armed police, and remanded in custody. [Dickenson] had been due to appear in court this week, but was found hanging in his cell last Sunday and died the next day... [aged] 52. Residents of Webster Close are still in shock, expressing bafflement that such bloody mayhem could take place in such a "nice, quiet" cul-de-sac, and that two such "nice, quiet" [guys] should be involved. Both, we are told, were unassuming, inoffensive English[people]... Both were keen gardeners; neither seems to have sought much more from life than to live quietly at home with his family and cultivate his garden. Dickenson had lived there all his life. But the issue of the hedge had gradually been growing between them, as had the leylandil. It's not clear how the trouble started, but... [i]n one account, it started when Dickenson "just cut a huge chunk out of the tree without asking", on the grounds that it was obstructing his car. Another said it began when Dickenson took 30cm off the height of the privet hedge. Either way, it is hard to see how such behaviour could be worth a... life – let alone two... lives. Yet perhaps it is not so surprising. Britain is full of quiet, inoffensive people who keep themselves to themselves and channel their energies into their gardens – and into disputes with their neighbours. It is barely six weeks since Douglas Reed, 63, collapsed and died in the middle of a "hedge rage" dispute in Louth, Lincolnshire... According to Hedgeline, a group set up to seek ways of alleviating such problems, there are probably 100,000 hedge disputes active in Britain. That's just hedges, remember. Throw in fences, boundaries, party walls and rights of way, and who knows how many feuding neighbours we could be talking about? There they are with their bursting files of sarcastic correspondence, their solicitors' letters (and bills), their frosty silences and ever-more-withering glares across their disputed boundaries. It is largely a countryside phenomenon, perhaps because rural title deeds are more likely to have been shoddily drawn up in the distant past; and perhaps because rural boundaries are more likely to be marked with vegetation rather than bricks and mortar... Last week, the High Hedges Bill – inspired by Hedgeline and introduced as a private member's bill by Labour... – received its third reading in the Commons but was talked out by Conservative opponents. Its purpose is to neutralise thousands of hedge disputes by enabling local authorities to force owners to trim hedges to a reasonable height... [A spokesperson for] the Office of the Deputy P[M]... was extremely disappointed at the bill's failure. "High hedges can make people's lives a misery... This bill is a sensible way to deal with cases neighbours can't resolve." But the truth is, this isn't really about hedges at all. It's about something far more deep-rooted. The judge in [one hedge dispute] case spoke of "a tragedy of Greek proportions". But why the Greeks should get dragged into it is a mystery. This is an English vice, tied up with the addiction to home-ownership and DIY and the general aversion to anything resembling communal living. The English pride themselves on seeing their houses as their castles and see pig-headedness as a national virtue. Winston Churchill, the most revered of all English[people], expressed the attitude best: "Never give in, never give in, never, never, never, never – in nothing, great or small, large or petty..." All over Britain, ordinary, inoffensive English[people] are doing precisely that, digging their heels in over tiny details of mutual boundaries... and, in the absence of a radical change in Britons' attitude to property, tragedies such as the one in Webster Close will presumably become more common... [□ NZ h]omeowners whose trees are illegally chopped down by neighbours will no longer be able to count on council help once a proposed law change likely to become final this week is passed. The... only remedy... would be an expensive court case...

A dog owner in Switzerland has been charged with causing criminal damage after his pregnant terrier chewed 10 trees to death. Lausanne police said the dog, a 3-year-old Staffordshire bull terrier, caused 100,000 francs (\$[NZ]137,763) of damage. The trees had to be replaced.

"[The dog-walker] was well and truly stuck and wasn't going anywhere fast," said... Wellington[police. The resident] and his dog were returned home unhurt apart from a few scratches and prickles.

...The Waitakere City Council is axing plans to chop down seven phoenix palms at Laingholm Beach following widespread opposition. The proposal to remove the trees near Sandys Rd was dropped after "huge resistance" from Laingholm residents, says [the]Waitakere Community Board chair[perso]n... "People were overwhelmingly against removing the palms. There was no way in the world those trees would be touched,"... [T]he opposition was so intense the council will not even remove a diseased palm. "If any signs of a chainsaw or a digger appears I'll have a revolution on my hands,"... The idea was originally part of the Laingholm Beach Reserve Draft Management Plan following two separate submissions to the council suggested the palms' spiky dead leaves could cause injuries... Authorities who angered conservationists by uprooting 1000 native trees from a suburban park have admitted they acted hastily and may have pulled out more than they needed to. The A[RC] last month removed many of the trees planted by hundreds of volunteers on Hamlins Hill in May because they were too close to... a track and stone retaining wall dating back to early European settlement... Now the council, which approved the original planting, is saying some trees will probably have to be replanted in the area from which they were shifted.

...Up to 15 native trees planted in Glen Eden in June have been destroyed after someone ran over them in a car. The pohutukawa trees were planted in Virgo Place as part of a Keep Waitakere Beautiful... community street tree planting project. KWB[']s chair[perso]n... says there's no justification for last weekend's senseless act of vandalism. "The residents of Virgo and Hydra Place took the initiative to build a sense of pride in their community by planting the street trees and they are particularly concerned about this incident... Our challenge at K[WB] is to foster a sense of pride among all residents so that this type of blatant vandalism does not occur again." ...Some of the flattened trees will go back to the nursery for pruning and be nursed back to health. KWB plans to replace the trees... over the next few weeks. Anyone wanting to help can phone: 836-8000, ext 8561... [By the way, a] Waitakere City developer found guilty of felling established eucalyptus trees at Swanson, without resource consent, must now pay what could be the biggest penalty ever given for illegal vegetation clearance in N[Z]. G and A Developments is liable for most of the \$46,000 in fines and court costs, twice the highest penalty previously imposed by the Environment Court. [A f]orestry contractor... is paying about \$7500 of the final amount. [The j]udge... says G and A Developments took matters into its own hands when it cleared a large group of 40 metre, 60-year-old trees for a proposed residential subdivision before resource consents were processed. A tree expert called to give evidence at the hearing described the eucalypts as some of the largest and best specimens in the country... A... Waitakere Forest and Bird Society spokes[perso]n... is

pleased with the penalty which [it] hopes will be seen as a deterrent. [Waitakere's] Mayor... agrees, saying: "I hope this case will teach people that taking liberties with the environment has become a very expensive pastime."

...The woodchipping of a forest has a New Lynn community group at loggerheads with the Waitakere City Council... [A spokesperson] for the Manawa Wetland Reserve Community Group, says despite the group being chosen by the council to represent the community, and attending numerous workshops with council planners during 1998, their wishes have been ignored. "They promised us verbally that the forest wouldn't be cut down. Then I came for a walk on Tuesday and saw the workers cutting the trees down and putting them through a shredder." [A fellow New Lynn resident... describes the act as "sheer vandalism". The 'black forest', as locals call it, was a popular haunt with local birdlife and a pleasant spot for walks... But [a council spokesperson]... says the clearing of the black wattles was agreed to by the group, and a September 1998 plan clearly shows they will be removed. "The area is subject to a development plan, signed off... by the local community board, council and the Manawa Wetland Advisory Group." [However, the group's spokesperson] says the plan [the council spokesperson] refers to was never sighted by the group and the plan they agreed to... at an August 24, 1998 meeting... did not specify felling... [The group's spokesperson] believes the second plan was decided on after the one sighted by the group, contradicting promises of consultation... [Furthermore, the group's spokesperson] says council staff members... verbally agreed that the wattles should not be cut down... [although the council's spokesperson] says the black wattles "are weeds which would be on our list of weeds to remove. They couldn't have stayed..."... [Incidentally, eighteen car wrecks littering Muriwai Beach have been removed in an effort to clean up the shoreline. Some had been left on the beach since Christmas. One of the latest wrecks was a burnt-out stolen car. Nine of the cars were collected from the Five Mile Strip, frequently used for swimming... while the rest were found past Rimmer Rd. Rodney District Council's general inspector... says the council needed to contract someone with the right equipment for the job. "Had we got them out earlier it wouldn't have been such a big job, but once the tide comes through them a couple of times they get buried, with sometimes just the roof sticking out,"... In previous years, Defence Force personnel have helped remove derelict vehicles from the beach, sometimes as part of the annual Muriwai Beach Clean Up.

...Sea clean-up seeks help West Auckland residents are invited to sail to distant shores to help reduce sea rubbish polluting the environment. Island Care NZ are looking for keen volunteers for their 11th annual foreshore clean up and survey of Rangitoto and Motutapu Islands... Volunteers can choose which island to go to... The survey of the collected rubbish will be part of an international study, and free boat transport is provided for volunteers. Island Care's director... says the day is about giving the public a chance to make a difference to sea pollution. The trust aims to improve coastal foreshores' and waters' quality by raising public awareness and involving people in research and practical projects.

...IT HARDLY needed explanation. "Everyone knows the planet is in bad shape," thundered a *Time* magazine article last year. The seas are being polluted, the forests devastated, species are being driven to extinction at record rates, the rain is acid, the ozone layer vaporising, and the rivers are so poisonous that fish are floating on the surface, dead. As... [a] former US vice-president, put it in his book *Earth in the Balance*: "Modern industrial civilisation is colliding violently with our planet's ecological system." We inherited Eden and are leaving our children a depleted rubbish dump. But there's growing belief that what everyone takes for granted is wrong: that things are actually getting better. A new book is about to overturn our most basic assumptions about the world's environment. Far from going to hell in a handcart, it is improving by almost all measures. Those things not getting better are getting worse at a slower rate. Rivers, seas, rain and the atmosphere are all getting cleaner. The total amount of forest in the world is not declining, few species are being made extinct, and many that were endangered are thriving again. *The Skeptical Environmentalist* by... [a] professor of statistics at the University of Aarhus in Denmark, contains a scathing attack on the misleading claims of environmental groups, and the "bad news" culture that makes people believe everything is getting worse... When it was first published... it caused a deafening storm of protest and transformed the nature of the debate. The book is part of a growing backlash against green groups, and is potentially the most dangerous. Most previous criticisms have come from right-wing think-tanks hostile to the environmental agenda. Now the attacks are increasingly coming from left-wing environmentalists such as [the professor], a former member of Greenpeace. The accusation is that, although the environment is improving, green groups – with revenues of hundreds of millions of dollars a year – are using increasingly desperate scaremongering to sustain their donations... "It makes us scared and it makes us more likely to spend our resources and attention solving phantom problems while ignoring real and pressing, possibly non-environmental, issues." ...[the professor]'s book... doesn't deny global warming – probably the biggest environmental threat – but demolishes almost every other environmental claim with a barrage of official statistics... [The professor] says that the marginal benefits of the Kyoto Treaty would cost around \$100 billion annually, possibly twice as much, when half this sum could give everyone in the [Last] World access to basic healthcare, education, water and sanitation. "Kyoto makes us feel good, but if we really want to do good, we would do better to give the money Kyoto would cost to the [Last] World,"... Environmental groups claim, with justification, that many of the improvements are the results of the success of their campaigns... "The ozone layer is beginning to recover because ozone depleters are being rapidly phased out. It's a triumph of the environmental movement." ...Environmentalists admit there has been a change in emphasis – from problems that have occurred to warnings about those that might, such as genetically modified foods. "It is not scaremongering to draw attention to a risk that could have serious consequences if it comes to pass," says... [the] executive director of Greenpeace UK... Indeed, some potential risks – such as climate change – end up becoming reality if nothing is done... "Very few environmental groups are doom and gloom merchants. What we say is based on science," says... Friends of the Earth UK's director, who insists that the environment is facing new threats. "The more obvious and simple environmental issues have been tackled, by and large. But we have replaced smelly pollutants you can see with sneaky pollutants that affect you over the long term."

...Illegally reclaiming land in Glendene has landed a local [businessperson] in deep water with the ARC. The businessperson's attempts to enlarge his waterside boatyard by dumping a large amount of fill at the estuary's edge had led to threats of court action. Efforts to spruce up the Span Farm boat yard led one keen helper to cover old boat debris by the estuary with 150sqm of fill in August last year. [The businessperson] says this was accidental. "One of my team got a bit over-enthusiastic. It was a mess, so we were just trying to clean it all up." The land where the fill was dumped joins onto the boat yard and is leased from Waitakere City Council. Any changes to the land need council approval. While the fill dumped in the Wairau Creek extended the Span Farm boat yard's land area by one metre along the bank, it squashed mangrove trees and contains heavy metals which are polluting the coastal environment. According to the ARC, illegal reclaiming is a recurring problem in the west... ARC's coastal environment manager, says several people since 1996 have illegally extended their land in the Span Farm area and the cumulative effect is disastrous for the local environment. Even clean fill damages the ecosystem of our already highly-polluted streams and rivers... [The] ARC gathers information for court proceedings, but first tries to resolve the problem without legal action... [The] group Friends of the Whau, is horrified at illegal reclaimers' actions. "They're really being very selfish because they are spoiling it for everybody... They should be aware of these issues."

...In Auckland we define ourselves to a large extent by our coastline – characterised by easily accessible beaches, imposing sandstone cliffs, pohutukawa-lined shores, unspoilt islands and quiet estuaries. But Auckland's coastline has become increasingly punctuated by illegal coastal structures – jetties, landings... boat ramps and others – which have been built without resource consents. Undoubtedly these structures were all conceived as enhancements but in reality many are eyesores and some are physically damaging to the coastal environment. [The] ARC Environmental Management Committee chairperson... says the council is committed to working with other local bodies and the wider community to rationalise such structures in an effort to restore some of Auckland's coastal character. "We all have a vested interest in the coast, harbours and sea... We need to assess structures and ensure that only those which serve or are compatible with the wider public good remain." That process has

already begun with... at least 1400 structures in Auckland[’s district]... identified as illegal. All of these structures are at least partially in the Coastal Marine Area (the area below mean high water springs) which the ARC is charged with managing. About half of them extend on to local council land while the other half are partly on private land. Over the next few months local councils will be asked to indicate which of the structures partially on their land they want to retain. They will need to apply for a resource consent for those while making arrangements with the owners in conjunction with the ARC to have the structures they don’t want, removed. Later this year the ARC will be working with the owners of structures partially on private land towards removal of those deemed inappropriate and consents and compliance for those which are to remain.

...A house removal company has been given a hefty fine for bulldozing a protected reef on the North Shore... [The company] pleaded guilty in the Environment Court at Auckland to illegally clearing a... 10m-wide... channel through the reef at Thornes Bay, south of Milford Beach, to move a two-storey house on to a barge... before shipping the house to Northland... Barging the house avoided expensive road transport costs... [The company] had resource consent for the house removal from the North Shore City Council but no permit to disturb the seabed. It agreed to carry out remedial work, but some damage was permanent... The company was fined \$27,000, with costs of \$6114. A[n ARC]... coastal officer... said: “This decision sends a clear message to commercial operators that they won’t get away with damaging the environment without hurting their pockets.”

...*Trawlers blamed for plight of underwater ‘rainforest’*... Scientists have raised the alarm about fishing trawlers that are destroying deepwater coral around N[Z] as far south as Fiordland. The trawlers, fishing for deepwater species such as oreo and orange roughly, drag nets along the surface using heavy cylinders designed to ride over uneven ground. As well as fish, they are catching “trees” of fragile coral that sometimes grow 5m to 10m high – up to 2km under the sea. Some scientists and environmentalists want the Government to ban trawling in more underwater “seamounts” where the coral grow. Nineteen of the 800 known seamounts in N[Z]’s exclusive economic zone were protected from trawling two years ago... [A] squid and octopus specialist who quit his job with the National Institute of Water and Atmospheric Research... in January to speak out on marine policies, said trawlers had scooped up hundreds of thousands of tonnes of coral from seamounts in the past 25 years... 105 different species of coral had been identified so far in N[Z] waters... Unlike tropical coral, deepwater coral species usually live below human diving depths, although they are found in shallower waters in shady places such as under the arches in the Poor Knights Islands and inside the fiords of Fiordland. Since they grow typically at only 1.5mm a year and live for 400 to 500 years, they may take centuries to recover from trawler damage.

...The A[US]n Government yesterday released details of a plan to ban fishing and shipping in... a third of the Great Barrier Reef, dramatically increasing the level of protection for the world’s largest living organism... Only scientific research and carefully controlled tourism would be allowed in th[e protected] areas... But the Association of Marine Park Tourism Operators... called for 50[%] of the reef to receive protection.

...A[US]’s 217,000 sq km Great Barrier Reef is under more stress than ever before, according to scientists and conservationists. Parts of it are being poisoned to death. The world-heritage-listed Great Barrier Reef Marine Park’s inshore reefs and sea grass meadows are being choked by a lethal chemical cocktail gushing from Queensland’s rivers. The reef’s Marine Park Authority and Co-operative Research Centre... agrees it is facing a “one minute to midnight situation.” ...Tourism linked to the world’s largest coral reef complex contributes \$US700 million... to A[US] each year. Sediment is flooding down rivers on to the reef and silting the waters, blocking out sunlight and preventing photosynthesis. There are accounts of reefs disappearing under... 38 million tonnes of sediment... The sediment also carries pesticides and herbicides from intensive farming... When big weather systems such as cyclones blow through the area, as they often do, pollution can be carried ...to the outer reefs... Farmers say they are reducing sediment run-off and chemical pollution, and [the research centre’s]... deputy chief executive... acknowledges there have been improvements but [it] wants more done. Otherwise... the present precarious situation for these habitats will worsen, perhaps catastrophically... The reef is also being eroded by an outbreak of the crown of thorns starfish, and there is evidence to link that, too, with pollution from the land... Most alarming is the precipitous drop in the number of dugongs – ...also known as sea cows. The conservation body WWF A[US] said dugong numbers had halved in eight years in the park’s southern region; in some areas, the decline was 80[%]... Many scientists are linking the decline to the destruction of the main food source, sea grass. The WWF... says... [a]long many parts of the coastline, the water is often thick and brown like a muddy milkshake... and about 70[%] of freshwater coastal wetlands in the northern “wet tropics” region have already been lost.

...*Working for a wetland revival*... Think about Auckland’s natural heritage, and beaches, volcanoes and the bush spring to mind. But spare a thought for the humble wetlands which once covered large expanses of low lying land throughout Auckland and now cover just 0.4% of the region. Nationwide the figure is 2% but even that is frightening when you consider that wetlands are home to at least 22% of bird species and 30% of native freshwater fish... wetlands also play a vital role in controlling flooding and providing water in drought. Wetland vegetation reduces erosion and silt build up in streams and rivers, adding to the importance of these at risk eco-systems. “Fortunately all is not lost, and Auckland can still boast some fine examples of these important habitats while working to restore others to their past glory.”... [the ARC’s] Environmental Management Committee Deputy Chairperson... says. Among the region’s best examples are the internationally significant, 266 hectare Kaitoke Swamp on Great Barrier Island, the nationally significant Bethells Swamp (140 hectares) and Te Makutu Bay on Waiheke Island. While these are well established, restoration is just beginning at other sites, such as Lake Pokorua on the Awhitu Peninsula... If... [the] Lake Pokorua Adjoining Landowners Group... need... any... inspiration for their project, they need look no further than Awhitu Regional Park which was replanted from pasture in the 1970s to the point where it now contains sequences of native wetland vegetation from saltmarsh to freshwater and an increasing variety of native wetland birds. The ARC is heavily involved in wetlands restoration in other regional parks like Shakespeare and Tawharanui... Note: The importance of wetlands is also recognised internationally with World Wetlands Day celebrated on February 2 each year.

...*Off-colour lake eludes cure*... LAKE Wainamu’s mysterious illness remains a secret beneath the murky waters that are baffling scientists. The A[RC] is calling for further investigations into the picturesque lake’s ongoing deterioration, following hazy findings in a National Institute of Water and Atmospheric Research report... Problems were first identified in 1995 when the council noted a marked increase in nitrate levels and... plankton threatening marine life. The predatory koi carp was initially feared but ruled out after council staff failed to find any of the fish. Lake Wainamu, at Bethells Beach, is regarded as one of the most important freshwater lakes in Auckland, particularly for its recreational value.

...One of the wildest and most unique stretches of the west coast... [– where t]he endangered dotterel and variable oystercatcher nest on wetlands... along with the more common North Island fernbird and pukeko... [–] has been officially added to Auckland’s parks network. Whatipu, which includes about 6km of rugged coastline and 800ha of sandflats at the mouth of the Manukau Harbour, has been vested in the A[RC] after two years of negotiations with the Crown. The land was designated unallocated crown land and the ARC has been its de facto manager for the past 20 years... [The] ARC parks chair[perso]n... said revegetation and an upgrade of the historic Whatipu Lodge were two projects the council was keen to get on with. The lodge, built in 1867, is just one of the historic features at the remote beach... It is where survivors of HMS Orpheus struggled ashore after the ship foundered on the Manukau Bar in 1863 with the loss of 189 lives. Four of the highest points around the mouth of Whatipu Valley had fortified pa and tram tracks for hauling timber from now-defunct mills can still be found... There is also a series of caves, some so large they were used last century by timber mill workers for socials – one even had a wooden dance floor. Most of Whatipu Beach did not exist before 1900. The area is an example of rapid sand accretion and it took about 30 years for the sandflats to form a 1km strip between the cliffs and the sea.

...Whatipu is now the largest scientific reserve in Auckland. [The] Conservation Minister... says the stretch of west coast has the second highest level of protection under the Reserves Act and is recognised for its high geological and ecological values. “It’s a changing landscape... and unique

environment,” [the minister] says. The extensive mobile dunes and sand fields are home to native plants and animals... Waitakere[’s] Mayor... welcomes the extra protection and hopes it will eventually extend to the Waitakere Ranges. “...I would also like to see a coastal plan offshore.”

...minor changes to the management of Piha beaches have failed to appease some property owners... [mainly because] the controversial artificial sand dunes would remain... [The] Waitakere Community Board chair[perso]n... says removing the dunes would change the dynamics of the movement of sand. “If we interfered with the natural processes that wouldn’t get us back to the way the beach used to be.” Changes by the board include a provision that any further structures built on the fore dunes at Piha will require board approval. The board also decided fences will not be built to protect the sand dunes, the Moana Stream channel will be modified to lessen the effects of stream channelling and spinifex will be planted on dunes to prevent damage from pedestrians. [However, two] Piha property owners... who have... been visiting the beach for more than 50 years... say dunes blocking the Moana Stream delta have altered the natural flushing processes of the beach. They say sand accretion has raised the level of the beach and the location of the rip has moved, making the beach unsafe.

...ANGER and troubles have erupted again at Piha over two contentious beach-front fixtures... Someone set fire to the... new surf lifesaving watch tower... on Thursday... [The] United North Piha [gals’ club captain is]... disgusted at the attack. “Whoever is doing this doesn’t think. By vandalising our watch tower they are putting people’s lives at risk.” [The captain] says in the past fortnight a new motor has [also] been stolen from the clubhouse and someone tried to kick in the door of the north tower... [However, most locals don’t share her disgust. The r]esidents and ratepayers president... says... “Most of us were pretty upset to find it had been placed closer to the beach than anyone had thought... The design of the whole thing is very ugly and it’s... been a target for graffiti.” Meanwhile, the Waitakere Community Board is angry it wasn’t told a film crew had been given permission to use the rescue helipad by the Waitakere City Council... [T]he board’s permission is required under the Piha Reserves Management Plan... [and] residents had been assured the temporary helipad would only be used for emergency landings... [The council’s c]hief executive... says the Piha helipad incident was an oversight and it is reviewing procedures to ensure it doesn’t happen again... [● NZ c]onservation’s worst-kept secret was formally announced yesterday. The windswept coast and unspoiled forests of Stewart Island would become N[Z]’s 14th national park, said [the] Conservation Minister... about 85[%] of the island, or 163,000ha, will become the Rakiura (land of the glowing skies) National Park – the country’s fourth biggest. Its remote and rugged ...land is home to some of N[Z]’s most precious native birds, including... 20,000-plus... kiwi. Rakiura National Park brings the total area of park and reserve land to ...o[ve]r... 5 million ha, or nearly a third of the country.

...the National Parks Board of South Africa has been appointed to ensure Table Mountain’s preservation. The board wants to meet tourists’ needs while minimising the damage they can bring. “We have to concentrate the visitor usage on appropriately designed and constructed facilities which might use perhaps one or two or possibly three percent of the environment. We’re talking about pathway systems, recreational areas and so on, while the rest of the area is preserved as close as possible to its pristine state... One of the things that’s extremely special about this place is that in the context of a growing metropolitan city [– Cape Town –] you’ve got an incredible natural resource stretching all the way down the peninsula. This is one of the hottest of hot spots of biodiversity in the entire world. We’ve got here on the peninsula 2285 different species of plants... that’s more species than the entire British Isles, or N[Z] for that matter. There are about 100 species which are endemic...” But the mountain range also has the highest density of endangered species on Earth. Its rich biodiversity is threatened by poor management and introduced plants. Alien trees such as eucalyptus have stifled native species. 15 indigenous plants have already been wiped out. Uncontrolled fires have swept across the mountain slopes, causing soil erosion. In 1994, in this environmentally vulnerable area, the Apollo ...oil tanker ran around. The oil spill damaged the habitat of many marine species, including the endangered jackass penguin. The entire mountain complex is under pressure from rising human intrusion.

...N[Z]’s five subantarctic island groups have been added to Unesco’s World Heritage list at its annual meeting in Kyoto, Japan. The Auckland, Campbell, Snares, Bounty and Antipodes islands are among the most unspoiled in the world and are home to 126 bird species, including... albatross... and... petrels... They are also a haven for the world’s rarest sea lion, the southern right whale and plants such as the unique daisy tree, tree ferns, buttercups and flowering megaherbs. Conservation groups have been pursuing World Heritage status for the islands for... a decade. An application finally reached the U[N] Educational, Scientific and Cultural Organisation... last year. The Minister of Conservation... last night welcomed the “christening” by the international community of another N[Z] conservation asset... World Heritage status was granted to Tongariro National Park [– ‘the first of NZ’s national parks, most of the land including the 3 mountains having been donated to the government and people in 1887 by TE HEUHEU Tukino IV and other chiefs of the Tuwharetoa tribe from the Tokaanu district (the original size was 2600 ha’; ‘the 3150ha Erua State Forest and the 6100ha Rangataua State Forest were added to the park’s then 76,504ha’ in 1982) –] and Te Wahipounamu, in South Westland, in 1990.

...Archaeologists want Auckland’s volcanic cones to be given World Heritage Convention status because of their unique natural and cultural landscape... The 500-member Archaeological Association is pushing for the same kind of... status for the Auckland cones as Tongariro National Park won in 1993, and which was marked in a ceremony at Mt Ruapehu last month... Members of the Auckland Conservation Board yesterday supported the idea, but want more details on the implications of such status being conferred on cones in the heart of Auckland urban areas... Auckland’s public watchdog on conservation issues, [said] the cones were a unique landscape globally and... had been occupied by Maori in settlements of thousands. Maungakiekie, or One Tree Hill, received 1.5 million visitors a year... “You can tell by the footprints. Schoolchildren go there in the thousands. There is immense public interest. The cones symbolise what is important to Auckland people.” The Auckland region is built on a field of 48 volcanoes, all of which erupted within the past 150,000 years. The crater forming Lake Pupuke and a volcano in the Auckland Domain are among the oldest... [while] Rangitoto is the youngest at about 600 years old... [Unfortunately,] Auckland stonefields showing evidence of complex Maori gardens and early European settlement would not be included, despite their international significance. The stonefields were not publicly owned, and as recently as last week the A[RC] parks committee had withdrawn its intention to protect one of the areas at Matukurua...

New marine reserves have been delayed and possum, deer and weed control pared back so that the Department of Conservation can meet budget cuts. The department has to shave \$54 million... over... four years... Natural heritage would lose \$6.1 million a year and recreation \$2.8 million.

...If motoring memorabilia... is... your thing... visit... [the] Museum in Victoria Rd... Devonport... [–] recently named runner-up in the Auckland Heritage tourist awards’ activity-experience category... [– where] collectables range from spark plugs, petrol tins and radiator emblems to three Model A Fords, a 1928 Chandler sedan... a 1962 Cadillac Fleetwood limo... and... a 1922 Rolls Royce Silver Ghost dual-cowl Phaeton... Among some [of the museum’s other attractions] are... eight working steam locomotives... hotel memorabilia, a toy collection... tools... and what is thought to be the largest collection of floral toilets in the world. It is really worth a day, or at least half a day[, of your spare time]... “Visitors will not see everything in a single visit. One person has returned a record 17 times...[,]” says the owner, who suggests that is because it is no ordinary museum... “That’s why it is spelt with a ‘z’ – it’s because our ‘museum’ is unlike any other on earth.” ...The museum is open daily from 10 am to 5 pm.

...LIFE AND DEATH IN ANCIENT EGYPT... [is an exhibition of] *Egyptian Art from the National Museum of Antiquities at Leiden, the Netherlands... organised by the Western A[US Museum]*, which is currently on show at the]... *Auckland Museum Discover it for yourself*... [However, if modern art is more your thing, check out the] mixed media art exhibition... at Te Atatu Peninsula... Still Life will display work by 28 students... [who] are studying for a Manukau Institute of Technology’s certificate of visual arts... The course... [t]utor... says many of her students will continue in art studies... “I think the quality of their work is amazing for people in their first year. They really make people question ‘what is art’.”

...“It’s a kind of westie art – westies have different attitudes to things[,]” says one of the co-organisers of the]... ‘Drive to Survive’ campaign... to help raise drivers’ awareness of the need to slow down on rural roads in the Waitakere Ranges... T[he t]wo Huia residents... are selling framed... [g]raphic photos of animals killed on the road[s]... and a cartoon character to raise money for road signs... The idea to stop road kill came to

fruition while [one of the co-organisers], a bus driver, was taking the local children to school. “It started out as a bit of a joke. The kids and I would look out for road kill and count it. But it got beyond a joke so much so that it really put my back up,” says [the bus driver, who points out that it] isn’t an animal advocate or greenie. Now [the bus driver] takes a camera and a shovel with her on the bus. When a dead animal is spotted [the bus driver] stops, grabs her camera to take a snapshot, then buries the animal: “I just can’t stand the thought of them being completely squashed on the road without any recognition,”... [The bus driver] estimates around 25 animals and birds die at drivers’ hands between Huia and Laingholm each week. Some are native, like pukeko, while others are the less endangered rabbit, possum, or duck... [The driver] estimates around 90[%] of the road kill is deliberate. “People take them as targets on the road, people don’t slow down. They swerve to hit these poor things. It’s people’s attitude to it that’s set me off.” ...The Land Safety Transport Authority does not have any formal advice about avoiding road kill, but [an LTSA spokesperson]... says it is important to think of peoples’ safety before animals”. “I guess our advice to drivers would be to drive to the conditions, keep a reasonable speed, with eyes open and try not to hit them. But we don’t want people to be swerving all over the road to avoid animals and end up hitting a pedestrian or car.” ...[the co-organiser’s] advice to drivers is to “enjoy the view, enjoy the drive, but just watch where you’re going”.

...A [weaver] is giving advice to... Aucklanders visiting her exhibition... Visitors to... [the] show are encouraged to explore the rugs featured in Rags to Rugs with their hands. The display... at Titirangi’s Upstairs Gallery... features rugs made from a variety of materials... [A] rug weaver for 15 years, [it] creates rugs which can be used as wall hangings, or floor mats... [A]ll her rugs are unique and because [it] uses recycled fabric, any repetition of colour or style is virtually impossible... The pieces are all hand woven on a floor loom and include materials like knits, satin, linen, lace and silk... The 22 pieces featured in this exhibition are all new and have been created over four months... Upstairs Gallery is at Lopdell House...

Employees at Titirangi’s Lopdell House Gallery are keen to delve into the historic building’s past. Lopdell House[’s] public programmes manager... hopes to learn more about the former hotel during a forum at the venue on Saturday, from 1pm to 4pm. [The manager] looks forward to hearing tales about the building in its heyday when it provided upmarket accommodation, with a rooftop garden and aviary... [The manager] also wants to display memorabilia from its varied past, when it was a... school for the deaf and a residential training centre for teachers... The building was vacated... [by] the Department of Education... in 1982 and bought a year later by the Waitemata City Council for \$400,000 for use as an arts and cultural centre. It now houses the Lopdell House Gallery, the Upstairs Gallery, Titirangi Drama and a number of small businesses... The impressive four-storey building was opened on November 20, 1930, by Prime Minister Gordon Coates and promoted as a Swiss Alps type retreat...

Having an “alpine village” theme for Titirangi Village centre does not mean locals will wake to the sound of cowbells. The Swiss-like theme is part of the revised Titirangi Village Design Guidelines, which were first developed five years ago but never formally included in the District Plan... The village design should reflect the forest and hilltop setting, says a recent report... [However, the] Lopdell House Gallery director and curator... is dismayed future developments in the village may be to the alpine theme. “It’s appalling someone is even thinking of it. We have a unique area of flora and fauna, who would want to implant an external theme on this unique environment?” ...[the curator] says any theme should focus on the native surroundings and the pacific... [L]ocals describe Titirangi as the “fringe of heaven” because it is on a hilltop... with views of the Manukau and Waitemata harbours... and there is often a cloudy atmosphere.

...*Delightfully spooky little hideaway*... A... Titirangi resident... has a fine eye for detail. [The resident] is among Auckland-based miniature enthusiasts who spend years ensuring their creations are picture perfect. Her haunted house, which featured in the N[Z] Association of Miniature Enthusiasts’ 12th national convention on [the] weekend, took five years to build and comes complete with cobwebs, loose roof tiles and rickety window shutters... This is the first complete house [the resident] has made. Her other creations have been sections, or rooms of houses or shops. [The resident] says making miniature houses is better than watching television. “You kind of get really swept away in it... I didn’t want a really pretty house. I wanted it to look spooky. I wanted it to look deserted and look like it had been locked up for years,”... her favourite part of the house is the garden room. The model has a spiral staircase, chandeliers hanging from the ceilings and lights that work. The... garden includes urns, statues...

A life-size bronze statue of former Auckland mayor Sir Dove-Myer Robinson – known to a generation of N[Z]ers simply as “Robbie” – is being planned for Aotea Square. The move to raise about \$80,000 in public donations to commission a statue was announced yesterday by Sir Dove-Myer’s niece... who was his mayoress and is still a city councillor. “[Although] Robbie... once suggested the civic area needed a statue like Piccadilly Circus’ Eros[, Robbie]... never wanted a statue of himself[– so] we are going against his wishes. But it’s important to mark, for future generations, his service as the city’s outstanding mayor.” ...The council in 1981 commemorated Sir Dove-Myer’s service to Auckland by renaming Parnell Park after him... A tireless campaigner for a rapid transport system and cleaning up the Waitemata Harbour, [Robbie] became a nationally and internationally known figurehead of Auckland. [His niece] said the Auckland Central Area Arts Committee had approved a steering committee starting to seek public donations. Proposals had been invited from two sculptors, [who are Auckland-based] and English-based [respectively]... The winning design would be announced... and [the] work completed by October this year... Sir Dove-Myer died in 1989 after being Mayor of Auckland for six terms from 1959-65 and 1968-80. [Robbie] was also a founder of the Auckland Regional Authority (now council) in 1968. [Editor’s note: ‘Auckland was ruled by a proliferation of local bodies from the abolition of the provinces in 1876 until the 1960s. There was an attempt in 1903, inspired by the city’s mayor, Sir Arthur MYERS, to form a Greater Auckland organisation to administer all municipal services in the whole urban area. In 1956 an Auckland Metropolitan Council was formed as a purely advisory body. However, parochial in-fighting prevented any regional organisation with administrative capability being formed until the Auckland Regional Authority Act of 1963 vested responsibility in an elected, regionally representative authority for planning, bulk water supply, sewer drainage, the international airport, passenger transport, reserves, regional roads and civil defence.’]

...The Auckland rescue helicopter, the world’s first civilian rescue service, was launched at Piha in the summer of 1970... The original airborne rescue crew... featur[ed a] Karekare lifeguard and now Waitakere City Mayor... and... [another v]olunteer lifeguard... who [today] manages and lives at Piha Surf Club... and is still involved. “It was pretty hair-raising... [in] 1970... In the original chopper there was no winch and we had a static line. Now it’s just amazing, it’s like a flying hospital. I still jump into the water though.” The original crew was made up of lifeguards from surf clubs along the west coast. They took to the skies in a Hiller 12E owned by [a pilot who]... offered his services to the Auckland Surf Lifesaving Association after realising [it] had some spare flying time. The idea got off the ground after intensive training and a string of mock rescues, with the service completing 11 missions in its first summer. Since then the service, now sponsored by WestpacTrust, has gone through half a dozen choppers and flown more than 10,000 missions. Today it covers the greater Auckland region, from Te Hana in the north to Meremere in the south and Coromandel and the gulf islands in the east... The helicopter lands on car parks [or] highways to pick up lifeguards before swooping over the water and dropping them off. Once the rescue [i]s... completed, the patient is transferred to hospital, hopefully within the so-called “golden hour”.

...Surf lifesavers may... be forced to cut back on some of their services this summer after being refused a government top-up... A plea from surf lifesavers for at least \$1.8m in guaranteed annual government funding was rejected last month, despite [the] Sports Minister... taking the credit for a \$2m Lotteries Board grant. Surf Lifesaving [NZ’s] northern region president... says the minister’s recent announcement of a \$2m one-off payment is “a red herring”, as it is the same money already pledged by the Lotteries Board three weeks earlier. The board has provided this level of funding each year since 1995. None of it comes from the Government, nor does it represent an increase... The decision follows a six-month government review of community-based rescue operations, the first in a decade, after a spate of drowning incidents on the west coast last summer... [The president] says an additional \$2.6m nationwide is needed to expand surf lifesaving services. This would be spent on new first aid kits, maintaining equipment, training and community education programmes to reduce the drowning rate, and offsetting past financial losses. Over the past five years, clubs in the Auckland region sustained losses in excess of \$500,000... [I]t costs \$7m each year to run N[Z]’s 79 volunteer surf life

saving clubs – 17 of them in the northern region – with \$5m of that raised by the clubs themselves... There are around 1050 active volunteers in the Northern Region and 45 paid lifeguards, who earn from \$10 to \$12 an hour. “It’s not good money given what they get confronted with, and sometimes they have up to 10,000 people under their care.”... • Piha Surf Lifesaving club... was last month given \$3000 by the Waitakere Community Board from its Community Well Being Fund. But... other wards were not accepting their fair share of responsibility for the service. Piha surf lifesavers were on patrol for... 5900 hours last year, did 5000 preventative actions, 91 first aid actions, 15 searches and 135 rescues...

Lifebuys will be installed at some popular fishing spots along Auckland’s notorious west coast this summer in a trial to see if they prove as successful as in A[US. At]... least 24 lives had been saved... since the... flotation devices, known as “angel wings”... were introduced... in N[SW]...

The lemming-like rush of sunbanned bodies began pouring on to A[US]’s beaches as the nation pulled down the shutters and raised sun umbrellas for the summer break. But with hundreds floundering in rips, the death toll rising and lifesavers battling almost without rest, the holiday season is shaping as the one that will change forever the sunscreened anarchy of sand and surf. Next month, the N[SW] Government will meet surf lifesavers to consider their demand for tough laws that would compel swimmers to bathe between the flags, allow boogie-boards to be confiscated, force some swimmers to pay for their rescues and ban others from the beach. While the notion of surf lifesavers as police officers does not sit well with everyone – including those who see huge problems of enforcement – it is a concept that is being closely watched outside the state, where surf clubs and local councils face similar problems of reckless swimmers as well as a rising threat of litigation. But even if lifesavers get the powers they seek, they will remain an extremely thin, zinc-creamed line against a nation that regards untrammelled access to even the most dangerous of seas as its birthright. The 270 clubs associated with Surf Life Saving A[US] (SLSA) have about 25,000 patrolling members, who among them watch over 300 beaches – a mere handful of the almost 4700 accessible to swimmers. Even on patrolled beaches, lifesavers are stretched to the limit. They already have an eight-point plan in place to reduce drownings, launched after the number of surf deaths during the peak 1997-98 summer period more than doubled to 34, from an average 15. But this summer has already given its own grim notice that more action may be needed... [Last weekend], Sydneysiders flocked to beaches as the temperature soared to 30 degrees. And from Bondi to Cronulla, even in ankle-biting surf, lifesavers rescued 60 people from rips, all of them outside the flags. At Elouera Beach, near Cronulla on the city’s southern beaches, a 25-year-old pregnant [swimmer and two guys], aged 40 and 20, were pulled from the sea after floating unconscious beyond the patrolled area. Despite the near drownings and a line of lifesavers trying to herd swimmers back to the flags, Elouera on [the very next d]ay became almost a disaster area. Lifesavers pulled 170 people from rips at the beach – about one-third of the more than 500 rescues made along the Sydney coastline that day. A day later, a 36-year-old... drowned at Elouera and two others were saved after being found unconscious in the surf. Elouera is a microcosm of surf lifesaving’s agonies. Crowds ignore repeated warnings and even disregard rescues from the rips they are about to enter. Swimmers plunge back into treacherous seas within minutes of being pulled to shore; the public believes no one has the right to stand between it and the water; and sheer weight of numbers makes the situation difficult to control... SLSA surveys show that while 96[%] of swimmers know they should swim between the flags, less than two-thirds head for the patrolled areas. Many of th[e remaining one-third] appear to be convinced of their own invulnerability, deterred by crowds or looking for better waves. Others will be tourists who simply do not know better, prompting special publicity blitzes at the borders. A study after the 1998-99 summer showed the risks – only one of the 33 surf drownings [las]t summer occurred between the flags, and 13 people died within 1km of a lifesaving patrol. For surf lifesavers, the frustrations of unnecessary deaths and their own impotence to prevent many of them have been steadily mounting. They have mounted extensive education campaigns, pioneered the use of new lifesaving technology and launched a computerised beach safety and management programme that will eventually cover every accessible beach in A[US]. Yet the drownings continue.

...the wives... used to love going to the beach. Now the mere thought of being near the sea makes them shiver with fear. The South African friends lost their husbands, Peter and Michael, to Piha’s surf last Labour Day, and life since has been unbearable at times for the immigrants. Each has been back to Piha just once since the tragedy – [one]... to show her visiting family and [the other] to lay flowers on her wedding anniversary... The weather last Labour Day was perfect for a trip to the beach. The two Papakura families, who had immigrated to N[Z] a few months earlier and had known each other for more than 20 years, decided to make their first trip to Auckland’s rugged West Coast for a barbecue. They had not seen waves since leaving Cape Town and were impressed when they arrived at Piha. The w[ives] now describe it as the worst day of their lives. They did not realise that it is one of N[Z]’s most dangerous beaches, with a death toll since 1980 of more than two dozen. After eating, [one family’s 12-year-old daughter and the other family’s 11-year-old daughter] took their bodyboards into the water at north Piha for a paddle. Before they knew it, they had been swept out to sea. Their fathers saw they were in trouble and heroically went to their rescue, but quickly found themselves in trouble. Surfers brought the two girls to shore but were unable to get to the [fathers] in time. The deaths began a horrible se[quence] at Piha. Three more foreign nationals drowned while swimming or fishing at the beach. Another w[ife] widowed last Labour Weekend, [a]Ukrainian immigrant... whose husband Yakiv was swept to his death while fishing from rocks at Piha, has been befriended by the South African[s – both of whom are now]... working fulltime to support their families... They... pray... no one else dies... [at] Piha or other West Coast beaches... They want information on dangerous beaches included in literature for new immigrants... a[nd a]re angry that it took their husbands’ deaths for warning signs to be put up.

...Signing up your baby or toddler for swimming lessons has become wildly fashionable over recent years for Kiwi parents determined that their offspring learn to be safe in the water as early as possible. But are we in fact lulling ourselves into a false sense of security and perhaps endangering our children’s lives in the process? Controversial US research certainly points that way. The latest report by the American Academy of Paediatrics says children are not developmentally ready for formal swimming lessons until after their fourth birthday. Any earlier than that, according to the study, and parents erroneously believe their children are at less risk of drowning, which leads them to be less vigilant around water... “Programmes that claim to make children safe in water or safe from drowning are misrepresenting what is possible...,” the report says... Water Safety NZ published the report in their latest newsletter. [The organisation’s p]roject manager... says while debate on the issue is important, it’s important to remember the report was written in the lawsuit-happy climate of the US. “There is also a Swedish study that says providing water confidence at pre-school age and swimming lessons at three to four years is very beneficial because it gives kids that confidence,” [the manager] says.

...A 12-year-old boy was shrugging off his hero status yesterday after... plung[ing] into the Waitara River to rescue a drowning schoolmate... “I don’t really have time... t[o] talk to the media... I’m just going into town to go for a surf.” The drama began shortly after 3 pm on Sunday when [the schoolmate], who was fishing near the rivermouth... slipped off the edge and fell headfirst onto the rocks. [The 12-year-old saw his schoolmate] fall and thought some of the nearby adults would try to save him – but they didn’t. After waiting for nearly a minute, and able to see only the tip of the drowning boy’s head, [the 12-year-old] dived into the water and pulled the 10-year-old to shore. A [16-year-old witness said it]... could not believe that [the 12-year-old] was the only person who tried to save [the 10-year-old]. “It was stink because nobody jumped in except [the 12-year-old boy]. They didn’t want to get wet.” [The 10-year-old] spent Sunday night in hospital with heavy concussion and will be off school for a few days.

...A surge in drownings is concerning water safety experts... Already this month seven people have drowned, including two schoolboys who last week died during a school trip near Waimate... [Last month]’s total of 21 was the highest it has been for five years, and... it could increase further when pathology reports are received... The trend in recent years had been towards fewer drownings... A worrying number of people were dying in immersion accidents... where they had no intention of actually entering the water. “We had five of them [last month], and it can be anything like someone falling over during a walk and knocking themselves... out near the water,”... [(‘NZ has the second-largest number of drownings per capita in the world’; ‘130 people drowned in NZ during 1997’.) Polish police are also] pushing water safety after 34 drownings in the first two days of summer.

...It's a sad fact that many dogs drown in swimming pools during summer. Although most dogs can swim, many have difficulty finding their way out of the pool. Puppies, in particular, exhaust themselves very quickly...

The... self-styled Prince of Darkness, was determined to save the life of his son's favourite dog. "I don't care how much it f***** costs... we can't let him die," decreed the veteran rock'n'roll star. Tank, a pedigree bulldog puppy, had lived with TV's weirdest family for only a fortnight, but [the son] was devastated when his pooch came down with a serious case of pneumonia. Sniffing and wheezing, Tank was rushed to Hollywood's most exclusive veterinary hospital. [The puppy] languished in a doggie humidicrib for three weeks – at a staggering cost of \$89,000 – until [it] was given a clean bill of health and allowed to go home. Sadly, the [family's] joy was short-lived, like Tank himself. Within seven days of his return, the unfortunate puppy drowned in the swimming pool at the family's glitzy Los Angeles mansion.

...Frogs croaking, goldfish splashing and the gurgling tranquillity of a water fountain may not be everyone's backyard cup of tea, but elaborate ponds are making a comeback in the modern garden layout. Very few people are lucky enough to enjoy a naturally occurring body of water in their garden, but that doesn't mean you're out of luck if a lilly-bordered ornamental pond is what you fancy for that irritating gap in the front lawn. Anyone can plan and build a pond, even if their personal space is very small, because water features come in every shape and size imaginable to complement the individual style of any garden... Concrete ponds are probably the most common... Bricks can be used for ponds that need straight sides, giving a more formal 'above-ground' look to the pond whilst readymade ponds of fibreglass or glass resin... can be ideal for an instant effect... It's always wise to consider safety where water is concerned, and a pond is not exempt from this rule. Small children are automatically drawn to a garden pond, so check with your local authorities at the planning stage of your water feature to check whether fencing will be required.

...Nearly two-thirds of Waitakere City residents are breaking the law by not having properly fenced swimming pools. Council inspections over the past six months show a non-compliance rate of 61[%] among the 368 swimming pools checked... [T]he most common faults were that latches and fences were not properly maintained and there was an "apathetic approach" from owners... After re-inspections nearly 23[%] were still not up to standard. Property owners face prosecution if their pool fences are not satisfactory after the next inspection... [The council's] manager of consent services... says they are seeking additional resources from the council through the annual plan so inspections can be increased... [Currently, the council only] inspects 700 to 800 of Waitakere City's 4280 [private] swimming pools yearly.

...It's hot, sticky and sweltering in the shade. You're sweaty, uncomfortable and yearning for a quick cooling dip in sparkling blue water. Is it too late to invest in a backyard swimming pool? Absolutely not. There are many types of swimming pools on the market, ranging in price from cheap to expensive, and in Auckland these valuable recreational facilities can be used year-round... Whether it's a blow-up inflatable pool or an elaborate inground concrete pool, there can be planning, building and safety regulations to take heed of. Every local authority's rules vary, so you will need to find out which [rules apply to your area]... Inflatable pools can be erected and filled anywhere there is sufficient space and water, and range in volume from 25 litres up to 3000 litres. A knock-down pool – named because it can be erected or 'knocked down' in roughly an hour – uses an aluminium frame in conjunction with a heavy-duty high-tech fabric liner, and holds between 1000 litres and 35,000 litres. Permanent-frame pools range from 12,000 litres to 50,000 litres and can be landscaped effectively using decks, plants and paved surrounds... Concrete pools are by far the most adaptable. These types of pools are higher in price and ongoing operating costs, with the average family pool holding 57,000 litres.

...make your pool a pleasure NOT A PAIN... [with] floatron... • SAVE time on maintenance • SAVE money • SAVE your health • REDUCE CHEMICALS 80-90%... [with floatron's r]evolutionary alternative to chemicals and salt...

[AN] OPTIONAL EXTRA FOR YOUR POOL [IS THE] AQUA BUG VINYL LINE AUTOMATIC POOL CLEANER... [FOR] ONLY \$455...

The revamped candy-coloured Parnell Baths are back in business. The Auckland pools reopened at the weekend following a \$4.2 million spruce-up, the first in 45 years for the baths, which opened in 1914. The new look has been done in the popular style of the 1950s renovation, which was designed to create the "Lido" atmosphere of a glamorous seafront bathing resort. The baths are among the largest saltwater pools in the Southern Hemisphere, with a 60m-long main pool... The revamp was nearly delayed and the pools threatened with closure last year while the Auckland City Council considered demolishing them for the proposed eastern highway. A petition signed by 6800 people helped save the baths... As part of the revamp, three 25m swimming lanes have been added to the main pool. The complex now includes a main pool and a children's fun pool with an aquatic playground, which children happily tried out yesterday. A new toddler's pool and adult and child spas are also welcome additions... Less obvious but more costly are the \$1.5 million of new pipes and filters required to meet water quality and health and safety standards.

...SCHOOL principals across Auckland are concerned that new water quality standards are too strict and may ruin the summer for many of the city's children. Some school pools will be closed to the public... as principals err on the side of caution to meet the Government's new recommendations. The Ministry of Education's Swimming Pool Water Quality Standards says public pools, including school pools, should have water tests every three hours while they are open. The standards also say a nationally qualified water tester must be accessible while public pools are open... But many school officials feel the... standards... are too costly and impractical. Edmonton Primary School's principal... says his school was looking at upgrading its pool before learning about the guidelines. Instead it has removed its pool... [The principal] claims more than 90 pools have been closed or removed from schools nationwide... Kelston Primary School's principal... says his school has removed its pool and confirms the new recommendations played a part. Kelston Girls High School's property manager... says the new water testing standards create extra costs schools can do without... "I've got a quote from a lab [for water testing] and that's about \$112... a month. That's \$1300 a year." [The property manager] says Kelston Girls High will keep its pool, but agrees many smaller schools will be forced to close their pools. [The m]icrobiologist... who advised the Ministry of Education on the water quality standards, is concerned at the effect they are having. "I don't think the committee actually thought that it was going to apply to other, smaller pools,"... Closing school pools to the public will have a detrimental effect on children learning to swim, [the microbiologist] says... "It's probably more important to stop people drowning than stop people getting gastro [enteritis]."

...CHILDREN defecating in the kids' swimming pool at Henderson's [Aquatic Centre] has forced it to close four times in the past fortnight. [The p]ool centre management says it's a continuing and frustrating problem... [The instructor] whose... Swim School uses part of the pool... loses money every time the pool is closed. "[Over the past 17 months] the pool has been closed off 21 times because kids messed up the pool,"... [A mother] whose daughter missed five swimming lessons over the past three weeks, is angry that children are allowed into the pool without proper protective togs. "It's disgusting that children swim around in the mess not knowing how long its been floating in the pool before being discovered,"... [The pool centre's] manager... says they are very aware of health and safety... "If there is a deposit in the pool then we close it, super chlorinate it and back wash it and that can take up to three hours,"...

[Henderson's Recreation and] Aquatic Centre was closed... over the... holidays... [for major renovations] leaving westies to try the local school for a swim... But... holidaying Westies looking to cool off in their local school pool... dipped out. New water testing regulations forced many schools to shut the gates on their pools – because they can't afford to pay someone to test the water and supervise swimmers.

...PART of the Waitakere City Council's newly opened West Wave Aquatic centre is closed for at least a week following a chlorine gas leak on Saturday night. The spa pool, wave pool and bubble pool are shut indefinitely while independent pool experts and Occupational Safety and Health investigate the leak. The main pool, learners pool and fitness centre will remain open. The incident saw 200 people evacuated and 48 hospitalised... [The council's] public affairs manager... says it is not yet known who will pay for the problem to be fixed or how much it will cost... [T]he council will reimburse swimmers for any medical costs caused by the gas leak and will pay for hospital treatment... Firefighters and ambulance officers

attending the incident treated children with headaches, sore throats and runny noses. At least one child was vomiting. [The]Fire Service hazardous substances adviser... did tests when [it] arrived... which showed the chlorine was five parts per million. An acceptable level is 0.5 parts per million. [The adviser] says at their worst, levels could have been 20 parts... It is only two weeks since the \$14 million centre was officially opened around an empty swimming pool. Hundreds of tiles detached themselves from the new pool floor three weeks ago when the pool was heated. About 590,000 litres of water was drained from the wave pool so repair work could be carried out. The pool won't need to be drained after the latest incident.

...Bad luck has come in threes for the multi-million dollar Waitakere Aquatic Centre... The centre was originally built for the 1990 Commonwealth Games. The new addition... was almost overshadowed by news older parts of the complex were in need of repair. Then there was speculation the formal opening of the new section by [the P]M... could not go ahead after tiles in the wave pool started to crack and peel. However the... opening went ahead as planned. Now, just two weeks after the new \$14m addition to the centre had opened, [the Waitakere City]Mayor... has closed the centre indefinitely... [after] 200 people were evacuated and 48 taken to hospital on Saturday after a chlorine gas leak around 7pm. Speculation on the cause of the accident suggests either an emergency button on the spa pool had been switched off after swimmers smelled gas, or... the button had been pushed accidentally and a malfunction meant gas continued to leak out. The aquatic centre resembled a disaster scene as people choked and spluttered for breath following the leak... [The mayor] says the council has launched two independent inquiries into the leak.

...A faulty regulator... is being blamed for the latest gas leak at Henderson's West Wave Aquatic Centre. About 150 people were evacuated from the pool at 7.30pm on Tuesday, the second time patrons have fled the pool... [T]he latest problem occurred when a regulator on a chlorine storage tank failed, setting off an alarm. No chlorine entered the complex... Firefighters and ambulance officers were called and swimmers were allowed back inside after 40 minutes to collect their gear. It remains open to the public.

...Waitakere City, famed for its wild west coast surf beaches... offer[s] surfers a softer, artificial alternative. A wave-making installation called a Flow Rider is [one of the new attractions at the city's upgraded]... Aquatic Centre in Henderson. The \$1 million installation is... a crowd-puller at overseas aquatic parks, says [the]centre manager... "With it you can simulate surfing and snow-boarding and skateboarding motion." Waitakere... [is] the first city in the Southern Hemisphere to have one... Flow Riders use powerful pumps to generate a thin sheet of water that flows over a padded wave form. Surfers on bodyboards can drop in on their own unbroken wave, feel the power and slide down, carve a turn, and ride up the simulated wave surface. Wave shapes vary according to which model is installed, but the Retro Rider model chosen produces a "dynamic breaking wave," according to [the]manufacturer... The Retro Rider can take 300 people an hour and has been hailed for its safety...

Warm wave pools prove perfect for a winter's swim... If you haven't been to Philips Aquatic Centre in Mt Albert or Massey Park Aquatic Centre in Papakura, you haven't experienced the latest indoor wave pools that Auckland has to offer. Great for all the family, both water parks host fun activities for young and old. Gone is the tank-like rectangular pool, replaced with a beach area... and best of all, waves that... help your kids be prepared for the great N[Z] beaches by letting them swim in a... swell or surge that simulates the ocean... Alternatively you can ride the swells of the lazy river [or] zoom down the hydroslide... Based on the American concept of aquatic leisure facilities... [b]oth... have their own unique themes. Philips is set in a tropical Caribbean pirate lair with pirates, ships, and great murals. Massey Park... is a steaming jungle. After being greeted with a smile, you can start to forget about the hassles and stresses of the outside world by... getting your caffeine fix at the Croc Cafe... doing laps in the 25 metre pool with the 'hippos', lying on the beach while the waves are lapping at your feet with the elephant... sizzling in the sauna or steam room with the 'monkeys'... or... soaking in the spa pools with the 'orangutans'...

Bubbles in a spa pool contributed to the death of a 4-year-old boy, says the Wellington coroner. Troy Julius Matthews of Titahi Bay, Porirua, died in hospital after almost drowning at the Porirua Trust Aquatic Centre... when [the 4-year-old] climbed into a spa pool unsupervised... The spa pool's water level was greater than Troy's height and the bubbles in the pool meant [Troy] could not be seen underwater when [the boy] got into trouble... [The] lawyer for the Labour Department, said when spa pools were operating with their bubbles at full power they "might as well have been filled with black ink"... Troy's mother had not read the pool rules and had not been watching him when [Troy] got into the spa for adults and children... However, the Porirua City Council-owned swimming centre had failed to make clear the rule that a person aged 15 or older must accompany children under 8. The rule was displayed in a photocopied notice on the counter at reception, but the only other indication was a sign standing at the mixed spa pool. When [Troy's mother] searched for Troy, [his mother] looked into the spa pool but it was foamy and [the mother] could not see anything. [A 17-year-old l]ifeguard... was alerted when a 14-year-old ran to his post and told him there was a boy floating in the spa pool. Troy was given resuscitation but died in Wellington Hospital the next day. The council said the bubbles in the mixed pool had since been permanently disabled, its water turbulence was reduced and visibility improved... More water safety notices had also been posted. [But the Wellington coroner] said there were not enough lifeguards on duty at the time of the incident and there was inadequate communication about which parts of the centre each lifeguard was responsible for. [The 17-year-old] had been employed as a lifeguard for only 3 1/2 months and another lifeguard on duty, aged 19, had two weeks' practical experience. [The coroner] said the pair were not given the close supervision they needed.

...*"Get rid of them!"* ...Most spa pools retail between \$5,000 to \$10,000[, but t]his Thursday afternoon Spa International[– which exports spas]... as far afield as the Falkland Islands... [– is] clearing eleven factory seconds for an incredible \$2,555 (with full warranty) plus 4 spas at \$2,000. Classified as seconds because of minor cosmetic marks, these pools cannot be supplied for normal retail... A deposit of \$250 will secure an order... The only 'extra' item that will be required is a thermal blanket... Two types of blanket-cover will be available ranging in price from \$280 to \$500.

...Hundreds of [swimmers] are having... chronic ear infections. Doctors in Northland... are seeing numerous cases of swollen red ears among swimmers... each week[, but h]ealth officials say it is a problem hitting most... hot spots... [for swimming in NZ. P]atients are advised... to stay out of the water for at least 10 days... Alternatively, they could plug their ears... Symptoms... [of] the ear-canal infection, commonly known as swimmer's ear... include itching, pain and swelling. It occurred when regular swimming washed out the protective lining in the ear, leaving it open to bacteria and fungal growth... [To compound the problem, r]egular swimming created warm, moist conditions in the ear in which fungi and bacteria could flourish... Divers were equally susceptible to ear infections from the pressure differences they were exposed to, combined with moisture levels.

...[extreme diving is where people dive to over 70m using only their own breath. Such divers need to have assistants on hand in case they pass out before returning to the surface (such diving can compress lungs to the size of a fist – an action which causes lungs to fill with blood to prevent them collapsing)].

...A Frenchperso]n attempting to break the world record in freediving in the Dominican Republic yesterday was declared dead shortly after plunging into the sea... carried down... by a 90kg sled... Audrey Mestre was trying to break the world record of 162m... achieved by her husband...

The... husband of a record-breaking free-diver is to commemorate her death with a death-defying dive of his own... "and I am ready to be with her."

...A diving company has been fined more than \$13,000 in the Auckland District Court after one of its divers got the bends while working in the Rangitoto Channel. [The]judge... found Auckland company DiveCo guilty of two charges under employment health and safety legislation and Department of Labour regulations relating to the diving accident... [T]he scuba diver... suffered the bends or decompression illness after conducting multiple dives or "bounce diving", with fewer than 10 minutes on the surface between dives. [The scuba diver] suffered pain and discomfort for three or four days and was out of work for three weeks. [The]judge... made an order that \$870 of the fine be awarded to [the diver].

...FRIENDS and family of a diver missing in the Marlborough Sounds were refusing to give up last night. They continued diving in the fast-flowing and dangerous French Pass where David Welsh, 21, of Nelson, was sucked down a 95m hole on Friday... A sea, air and land search[had] failed to find David... Police said it was unlikely [David] was alive and there was a chance his body would never be found. It is thought [David's

body] is being held on the bottom by his weight belt and tank... Fellow divers Ricky McDonald, 40, and Narelle Tanika Te Pure, 33... were... also... killed... Four other Nelson divers... were flown to Nelson hospital. Three were treated and discharged [while the fourth] was kept in for observation... Staff from Nelson Dive Centre, which organised the dive, also helped in the search last night.

...Police will today reassess the search for the body of a diver missing after an accident... which killed two others. David Welsh... was with a group of seven divers... [who were] apparently sucked nearly 100m into a notorious hole... at French Pass... Another four divers who resurfaced following the incident were flown to Nelson on Friday. One was admitted to hospital. However, on Saturday all four were flown by helicopter to a recompression chamber in Christchurch. Nelson Hospital said one of the divers who had originally been treated and discharged had returned to hospital on Saturday with possible symptoms of the bends. The others were recalled and flown to Christchurch as a precaution... Blenheim police had received an offer of specialist camera equipment to help in the search for Mr Welsh, but even if the diver's body were located, it might be too dangerous to recover it... Blenheim CIB was reviewing statements from survivors and witnesses and had seized dive gear and other equipment which would be sent to Wellington today to be examined. Police were also looking at how the divers, who were roped together, apparently became detached from a floating buoy which was rigged to allow them to dive to a set depth of 30m. [A police spokesperson] stressed that the investigation was not a witch-hunt but part of an effort to ensure such a tragedy did not happen again.

...Three Nelson cave divers were rescued at the weekend after they ran out of light and could not find their way out of a cave. The partner of one caver phoned police when the [trio] failed to emerge from the Riwaka Resurgence, near Motueka. Four professional divers went in search of the [trio] and found them in a chamber about 100m from the cave entrance... "All three were uninjured but cold[...]" said a police sergeant, who added that the cave divers'... torches failed. "They had also failed to lay a guide rope to lead them to the exit from the chamber."

...“I’ve screwed up – my wife’s dead and the kids are on a ledge.” That was how [a husband] summoned help after his futile attempts to save his wife deep inside a cold, wet cave. Noelleen Merle O’Brien succumbed to hypothermia during a family outing to Cave Stream, near Porters Pass, a week-and-a-half ago. Their children, [aged] 13, and... 8, were plucked by rescuers from a narrow ledge. A short distance downstream, on her back with water rushing over her face, lay Mrs O’Brien. At a preliminary inquest yesterday, [the]Christchurch coroner... was told of an unwitting domino effect that ended with what [the coroner] ruled to be death by misadventure. Mrs O’Brien, 40, was especially vulnerable to hypothermia. [Noelleen] weighed just 46kg, smoked heavily, and suffered severe asthma and acute emphysema. [The coroner] took the unusual step of convening an early hearing to quell “public conjecture” surrounding the tragedy. The O’Brien’s marriage had foundered about seven months ago and they separated... However, they had kept in regular contact and, according to their pastor, were working towards a reconciliation... In his statement, read to the court, [the husband said it] had the weekend offer of a home at Castle Hill, and initially planned to take just his son. “We had heard about Cave Stream [near Castle Hill] and thought that would be pretty exciting,”... Then his wife and daughter decided to go too. It was an opportunity to be a family again. [The husband] said his confidence in tackling the cave with children was boosted by his understanding that a friend had taken a 5-year-old through. [The husband] learned later they went only into its entrance, took photos and left. The day before the tragedy, the [family] checked out advisory signs at Cave Stream. Wool or propylene clothes, a warm hat and gloves, secure footwear such as running shoes, and one torch per person are recommended. [Yet]Mrs O’Brien was ill-prepared. [Noelleen] entered the cave wearing two long-sleeved cotton tops, green trackpants and borrowed oversized sandals. “You’re brave,” [an]outdoor safety expert... working on a nearby track, told the family, adding that the cave was cold... [The husband] decided to plough on, believing... his family were adequately clothed. “Now... I wouldn’t go in without a wetsuit,” [the husband] told the inquest. “It was cold, but I’m used to the cold. I’m a diver...” Mrs O’Brien’s clothing provided little insulation against a water temperature of 5.5C. After [Noelleen] became soaked from wading through a waist-deep pool, then slithered, with her husband’s help, up a small waterfall, her body heat rapidly drained away. [Noelleen] lost her shoes, and [her husband] dropped one of their two torches. [The husband] decided they should turn back when confronted by a second, steeper waterfall. “Noelleen started saying things like ‘keep on talking[.]’ ...then started slowing down,”... [The husband] recognised his wife was in the grip of hypothermia. “Noelleen was exhibiting signs of slurring, slow speech, slow movements, [and] seemed to have lost touch with what we were doing. [Noelleen] didn’t recognise the need to get out of the cave... I knew we were in a crisis.” By this time, the other torch had failed. [The husband] elected to put his wife and children on a ledge and go for help. “I got about 10ft down, hugging the wall. The kids then yell out ‘Mum has fallen into the water.’ I found her and picked her up out of the water... I knew [Noelleen] was dying, or was already dead. I reassured the kids that Mum was just asleep. I tried mouth-to-mouth for a while, but I knew it wasn’t going to work.” Through the dark, [the husband] told his frightened children to stay put while [it] went for help. Stumbling out of the cave [it spotted the safety expert]... As the alarm was raised and rescuers scrambled to respond, [the husband] went back for his family with [a person] who happened to be heading for the 360m limestone cave walk... [The husband yesterday thanked that person] and other rescuers for preventing what could have been an even bigger tragedy. The inquest was adjourned to allow evidence to be gathered on safety issues, including whether Cave Stream should be off limits... [to unguided inexperienced cavers. In related news, a Queenstown resident] was killed yesterday in a hang glider accident at Flight Peak. Jennifer Hornsby, 27, was flying with a training group when [Jennifer] lost control.

...Two people were killed in a freak air collision over central England, when a skydiver smashed through the wing of a glider sending it crashing to earth... in a field alongside the... Hinton-in-the-Hedges private airfield in Northamptonshire... police... [and] Air Accident Investigation Board... investigators said... The collision... [between the one-person] glider... and... the... freefall parachutist... occurred at over 610m on a sunny afternoon...

A group of seven skydivers has set a world record for unassisted human flight by gliding from a Dutch island in the North Sea to the mainland. Dropped from 4800m, the group of parachutists flew the 4km that separates the island from the town of Den Helder. Organisers said it was the first time that such a distance had been bridged in pure human flight. The parachutists wore special suits in which the arms were joined to the body by a layer of material – providing a sort of wing... Their legs were also joined in the same manner. “It was a pure adrenalin rush,” said... the 31-year-old Finn who designed the suits... [While on the topic of world records, in Malaysia they] keep rolling in: the [guy] who climbs thousands of steps backwards, the largest gathering of old people at a circus, the smallest frog and the world’s tallest skyscraper. As Malaysia attempts to put itself on the world map, record-breaking feats have become a national obsession. Barely a week goes by when novel, some would say dubious, feats aren’t attempted by a[n adult]... or child in Malaysia... To tally all the records, the *Malaysia Book of Records* has been created. A coffee table-sized hardcover published in 1997, the book aims to “inspire greatness within all Malaysians,” according to its foreword. The 300-page glossy features 1300 records in 11 categories ranging from sports and technology to buildings and human achievements. The... second edition, due next month, will include 400 new entries... Unlike its international model, Malaysia’s book turns no one away. More than low hurdles, the book offers Malaysians “a way to be nationalistic” and to do “a lot of positive things for the country,” says... its... editor... a former beauty pageant organiser. That spirit was what drew many on a recent Saturday when a small army of hairdressers shampooed through 1068 scalps to wash the most number of heads at a shopping mall. “I came to set a world record. It makes me proud to do this for my country,” said [one record-breaker], aged 29... Critics say that as competition heats up to set outlandish records, the country’s image will pay the price. In January, national shame set in when a team of Malaysian skydivers, who claimed to be the first Asians to parachute to the South Pole, returned home and grudgingly confessed they had jumped 1800km from their goal. The South Pole controversy has since spiralled into ugliness. One of the team members filed a police report, calling it a fraud. The organiser retaliated with his own police report, which chastised criticism of the Government-backed team as “akin to an act of treason.” Record-making is now under scrutiny. After the botched parachute attempts, [the]Sports Minister... said the nation must be wary of superlatives. “Everybody seems to be proposing the best, the first, the largest, the biggest, the smallest, the highest... But from now on we will be very strict...”

...[an AUS]n adventurer plans to attempt a... parachute jump from... somewhere around 40,000m above the Earth's surface. [The s]kydiver... intends to fly to the edge of space using a high-altitude helium balloon and then, insulated in a pressurised space suit, jump off, breaking the sound barrier as [it descends. The AUSn] expects to fall at speeds of up to 1800km/h to become the first [perso]n to break the sound barrier by merely falling through the air. It will take him 2 1/2 hours to reach 40,000m but only 10 minutes to parachute to Earth. [The AUSn] is planning to launch his space jump from Alice Springs in the A[US]n outback next March.

...A retired French Army colonel is soon to make [hu]mankind's biggest jump with a 40,000m freefall... from the edge of space that will take him through the sound barrier before [the French colonel] opens his parachute 1000m above the ground. [The French colonel], 58, who has 8300 jumps to his credit, will pass through temperatures as low as minus 115C and reach a top speed of Mach 1.68... after stepping out of a balloon-borne capsule above Saskatchewan, Canada... The freefall will involve 200 scientific experiments in the stratosphere and troposphere, some of them linked to the possibility of parachute escapes from stranded space shuttles. [The French colonel] will break a 42-year-old record set by an American colonel... who jumped from 31,333m over Florida. Although sponsored by the European Space Agency, the record attempt will be the culmination of a costly personal dream for [the French colonel], who left the Army in 1992 when its plans for a similar experiment were shelved for lack of funds... Four records are at stake: the highest [piloted] flight in a balloon, the highest freefall drop, the longest time spent in freefall and the fastest speed in freefall... [The French colonel] will take six minutes and 25 seconds to reach the ground on the Canadian plains. But the risks of an accident during the jump are considered lower than during the painstaking process of reaching maximum altitude... "Once [the French colonel] has reached the near-stratosphere,[" said a spokesperson for the agency, "the French colonel] will have to breathe oxygen for four hours before deciding whether to jump. It will be up to his conscience whether it is safe to dive headfirst out of the pod, knowing that [his body] will pass the sound barrier with a bang after 5000m."

...THREE people were injured when a hot air balloon exploded over Canberra yesterday... [● On this day in 1987, an] 18-month-old... fell into a narrow well while playing at [her auntie's'] day care centre in Midland, Texas. Rescuers dug a shaft parallel to the well and struggled for over 2 1/2 days to save a scared and dehydrated toddler... [F]ootage of the harrowing event... captured world attention.

...Seven potholers trapped 120m underground... are feared dead, despite desperate efforts to save them... 100 safety experts gathered at the Vitelles grotto in southwest France are being hampered by continued heavy rain which swelled subterranean rivers and trapped the [potholers] last Thursday week. Conditions have further deteriorated as repeated rescue attempts have worn away any secure footholds. One rescuer has been injured trying to secure a positioning beacon for one of the three drills involved in the rescue. A second team... was sent to recover him and one member was also injured... Rescuers are pinning their hopes that the highly experienced potholers found shelter from the rapidly rising waters.

...Eight Swiss potholers have emerged safe and sound from a cave in eastern France where they spent three days trapped by flooding. Rescuers used dynamite to unblock the flood waters. The eight – seven students in their 20s and the leader of the inexperienced expedition – rose through the entrance to the cavity... to cheers and sighs of relief from... 250 rescuers who worked day and night since last Thursday... The novice Swiss potholers were caught off-guard by a sudden rain-storm... and forced to take refuge... [from the] floodwaters... on a rock ledge... 80m from the mouth of the cave... Divers swam through the water channel which had trapped the potholers in the cave to bring food, drinking water, blankets and heating equipment but the final rescue was held off while teams on the surface worked to drain the waters... [It has not been long since] an equally big rescue operation was mounted to hoist seven experienced potholers out of a flooded cave in southwestern France, where they survived on tinned sardines and chestnuts.

...A[n Auckland]er... escaped from a wall of water in the Swiss Alps minutes before it swept away her husband of two years... John Roe, aged 30, of Hamilton, was last night missing, feared drowned, after a flash flood swept through a stream near the central alpine resort of Interlaken yesterday. Unconfirmed reports late last night said a Rotorua [resident] was also killed in the accident. Two other N[Zers from]... Christchurch... and Wellington... survived the torrent... [The Auckland]er and her husband were among 44 travellers on a Contiki tour who decided to try the adventure sport of canyoning, which involves swimming and sliding downstream in fast-flowing rivers wearing wetsuits and helmets, and often using ropes. The accident – caused by a sudden storm which turned a narrow canyon into a raging torrent – shattered the couple's dream of a working holiday in England. They left N[Z] a month ago and were due in London on Saturday. At least 11 N[Z]ers were on the tour, but not all went canyoning... [A] group of 52 people, including guides, [were] canyoning on the Saxeten brook... 60km southeast of... Berne. The accident was discovered... by a local jogger, who saw bodies floating into Lake Brienz... [The] Wellington student... tried desperately to relax as [it] was swept down about six waterfalls and pounded against rocks... Gasping for air whenever... the 22-year-old... surfaced, [it]... knew his best chance was to make his body go limp and let the current sweep him to safety. And his luck held, though it was a rough ride. [The student] landed on rocks and was pulled unconscious from the river. Doctors suspected [the student] had broken his back in the accident, but by last night it seemed [the Wellingtonian] had escaped with severe bruising. [The student], who was starting a working holiday, was abseiling down a canyon into the river when the sudden torrent struck.

...Swiss flood victim laid to rest... Despite his lust for speed and adventure, Jon Roe always chose the slowest queue at the movie theatres... Yesterday 400 relatives and friends turned out for his funeral at the Hamilton Gardens Pavilion to recall those quirks. Mr Roe, aged 30, died two weeks ago when a rolling wall of water and rock tumbled his body down a stream in Switzerland – a disaster that also killed 20 other tourists. His wife... aged 24, survived the flash flood at Saxeten Brook. Yesterday's funeral was especially bitter for the Rev... who officiated at the couple's wedding just three years ago. "I've got a real knot in my stomach... They were the prince and the princess." Others spoke of a passionate sports[perso]n with sparkling eyes and a cheeky grin, a canny marketing manager with a love of music, animals and Indian food... Swiss authorities are still investigating the disaster. They refused to let [the victim's wife] see her husband's body at first because of its horrific injuries, but later relented. [The wife] has praised tour operators Contiki and Swissair for helping with grief counselling and accommodation. The couple took the trip so they could spend time together after four months working apart in Auckland and Hamilton. Mr Roe was buried at Whatawhata Cemetery.

...EIGHT people will stand trial for a Swiss canyoning accident... [in which] eighteen tourists and three guides died... The group were trapped as they took part in a thrill-seeking excursion organised by an extreme sports company, Adventure World. Kiwis John Roe from Hamilton and river guide Andrew Lee, from Rotorua, were among the victims. Six other N[Z]ers survived the... canyoning adventure which went tragically wrong. A rival canyoning company cancelled a trip around the same time that Adventure World's ill-fated tour went ahead. A preliminary inquiry into the accident... has just finished. Eleven people from Adventure World – including five guides who survived the accident – were under suspicion of negligent homicide. One of the guides was also a Kiwi. T[he t]op whitewater kayaker... from Christchurch was cleared and will not face criminal charges. [A] Swiss investigating magistrate... was looking into reports that guides had been threatened with the sack if they cancelled trips. Adventure World closed down... after an American bungee jumper plunged to his death. An inquiry found the bungee rope was too long.

...An... [American] developed a speech impediment, a severe depressive disorder and was unable to work for a year after [it] saw his wife fall out of a raft and drown. This week... [the] American teaching in Hawaii, received a secret payout for the mental trauma [it] suffered after 26-year-old Carol Palmer's death in 1995. The payout highlights the need for clear legislation on nervous shock claims and is likely to have effects beyond the adventure travel industry. The [American]s, holidaying in N[Z], decided to take a rafting trip down the Shotover River with Danes Shotover Rafts, a venture approved by the Queenstown Lakes District Council. The raft was swept down a rapid known as "the Toaster," and Mrs Palmer was thrown in to the water. Her lifejacket became snagged on a submerged log and her body was found wedged against a rock. [The husband] filed a

mental trauma claim in the High Court at Invercargill against the council, the now-defunct Danes Shotover Rafts Ltd, [the]harbourmaster... and his company Tuawera Operations... The defendants had unsuccessfully appealed to strike out his claim on the grounds that the Accident Rehabilitation and Compensation Act precluded him from suing for mental injuries... [The] head of Brookfields medical law team in Auckland, said it was disappointing that the case did not make it to court... If [the American]'s claim had then succeeded in the High Court, it would have set a legal precedent for mental trauma claims... [However, the American]'s Queenstown lawyer... said that even though the claim was settled out of court, [i]t... “...really reinforces the need for people... [in] the adventure tourism industry... to take safety considerations seriously.” But adventure tourism operators spoken to by the *Herald* said safety concerns had long been addressed by operators...

Eleven jetboat passengers were injured yesterday when their craft slammed into a rock wall on the Shotover River near Queenstown. The jet was operated by Shotover Jet, which bills itself as “the world’s most exciting jetboat ride”... The... Queenstown police chief... said the jetboat, riding downstream, collided with a rock wall near the entrance to an area known as The Second Gorge... Jetboats travel at high speed through the steep gorge, travelling close to the rock face to give a thrillseeking ride... The company... said it was too early to say what had caused the accident. The company immediately halted its operations for the day and alerted relevant authorities... Yesterday’s accident is the second on the Shotover River this week. On Tuesday, Yoly Nim Yan Chi, 19, an Otago University medical student, drowned after falling from a Queenstown Rafting raft into the swift-flowing river in part of the Mother rapid known as Toilet. Ms Chi’s body was trapped underwater for more than an hour. Her death was the 40th adventure tourism-related accident in the Southern Lakes area since January 1997... [□ A Winton resident who is] married with three sons, aged 19, 14 and 12... died during a jetboat race on the Waimakariri River, north of Christchurch, yesterday... Allan Wayne Baxter, 47... was a navigator in a boat which hit a pressure wave and flipped, trapping him underneath. Police and the Maritime Safety Authority are investigating.

...*Jetboat scrutiny* THE M[SA] will conduct a safety review of the commercial jetboat industry, following a number of accidents in the past 12 months. The review will analyse present and future safety issues to identify and remedy safety risks... The authority yesterday released reports on two accidents on the Shotover River... both involving Shotover Jet. The first... happened when engine failure caused the boat to run into two rocks at the river’s edge. The second... was caused when the boat’s steering jammed and it hit a rock. Reports into both accidents recommended mechanical changes to or systematic upgrading of parts of the fleet and improvements and regular reviews to safety systems. The managing director of Shotover Jet... said the firm had acted on all the recommendations. [The director also] said his company welcomed the safety review.

...*Rising demand for thrill-seeking is creating a boom in N[Z]'s adventure tourism business. But how safe is it?* ...FOR A split second after stepping off the Sky Tower you will feel as if you have made the biggest mistake in your soon-to-be-shortened life. “It’s probably the longest half a second in the world,” says the [operator] behind Auckland’s newest high-adrenalin attraction... Even when the allegedly gentle and reassuring tug of the jump cable kicks in, you will still be plummeting feet-first towards the city landscape at 60km/h. Your stomach will have disappeared. Terminal velocity for a human body is around 200km/h but [the operator] adds cheerfully that you cannot really tell the difference – until you come to a smooth stop near the ground... The 192m, \$195 Sky Jump opens to the public today with television celebrities among the first to put themselves on the line. When they get their breath back they can claim to have made the second highest controlled leap in the world, after a South African bungy drop. It will be the highest tower jump, and the only one using a cable system pioneered by thrill-seeking guides at Waitomo. Next year the tower will also host a guided tourist climb up its mast to a crow’s nest 275m above the ground. The city’s other [hu]man-made icon, the Harbour Bridge, made its adventure tourism debut last week, with [the P]M... joining the first guided tour around and over the main arches 65m above the harbour. [An ‘officially-sanctioned bungy-jump from the bridge into the water’ is scheduled to begin operating shortly]... A massive flying fox said to be the world’s largest and “most thrilling” is about to open near Taihape. Slung 180m above the river bed in the Mokai Gorge, riders of the 1.1km wire can reach a giddy 160km/h... The new attractions are capitalising on N[Z]’s tourist-grabbing reputation as being not only clean and green, but extreme. Bungy-jumping and white-water rafting put the country on the adventure map in the past decade and the continued demand for thrills has seen innovative ways to make the scenery come alive. The question that hangs over this burgeoning and lucrative industry – backpackers spend more than \$650 million a year here – is safety. It is a sometimes uneasy balance between government bodies upholding safety standards and operators offering activities which by their definition depend on risk. Adventure tourism operators acknowledge a “[i]t’ll be alright” attitude in the industry’s younger days, but say that is disappearing. A generic standard for adventure businesses is being developed, allied to specific standards for activities as diverse as horse trekking and jet boating. In downtown Auckland young tourists on a highly charged tour of the country are philosophical about the risks. “I just put my life in their hands and hope they are not cowboy operators,” says [a] 26-year-old Irish traveller... who has been skydiving, rafting and jetboating. “It’s just something you have to do when you get here.” [But one]Swedish tourist... probably wishes [it] hadn’t. The 29-year-old returned home last weekend after spending most of her N[Z] holiday in hospital after an accident at the Fly-By-Wire adventure ride near Queenstown. [The Swede] received two broken arms and other upper body injuries when the rocket-shaped plane, suspended on wires and able to reach speeds of up to 145km/h, crashed into safety handrails three weeks ago. The accident... followed the death of a white-water rafter on the Shotover River, a jetboat accident on the same river which injured 11 people, a hang glider crash which left the pilot with serious spinal injuries, and a paragliding mishap where a 12-year-old girl slipped from her tandem harness, receiving serious injuries. No overall statistics are kept on those killed or injured in adventure tourism. But in a study published this year for Massey University’s department of management and international business, researchers found eight out of every 100,000 overseas visitors were sent to hospital as a result of adventure tourist activities between 1982 and 1996. That compared to 12 out of 100,000 tourists hospitalised from vehicle accidents. Although international comparisons were not available, the authors argue the rate was unacceptably high given the relatively low exposure to adventure tourism compared to driving. But a breakdown of the accident sources showed unguided, independent activities, such as skiing and mountaineering, had the highest injury counts... Despite the perceived high risk, bungy jumping has had one of the lowest injury rates and no deaths. The study found cases of smaller operators putting the pressure to make profits ahead of safety concerns, for example, by carrying on in marginal weather. The researchers argued for greater regulation in some activities but acknowledged “there is a delicate balance to be struck between ensuring that tourism businesses are not swamped by bureaucracy and red tape, while their clients are offered an experience that falls within internationally acceptable levels of risk and injury”... [The operator] whose Waitomo Adventures Ltd won Sky City’s backing for the tower jump, says when [it] started in the adventure industry 13 years ago a “wild west” mentality prevailed among some operators. “In the old days you used to employ people who were recreational climbers and cavers and put them in charge of tourists. It was not such a bright thing to do. Just because you are good at something and can keep yourself safe does not mean you understand risk management for clients.” [The operator] says today the attitude is different. His Lost World caving operation, which includes a 100m abseil and underground river journey, has never had a life-threatening injury to a client since it began in 1988.

...Residents and cave operators at Waitomo want the D[OC] to ban commercial caving in one of N[Z]’s largest caves. The part-owners of the Gardners Gut cave[, which was]... discovered in 1957... say it has suffered the equivalent of hundreds of thousands of years’ worth of damage in the past 10 years... [as a result of] significantly increased use... [by] commercial adventure tourist[s]... The 13km cave, located in the Ruakuri Cave system, is the longest in the North Island and the Speleological Society classifies it as nationally significant... [One of the part-owners said]large, “unruly” groups had open slather. Rock formations including massive stalagmites were damaged and mud was being trekked through the cave[, whose walls were now covered]... in graffiti... “It’s a real mess and disgrace. The cave is not an endless resource. The damage is irreversible and the rehabilitation process is slow.” ...a 1998 earth science masters thesis on the impact of recreational caving... suggested that management changes

were needed to ensure that the impact of visitors was at an acceptable level... But... [DoC's] King Country manager... said... "It is better that the public has access to a cave which has already been weathered by traffic and tighter restrictions are [only] placed on untouched caves." ...[this approach is unlikely to please residents and Waitomo cave operators], particularly those who] want DoC to stop Black Water Rafting conducting tours through Gardners Gut. The company has run them for at least 10 years without a licence. [The DoC manager] said Black Water Rafting's educational tours were not illegal because they were not strictly commercial... but the department has now asked the company to apply for a licence. [The DoC manager also] said Black Water Rafting was originally given permission to operate in Gardners Gut by the Tourist Hotel Corporation, which managed the reserve until 1990... Black Water Rafting's [licence] application hearing was due to start last week but was postponed after the department bowed to pressure... [from] local cave operators... [Their spokesperson, the managing director of] Waitomo Adventures... said... [they] were appalled that Black Water Rafting did not have to meet the same standards as other operators. "Black Water Rafting has made a profit from using a public asset for free but has not been required to stipulate management plans or make any financial contributions to maintaining the cave or limiting the damage." Black Water Rafting's director... said the cave had been damaged by unmanaged recreational cavers... [but agreed that] regular monitoring and a management plan for the entire system was needed to prevent further damage.

...[Caves are found in many types of rock but are most common in limestone, dolomite, and gypsum, which are readily dissolved by ground water. Such caves are called solution caves. Caves in the form of lava tubes, some several miles long, are common in extensive lava fields, particularly in the western part of North America. These caves are formed when successive lava beds from volcanic eruptions cool and solidify, trapping liquid lava that leaves open tubes when it escapes to flow to the surface. A third type of cave is found along sea shores or lakeshores where the shoreline is cliffed or steep in slope. Waves attack zones of weakness in the face of the shore, and cut openings in the rocks which eventually develop into large cavelike passages. Small caverns also develop along fissures, joints, or faults where slight movements of the rock give rise to small openings. Caves are generally located in areas known as karst lands. *Karst* is the surface expression of the subterranean solution of limestone that develops caverns. Karst landscapes are pitted with sinkholes, vertical shafts, and long blind valleys that lack surface outlets. The most famous of the karst and cavern areas in North America are in Kentucky and Tennessee. In these states, and in adjacent areas of Indiana and Illinois, there are over 20,000 sq miles of limestone that are "karstified." Sinkholes dot much of the landscape and in places there are as many as 1000 sinks per sq mile. On the plateau surrounding Mammoth Cave in central Kentucky there are sinkholes over 1 mile in diameter with steep slopes over 300 feet deep that have resulted from the collapse and subsequent solution of underground chambers. Passages in these caves are mainly large galleries extending for miles; gypsum is often present. Mammoth Cave, discovered in 1799, and the connecting Flint Ridge System, have over 150 miles of known passageways. Mammoth Cave National Park was created in 1936. In the same region with Mammoth Cave are five other large commercial caves, including Crystal Cave, which was owned and developed by Floyd Collins, whose death in a small cave nearby attracted worldwide attention in 1925. Most people who visit caves tour those that have been developed for commercial purposes (in the US there are about 130 caves opened commercially, and throughout the rest of the world there is probably an equal number). Commercial caves have graded paths, elevators, and in the case of Postumia Grotto in Italy, an electric tramway to make passage through the cave safe. Electric lights are now extensively used. The Pyrenees of southern France, near Grenoble, contain the world's deepest known cave, called the Beses de la Pierre Saint-Martin, with a reported depth of 3,842 feet below its entrance. In eastern Belgium and western Germany are caverns that are well known because of the remains of ancient people found in them. In the Urals and the Caucasus are extensive caverns and karst, some of which are important for the presence of radium. Other noted cavern areas are in central England, North Africa, southeast Asia, and in parts of southern and southeastern Australia. The study of caves is known as speleology, and those who explore caves are called speleologists or spelunkers. Aside from their interest as tourist attractions, caves are being commercially exploited only to a limited degree at present. Natural caves have been considered for use as shelters in warfare but in general have been found unsuitable because of the irregular size of passages and the danger of flooding. However, prior to the development of modern chemical methods they were an important source of saltpeter, used in the manufacture of gunpowder. Large deposits of guano, sand and clay in many caves have also proved to be economically valuable.]

...The Eden Project, a "living garden" that has attracted worldwide interest from architects and horticulturalists, is set to open tomorrow in eight giant domes built into the side of a disused claypit. The... £80 million... scheme – underway since 1988 – will house two... ETFE (ethylene tetrafluoroethylene)... covered climate zones and one outdoor zone designed as a living museum and education centre for thousands of plant exhibits... The larger dome, 240m long, 110m wide and 55m high, is called Humid Tropics. It recreates the climate and vegetation of Amazonia, Oceania, Malaysia and West Africa. The smaller dome is called the Warm Temperature region. Here the climate is similar to the Mediterranean, South Africa and California. A third zone, called the Temperate Zone... contains plants from countries such as China, Japan, New Zealand...

NZ has been voted best long-haul destination for the third year in Britain's *Guardian/Observer* travel awards, but, says the *Observer*... take a book... Two of my best friends are Kiwis who, when I told them I was going to N[Z], independently said almost exactly the same thing. "Beautiful scenery," they said, "really nice friendly people – you'll hate it." At the time, this seemed rather hurtful: I know exactly what they meant. N[Z] is truly paradise in many ways – clean, unspoiled, virginal, with sparkling air and staggering landscapes everywhere you look. It has snow-capped mountains, glorious forests, untouched beaches, fjords, glaciers, volcanoes, geysers, mud pools, desert islands – the best of English and Scottish landscape plus all the exciting bits from your school geography books. And no snakes! No predators, no leeches, no dangerous insects, in fact, nothing to worry about at all. And there perhaps is the rub. I've always thought paradise would be pretty boring and perhaps that's why N[Z]ers seem to expend all their intellectual energy inventing new extreme sports. To appreciate N[Z], you need to be all the things I'm not – outdoorsy, non-smoking... sports-loving, uncynical and culturally undemanding... (N[Z] has solved the cultural cringe problem by simply forgetting culture...)... You must be a keen hiker, boater, camper, skier, runner, climber or kayaker; you must be prepared to talk about rugby 24/7; you must have limitless unfeigned interest in Maori customs; you must believe that bungy jumping is the most important invention of the 20th century. You must forget Katherine Mansfield – most N[Z]ers have – ditto Sir Ernest Rutherford... The most famous N[Z]ers are the guy] who invented bungy jumping... Sir Edmund Hillary, Sir Peter Blake, [the director of the movie *The Lord of the Rings*], the star of the movie *Gladiator*] and... a model who used to be [married to a British pop/rock star and also dumped its current biggest pop/rock star (r:p1639, ln56)] – or else... the... [giant All Black winger] and another 500 rugby players whose names will live forever in Kiwidom... Still, one cannot call a country entirely uncultured when it has such excellent wine. You can rely on finding good wine anywhere, even on trains. The food is pretty good, too... So – good food, good wine, good scenery – mustn't grumble. My itinerary was ill-conceived, but my own fault. In Auckland for a conference, I thought I'd whiz round the country in a week. Daft. I would have been much happier staying in Auckland, which is almost like a grown-up city... Wellington is the capital, but the population is under a million and you can walk around the centre in less than an hour. The tourist brochure boasts "a live show to see almost every evening" but I hot-footed it to Rotorua, even though I was warned I would leave stinking of rotten eggs. But, if you are a hot-springs enthusiast, which I am, the... geothermal stuff is seriously world-class. This despite the fact that the "eighth wonder of the world" that first made Rotorua famous in Victorian times is no longer there... For me, Rotorua justified the horrendous 24-hour flying time (from Britain)... Anyway, I should have stayed in Auckland... taking a ferry every day out to one of the islands; there are dozens, ranging from residential suburbs to completely deserted nature reserves. One in four Aucklanders owns a boat, and they all potter around the islands. Consequently, Viaduct Harbour is really the centre of town, and a great fun place, with a stonking marina for millionaires' gin palaces and a long line of working boatyards where the next generation of America's Cup challengers is being built... Maybe N[Z] does have culture – just not as we know it.

...A hardcore of Team N[Z] sailors have pledged their loyalty to the next America's Cup defence, but there are serious concerns that the defection of their leaders could open the floodgates. The new Team NZ are relying on a pile of envelopes on the table this week to stop the flow of crew losses

to rival Cup syndicates. Three more sailors appear to be on their way to joining [their skipper and his tactician] – two-thirds of the team leadership – at a European syndicate bankrolled by [a]Swiss billionaire... But the invasion of campaigns from moguls such as the world's [second-richest person]... could further injure the N[Z] camp... Others considering their options include [the bowperson, whose]... main offer is from the... [US. The bowperson] had made it clear to Team NZ two months ago that [it] was looking for a new challenge... "But I'm not ruling out staying..." [His] crewmate on the bow of the black boat... said [it] would stay with Team NZ – but did not know how many would do the same... Last night, there were probably more Kiwi sailors and designers saying "don't know" than whether they would stay or go... [However, m]ost younger members... are expected to remain... There is still ill-feeling in the camp... [with one loyal sailor calling the departing skipper and tactician] "traitors."

...After a weekend of bitter fallout, maybe it is not so surprising that [the skipper and his tactician] bailed out of running the next America's Cup. The telltale signs were there. Disputes with the old guard, long absences on the other side of the world, a kind of reticence as their crewmates back home grew more and more confused about their own futures. The overwhelming public reaction, mostly anger, may have been too harsh. Yachting is more profession than sport, where patriotism has been scrubbed from the sailor's vocabulary, and most go where the pile of money is highest. It's their living. But the guys' timing was off – [the skipper and tactician] could have left two months ago, the day after Team N[Z] won the Cup again... No matter how or when they did it, the leaders would still be vilified for quitting a team which has become a national icon. There is a definite split within the big black shed now about whether what [the skipper and tactician] did was wrong. Some call them traitors, who asked the team to remain loyal then left. Others say it was for the best, that it would have been worse having an unhappy leadership. Maybe it all became too complicated. [The skipper and tactician] are true competitive sports[people] – on the water, on the golf course... Their decision to leave was apparently made on a golfing break on some foreign shores. Perhaps they did not want to be chained to a desk, coercing sponsors for more dollars, running a cut-throat business like the America's Cup... Breaking his vow of silence on radio yesterday, [the tactician] maintained it was all about the business end of the deal. [The tactician and skipper] could not accept the obligations the old trust and the sponsors had placed on the new Team N[Z]. Increasingly the word is that the... [pair] wanted to start their... new... defence with a clean slate. They did not want to inherit the debts of the past campaign, supposedly around \$5 million. And it seems they wanted one major backer – rather than the Family of Five, who brought their own rules, like first right of refusal on additional sponsors. Now they... will never have to worry about where the money for the next mainsail is coming from. They will not have to lease out NZL32, the glory boat of the 95 victory, to the highest bidder to add money to the coffers. They will not have to rely on red socks to buy a mast.

...[the] skipper and head of AmericaOne... has sold all his America's Cup assets to one of the world's richest [people. The skipper]... had done a feasibility study into how much it would cost him to enter the race in 2003[that showed it] could not get more than \$60 million through sponsorship and donations, and would need \$140 million to keep pace with the billionaire-backed syndicates this time. [The world's second-richest person] has bought everything – including the boats, the lease to the Auckland base and [the skipper] himself – for the new syndicate, Team Oracle. [The skipper] will not say what his new role in the San Francisco-based challenge is, though it is unlikely to be skipper, with [a]Kiwi... touted for the sailing role.

...A[n]America's Cup hero... is resisting a \$500,000 offer to lure him away from N[Z]. The second-string skipper] and the other Team N[Z] champions are being targeted by a multi-million dollar raid to lift the America's Cup... An America's Cup... syndicate's source is set to approach Team N[Z] crew members this month... Most America's Cup crew were on salaries ranging from \$40,000-\$100,000... The raids are nothing new to Team N[Z]. America True led a raid on Black Magic after the 1995 America's Cup success. Team N[Z]'s first-string skipper in 1995 and again this year – who has now gone to a Swiss syndicate – said at the time that it]... hoped no one would accept the lure.

...Switzerland's 2003 America's Cup challenge, the... landlocked... country's first attempt at the competition... received a pledge of ...\$131.04 million... from[its backer, the] Swiss billionaire... based in Geneva[who] won the city's Bol d'Or regatta – which draws 500 yachts – in June, aboard his catamaran Aling[(it] also won the race in 1997[)]... "We want to build a team to be proud of, capable of winning the America's Cup and which also will inspire people to achieve higher goals," [the billionaire] said at the team's official launch. The 35-year-old deputy chair[perso]n of Swiss biotechnology company Serono said [it] had decided to pledge the money after a chance meeting with [the now]former Team N[Z] skipper... "I thought it would be very difficult for Switzerland to make a successful challenge until [the NZer told me it] was looking for a new start and clean sheet,"... [The guy] known as the "Baby Billionaire" – the 34-year-old Swiss ranks 125th on the latest Fortune 500 of the world's wealthiest – and N[Z]'s double America's Cup winner... had built up half a 55-member syndicate for the Auckland regatta... [The NZer], aged 38... caused a furore at home when [it] defected from Team N[Z]... with several other key members of the team who had successfully defended the Cup...

Moral issues – the agony of people who wrestle with them and the outcomes – dominate the mailbag. Quote: I thoroughly enjoyed your allegorical tale (on America's Cup issues)... But you have rekindled a moral dilemma I have... I understood the deeper meaning you intended to be that the Swiss acted badly when they "purchased" our yachts[people, and that those yachtspeople] acted badly in accepting their money to compete against N[Z]. But here's the moral dilemma for me. I have always admired [two former All Blacks, one a flanker and the other an inside centre. The flanker] played rugby for his native Samoa in 1986 and in 1987 was the star in the All Black team that won the [first]Rugby World Cup. [The centre] played for Samoa in 1993, I think, but was the linchpin of the All Black backline from 1994 to about a year or so ago. Similar facts apply to [some of the current All Blacks]. Rugby is not the only sport where N[Z] has recruited foreigners to represent us, even against their native countries, sometimes even pitting brother against brother, as happened... when the All Blacks played Tonga[(and, of course, the giant All Black winger is also Tongan)]. The Silver Ferns have robbed South Africa of their two most talented [netball]ers, and Fiji of their best goal defence... [Someone] played cricket for N[Z] instead of his native England. There are many other examples... The dilemma for me is this: Can I continue to support these people while decrying what [Team NZ's former skipper, tactician and] mainsail trimmer... have done? Would that be a moral stance for me to take? Or would you perhaps call me a hypocrite...? ...★ [The flanker, who is now on Samoa's coaching staff, will have been pleased with the result from last weekend's round of the Pacific Rim Championship: Manu Samoa 19, American Eagles (USA) 12...

More NZers will] play... against us than for us at the world cup. [38 NZ-born players will be] at the world cup representing 10 teams other than the All Blacks[(though some are ex-All Blacks). Most will play for Samoa (11), followed by Scotland (6), Japan (5), Fiji and Tonga (4). Each squad is allowed 30 players. 8] of the 19 teams competing... also have a N[Z]er on their coaching staff... *Rugby World Cup fact file* Georgia... may be a debutant nation at the... World Cup but you could argue they've been in training for this moment for centuries, thanks to a peculiar national game called Lelo-burti (translation: try-ball). Lelo-burti is played like rugby with 15-a-side and is in many ways similar to rugby. The ball however resembles a heavy medicine ball... [T]he game of rugby itself took hold in Georgia in the early 60s and Georgia was granted full membership of the IRB in 1992.

...phase three of the All Blacks World Cup buildup... starts in Palmerston North on Wednesday... [The 30-strong] squad enters the new adidas Institute of Rugby at Massey University for the start of a 10-day camp which also involves four days in Taupo. [The coach] sees it as a chance to review where the team is at and to further develop its game plan for the World Cup which opens in Wales on October 3... "The World Cup will be won by the teams who play the game in the opposition half and kick the goals," was his simple assessment... Midfield remains one area of concern...

For the past two seasons, the worries about the All Blacks have been the same... [1:] T]he distribution problems from halfback through to the midfield... have troubled them consistently... [2:] Put them up against average opposition and they will look worldbeaters, but when they are hit

with physical fury they have struggled to come through. Too often they have unravelled. It was a point accepted by both [the]coach... and his assistant... as they woke to contemplate a World Cup playoff with the Springboks after the disastrous failure against France. In 18 internationals in that two-year period, the All Blacks have won 11 and been beaten seven times. Seven of those wins have come against opposition which would be considered mediocre or even worse, like the two victories over England C to start 1998. Then understrength Samoa and France were beaten earlier this year[(the latter by about 50 points).] Tonga, Italy and even Scotland at this World Cup were no more than average sides and the All Blacks had their problems in two of those. So the only wins you would accept as meritorious... would be the two tests against the Springboks... one against the Wallabies and the World Cup pool game against England. There have been four losses to A[US], two to South Africa, and the French capitulation.

...[an experienced NZ] prop... said the All Blacks panicked when they sensed that France were stealing their rugby World Cup dreams at Twickenham on Monday morning. "We hit the panic button in the second half when we realised we were in trouble," said [the prop], who experienced his second [World Cup semifinal] loss in the 43-31 French... victory. "In the first half we didn't think we were going to lose that game, but it slipped away from us." The All Blacks felt the game going when [the French scored a try] in the 54th minute, and as [the French kicker] was adding to his tally of 28 points – the highest individual total by any player against N[Z]... "At 24-10, we should have won," [the coach] agreed about the semifinal. But the All Blacks relaxed and when they had the opportunities they did not put France[– who had closely studied footage of the All Blacks']... record 7-28 loss to the Wallabies... [in this year's Tri-Nations –] away.

...Stunned by France's surprise rugby victory over N[Z], the French have now recovered some of the World Cup spirit that first swept the country when their soccer team won the biggest prize in sport last year. Immediately after the match ended, hooting cars filled the Avenue des Champs-Élysées, a modern tradition whenever there is cause to celebrate. Many French[people] missed the match and found out that their team won the semi-final only after several hours... [M]any shook their heads in disbelief... "What?" asked... a Parisian translator. "They won? But they weren't supposed to. I deliberately didn't watch because I knew it was going to be painful." With politicians and sports officials hailing the exploits of the French team, radio stations noted with surprise that the British press – which has been giving France a pasting this past month over its refusal to readmit British beef – was effusive in its praise... [The French] President... telephoned... the team captain, to ask him to pass on his congratulations to each member of the team. The [French P]M... told the team in a message: "Since the beginning of this World Cup I knew you were capable of excelling." In an editorial, *Liberation* suggested that France had not merely won a World Cup semifinal. "They beat N[Z] in a game of a lifetime that most players would happily exchange for a winner's medal against less exalted opponents," it claimed... After the flamboyant performance, even a defeat in Sunday's final against A[US] in Cardiff would not be seen as a calamity back home.

...THE All Blacks will not have to qualify for the 2003 world cup. That's the word from [the chairperson of the]NZRFU... who last night promised the All Blacks that they would not have to play in small island countries to make the next tournament... The 2003 Rugby World Cup will be jointly hosted by A[US] and N[Z]. The Aussies secured their place in the tournament by qualifying for... the final[of this world cup]. Now there is a push to give N[Z] the host berth even though A[US] will ultimately host the final... By rights N[Z] should qualify for the next world cup by playing Tonga, Manu Samoa and Fiji in the 24 months before the event... But *Sunday News* understands the defeated All Blacks will be spared the pedestrian process of qualifying for the big tournament [after failing at this one to gain a top-three] place... This cup's fourth-placed finish is the All Blacks' worst.

...reasons why the All Blacks finished fourth at the Rugby World Cup... Lack of leadership... Once upon a time the All Blacks were full of leaders... Legends of our national sport are staggered at the lack of candidates for a captain... Lack of passion. Think passion and watch the French. They have it in abundance. Down by 14 points, they still had the spark to come back. By contrast, the All Blacks lacked emotion or feeling for the game. Half the time they looked bored on the field... Faulty game plan. The All Blacks didn't have a distinctive style of game plan. They were too loose against France, a team that thrives on disorder. The clinical plan adopted against England would have been the safer bet against France but they wanted to show they were an attractive team... Too regimented. The All Blacks may not have made a personal decision in the nine weeks since assembling at the rugby institute in Palmerston North. Since then every detail of their lives has been decided, issued and scheduled for them. Each day they received a minute by minute schedule of how their day would proceed. Even the clothing to be worn is stipulated. If players don't make decisions off the field how can they make them on it... Too pampered. From cooking to washing to providing boot insoles, every whim and fancy of the players is taken care of by support staff and hired help... Sanitised forwards. When... Pinetree or a hundred other past All Black [forwards] had their testicles pulled, ears bitten or eyes gouged they sorted it out on the field. The nasty stuff could have been ended with a quick 99 call, which past teams used to start all-in brawls. Sounds barbaric but it's effective... Two game strategy. The All Blacks planned for two games at the world cup – England and the final. They believed the England win gave them a soft run into the final and started planning to play South Africa or A[US]. When AUS] won the Saturday semifinal the All Blacks started thinking about the Wallabies a week later rather than the French the next day.

...THE morning after losing to France the All Blacks travelled to Cardiff by bus for their playoff against South Africa. On the way they watched two movies, *Shawshank Redemption* and *Desperado*, and the bus diverted for three hours to avoid a fatal crash. It was as if they were getting a message... The truck crash stole two lives. It was a timely reality check for the All Blacks. They had stuffed up their dreams but at least their loss was just a game. Hopefully, the All Blacks realised they are only as good as their last performance and when it's the world cup a miss can have ruthless ramifications. They may appear on TV adverts for the National Bank, or on the nose of Air N[Z] 767s, or stay in \$450 a night hotels in Surrey, or take mid-tournament holidays to Cannes, or... fly their partners to the world cup, but it all turns to custard if they start losing. The All Blacks went from winners to losers and the fortunes of many players changed dramatically. No doubt they thought they would win the world cup, pocket the \$20,000 bonus, pay for their partners to travel to the UK, and secure lucrative sponsorships. They assumed too much. Their great season was transformed to disaster in four days. The French exposed them and the All Blacks moved from hero to zero.

...Dear John, I forward you this: "You played the world's best fullback at centre, the best wing at fullback and a flanker at No.8. You took the world's best first-five and told him [it] was crap, swapped halfbacks at the quarterfinals and made the nicest guy captain. You're a record-maker John – most points against the ABs, biggest losing margin, biggest defeat."

...[THE] FALLEN All Blacks coach... feared for his family life had [it not quit. The coach] received death threats after leading the All Blacks to five losses in a row last year and believed his wife... daughter... and son... were in danger. "I hope the same doesn't happen this time and that's one of the reasons I made the decision not to coach again... The obsession has got to have reality in it. The pressure we put the team under can be unhealthy. Young [guys] who play the game need support as well as criticism... People say and do things and it takes a toll." His family had been supportive but "...have been through the rollercoaster of highs and lows, always in the public eye. I don't want them dragged through any more debate." H[i]s international career has been dogged by controversy. The latest anti-[John] campaign was launched as [the All Blacks' coach] quit.

...All Blacks hopes of Rugby World Cup victory have disappeared – and so have the ads. Companies which placed their advertising dollar behind the team and saturated television and newspapers with campaigns showing their commitment during the cup are re-evaluating and pulling back support. The National Bank yesterday withdrew its television and print advertising campaign featuring [the]All Blacks captain... and the slogan "Luck has nothing to do with reaching your goals." The National Bank chief executive... said the advertising campaign was pulled a week early, but admitted the... campaign was aimed at the team's winning the World Cup... Air N[Z] has replaced its television ads featuring images of on-the-field action from the All Blacks with the airline's "generic" brand ads... However... a... spokes[person]... said the change did not indicate a lack of support... Sanitarium, which uses team members to promote its Weet-Bix brand, said it would consider editing its advertising featuring players...

Dear Tim, I can't believe the All Blacks didn't win. I've been so depressed and it's been made so much worse by this sick e-mail I send on to you: Who is going to buy all those All Blacks Weet-Bix tins now? Will there be super special deals on black Fords? How stink does adidas feel? Do we have to boycott french fries? Will the souvenir shops still be selling All Blacks jerseys for ridiculous prices? ...Does this mean Moro bars don't work? Is Air N[Z] glad it didn't paint the whole plane? Should we kill all the people who say "It's only a game?" ...Are the All Blacks just trying to take the heat off the Black Caps? What are we going to do with all that ticker tape now? What are we going to do if A[US] wins the cup?

...What have the Aussies got [that] we haven't? A sideboard full of trophies... SCRATCH your heads no longer. For those looking for an explanation as to why A[US] is collecting world sporting titles... while N[Z] is playing roadkill, the answer is at hand. It's all in our national anthems. As a window to the nation's soul, they light up the answer in neon. The A[US]ns clear out their vocal cords to a tune that has them advancing their nation fair, no doubt trampling on anyone who gets in their way, while little old N[Z] cries out meekly for God, and whoever else might be handy, to defend us. Please. One person spoken to as part of this sporting inquest reckoned that little analogy might not be as tongue in cheek as it sounds. The Aussies are an aggressive race, prepared to play second fiddle to no one. And that is reflected on the fields of play. N[Z] is a tiny nation of sporting overachievers which does well to even figure in the business end of events on a global scale. And when the heat really comes on, it seems we might be a little passive when the big prize is there for the taking. The evidence is overwhelming. A[US] is, pound for pound, the world's premier sporting nation. And it just so happens that the big four sports in which it has snapped up "world championships" this year are the very set we had our eyes on. The Aussies started it with the cricket World Cup in England, then claimed the netball title with that amazing comeback from six points down heading into the last quarter against the Silver Ferns, claimed rugby league's tri-series crown (effectively the world title) with a try in the dying minutes to beat the Kiwis and then, of course, added the Rugby World Cup in Wales last weekend. Throw in the fact they're in the Davis Cup tennis final against France, rule the world in swimming, have the planet's best [gals'] hockey side, the top [gal] squash players, dominate triathlon and naturally, rule the waves in surfing and surf lifesaving and you have an impressive resume. Normally, we in N[Z] would be the first to applaud our neighbours' purple patch and perhaps reflect a little in its glory. The only problem is we've rather emerged as the sob story in a few of those key successes... In sport one thing is clear, the advancing A[US]ns have got it over the defending N[Z]ers. For now at least.

...[the] Black Sox softballers are a rarity in N[Z] sport at the moment. The Sox are world champions... THE BLACK Sox hope to break the sporting voodoo that has struck too many of our national sides at world championships. The All Blacks, Silver Ferns and Black Caps have all watched their world championship hopes go down the gurgler this year. [The]Black Sox coach... said those results would hopefully prevent his side from being complacent as it defends its World Series title in South Africa... Unlike the All Blacks, members of [the Black Sox] aren't paid \$500,000 a year, don't holiday in exotic locations during world tournaments or stay in lavish \$450-a-night hotels. "Our guys actually pay to play for their country... They have to come up with a personal contribution towards any tour. It's a tough, cold world out there." N[Z]'s top 30 softballers gather in Wellington on November 20 for a two-day training camp at the Trentham army camp. The camp follows a comprehensive series win over A[US]...

A] 34-year-old... stepped out of the shadows to lead N[Z] to the world softball title in South Africa yesterday. The... pitcher struck out 17 of 25 batters and gave up no hits as N[Z] beat Japan 2-1 in the final at the coastal city of East London... N[Z] had earlier lost 0-1 to Japan in pool play and had to beat [Canada and the US] to make the final... [- continuing] a 16-year unbeaten World Series run against the Americans, who used former... [NZ] pitchers... It was N[Z]'s second consecutive world title following their triumph... [over] Canada... in Michigan four years ago... and their third in 10 world tournaments. Their first came in 1984, also at Michigan, when the side included [the]current captain... who has... now... been to five world championships... At the 1992 tournament in Manila in the Philippines... [NZ was] beaten 3-5 by Canada... in the final...

The N[Z] softball side return home early tomorrow with another world title in the bag, and wondering what their success will mean for a battling sport... The Black Sox players had to contribute \$500 each and pay for many of their own meals at the World Series, and lived four-to-a-room at a school hostel... [But s]oftball's efforts to take advantage of its world-champion status finds its greatest hurdle with television, the make-or-break factor in world sport. [The]Black Sox manager... said: "I think there are five sports in N[Z] who don't have to pay for coverage. If we brought the [US] team here it would cost us around \$30,000 to have one game covered, and even then it wouldn't be live. We just don't have that budget. We get a lot of help from the Sports Foundation, but it would be nice to get a backer. I suppose last time we won the Olympics were on at the same time and we got a bit overshadowed. But if we got television coverage most of these guys would be household names." ...Just hours after the win, [the NZ] Softball chief executive... [was calling for NZ] On Air grants to help second-tier sports get television coverage... "In 1980 we had 80,000 players and 22 hours of television a year... Now we have 30,000 players[, including]... 20,000... children... and no television hours." ...The... triumph in East London left N[Z] at the top of a sport played by 40 million people in more than 100 International Softball Federation countries, although N[Z], Japan, Canada and the U[S] are the only World Series contenders.

...[One of NZ]'s greatest softballers... announced his retirement after the Black Sox won the world title... a fitting finale for the legendary [3]rd base... The 33-year-old[']... international career began disastrously when, as the new boy in the 1988 side, [the 3rd base] wrecked a knee in the first warm-up game before the series in Canada... "In a sense I look back on that injury as being a positive thing for my career... Sitting there, watching, I didn't think I was good enough to play at that level. It woke me up - I needed to put in a lot more hard work..." If the knee injury helped to drive [him] in his training, it was the disappointment of losing the 1992 final to Canada... which helped provide the motivation to make him a vital part of two subsequent world series-winning teams. N[Z] led the 1992 final 3-0 before a home run from... a former player with Auckland United, levelled the scores and Canada went on to win... "We probably weren't the best team at that series but we should have won the final. It made a lot of us really determined." But [the 3rd base] is no longer motivated to put his all into... softball... [The 33-year-old] may have given up the big league himself, but... will head to the Sydney Olympics to support his girlfriend of seven years, [who is] an outfielder with the White Sox.

...White Ferns best in world N[Z] beat favourites A[US] in a thrilling finish to win the [Gals'] Cricket World Cup at the Lincoln Oval, near Christchurch yesterday. In reply to N[Z]'s 184 in 48.4 overs, the A[US]ns managed 180. The end came in the first ball of the last over... A[US] seemed set to retain the cup even after a nightmarish start when they lost two quick wickets for just two runs... [The White Fern's score] didn't look good enough to win the match against an A[US]n side that had been thrashing other teams in this tournament until the last few overs of the match... [when NZ]'s solid bowling and magnificent fielding took them to... N[Z]'s first world cup victory... spark[ing] amazing celebration scenes...

There is no doubt that [one NZer] is one of the world's best all-rounders, but even by his own lofty standards [the player] was in breathtaking form during N[Z]'s ICC Knockout Trophy final triumph in Nairobi. The 30-year-old vice-captain provided the winning ingredient against India, bowling his 10 overs for a miserly 40 runs before stroking one of the most majestic one-day centuries you could imagine, ending unbeaten on 102 as his team grabbed their first big international title. Fairytale stuff, to be sure. But [the 30-year-old] was not even supposed to play. The mercurial all-rounder was fighting a knee injury and had missed the semifinal against Pakistan. Cleared to play just one hour before the final, [the all-rounder] arrived at the bowling crease as [India's opening batters]... were flaying the opening bowlers, and was the chief reason India were held to a competitive 264. [The 30-year-old] then took control after N[Z] lost their first three wickets for 83, forgetting his pain as [it] struck his third ODI century off 113 balls, leading the underdogs to their most famous limited-overs win.

...Slapstick victory skittles records... It was almost more of a comedy than a cricket test, a slapstick type of performance that set all sorts of records for all the wrong reasons. N[Z] not only managed to beat India in the second test and claim a 2-0 series win yesterday, they carried it off without

their most successful bowler delivering a ball. After the match at Hamilton, N[Z] were able to reflect on a four-wicket win over the crack Indian side, hard on the heels of an even more emphatic 10-wicket margin at Wellington... On a pitch so green that the Indians were hoping to have it registered as an offensive weapon, [the NZ]... spinner... with 139 test wickets... was not required at the bowling crease and, instead, assisted in the field as N[Z] beat the tourists in a mere two and a bit days – or 176.5 overs. The game's most extraordinary passage was on Saturday when 22 wickets fell in the day – the fourth-highest number in test history, and the most since 1952, when England played India at Manchester. Having been rolled over in their first innings for 99, the tourists managed to dismiss N[Z] for a mere 94... in the process becoming the first team to score fewer than 100 and still grab a first-innings lead. Not only that, it was the first time since test cricket started in 1876 – some 1633 matches – that both sides had been bowled out under 100 in their first innings... It was also the first time since 1980-81 that a test had been completed without any bat[ter]s... posting a half-century, the top-score of the match... [being 39. NZ], who needed another 136 to win when they resumed yesterday morning, managed to graft their way to the target... N[Z]'s 53rd test win in total, it was also the side's fourth this year following triumphs over Bangladesh, England and the West Indies, and cemented their third placing in the International Cricket Council's Test Championship Table.

...Counting wins and losses... Too many N[Z]ers still think it is not important to win, says the retiring chief executive of the Hillary Commission... Farewelled in Parliament last night after 10 years in the job, the 54-year-old has overseen the spending of nearly \$100 million on high-performance sport and a similar amount on getting children into sport. [The 54-year-old] is pleased the old "competition is bad" philosophy is waning...

The tide of public opinion has turned. It is now almost acceptable again to be competitive. Even those bastions of egalitarianism like the Ministry of Education and the Hillary Commission are beginning to make noises that sound as if it might be politically and socially acceptable to win and lose again. After almost three decades of blatant so[cial]-engineering, which reached the ridiculous levels of highly skilled youngsters being discouraged from developing their abilities, even the most colourless politically correct Wellington bureaucrat has now to admit that the entire experiment has been a gigantic disaster. Many of the phonies who were responsible for preaching th[e anti-competitive] doctrine... were so hypocritical that they grovelled to get their own kids into schools like Auckland Grammar which stood apart from the trend. It hasn't been the failure of the education system that has turned the tide of public opinion. No, that tragically would have gone unnoticed if our sports teams had continued to win. They haven't. Why not? Initially it was convenient to look across the ditch and grizzle about the amount of money the Aussies were throwing into sport. That argument led to envy of their sporting institutes and the exclamations that no wonder they win everything with all those facilities. It seemed logical to follow that up with the belief that if we spent the same sort of money we could have similar success. Everyone went down that track but few stopped to ask why we [had]n't set up academies and institutes to promote excellence. It wasn't to do with money. It was all a question of philosophy. We had bought into the doctrine that if you don't have success you can't have failures. All the emphasis was on participation, and competition had become a dirty word. It still is in some quarters. Just last week, an Auckland primary school sent home its newsletter to parents advising them to speak to their sons about showing too much enthusiasm when their team won. Once again, a politically correct school principal was worried about how this would affect the losing team. I am reminded of how far we have travelled down this wrong track when I think back to my first year of teaching, in 1970 at Auckland Grammar. The late Sir Henry Cooper was the headmaster at that time and at every Monday assembly [Henry] would read the sports results in full. This particular day [Henry] announced that one of the school's hockey teams had won its match 15-0, adding: "I saw that game and I'm pleased to say they never gave up." After the assembly I remarked to him that I was pleased [a headmaster] had given recognition to the losing team. [Henry] looked at me quizzically before explaining, "...you're new here so I forgive you on this occasion. I wasn't referring to the losing team. I was talking about our team. It is not easy to maintain your standards when you're playing against an ill-disciplined rabble that has had no coaching and no interest taken in it. Remember that." I have. I've tried to remember it as I've watched politicians pander to mediocrity, sports administrations putting money before principles, referees turning a blind eye to thuggery, parents dropping kids at sports grounds without ever watching them kick a ball, coaches giving excuses instead of reasons for defeat and precious players chucking it in when the going got tough. In trying to make us all equal they have actually succeeded in making us bad sports. We no longer know how to win or lose graciously. You doubt me? Cast your mind back to the public reactions at the loss of the Rugby World Cup and the victory at the America's Cup. On both occasions the reaction was completely out of proportion to what had happened. They were the realisation of a generation of social engineering... But... [a] year of quite dreadful sports results may lead to wider social change. Let's hope so. You could do your bit by patting your kid on the back if... [it] wins today. That way the waves of success may come to N[Z] sports a little quicker.

...[As the] chief executive of Sport Waitakere... I often get asked to explain the way sport operates in N[Z]. Following is our sport structure explained as simply as I can. We should start at the top with the Government. The government appoints a minister for sport, fitness and leisure. Under the current government the minister of sports also holds the portfolios for education and state services. In my view this will be a good mix. For years the funding of sport has been diluted by the creation of positions that should be supported by education or state services. In an effort to get to the top of the proverbial cliff, rather than waiting at the bottom with an ambulance, sport has been the one sector to take proactive steps in prevention with a focus on wellness rather than sickness. The government established the Hillary Commission to fund sport. In a move to separate the participation focus from the elite another body was established, the N[Z] Sports Foundation (NZSF) which manages and funds elite athletes. Part of the money the Hillary Commission is entrusted with, and is accountable for, is contracted to the NZSF to make sure N[Z] is represented well on the world stage at premier sporting events. This has created a duplication – two leased offices containing a double-up on administrative resources, two chief executives and so on. The Hillary Commission also provides funds to national sports bodies to assist with the management and development of their sport. While there has been criticism from people about the manner in which this is done, it is not entirely the Hillary Commission's fault. As a government agency they are bound by an Act of Parliament which forbids them to interfere in the running of national sports organisations. In support of the provinces, the Hillary Commission also funds regional sports trusts to deliver their programmes at the community level throughout N[Z]. Regional sports trusts, like Sport Waitakere, are charitable trusts and governed by a board of trustees. While the 17 trusts are autonomous they all belong to an umbrella organisation called Sportnet. Sports trusts do not deliver sport specific events or programmes as part of their core business. They are there to provide support, services and programmes for all sport and physical activity organisations, and are not generally funding institutions. While the size and ability of trusts may vary there are three core Hillary Commission programmes all trusts are contracted to deliver. • Active Living – encouraging communities to be more active. • Sport Development – programmes and services for sports clubs and associations. • Junior Sport – KiwiSport in Primary schools, FairPlay and secondary school sport.

...There has been some public debate recently about the role of competition in sport played by primary school-aged children. Much of this debate has been driven by commentators who miss the point about KiwiSport. According to these commentators, KiwiSport discourages competition. They say it puts too much emphasis on participation and fair play, and as a result our sports people have gone soft. This is why netball and rugby teams failed last year to bring home their world cups. Well, now I've heard it all – we should blame the children for our results at the top level! But the answers to our recent performances on the international stage do not lie on the playground, gym or school sports field. A[US]n teams won the world netball and rugby cups. It is interesting that all A[US]n children play AussieSport, which is the same as KiwiSport! We share the same philosophy about introducing children to the right level of sport at the right age. [As its chief executive, I feel qualified to say that t]he Hillary Commission believes competition in sport is vital. Striving to win is the essence of sport, and children respond to this because they tend to be naturally competitive. We don't think it is possible to take the competitiveness out of children, even if you wanted, but they have to learn to compete properly. They can't achieve personal success without essential skills and a strong sense of teamwork, cooperation, confidence and fair

play. These are the building blocks of a lifelong participation in sport. During the primary school years, these are the most important features of a child's involvement. They will strive to win, but winning must not be the overriding priority of their teachers or coaches. Sport is about doing your best, whether you win or lose – whether you are eight or 48. The great news is that more teenagers, particularly girls, are now involved with sport. This is a tribute to the success of teachers and club coaches who are delivering KiwiSport the way children want it. Leave the children alone, and look elsewhere for any perceived failures at the highest level of sport.

...The... Sports Minister... has promised that no schools will end up worse off under the Government's Kiwisport scheme. High school principals reacted angrily when they learned that most lower-decile schools would get less money to hire sports co-ordinators... [in] the Sportfit programme... The... [minister said:] "When you're spreading over \$20 million around where there used to be \$5.3 million, we can make sure there are no losers."

...There were no swear words... as girls battled it out for the supreme title of best west Auckland soccer team at Fred Taylor Park last week. None of the leg-chopping tackles or Hollywood dives of professional soccer for these girls. They still went in for the hard tackles and one lass had to be carried off the field nursing a leg injury. But the difference was there afterwards, too. The players felt bad about it, or at least showed some good manners, with "sorry" clearly heard above the din on a number of occasions. Can't say the same for the teacher referees though. Our [mole] at the match says some decisions were shocking and blatantly biased. Fair play is one thing, unfair advantage is another.

...It costs a small fortune in taxi fares to get some of N[Z]'s best young athletes to the sports fields every week... Auckland schools plan to cut back on city-wide sports competitions as some colleges spend up to \$20,000 a year in taxis to get students to games. The changes are also aimed at helping parents who have to drive their sports-playing teenagers from one side of the city to the other most weekends... Many parents are unable to drive their children to games, especially at poorer schools such as Papatoetoe High... [T]he school... tried hiring buses to drop teams off at different games but there were too many teams at different times and venues. For the same reason it could not solve the problem by buying its own minivans.

...South Africa was the backdrop for some classic rugby clashes between the All Blacks and Springboks of tomorrow, as the Kelston Boys' First XV went on a whirlwind tour of the rival nation last month. The team is just coming back down to earth after last weekend's Auckland secondary schools semi-final against the unbeaten St Peter's side, holder of the Moascers Trophy. The boys are disappointed to have lost that crucial game 37-22, but are still buzzing about their two weeks in South Africa. "Most people say how lucky we are to have gone, because it's a once-in-a-lifetime opportunity," says Kelston[s] centre... The team won three out of its four games in an almost unthinkable six days, performing numerous magnificent hakas along the way – including a special haka in a Capetown pizza restaurant for a visiting Argentinian girls' hockey team. The timing of the trip was unfortunate, as [a NZ]er... had just scuttled South Africa's dreams of hosting the next football world cup. "We faced that straight away – it was brought up by a lot of people... We were worried... Soccer is such a big thing for the black community over there, but it kind of died down after a week," says... [one of the team's three] coaches...

THE... UNREPENTANT soccer renegade... is refusing to apologise for embarrassing N[Z] by costing South Africa the chance to host the [Soccer] World Cup. Under siege from the world's media at his Auckland waterfront home, [the expat-Scot said it would] explain all at a crisis meeting of the Oceania football confederation... Speaking exclusively to *Sunday News*, [the confederation's president said it] didn't expect to be asked to resign at the meeting, being held at a secret location. The Oceania president ignored his executive's orders to back South Africa's bid to host the 2006 cup, once England had been eliminated. [The president] abstained and Germany won by 12 votes to 11. [His] non-vote has cost the South African economy \$5 billion... The no-vote could rob N[Z] of the chance to play in a Tri-nations tournament with South Africa and A[US]. It could also scuttle the Kingz' hopes of an extension to their two-year licence to play in A[US]'s national league... [The president apparently] did not vote because [it] felt threatened by attempts to bribe him and threatening phone calls... Last night South African bid organisers threatened to sue [him].

...THE NZ] soccer official whose voting decision altered the course of the World Cup closed the door to the world's media yesterday... The 79-year-old is likely to be sacked as president of the Oceania Football Confederation if [it] doesn't resign at an Oceania executive meeting this morning... Oceania confederation members are... furious [the president] disobeyed strict voting instructions... The Pacific island nations wanted to vote for South Africa because of their similar ethnic backgrounds... One high-ranking Oceania source said: "[The president] might have a good reason that... can... justify his actions... [which it] hasn't told the press about and if it] does then no action will be taken and we will support him. But if... it was bribery then bribery is not good enough. [The president] should have reported it." Many of the executive members suspect [the president] came under pressure from UEFA who said they would turn their back on Oceania if [its representative] didn't vote for Germany... [The president, who had] announced Oceania would give its vote to England to host the 2006 cup before consulting his own members... has always aligned his vote on the executive with Europe. His daughter... who is Oceania[s] general secretary, is also head of the UEFA [gals] committee. "The president] got scared of UEFA and didn't want to upset them," the source said. "But the members are saying what has UEFA done for Oceania – nothing. If [the president] can't handle the pressure then maybe [it]'s not fit for the job."

...HIS World Cup non-vote is not the first time... [t]he 79-year-old Oceania president has rocked the boat... [It] defied world soccer bosses when acting for Oceania and in 1986 was suspended from Fifa. [The Oceania president also] repeatedly withstood pressure from both A[US] and the] Fifa president... to disband the Oceania federation to become members of the Asia group. A[US] made three attempts to become members of Asia and resisted Oceania's move to become a full confederation. That was to make it the equal of the five other confederations, including UEFA, Asia and Africa. Oceania won the vote 179-1. But [hi]s latest stand has infuriated politicians[– 'NZ's PM phoned South Africa's President the evening before the vote to say his country had Oceania's support' –] the public and his Oceania executive committee... Born in Glasgow, [the Scot]... made it onto the Oceania executive committee... in... 1966... and was elected president in 1982. That... year [it] was awarded a Commander of the British Empire.

...While [the Oceania Football Confederation president] and his wife... prepared for their regular Sunday night bridge game with friends, [presidential]... wannabies gathered for the kill... [The] OFC vice-president... (Vanuatu)... Fiji[s] Football Association president... and A[US's] OFC member... are expected to be the contenders for the presidency... "We do not want Oceania to be kicked around like a football," said... [the Fijian. "The OFC president] was given a clear mandate... that once England were eliminated from the World Cup race [it] should give the Oceania vote to South Africa. [It] should have complied with that. What is more disturbing is that [the president] took advice from his lawyers and not his own executive... Article 2 (1) of the OFC statutes says every member is bound to follow the decisions of the executive committee..." [The Fijian] is concerned that when Oceania members – including three delegates from all 11 Oceania nations – front up at the August 4 Fifa congress in Zurich they will have to face the music. "I do not want this to become an Olympic-like scandal and that our 11 members can be branded as corrupt. I feel very sorry for NZ Soccer... [The president] has made it clear [it] will retire, but... I hold the view that [the president] should write to South Africa and explain clearly his actions and apologise." ...[the OFC vice-president] said: "...It is not the duty of the Government of N[Z] to apologise to South Africa. The OFC has been dragged into a political position. Because of this we are the ones who should be apologising to South Africa."

...South Africa's bid team has announced an investigation into whether [the Oceania president] violated the Fifa constitution by abstaining... [during the vote] for soccer's 2006 World Cup... Fifa, which has announced an internal inquiry, said only the executive committee could reverse a decision. Some commentators suggest that, because [the 79-year-old] went against the wishes of his Oceania members, the vote should be reopened.

...Fifa[s] president... is determined soccer will not become embroiled in an Olympic-style controversy over the allocation of future World Cup venues. [The Fifa president] is just as adamant [it] will not follow the lead of [the] IOC boss... in hanging about seemingly forever. [The Fifa president, who is] in Auckland for Saturday's opening of the... headquarters of the Oceania Football Confederation at Mt Smart, said Fifa had clear

guidelines for choosing a host nation. "We do not get into bribes and bargaining," said [the]62-year-old... who played semi-professional third category football in his native Switzerland and still plays for Fifa teams on a very casual basis[. The Swiss] came to Fifa from watchmaker Longines where [it] was director of marketing for seven years. [The Swiss] had 17 years as general secretary under [the]former president... before winning the presidency last year... "I'm advocating that no president should in future have more than two four-year terms. Football is changing rapidly and the president should be able to give his ideas and then go away. That [the term of presidency] will be a matter for the 2000 congress in Sydney.

...a harrowing .3 of a second... is... how close N[Z]'s top 400m hurdler is to qualifying for the Sydney Olympics. The 25-year-old has a personal best of 49.95... The time shortfall equates to less than a metre. But [the hurdler] also has a cash shortfall because of the Sports Foundation's stance on funding. [The hurdler] needs \$3000 to... travel to Europe and run in a series of top track and field meets... against the world's top 10 athletes – the increased pace and intensity of the races should push him under the qualifying mark... Ranked 14th in the Commonwealth after his performance at the 1998 Kuala Lumpur Commonwealth Games[, the hurdler]... juggles 22 hours a week training with a fulltime job... Like other athletes [the hurdler] receives training assistance from the N[ZSF. However, the hurdler isn't] part of the... "elite" athletes or three teams the N[ZSF] has placed in its high performance unit... [His] plight is similar to many other Olympic hopefuls... [who've] put in thousands of hours over the past four years with one thing in mind – Sydney... Don't expect N[Z]'s Olympic team to be the biggest ever despite the games being on our doorstep.

...THE SPORTS Foundation makes no apologies for its hardline Olympic funding policy. The... organisation is under fire for its decision to restrict high-level funding to what it describes as its "elite group of 23 athletes and three teams". It is only prepared to heavily fund those athletes who have succeeded. Athletes on the fringes of selection are fuming – and say a lack of funding is hindering their hopes... The [NZSF] got tough over funding following the flop of several big names at the 1998 Commonwealth Games. Olympic sports were told they would have to perform before they got handouts... Members of the [gals'] softball team had to pay \$3500 each to attend the Olympic qualifying tournament. The side's funding has been increased since it finished fifth and qualified. Team members now face a \$500 bill to get to Sydney. The stance has... been blamed for the failure of the [guys'] hockey team to qualify. Hockey could not afford to send a full squad to the qualifying tournament in Japan... The foundation has already spent \$5 million this year trying to get athletes to the Olympics. It announced last week a further \$1 million would be spent on athletes who had already qualified... Members of the [NZ guys' and gals'] basketball teams, the [guys'] track cycling pursuit team and the [gals'] softball team will each get \$3000 grants... [– but it will still] cost each member of... [the] Tall Ferns... \$4950 to get to the games... Olympians will receive funding as they qualify... The... [gals'] hockey team – which last week won the Olympic qualifying tournament in England – already receives \$500,000 from the foundation. [NZ's c]hampion equestrian... gets \$50,000 a year in Foundation money to cover feed and expenses for one horse.

...When [NZ's]Olympic hero first met his wife, [the equestrian]... was captivated by... the... former model[']s... beauty and warm smile. After a whirlwind two-month romance, the 30-something [equestrian asked her] to marry him... Wearing a fairytale gown from Harrods, [the bride] arrived at the Wellington Cathedral fashionably late on their wedding day, where the lovestruck couple promised "to love, honour and cherish" each other in front of 200 guests from around the world. At the time [the equestrian] said it was their love of horses, music and dancing that had drawn them together. As the years went by the great highs of his equestrian career, his favour with the royal family and his incredible respect among sporting fellows saw him named one of the top 100 sports[people] of all time. And personal crises like the couple's loss of their first child due to miscarriage and sponsorship concerns only seemed to bring them closer together. But last week, as the couple sought sanctuary inside their Gloucestershire mansion near London, they were attempting to rebuild their shattered lives and repair their 14-year marriage in the wake of [the equestrian]'s gay sex and cocaine scandal. It is the biggest test of their marriage yet. But the couple... are committed to making it work. [The wife], despite the stress and humiliation, is determined to stand by her... [guy. They] aim to make a fresh start when they return to N[Z] in September. They have bought a \$1.2 million mansion in [hi]s hometown of Cambridge where they plan to settle and breed horses... The allegations of [the equestrian]'s double life was exposed by Britain's *The Sunday Mirror* last week in a three-page story with intimate details of his sexual encounter... and... use of the class A drug... According to the newspaper, [the equestrian], 44, was having unprotected sex with a 24-year-old [guy] in a four-star hotel on the outskirts of Oxford while [his wife] was back in N[Z] sorting out their new home. The Olympic champion even made his partner, who [the equestrian allegedly] had seduced five days earlier in a horsebox, don riding gear for their sex session. And in an extraordinary cocaine-fuelled series of indiscretions, [the equestrian] told his pick-up how [it] planned to outwit tough drug-testing procedures before this year's Olympic Games... The champion rider, winner of individual golds at the Los Angeles and Seoul Olympics... [and a] three times... winn[er of]... Badminton, Britain's premier three-day event... said, "Do you want a line of coke? I enjoy smoking grass... but... it stays in the system for about three weeks or so..." [The equestrian] then joked, "I'm an Olympic athlete, my boy. I'm in serious training." [The equestrian], made a MBE by the Queen in 1984 and a CBE in 1995, added, "My favourite drug of all is Ecstasy." In the past [the equestrian] has spoken of the evils of drugs. [The equestrian says it] fears for his 11-year-old daughter and seven-year-old son... [H]is autobiography *So Far, So Good...* states, "You read all these stories about kids going off the rails, running away and getting into drugs, all sorts of horrific things, and that really terrifies me." But on that early June afternoon, such concerns seemed far from his mind... During the liaison, [the equestrian revealed that it has]... a pretty good relationship[with his wife. "I mean, I would love it if [my wife] got into watching me with another guy, being involved in threesomes or something, but [my wife]'s not like that." But despite his love for his wife, [the equestrian] admitted to other gay affairs... [and referred] to a recent night when [it] had sex first with a [gal] and then with a [guy. The equestrian also revealed that it] was paranoid about [having it]s secret life of adultery and drug abuse... exposed... [The equestrian said it had] everything to lose, including sponsorship deals with Saab and Toyota... "You don't understand that in my position, doing this stuff, I can be kicked out of the country. I can be banned from the Olympics. Doing what I am doing with you, I can lose my marriage and lose my life. I don't want that..." [The *Mirror* said the equestrian] also revealed how [it] feared that a newspaper would expose details of his private life four years ago... The scandal has rocked the equestrian world.

...Eventing N[Z] says it has no power to question [a NZer] about allegations that [it snorted cocaine. The equestrian] was last week named as a member of the N[Z] eventing team for the Sydney Olympics. The selection policy states that the overriding principle for selection is that an athlete "must bring credit to himself/herself, their sport and N[Z]." Athletes also had to "serve as an example to the sporting youth of his or her country." E[NZ's chairperso]n... said last week that [the equestrian] had never been asked whether the allegations... were true. But last night, when the *Herald* asked why the question had not been put to [the equestrian] before his selection, [the chairperson said: "ENZ]... has no power or right to demand that... any athlete... answer to allegations that ENZ does not itself have positive proof of. Currently, E[NZ] only has the newspaper story in front of it. If a request was made... and [the equestrian] declined to give an answer, E[NZ] would still have no proof on which it could act." [The equestrian] had made it known that [his intention is to] make no comment on the allegations... [The Olympic t]eam selector... has [also]refused to comment... But the allegations of drug-taking have brought a sharp response from the group responsible for testing N[Z] athletes for banned drugs. [The NZ] Sports Drug Agency programme manager... said... "...it does concern us that athletes [who] are meant to be role models could be seen to be taking illegal drugs,"...

[The person who is due to] become... president of the NZ Olympic Committee... after the Sydney Games... has delivered an overdue wakeup call to a nation in denial over allegations that one of its most famous Olympians sniffed cocaine. The impeccably credentialled [future NZOC president says the equestrian] should declare his innocence or guilt. Failing that, [the future NZOC president] wants equestrian's governing body... to seek

clarification. In the absence of resolution, [the future NZOC president says, the equestrian] should not have been selected... The logic backing such a course of action is overwhelming. The allegations... were substantial, and cocaine, as well as being illegal in Britain and N[Z], is banned by the International Olympic Committee... Eventing N[Z]'s limp response has been a refusal to act on "unsubstantiated" allegations. Given [the accused]'s silence, it should have sought to discover if the claims had substance. Could, for example, the *Sunday Mirror* provide audio or visual evidence? Eventing NZ would not be the first sports body to take such action. England's Rugby Football Union inquired into drug allegations levelled against [their premier role-model] by another British newspaper. [The player] was stripped of the English captaincy and fined for bringing the game into disrepute. The inaction over [the equestrian] has been made more embarrassing by the banning from the Sydney Olympics of [an] outstanding high jumper... [who] tested positive for cocaine last year. The embarrassment could become even greater if the matter is left to bubble along.

...[a local presenter] is furious over a newspaper column critical of his television interview with [an] equestrian... over sex and drugs allegations. The column, "Media Watch"... in yesterday's *National Business Review*, contained a purported conversation between [the equestrian] and someone from TV1's *Holmes* show setting the ground rules for questions. Both [the columnist and the show's presenter] say there was no such conversation. But while [the columnist], a former television journalist, said yesterday that it was obviously written as a "mickey-taking piece" and not for real, [the presenter] took a different view... sa[ying] it was nasty, defamatory and struck at his integrity and that of the show... [The presenter] did not accept the column was satire or that it was clear to readers the quotes were not real. "[The columnist] has lost the plot completely." ...[the presenter said it] expected a complete retraction, but *NBR*'[s] editor-in-chief... said there would not be one... The mock conversation... has an unnamed person promising [the equestrian it] will not be asked to give a yes or no answer to the allegations that [the equestrian] snorted cocaine and had [gay] sex... In fact, when [the equestrian] was asked... during the live June 28 interview whether [it] denied the allegations, [the equestrian] responded: "That's a curly one." [The columnist] said yesterday: "It's pretty obvious that they went soft on him... and [that's why] I'm... taking the mickey."

...The Olympic gold-medal-winning equestrian... will continue to enjoy the financial backing of the Sports Foundation... despite widespread rumours of illegal drug-taking... [The NZSF] said the cocaine allegations played no part in the... latest round of funding... announced yesterday... [The equestrian]'s funding is expected to continue at least until his retirement, which is expected to be announced after the Sydney Olympics. And if there were an Olympic event for taciturnity, [the equestrian] would probably win gold in that as well. For... the past eight weeks the Olympi[an]... has flatly refused to confirm or deny allegations made by Britain's *Sunday Mirror*... The story led to a torrent of media inquiries from around Britain and N[Z]... While the frequency of media reports may be dwindling, public relations specialists contacted by the *Weekend Herald* say the double gold medallist has done far more damage to his public image by refusing to answer questions than if [it] had spoken up... "Contrary to popular belief public relations people think honesty is the best policy. People are much better to front up, otherwise they give off the impression that they've got something to hide... [The equestrian] could have squashed this really easily. The evidence was relatively small but his silence has [increased public interest.]..." ...the public had a relatively short memory and clients were generally advised to talk openly about an issue, unless there were sensitive circumstances involved... "Look at... [the British actor caught with a US prostitute]. After [the actor] fronted up it hardly took any time at all for him to become popular and for the public to love him again." Consultus['] chief executive... said the community needed to believe in its heroes and, although [the chief executive] did not know the circumstances involved, it was a pity that [the equestrian] had not been able to defuse the situation earlier. "Where there's smoke there's fire." Meanwhile, the [NZSF] says it has cut equestrian sports funding... to \$558,620 from \$717,000 last year.

...A top Canadian show jumper has been banned from the Olympics – and could be banned for life – after testing positive for cocaine... his second breach... [The Canadian], who was tagged as one of Canada's best hopes for an Olympic medal... also tested positive for cocaine in 1996 and was suspended for four years. This was later reduced to seven months after [the Canadian] successfully appealed against the penalty, arguing [that it] used the drug for personal reasons and not to improve his riding performance... News of the positive test on [the] 32-year-old... came as N[Z]'s top equestrian was being... tested for drugs, along with other members of the N[Z] equestrian team... The... team were tested at Lulworth Castle, in Dorset, last week. [The 44-year-old] said the results were not expected to be known for at least another three weeks... [But] top equestrian competitors likely to compete against [him] at the Games had no complaints about his inclusion in the Olympic team... A[n AUS]n eventing team member... said: "[The 44-year-old]'s an amazing person in our sport... Most of the people [in our team]... [woul]d like to be able to beat the best that there is..." ...Since a British heavyweight newspaper alleged in June that [the 44-year-old] had snorted cocaine, [the NZer] has refused to make any public comment on whether the claims are true. However, since being publicly named in the N[Z] team on June 27, [the 44-year-old] has signed two official Olympic documents saying [it] does not take drugs. The two contracts include the Athletes' Agreement, effective between September 1 and October 4, banning drug use and obliging athletes to behave in a "proper manner." ...the NZ Olympic Committee... secretary-general... yesterday refused to comment further on the cocaine allegations or on its recent investigation into the matter. The N[Z] Equestrian Federation, which has received more than \$2.6 million in funding since 1996 from the Sports Foundation, also declined to comment or say how much [the 44-year-old] receives from the federation, although it is estimated to be \$50,000 a year. Four major foundation sponsors the *Herald* contracted – Air NZ, C[HH], Sanitarium and the... Challenge Trust – refused to say if they were reviewing their sponsorship or had any concerns regarding [the 44-year-old].

...The Government [has announced a] \$9 million Sport Education Scholarship fund for "aspiring sport stars"... [The] Sport, Fitness and Leisure Minister... said the fund would allow talented athletes to pursue tertiary studies and train... at the same time... About 100 scholarships, averaging \$10,000, would be available... to... athletes who had the potential to represent N[Z]. The scholarships tied in with the Government's announcement last month of \$16 million for high-performance sports centres in Auckland, Wellington and Dunedin. These will replace 18 separate sports academies. While the money is aimed at producing Olympic medal-winners, the emphasis is on Athens in 2004 rather than Sydney this year.

...The Sydney Games have been tipped to provide N[Z] with the second-best medal haul in the country's Olympic history... [behind] Los Angeles in 1984... American magazine *Sports Illustrated* has predicted that N[Z]ers will leave with four gold, four silver and two bronze medals... *Sports Illustrated* put the U[S] at the top of the medal table with 44 golds to Russia's 30 and China's 27. Home advantage would lift A[US] into fourth spot with 18 golds... The NZ team's operation manager... downplayed the magazine's predictions... "*Sport Illustrated* will probably get about 80[%] of their predictions right, but we don't pay any attention to them." ...[NZ's] three-day-event rider... is seen as a potential double gold medallist with victory in the individual and teams competitions... *Sports Illustrated* said the other N[Z] golds would go to [the gals'] boardsailer... and... [the gals'] points race... cyclist... Meanwhile, A[US]n betting agency Centrebet has ranked... [NZ's guy] triathlete... as the only N[Z] athlete likely to win gold.

...[NZ s]ports punters will have to go offshore if they want to bet on the Sydney Olympics because the N[ZOC] will not allow betting on them. [The] N[ZOC] chief executive... said the committee had decided when sports betting was introduced in 1995 that it did not fit the Olympic ideal and that decision would not be reconsidered. That means... [NZ] punters will have to use organisations such as A[US]'s Centrebet to place their wagers.

...The I[OC] will keep an eagle eye on gambling at the Sydney Olympics after failing to convince A[US] to ban Olympic betting. Athletes, coaches and officials are free to bet despite fears that it might lead to corruption and match-fixing. The IOC says it is monitoring the situation but officials doubt that an athlete would throw away a medal for money. "The Olympics is one chance in a lifetime. It is more important,"...

It is conceivable that Newcastle might one day import coal when stocks begin to run out. Eskimos may even resort to buying a little ice if global warming continues apace... But A[US] importing didgeridoos? It is the latest case of cheap overseas labour costs trumping the A[US]n market, no matter how sacred the product. The impending Sydney Olympics are expected to be a giant money-spinner for A[US]n companies contracted to

produce games clothes and memorabilia. It is such a plum ride that a few overseas ventures have dabbled in a little illegal production. One was s[prung] when its line of T-shirts proclaimed "Sidney 2000 – Be part of it." Now it seems A[US] is becoming flooded with cheap didgeridoos made in China and Taiwan in anticipation of a sharp rise in demand for Aboriginal souvenirs during the games. With spending by overseas tourists... on souvenirs... each year totalling around \$A1.7 billion... it means traditional Aboriginal communities who make the instrument are losing a hefty chunk of their income. It seems it is not just A[US]n goods but also services – that is, jobs – being snapped up by foreigners. Indian workers, using A[US]n names and accents, have been trained to replace sacked Sydney call centre employees in a deal which has raised the hackles of trade unionists... [- who] claim... that the new names appear to be constructed from first and last names of the... 140... sacked employees... They will take calls from thousands of unwitting A[US]n customers of companies as large as Grace Brothers and Myers, who will not realise their queries have been routed through New Delhi. Commercial finance company GE Capital... confirmed that the new trainees had already been familiarised with A[US]. The Indian workers have been brought out in groups of 20 or 30 for several weeks each before returning to India to train others... The familiarisation process could best be described as dinkum. As well as watching true-blue A[US]n movie *The Castle*, they have been taken to A[US]n Rules matches and treated to barbecues... [■ S]pectators will have to pay \$A3.50... for a meat pie and \$A3.90 for a carton of hot chips during the Sydney Games. The organising board has also given caterers approval to charge \$A4.80 for a 425ml cup of beer and \$A3.20 for a 600ml bottle of Mt Franklin spring water. The prices are up to 100[%] more than those charged at takeaway food shops and are bound to anger many consumers.

...*Big 'no' to greedy Games...* N[Z]ers have decided the Sydney Olympics are a non-event, much to the dismay of airlines, wholesalers and agents. With the opening ceremony barely a month away, indications are that only 2000 of the 12,000 N[Z]ers who were expected to attend will be there. The travel industry is blaming Air N[Z]'s high fares and the pricey packages offered by the Sydney Organising Committee for the Olympic Games (Socog). Air NZ... offered no comment why the fares had been set at such a high level... [but] now sees no need to schedule extra flights to Sydney... Qantas opted to retain normal fare levels but its bookings are not looking any better... Socog had launched a range of packages that included the opening and closing ceremonies, but only the most expensive (\$1700) had been made available to N[Z]ers... Travel agents are upset that the Olympic packages carried no commission – only a flat fee. One agent, who did not want to be identified, said [it] had received only \$50 for selling a \$20,000 Olympic booking... Sydney still has thousands of rooms in the two-star and apartment categories available... at up to \$A450... a night.

...the athletes' village on a 90ha site next to Olympic Park... cost \$A750 million... A new suburb... Newington, with house lots of between 200 sq m and 333 sq m, will house more than 15,750 athletes and officials during the two weeks of competition. The athletes' village is a mix of low-rise apartments, terraced houses and units, some of which have already been sold for post-Games occupation... Apartments are selling for up to \$A525,000 and houses to \$A540,000... After the Olympics, [a further] 600 dwellings... 50,000 sq m of office park and 6700 sq m of shop[s]... will be built... All... houses in Newington – said to be the world's largest solar suburb – have solar-power and energy and water-conservation strategies.

...Two months ago, a power cut blacked out... Sydney Airport[s]... radar system. A fortnight ago, the \$A43 million... computerised baggage system went into meltdown, delaying 27 international flights and irritating 6000 passengers. The baggage system also crashed in June, breaking down for 11 hours and forcing 2000 bags to be left behind. Despite continuing problems and reports by independent experts that the power supply system remains fragile, authorities are confident that they will cope with demand at the refurbished airport, which will handle 2300 extra flights a day over the... month... of the... Olympics... At the peak on October 2, the day after the closing ceremony, 80 flights an hour will depart Sydney. Getting around during the Games, visitors will be funnelled through the public transport system. Trains are all linked to the Olympic Park railway station[(there is 'no public car parking at the Park')]. Despite... a series of derailments and serious timetable delays over the past few weeks, the[trains] will probably be a better bet than the 13 Olympic spectator bus routes as the roads are likely to come to a standstill. Sydney's notorious taxi drivers are already rubbing their hands with glee at the prospect of watching their meters tick over in traffic jams on... the way to Homebush.

...The U[S] has joined the European Union in accusing A[US] of unfair trade practices for the Olympics... N[SW] authorities have said only eight foreign broadcasters would be given access each day and they would be drawn daily... [A] US trade representative... said the rules appeared to violate both the Olympic charter and A[US]'s obligations under... rules administered by the World Trade Organisation. In America, the Olympic broadcast rights were purchased by NBC for \$1.5 billion.

...Sydney television steps into the digital age well and truly at the Games, with a variety of new camera angles and options available as a result of new, smaller technology. There will be rails beside the athletics track and up the rowing course and flying cameras on wires at a variety of other venues to give a new perspective... [to a potential] 3.9 billion people... Altogether, the host broadcaster, Sobo, will have 940 cameras in action, 100 of them in the main venue, Stadium Australia, alone. Out the back, the Easter Show pavilion is [being] converted to a huge broadcast edit centre where pictures are cut and edited to suit the variety required by the 200 home markets. A total of 402 monitors [will b]e crewed to do that work out of 35 studios, with the results beamed off continuously by 15 satellite dishes. There[will b]e nearly 15,000 broadcast staff, technicians and television front-people... to report on 10,500 athletes. Sobo will film 3400 hours of competition in total, which would take 144 days to put to air if you bought all of it. Canada has bought most time, 1039 hours. South Africa and Korea tie for second with 930... No rights have been sold to pay-television broadcasters, as the IOC charter requires the Games to be available to all, free of charge. Here, as in N[Z], one channel has rights and broadcast access. TVNZ's deal denies TV3 rights to screen pictures of any event until 24 hours after they have. In Sydney, Channel Ten has decided it cannot compete and will flash messages on screen to tell when [AUS's top gold-medal hopes are]... in the start blocks. They have planned up to 10 breaks up to seven minutes long where they see medal victories and hope viewers will reward them for the warning by switching back once the action finishes.

...A[US]ns have fallen out of love with the Olympics... With less than four [week]s to go before the Olympics open in Sydney, only 49[%] of people over the age of 14 say they have any interest, according to a survey released yesterday. That figure was down six points on the February result and 17 on a similar poll held more than [a] year ago. The survey... showed that interest in watching the Games on television had also declined, with just 41[%] of people keen to watch the opening ceremony and 33[%] the closing ceremony. Sydney's organisers have had more than their share of problems in the build-up to the Games, with complaints about ticketing and problems involving their IOC members.

...victims of the online... Olympic ticket scam are suing the ...IOC... for "millions of dollars". [The] Texan class-action lawyer... representing 400 victims from around the globe... also has his legal sights set on the London-based touts allegedly behind the scam, the US Olympic Committee and the official US provider of tickets, JetSet/CoSport... The lawyer... said it was unlikely [the lawyer] would go after the A[US]n Olympic Committee.

...[the fact that] 'many of the printed tickets are too large for the ticket machines' has compounded the embarrassment of officials who were already red-faced after s[tray] fireworks from Saturday's Olympic opening ceremony rehearsal caused a spectacular scrub fire that burned off nearly a hectare.

...The waiting is over. The... Olympic Games begin tonight in Sydney. The "greatest show on earth" kicks off at 7.30[pm] with a spectacular opening ceremony in front of 110,000 people at Stadium Australia, plus a television audience reckoned... to [be] the largest audience[in the history of television] – 3.7 billion people... Even before the competition begins, the superlatives have been flowing freely about these games. It is the biggest Olympics of all time, with 300 events, 10,000 athletes, 5000 officials[, '4700 volunteers'] and 199 countries. It is also the most expensive, costing \$A2.6 billion... But after the 16 days of competition, we will know the most important superlatives – who is the fastest, highest and strongest.

...Olympic leaders may have to cut the ever-increasing number of people involved in Summer Games in the future to stop the event becoming impossible to manage... "You are looking at 500,000 people coming into Sydney Olympic Park on a daily basis,"... [the] IOC director general... said yesterday... "We will have a post-mortem as quickly as possible after the Sydney Games to see what is really the impact of these numbers. The

media is 21,000 here. It was around 12,000 in ...1992... Everywhere there are increases and we have to watch that very closely and monitor it. The IOC will sit down and reconsider where we could possibly put some limits." Triathlon, [gals'] weightlifting and taekwondo will all be[gin today]...

For every Olympic champion who carves his name into legend in Sydney, there will be another who has to make do with 10 fleeting minutes of fame. Like all preceding Games, the 2000 edition will provide a bizarre amalgam of major and minor sports, of anonymous amateurs and world-famous professionals. The focus as ever will be on such stars as track and field athletes, swimmers and gymnasts, their exploits scrutinised by packed crowds and a vast global television audience. Other household names – soccer, tennis and basketball players among them – will enjoy a brief flirtation with Baron de Coubertin's ideal before returning to the more serious business of earning money... [(although)Taiwan, seeking a first Olympic gold, is offering \$US330,000, with big payouts for silvers and bronzes too[; while t]he Singaporeans, whose only medal – a silver – came 52 years ago, are offering \$US575,000 for a first place[)]... In their shadow, the rest – the part-time archers, canoeists, wind surfers... volleyball players, the butchers, bakers and candlestick makers – will joust for the remaining limelight... Some sports seem forever destined to stay on the margins. Fencing, with its epees, foils and sabres, its balestras (short jump towards opponent), reprises (counter-attack following lunge) and ripostes (counter following parry), may be too esoteric. It is also so fast that only the connoisseur can follow the sport's subtleties... And you don't get more [subtle than a former] Soviet army major. [The major] put modern pentathlon on the world's front pages in Montreal in 1976 after being caught with a fencing sword adapted with a special button, which tricked the electronic scoring system into awarding him extra points... [The major] returned home and never competed abroad again. One question remained unanswered: had [the major] used the same sword when winning the individual silver and team gold in Munich in 1972? ...Other disciplines, meanwhile, have been able to provide spectacle while struggling to match it with drama, largely due to the domination of one nation. Nobody, for instance, bets against the Chinese table tennis team. In 1996, they not only won all four golds... but their second-string players also claimed three of the silvers and one bronze. And who will win at taekwondo – a debut sport rooted in Korea's ancient martial arts – if not the Koreans? They have, after all, been practising for 2000 years... [T]he Kenyans... have won every steeplechase they have competed in since 1968[(t]hey boycotted the 1976 and 1980 Games[), ha]ve taken gold and silver in six of their last seven Olympics, and with the last five world championship golds and a solid grip on the world record their dominance is total... For Sydney romance, look no further than... [t]he shaven-headed... 130kg super-heavyweight Greco-Roman wrestler from Russia[who] is seeking a fourth successive Olympic gold. A tax official, member of parliament and friend of the Russian President, [the wrestler] has not been beaten since 1987.

...Scores of medals are not enough for a former superpower desperately hoping that its athletes will provide a glimpse of lost glory. EVEN as the Russian team surged to second place in the medal count, Russia mourned losses by its once-unbeatable Olympic champions in Sydney as a national tragedy... The greatest blow for Russia was the incredible defeat of the legendary... Greco-Roman wrestler who had never before lost an international match. [The Russian] was beaten by ...a... [US] wrestler who had never won a collegiate or world meet... "It happened. There is an emptiness. Nothing else," said the daily newspaper *Moskovsky Komsomolets*... in a front-page story... Some chalked up [the wrestler]'s loss to alleged bias on the part of the judges. Others blamed [hi]s entry into politics, saying it distracted him... "After all, one cannot sit on two chairs at once,"...

The past isn't what is used to be. Ask the gymnasts. The young [girls] who took to the floor of the Sydney SuperDome for the all-around final on Thursday night sparkled like princesses. Glitter in their hair, sequins and curlicues on their gloriously patterned leotards, they were figures of fragile, fairytale beauty. But the fairytale doesn't have the same perfect ending any more. The gymnasts go through their routines and quartets of unsmiling judges mark them down. Down from 10 that is. Remember... the Romanian waif who stole the hearts of the world at the 1976 games in Montreal? [The Romanian] did what no one in the modern era had managed before her: [the Romanian] executed a routine, on the uneven bars, which even those nitpicking judges called flawless. [The Romanian] got 10. At the finals on Thursday, the performances fell well short of perfection. The two-point landing of utter poise just never seemed to happen. Watching the... all-around is like trying to watch a split-screen movie being projected on to all four walls, so I'm happy to accept I may have missed something, but I soon lost count of the landings that were tentative, uneven, ill-balanced, even graceless – and no amount of that arm-spreading, chest-thrusting, wide-grinning pose of triumph was going to fool the judges. Of course there was a reason for all this. When [an]English entrant... fell heavily and injured herself on landing ([the Pom] took no further part), they ought to have guessed. When the favourite, the lissom and scowling Russian... landed on her knees with a yelp of pain and walked away in tears of frustration, her early lead in shreds, the penny may have dropped. Incredibly, mindbendingly – heads are still shaking among the specialist press corps here – the vaulting horse was set at the wrong height. And it wasn't just a whisker out, but 5cm – which the last time I looked was just under two inches in the old measure. Two inches isn't much when you drive it, but to a gymnast somersaulting at steeple-height and hoping to execute a routine designed and refined with algebraic precision it must seem like the length of a football field... [T]he magazine *International Gymnast*, says we're entitled to wonder whether the glitch cost her the gold medal. On her next apparatus, the uneven bars, [the Russian] missed a grip and fell to the mat in a cloud of chalk... "You have to believe that if [the Russian]'d landed on her feet in the vault, [it]'d have gone to the bars feeling more motivated," says [the magazine's reporter], who cannot remember seeing such a mistake since school mess.

...[as g]ymnastics' governing body finally took responsibility yesterday for the blunder in which the vault was set at the wrong height... the A[US]ns were still getting]... worked up about the disqualification, barely 150m from a golden victory, of [their gal]20km walker... The disqualification was unquestionably the sensation of day 13 – and it would be a hard heart indeed that would not feel compassion for the [perso]n who came so close to gold[(NZers will recall that our guy 50km walker – who collapsed within sight of the winner's tape at the 1998 Commonwealth Games – had been 'disqualified while leading at Atlanta' in 1996)]. Yet – and maybe everyone's getting a bit tired and needs a lie-down – those voices... raised in [the AUSn walker]'s defence seem to think this is not simply a tragedy but a scandal. The tabloid paper the *Daily Telegraph* called it "the most excruciating example of vile sporting misfortune that it is possible to imagine" which is simply hyperbole but not wrong. But [the paper's columni]st went further and said [that, like ice-skating (the Winter Games sport which has at times been tainted by fixed judging),]the sport could not be taken seriously when it is about technique which is "a matter of opinion." [The walker]'s coach – who may have temporarily taken leave of his senses – bizarrely suggested a political motive. And... the deputy chair[perso]n of the A[US]n Track and Field Athletics Commission, who should have known better, called it a "ludicrous result." Ironically, the athlete herself was the most clear-eyed about it. [The walker] collapsed in distress when the chief judge held up the dreaded last red card but... quickly composed herself to shrug that "that's race walking" and "I will have to fix up my technique." A discus thrower may not walk out of the front of the circle even if her discus landed ...in... an[other country]... It will be a no-throw. It may seem silly but it's a rule and everyone knows about it. Walkers must have one foot in contact with the earth at all times (there's a name for people who don't: runners) and they have to keep the front leg straight until it becomes the back leg, which accounts for that odd rolling gait. [The AUSn] didn't. On at least three occasions, [the AUSn] was adjudged to have "lifted." This wasn't – as [the columni]st suggests – a matter of opinion but of fact. Yesterday's papers were full of pictures of [the AUSn]'s feet more than 2cm off the ground. I found it hard to see on live-speed TV, but that's why they are the judges and I'm not. And, incidentally, none of the three judges who reported her for lifting knew that any of the others had. Each runner approached each judge with a clean slate. [The AUSn] broke the rules[and] was out. End of story. It's heartbreaking – although for my money it pales beside the story of a gymnast robbed of a medal because [the gymnast] took a cold pill her doctor gave her – but let's keep it in perspective. The A[US]ns have been, until this, gracious in defeat – though God knows they've had little enough of it to be gracious about. But if they want a steer on how to approach [the walker]'s misfortune, they should take a tip from the Channel 7 satirists... Over footage of the A[USn] guy's hockey team's centre half collapsing in grief after missing a penalty in a shootout and letting the Dutch slip into the... final, they expressed the only appropriate view. "That[centre half]'s... let everybody down. [The centre half]'s a disgrace to his country."

...If watching our Olympic team falter and fail feels painful from where you're sitting, try and imagine how hard it is to be a N[Z]er in the middle of all this. The weekend finally brought a break in the medal drought when [our 44-year-old equestrian] picked up bronze and... [our] double world champion [r:p1550, ln10]... a gold... for the single skulls... but the dreams of the moderate Olympic glory that we secured in Atlanta and Barcelona seem now as elusive as a scent of rain to a parched Canterbury runholder. There is, of course, no shortage of A[US]ns to rub it in. The *Sydney Morning Herald* has several hundred staff covering the Games, but many of them are on secondment from other papers in the Fairfax group like the *Wee Waa Weekly*. And woe betide any N[Z]er who bumps into these blokes on a media bus. When they find out you're from N[Z], their eyes crease into something between a chuckle and a grimace of pity and they say: "Don't worry mate, I won't tell a soul." It makes you inclined to take the advice of Channel 7's irreverent and vulgar late-night comic roasters... who advised us, if asked, to "deny you are a N[Z]er." Even when we win, we lose here. The *Sunday Telegraph*'s story on [NZ]'s triumph in the [guys'] single skulls began: "The bleats of joy could be heard from across the Tasman." But hang around Sydney for even a few days, even when the world's elite athletes are not here, and you realise there's a lot more to it. Perhaps it has to do with the different circumstances in which our sense of colonial nationhood was formed. N[Z] was settled by hopeful but often downtrodden souls looking for a better life; A[US]'s First Fleet was full of convicts, many transported for petty crimes, who had to make a new start or die. We started full of dreams and apprehension; they full of the rage of rejection and having nothing to lose by looking to the north and hoisting a giant two-fingered salute to the old country. That which we call arrogance and conceit in the A[US]n looks a lot more like self-belief. It shines out of every encounter you have on the street, every newspaper you open, every television programme you watch. The discourse about national identity does not begin with a shrug and an "Oh, well, never mind". A[US]ns expect and embrace excellence, in themselves and in each other. And they know that that excellence, in every sphere of life, depends on a robust public debate and all shades of self-expression (can you imagine a [Channel 7-like satirical] show on TVNZ lasting more than a week before the purse-lipped naysayers had it hauled off?). They also know that defeat is something only centimetres short of triumph. When A[US]'s gal pole vaulter... a former world-record holder, failed even to qualify for the final [it] said simply "I should have jumped better." Sure there were tears, but they were tears of frustrated disappointment. Compare her reaction with that of our high jumper... a rookie with a big future who jumped well below his best and failed to make the finals. Forced to wait out the rest of qualifying in the competition area, [it] did so with a towel over his head, bent low by bitter shame. Watching that sad sight, I felt I was looking at a [guy] with more than the weight of defeat on his shoulders. What slumped him low was the weight of being a N[Z]er.

...a NZ judo referee... has left the country, escaping a continuing hail of abuse from Japan for his handling of an Olympic final. The furious reaction, mostly by e-mail, included a death threat... Japanese judo fans [were] angered by his ruling in favour of a French [fighter] during the over-100kg final in Sydney last weekend. The N[Z] Judo Federation has received a number of angry e-mails... Irate e-mails and letters from Japanese fans are also being sent to the *Herald*... Under International Judo Federation rules, [the referee] is not allowed to speak to the media about umpiring decisions. But... [the NZ Judo Federation president] said the decision against [the Japanese competitor] was "completely above-board." Judo effectively has three referees – the scoring umpire and two sideline judges. If the judges do not agree with the scoring referee's decision they can overrule it. This was not done during the final. Even [the Japanese competitor] conceded: "I was not good enough. I am not dissatisfied with the call." The... over-100kg is judo's most prestigious Olympic event... [The NZ Judo Federation president] said the "outpour of rage" was surprising. Japanese people, especially judo competitors, are renowned for their discipline. "But these ones... demand[ing] an apology from... [the NZ referee and calling NZ 'a hateful country']... seem to be bad losers who probably don't know much about judo."

...The Games were not a weekend old when a political activist complained that they were displacing the serious things of life. "Don't we do the serious things to earn the frivolities?" I asked. We were about to play tennis. "Maybe I'm just a bad spectator," [the activist] said, putting a good ball past me. I can't remember an Olympics like these. I suppose we were spectators, but with an event of that scale so near, you felt at times like a participant in a celebration of A[US]. While we ached for medals, wondered whether it was worth paying more tax to get them and pretended to begrudge A[US] its success, we were delighted really that dirty old Sydney town was doing it so well. And there was a serious dimension for A[US]ns that possibly we understood more intimately than most others. The opening ceremony engaged the ghosts of their history as well as the glories. When great white [AUSns] of the past handed the torch to an Aboriginal to light the flame, we understood. We are in a similar post-colonial predicament, with one big difference: we have a treaty that many A[US]ns envy... With a solid reference point for our past and present race relations, we probably do not fully understand A[US]'s struggle with its history. If nothing else, the treaty is a statement of good intentions... (...the... [treaty's] signatories never contemplated... the devastation of Maori society[– which]... is precisely one of the dangers they were trying to avoid...)... A[US] has no comparable testament. It has nothing except rigorous historical scholarship to counter the impression that the only fate its colonists ever intended for the natives was genocide. Rigorous historical scholarship, unfortunately, is becoming a rare commodity in both countries. For some time now it has been steadily sacrificed to the contemporary need for post-colonial reconciliation. It is not widely known in this country that treaty grievances no longer receive more than perfunctory historical research. Claims are quickly conceded as long as they fit into a general category of land alienation, and the Crown spends most of its time coming to the terms of settlement. Frequently the terms include an apology. A[US] is trying to deal in the historical apology, too. [AUS's PJM]... to his eternal credit, has steadfastly avoided saying "sorry" for a plainly well-intentioned policy that involved removing Aboriginal children from their families in the bush. If it were possible to acknowledge the best motives of the past, there would be no harm in apologising for the consequences. But in the climate of today it is seldom possible to give the past a fair hearing. Not long before the Olympics, a court in the Northern Territory finally heard a test case brought by two members of the so-called stolen generation. The judge took a long, dispassionate look at the evidence and decided the two had not been "stolen" from their families and that at the relevant time there was no policy of forcible removal of children in the N[T]. Since then a similar case against the state of N[SW] has been thrown out of the Court of Appeal. The decision, of course, cut no ice with those who believe what they want to believe, and the fury that followed the first judgment threatened for a while to be visited on the Olympics. These people are not concerned about the finer points of history. They want the past converted to a morality play for modern purposes. And the appalling thing is that historical scholarship today seems inclined to play along... To apologise for the past is an affront to history as a study of humanity and an insult to people who can no longer speak for themselves.

...HOWLS of protest greeted plans to kill off the swarms of begong moths that have besieged Olympic Park. Games organisers said the moths – which have been drawn off course during their annual migration by the bright lights of the stadium – might have to be killed. But Greenpeace has pleaded the moths' cause, saying it would "not be a very good concept" to be spraying pesticide around the games' venue... ● The... Sydney Olympics will go out with a bang – a low-flying fighter bomber will ignite a long stream of jet fuel and a million people will be treated to... the largest fireworks show in the world to follow the closing ceremony tomorrow... Sydney loves to party and organisers expect up to a million people to pack the best vantage points around the harbour to watch the 23-minute show, which will consume \$A3 million... worth of fireworks... The F-111 jet will "dump and burn" fuel at 1000ft above Stadium Australia... The plane's dramatic flight will be the signal for 24 "lightning shells" to explode like giant flashbulbs all the way down the Parramatta River to downtown Sydney, where another F-111 will light up the sky over the Harbour Bridge. It is being dubbed "the river of lightning." ...in a dig at London's "river of fire" that proved a damp squid on millennium night, [the]... artistic director of tomorrow's extravaganza... said: "It will be very different from the river of fire on the Thames in that it will work." The night sky will then blaze with fireworks that have a truly international flavour – pyrotechnic experts from Spain, Japan the U[S] and South Africa are contributing to the grand explosion of light... [For the finale, t]wo 61cm shells will be fired simultaneously for the first time in the world.

...It was the moment which surprised no one. The president of the [IOC] gave his imprimatur to the Sydney 2000 Olympic Games, announcing officially what anyone who has been here has known since before the flame was lit. "They could not have been better... and therefore I am proud and happy to proclaim that you have presented to the world the best Olympic Games ever." ...the 110,000-seat Stadium Australia erupted at the verdict – and faithfully followed his accented "Aussie! Aussie! Aussie!" with an enthusiastic reply, "Oi! Oi! Oi!" The last scene of all to end this strange, eventful history began with a surprise and ended with the biggest controlled conflagration in the history of the planet. [The r]amping... stars of Channel 7's late-night satirical show *The Dream*, were pressed into service as the audience warmup act – presumably chosen on the basis that the best way to blunt satirical wit is to employ it. And a [guy] on a farm bike, apparently bent on destroying proceedings but in fact all part of the act, was gently brought under control by a goodnatured "crowd" of performers. The athletes were not forgotten: flag-bearers for each nation filed into the arena, later to be joined by all their team-mates in riotous profusion rather than orderly file. It complied with a tradition suggested 44 years ago at the Melbourne Games by a 17-year-old Chinese-A[US]n boy... An entry en masse, [the boy] wrote, would "make the Games even greater [because] there would be only one nation. War, nationality and politics would be forgotten." [The Chinese-AUSn ha]s had his wish at every closing ceremony since and last night... was at Stadium Australia to see it. And... as the Games drew to a close, Greek priestesses danced slowly to music... and angelic choirs filled the air to herald the handing over of the Olympic flag to Athens, the venue for the next Games in 2004.

...in... 1997... the Olympic movement celebrated the sentimental return of the Games to their birthplace in Greece in 2004. Yesterday, the message to Athens was vastly different: get your act together. [The]IOC president... said the Athens Games were in the worst organisational crisis faced by an Olympic city in his 20-year tenure. [The president] would not rule out moving the Games, but said it was unlikely... Since the[Games were awarded to Greece], many plans promised during the bid have been changed or dropped, and the organising committee has been bogged down in bureaucracy... Shocked Greek organisers said [the president] was exaggerating the problems. The Government said it would meet all deadlines.

...A MULTI-million dollar Olympics rescue package is being put together to stop the rot in N[Z] sport, the P[M]... told *Sunday News*... N[Z]'s four-medal tally... in Sydney... is the worst performance since the zero count from the 1980 Moscow games[– which we boycotted as a team. AUS]... spent \$135 million on its golden Olympians[this past year, and has 'invested \$300m in Olympians since Atlanta (NZ has invested \$31m' since Atlanta)]...

What a nation of whingers we are, seeing the glass as half empty rather than half full. Our athletes come back from the Olympics and all we can do is moan about how they dipped out. Surely none of our athletes went to the games to cruise – or lose... Check out the medal hauls of countries with similar populations, such as Ireland and Singapore; way behind[NZ]. Or maybe, just maybe, their priorities are elsewhere. Like making sure their people are fed and housed, their kids not being abused, everyone able to access a job, training and education. Sure, Olympic glory is good for the nation's collective feeling of well-being but the latest call for more money to be thrown at sport is not the answer... • The... members of the A[USn gals'] 4 x 100m relay team... [are involved] in a bitter feud... A[USn a]thletics officials are threatening to drop the team if they continue blaming each other for failing to win a medal at the Sydney Olympics.

...[the r]eigning Olympic 100m champion... has called for an investigation into allegations that prominent U[S] Olympians such as [the country's most successful Olympic athlete – having]... won nine Olympic gold medals in a glittering career... [–] failed drug tests in the build-up to the 1988 Seoul Games. "Everybody who tested positive should get busted. There shouldn't be any coverups," [the champion] said... The charges, reported in *Sports Illustrated*, the *Daily Telegraph* in London and the *Orange County Register*, came in documents released by [a]former US Olympic Committee anti-doping official... [Hi]s papers indicated that [the USs' most successful Olympic athlete] was one of 19 prominent [US] athletes who tested positive but were still allowed to compete in South Korea. [Ironically, the USs' most successful Olympic athlete] was awarded the gold medal in Seoul in the 100m after [a]Canadian... was stripped of his victory for failing a dope test after the race... [The US athlete] who won the 200m, and [the US athlete] who won the 400m hurdles, also tested positive for a banned stimulant in 1988. The US Olympic Committee determined that they had ingested the substances inadvertently... "Those are fake medals... and I don't like it," said... [the] Japanese... who was fifth in the 400m hurdles.

...[The USs' most successful Olympic athlete] dismissed a demand by the manager of [a]former Canadian sprinter... to give back his 1988 Olympic gold medal in the 100m, saying it was unrealistic. "It's ridiculous, who cares? ...I did 18 years of track and field and I'[m retired yet]... they're still talking about me, so I guess I still have it." ...The 41-year-old... was arrested for... driving under the influence after his... Maserati hit a wall along a Los Angeles freeway on Tuesday... [The Canadian]'s manager and lawyer... told the *Sydney Morning Herald* last week that [it] plans legal action...

Hard workouts at the gym could soon be a thing of the past as American scientists have found that just imagining yourself exercising can increase muscle strength. It is hoped that the research could one day help people too weak to exercise to start recuperating from strokes or other injury. Volunteers aged 20 to 35 were put through strict "mental gymnastics" tests and after a few weeks showed up to a 13.5[%] increase in strength. They maintained that gain for three months after their training stopped... [A]n exercise physiologist at the Cleveland Clinic Foundation in Ohio, told *New Scientist* magazine that muscles move in response to impulses from nearby motor neurons. The firing of those neurons in turn depends on the strength of electrical impulses sent by the brain. "That suggests you can increase muscle strength solely by sending a larger signal to motor neurons..."... The researchers are now repeating the experiment with people aged 65 to 80 to see if mental gymnastics also works for them.

...The message behind... national arthritis day is 'move it or lose it', and locals are encouraged to join exercise and workshop classes this Friday. More than half of N[Z]'s population suffers from arthritis... By holding the national day, the Arthritis Foundation is hoping to raise awareness of how beneficial exercise is for arthritis sufferers... The Arthritis Foundation's chief executive... says... "Move It or Lose It Day will lead to a greater recognition that there is something positive almost everyone can do to have a healthier lifestyle as they get older." These include building up exercise to 30 minutes a day [– 'if it adds up to just 30 minutes a day, exercise can add years to your life' (though 'half an hour of moderate exercise a week is all that is required') –]to increase mobility, improve energy levels, reduce stress, help make bones stronger, reduce falls, and give more restful sleep. For people with arthritis, keeping joints mobile reduces joint pain, and increasing muscle strength prevents joint deformities.

...Very often, towards the end of a professional athletics career, exercise and competition become so strenuous... and painful, that those involved in sport can't contemplate enjoying a walk in the park again, let alone an aerobic workout. In fact, I can't tell you the number of Olympians who've said to me that the day they retire from the competitive arena will be the last time they swim a stroke, run a step or bounce a basketball.

...A group of Western Heights residents are angry their local park contains a basketball hoop they did not want. The hoop was installed along with a children's playground on the Semillon Ave Reserve in March last year... [A resident] who lives across the road from the playground area, says the basketball hoop is making life miserable for residents who live around the park's perimeters. "It attracts 18 and 19-year-olds that play at night. Why should we have to listen to balls bounce?" ...Another resident... has the same concerns. "It's not just the bouncing, they yell and scream and swear. They drive up in car loads to use the hoop..." It was built by [the]developers... but the land has recently become the property of the Waitakere City Council... [The] council... parks project manager... says the council has decided to remove the hoop... [following the presentation of] a petition signed by 20 residents... but they are not sure when. There is also the possibility the council may try to gauge residents' opinion of the hoop through a letter box drop. However, [the resident who presented the petition]... says a letter box drop would be pointless. "It means nothing to people who are away from the area because they can't hear the noise." Both [residents we spoke to] have children aged under five. They have trouble getting them to sleep at night when people are using the court. They have been woken up early on Sunday mornings by people using the hoop... Last Wednesday, some of the residents met with... Waitakere Community Board member[s]... They agreed with the residents that the hoop was too close to houses around the reserve. The hoop may be moved to the grounds of the new school that will open in the area by the end of the year.

...[A] HIGH SCHOOL basketball star... is set to... [sign] a multi-million dollar sponsorship deal with sportswear giant Nike. The 18-year-old, who has yet to play a professional game, is understood to have agreed to a deal worth \$US90 million... The deal runs for seven years... [The 18-year-old] is widely expected to be the number one pick in the... National Basketball Association... draft. The Cleveland Cavaliers will get that coveted selection and will pick [the 18-year-old], who lives just 55km down the road in Akron, Ohio. [The] deal dwarfs what [the 18-year-old] will be able to earn from actually playing basketball. Under the NBA's collective bargaining agreement, the 2.03m... guard/forward can earn \$US3.349m in the first year of his contract... Nike has been searching for a player who will resonate with teenagers the way [its] former Chicago Bulls star... did.

...No matter what [an AUSn]... achieves in the world of golf, no matter how many tournaments [it wins, it] will never be able to erase one fact from his record. [The AUSn] was among 48 players beaten by a 14-year-old girl at the Hawaiian Open... finishing three shots behind [her]... at the weekend. And don't think the Queenslander's fellow A[US]n pros will let it pass quickly. It seems [the Queenslander gave a compatriot] a hard time after [the compatriot was beaten by a Swedish gal golfer] at last year's Colonial... [The girl], a Hawaiian with parents of Korean descent, fired a two-under 68 at the US PGA Tour's Sony Open in Honolulu to finish 36 holes at even-par 140, missing the cut by just one stroke... Asked whether [it] belonged on the [guys' or gals'] pro golf tour, [the girl] said: "I think I belong on both." ...[the] girl became the first [gal] to break par in a US PGA round. Her final score was the lowest of four [gals] who have played alongside [guys. The girl] was attempting to become the first [gal] to make the cut in a PGA Tour event since Babe Zaharias at the 1945 Los Angeles Open... [However, the girl] will have some work to do to match [another 14-year-old's] opportunity. The boy... is already the highest-paid player in... [US] Major League Soccer... making US\$500,000... [and] becoming America's youngest pro athlete in more than a century... [The] US citizen born in Ghana... might well become the American saviour of football... [B]oth 14-year-old phenomenons with huge expectations... swiped headlines in the U[S] on a big sports weekend usually dominated by basketball...

The Tall Blacks will look to reciprocal visits from Brazil and Argentina and more regular competition with the A[US]n Boomers, whom they beat 89-78 yesterday, as they build to the world championships in the U[S]... Their 2-1 series win over A[US] came on the back of decent planning, enthusiasm and commitment from the players, plus composure and self-belief. There has been a big attitude change since the Olympics. In Sydney, [the former] coach... tried not to lose by too much. Yesterday in Auckland, the new-look Tall Blacks proved they have a new confidence in their own ability and that they know they can beat top sides after taking Russia to overtime and beating Brazil at the Goodwill Games. And now this... "We didn't have a plan before today – now we do,"... [the new] coach... said, acknowledging it meant television cover, sponsors, more international competition. [The new coach] expected a more intense national league as others tried to force their way into the world championship side, thus maintaining pressure on yesterday's winners. A[US] miss out on a world titles berth for the first time since 1970. At least they are in good company – Sydney Olympic silver medallists France, bronze medallists Lithuania and the fifth-placed Italy have also crashed out in qualifying matches.

...the N[Z] basketball team have blown away the form card... The Tall Blacks [have] made the top four at the world championships without consistent international competition, finance – [the]... Kiwi with the Yankee accent[']s... coaching job is unpaid – without the physical size of the other teams and minus two of their tallest and best players. [One of the two] did not even make it to Indianapolis, a big psychological blow. When [the other, NZ's only NBA player,] was ruled out with an eye injury the mental blow could have killed them before tip-off. But [the coach] gave them faith again. What [the coach] tells them works, so they listen next time. [The coach] is a master strategist and mid-game tactician and the team have followed instruction. They have brought a game no one was prepared for – full-court, fast breaks, under and around rather than over... The Tall Blacks got this far because they played smart, played to their strengths in defence and, critically, played as a team. The core of them were at the world youth championships in 1997... It would be churlish to suggest that [the Kiwi-Yankee] could not continue as N[Z] coach from overseas. But, knowing him, [it] will be keener to keep a firm hand on Kiwi basketball from his Kiwi home. Other countries can't offer him a job as coach at the Athens Olympics, not even the U[S] – who beat NZ in pool play but can end up no better than fifth and now] must fight for one of three qualifying spots for the Americas. The A[US]ns will be happy, because N[Z] have earned them one of 12 places at Athens. Along with the hosts and the winners of the Argentina-Yugoslav final, each of five Fiba zones gets one spot, but a top-six finish in the world championships earns a second place for that region. A[US], who scorned the standard of competition this side of the Tasman right up to the moment... when they found they weren't going to Indianapolis, will now want to play the Tall Blacks in an annual three-test series. [NZ b]asketball can expect new sponsors, TV time, public money.

...[Yugoslavia – who beat the Tall Blacks (who had taken] to the court against Yugoslavia buoyed by their win over them at the Super Cup tournament in Germany three weeks ago... [and yesterday lost their playoff for 3rd/4th against Germany) 87-78 in their semifinal – showed] why they are rated the strongest team in the world... [by retaining their title (their '5th – two more than anyone else, including the US'; who a day earlier had]... suffered another humiliating loss, 81-75 to Spain, to finish sixth[]). It was a forgettable week for the U[S], who saw their streak of 58 consecutive wins... when using NBA players in international competition come to a[] spectacular end – losing three times]... in four games.

...Basketball is flavour of the month, and rightly so. Not only did the Tall Blacks exceed expectations with a stunning run to the world championship semifinals but they did so with nothing but good play, planning and heart... Get out the Halberg Awards now... This team[']s... feat is right up there with the All Whites making the [1982] World Cup... It beats any All Black victory, including the World Cup.

...[the NZ team's] Sevens World Cup... win topped off last year's world series win and was made all the sweeter when they beat A[US] in the final... [The 'Half-Blacks' have] won three tournaments on the trot this season... [but a] sevens win at home is overdue and... [the player who] will captain the side again after taking the reins last month... wants to make sure the tournament in Wellington will break the duck... "We're really looking forward to playing in front of the home fans. I value these awards, we've won a world series and a gold medal but we haven't won in front of our home crowd yet. We want to turn it on for the fans and experience winning at home."

...The next time you urge your favourite team to score, you may be better off saving your breath. New research suggests... [that w]hile barracking may boost players' speed, it also hinders their coordination... [A] report in *New Scientist* magazine[] says r]esearchers in Germany... analysed both the teams and spectators in four home games of... an American football team, in Kiel. [They] filmed 631 downs, discrete plays in which one team attempted to move the ball down the field. On a separate videotape [they] recorded the behaviour of the team's most loyal supporters, a group of 300 fans who sat together in a certain section of the stadium. All the games were sellouts and the crowds could be clearly heard and seen by the players on the field. A judging panel compared the players' success or failure... with the crowd's behaviour at the time... [and] found the crowd support had absolutely no impact on an individual down, adding that cheers are probably also ineffective in other complex team sports such as soccer, rugby and ice hockey. But [the researchers] concluded that it does make the supporters feel better, giving them the illusion that they are controlling the game. [A f]ormer All Black... [said]: "Crowd support definitely gives you a lift without doubt. I used to love it when fans yelled out my name, especially if you are feeling a bit down. And you are so focused on the game that you can filter out the negative vibes and heckling."

...A leading academic on team leadership... is impressed with the depth of planning and free thinking of [the new] All Black coach... and his coaching team. The outlook for the future of the All Blacks under the... [new] leadership is good, says [the academic], who has been appointed professor of sport at Unitec's school of sport. His appointment is said to be a first for N[Z] and AUS] and one of few such posts anywhere. His doctorate on elite team leadership, which was based on three years of study and research within the All Black camp, is claimed to be the first doctorate thesis to obtain first-hand research data on the leadership of an international sports team... Findings from his doctoral research have been used here and overseas and [the academic] has worked as a consultant on coaching and team leadership with five national codes – cricket, rugby, netball, hockey and petanque... "I think the[] new All Black coaching team] value and have a realistic appreciation, not of the hardness of the

players, but of the personal qualities and the unyielding commitment to sport that players need at that level. They're thinking people and that's a critical aspect of a coach. This idea of mechanistic coaches who are so authoritarian – it doesn't last for long in terms of winning or developing people." ...[■ After their first-ever] series victory against the British Lions... [t]he *Sydney Morning Herald* under a headline "Wallabies on top of the world," asked: "Can it get any better than this? Probably not, because there is nothing left for the Wallabies to win."

...THE All Blacks will lose their \$120 million deal with adidas if they don't start winning. The sportswear giant met N[Z] Rugby Football Union bosses in Wellington three weeks ago and told them to win or else... The company is understood to be unhappy with the... All Blacks over their fourth-placed world cup finish. They also consider some players were arrogant and unhelpful while in the UK. The NZRFU's... chief executive... confirmed adidas had raised the issue of the All Blacks' poor world cup performance. Success was the "bottom line," [the chief executive] said.

...GET TOUGH... message to the All Blacks... ALL Blacks enforcers will be given free rein to intimidate their opponents... [NZRFU] officials are this year determined to find "no-nonsense" players to toughen the [guys] in black. "If you are not a bit of an intimidator, the opposition aren't fearful of you," [a selector] told *Sunday News*[, adding that] the All Blacks needed to dig deep to find that "get hard" attitude that once made Kiwi rugby great. "That's the thing the All Blacks used to be so renowned for. Rugby is a confrontational game. It goes a long way to being successful at that level,"... Last year the All Blacks were called "soft". They were clearly put off by rough tactics in the semifinal loss to France. [The selector] said there was no reason why players couldn't deliver a more powerful "fighting fire with fire" commitment. "But perhaps the environment or laws of the game aren't conducive. It probably plays on players' minds with the video cameras and touch judges," [the selector] said.

...If the Crusaders flunk tonight's Super 12 ...final exam, the All Black selectors may need to reappraise their homework. The... Crusaders have been the most consistent N[Z] team... so many of their players must be filling the... selectors' notebooks. While there is little oil leaking from the All Black bunker, there are enough signs to show [the Crusaders' skipper] is favoured to take over as the All Black skipper... During the series, the... gap between the top two teams and the rest of the field was significant... [but] the Brumbies have to be favoured to win... They have played the most appealing rugby and won most of their matches as well. They are the best side to watch and the most effective. Not only do they have a wondrous array of backline talent and moves but they possess a powerful pack who hunt with the precision of the "big black blanket" All Black packs of yesteryear... [The] Brumbies-Crusaders final... act[s] as a great appetiser for the All Blacks' opening Tri-Nations test, against the Wallabies...

When [the #11] scored his late Bledisloe Cup match-winner, [the new All Black] coach... finally let himself go. In the coaches' box high in Stadium Australia, [the coach grabbed his] assistant coach... and [their fellow] selector... in joyous embrace. It had been a hell of a rollercoaster journey for the world-record 109,874 crowd, the players and the coaching staff as the All Blacks upset the World Cup champions 39-35 in perhaps the most extraordinary game in test rugby history. Even when the All Blacks sprang to a 24-point lead in the opening seven minutes, [the coach] did not raise a smile. [The coach] knew the Wallaby resilience, and that they had not touched the ball. [The coach] had also been through the tough times in the last two years, watching the All Blacks wilt under pressure. That nightmare pattern reappeared as the Wallabies cut into the lead, drew level at the break and went to an early second-half lead... This was not test rugby as we knew it. It was crazy, head-scratching stuff born out of both sides' desire to play with immense pace and intensity. "We lost in the last two minutes, not in the first seven," [the]Wallaby skipper... lamented as everyone tried to make sense of the madcap evening. The first part showed what everyone knows. Give the All Blacks some ball and a little room and they can sting even the best defences... [But the coach] knew the dangers and then saw them realised... [Second-phase play] showed some All Black weaknesses. They were exposed at the lineout, and the Wallaby pack were all over them... The defensive pattern went awry, tackles were missed all round the park. The All Blacks had surrendered their huge lead and were struggling for possession... [However, t]he Wallabies were struggling for goalkickers... [although the All Black goalkicker also] had trouble with several... shots... With seven minutes left... the Wallabies... Kiwi-born [hooker]... smashed in at the corner for a one-point Wallaby lead and the All Black gallantry looked spent. They got back to the Wallaby goal-line, but [the All Black hooker] missed his skipper with two lineout throws. It had to be *Advance A[US] Fair* – until the miracle. With one final flurry the ball went along the line, [the deposed All Black skipper] got it with two defenders all over him but handballed a magic pass to the charging [winger. The big guy] surged away from [a Wallaby]'s despairing tackle and tiptoed along the touchline for another 15m as the whole of N[Z] bellowed at him to put the ball down. It was... the third time the All Blacks had stopped a record-equalling Wallaby 10-test winning streak.

...The Sydney test was an historic occasion for rugby. It was the best test I have seen, and undoubtedly one of the greatest matches of all time. A[US] certainly sees it that way, even though their world champion side was defeated. Rugby followers across the Tasman generally regard the All Blacks' match against the Barbarians in 1973 as the greatest game. But those I talked to believe Saturday night's match deserves that accolade. Ironically, the most stunning aspect of the All Blacks' victory was A[US]'s comeback from 24-0 down. No other team in the world, including the All Blacks, would have been capable of stemming the early flow against them and come back into the game the way A[US] did. The speed, intensity and range of skills turned it into an absolutely brilliant match... It was a tribute to the players' skills that [the]referee... blew his whistle only five times in the first 15 minutes. The match was also a major triumph for the game's rule-makers after an often stodgy World Cup. The 100,000-plus crowd showed that rugby [union] is also on an incredible roll in A[US]. The crowd could have been 150,000 if the stadium was big enough. Two World Cup triumphs have helped [union]'s cause in A[US], but it is no coincidence that the sport's rise has come when rugby league is self-destructing. Apart from what is happening on the field in rugby league, things such as the amalgamation of clubs do not seem to have worked for the game. The great thing from [union's] point of view is that the players are trying to get the ball a little wider than they were last year and the tries flowed... despite the high quality of the defences... The A[US]ns were even relaxed about the result afterwards. [The Wallaby skipper] made some outstanding comments along the lines that while you never like to lose, it didn't matter so much when you had been involved in such a game. Who knows what lies ahead, and whether Saturday night is a taste of things to come. The match has certainly raised the bar for test match rugby... People such as [the NZ coach of Wales] – who was at Stadium A[US] – must be shaking their heads over how sides like Wales can get even close to that high a level.

...Before his first Bledisloe Cup test, [the]new All Black captain... was blown away by the atmosphere at Stadium A[US]. "On the way in looking at the crowd and the carparks – I think you would fit the whole of Christchurch in this stadium." After his team's palpitating 39-35 victory, [the new captain] said the memories would stay with him for the rest of his life... It was a test which will net A[US]n rugby about \$4 million. It dragged 109,874 past the turnstiles and gave everyone, even those without any amber inside them, a headache in trying to assess both its merits and rating. The greatest game of all was thrown into the mix, but that seemed to overstate its standard. It was exhilarating, surreal and magnetic... but with too many mistakes to qualify as the best in test rugby. Anyway, how do you define the greatest? It is easy to dwell on the present and forget superb matches from not too long ago. Remember these from just the last decade: all three Wallaby-All Black tests in A[US] in 1992 were as good as it gets; the French win in the second test at Eden Park in 1994 with the try from the end of the Earth; the... 33-26 win [by the All Blacks] against the Boks at Loftus in 1996 to take the series in South Africa for the first time. For drama and tension it is hard to go past the All Blacks' 16-20 loss to [a Wallaby]'s tackle at Sydney in 1994, or the 23-24 [All Black] loss at Durban in 1998 when [a Bok] scored his dubious late try. Perhaps it would be more useful to compare the sides, but even that was difficult in this madcap match. Outside the opening seven minutes [and] the All Blacks'... late matchwinner, the Wallabies controlled most of this international. They were the better team. So were the All Blacks jammy? They did have some luck early. The ball bounced their way, but they nailed those chances. What the test underlined was the danger in kicking away possession. [The All Black No 10] was guilty early but escaped, while in the final minutes... A[US]'s dual league and union] international... kicked downfield with his team a point ahead. The ball went to [the All Black No 15, who passed to No 14, who] made 40m and several phases later [No 6 set No 11] off on

his victory tread... The Wallabies suffered with their goalkicking... [Three different players] goaled four from nine between them, [while the All Blacks'] kicked six from eight... Illness claimed [two Wallabies before Saturday's game and, afterwards, two players] have rib cartilage damage, [another has] an ankle problem, [a fourth has] a knee medial ligament strain and [a fifth has] a hamstring strain. The All Blacks have no injuries and yesterday flew home to stay at Hanmer Springs... They had no cause to dry out at the [local] alcohol recovery centre – they had little sleep or time to celebrate after their opening win in the Tri-Nations series. The Springboks are still at Stradbroke Island in A[US] and do not fly to Christchurch until tomorrow night.

...Things don't come much better than this, beating the world champion A[US]ns in front of the biggest crowd in rugby history... As [the All Black No 11 left an AUS]n star... sprawling for the last-gasp try... [a former AUS]n captain... was moved to call it "the greatest test ever." Extraordinary, yes. Nerve-fraying. Bloody great. Lucky. Call it what you will – but greatest? Not according to former All Black greats. For them, the highest highs and the worst lows have come against the old enemy, the Springboks.

...the Springboks' most capped player, will not get a selection reprieve for their start to the Tri-Nations against the All Blacks at Christchurch on Saturday... the feisty [No 9 will, however,] ...be a reserve... After travelling to Sydney with [his] assistant... to watch the frenetic series start between the All Blacks and Wallabies, [the Springbok coach] is even more convinced that [it] is on the right track with his plans for expansive rugby. [The coach] has been involved in a strident battle with conservative rugby factions in South Africa who want the behemoth forwards and kicking five-eighths pattern retained. "I do not see how anybody who saw that match can still believe the Springboks must resort to their traditional game... The level of play was like nothing seen before and it was by two teams embracing the modern concept of keeping the ball in hand... It is clear to see that if we play with big immobile forwards and a kicking five-eighths, we would not be able to live with [the All Blacks or the Wallabies.]"

...More than 10,000 fans at McLean Park in Napier watched points flow freely in a star-studded benefit match for [a]former Hawkes Bay rugby representative... who has been diagnosed with... a form of motor neurone disease... [m]oney raised from the game and Saturday night's benefit dinner will be spent on research and production of natural supplements for people with... [the disease]. Hi[s] Invitation XV were pipped 61-60 by the Magpie Invitation XV[i]n a game where penalty kicks at goal were outlawed... [A] former All Black No 8... was penalised for attempting a drop goal in general play, but converted his own try... and proved [that, despite seeing out the last of his serious playing days in England, it] had lost none of his clever passing skills.

...A last-ditch attempt to save England's troubled Millennium Dome has emerged in the form of a £150 million... bid from its boss, P[Y]... says the *Mail on Sunday*. The bid has been offered to keep the Greenwich attraction open as an entertainment complex as the site prepares for its close...

If the British Government acts on its advice, the Millennium Dome will be bulldozed – an ignominious \$[NZ]8.43 billion failure... Before it goes down as one of the worst white elephants in history, London's Millennium Dome does deliver some lessons on the need for curatorial vigour. The dome was conceived to house a great national exhibition, made possible by a huge budget equivalent to about six Te Papas. The result is the essential Millennium Experience, shaped by the opinions and wishes of thousands of people across Britain. And therein may lie the problem. It was to follow in the tradition of the Great Exhibition of 1851 at Crystal Palace and the Festival of Britain in 1951. But compared to these historical blockbusters the 2000 show... proved lacklustre. Twelve million visitors were expected in the first year but... only seven million... turn[ed] up, many no doubt deterred by the £20 door charge. To reflect the optimism of the new millennium, the dome had to be huge. As the largest enclosed space on Earth it claims some imaginative statistics. For example, it could house 13 Albert Halls and 18,000 double-decker buses – which some critics might consider a better use for it. The dome is divided into 14 themed attractions, or zones, whose names hardly suggest compelling viewing: [e.g.] Work... Play and Talk. Body is allegedly a highlight, boasting a walk-through pair of human forms that are the world's largest. On this tour of self-inspection the visitor clammers through tunnels of red-tinted back-lit plastic, all pulsating and heaving to simulate bodily functions. It's anatomically unconvincing and pales in comparison with memories of low-tech ghost-train rides at old Easter Shows. Near the entry is the dome's stated aim, to be an exemplary visitor-friendly attraction. This philosophy extends to heavy doses of audience participation. What's your story? it asks, unleashing walls of post-it notes with personal messages for the new millennium. Well intentioned no doubt, but who has time to read it all? There are even 20 recommended and carefully marked photo points within the dome, just for the record... One of the many ironies is that if the public told the designers what they wanted in their essential Millennium Experience, they're not coming to see it. Another one is that dome-goers may be spending hard-earned money looking at exhibitions in Work, and using up valuable leisure time contemplating Play... In an attempt to be populist it has failed to be popular... In the middle of it all is the Millennium Show, theatre in the round, and a few other dimensions as well. Essentially, this is the story of the interaction between the Sky people and the Earth people. There is a love interest, between Skyboy (from the first lot) and Sophia (one of our own). It all takes place on a huge set, with plenty of pyrotechnics and pompous music, and giant constructions rising up from beneath the floor. The vast cast is colour-coded in what appear to be wearable art award entries, and engage in free-range aerial activities including abseiling and intergalactic maypole dancing. As the official programme puts it, the show ends with the Earth and Sky people looking forward with hope to an unknown future. One suspects their audience might be looking back and wondering what on Earth it was all about.

...*Little gerbil loves large white elephant...* It's Christmas at the Dome. The pantomime dames are showing their knickers on the ice rink, there's the smell of roasting chestnuts, reindeer are grazing under a giant Christmas tree and Father Christmas is embracing me as snow falls around us. His beard gets caught in my scarf. "PY, please put me down," I say, because this Father Christmas is actually a diminutive French[per]son called PY, the Gerbil. "I'm so happy," [PY] says. How can [PY] be happy? It has had the most miserable job in the world – the gnome on the top of the Dome. [PY]'s been in charge of a radioactive cowpat, robbers have tried to steal his jewels and politicians won't touch him. The Millennium Dome will not survive long into the New Year[– or, in other words, its official 1st birthday.] It shuts at 8 am N[Z] time on New Year's Day. After sucking in £1 billion... in taxpayer funds it is being sold for £100 million and will become a high-tech business centre. But... the Dome's chief executive, is still smiling. "I love Britain. Everyone here is so friendly," [PY] says with a fluent Bordeaux-Bronx accent. Now I'm feeling embarrassed. The British have been horrible to him – letting a foreigner take the blame for their calamitous carbuncle. But PY (pronounced Pee-Wee) is an optimist. As we walk, it is clear how much the staff have warmed to this 34-year-old, spiky-haired Fr[og], who arrived in February. A cleaner hugs him. A Domophile, who has come six times, kisses him; a[pensioner]... asks for his autograph. There are no queues. Staff, wearing reindeer horns, point out the highlights. "I didn't ask them to, it's their call, but they're fantastic and passionate about this place." [PY] hasn't taken a day off since [it] started... PY has no personal life. [PY] has given his all to the Dome since [it] took over... and the British have been an ungrateful lot. [PY] blames the politicians, not the public, for this. "I wish all the British could be proud of what they have paid for... But it became a political football. If people wanted to knock the Government, they kicked the Dome – it's been hit so hard it's deflated." Doesn't it make him angry that the Dome's builders have done a runner, leaving him to paper over the cracks? "No one told me there were so many financial problems. In nine months, we have turned this place around. Ninety per cent of people now say they have a great time... The... politician[s]... threw money at the Dome without any vision – it made people lazy. Now we have a small budget but we are thinking of ingenious ideas. If I could get in the time machine and go back five years, I would do everything so differently. I would have made it more historical, given it a story. The Dome should be educational and cultural. You need to leave asking questions." I'm beginning to feel nostalgic for the Dome. "All our publicity has been by word of mouth," PY says. "If only we had another year and some good will, we could make the Dome fantastic. I'll miss her. [The Dome]'s so beautiful on a sunny day."

...*Sun sets on monster blancmange...* When the end finally came, it was terribly British. Hundreds of staff who had been exoriated for 12 months, the butt of the biggest political joke of recent times, held hands and took a bow. And we all felt rather sorry. It was perhaps the most crowded the

centre of the Millennium Dome had ever been as they filed past. There were the aerial acrobats, the jugglers, actors, [people] on stilts and, of course, the ubiquitous... P-Y, the Dome's ebullient chief executive, w[ho i]s there to say goodbye and to thank all those people in the middle of this vast structure – a “monstrous blancmange,” in the words of the Prince of Wales. After a year of political disaster and public bewilderment, staff were to lose their jobs and, at last, the Dome was to close. The day had been a long one. The three breathtaking aerial performances seemed to take longer than usual. The queues seemed to move more slowly. Inevitably, a moribund feeling hung about the place and it rubbed off on the visitors. Too late, there was a groundswell of disappointment that the huge tent on the Greenwich Peninsula in London was to be lost and, again in typically British fashion, there followed a desire not to see the underdog put down... By 7 pm local time, the last visitors were out and the gates were locked. In adjoining buildings, thousands of youngsters were turning up to see in the new year with a rave. In the Dome itself, all was quiet save for a small crew dismantling the vast lighting system in the central auditorium. The set had been rented and now it was being taken back. The work began at 11 pm. By the time 2001 arrived, the Millennium Dome was already being dismantled and consigned to history.

...The sorry saga of the Millennium Dome approached its final chapter yesterday, when the British Government handed over the failed attraction for nothing to private developers. The dome was, in effect, given to an international consortium which plans to turn it into a 20,000-seat stadium for sports and concerts. Opposition MPs expressed dismay that the Government would not see any cash from the profit-sharing deal until the end of 2004 and that one of the most valuable real-estate sites in Britain had been handed over without immediately returning a penny to public coffers. The dome has drained £628 million... from National Lottery funds since it opened on New Year's Eve 2000. It will be handed to the Meridian Delta consortium on a 999-year lease. The consortium will make phased payments to the Government for the rest of the 76.4ha Greenwich site. Ministers have been anxious to offload the former attraction since two deals to sell it to private companies fell through. The dome started with a lavish opening party and went steadily downhill, failing to reach its visitor targets and needing to be bailed out repeatedly with millions of pounds of taxpayers' money. It has cost the taxpayers more than £20 million since it closed... The Government will also face a £20 million bill from Lattice, formerly part of British Gas, which used to own the site and has a claim to a proportion of its sale proceeds. P[Y, the Gerbil], the former chief executive of the dome's operators, the New Millennium Experience Company, who once wanted to buy the dome... was “amused” by the deal. “Nine months ago, we came up with exactly the same proposals but we were written off as a bunch of mad[-hatters]. I am not going to be bitter, I am happy that the dome has a future, but the past nine months have been a waste of time and public money.” ...The Meridian Delta consortium, which is backed by... the U[S] billionaire who owns the Los Angeles Lakers basketball team, will foot all the costs of regenerating the site and will assume all the risk if the project goes awry. The other members of the consortium are property company Quintain Estates and Lend Lease. But there are still doubts about whether the Government may have to bail out the dome to improve transport links and infrastructure.

...People stream[ed] across London's Millennium Bridge [yesterday] on its reopening after two years of engineering work to stop it from wobbling. The £18.2 million... bridge, [London's] first new central city crossing for more than a century, was... shut three days... [after it had] opened... because of excessive movement... [Incidentally,] Versace is to create the world's first refrigerated beach so hotel guests can walk comfortably across the sand on scorching days... A network of pipes beneath the sand containing a coolant will absorb heat from the surface.

...A Henderson mother is warning west coast [visitor]s to watch out for hidden oyster shells after her son's foot was cut to the bone. [The mother] says the accident happened when [it] took her two children to Cornwallis Beach for an after-school dip. One minute [her] [nine-year-old... was playing happily... the next [it] was in his mother's arms at the start of a quickfire dash to the doctor's... [The Woodlands Park doctor i]s used to treating people with similar injuries, mostly children younger than [the nine-year-old. The doctor] also regularly treats cuts caused by broken glass left at the beach. “...although probably not as many as one a week,”... [the doctor adds. The nine-year-old], a pupil at Freyburg Memorial School, is making a swift recovery, but missing out on soccer practice while his toe heals... “People don't have any idea what damage the shells can do,”... his mother... says. “If I'd have known, I wouldn't have let my children go out there with bare feet.”

...Beaches around the Titirangi coastline are fast becoming off limits to swimmers as sharp-shelled Pacific oysters rapidly carpet the foreshore. The oysters are becoming an acute problem throughout the Manukau Harbour and are regarded by some environmentalists as the marine equivalent of ginger... [The] president of the Manukau Harbour Protection Society, says the sharp shells make it difficult for swimmers at spots like French Bay, Titirangi Beach and Cornwallis. “It's a biosecurity thing. They're an introduced species... The theory is they were introduced about 20 years ago by falling off the bottom of a barge,”... says... Waitakere City's representative on the Auckland Regional Council. Pacific oysters generally grow in thick clusters and quickly dominate open areas away from the rocks... Native rock oysters and mussels are not pests and recent regeneration is seen as a good indicator of improving water quality. But [the Manukau Harbour Protection Society] remains stumped over how to tackle the Pacific oyster problem... [T]he society has held volunteer events to clean up dead oyster shells, but with little success. A modified rock crusher was also trialled but failed.

...a group of 30 [people] rid... French Bay... of dead oyster shells this month in a clean-up organised as part of Auckland Regional Council's coastal enhancement oyster project. [The ARC's e]nvironmental management committee chair[perso]n says... “The inter-tidal zone is an area the public can clean up. But the channel area requires dredging by commercial boats.” ...if channel dredging is needed... that could... cost... \$100,000...

The prospect of pay-and-display parking machines cemented into the shores of isolated beaches has stirred up communities in one of the North Island's most picturesque holiday spots. The Thames-Coromandel District Council's 10-year plan included a move to charge... \$6 a launch or \$65 a year for parking near ramps and formed accesses... which w[ere] built and maintained by locals... unanimous in their opposition to the... fees.

...Opponents of a holiday resort proposal at one of the last undeveloped beaches on Auckland's east coast are claiming a major victory in a five-year battle that may yet end in court. Rodney District Council has accepted the recommendation of independent commissioners not to allow the 180-home and park project at remote Te Arai Beach, south of Mangawhai... The report also said the Pakiri-Te Arai coastline was unique... and was highly valued as a special place with undeveloped character... [In related news, t]he last thing... [a couple] expected on their wedding day was to be verbally abused while they were getting married. The couple had decided to make a life-long commitment on Pakiri Beach... because it was one of their favourite spots. [The groom] phoned the Rodney District Council to check whether they'd need permission to use the beach and was told [they] didn't need a permit to hold the ceremony on the sand because it was a public place... However, on the wedding day [the couple]... were stunned when a local Maori [gal] began yelling at [the bride] and her bridal party as they walked down an access way to the beach. The [Maori] told the bride [it] was trespassing on private property – the access way – and began asking for... \$1000. Her father... initially offered to pay the money. An ex-councillor, [the father] knew the type of form that the [Maori] was legally required to have. But... the [Maori] failed to produce the form...

The public has no right to stroll along... a third of N[Z]'s beaches, and large chunks of the foreshore are already held in private ownership. This is revealed in two reports prepared for the Government... [T]here is no such thing as an uninterrupted Queen's Chain... ringing N[Z] waterways... The Government is grappling with a Court of Appeal finding that iwi may be able to claim customary title to the foreshore and seabed.

...*Foreshore belongs to all*... Government plans to declare the foreshore and seabed off limits to private ownership sparked talk of a revolt among some Maori MPs yesterday... The long-awaited announcement... was billed as a “win-win” solution, but was soon widely condemned.

...[49%] of Maori support the Government's plans to hold the foreshore and seabed in the public domain. But a *Marae-DigiPoll*... found that most Maori are unhappy with the Government's handling of the issue and confused about what it proposes... ■ [Two fishers]... used their dead friend's life-jacket to survive the sinking of a fishing boat off Oamaru yesterday. They clung together to stay afloat... for three hours until rescuers found them.

...Divers inspecting the wreck of the second-deadliest maritime disaster in history found the disintegrating vessel all but buried in sand off the Gambian coast, and urged authorities not to try to recover the human remains. "For technical reasons... but also out of respect for the victims and their families, I think that it would be best to consider the wreck of the MS Joola as a sanctuary," said [the]dive-team leader... More than 1800 people died... when the Joola rolled in a storm – loaded with three times the passengers for which it had been designed. A Government-commissioned inquiry weeks later... faulted a search effort that took hours to get started... [In local news, g]aps and inconsistencies marked the delayed search and rescue operation after a pleasure boat sank off the North Otago coast and three [fishers] died, says an independent review... Those who survived have criticised delays in getting to the capsized boat as a factor in the... deaths. [But the s]earch and rescue co-ordinator... maintained [it] made the right decisions with the information... available... [A]nother distress beacon had been active at the same time... at Wanaka. Both beacons were pinpointed at 10.50am. "...using a cellphone from his home... [t]he (co-ordinator) first tasked a helicopter to locate the Wanaka signal and then at 11.19am arranged for a helicopter based at Taieri Airport, Mosgiel, to search for the beacon off Oamaru," the report said. "However, unknown to the (co-ordinator) there was a delay in assembling its full crew and the helicopter did not leave Taieri airport until around 12.10pm." The survivors and... [t]he body of Richard Wallis... were found about 12.30pm. The two other missing [fishers]... Keith Allan Wallis, 62, of Mosgiel, and Tainui Pompey Kani, 42, of Timaru... were not found... The review found a "significant factor" in the Oamaru incident was that the co-ordinator was over-worked and there was a lack of communication between him and others involved... [The co-ordinator] did not contact police, as [it] was meant to do[, and Oamaru fishers – 'who could have had their boats there in minutes – say they weren't called'].

...Rescue fee call Police should start charging climbers for unwarranted search and rescues in Mt Cook National Park, says the Alpine Club president... [The president] supported the Twizel police's recent refusal of several requests for rescues because they deemed them unjustified.

...Adventure insurance might save taxpayer money but is hugely problematic, say Marlborough trampers and mountaineers involved in search and rescue. United Future's M[P]... has called for mandatory insurance for those people tackling the outdoors, saying [last year's] \$885,000 bill for search and rescue missions... was just too much... [In international news, a] police officer searching for two robbery suspects on [Miami B]each drove over two French sisters yesterday... [The] officer... was driving a marked Ford Explorer along the crowded shores – following information that the robbery suspects were on the beach – and apparently did not see the sunbathers... The officer was not using a siren, and witnesses said the [sisters] did not see the truck coming. [The driver], an officer for seven years, was placed on administrative leave. [The c]ity manager... said speed did not appear to be a factor... "What still isn't clear is how [the officer] ended up running over the two victims,"... However, several witnesses said the officer's actions were reckless... "The cop was just running around like a crazy [person]," said one. The sisters... were taken to Jackson Memorial hospital, where 27-year-old Stephanie [Tunc died. Her sister, aged] 26, was in a critical condition. The sisters, who lived in Britain, were on holiday.

...As stories of jet-skis running over sunbathers and colliding with boats hit the headlines each summer, promoters of the burgeoning water sport utter a collective groan. For them jet-skis, properly known as personal watercraft, constitute a healthy family pastime or an exciting competitive sport run sensibly by established clubs. They recount stories of jet-skiers rescuing swimmers in the surf and the machines being used to patrol sporting events. With national sales... [of] 1000 machines annually over the past five years, the sport is enjoying remarkable growth... The stable, sit-down jet-skis are cheaper than many boats, easy to maintain, can be stored in a corner of the garage, and can tow children on knee-boards or serve as versatile inshore runabouts. But, they say, all that is overshadowed by the antics of a handful of hoons roaring round rivers and harbours with complete disregard for others' safety... Already jet-skis have killed... [However, the] managing director of Kawasaki N[Z] says the sport is comparatively new and will settle down. "If you go back to the 60s they were talking about licensing surfers. They were the scourge of swimmers... and their fins were going to slice people in half. Then it was ski-boats and now it is personal watercraft,"... [The main difference is that] faster and more manoeuvrable [jet-ski]s are now on the market, with some models boasting 130hp motors capable of reaching 100km/h. Those with the will and cashflow can soup up their machines for even greater speed and noise. But... [jet-ski r]iders are bound by the same rules as other boaties. They must reduce speed to 5 knots within 200m of the shore and 30m of swimmers or other craft... Riders must also be 15 years or older. A key problem for... authorities in bringing reckless riders under control is the fact that neither the machines nor the riders are identifiable. Even more problematic is that riders are under no legal obligation to supply their names or details, which makes prosecution next to impossible... [Yet] a couple of prosecutions had succeeded under section 65 of the Maritime Transport Act, which forbids the use of any craft in a dangerous manner. Penalties ran to 12 months imprisonment or a \$10,000 fine and one judge had ordered the sale of a jet-ski, "so they stand to lose a lot," said... Auckland Maritime Police... However, that was a little heavy-handed for minor offences which would best be managed by... instant fines – a provision expected under a revised Harbours Act due to be passed this year.

...A safety argument is brewing over a proposed jet-ski zone off Kauri Pt near Birkenhead intended to lure riders from popular beaches. The trial zone, which encompasses Fitzpatrick and Onetaunga bays, is one of two the A[RC] is considering... But the Birkenhead-Northcote Community Board says locals do not want the noisy machines chopping up the waters off bush-clad Kauri Pt. The board chair[per]son... feared for local birdlife and the safety of swimmers, kayakers and boaties, particularly around the popular fishing spot within the proposed zone... [However, the ARC's chairperson] said... "...it's all very well to say we don't want any jet skiers in our backyard when at the moment there's nothing we can do if they're there anyway. So isn't it better to have areas that are monitored and policed?" ...The Auckland Jetsport Association[']s president... understood residents' concerns but believed the zone and other controls were essential... [I]t had been a "summer from hell" because of a spate of accidents nationally, and responsible jet-ski owners were angry that reckless riders were giving the sport a bad name.

...Jetskiers are flouting a new bylaw, with just over 10[%] bothering to sign up for compulsory registration. Only 400 of the estimated 3500 jetskis in the region have been registered for the A[RC] scheme... The N[Z] Jetsport Boating Association says some of its members are refusing to register because they are already members of the regional club and the national body. On top of a national body annual registration fee of \$50, plus Auckland Jetsport Association annual fee of \$55, members are now expected to pay the ARC another annual fee of \$47.50... [(from) an annual registration fee of \$35, plus \$12.50 for a pair of identification stickers)]... The bylaw was brought in to monitor personal watercraft activities after public complaints about dangerous behaviour. [The]ARC harbourmaster... says the council will not come down hard on those not registered – yet.

...Jetskis, the cause of friction at many N[Z] beaches and waterways, have been cited as a terror to swimmers and a major nuisance in N[SW]. Water police have reported a 30[%] increase in jetski incidents to 120 last year, and some Sydney councils receive up to 10 complaints a day. There have already been two serious incidents this year. In one, a passenger received internal injuries when a jetski hit a wharf, and a rider tore open his leg when his machine became airborne. Now the Sydney Coastal Councils Group has called on the state Government to ban jetskis from Sydney Harbour and to crack down on riders elsewhere... [In local news, t]he worldwide credit card company American Express paid... just \$200,000 towards... an exclusive... \$2.8 million yacht club... in the Viaduct Basin and... nothing for... the America's Cup village... naming rights valued at \$2.2 million. The deal goes some way to explain the huge cost overrun of up to \$8 million at the Cup village from missed sponsorship opportunities and several projects that include: • Spending \$700,000 on a 1980s-style nightclub at the Viaduct Basin after a plan for a local franchise of the Hard Rock Cafe fell through. • Leases on the old City Markets and the Winstone Building with a combined net loss of more than \$1 million. • Investing \$2 million in the yacht club that sits empty in the Viaduct Basin waiting for a buyer. But it is the American Express sponsorship deal that caused the biggest ruction inside the company funded by \$85 million of Aucklanders' money, and led to the resignation of the village boss. In an exclusive interview with the *Herald*... the former chief executive of America's Cup Village Ltd, said [it] resigned 13 months ago because the American Express deal put together by the village's chair[per]son... was "commercial suicide." "The deal did not give the village company anything. In fact, it

cost the company over \$5 million and yet at one stage we had a definite commitment that they would pay for the naming rights and the yacht club would not be subject to the risk the company finally took on.” [But the chairperson], a former oil company boss who was also chair[person] of the financially disastrous 1994 Whitbread race stopover, said it was not true that American Express paid next to nothing... “...It’s all a question of how the deal was structured. There was a confidential deal between the village and American Express [and if the village’s former chief executive] is discussing it, [the former chief executive] is acting completely improperly... is being unethical and... is breaching a commercial confidence.” ...It is understood that American Express started to unpick the original deal early last year after an expensive worldwide marketing drive selling memberships to the yacht club for up to \$1995 bombed... American Express, facing a costly exposure, insisted on a new deal on its terms or it would walk away. [The former chief executive] and Strategic Media, the company which stood to gain about \$600,000 in commission for putting the original deal together, were incensed and recommended suing American Express to complete the deal... Shortly after... [his predecessor] resigned in protest... the new chief executive... and [the chairperson], said to be worried about the sponsorship repercussions and the bad publicity that would ensue, signed the new deal with the backing of the ACVL board... [American Express] would not divulge how much the company paid in sponsorship to ACVL.

...America’s Cup Village, run by some of N[Z]’s top business[people], lost more than twice the amount previously disclosed. Papers released under the Official Information Act show that instead of the \$23.5 million loss declared last week by A[CVL], the real loss could be nearer \$57 million. Amongst previously unknown spending was: ● \$2 million on public relations... \$8.6 million on administration... \$72 million to build the yachting syndicate and marina facilities... [plus i]ncome from superyachts falling about \$2 million short of projections. A written denial by... a top city lawyer... [on the] ACVL board... that “no public money went into setting up the Music Factory” was also contradicted in the papers, with several references to spending on the 1980s-style nightclub.

...A yacht club built on a barge for the America’s Cup regatta in Auckland may end up as a floating museum... fill[ed]... will... memorabilia... of the event, towed to ports around the country. The designer of the American Express Yacht Club... said yesterday th[e]... 20m by 36m barge platform had 375,000 litres of water ballast to keep it on an even keel... [By the way, u]p to 60 billionaires with their assorted families and powerful friends celebrated the new millennium on Auckland’s Hauraki Gulf... in super yachts that cost \$20[million] to \$200 million. It was not just the America’s Cup that brought them here. Several came especially because they heard about... the NZ Millennium Cup Super Yacht regatta... [-] a yacht race... to Kawau Island and back... where the only rule was that the size of the yacht had to be more than 65ft.

...Despite the billionaire bickering of the America’s Cup, yachting is not exclusively a rich [perso]n’s sport... That is the message from the new chief executive officer of Yachting N[Z]... who takes up the job this week in Auckland. “The America’s Cup may have reinforced the perception that yachting is a rich person’s sport... But those people make up a tiny percentage of the s[ailing community]. Anyone who has anything to do with [local] yacht clubs would know that most people involved are typical ordinary N[Z]ers. You don’t have to own a yacht to go sailing. There are plenty of chances to sail on other people’s boats for the price of \$10 a week in the crew kitty. And parents will find that they can give their children a taste of sailing through clubs which rent out boats.” This way, if a child loses interest in yachting... [it] can move on without additional cost to the family... [The new chief executive officer] believes the spinoff from the America’s Cup regatta in Auckland has been positive throughout the country. “The profile it has given yachting in this country has been enormous. There is now a large proportion of the country talking about gybing and tacking and understanding what they mean. [But t]he Cup is not the only reason... N[Z] despite its size has, I think, the ninth largest coastline of any country and yachting with its emphasis on water safety and respect for the environment provides the ideal sport for our young people.” ...Yachting N[Z] is the national body for competitive and recreational yachting and boating. Among its core activities it: ● Administers the international rules of yacht racing. ● Sets standards and administers accreditation of coaches and race management officials. ● Receives and administers funds from the Hillary Commission and Sports Foundation. ● Acts as a lobby group to central and local government bodies. ● Acts as sole entry agency for N[Z] yachting teams in the Olympic[s and]... other international events. ● Establishes and maintains safety standards and maintains the register of boats.

...Sir Peter Blake has been made a special envoy to the U[N] Environment Programme – and... is wasting no time in living up to the role. The first N[Z]er to be made a special envoy, [Sir Peter] was appointed yesterday by the programme’s chief... at a Royal N[Z] Yacht Squadron lunch hosted by [NZ’s P]M... Sir Peter spoke up for a clean world and for its life in the oceans – and against threats including pollution, overfishing, deforestation and global warming... ([Sir Peter’s Antarctic expedition last summer showed a lack of sea ice and collapsing ice shelves – consequences of global warming])... As special envoy [Sir Peter] will do more of the same – raising awareness far and wide of environmental problems... Sir Peter, former head of Team N[Z] and now the head of the ocean-exploring organisation blakexpeditions, is about to take his schooner, Seamaster, to the Amazon and Orinoco rivers. Seamaster, which was designed for polar sea exploration in temperatures of minus 40 degrees, will be kitted out for 40-degree heat with mosquito nets, extra ventilation and awnings. News of the expedition’s progress will be broadcast on www.blakexpeditions.com...

Brave to the end, Sir Peter Blake rushed upstairs with a rifle to confront the armed invaders on his boat, Seamaster. In the next few calamitous moments [Sir Peter] fired a shot, wounding one of the “ratos de agua” (water rats) in the hand and shattering one of their weapons. Rather than disarm the pirates, it angered them. They returned fire, striking Sir Peter twice in the back with a .765 rifle. A life of adventure, conquering oceans and yachting’s greatest competition, the America’s Cup, ended on the deck of a boat in Brazil at the mouth of the Amazon River, the scene of his latest environmental odyssey. At age 53, [Sir Peter] was dead, drawing tears from [the NZ P]M... who had visited him three weeks ago. It was an end Sir Peter had dreaded: [Sir Peter] had been so anxious about pirates that [the sailor] spent part of his honeymoon on the firing range, readying himself. Late last night, police in the river town of Macapa arrested seven suspects and said they were looking for an eighth reported to have piloted the bandits to the Blake vessel. After the raid, the [bandits] sped up the river in their own craft and an inflatable stolen from the Seamaster. They stole watches and cameras from the crew, but suggestions seeped out yesterday that the motive for the attack may have been more sinister than robbery. Local reports said the gang were professional, and hinted that they may have been anti-environmentalists. Brazil has a history of environmentalists being assassinated... In 1988, world renowned campaigner Chico Mendes was shot by forces who opposed his efforts to protect the Amazon... From her home in England, Lady... Blake drove to Bristol to pick up [the couple’s] daughter... 18, from university, then carried on to Dorset to break the news to [the couple’s son], 14. “This is completely devastating and unbelievable,” Lady Blake told England’s *Daily Telegraph*. “My one comfort is that [Peter] died doing something [it] loved and... died protecting other people.” ...an Auckland weather forecaster who was on board the Seamaster two weeks ago, said the crew were aware of the risks of pirates. “We ran a 24-hour watch system with at least two people on deck at all times.” Sir Peter himself sounded a warning about pirates to a friend in Rio in September. [The friend], an events manager for sponsor Omega, said yesterday that Sir Peter told him [the Seamaster] carried guns on board. “[Peter] said, ‘No one will get this boat off me.’”

...For someone trying to sweet-talk billions of dollars out of the Government for new roads, [Auckland’s] Mayor... has a strange way of cuddling up. Here’s the Government getting a roasting from a battle-worn public for giving another \$5.6 million to... Team N[Z]... when up leaps the mayor with a claim that [it] and the Government have secret plans to spend another \$20 million on a memorial to former Team N[Z] leader Sir Peter Blake. “A huge significant memorial that I think will blow your socks off,” is how [the mayor] described it... The... [mayor] can thank his lucky stars [it] was nowhere near... the Beehive on Friday when his bombshell went off. If any of the ministers involved in this project had been within reach

at the time, [the mayor would] have lost a lot more than his socks. Not only was it bad timing given the present public disenchantment with anything to do with Team N[Z]. It was also bad in the sense that [the P]M... wants to be sharing the limelight when any announcement is made. That is likely some time next month after a Cabinet paper is prepared and accepted... A statue had been [the mayor's] first instinct... soon after Sir Peter's murder. "I am committed to... an epic statue." One, [it] generously offered, that ratepayers would fund... [The widow] was later to reject that idea, not liking... the idea of birds "shitting on his head"... In the aftermath of... Peter's death, [the]... Sports Minister... had proposed a Government-backed foundation to keep alive the message of blakexpeditions, which was to use the vessel Seamaster "to help protect life in and around the waters of the world"... The concept now is, according to one participant, "a living monument" where "we can all learn to sail". And more besides. Whatever that means we will just have to wait to find out. As a result of [the mayor's] premature leaking on Friday, and the ensuing flurry, usually reliable sources have suddenly dried up.

...The Sir Edmund Hillary Outdoor Pursuits Centre is being prosecuted over the deaths of six school pupils and a teacher on the Mangetepopo River. [The] students and teacher... from Elim Christian College in Howick were canyoning on the river near Turangi with [an] instructor... when they were swept to their deaths on April 15. Questions were raised at the time about why the centre did not heed heavy rain warnings that morning. The Department of Labour yesterday laid four charges against the... centre under the Health and Safety in Employment Act. They include failing to take all practicable steps to ensure the safety of its employee, [the instructor], and the safety of others in the work place... "Seven people lost their lives that day and several others were put in serious danger. So it is important that someone is required to answer what the department says were failures to better ensure the safety of the group. Our hope is that this prosecution may help prevent others from suffering a similar loss." Elim[s] principal... said the department's investigation... found the school had met its obligations under the act and would not be charged... [T]he school still supported the centre and the work it did. It[s] chairperson... said the centre was reviewing the tragedy and "welcomed any expert scrutiny and suggestions for improvement..." The gorge where the accident happened had not been used since the tragedy and would continue to be off limits... The charges were laid in the Wellington District Court, but will be filed in the Taumarunui District Court – the closest to the outdoor pursuits centre's head office and the scene of the incident. The first hearing is likely to be in four to six weeks. If the centre is found guilty of the charges, it can be fined up to \$250,000 for each offence. It can also be ordered to pay reparations to victims' families.

...[hi]s family were the Queen's guests a[s]... Sir Edmund Hillary was commemorated in royal splendour late last night... [T]he Queen paid her respects to the great mountaineer at a rare memorial service at Windsor Castle near London. Dressed in a black coat and hat, the Queen, accompanied by [her daughter], took her place in the 500-year-old St George's Chapel for the service of thanksgiving, which also marked the laying up of his Knight of the Garter banner on the altar... Other notables present included the Countess of Wessex, [the]Commonwealth Secretary-General... [a] former All Black captain... [a former NZ PM and] her husband... a... former British Foreign Secretary... and Sir Winston Churchill's daughter. [The Queen's husband] was to have attended but had a heavy cold... The service included addresses by [Sir Ed's son and the current NZ PM, who]... described Sir Ed as "our most loved, most famous and most international citizen. [Sir Ed] stood tall among us like no other. His outstanding achievements as an adventurer and explorer on their own secured his place in N[Z] and world history. But the very high esteem in which we held Sir Ed... was also based on his humanitarianism and his values... [Sir Ed] set high bench-marks of citizenship for others, [and] made a big difference to many. We N[Z]ers saw Sir Ed... as one of us – from his craggy looks to his love of the outdoors, his sense of adventure, and his concern for others. Sir Ed... was our hero – we admired and respected him, we saw in him the values we would want our citizens to uphold." After the service, Lady [Hillary] and... the family had a private audience with the Queen. Later, [the]... Dean of Windsor and Register of the Order of the Garter... was to return Sir Ed's banner[– which it had]... received... from the Military Knights of Windsor, resplendent in their scarlet tunics... [–] to his family. [● A memorial service will be held in the Ukrainian city of Lviv today to honour victims of *the world's deadliest air show accident*.]

...The fighter jets spun and swooped through the... sky, thrilling families on a day out at a Ukrainian air show. [A boy, aged] 4, was watching the jets soar at the Sknyliv airfield... with his parents. But then a plane fell out of the sky and a giant fireball seemed to blot out his world. "Mummy, Daddy?" [the boy murmured as it] stumbled around on the tarmac, scared and suddenly alone, separated from his parents in the panic. His trousers were drenched with blood. The low-flying, Russian-made Sukhoi Su-27... had smashed into the ground near spectators, killing 83... and injuring 116 in the world's deadliest air show accident. [70] of the injured were in a serious condition. Many people received burns, fractures and head injuries. Screaming people ran through the thick smoke, many injured by bits of metal flung far and wide. The twin-seater, twin-engined plane was performing an aerobatic manoeuvre involving a low pass when its wing appeared to suddenly clip a tree and slice through a plane on the ground. It then bounced up, allowing its two pilots to eject to safety at the last minute as, consumed by flames, it sheared through a stunned crowd... Video of the crash showed... the plane... sliding backwards along the ground on its left wingtip and nose before it began cartwheeling and then exploded. The Defence Ministry... said engine failure was the preliminary reason for the crash. [The]Ukrainian President... broke off his holiday in Crimea to fly to the crash site, describing the incident as a "terrible tragedy, a real nightmare". During an on-the-spot briefing, [the president] fired both the... Air Force chief... and... [the] commander of the 14th Air Force division which took part in the air show... The Government has launched an investigation. About 1500 people were watching the air show. Last night... the... [president] said the country would consider a ban on air shows. A former pilot... said the show's organisers failed to provide a clear space that would have enabled the pilots to manoeuvre the plane away from the crowd. The previous most deadly air show crash was in Germany in 1988, when Italian jets collided and spiralled into the crowd, killing 70.

...*Disaster strikes fairground ride*... Screaming fair-goers were hurled to the ground when a... funpark ride collapsed, injuring 37 people. Four of the victims suffered severe head injuries. [One fair-goer] was queuing at the Royal Adelaide Show with his 22-year-old son... for a turn on the Spin Dragon on Saturday evening when the ride went haywire. "We were all standing behind a makeshift barrier at the front and, as the thing fell apart, we had nowhere to run. As it came down, I heard this incredible grinding sound and then it just rolled off its mounting..." ...[the] Workplace Services Minister... said it was very lucky more people were not injured. The ride collapsed on top of the waiting area, where about 30 or 40 people would have been standing had it not been raining... [I]nvestigations had begun looking for the cause of the accident... "It is of concern that these events can happen... [– recall that an] American... standing near an amusement park ride... in New Orleans... was [recently]killed after being hit by at least one of the ride's cars... [–] but this device had a current certificate of registration and all its papers are in order." [A]Royal Adelaide Show spokes[person]... told the A[US]n Broadcasting Corporation that... "Each ride operator takes responsibility for their own safety precautions... and this ride was approved for use in S[A, NSW and] Victoria... and has recently come down to Adelaide from the Queensland Brisbane Show."

...Steel Dragon 2000 – the world's tallest, fastest, deepest and longest roller coaster – is to start running tomorrow at the Nagashima Spa land amusement park... The train carries 36 riders over a series of peaks and valleys, through tunnels and around curves, reaching a maximum speed of 153 km/h. The train starts its 2479m course by scaling a 97m hill and then plunging 93m down a 68-degree slope... The trip lasts about 3 1/2 minutes. The ride cost 5.5 billion yen...

Two people were injured at an amusement park in central Japan when the world's tallest and longest roller coaster screeched to a halt after dropping... wheels. The Steel Dragon... lost several wheels from the right side of the front coach at the Nagashima Superland park outside Nagoya.

...[In a contest for punters' dollars that has been labelled the 'US roller coaster war, 500 roller coasters across the US are vying for the title of highest and fastest – but some neurologists warn such rides may be causing brain clots, etc., although the manufacturers say the latest designs reduce G-forces.']

...The Stratosphere resort in Las Vegas plans to build a freefall-style ride that will reach speeds of 193kmh – making it the world's fastest ride.

...*Santa's ride too risky*... Santa Claus won't be travelling through Huntly on a float this year because parade organisers are worried they will be liable if something goes wrong. The [guy] in red will instead trade his... float for a seat inside a grotto on the main road, and other parade floats will be replaced with festival stalls. Huntly is one of several small towns to alter the way they run public events after the prosecution of [a] Christchurch event manager... who was fined \$10,000 over the death of a cyclist in a race [it] organised... In Morrinsville organisers have turned their annual float parade into a "walking" parade. The risk of public liability does not seem to be of so much concern in bigger towns. In Auckland, where 250,000 people cram Queen St for Santa's parade, organisers have reviewed safety procedures but say everything will continue as normal...

■ [To the relief of volunteer event organisers nationwide, the Christchurch event manager has 'had her conviction overturned on appeal.']

...Habitat for Humanity, the non-profit group that builds low-cost housing, is opening an unorthodox "theme park" at its world headquarters this week designed to give tourists a look at the world's worst slums... [The] founder of the organisation... expected the Global Village & Discovery Centre in Americus, Georgia, to attract as many as 70,000 tourists in its first year of operation. "Essentially, it's a theme park for poverty housing. You'll come out of the centre and walk right into a slum. You'll see the kind of pitiful living conditions so many people in the world have." After touring mock slums from Africa, Asia and Central America, visitors... will see examples of the modest homes Habitat builds in those regions. "You see what a steep improvement acceptable housing makes in someone's life. We think we'll recruit a lot of volunteers this way," [the founder] said.

...Never one to do things by halves, [the US *Queen of Talk* (who)]... was meant to be named Orpah after a biblical character in the Book of Ruth – but her name was misspelled on her birth certificate[)]... seems set to adopt an entire orphanage. The hard-working star wants kids but isn't sure [it wants a husband or] wants to make enough time to be a mum, so [it]'s donated millions to an orphanage in Chicago to give the kids an education... The... [television] talk-show queen... [– who lives] in fear of the words, 'Lose weight or die'... [–] visits regularly and is taking all the children to Disney World...

[Since Disneyland first opened it has been an unparalleled success, but the] original magic kingdom... is not resting on its middle-aged laurels... After [nearly half a century] in the business, the original Disneyland is updating some worn-out fantasies... [such as] Tomorrowland... Frontierland [the Wild West]... and Autopia... while construction is well under way next door on the \$1.4 billion Disney California Adventure park. That will open next year and is a celebration of California itself, with not a mouse ear or cantankerous duck in sight... [The new Autopia, which] will open as part of the big birthday bash... [is] a look at the world through the eyes of a car – make that headlights. Bringing Autopia up to speed... – ...[the] original ride... marvelled at the then novel sensation of driving on the motorway... [–] is part of keeping the park one step ahead of increasing expectations... says... [the person who is] three years into overseeing the upgrade[s. But the overseer]... does not have a blank canvas to work with. Disneyland, including its sprawling carparks, is locked into about 34ha. "It's a tight area and like a game of chess, to move the pieces around you have to take a piece off the board." ...[even so, three] days is probably needed to take in all of Disneyland... One, two and three-day passes for the park are available, costing between \$82 and \$198 for adults and \$62 to \$150 for children... Prices around the park are not especially cheap, with soft drinks running at \$5 and fruit \$2.50, but the restaurants... provide good fare... Queuing is unavoidable in Disneyland and you can guarantee a wait of at least 10 to 15 minutes for every ride, going up to two hours at times for Indiana Jones, the best attraction by far. But with the recently introduced Fastpass, included in the ticket price and allocating a time slot, the wait should be reduced to between five and 10 minutes... Away from the rides and... queues, adults can get the best feel for Disneyland on the Walks in the Park tour, held daily at 10.45 am. It is \$28 on top of your admission but little gems do pop out, including learning that the light is left permanently on in Walt Disney's old apartment to show [the creator] is still around, and that the buildings were made progressively shorter and narrower down Main Street to make the rest of the park seem further away and increase expectations... [Disneyland is] where dreams – even those which involve eating... peanutbutter-and-jelly pizzas for breakfast while Goofy does the macarena – come true... Even old Walt eventually got what... [it wanted. Peeved about failing to gro]w taller than 180cm in life, his posthumous statue with Mickey Mouse now measures him at 186cm. That is one of the easier targets for adult cynicism in a world where... [t]hey... pump out smells from the popcorn stands and chocolate shop... The sense of magic is heightened at night when wandering around Fantasyland, Frontierland, Tomorrowland, Adventureland, and New Orleans Square can be as much fun as the rides themselves.

...*California dreaming*... [M]y official guide around the new Disney theme park in California, has a problem. [My guide] wants to help. [It] really does. S[o my guide tells me it] is there to answer my questions and encourages me to ask anything that is on my mind. But clearly I am breaking some unspoken rule of theme park etiquette, because every time I do ask something her eyes glaze over, her mouth quivers in a nervous smile, and [my guide] does her best to pretend I have not asked a question at all. We are touring Disney's California Adventure, a concept that takes the theme park idea to new levels of chutzpah since the fantasy world it purports to recreate – the state of California – is actually all around. It doesn't seem unreasonable to ask questions about the dizzying \$US1.4 billion... cost of the enterprise, the relatively cramped space (22.26ha of what used to be the Disneyland car park), the company's hope that tourists will now treat Disneyland like a resort destination rather than a day trip, the fears of overcrowding, and so on. But at every turn, [my guide]'s body language suggests that I have merely indulged in idle chatter that merits no response... Finally, a query penetrates the thick skin of robotic corporate programming. Are the people dressed up as Goofy or Buzz Lightyear members of an actors' union, I wonder – not because I really want to know but because I am desperate to keep the conversation going – or do they fall under some other category of employment? "We refer to our characters as characters," [my guide] replies firmly. "We don't see them as people." Preview day at a Disney attraction is an exercise in cultural dislocation that most visitors have no opportunity to savour. The constant surveillance, presented as a form of benevolent hospitality, resembles nothing so much as an official trip to Libya, complete with the vague promise of an encounter with a member of the supreme leadership that may or may not materialise. But this exercise in corporate control, and the extraordinary fear and paranoia that it betokens, is actually not a bad introduction to the park itself – which, being Disney, is a triumph of corporate image-making over any serious engagement with reality. The California of the California Adventure is a series of finely honed clichés, carefully emptied of dirt or sleaze and dressed up in the same pastiche architectural style that Uncle Walt first perfected at the original Disneyland more than 40 years ago. Perhaps nothing epitomises the place better than its centrepiece attraction, a dizzying Imax tour of the Golden State called *Soarin' Over California*... It is not only a sanitised version of California, it is also overwhelmingly a white [perso]n's view. The Native Americans and original Spanish settlers are relegated to a mural. The huge Asian and Mexican populations of the state are reduced to floats in a daily parade. And blacks are nowhere to be seen. It is hard not to have mischievous thoughts about what a truly honest Californian theme park would look like: power cuts on the rollercoaster, in acknowledgement of the state's huge ongoing electricity crisis (it could still happen), or a bumper-car ride simulating gridlock on the San Diego freeway, or an invitation to guests to dress up in Los Angeles police uniforms and whack an image of [a black motorist]. But a theme park by definition is not about reality. It is about a mediated reality in which signature features are copied and the rest simply discarded. Ironically, the real California has become so infected with the Disney architectural ethic that the California Adventure park ends up holding a mirror to something not unlike itself. The park's Mondavi winery, for example, is a copy of the real Mondavi winery, whose California ranch style is itself based on hacienda architecture and elements of Mediterranean style. In other words, Disney's California is a replica of a replica. Why, one might ask, would someone pay \$US43 to visit a simulated, antiseptic version of Venice Beach, when the real Venice Beach is free of charge and barely an hour's drive away? The answer, sadly, seems to be because it is convenient and predictable. That's why more and more Americans are going to Las Vegas to see the Paris... and... Venetian... hotels (which, at heart, are just Disney resorts with slot machines); it saves the bother of schlepping to Europe... and alleviates all worry about foreign languages, crime, garlicky food or dodgy toilets... Have a nice day.

...Behind that radiant smile, Mickey Mouse must be a depressed little rodent. This year was supposed to be an *annus mirabilis*, but instead it has been an *annus horribilis*. Disney crafted the script for [this year] to be the year the Magic Kingdom would sparkle. The tenth anniversary of Disneyland Park in Paris coincided with the opening of Walt Disney Studios next door. The vast complex on Paris' eastern rim was meant to hum. After the first few bumpy years followed by a drop in profits by almost 50[%] in 1999, Disney bosses hoped to draw 16 million visitors annually to the new park to see first hand the tricks of cinema productions, including stunts. The construction cost of ...\$[NZ]350 million... would soon be recouped. "Ten years ago there was nothing here, and in January... we welcomed our 100 millionth visitor," [the]Disney resort chair[perso]n... enthused. "It means we really have become a tourist destination at the European level." But what a dreadful time Mickey, Minnie, Donald and Pluto have had. Attendance at Disneyland Park fell 4[%] last year to just 12 million. And in its first summer, ticket sales to Walt Disney Studios failed to meet expectations. A separate entry fee is payable for the Studios, and at ...\$75.40... an adult for nine attractions, it barely compares with the same entry price for the Park and its 43 attractions. Among the gripes are not enough attractions for the price, too many mechanical breakdowns and an overall feeling it was not as magic as Disneyland. In July, customer satisfaction was around 49[%]. Disneyland Park started this year under renewed pressure from other theme parks mushrooming around France such as Park Asterix, Mer de Sable and the Grand Parc du Puy du Fou – whose main attraction is gladiator fights. The newer parks offer discounts and at peak season an adult can pay just ...\$48.17... entry. As if that wasn't enough to get Grumpy upset, the happy Disney image has been marred by a series of bizarre incidents. In June masked [robbers] crashed a car into a currency exchange office at Disneyland and opened fire with... gun[s at]... police as they fled from the scene. Three officers were injured as bullets ricocheted off neighbouring buildings. "At the start I thought it was a show," said [one]eye witness... A fortnight ago thieves broke a ground-floor window of a hotel in the Disney complex and stole jewels worth around... \$43,980... A few days later fire broke out at an apartment block that houses many of Disneyland's casual staff. No lives were lost but some of the staff's personal belongings were destroyed... Despite the introduction... [to] Disneyland Park... last year of a FastPass, which provides a time slot for five of the most popular rides, it hasn't solved the problem of long queues at other attractions. Since opening, staff have gone on strike twice over pay and are now threatening new industrial action over bonuses for employees in senior positions. The pixie dust doesn't seem to work as well in Europe as it does in the U[S].

In a society where workers are only employed for 24 hours each week, the majority of ex-workers have long and healthy retirements, and nobody has to allocate any time for activities such as shopping or banking, there would be a greater requirement for recreational facilities than at present. However, until everyone in the world has enough food to eat, has access to proper health treatment and accommodation, etc., recreation should sit at the bottom of the list of priorities. Indeed, all of the recreational industries could be shut down while labour and resources are focused on providing essential needs – and many should never be started up again, at least as a source of employment. In particular, any activity that can be classified as a HOBBY ought to forever cease being acknowledged as work! This means no more professional artists (including cartoonists, tattooists, make-up appliers, fashion designers, sculptors – society also ought to cease making monuments), actors, dancers, musicians and singers, story-tellers (including comedians, writers of fiction and poets), or entertainers of any kind (including prostitutes and people employed to create games – be they computer or board), as well as their associated personnel (e.g., agents, ticket and merchandise sellers, record producers and distributors, roadies and stage-hands, critics).

People could still participate in HOBBY activities in their own spare time – but only if they have access to the necessary equipment, or are able to produce it themselves. This means, for example, that artists would have to make their own paints, paper, and brushes – at least once all of the art equipment currently being held in shops or warehouses has been consumed. However, this art equipment should be divided amongst schools – particularly pre-schools and primary schools. If the Manufacturing Ministry continues producing basic art materials for educational purposes (or when it resumes producing them after allocations of existing supplies are running low), adult artists might be able to gain permission from their local education facility to join in with children's art classes – perhaps acting as extra tutors – or use left-over materials that may otherwise be thrown away.

If every existing musical instrument was donated to the Education Ministry, they could then be divided amongst schools so each has a well-stocked music room – although, because music has ceased to be a career option, not many children are likely to take a serious interest in learning how to play an instrument in future (learning music can help develop memory and other useful skills – r:p1898, ln58 – but, as with learning extra languages, children can hone such skills via non-musical methods). However, those who are interested – and are trustworthy – should be able to use their school's facilities to practise during intervals or outside of school hours (which means they won't disturb their families or neighbours), and adults could also arrange with a local school to use the music room outside of school hours or join in with music classes. Such adults might act as tutors – although children will be able to learn via instructional books, videos, etc. (r:p1893, ln14). Musicians ought to be able to borrow school instruments to perform in public (either using a school room or hall, or another public building), but such concerts would obviously have to be put on for free. Unlike art equipment, most musical instruments will last indefinitely if looked after properly, which means there may be no justification for producing any more (and, if a time comes when every existing instrument has become unplayable, schools can concentrate on singing as a source of music – perhaps in association with hand-made percussion and wind instruments).

Only a HB would bother trying to create new music (be it an original piece or remake) – a human knows that there is already more music in existence than it will ever have time to listen to (even though it believes much of that music is not worth listening to); plus most new songs are similar in sound or lyrics to one or more older ones (consider classical music: if it were possible to run every piece of orchestral music through a computer programme that eliminates any sequence of notes from newer compositions which already feature in older compositions, there might be nothing left of most or all of the classical works created in recent years; consider also the following lyrics: 'heroin it's my wife' – 1960s, 'she's like heroin to me' – 1980s, 'I'm happy here with my heroin girl' – 1990s; finally, consider the fact that for '\$3500 you can buy a machine which enables you to re-create or produce new music by waving your arms through the air', plus the evolution of 'mashing' and sampling – 'Mixers, turntables, samplers: the technology to create your own grooves. Cut up stuff from a record or CD and re-mix it the way you want it. Get the gear to do it cause anyone can do it'; and also knows that time spent composing is time that could be used to learn or do something which is more important! However, new music may still be recorded (especially if school music rooms include recording equipment), then be downloaded onto the Internet – so its creator(s) and others can listen to the song without having to produce a record, tape or CD (and without having to pay for the privilege or ordeal). Incidentally, if every piece of music was downloaded onto the Internet, and a programme was created that enabled householders to hear a random selection of all songs, or a selection from one or more musical categories (e.g., classical, blues, rock) – and even store a list of personal favourites (perhaps in the memory of a house's communications system – r:p2391, ln51) – then music-playing radio stations (at the end of 1996, Auckland – where there are 'more radio stations per head of population than any other city' – had 22 radio stations; a year later the figure had risen to 24, with one of the new additions being called *Channel Z*; 'the city's residents can now scan across almost 50 FM stations – NY's 19 million residents have 43, and Londoners just 36') will be redundant (note that talk-back radio shows would also be redundant if HBs ever become extinct). Such a programme can also be used instead of DJs (be they biological or electrical) at arranged dances (which ought to be held in school or multipurpose public halls – rather than maintaining specialised discos or nightclubs – unless an existing facility is being used regularly enough to justify its upkeep; obviously, pubs or bars won't be needed if alcoholic beverages are no longer produced by society – r:p2087, ln58 – but existing premises could be maintained for holding sober gatherings).

During daylight hours, public halls and other facilities – including nightclubs if they are still available (although dances needn't only be held at night) – could be used by any groups of people who wish to gather in numbers too large to be seated in a house, or who wish to have a clubroom. Alternatively, they should be able to arrange with a local school to use a classroom or other building outside of school hours. Indeed, it may be unnecessary to provide

public halls, community centres and related facilities – or at least built new ones – if school facilities are sufficient for the purpose but aren't being fully utilised. School facilities can also be used to stage plays (be the actors children or adults) – although, as with nightclub facilities and public halls, etc., if existing theatres are receiving regular enough use that might be a justification for maintaining them. However, as with music, there are already more than enough films (and TV programmes – including live recordings of plays) in existence than any one person could hope to watch in its lifetime – or wish to watch – and there is even less justification for producing more of these than there is for producing more music! Furthermore, if every film and TV programme in existence (or at least those worth watching) was downloaded onto the Internet in a way that enabled householders to view their own selections, video shops, movie theatres and TV channels (excluding those providing news or educational services) would be as redundant as *music-playing radio stations*.

Until every home in a district has access to such an Internet-based communications and entertainment system (which could include the ability to access computer games – thereby rendering video-game machines and arcades unnecessary), video shops that lend both cassettes and VCRs may remain open. If no ministry (e.g., Education) can make use of the equipment once video shops have been closed down, interested members of the public might be allowed to divide the equipment between themselves to keep in their own homes for as long as it remains operational. HBs who want to continue watching pornography and other objectionable material would, therefore, still be able to do so in private (it will be ideal if such material was eliminated from society completely – although smutty video cassettes could have their contents erased then be reused to store other images – but that involves searching every house, an unpleasant and normally unwelcome activity which is also unlikely to be completely successful; note that it is possible to 'edit out violence, bad language and nudity from films using masking software called "Movie Mask" – though an unhappy Directors' Guild is trying to block distribution of the software').

The ability to access literature and academic information via the Internet (e.g., Google's virtual library) also eliminates the necessity to maintain libraries (plus a book-printing and distribution industry). However, libraries could continue to operate for as long as they have books that are in a readable condition (in some instances – i.e., wherever books are well-preserved – this might be indefinitely); and, if it is still deemed necessary for people to have access to a paper copy once every original copy has been lost or damaged beyond repair, be capable of printing off a scroll-like copy of a requested document – which can then be read by subsequent borrowers (but additional scroll-like copies should only be printed if another person has an urgent need to view one which has already been lent, and no other library within the district has a spare copy). Each suburb can initially have a library situated in a central location (although, if primary schools temporarily or permanently maintain their own libraries, there should be no need for suburban libraries to have a section for children's books; whereas high schools wouldn't need their own libraries if they are also centrally located – r:p,1925 ln29), and all of a district's libraries ought to be linked to a central database – Auckland's libraries are currently divided into multiple database systems (e.g., one for each of its four city councils, plus Auckland University's and those of other tertiary institutions) that are mutually unconnected – but, if someone wants to borrow a book that isn't held in its local library, it should have to go to the relevant library (and return the book there after finishing with it) rather than have a service which transfers books between libraries. Eventually (i.e., when every household can access the Internet), each district may only need to have one physical library – which ought to be situated in the middle of the city, and be managed by the Education Ministry.

Toy libraries should also come under the management of the Education Ministry, to form the basis of a service that lends educational toys to the parents of pre-schoolers (r:p1921, ln5). Educational toys currently sitting in shops or warehouses can be divided amongst such libraries and pre-schools, while the production of non-educational toys – including comfort toys (i.e., substitutes for parental attention) and sex toys – is brought to a permanent end (non-educational toys can be sent to non-essential warehouses – r:p2207, ln47-8). Production of sophisticated board games (for children or adults) ought to cease as well, but the production of dice sets and playing cards could just be temporarily ceased – because they are simple enough to produce (and can be made out of plastics, thereby maximising their life expectancy), while providing a variety of gaming options (that assist children in developing their memory, adding and planning skills), to justify supplying these items to every household which requests them. By the way, casinos may be kept open – or eventually be reopened – if patrons are happy to only play with pretend money (e.g., upon entering a casino each patron is given \$x worth of 'chips' – then they simply stop gambling when their money runs out or return any winnings at the end of that visit, or keep a record of their total earnings or losses from multiple visits). However, rather than have physical casinos, they might just exist in cyberspace.

Sports equipment is another product category that ought to temporarily cease being manufactured – although professional athletes (and their associates – trainers, commentators, etc. – r:p1594, ln5-6) can immediately become an extinct species. Existing sports facilities could initially be controlled by club members – who would have to be responsible for maintaining the facilities on a voluntary basis; and, if the facility has any ongoing expenses, share the burden by paying membership fees. Eventually, however, every sports facility will need to be managed by the Recreation Ministry.

The Recreation Ministry should aim to provide each suburb with a centrally located recreation complex (r:p2438, ln46-51) where there is, for example, a range of swimming pools (the only swimming pools in the suburb – meaning that swimmers are always supervised) and related equipment (e.g., diving platforms, water-slides and, perhaps, wave-makers), a gym, a games hall (which contains pool and snooker tables, darts boards, tenpin bowling alleys, table-tennis tables, simple board games such as chess and draughts, etc.), and an assortment of courts and fields (shopping malls and their car parks could, perhaps, be converted into recreation complexes). The assortment ought to be capable of catering to the preferred sporting choices of a suburb's residents – although such preferences are likely to be fairly uniform for every suburb within a district. As much as possible, facilities should be multi-purpose (e.g., the same field may be used for soccer and rugby games by having 'multi-use goal posts'; the same court used for basketball, netball, volleyball and, if indoors, badminton – not simultaneously, obviously) and low-maintenance (e.g., have artificial surfaces – although players would then need to be provided with safety equipment such as knee and elbow pads, helmets). Relevant protective equipment will have to be lent to players along with the necessary balls, bats, etc., but players who need mouth-guards ought to be given one to keep for personal use – and, if standard-issue shoes (r:p2207, ln23) are designed to be suitable for running in (taking into consideration the three different foot movement styles – 'tend inwards, neutral, tend outwards'), recreation centres won't need to lend footwear (even for tenpin bowling). If the demand for a particular sport warrants it, use of the relevant facility (e.g., field) and equipment will have to be shared via a booking system – which ensures that use of sports facilities is distributed evenly (i.e., someone would only be able to rebook a facility after everyone who wants to use the facility has had a turn – although someone may be able to jump the queue if a booking has been cancelled and no one who is ahead of it is willing or able to utilise the vacancy; computers make such a booking system feasible). In some instances a facility might need to be booked for an entire day (e.g., cricket pitches), but booking a facility for a longer period – e.g., for a two- or three-day cricket game – should be discouraged (unless demand for the facility is low enough to allow that). Ideally, a suburban recreation centre would have just enough of the right assortment of facilities to ensure that each of its fields and courts is being used almost constantly – at least during operational hours (which can be maximised with the assistance of standard lighting for interior facilities and floodlights for outside facilities; use of recreational centres could be further maximised if some or all of their outside facilities are covered by a high, transparent and permanent, or retractable, roof – thereby eliminating the requirement to cancel or postpone outside games due to the weather; although, if artificial surfaces are used and the players don't mind getting wet, games on exposed fields would only be affected by extreme weather conditions such as thunderstorms or cyclones and heat waves). Less popular sports might only need to be provided at one or a couple of suburban centres district-wide, in which case the centres will have to cater for players from other suburbs (a sport ought to be less popular because its rules are complicated or it requires a lot of equipment; sports that are simple and require little or no equipment should become more popular).

A group of friends (who may be of mixed sex – particularly for suitable sports like soccer) could book a field to play games against each other (with opposing teams wearing different coloured bibs or sashes; and players wearing old clothing rather than having specialised uniforms) – perhaps having use

of the field at the same time of each week – or arrange to play socially against another group (and team-members who are familiar with the rules can take turns at being the match official – rather than having outsiders or recreation centre employees perform this task). People should only participate in sports for personal enjoyment, socialising and fitness. However, if enough groups are playing a particular sport at a centre to warrant organising an in-house competition, that would be okay. Furthermore, competitions could be organised between different teams from different suburbs (such competitions would primarily involve selecting a team from the best players of a popular sport to represent the suburb against similar teams from other suburbs – in which case the players might be expected to attend training sessions – although such competitions may also be arranged to enable players of less popular sports to have proper games) – but sportspeople should no longer be able to compete with peers from other districts (which means no more Olympic Games, World Cups, etc.), and the winners of a competition shouldn't receive any kind of prize (personal satisfaction ought to be reward enough)! In addition, world records can cease to be collated – individuals (or groups) could still attempt to break an existing record if they want to prove something to themselves, but without the intensive training and competition of today's top athletes they are unlikely to ever succeed. Likewise, sporting events don't need to be televised (people who want to watch sports will have to see the event live – but, when there are no professional sports teams, no major competitions and, in particular, no inter-district contests, only people with a personal interest are likely to be spectators; which means grandstands and stadiums won't need to be built in future – space for people to stand one-deep beyond the sidelines ought to be sufficient), or even be mentioned in future news bulletins – although a catalogue of previously televised sporting events could be accessible via the Internet. Note that if both suburban medical centres (r:p2163, lns8-9) and suburban recreational centres are centrally located, injured players wouldn't have far to go to receive treatment – although injuries might be less frequent, or at least tend to be less serious, than at present (thereby minimising the impact that sport has on people's ability to perform their work) if players aren't as competitive, perform stretching exercises after games (r:p1570, lns35) and, when appropriate, wear protective gear.

If high schools are also centrally located, they can be situated next to the recreation centre. This will enable high school students to use the facilities during morning or lunch breaks, and for Physical Education classes – and, therefore, high schools won't need to incorporate fields and gymnasiums within their own grounds. The recreation centre's booking system could take PE classes into consideration, and leave some facilities available to students during their break times – although it would be preferable if students weren't able to use the facilities during breaks (because they shouldn't be running around straight after eating). It shouldn't, however, be necessary to offer PE to high school students (although fitness ought to be a topic covered in nutrition classes) because they can be responsible for their own fitness outside of school hours – and, anyway, there might not be space for PE in a curriculum which is designed to teach students everything that they need to know (r:p1920, lns63-5)!

High school students could play sports with adults, but recreation centre staff – who, in the absence of a PE curriculum, would effectively be the equivalent of PE teachers – may be able to organise age-related games or coaching sessions for the students (although it might not be necessary for recreation staff to actually do the coaching – because videos or books, in association with the catalogue of televised sporting events, can perform that task). Primary schools, however, ought to have their own multi-purpose field and basic sports equipment – excluding swimming pools – for their pupils to use during breaks and after school hours (r:p1924, lns41-2). Parents, and any interested teachers, can be responsible for coaching primary school children, who should only be able to use a recreation centre's facilities – excluding swimming pools – if accompanied by an adult (unless a recreation centre's age-related games and coaching sessions extend below the age at which pupils enter high school; recreation centre staff should definitely conduct swimming classes for young children). Games may be played between teams representing different primary schools, but they ought to only involve primary schools from within the same suburb (which, because many of the players would know each other even though they attend different schools, will help to ensure that such games are more sociable than competitive). If primary schools have multi-purpose fields, recreation centres could use them – outside of school hours (as long as they aren't required by primary school teams; and aren't too wet or frozen) – for adult or high school-aged players whenever demand for a centre's fields outstrip its capacity.

One of the most equipment-intensive – or, more accurately, resource-intensive – sports is golf (NZ's 'Cape Kidnappers golf course, with green fees of \$400 a round, has been rated the world's best by Britain's *Daily Telegraph* newspaper'), but it probably won't eventually become unpopular with everyone for that reason! Therefore, districts which currently contain golf courses may always contain them. However, districts like Auckland – which has over 25 full-size courses and a few 9-holers within its urban limits, and dozens more 18-holers within a hour's drive of its CBD (sometimes, at inner-Auckland public courses, players have to queue for an hour before getting to tee off) – should aim to minimise their number as much as possible. Golf equipment sitting in sports shops can be divided amongst existing golf courses, and golfers ought to be encouraged to also donate their personal golf equipment, so that each course is capable of simultaneously providing a set of clubs – plus balls, tees and trundlers – to every player having a round (assuming that most rounds take about four hours to complete, and groups of four players normally tee off between seven and ten minutes of each other, that would mean each course needs at least 140 sets – which isn't a lot when the number of sets currently sitting in people's garages, and getting used only once a week or less, are taken into consideration – but each course might need closer to double that amount to allow for left and right-handers, plus undersized sets). Players will have to book tee times at every course (when booking, they could stipulate what type of clubs they'll require, and a course that is going to be short of a particular type can try to source the necessary sets from the others; or, as a last resort, players may sometimes be able to share a set) and, at least while money continues to be used, pay for their rounds (which should discourage most people from playing golf on a regular basis). If there are more tee times available in a district than are being filled (as is the case in Auckland at the moment), the course that has the least traffic can be closed down (and either be converted into a park or used for other purposes); then the next least-used course and so on until the capacity equals or exceeds the demand.

If each course averages 25,000 rounds a year, Auckland would need to maintain at least forty courses in order to ensure that every Aucklanders can play just one round per year. Fortunately, not everyone in Auckland is interested in playing golf. If only 100,000 Aucklanders (i.e., approximately 10% of them) were keen on golf, and the city had twelve courses, each golfer will then be able to have three rounds per year. The majority of Auckland's golfers might be satisfied with that amount but, because the Recreation Ministry is also providing recreation centres which are able to cater for a wide variety of sporting interests – and people should be interested in playing more than one sport – it ought to regard the amount as being more than necessary. Four courses – preferably situated on the city's fringes (as opposed to being located within the primary urban area) – could be enough, even if each of the courses took turns at being closed for one week out of every four so their fairways and greens are able to recover from being used to their maximum capacity during the previous three weeks. This means – if 10% of Auckland's population wants to play golf – that each golfer only gets three rounds every four years (or one every four years if 30% of the population wants to play golf). However, keen golfers may be able to get in more rounds per year if courses notify them of cancellations. If the production of energy eventually ceases to consume resources (r:p2293, lns42) – other than the materials used to build power stations, superconductors, etc. – and a district is producing excess energy during night hours, rather than allowing that energy to be wasted, golf courses could be floodlit. Floodlighting would extend the number of rounds completed each day – although, rather than operate courses for 24-hours of each day, such lights should only be used to enable the first golfers to tee off earlier, and the last golfers to tee off later, than is otherwise possible (and allow groundspeople to tidy up the greens and fairways after the last round of a day has been completed and before the first round of the following day is commenced).

To compensate avid golfers for such a reduction in the amount of rounds they are able to play each year (not that they deserve to be compensated in any way), each course could be adjoined by a driving range (so golfers would at least be able to get plenty of practise in between rounds; and if these ranges have upward slopes, the balls will gently roll back to the golfers – thereby eliminating the need to employ someone to collect them). Novelty mini-courses may be supplied to make putting practise more interesting. Keen golfers can also play computer golf (and, perhaps, virtual reality golf) or in their dreams!

It would be ideal if violent computer games were all erased from the planet immediately – but that might be expecting too much. However, such games only appeal to a primitive mentality, so their popularity will wane as less people are prepared to be stigmatised through being associated with them. In the

meantime, their capacity to enable violent people to direct anger towards imaginary characters rather than at real people might outweigh their potential to create a thirst for physical violence – and can be used as an excuse for the Recreation Ministry to shut down opportunities for HBs to participate in blatantly violent sports (there would be less of an excuse to shut down sports based around self-defence techniques – but, as society itself becomes less violent, gradually there should be less motivation for people to learn forms of self-defence until, finally, there is no motivation; it may, however, still be necessary for police officers to learn self-defence). Refusing to give HBs permission to use public facilities to train for and participate in boxing bouts or other forms of arranged fights, and to promote them, is unlikely to bring an immediate end to such sports – but it ought to dissolve the support of the masses for these mindless spectacles. Likewise, the Recreation Ministry can make it harder for citizens to engage in blood sports (the ministry can't stop HBs from wanting to kill other animals for fun, and doing so, but the Manufacturing Ministry need no longer employ people to make any equipment that these pseudo-hunters use) or any activity that involves other animals (e.g., horse racing). The same goes for motor sports – although, while citizens continue to have access to private vehicles and fuel, it won't be possible to stop interested parties from arranging these in secluded spots (but it would be possible for the Health Ministry to refuse to provide treatment for injured drivers or spectators if there is a backlog of patients whose condition wasn't self-inflicted!). Further examples of current activities that social authorities should disassociate themselves from are body-building and beauty contests, battle re-enactments, air shows (there is, after all, plenty of existing TV footage of air shows – especially the ones where performing planes have crashed into the crowd) – although pursuits such as parachuting, gliding and hang-gliding could still be made available to interested parties in future. In addition, the Recreation Ministry can provide boating and scuba-diving facilities (and suitably located, see-through tunnels, could easily be built for people to walk through underwater – rather than having aquariums above the water; a district like Auckland might use such tunnels to link some harbour islands with their closest neighbours) – although citizens will have to pass a training course before being allowed to borrow diving equipment or boats capable of carrying more than one person.

If every recreational boat in existence became the property of the Recreation Ministry, it might not be necessary to build any more for a long time – especially if the new or near-new craft are stored until older ones need to be replaced. When, or if, production recommences, it ought to primarily be focused on making simple, non-motorised, one- or two-people craft (e.g., canoes, dinghies or other types of rowboat – although dinghies can be masted), plus one-masted yachts capable of carrying a crew of up to six people (and have small, environmentally-sound motors – e.g., electric or seawater-powered – to be used when leaving and returning to the marina, or whenever they are becalmed), and a few suitably-powered speedboats (some of which could be used by qualified people – e.g., Recreation workers – to offer water-skiing in designated areas; the rest of which would be used for rescue work). Rowboats and small yachts (e.g., masted dinghies) should only be lent out for an hour or so each time – meaning they can't be taken far from the marina – but, if at least two people on board have passed the relevant training course, larger yachts may be lent out for a whole day or longer.

Surfboards (and other wave-riders – e.g., boogie boards, wind-surfers) could be stored at relevant locations and be lent to members of the public so that they are used under supervised conditions – groups of surfers ought to look out for each other, but the store-workers should be qualified lifeguards (so an experienced person is nearby if anyone needs to be resuscitated). Areas of popular beaches can be divided into surfing and swimming areas – the store-workers would be responsible for marking out the safest swimming area, but swimmers should be responsible for themselves (rather than have the Recreation Ministry simultaneously employ fulltime store-workers and fulltime lifeguards, plus recreation centre swimming coaches). Because more people tend to surf year-round than swim, it may be necessary to also employ beach store-workers year-round. However, because such store-workers are really only needed when demand for beach equipment exceeds capacity – like during weekends (in which case each surfer might only get to use a board for an hour or so) – if the equipment is handled responsibly, people could still be able to access the stores to borrow equipment whenever no Recreation Ministry staff are rostered on.

If a beach is part of a suburb, getting to it won't be a problem. Where popular beaches lie outside of a city (as is the case with Auckland's west coast), bus services could be put on during times of peak demand – or operate year-round, but with a decreased frequency during off-peak months. In addition, districts can use buses to take people on scenic day-trips. The Recreation Ministry might operate a fleet of buses for such day-trips – and visit the same destinations every day, or a daily selection from a range of destinations (with the selection being dependant on the seasons). However, if there are periods during the year when the fleet isn't being fully utilised, groups of citizens (e.g., packs of friends, families) may be able to arrange to borrow a bus – especially if at least two members of the group have passed a relevant driving test – to go to a location of their choice (assuming the access roads are adequate). Alternatively (or additionally), if the Transport Ministry has a fleet of minibuses that it only uses as taxis at night (r:p2346, ln48-9), these vehicles could be borrowed by members of the public for personal day-trips – although use of such vehicles would have to be fairly distributed, which, as with golf, is unlikely to mean being generously distributed (to allow every citizen in a district with a population of 1 million one day's shared use of such a minivan each year, the district will need about 274 ten-seater vehicles – which might be more vehicles than are required for the night-time service; in comparison, to provide every citizen with one official scenic day-trip per year will require just under fifty sixty-seater vehicles – less if bendibuses or double-decker vehicles are used, or if the vehicles can pull carriages; or if one or more buses are substituted for a ferry – for cruises along a river, around a lake or harbour). One day-trip per year may seem like a pitiful amount but if, for example, the Recreation Ministry's scenic service offered between forty and fifty different routes, the average person should get to travel along each route (or most of the routes) twice in its lifetime – which ought to be enough to satisfy the average person. If minibuses are added to the calculation, or if such a district was able to provide double the number of scenic buses, etc., each person might be allocated at least two day-trips per year.

Instead of trying to allocate such day-trips evenly – especially if (or while) the capacity to provide them equates to less than one trip per person per year – seats could just be divided amongst applicants; by lottery-style draws; or be used to reward people (plus their partners and children, or their own parents if they are childless) for exceptional work (r:p1953, ln50). However, there can also be an alternative means of travelling along scenic routes – by bicycle!

It should be relatively easy to eventually provide a bike to every human who wants one for private use, but this would be unwarranted in a society that also has a thorough public transport system. For this reason there ought to just be a supply of bikes – in a range of sizes but only one design (multipurpose, such as *mountain bikes*; note that the *Segway* scooter – r:p2330, ln68 – has been temporarily 'recalled because it loses balance when the battery becomes flat') – which people can borrow for an hour, a day or longer from the Recreation Ministry (the bikes could be kept at suburban recreation centres). Being allowed to borrow bikes for longer than one day means people will be able to go on camping trips over weekends or during their holidays. In that case, and cases of people going on hiking holidays, the ministry would also have to lend camping equipment (e.g., tents, sleeping bags, packs, portable cookers – preferably battery powered, or powered by another environmentally-safe source; sleeping bags might be provided as a personal item by the Manufacturing Ministry). Such campers could pitch their tent in any suitable location, but the ministry ought to provide camping sites at strategic locations that have ablutions facilities (which, in addition to providing toilets and showers, can contain sinks for washing dirty dishes or clothes, room for campers to shelter if the weather turns nasty, and maybe even ovens – though the portable cookers should render extra ovens unnecessary). However, huts (which have bunks and, perhaps, ovens) might also be maintained along hiking trails such as NZ's Milford Track – a 'three-day, 55-km long route' which 'is walked by 10,000 people each' summer (therefore, if the district the track lies within was to eventually have a population of 1 million, everyone will only get to hike the track once – that district could be based on either Dunedin or Invercargill, since both cities are about the same distance from the track; but Dunedin's residents may instead get to use the Routeburn Track – which is situated 20km or so northeast of the Milford Track, and recently started being managed via a booking system to overcome the 'scramble for beds'). By the way, school camping trips should cease to be organised – though parents of classmates could arrange and supervise combined camping trips during school holidays.

It was previously suggested that unnecessary migration should be stopped and money paid for cancelled tickets shouldn't be refunded (r:p2348, lns17-23). It necessarily follows from this that international tourism is an existing recreational industry that would have to be *shut down immediately*. This means that, initially, people who are on overseas holidays ought to be returned home a.s.a.p.; while people who work in hotels, or as tourist agents, guides, etc., will need to be re-employed (nowadays, 'one-in-ten NZers are employed in tourism'). Incidentally, the building of hotels (plus motels and lodges) can also cease, and existing ones be used to house people who are homeless or have substandard accommodation (then eventually be converted into apartments or some other use). If, when there are no more hotels, etc., someone has to temporarily visit another district, and there is no vacant accommodation available, the person could be billeted with a family (or be given a tent – if that is the person's preference). However, workers who travel between districts (e.g., when official migrants or goods are transferred) and have to be accommodated overnight – because to return home in the same day would be too tiring – should be provided with sleeping compartments by their ministry at the relevant location (e.g., airport); such compartments, along with tents, could also be used as emergency accommodation when necessary (and vacant).

If a time arrives when the basic needs of everyone are being catered for, the official migration of people has created a situation where most districts have approximately the same population (hence, official migration has been ceased), the working week is 24-hours long, and societies have resources (both material and human) to spare, it could be possible to create opportunities for people to travel outside their district for specific recreational purposes – particularly if the return-trips can be completed within a day and are organised in a reciprocal fashion (i.e., residents of a coastal district might visit a mountainous inland district to engage in skiing and other snow-related or ice-activities such as glacier-climbing, while residents from the mountainous district visit the coastal one to experience the seaside – although every district should include either a coastline, large lake or major river, and some may include all three, while coastal districts can build artificial ski-slopes), and doing so doesn't interfere with each district's ability to cater for its own residents (during summertime a coastal district may have difficulty handling out-of-district beach-goers on top of local beach-goers; during wintertime, the mountainous district may be unable to simultaneously cater for skiers from both districts).

Recreational trips between adjacent districts (adjacent districts might also share recreational facilities on their mutual border) can be made via an inter-district railway line, or by bus if the ride takes no longer than about two hours (therefore, the driver will be able to have four hours rest – while the passengers are skiing, swimming or whatever – and complete an eight-hour work-day with the ride home). If, however, the districts aren't adjacent (making the use of trains or buses impractical for a day-trip; but they could be practical if trippers camp overnight, and each day the transport used delivers a new group and returns home with the people it dropped off the day before), it might be possible to use aircraft (in which case, hundreds of passengers could be moved at a time) – especially if the aircraft used are powered by environmentally-sound, or at least energy-efficient, engines. To maximise the efficient use of any transport (be it for rail, road or air) operated for inter-district day-trips, it may be possible for a vehicle to, for example, leave District A with a load of passengers, drop them off in District B, return to District A with a load of passengers from District B, return to District B with a second load of passengers from District A, return to District A with the first load of passengers from District A, return to District B with the passengers from District B, and finally return to District A with the second load of passengers from District A (meanwhile, an identical vehicle could be operating in the opposite direction – i.e., leaves District B first; alternatively, if the vehicles can travel fast enough, there might be time for each vehicle to complete more than three round trips per day). Each district could have reciprocal recreational activities arranged with more than one other district. But regardless of how many out-of-district trips a district offers (be they reciprocal or not), they should only involve travel within the same state.

One means of creating new state boundaries would be to utilise time zones, the equator and both poles (i.e., the world could be divided into 24 Northern Hemisphere states and 24 Southern Hemisphere states – with each state forming a triangular shape that has one point at either the North Pole or South Pole and two points 15° apart at the equator; alternatively, the world could be divided into 96 states if the two points on the equator are 7.5° apart). The primary motivation behind arranging states in this fashion is to have every district within each one share the same Greenwich Mean Time and seasons. However, if such a plan was applied literally to the globe, some states will exist where there is either no land or just a few small islands. Therefore, wherever there is little in the way of land, a state's width might be wider at the equator or elsewhere (perhaps incorporating two or more time zones – although every district in such a state can use the time as read at the mid-point of the zones); and where there is a lot of land, a state's width may be narrower. Furthermore, there is likely to be more states formed in the Northern Hemisphere than in the Southern Hemisphere. While districts would be named after the city they are associated with, Northern Hemisphere states can be named N1, N2, etc; Southern Hemisphere states S1, S2, etc.

Examples of what such future states might look like are: N1 – incorporating Iceland, Ireland, Portugal and the area of Spain that lies west of the longitudinal line 5° west of Greenwich (including Gibraltar), plus the western coastline of Africa (with the inland border following the same longitudinal line) and the eastern Atlantic islands; N2 – incorporating the area of Africa that lies between 5° west and 2° west, the area of Spain which lies within the same longitudinal lines, plus Brittany, the Channel Islands, England, Wales and Scotland, and its northern islands (including the Faeroe Islands and Jan Mayen); N3 – incorporating the western coastline of Norway and inland to about the longitudinal line 6° east, plus the areas of Europe and Africa which lie between 2° west and 6° east; N4 – incorporating the areas of Europe (including Scandinavia, Corsica and Sardinia) and Africa that lie between 6° east and 10° east, plus the north-east coast of Tunisia and the island Fernando Poo, but excluding the area of Africa which lies below the city of Douala in Cameroon; N5 – incorporating the areas of Europe that lie between 10° east and 15° east (including, perhaps, all of Sicily, and maybe even all of eastern Italy), plus the area of Africa that is bounded by the same longitudinal lines and the equator, with the addition of the Gulf of Guinea coastline between the equator and Douala; the African lands below the equator could become three states, with each sharing a mutual boundary at the point where the Congo river dissects the equator – so that the northeastern part of the western state shares the western coastline as far south as the Tropic of Capricorn (with its eastern border creating a straight or curved line from the point on the Congo to the place where the western coastline dissects the Tropic of Capricorn), the northwestern part of the eastern state (which would include Madagascar, Mauritius and the other west Indian Ocean islands) shares the eastern coastline as far south as the Tropic of Capricorn, while the remainder of central Africa shares the southern coastline below the Tropic of Capricorn; S4 – incorporating the lands below the equator to the west of 120° east (including Western AUS but excluding any part of Sulawesi); S5 – incorporating the land between 120° east and 140° east (plus all of Sulawesi and the Moluccas – including their Northern Hemisphere parts – and the western half of New Guinea); S6 – incorporating the eastern side of AUS, eastern New Guinea and the Solomon Islands; S7 – incorporating NZ and all of the remaining South Pacific islands.

An aim of forming states should be to try to maximise the variety of natural resources contained within each state to increase the likelihood that if one or more districts within a state lack a certain essential resource, other districts within the state will be able to provide it (dividing the world into states which all contain part of either the Arctic or Antarctic plus equatorial lands and all that lies between may greatly assist in achieving that aim). However, another aim of society ought to be to gradually concentrate the districts of each state within its temperate zones (leaving the extremely hot and extremely cold parts of a state as wilderness – which, perhaps, can be used as destinations for recreational day-trips). In most instances, a group of islands can become a single district, but efforts should be made to eventually create just one community (e.g., on the largest island in the group, or the one most suited to supporting a large population), or a couple at most – or the people could 'all live on one island and grow their food on another' (note: 'some Pacific Islands are so crowded that they import 90% of their food') – with the remaining islands being left unused (except, perhaps, for recreational purposes). Alternatively, all of the inhabitants of an island group may be encouraged to migrate to a mainland district (e.g., using the example of S7, people from south Pacific islands would go to NZ) – especially if all of the islands in a group are small – or to a large island in another group. Therefore, an entire island group could be left untouched by humans in future (unless, for example, they're visited by day-trippers). By the way, it was mentioned previously that Earth is capable of accommodating a *stable population of 10 to 11 billion* people. If this is true, perhaps the planet can accommodate between 6 and 7 billion humans within its temperate zones (where life is less harsh, the land is more fertile, and it is less affected by climatic changes such as Ice Ages – which could, otherwise,

mean that some populations are periodically forced to move due to rising and falling water levels; it has been suggested that 'Male Island in the Maldives group be surrounded by a wall to protect it from rising sea-levels, yet if this wall is ever breached by damage in just one place, even for only a day or two, the salt water will render the island's cropland unusable for at least two years')? But even if it is possible to minimise the impact of climatic changes, the shape of many states will change over long periods due to the natural movement of the planet's crust (e.g., the 'Red Sea is widening by 2.5cm/year while the Mediterranean is shrinking – its northern and southern shores will meet in a few million years') or other natural phenomena (e.g., newborn volcanoes) – though in future it will be much easier than at present to relocate entire communities to new sites (i.e., once houses are being made out of plastic; note that, as with footpaths, roading might also be made of plastic that is *removable*) should that be necessary (r:p2204, lns14-5; such relocations can be gradual processes spread over many years just like the movements of the planet's crust).

Most people won't be able to visit relatives and friends who live in other districts or states in future, but they would still be able to throw parties in their own homes (inviting relatives and friends from their own district) – although they shouldn't be able to obtain balloons and similar paraphernalia; and, unless they are personally able to produce them in large enough quantities (or combine the small produce of a number of guests), won't be able to serve alcohol or narcotics. However, when people are living in a society that is less stressful than those of the present and past, they ought to be able to enjoy themselves socially – as most probably did on many occasions when they were children – without the stimulation of mind or mood-altering substances (r:p1325, lns14).

When people are being supplied with enough food via the Food Ministry they won't need land for private vegetable gardens. Therefore, when replacing existing subdivisions or building new ones, the plans don't need to feature space for large private gardens (or private driveways and parking areas such as carports and garages – r:p2347, lns22). Ideally, each house ought to have an adjacent private courtyard (or deck if the house is located on a hillside). Such courtyards (and decks – which, depending on what is most practical, can either be placed adjacent to one side of the house or wrap around three sides of it) should be no larger in ground-area than is covered by the house itself. Courtyards will have to be high-walled (to give the residents privacy from neighbours – assuming they don't always talk at the top of their voices) and, like decks – which should only need to have waist-high walls – have a solid base (such as paving or the same material used for decking – but not stones, plain dirt or grass, although artificial grass might be okay). Householders can grow plants (including wine-making grapes, tobacco, marijuana, coffee, tea, etc., if a resident believes it needs one or more of these things for personal use – r:p2087, lns58-9 – and, if they are able to obtain the relevant seeds or cuttings, any vegetables that they love but the Food Ministry doesn't provide; excluding plants which are locally classified as pests) indoors or in their available garden space using pots and similar containers, and even allow their plants to grow over the walls – although they shouldn't be supplied with gardening tools because, if they want to do any kind of private gardening, they could use their bare hands or find something appropriate amongst the house's kitchen utensils.

Because courtyards aren't grassed, households won't need to have lawnmowers. However, the land that immediately surrounds a house and courtyard – which can be considered communal ground, even though no one but the house's residents and visitors are normally likely to walk over it – should be grassed if possible. In which case, someone will have to be responsible for mowing it (preferably with an electrically-powered mower that doesn't leave tyre grooves) – and that someone would be a Recreation Ministry employee. In addition to grass, there ought to be fences, trellising – perhaps covered in climbing plants – hedges, shrubs or small trees that are strategically placed to obstruct direct lines of sight between the windows of neighbouring houses (ground that can't grow grass may be able to support shrubs, etc. – especially natives; whatever is grown should be able to survive on whatever rainfall is normally available), which ought to be no closer or further apart from each other than one house-width (with the possible exception of houses situated on hillsides). Recreation Ministry workers would also be responsible for tending to this vegetation – plus the vegetation around apartment blocks; and for operating nurseries to produce replacement plants, as well as flowering plants for beds in large public gardens or other suitable locations – and, in Autumn, removing any fallen leaves from paths and drains (leaves and other cuttings, including any excess grass not mulched back into lawns to feed it, could be collected for use as compost, or for other purposes – e.g., producing plastics; there could also be strategically placed collection bins for household food scraps, rather than having households return them to the Food Ministry – r:p2089, lns60 – though such bins would need to be emptied and cleaned daily). Preferably, any trees growing between houses will be evergreen (thereby eliminating the problems caused by fallen leaves; trees ought to either be kept away from roadsides or be evergreen also), be situated far enough from each house to avoid falling on one – although plastic houses could be strong enough to withstand the impact – and be of a variety that doesn't grow above roof height (thereby simultaneously maximising the amount of natural light and warmth that reaches houses; residents who don't like direct sunshine can utilise blinds or whatever other system is provided – r:p2205, lns51-5). By the way, if some of the varieties are citrus trees, the Food Ministry might not need to produce and distribute citrus fruit – at least while the fruit is in season.

Taller trees may still need to be grown between houses situated on hillsides – in order to prevent landslides, and residents from looking down on the houses situated directly below theirs – but, within urban areas, other large trees ought to only be grown in parks, to provide shade along pathways or to serve as windbreaks. However, rather than try to immediately cut down every existing urban tree that is too tall but doesn't fulfill either of the categories mentioned in the previous sentence, unwanted trees could just be removed whenever a resident requests such action and it is also convenient for the Recreation Ministry to do so – otherwise they should only be replaced when their age demands such action (note: if the Recreation Ministry has control over all of the trees grown within each city, and considering that a percentage of these trees will need to be cut down each year – plus others may need periodic trimming – if this timber can be used by the Manufacturing Ministry there might be no need, or at least a severely reduced need, to have plantation forests).

Each house has to be accessed by a firm pathway (under which should be laid its water and sewage pipes, and any wiring – r:p2294, lns58) – but such paths needn't be wider than the span of a wheelchair or trolley (such as might be used to deliver food, or the type used to move patients). The pathway would access a one-lane road that can be used by ambulances or vehicles driven by doctors, vehicles driven by maintenance workers, delivery vans, tractors or forklifts (in order to deliver weekly food allocations – r:p2089, lns6 – the Food Ministry could use trucks to carry allocations from suburban food warehouses that, on their first trip of the day, also carry a forklift which is used to completely offload the truck near to the start of the one-lane road leading to the target houses; while the truck is returning to the warehouse to receive its next load, the forklift carries a pile of allocations along the one-lane road and deposits the pile at a suitable spot nearest to houses the pile is meant for; while the forklift is returning to collect another pile, workers would carry – or trolley, or handcart – individual allocations to their respective houses, then move on to the next pile; ideally, the truck and forklift will both reach the next offload point at the same time – to help achieve this, the forklift and associated workers may need to cover more than one one-lane road in-between offloads, perhaps delivering along the two one-lane roads either side of each offload point). To prevent stopped vehicles from blocking one-lane roads, the start of each pathway could be wide enough to park a single vehicle (such parking-spaces will also enable vehicles, or pedestrians, to give way to other vehicles heading in the opposite direction to themselves – although two or more vehicles are seldom likely to be simultaneously using the same one-lane road, and one-lane roads can be one-way for all vehicles but food delivery forklifts and ambulances). Such a road ought to link the pathways from four rows of houses (i.e., two rows from its left side – with the first row of houses being situated immediately beside it and the second row of houses being situated behind the first row; with houses from the two rows either being situated directly behind each other, meaning that houses in the back row are hidden from the one-lane road, or offset so that every house is visible from the one-lane road – and two rows from its right side) – although the rows, and the one-lane road itself, don't have to be perfectly straight – while the next four rows have pathways leading to a second one-lane road. However, rather than have each pathway lead to just one or two houses, a pathway might run between adjacent one-laned roads – with secondary pathways leading to the eight houses it passes (four on either side of the primary pathway).

Each one-lane road will have to start from and end at a standard road (i.e., a road wide enough to at least fit three vehicles abreast). Such a system of one-lane roads could mean that each suburb only needs to have four standard roads running through residential areas (i.e., a standard road can start out at the centre of a suburb and wind its way around a quarter of the suburb before returning to the centre again – with the start, the end, and perhaps up to three suitably-positioned link roads that allow access between adjacent standard roads, being the only points where the road encounters intersections; one-lane road entrances/exits would only need to resemble traditional driveways). This simplifies the public transport system, but means that residents will have to walk to and from the part of the standard road which is nearest their house in order to catch a bus (three-vehicle-wide roads mean that there is room for two lanes of traffic – one lane travelling in each direction – and, on one side of the road, a lane for vehicles to park and buses to stop so they can collect or drop off passengers) – although, if each one-lane road was no longer than 1km, the maximum distance anyone has to walk is only about 500m (unless they have to walk to a bus shelter because it is raining – shelters ought to only be placed intermittently, such as by every second or third one-lane road entrance). Pathways on hillsides would have to snake their way down to eliminate steps – thereby making them accessible to wheelchairs, etc (although steps could also be provided so able-bodied people have the option of walking straight up and down hillsides rather than having to snake their way up and down them).

The material that pathways and one-lane roads are made out of – or at least their upper surface – should be smooth enough to walk on barefoot while not becoming slippery when wet (and slightly arched to eliminate puddles) or hot in summer, as well as being coloured so as to prevent glare (e.g., brown or grey). The material could even be luminous or, alternatively – and especially if the surfaces are designed to be removable (r:p2294, ln60 + p2520, ln7) – there might be built-in lights that are sensor-activated (so they only work when required). However, lampposts (also sensor-activated) may continue to be the best option. Wherever large pipes are required – especially when they follow the route of a road – they could be built with flat tops suitable for walking on.

Houses won't need letterboxes, but they will still need to be numbered. Each one-lane road could be named after the suburb it is located within, and where it is located, followed by an alphabetic number (e.g., Suburb X-East-One, Suburb Y-West-Two, Suburb Z-South-Twenty-nine) – although there should be no need to put the suburb's name on street-signs identifying one-lane roads. Each house that is adjacent to a one-lane road can use just a proper number, while houses that aren't adjacent to one-lane roads use a proper number plus letter (i.e., houses are numbered 1 and 1a, 3 and 3a, etc., along one side of the road, while the opposite side goes 2 and 2a, 4 and 4a, etc.).

Late-20th century adults are often generalised as being happy to sit in their homes watching their TV ("We'll watch them [entertainers, sportspeople, etc.] rather than go out and have a life of our own" is a statement which typifies such a generalisation). Yet, an adult ought to: have enough imagination to be capable of entertaining itself (indeed, if its imagination is highly-developed, an adult doesn't need to read fiction – i.e., consume hours of its own time to experience another person's imagination); know that if it feels bored, no one but itself is to blame; refrain from idolising entertainers (or even clap/cheer their performances – r:p1646, ln17-22) – or want to get their autograph and other mementos; and primarily regard leisure time as an opportunity to interact with its children (bearing in mind that, as they grow older, children may want to spend an increasing amount of time with friends their own age) or grandchildren – especially to aid their mental or physical development – to further its own development, to simply relax (at home or on a beach), or socialise with other relatives/friends, and to complete household chores (including cooking). If, in addition to its capacity for self-entertainment, an adult has access to a catalogue of movies and TV programmes, music, books, and simple games while at home, local parks (where they can relax or picnic, or exercise their bodies by walking, jogging, etc.) and recreation centres (where they can exercise their bodies by playing sports or borrowing a bike; or watch other people playing sport), and opportunities to visit a variety of scenic locations within its own district, it wouldn't have any need – or even enough spare time – to ever go outside of its district for recreational purposes.

Most public libraries have a travel section, comprising books either about specific destinations or written by travellers recounting their experiences. Furthermore, there are few if any major tourist attractions in the world that haven't been extensively videoed or photographed (Japan's 'Mt Fuji is the most painted and photographed mountain in the world') – either for travel programmes, or by tourists themselves. The existence of such material means that if people are no longer able to travel around the world physically, they can instead do so vicariously (e.g., via the Internet)! However, there is no justification for producing more of these programmes and photographs. In addition, it shouldn't be necessary for members of the public to video or photograph relatives and friends (for most of the history of humanity, the majority of the species' members have coped with using their memory to recall the image of people they know or knew – or majestic scenery – and there is no reason why everyone can't do so again in future; after all, photographs of people generally either pander to their vanity or cause them embarrassment). As with video equipment, existing cameras and related items should be offered to the ministries which need to use them (but the Education Ministry needn't use them to produce class photographs). To encourage members of the public to donate their photographic equipment to relevant ministries, sales of camera film ought to be stopped and public development facilities closed down – although, obviously, HBs who maintain a stash of unexposed film and development equipment will temporarily be able to continue taking private photographs if they want to. Unfortunately for most of the people currently employed (or working freelance) as professional photographers – especially the paparazzi and those who take unsolicited photographs of people at tourist resorts then ask the subjects to buy a copy at exorbitant prices – the lack of skill required for their job (r:p1177, ln15) suggests they might find themselves being re-employed as labourers or in other low-skilled, possibly unpleasant, positions (such as cleaning sewers or public toilets), in a non-economic society (r:p1952, ln570-1)!

Because the Recreation Ministry would have to be responsible for a district's parks – as in *large public gardens* (low-lying areas within cities ought to be turned into parks because it doesn't matter if they occasionally end up under water – r:p2287, ln47), not the spaces where vehicles are kept! – it could be responsible for the management of public toilets (e.g., restocking the toilet-paper, cleaning them – although public toilets can be *self-cleaning*); and also for cleaning drinking-fountains, which, in addition to being placed in parks, should be provided at recreation complexes (along with toilet and showering facilities). However, because maintenance such as plumbing repairs ought to be performed either by the Manufacturing Ministry or Energy Ministry, it might make more sense to have one of these be responsible for managing such facilities (the Manufacturing Ministry, being the producer of toilet-paper and other cleaning products, seems the logical choice – with its workers receiving assistance from Energy Ministry workers when undertaking major plumbing repairs). Furthermore, because it is responsible for handling rubbish, the Manufacturing Ministry may be the employer of street-cleaners – although, if no one dropped litter, street-cleaners will normally only be required to empty strategically-placed public rubbish bins. Yet, if the Recreation Ministry is responsible for the tidiness of parks and sportsgrounds, perhaps its workers can also look after roadside verges (in which case its workers should remove any rubbish – including leaves and other foliage – they find lying on verges, footpaths or roads, and deposit it in the nearest rubbish bin, or deal with it in another suitable manner; and may even collect the contents of public rubbish bins on behalf of the Manufacturing Ministry), plus any land surrounding buildings or facilities used by other ministries – rather than have the other ministries employ groundspeople. In addition, the Recreation Ministry would be responsible for the upkeep of school grounds (excluding school buildings).

If pre-schools and primary schools all have children's playground equipment – such as swings, slides and 'jungle-gyms' – and children are always able to access it, large public gardens shouldn't need to contain playgrounds. However, each district may provide an amusement-park where citizens can ride on Ferris wheels, roller coasters, go roller-skating or skateboarding, skiing on artificial slopes, etc. Incidentally, cemeteries ought to eventually have their plots dug up (and the contents disposed of via a furnace or another suitable method) plus their memorials removed so that the land can be converted into a proper park or for another purpose (e.g., housing).

Another Recreation Ministry responsibility would be wildlife conservation (of flora, fauna and their habitats). As part of this responsibility (which involves the removal of pests), the ministry – in conjunction with the Food Ministry – should aim to eventually eliminate domestic animals from human society (which also means eliminating them from the planet – no great loss as long as distant relatives of a domesticated species still exist in the wild).

The sheep, next to the goat, was the earliest ruminant to be controlled... Today there are about 450 breeds of domestic sheep... There are six species of wild sheep. *Ovis canadensis* is the bighorn of western North America, *O. dalli* is the Dall sheep of north-western Canada and Alaska. In the Old World, *O. ammon*, the argali or Marco Polo sheep, *O. orientalis*, the urial or shapu are found in the U.S.S.R. and south-western Asia, *O. laristan* is confined to southern Iran and *O. musimon*, the mouflon, occurs in Sardinia and Corsica. It is presumed that one or more of the Old World species gave rise to the domestic sheep... There are, however, other theories, one being that domestic sheep are descended from species of wild sheep that have since died out... None of the wild sheep has woolly coats comparable with the domestic sheep. Rather, they have coats of coarse hair ranging in colour from creamy-white to brown. The coat of the wild sheep is, therefore, not unlike that of a goat... Scientifically, it is not easy to sort sheep from goats. The distinguishing features are that the horns of sheep grow to the sides of the head, those of goats curve upwards and backwards and are worn by both sexes... In goats the forehead is convex, not concave as in sheep. There are five species of wild goat, including the ibexes... [-] the name... applied to seven high-mountain forms of wild goat... [-] and the markhor. The wild goat *Capra hircus* from which the domesticated goat was derived, ranges from southeast Europe through Asia Minor to Persia and Pakistan. Domestication can be traced to 6-7 thousand years ago and it may have been earlier... Domestication of the zebu may have been earlier than that of western cattle. The first record was made in 4500 BC... its horns are more upright than those of the aurochs, the wild ancestor of European cattle... The zebu or Brahman cattle originated in southern Asia, possibly in India, but their wild ancestor is unknown... Some scientists claim it was domesticated from the wild gaur... but it differs... in its long slender face and in other features... The gaur is the largest species of wild cattle... one... shot in Burma stood 7 ft high with a girth of 8 1/2 ft... Closely related to the gaur are the banteng and the kouprey... Gaurs are still common in many places and banteng are not rare, but the kouprey is scarce... Some 50 million bison once roamed North America but in 1889 there were 540 left... The two species of bison alive today are the European bison, or wisent, and the American bison, often called incorrectly the buffalo... The buffaloes are a distinctive group of cattle... The two genera of buffaloes are *Syncerus*, the Cape buffalo of Africa... and *Bubalus* the Indian or water buffalo of Asia... There are localised populations of wild Indian buffaloes in Ceylon, Nepal, Assam, Indo-China and Borneo. A smaller species is the tamarau, restricted to the island of Mindoro in the Philippines... The other two Asiatic buffaloes, known as anoas, are found only on the island of Celebes... Th[e giant] forest hog, the largest wild pig in the world, very nearly became extinct before the western world ever knew about it. It was unknown to Europeans until 1904... Since then it has been found on Mount Kenya, in the Aberdare Mountains and in the mountain forests of Uganda and westwards through the Congo to Liberia... Domesticated pigs, or hogs, are derived from two wild species, the European wild boar and the Chinese wild pig. The Indian or crested wild boar may have contributed, but this is doubtful. It is not certain whether these three animals represent three different species or whether they are one species... The tendency today is to accept the latter idea. One reason for the uncertainty is that the wild pigs in question show a great deal of variety. One that probably must be separated from the rest is the pygmy hog of Nepal which is only 1 ft high at the shoulder... Peccaries are the South American equivalent of the Old World wild pigs, which superficially they resemble. They are smaller than the true pigs, however, and differ in other important details so they are placed in a separate family, the *Tayassuidae*... There are two species: the collared peccary... and the white-lipped peccary... Alternative names are musk hog or javelina... The warthog is thought by some to have the most grotesque face of all mammals... Perhaps this extraordinary grotesque head would prove, were we better informed on the habits and behaviour of the warthog, to be the result of a combination of remarkable adaptations to a specialised way of life... The name ass is given to two species of wild horse, *Equus asinus* of North and North-east Africa and *Equus hemionus* of Central Asia... It is doubtful whether there are any truly wild asses at large in Africa. Their numbers have been on the decline for centuries, the North African race becoming extinct in Roman times, and the others have interbred with domestic donkeys that have gone wild. The so-called wild asses found today in Ethiopia are probably derived from donkeys released by the Ethiopians as they retreated in front of the Italians during the last Abyssinian War. The Asiatic wild ass is more numerous and is being protected in several parts of Asia. There are three races of Asiatic ass, which are probably all the same but have been given regional names: they are the Onager of Persia, the Kiang, Kulan or Chigetai of Mongolia and the Ghorkar of north-west India... Early in the historic period [wild horse] numbers were much reduced through their being hunted for their flesh and for domestication. Only two remnants of what must have been big populations of wild horses persisted. One, the tarpan, survived in the Ukraine until 1851. The other is Przewalski's horse, also called the Mongolian wild horse, of Central Asia, which almost became extinct. The domesticated horse must have been from one or both of these, but when and how this happened is unknown... Przewalski's horse was discovered by Nicolai Przewalski, Russian explorer, in 1881... At that time they seemed to have been numerous but numbers decreased in the disturbed times following the Revolution of 1918. It is believed that 40 of them survived this but experts on this horse suggest that even these had been diluted by breeding with domestic horses. Even so, efforts are now being made to protect the surviving stock in the wild and preserve this horse in zoos... Horses readily go feral. This has happened in so many places that it helps us to understand how easily the wild horses surviving after domestication should have become so diluted by crossing with domestic stock... When we say somebody 'keeps chickens' in his backyard, we mean that the person owns domesticated fowls of the kind known scientifically as *Gallus gallus*. This is also the name of the red jungle fowl of southern and south west Asia, from the foothills of the Himalayas to Java. It is from this the domestic fowl is believed to have been bred, although some scientists believe that other wild fowl of the same region may have been involved, and they prefer to call the domestic fowl *Gallus domesticus*... The two species of prairie chicken are grouse that live in eastern and central United States... Prairie dogs are hamster-like, short-tailed ground squirrels that are so named because of their barking calls... They... live in vast 'towns', although these are smaller than they used to be because such large concentrations of animals inevitably came into conflict with [humanity]. In 1901, one town was estimated to cover an area 100 by 240 miles and to contain 400 million prairie dogs. As with other colonial or social animals prairie dogs have a social organisation which... is very complex. A single town is divided into a number of wards, whose boundaries depend largely on the geography of the area. The wards are divided into a number of coterie, each covering less than one acre. The coterie is the base unit on which the prairie dog's life is founded. It is the family unit that defends its territory and individuals rarely venture from it... A typical coterie consists of a [dad, three mums]... and a variable number of young... Perhaps the main advantage of the coterie system is that each group of prairie dogs has sufficient area for feeding, and over-grazing is prevented by not allowing other prairie dogs onto the square. When the population gets too big, some members emigrate to form 'overspill' towns... From a distance a prairie dog town appears pockmarked with craters because each burrow entrance is surrounded by a volcano-like cone. This... serves as a lookout post and a protection against floods... Prairie dogs fall prey to many predators, particularly coyotes... The depredations of so many predators does not affect prairie dog numbers but the prairie dog's use of the grassy plains has led to it being nearly wiped out... [USers] wanted the grasses for [their] livestock, who were also in danger of breaking their legs in prairie dog burrows. Poisoning was so successful that the towns were wiped out and prairie dogs now survive mainly in national parks... Scientifically the coyote is *Canis latrans*, barking dog, so-called because apart from the domestic dog it is the only member of the dog family that habitually barks. Foxes, wolves and jackals only bark at specific times... A half-eaten carcass of a cow or sheep with coyote tracks around it leads to the assumption that coyotes killed it, and revenge is extracted without thought that the animal might have died for some other reason, such as thirst... Coyotes used to live on plains and in woods of the western part of North America, being known as the brush wolf in forested regions and the prairie wolf in open lands. Within the last century their range has increased despite persecution and they are now found from north Alaska to Costa Rica... Even urban development has not deterred coyotes. They have moved into suburbs where, like the red fox in Britain, they can supplement their diet with gleanings from dustbins and other sources. There is a story of a Californian who wondered why his dog was not gaining weight despite being very well fed. [It was] later discovered that a pair of coyotes were stealing its food. One lured the dog away while the other bolted the contents of the feeding bowl... It is usually assumed that, but for its careful preservation by the various 'hunts', the red fox would have become extinct

long ago in the British Isles except in the wildest and most remote corners. For centuries it has been persecuted outside the hunt areas because of its alleged poultry-killing habits and even today the killing of a fox is still looked on with approval. Yet, in spite of all this, the fox has survived and at times is unusually numerous... The red fox ranges over Europe and over Asia as far south as central India, as well as northwest Africa... The North American red fox... is very like the Old World red fox in build and habits. There are several mutants, the cross fox... and the silver fox... The 'blue' fox is a variety of Arctic fox... The Arctic fox is very similar in appearance to the common red fox except that it is a little smaller... Sometimes called the tree fox, the short-legged grey fox is noted for its ability to climb... The difference between the crude climbing of the red fox and the skill of the grey fox can best be illustrated by an accident. A grey fox was found dead in a tree its tail caught by the tip in a forked twig and further held by having passed through a second fork. From the scarring on the bark of the nearby twigs the fox had made desperate efforts to free itself. The important point is that all the twigs around the fox were no more than 3/4 in. thick... Domestic dogs will sometimes climb trees. Those that do this most successfully are the small breeds with short legs... [T]he fennec fox... holds pride of place as the smallest of all foxes, and as the one with the largest ears... The bat-eared or big-eared fox is more like a jackal in appearance than a fox... There are three species of jackal, distinguished by their colouring... The divisions between these is obscured by the existence of many races and subspecies... The jackals are alike in size... they stand about 16 in. at the shoulder... The maned wolf is a South American fox. It looks like a large red fox on stilts because of its long legs... It stands 2 1/2 ft at the shoulder... Besides the maned wolf... South America... [has] the crab-eating fox, the small-eared dog... [- or] Zorro, the Spanish word for fox... which does not seem to be closely related to any other member of the dog family[-] ...and others, of which Azara's dog is one. It looks like a short-legged fox... The raccoon dog is a little smaller than a red fox... It gets its name from the patch of black around and under each eye that resembles the 'robber mask' of the raccoon... Raccoon dogs are native to eastern Asia... and... Japan... The raccoon dog has a valuable pelt and is now rare in Japan because it is hunted both for its skin and flesh. It has, however, been... introduced to... eastern Europe where they are now spreading... The introduction of a carnivore is usually detrimental, as with the mink in Britain, and the red fox in A[US], because they often severely affect the numbers of native animals. [But t]he raccoon dog does not seem to be a serious pest... A century or more ago the thylacine or Tasmanian wolf was being hunted relentlessly. Today expeditions go out in the hope of finding just one alive. The largest carnivorous marsupial, its scientific name means 'pouched dog with wolf head'. It has, however, been given a variety of other names at different times: dogheaded thylacine, tiger pouched wolf, zebra wolf, and even hyena. It is 3 ft long with an 18in. tail, although some reports have given its total length as up to 6 ft... The thylacine seems to have once been numerous over most of the continent of A[US]... The thylacine was probably exterminated on the... mainland through the introduction of the dingo, with which it could not compete. It was still plentiful in Tasmania, however, up to a century ago. As the settlement of the state increased and the thylacine began attacking sheep and poultry, a relentless campaign was launched to exterminate it... It is only recently, when it was seen to be on the brink of extinction, that the thylacine has been protected by law in Tasmania, and reserves are now being set up for it... The dingo is the wild dog of A[US], about the size of a collie... It is popularly supposed that dingoes always have the yellow-brown coat immortalised in the Yellow-dog Dingo of Kipling's Just so Stories, but they vary from light red to brown... Albinos are known... The darker dingoes are often assumed to be the offspring of matings with domestic alsatians, but this is not necessarily so, although dingo x dog crosses are quite common... The most likely explanation of the dingo's presence is that it was brought over in one of the Aborigine invasions from Asia as a domestic dog, and later went wild. The New Guinea singing dog is thought to have had the same origin... The red, or wild, dog of India and southeast Asia is not a true dog although it resembles village or pi-dogs, with which it is sometimes confused in reports... Like Cape hunting dogs to which they are related, dholes hunt in packs remorselessly running down their quarry... A widespread story in Asia is that a pack will urinate on some bushes in a selected part of a wood, then drive their prey through them. As the prey crashes through the bushes, it is blinded by the acid fumes given off by the urine and set upon by the dholes before its eyes have a chance to clear. Another version of the story is that the dholes spray urine straight into the eyes of their prey by flipping their tails... The story of the dhole's chemical warfare may perhaps have started as an observation of their marking bushes in the same manner as domestic dogs... The bushdog... is a South American member of the dog family, only distantly related to the domestic dog but behaving very like it when tamed... [T]he Cape hunting dog, or African wild dog... is a ferocious carnivore [which also is] only distantly related to the domestic dog. Unlike true dogs, foxes, wolves and jackals[, it]... has only four toes on the front foot, that is, the dew claws are missing... Today, there are two distinct species of wolf, the grey or timber wolf which is still found in the wilder parts of northern Europe[('it has been extinct in Britain since the 1740s')], Asia and North America and the red wolf which is restricted to the south-central U[S]. There are numerous local races, however, differing in size and colour... From the many races of wolf, the Indian wolf has been selected by some students as the probable forerunner of the domestic dog... but modern opinion favours an extinct wild dog... There... is a real fear that... wolves may soon become extinct... One way they are hunted is on horseback, with a lasso. The wolf is vulnerable to this because, having... no natural enemies... it merely runs for a while then stops and looks around. The idea of continuous flight seems to be absent from its makeup, so it fails to make the use of its speed, which is said to be greater than that of any other member of the dog family, and comparable to that of the cheetah in the cat family... The wild cat of Europe and Asia resembles the domesticated tabby but is more heavily built... The wild cat is one of the fiercest and most destructive of the cat family and when hard-pressed its strength and ferocity are remarkable. Some so-called wild cats are feral domesticated cats and although these do not attack human beings they will fight capture as furiously as the true wild cat... [I]t is indeed remarkable that the cat was domesticated in the first place... A typical... domestic cat is about 2 1/2 ft long, including a 9 in. tapering tail which, unlike that of the wild cat, is held horizontal when walking... The most common, the tabby, is of two kinds. One has narrow vertical stripes on the body, similar to those of the bush cat and European wild cat. The other is nearly the same colour, but consists of broad, mainly longitudinal dark lines and blotches on a light ground. In extreme cases, the dark markings are relatively few, strongly drawn, and stand out conspicuously against the lighter background. Such cats are recurrent mutants that parallel the king cheetah... The cheetah is one of the 'big cats'... The big cats hold their feet out in front of them when crouched, like Landseer's lions in Trafalgar Square, while the small cats tuck their feet in, like a domestic cat... Lion's were once common throughout southern Europe and southern Asia eastwards to northern and central India and over the whole of Africa... Lions have been wiped out in northern Africa and in southern Africa, outside the Kruger Park... By 1884 the only lions left in India were in the Gir forest where only a dozen were left... Since the beginning of th[e 20th] century the Gir lions have been protected and a... census taken in 1968... puts the figure at about 170... The total length of a lion may be up to 9 ft of which 3 ft is tail, the height at the shoulder is 3 1/2 ft and the weight up to 550 lb. The lioness is smaller... [T]he tiger... averages... 9 ft 3 in. in length including a 3 ft tail. It stands 3 ft at the shoulder and weighs 400-500 lb... The various races of tiger vary considerably in size from the small Bali Island tiger to the outsized tiger found in Manchuria which may reach 12 ft in total length... From its original home in Siberia, the tiger spread across almost the whole of Eurasia during the Ice Ages. Today it is found only in Asia... Tigers have a respect and fear for [humans] which is difficult to explain. Even if harassed by curious humans... a tiger will not normally react until its patience is well-nigh exhausted. Normally a [hu]man can walk in a tiger's habitat without fear or hindrance and there have been several instances of a tiger approaching a [hu]man while sitting quietly near his camp and passing by, doing no harm even though it was obvious that it had seen him. [People] have been followed for many miles by tigers and have come to no harm; they were probably being escorted off the territory. It is only when its normal hunting routine is disturbed that it becomes really dangerous... especially when shot at indiscriminately, incapacitating it rather than killing it. A wounded tiger left to its fate, without the strength to hunt, will resort to [hu]man-eating or cattle killing, out of necessity, as it will when injured by natural mishap... Old age may also cause a tiger to attack cattle or humans... One of the most beautiful members of the cat family, [is] the ocelot... The name 'ocelot' is from a Mexican word tlalocelotl, meaning field-tiger... The margay cat, which is about the size of a domestic cat... is closely related to the ocelot... Although a member of the cat family the jaguarundi is more like a large

weasel in shape and habits... Jaguarundis [inhabit]... the southern border of the U[S] southwards to northern Argentina... [The jaguar] is the largest of the American cats and is known as el tigre in South America. The jaguar is no longer than a leopard but is more heavily built... The size of the leopard... varies from one part of its range to another, the range being southern Asia and much of Africa... The panther is a black or melanistic variety of the leopard... Probably no other animal has received so many common names... [than the one] known in Britain as the puma and in the U[S] and Canada as the cougar... [A]nother... is the mountain lion, which gives a clue to the appearance of the puma. It looks like a lioness... Although there is only one species, 30 subspecies have been named, based on differences in size and colour... The puma is known for its remarkable strength and stamina. It will cover up to 20 ft in one bound... can leap upwards to a height of 15 ft and has been known to drop to the ground from a height of 60 ft. Like many other members of the cat family, the puma leads a solitary life keeping very much out of sight... Although there are other cats, the puma or lynx for instance, in the U[S], the... wildcat of America... is... the bobcat[– which is] much smaller and is comparable with the European wildcat... The name bobcat is linked with the short tail, [but it]... stands somewhat apart from the other... bobtailed members of the cat family[– the lynxes]... The original animal to be given this name, now distinguished as the European lynx... has a relatively short body, tufted ears and cheek ruffs... Closely related to it is the Spanish lynx, which is smaller... The Canadian lynx is larger... Also known as the desert lynx, the caracal is regarded by some zoologists as akin to the serval, one of the medium-sized cats... Although it used to be classified as a distinct species, the servaline cat... is now known to represent only a second colour phase of the serval... The serval is hunted for its skin, used in making the mantles worn by the chiefs and high officials of some of the African tribes. Apart from [those people] it probably has few enemies.

Ideally, farm animals would be allowed to live out the remainder of their lives in peace on land that is unsuitable for growing crops (domesticated animals should only be released into the wild if the survival of their wild cousins is threatened, the domesticated and wild genes can be mixed, and in numbers that won't create a population explosion). However, farm animals can't be left in peace – because the sexes have to be kept separate (at least during breeding seasons; unless they are able to be sterilised via their feed or some other simple solution) so the population isn't maintained or increased; fences have to be well maintained to prevent the animals from invading urban or wild areas; plus their health, and access to adequate supplies of feed and water, has to be checked. Furthermore, if the aim is to eliminate domestic animals from the planet, it isn't logical to put their needs ahead of those of starving people – after all, even if all of the grazing land could immediately be converted into crops and everyone instantly converted to veganism, there is the issue of how to feed people until those crops can be harvested. One option is to increase the volume of fish harvested from the oceans (r:p2088, ln69) – but, because many stocks are already threatened by overfishing, increasing the volume might not be viable; indeed, it may be necessary to reduce the volume. Therefore, the number of farm animals might have to be reduced gradually.

The Food Ministry should concentrate as many farm animals as possible on hilly pastures, orchards and within plantation forests. The excess – preferably made up of older animals – ought to be humanely slaughtered (rather than be kept on land which is suitable for growing crops) and used to feed members of threatened carnivore species that are being kept in zoos (until they, or their offspring can be released back into the wild – after which time zoos would become extinct instead), pets (although dog-food can be mostly vegan – r:p2086, lns61-2 – while cat-food could have an increased fish content) and HBs. If the initial cull produces more meat than is immediately required, any leftovers will need to be frozen or processed (e.g., tinned – especially as petfood).

The activities of organisations such as the Society for the Prevention of Cruelty to Animals, pet shops and veterinarians (including those who work with farm animals) should all be condensed under the management of the Recreation Ministry – then be focused on trying to prevent existing pets from breeding; from causing problems (e.g., attacking other animals or people); and being mistreated (the Northlander who 'drove past the local SPCA office on his way to the bridge from which it threw a bitch and her puppies – the bitch and one puppy were saved by witnesses – will be prosecuted'; but no one witnessed pups being thrown into a Bay of Plenty river, some of whom were saved by a teenager; or saw the 'coward who dumped a litter of 12 10-day-old pups in a rubbish bag in a Te Atatu South reserve' – thankfully, 'most of the crossbreeds have now found homes'). Citizens could be obliged to register their pet(s) in order to gain access to society-produced supplies of petfood (production volumes of which can be calculated via the register). Owners of neutered pets might receive their allocation of petfood for free (and neutering, as well as any other veterinary work, be performed for free) – dependant on how many animals an owner has – although petfood would have to be provided for free to owners once money has been eliminated from society (however, if everyone co-operates in the effort to prevent further breeding, the existing generation of pets will be the last – i.e., their extinction may occur before money's; and roughly coincide with the death of the last farm animal – after which society won't need to train any more specialist veterinarians).

In the event that a pet does produce a litter, the Recreation Ministry ought to be responsible for placing the weaned offspring in suitable homes. The same goes for captured strays. Unwanted or uncontrollable pets and strays shouldn't be kept alive – unless society is able to produce an excess of petfood, and an excess of workers to care for them at a suitable facility. Assuming that this isn't a viable option, their carcasses – excluding those of animals which were afflicted with certain diseases – can be turned into food for HBs and other carnivorous animals (including household pets). *Unwanted* would need to include animals which may be wanted by owners but not by local authorities (e.g., mustelids within NZ). Rather than return these animals, and other humanely captured pests (such as NZ's possums), to their closest natural habitat, their carcasses could also be used as a food source – at least for pets or zoo animals. Furthermore, having slaughtered any animals, it makes sense to use their pelts to produce clothing or other products, and utilise as many remaining body parts as is possible. However, it doesn't make sense to continue trying to control pest populations ad infinitum – therefore, while the existence of deprived peoples is the paramount concern of society, efforts to keep pest populations in check should be maintained at present levels; and efforts to completely eradicate pest species be activated once essential resources and services are available in sufficient quantities.

There may be some instances where, instead of slaughtering them, a group of animals which have been designated as pests in one part of the world are transferred to another part. An example of this already mentioned is the transfer of certain wallaby species from NZ back to AUS (r:p2473, ln49) – although, since being 'reintroduced into SA's Innes National Park, 4 of 10 tiny tamar wallabies have been killed by foxes'. Similar – but better-planned – schemes could be put in place for the wild horse populations of NZ and AUS (which is estimated to 'now have more wild horses than any other continent'). Both of these wild horse populations (and AUS's wild camel population, perhaps), should eventually be removed from these lands – where their continued freedom threatens the environment. One solution might be to capture Kaimanawas and Brumbies one family unit at a time, then transport the unit to a part of the world which has supported large wild horse populations for millennia – especially those that no longer do but could again (e.g., Central Asia).

NZ already has a number of reserves for native flora and fauna which are surrounded by fences designed to prevent pests – especially predatory animals – from gaining entry (in addition to this specialist fencing, 'it's estimated there are between 10,000km and 12,000km of [standard] DoC fences in the North Island' alone). The 7km of fencing at the Karori Reserve near Wellington 'is curved at the top to stop climbing animals going over it, has small enough mesh to stop little animals (even baby mice) getting through it, and more mesh at the bottom to stop digging animals' getting under it. The Manufacturing Ministry ought to continue making more of this type of fencing (or, alternatively, translucent plastic panels whose surfaces are too smooth to be climbed) so the Recreation Ministry can continue to create these reserves or extend existing ones.

Wherever suitable, the Recreation Ministry should enclose an area of land with such fencing, eliminate every unwanted plant and animal from within, then replace them with native species (bush or forest regeneration may have to occur before some or any native animals are released). In the meantime, work can commence on a second fence – which will eventually enclose a larger area of land, with the first area approximately at its centre. Once the second fence has been completed and the first area of land cleared of pests, work to eliminate pests from the land between the first and second fences would commence, and on building a third fence – which encloses the second fence plus more land. After the third fence is completed, work on clearing pests from

the newly enclosed area of land commences, as well as work on a fourth fence. When every pest has been eliminated from the land between the first and second fences, the first fence can be removed (and used to help complete the fourth fence). The clearing left by the first fence could be maintained as a scenic road or walkway, or be planted with seedlings to remove all trace of its existence (along with any other evidence of human habitation). The second fence may be ready for removal while a fifth fence is being completed. Eventually, scenarios would arise where two reserves end up sharing the same outer fence – until some or all of that fence is removed, thereby turning the two reserves into one; or where a fence reaches the outer limits of a city's farmland. The Recreation Ministry continues this process until, for example, it has eliminated every animal and plant pest from NZ (a process that could take decades, if not centuries), by which time the remaining fences can be removed – and taken to be used in another part of the world, perhaps – with the exception of those which surround cities and their farmland. Those ought to be kept in place to prevent wild animals (with the obvious exception of non-flightless birds) from getting into farmland and urban areas (note that once such a fence is in place, there would be no need for any other kind of fencing – except, perhaps, to create windbreaks – within farmland areas). By the way, if plantation wood-pulp continues to be used by society in future, harvesting of trees – via helicopters (to minimise damage to other trees) – should cease during nesting season (loggers could cut down more trees than processing facilities are able to handle, thereby building up a backlog for the facilities to process during nesting season – at which time the loggers would perform other forestry work, such as replanting and pruning, or use up some or all of their holidays).

Where two or more cities share a mutual rural boundary (as might be the case in NZ if districts are based on the cities of Auckland and Hamilton), there would be no need for any fencing along that boundary – instead, one fence will effectively surround the two cities (although, using the example of Auckland, there may be breaks in the fence where it reaches a river or harbour's edge then recommences on the opposite side of the water). Some parts of the world (e.g., south Britain) could continue to be so overpopulated that there is no room for any wildlife areas between a number of neighbouring districts – and, therefore, no need for any fencing between them – or there are only a few small, fenced-off wildlife reserves surrounded by the rural boundaries of three or more districts (efforts can, however, be made to develop corridors that link small reserves – much like a 'group of billionaires are trying to do in North and South America to recreate former migration trails' – thereby also helping to prevent wildlife populations from becoming inbred). In other parts of the world (e.g., most of Africa), fences should only need to be built around areas of land which have been designated for cities and their surrounding farmland – which means wild herds ought to be able to follow traditional migratory trails undisturbed by humans (albeit with the occasional detour around a fenceline).

Such fences should mean that people living in Africa, for example, are going to be safe from potentially dangerous wild animals if they remain inside their city's boundary (although, where elephants and other large animals roam, the fences might need to be stronger than elsewhere – but sheltering the fence with rows of large trees may be an easier solution, as long as firebreaks are created between the trees and fence to prevent wildfires threatening farmland and urban areas, which would also mean that the trees are too far from the fence to ever fall on it or enable animals to leap over it; alternatively, fences in African and Asian states could be fitted with sensors at strategic places to ward off any large animals that during periods of drought might individually or collectively try to knock such fences over). There would, however, need to be occasional exits in the fence (preferably utilising a prison-like double-gate system to prevent wild animals from entering farmland and urban areas while citizens or vehicles are using an exit – although, sensors could again be used to set off a horn or other noise capable of scaring off wild animals that enter the vicinity of such exits; if railway lines aren't enclosed – r:p2348, lns30-1 – an extended double-gate system can also be used wherever they dissect a fenceline).

Buses can go through these exits to take citizens on scenic tours. Bikers and hikers and campers will also be able to use such exits – although, if the wildlife area contains potentially dangerous animals ('a stroll in the British countryside isn't what it used to be – a panther is thought to have recently attacked an 11-year-old boy near Monmouth; from panthers to pythons, a menagerie of beasts more often associated with jungle expeditions than weekend rambles is populating Britain's fields and woodlands; the Royal Society for the Prevention of Cruelty to Animals accepts the possibility of big cats on the loose, especially after a former lion tamer confessed in a BBC documentary to releasing a panther and a cougar near Sheffield in the 1970s; "Panther Watch" has logged over 100 sightings this year, and believes the cats are descended from animals released into the wild around the time of the introduction of the Dangerous Animals Act in 1976 by owners fearful of the consequences of being discovered'), they ought to notify the relevant authorities and carry some form of protection (such as a fog-horn – which may be safer for the biker or hiker to use than a gun, and definitely safer for the wild animals! – plus some kind of transmitter, or other means of raising an alarm if they get into difficulty) – either provided by the Recreation Ministry via suburban recreation centres or stored beside fence exits. Manufacturing Ministry vehicles might have to use fence exits to access any quarries that are located outside of a city's urban or farmland area (in which case an animal-proof fence should be constructed around the quarry) – although the quarry could be linked to the city by railway. However, the long-term use of quarries would be unnecessary if a time comes when all of the products humans use are able to be sourced from plants.

Wherever possible, the Recreation Ministry should aim to restore any environments altered by humanity for farming, forestry, mining, etc., which society no longer needs to use. That ought to be largely possible in places like NZ (the 'Department of Conservation has been sending teams of workers to the Kermadec Islands to remove every plant that isn't native in an effort to return the islands to their original state'), but may be impossible in areas where humanity has existed for thousands of years – even if the land's original state is known. If a *balance of nature* can be resumed in wildlife habitats, human society won't need to continue devoting resources to achieving that balance. However, in some instances it might be necessary for a state to monitor wildlife habitats, and periodically intervene to curtail population explosions by certain animal species, *ad infinitum*. One instance could be North American bison – although North America's big cats and wolf packs should eventually be capable of keeping the bison and other herd species in check. Furthermore, cities like Auckland – where ducks seem to be capable of producing at least two broods of offspring per year – would become overrun with ducks once cats and dogs have been eliminated, the number of vehicles using roads has been reduced and street drains have received duckling-proof grates, if control measures aren't initiated (alternatively, Auckland could become overrun with eels). In addition, it might not be possible to fully eliminate some types of pests – especially insect species (although future technology may be of assistance – e.g., if it becomes possible to produce a tiny transmitter which can be stuck to the back of trapped wasps, thereby enabling the wasps to be tracked back to their nest, NZ could eventually eliminate its alien wasp problems; alternatively, alien wasp nests might be tracked by heat-seeking devices).

It will be much more difficult to restore aquatic environments, but serious efforts should also be made to remove pest seaweeds, starfish, etc., from coastal waters (and, ideally, eventually try to find and recover containers or other lost cargo from the oceans and seafloor – plus any hazardous chemicals at risk of escaping from shipwrecks, or even the wrecks themselves).

If the Recreation Ministry uses video cameras to film its conservation activities (e.g., to provide a record of what they are doing for future reference; to use as a training aid), such footage could be edited to produce up-to-date nature documentaries – in which case the ministry will not only need to employ video operators but video editors. Incidentally, the Recreation Ministry can be used as a means of providing employment to people who are in between jobs (e.g., people who perform seasonal work; people who have completed a training course and are awaiting permanent placement; people who are excess to requirements for other reasons) – because much of its work isn't essential or particularly skilful. The Recreation Ministry will still need to employ full-time crews (e.g., to keep urban areas mown and tidy; to perform conservation work) – but their numbers would be bolstered by temporary assistants whenever such are available (therefore crews should concentrate on completing their core tasks when the number of temporary assistants is low, tackle less pressing tasks when the number of temporary assistants is high). Obviously, there are going to be opportunities for talented sportspeople to apply their skills fulltime by working at suburban recreation centres. However, the skills of the most athletic members of society might be best employed by the ministry that provides emergency services (e.g., firefighters) and 'a civil force responsible for maintaining public order'.

FENCE

All the injustices and cruelties customary in present-day life have become habitual only because there are [people] always ready to carry out these injustices and cruelties. If it were not for them there would not only be no one to wreck violence on those immense masses of oppressed people, but those who issue the orders would never venture to do so, and would not even dare to dream of the sentences they now confidently pass. Were it not for these [people] ready to torture or kill anyone they are commanded to, no one would dare to claim what is confidently claimed by all the non-working landowners, namely that land surrounded by [workers] who are suffering for lack of land, is the property of a[n individual] who does not work on it, or that stores of grain collected by trickery ought to be preserved untouched in the midst of a population dying of hunger, because the merchant wants to make a profit. But for the existence of these people, ready at the will of authorities to torture and kill anyone they are told to, it could never enter the head of a landowner to deprive the peasants of a wood they had grown, or of the officials to consider it proper to receive salaries taken from the famishing people for oppressing them, not to mention executing, imprisoning, or evicting people for exposing falsehood and preaching the truth... A French writer, Alphonse Karr, now forgotten, when arguing the impossibility of doing away with capital punishment, said somewhere: *‘Que messieurs les assassins commencent par nous donner l’exemple!’* and I have often heard that *bon mot* repeated by [those] who thought it a worthy and convincing argument against the abolition of capital punishment. Yet nothing expresses more clearly than that epigram the error in the argument of those who consider it impossible for governments to abandon the use of violence as long as there are still [people] ready to employ it. The advocates of governmental violence say: ‘Let the murderers set us the example of abandoning killing, and then we too will give it up’; but the murderers say the same, only with much better right. They say: ‘Let those who have undertaken to teach us and guide us, set us an example by ceasing to kill people and then we will imitate them.’ And they say this not in jest but in earnest, for that is actually the state of the case. ‘We cannot give up the use of violence because we are surrounded by violent [people].’ ...Tolstoy saw more vividly than any writer of his time the immense evils of organized government. An English or West-European reader of course feels that Tolstoy’s denunciations are overstrained because when [Tolstoy] speaks of governments [Tolstoy] thinks chiefly of the Russian. Yet if [Tolstoy] had lived on to see the governments of Europe, as they now are, with the poison of war still coursing in their veins, [Tolstoy] would not have found much to alter in his language. The supposed ‘principles’ on which most of them are based are exactly described by Tolstoy, as ‘immoral off-hand jottings of utterly baseless thoughts’. And it seems to me no exaggeration but strictly accurate language to say that they are at the present moment engaged in ‘deliberately stupefying [their guy population] in order to make them fit instruments for murder’ – or at least, if ‘murder’ is a question-begging word, let us say ‘for the killing of the innocent’. The evidence is not only in the propaganda of various perverted Nazis and Fascists; the average English[guy] who attends an Air Pageant does as a rule feel himself thrilled, bewitched or, as Tolstoy puts it, ‘stupefied’ till it seems a splendid and heroic thing to make war from the air, not a monstrous and diabolical thing, as it really is. And the Government, lest there should be any doubts about its purpose, sends special invitations and free admissions to boys’ schools. They will be easiest to ‘stupefy’ if we catch them young, and they will be ready when wanted to do the killing. And this, one may fairly reason, is not because ours is a bad or tyrannical government, or a government that wants war. Quite the reverse. It is, as such things go, a very good government; but it is a... great Killing Machine surrounded by other Killing Machines, and it must act according to its nature. It dare not face the risk of its little boys growing up to believe in... humane principles while those of its possible enemies are properly ‘stupefied’. And that they certainly are. Never has there been such a terrific propaganda of evil doctrine as during the last few years, and the doctrine is precisely that mad worship of the State which Tolstoy so consistently denounced... Relieved of the checks and oppositions which control... patriotism... in a sane society, it swells into a megalomania which demands more and more... ‘All power corrupts’, as Lord Aston said, ‘and absolute power corrupts absolutely.’ ...War insists on absolute command, and cares nothing for right or wrong... - 1935

I imagine that a device that identifies and locates a... person with certainty – an “anklet” or its equivalent – will be introduced first for reasons of convenience in communications... Certainly, many people would find it attractive to be able to receive a telephone call anywhere, rather than having to hover around a particular phone booth... The extension of an identification system to crime prevention will be far more controversial, because it will necessarily require some loss of privacy. In... nations where human rights are protected, participation in a system of identification and location will presumably occur only on the basis of individual free choice. In that case, it is inevitable... enclaves will develop that are barred to persons who refuse to submit to identification. Is that bad or good? The debate over that issue will surely be hot and... continue for a long time. To state only the positive points, an accurate record of individual positions will be an effective deterrent to... crime in any enclave where such records are required of all who enter. For all crimes from mugging to vandalism, both the accurate identification of the criminal and his tracking and arrest would be quick and sure, and it would be far more difficult for him to avoid punishment than it is now. Technically, it would be easy to add to such a system a feature that would allow anyone in a threatening situation to call for help. Given the capabilities of the system for identification and location, that simple appeal would be enough to provide local police with instant and accurate knowledge of where the threat was occurring and who other than the victim was on the scene. That would make it possible to prevent, instead of merely punishing, most... crimes. What would it be worth in loss of privacy to know that one’s child could walk any street, day or night, and be safe from molestation, even in a world where a potential deliberate murderer could move thousands of miles in a single hour? ...A good deal, I suspect, and the proliferation of home burglar-protection monitors, the rapid growth of enclosed patrolled shopping malls and of planned communities entered only through gates, all suggest that a century from now most people... will be settled in enclaves where security is assured and from which weapons will be excluded. - 1981

[In *the words of Gandhi*... “Liberty never meant the license to do anything at will.” - 1982

In a game of deadly threats played by resolute [participants], the more amoral or ruthless side is bound to prevail and nuclear weapons and other genocidal devices are ultimately unsuitable for the defence of liberty. And if nuclear threats, unmitigated by moral factors or political dissent, are allowed to determine the political shape of the world we must prepare to live, if at all, under a ruthless global empire. Whether it is obtained by war, by political conquest, by Super Powers uniting ‘to keep the peace’, or by well-intended efforts to give military supremacy to the U[N], that is the most likely outcome. The empire will be obliged to employ totalitarian methods to ensure that no rebels can hope to make or steal nuclear weapons for themselves. So... we shall survive only at the expense of freedom. If we hastily switch to negotiated comprehensive disarmament, we might expect to scrape through with both lives and liberty intact. The improbability of such a profound change of heart on all sides, least of all among those who might expect to rule the world, suggests that our creative, freedom-loving civilization is doomed, one way or another... [In 1822

Lord Byron, much taken with thoughts of catastrophe, asked: "Who knows whether, when a comet shall approach this globe to destroy it human beings will not hurl mountains, as the giants are said to have done, against the flaming mass?" We know.] A growing awareness that the inner Solar System is littered with substantial objects that cross the Earth's orbit and sometimes hit our planet prompts thoughts about an *Anti-Comet Battery*. The chances of a formidable space collision in, say, the next thousand years are better than two hundred to one against and we should wish that nuclear war were as improbable as that. But the very small piece of Comet Encke that hit the Earth in 1908 was equivalent to a fairly large H-bomb and had it fallen on a city rather than the remote Tunguska valley of Siberia it would have killed many people. An entire comet colliding with the Earth can release energy equivalent to about a million megatons of explosive... In keeping with our new perception of our place in the cosmos and amid life on Earth, the management of comets and... Apollo (Earth-crossing)... objects to avert these rare but dreadful catastrophes has become a matter of small-scale study, notably in Project Icarus at the Massachusetts Institute of Technology. Large H-bombs carried by rocket can in principle deflect and perhaps disrupt an oncoming object and so 'save the Earth'. My nominal Anti-Comet Battery consists of perhaps a hundred missiles with H-bomb warheads... stationed in high orbits around the Earth, ready to be launched on command to deal with any inanimate cosmic intruder that is liable to cause death and damage on the Earth. But this is only the 'sharp end' of a much larger ground-based and space-based astronomical militia. Because the objects are difficult to spot, and even quite small meteorites might be regarded as suitable targets, there is no limit to the amount of effort that could be devoted to this task. The obvious risk of the Battery being subverted by someone wanting to dominate the Earth from space can be weighed against the benefit of channelling into benign purposes the military urges of the human [being]... For the precedents of this kind of activity one thinks of fire-fighting and lifeboats and especially medicine. - 1983

Believing that every object and every event in the universe is arranged and directed by an Omnipotent Contriver, we must admit that when the [Contriver] formed the wondrous plan of creation, 'foreseeing the end from the beginning', [the Contriver] arranged the periods and the velocities of comets in such a manner that, although occasionally crossing the planetary orbits, they should not pass these orbits at the time when the planets were in their immediate vicinity. And should such an event ever occur, we may rest assured that it is in perfect accordance with the plan and the will of Omnipotence, and that it is, on the whole, subservient to the happiness and order of the intelligent universe, and the ends intended by the Divine government... It seems likely that had not a comet or asteroid hit the Earth 65 million years ago (or subsequently), the dinosaurs would still be here, and we would not. We would be merely one of a countless number of unrealized possibilities in the genes and chromosomes of the other beings of Earth – as we can be again if we are not very careful... Fortunately, we are today midway between mass extinctions. The next bombardment is not scheduled, if the periodicity is correctly determined, for another 15 million years. Our job is to avoid becoming one of the background extinctions; in 15 million years, we may be ready for the comets... The idea that humans should be able to do something about a comet on collision trajectory with the Earth has many antecedents in science fiction, as does the notion of capturing an asteroid or a comet and employing it for human benefit... Since the platinum group of metals... is relatively more abundant in asteroids (and probably comets) than on the Earth, there may be real economic motivations for mining small bodies that come close to the Earth... Every 10,000 years or so, a comet or asteroid that is around a hundred metres across strikes the Earth... An asteroid 100 metres across has a mass of a million tons. There are some 100,000 of them in the vicinity of the Earth... [M]ost... will be ejected from the solar system anyway, if they do not first collide with the planets or disintegrate... so there is certain justification here... for the admonition, 'Use 'em or lose 'em'... A rocket motor is towed to the asteroid, attached to it, ignited, and used to change its trajectory. Perhaps use will be made of the gravity of the Moon... to bring it to a convenient orbit about the Earth; there, it would be dismantled, and great cargo ships would carry the valuable metals to the Earth. From a purely economic standpoint, [however,] the question is whether the [resources] spent to capture, dismantle, and transport asteroidal material to Earth would be better spent on extracting ores already on Earth... Where the... benefit of space mining becomes most apparent is in building large structures in the Earth's orbit. Such constructions might have other justifications: the manufacture of pharmaceuticals and exotic alloys, for example, for scientific investigations... and even – if we are so foolish as to permit it to happen – for the introduction of weapons systems into space. - 1985

It has been estimated that 80[%] of science graduates enter defence-related industries, which consume enormous quantities of raw materials, energy, space and... divert human capacities... At present, at the top of each nuclear state a few people have the power to decide about the life and death of the human and other species. Peace cannot be just the absence of war. We must rethink our attitudes and values. Peace requires... cooperation, mutual support and the free exchange of information. It means material security for all the world's people, regardless of sex, colour or age. It means realizing that we are all one... Any defence that does not promote trust and security is increasing, rather than reducing, the risk of war. Disarmament must be an intrinsic part of a world-wide movement towards a sustainable economic, social and political order.

...The notions of national security and defence lie at the very basis of... the nation-state. As [one writer] foresaw as early as 1957 in *The Breakdown of Nations*... the current nation-states are no longer effective units of governance, being too big for the problems of their local populations and, at the same time, confined by concepts too narrow for the problems of global interdependence... The only industrial planning in th[e US] at the national level, so conversion specialists... [(who) discuss switching from the production of weapons to that of products such as light-rail vehicles... and alternative energy systems[)]... maintain, is strictly defence planning... National-security imperatives render heads of state powerless to reorder their priorities towards an emphasis on human needs and development and, paradoxically, make them unable to resolve even the urgent problem of human survival... Replacing the notion of national security with that of global security would make resources and talents now consumed by national-security goals available for resolving local and regional problems. To realize the liberating power of such a shift of emphasis, we have only to remind ourselves that today nearly half of the world's scientists and engineers work for the military-industrial complex. - 1990

Up to 25,000 workers from France's state-owned armaments industries staged a noisy but peaceful march through central Paris yesterday to protest against Government plans to close factories... Meanwhile... a large asteroid – capable of causing widespread devastation and death – barely missed the Earth. This sobering incident convinced many Americans of the need to develop a contingency plan so that the next time the human race is threatened by a disaster of this magnitude, we can sue.

...Scientists are to discuss the threat posed by an asteroid hitting the Earth, amid claims the British Government is not awake to the risk and does not support an A[US]n early warning project. Experts believe the chances of being killed by an asteroid impact is four times higher than that of dying in a plane crash... Scientists are taking the danger seriously, and have set up observation teams to watch for Near Earth Asteroids (NEAs). But the early warning post set up in 1990 to cover the Southern Hemisphere, the Anglo-A[US]n Near Earth Asteroid Survey, is now under threat because its funding runs out at the end of the year... [The manager] who runs the observatory at Siding Spring in A[US], said no new funding has been offered by the British side of the partnership. Scientists will meet at the London headquarters of the British National Space Centre today to discuss the problem and the role Britain should be playing. [The manager] said the British Government was "working from a position of profound ignorance" and did not understand the danger... "The probability of an asteroid... impact is small, but the consequences are horrendous. People like to imagine that there are battalions of astronomers scouring the skies – there aren't. If a half-mile asteroid is due to hit us next week, you can expect six seconds' warning... By the time you've turned to look at it, it will have struck the ground... Then it's goodbye." ...[the] leader of

America's Spacewatch programme which is tracking NEAs in the northern sky, had also identified the closure of the A[US]n project as a major backward step, and... the father of the hydrogen bomb, had written to the [PM]s of Britain and A[US] expressing concern over the lack of action.

...In 1994 there was heavy media coverage when Jupiter was struck by some twenty kilometre-sized fragments of comet Shoemaker-Levy 9... Less well-known is that Howard-Koomen-Michels 1979XI, a comet whose head was larger than the Earth, hit the sun in 1979, while in late 2126 the comet Swift-Tuttle, a trillion tons of ice and rock moving at some sixty-five kilometres a second, will (if present calculations are right) cross Earth's orbit at a point from which Earth itself is only two weeks distant... Every year there are approaching twenty atmospheric impacts in the 1-kiloton range. In 1994 a 100-kiloton blast filled the skies near the Pacific island of Tokelau. In 1937 an asteroid almost 2 km wide crossed Earth's orbit, missing Earth itself by about six hours. In 1989 there was another six-hour miss, although in this case the object was only 1 km across. Glassy spherules suggest four impacts of bodies weighing about fifty billion tons over the last thirty-five million years, the latest taking place about a million years ago. A Spacewatch Workshop sponsored by NASA in 1980 concluded that a 'civilization-destroying' comet or asteroid strike, meaning one in which at least 10[%] of the world's population perished, could well have a 1 in 300,000 chance of happening in any given year: the participants felt confident only in saying that the figure should fall somewhere in the range from 1 in 1,000,000 to 1 in 10,000... [T]he less alarming 'best guess' figure of 1 in 300,000 would mean that one's risk of experiencing it would be something like a sixtieth as great as that of dying in an automobile accident. Might it be worth trying to deduce the risk? *The Economist* of 11 September 1993, working with the fairly conservative estimate that the annual risk of a person's dying through an impact was one in two million, pointed out that for Americans this was higher than the risk of death from any other type of natural disaster. Given, it continued, that the British government thought it worth \$1.2 million to save a single life through increased road safety, one might expect the... world to pay \$470 million a year to avert impacts. Working over twenty-five years, a set of electronic detectors and a few dedicated telescopes could discover 90[%] of threatening objects with widths above one kilometre, the program costing only \$50 million at the start and then \$10 million annually. If the telescopes detected a disastrously large object on a collision course, people might then be willing to spend much bigger sums on preventing the collision. An Interceptor Committee formed by NASA in 1991 had suggested changing such an object's trajectory with... warheads... in the million-megaton range – roughly ten thousand times as powerful as the present-day H-bombs. All this had made many people think that the defensive system, since they might fall into the wrong hands, could be more dangerous than the comets and asteroids themselves. Luckily, accurate tracking could reduce the need for huge energies: given a decade's warning, even a one-megaton explosion might be enough to divert a body one kilometre wide... [E]xperts have suggested that heating by lasers... would [also] produce the necessary change of direction. Another possibility would be to store up enough to allow people to survive until agriculture could recover from the effects of a large impact... [T]he Swiss 'have a national plan which is a good example of where to start. It is compulsory to have underground shelters for all individuals permanently stockpiled with two years' supply of food and other essentials'. While the plan was evolved for the case of nuclear war, it could serve for any number of other cases, too... In *[Humanity]'s Means to ...i[r]s End...* after surveying the possibilities of nuclear and biological warfare, [the author] concluded that humans could enjoy a long future only if they established 'a unique World Police Force', to be 'the only force in the world with armament exceeding that required for the maintenance of internal order in individual nations'. These words were written in 1961. Today it can be seen that the threat to the human race from terrorists and criminals (let alone governments) could be removed only by very intrusive policing... Although... [the] doomsday argument... gives grounds for re-evaluating the danger of imminent human extinction, these grounds would... necessarily be weakened in an indeterministic world... Perhaps any indeterminism might be considered unimportant... However, it might be believed instead that indeterministic factors had considerable importance. [The doomsday] argument would then serve mainly to reduce extreme confidence in humanity's chances – the kind of confidence which leads some people to say that a long future for the human race is *as good as determined*... *Does determinism destroy freedom?* The word 'free' behaves in a very complex fashion, often under a heavy load of philosophical and theological theories... Many philosophers... are attracted by the argument that anybody could be free only to the extent that... [it] acted deterministically: the sole obvious alternative to determinism is randomness, they say, and you surely wouldn't consider yourself free if you thought of your decisions as random... A much disputed matter is whether determinism would make people unfree in ways affecting the justifiability of blame and punishment. 'If misdeeds were fully determined from the beginning of time', it may be asked, 'where would be the justice of punishing? What good could it possibly do?' It certainly strikes me as very unfair to send a murderer to hell in an afterlife for deeds which it had been determined that [the culprit] would commit – so that if the world could somehow be rewound like a clock, [the culprit would commit murder] anew. And it might next be thought that the same would apply to punishing the murderer here and now. If the murderer had been part of a fully deterministic pattern, then the punishment would be wildly unjust, on this view of the matter. But be that as it may, punishing the murderer here and now could definitely do some good. In a fully deterministic world, the movements of billiard balls could still be influenced usefully by such things as the movements of other billiard balls. The fact that a ball's movements were determined wouldn't enable it to go on its merry way, no matter what other balls did. Likewise: in a fully deterministic world people's actions could still be influenced usefully by praise and blame, reward and punishment. The fact of a murderer's imprisonment could deter other people from murdering.

...['Originally imprisonment was not a mode of punishment but a means of holding offenders awaiting trial or execution; it was used also as a means of extorting payment of money, and even by the 19th c. a high proportion of prisoners were debtors. The modern idea of prison grew from the "house of corrections", a place used in the 16th c. for housing beggars and vagrants who threatened the peace of the community, and for setting them to work.']

...Prisoners will work a 30-hour week for up to 92c a day under a Government proposal aimed at preparing them for life on the outside... The Minister of Corrections... said this week that the launch of a footwear initiative at Wanganui Prison underscored the Government's commitment to "have every prison a factory and every inmate a worker. Many offenders come to prison with few or no work skills and unless they learn the value of an honest day's work, they will find it hard to get a job upon release and may re-offend,"... The deputy general manager of public prisons... said that involving inmates in productive activity cut boredom and violence, increased their skills and decreased costs... [NZ's] prisons housed more than 100 industries... Most schemes reduced the running costs of the prison, although if commodities were sold the money was reinvested... More than 75[%] of inmates were involved in some form of "productive activity" for between two and three hours a day... In 1995, inmates' hourly pay was increased from 4.5c to 11.5c and toiletries were distributed free, although subsidies were removed from canteen goods such as chocolate and cigarettes. The national director of... Prisoners Aid and Rehabilitation... said... their pay did not even cover their basic needs... and the families of inmates have suffered higher costs since heavy subsidies were lifted on canteen goods... [The director] said that if the pay were increased, productivity would rise and it would allow the prisoners to save to help them resettle when they were released... [The deputy general manager] acknowledged that the pay had not kept up with the cost of living, but said the prisons operated with limited Government funding... Meanwhile, the Footwear Industry Association is angry it was not consulted before the department bought the footwear plant in Wanganui and staffed it with prisoners. "I just can't get my head around the decision... to compete in the marketplace using prison labour at subsidised or artificially low wage rates and with the business financed by [the] Government..." said the association president. Editor's note: 'Prisoners get 4c an hour for working in fields in the US' (it is 'estimated there will be 33 million prisoners in the US by the end of the 21st century – suggestions on how such numbers could be dealt with include freeing inmates for the term of their sentence to save money; having robotic prison guards; building prisons in space and underwater')...

Hundreds of convicts will be locked up in a moored prison ship from next month to ease the overcrowding crisis in Britain's jails... The vessel will reportedly be brought over from America, where it has been used as a vast floating dungeon on New York's Hudson River... It is expected to hold up to 500 prisoners... [In local news, t]he Police Association [has] voiced fears that... increasing demand on jail beds would put pressure on judges to

grant bail to people who would not normally be given bail... [P]risoners are being forced to stay in police cells... [(although 'any person serving a sentence of up to 8 days may be detained at a police station which is deemed to be a prison for that period') because t]he country's jails are overflowing...

Senior Auckland police officers will try... to have prison overload demands on their cell space relieved. Some remand and sentenced prisoners have spent up to a week in police cells because of the shortage of beds at Mt Eden and in other jails around the country... A prisoner... who is due to be sentenced on theft and burglary charges tomorrow... says the Auckland police cell [it] is being held in is dirty and cramped and has not seen sunlight for a week... "The cells weren't getting cleaned... so we said give us the gear and we'll do it ourselves." ...prisoners, many of whom have yet to plead before the courts, were being unfairly punished... There was no exercise yard or open-air facilities for prisoners... There were no power points in the cells, prisoners had no access to televisions or radios, and there was a shortage of reading material... prisoners were being forced to re-use disposable cups and were fed mostly canned meals, such as baked beans... Smoking is banned in the cells, although it is permitted in most of the country's prisons... "I'm not sure what our rights are but they must be more than this," [the burglar] said... The Auckland district police commander... said... "It... is most unsatisfactory... It's been going on for a few days and we don't want it to continue... You'd have to feel sorry for anyone who had been there that long [seven days],"... [P]olice cells were not designed to hold people for longer than overnight... The Corrections Department has begun choosing sites in Auckland, Northland and the central North Island north of Taupo for prisons... for... the ever-increasing numbers of prisoners in the country's jails... Three 60-bed units have been built, two at Waikeria, near Te Awamutu, and one... near Christchurch. Because of a lack of staff the two at Waikeria will not... be operational until mid-November... Waikeria's staff problems were caused by recruitment not keeping pace with the inflow of prisoners. Prison officers there faced having to work an extra day a week to cover gaps in the roster until new officers had completed their training... The general manager of Waikeria... said that even when all three were taking prisoners, the long-term problem of spiralling numbers would not be solved... Waikeria's capacity of 722 had been reached and in the entire North Island prisons had only 52 spare beds – about half of which were solely for corrective training placements...

Arohata [Gals'] Prison in Wellington will open a 20-bed wing to [guy] inmates in a bid to ease a crisis in the country's overflowing prisons... The [guy] inmates, who are not sex offenders and have short prison terms, will be kept in a separate building from [gal] prisoners... The Waikeria general manager, [when]... asked if the prison could take ...other... prisoners immediately if it had enough staff... replied. "Yes, we probably could."

...Overcrowded N[Z] prisons are preparing for further stress as some guards consider industrial action. The Prison Officers' Association has balloted its members on the next step in their pay dispute with the Department of Corrections but would not give the result last night.

...Nine-hundred Defence staff are set to move into the country's prisons from this morning – and they may be in for a long stay as employers and... the Penal Officers Association... remain in an industrial deadlock... Prison employers are set to begin locking out the association guards from 8 am today when they were due to begin indefinite industrial action. The guards, who make up just over half of the country's prison officers, will walk out when the first suspensions are issued... The [575-inmate] maximum and medium-security Auckland Prison complex at Paremoremo appears likely to be hardest hit with virtually all of its 360 guards involved in the dispute... At the heart of the dispute is the... Department of Corrections... plan to pay casual staff for hospital guard and escort duties at lower rates, arguing that they perform restricted services.

...Prison officers yesterday claimed the gains as they began returning to work after their industrial dispute was settled... with a contract clause requiring members' approval before any widening of casual work... Defence forces, which had been helping to run 13 prisons, began pulling out yesterday after 86[%] of the Penal Officers Association membership voted to return to work... Twelve of the 13 affected prisons were expected to be back to their normal staffing set-up by this morning. Auckland Prison at Paremoremo will not complete the transition until Monday morning.

...the recently appointed general manager of the Auckland Prison complex at Paremoremo... expects to renew some old acquaintances in his new role as boss of the country's toughest prison... [The manager] is talking about inmates [it] first met as an idealistic young prison officer cadet at Invercargill Borstal nearly 30 years ago... [B]ored with his seven-day-a-week agricultural job in Central Otago, [the manager] joined the prison service in 1967 after reading a newspaper advertisement. [■ On this day in 1967, the NZ Herald contained the following item: 'The new maximum security prison at Paremoremo is expected to be ready for use in a year, the Minister of Justice announced yesterday. Overcrowding had made necessary the reopening of some low security areas of Mt Eden prison' in the meantime...

'Crowded, over-restricted life is commonplace in our prisons. Says Auckland's Queen's Counsel, "Many of our jails are fortresses designed for a Dickensian punitive system. It is highly disturbing that in 1996 the cell used for punishment in Mt Eden is a damp, subterranean dungeon." Remand prisoners, though still innocent in the eyes of the law, often fare worst of all. At jails like Mt Eden, they may be held for up to 12 months before they are tried, spending around 15 hours a day in their shared cell with its walls of plastered stone, high barred windows and unscreened toilet. Ironically, they have less access to education programmes, self-improvement courses and work in laundries, kitchens and mailrooms than some of the convicted prisoners. Last year, two remand prisoners at Mt Eden hanged themselves, prompting the Queen's Counsel to call again for the closure of the "medieval" prison. An associate professor of law at the University of Auckland is under no illusions about the despair and bitterness such conditions breed. "When a society fails to treat its prisoners with basic humanity, it cannot expect them to show a commitment to the community when they leave prison." Prison officials, lawyers and judges support the principle that offenders are sent to prison *as* punishment, not *for* punishment. But a growing number of experts observe that degrading conditions and insufficient re-education programmes make a mockery of the prison system's aim of rehabilitating prisoners to lead good and useful lives. NZ's crime rate may be no higher than in other Western countries, yet we have one of the highest imprisonment rates. In the past five years, our prison population hovered around 124 per 100,000 people, compared with 86 per 100,000 in AUS. Fluctuating numbers, an occasional increase of prisoners in certain security categories and the consequent need to transfer inmates to other prisons, can cause accommodation problems. Since 1985, the jail population has increased by over 50%, but only one new prison has been built in that time: Mangaroa in Hawkes Bay. High numbers and high turnover of prisoners put extreme pressure on prison officers, who often have to act as psychologist, social worker, sibling, disciplinarian and friend to prisoners. Many experienced officers have left their jobs and some of the current staff are ill-equipped to deal with the demands. New prison officers sometimes work for several weeks in a jail before receiving any formal instruction at the Justice Department's prison staff college at Trentham. In 1993, a ministerial inquiry into Mangaroa Prison found that 70 of the 101 staff there had no previous prison experience. The inquiry report cited "strong indications" that some had been selected for their rugby prowess; others were told in advance the questions and answers for interviews and tests. Inevitably there is friction. Almost every month brings a new outbreak of violence or protest in one jail or another. Officials agree that inmates regularly bash and sexually assault each other and the traditional "code of silence" in jails results in the vast majority of attacks being unreported. In 1993, six prison officers were suspended when an inquiry revealed 35 incidents of assaults on inmates in Wellington Prison. In the same year, 12 officers at Mangaroa Prison were dismissed for their part in a series of revenge attacks on prisoners after a staff member was stabbed. In August 1994, a Mt Eden inmate who had climbed to the top of a three-storey tower stayed there for 13 days in protest against conditions until officers forcibly removed him in a cage lowered from a mobile crane. In striking contrast to our prisons are Holland's, which have one of Europe's lowest number of inmates in proportion to population. Holland's crime rate is much the same as ours, yet it has proportionately only half as many prisoners. Overamstel Prison, on the outskirts of Amsterdam, opened in 1978, has six 14-storey tower blocks, each containing 120 prisoners and 68 guards. A 22-year-old convicted for trying to rob a bank has a cell to himself. It measures 10 square metres and has a comfortable bed, table, armchair and cupboard, plus his TV set – rented from the prison for \$7.70 a week. A shelf holds books and cassettes, and pot plants soften the decor. In a partitioned alcove are a toilet and washbasin. The building is well ventilated. At the end of his morning's work assembling table lamps, for which the 22-year-old is paid about \$26 a week, the 22-year-old calls his mother from a telephone on the landing. After lunch – prisoners are locked in their cells for meals – the 22-year-old joins a game of 5-a-side football, supervised by a sports instructor. At 9 o'clock,

prisoners are locked in their cells for the night. Their cell is unlocked at 7 a.m. There is no evidence that Holland's humane treatment of prisoners has any adverse effects. Indeed, the proportion of adult prisoners who reoffend – around 66% – is the same as in many other Western countries. The reasons why Holland's prisons can provide such civilised conditions are simple: courts send fewer people to jail. NZ has the same alternatives to prison – fines, suspended sentences, probation and community service – but Holland uses them more. Despite a rise here in the use of periodic detention from 12 to 25% of all nontraffic sentences in the 10 years to 1993, the Department of Justice estimates that our prison population will grow from a total of 4413 last April to around 5500 by 2001. "With an increase in public concern about violent crime prompting longer sentences and tougher eligibility for remission, that total could soar even higher," says the secretary of the NZ Howard League for Penal Reform, a human rights organisation. To help ease the pressure on prison space, two new 60-bed units have been built at Waikeria Prison near Hamilton. But building more and more jails is no solution because of the staggering cost: from \$65,000 to \$165,000 per inmate, depending on the level of security required. And keeping an inmate in jail costs the taxpayer an average of \$32,000 a year. Ultimately, the solution is to reduce the number of people sent to prison. Few would disagree that for violent criminals, imprisonment is the only penalty, but it is not always these offenders who crowd our jails. In November 1993, there were 275 people in jail because of traffic offences that did not involve death or injury. In fact, more than a third of prisoners in NZ have not committed a crime of violence – and an astonishing 12.5% are on remand. To reduce the number of prisoners, reformers would like judges to make greater use of noncustodial sentences. "Many offenders can receive the punishment they deserve without being sent to jail," says the secretary. Adds a Christchurch prison chaplain, "Only a very small percentage of prisoners need to be locked up in the interest of public safety." What are the alternatives to jail? The answer, in part, may lie across the Tasman where AUS is experimenting with some bold initiatives. In Queensland, the Corrective Services Commission scrapped a \$4-million plan for a new minimum-security prison for gals and instead bought two houses in Brisbane where 25 offenders are allowed to serve their sentences in the community under supervision. They are given day leave to seek employment or perform unpaid community service. The Queensland government also provides supervised living for some low-risk guy prisoners. In South AUS, some offenders sentenced to home detention are fitted with electronic bracelets so that their home confinement can be monitored by phone. A similar computer-generated random phone call system to check prisoners at home is being trialled in NZ with those on parole. Noncustodial sentencing has already proved effective in dealing with juvenile offenders in NZ. The use of family group conferences to arrange community-based sanctions such as an apology and assistance to victims or work for community groups has reduced the number of young people in custody. In response to charges that "soft" measures would only lead to a further rise in crime, reformers cite the experience of what was West Germany where a determined effort to use alternatives for jail cut the juvenile prison population by 42% over ten years, with no accompanying rise in crime. We would all benefit from a similar reduction in adult prison numbers here. "The focus in youth justice on taking responsibility for a crime and being involved in repairing the damage can work just as well for adult offenders," says the chaplain. Imprisonment is the most expensive form of punishment, and harsh jail conditions breed bitterness and more lawbreaking. A recent survey of 3760 inmates in NZ prisons showed that only 595 had never been convicted for nontraffic offences previously and that half the guys and just under a third of the gals had served time in jail before they reached the age of 20. As the secretary says, "Prisons are intended to cost offenders their freedom, not their self-respect. It's understandably difficult to feel compassion for criminals, but a system that makes offenders worse than they were when they went into jail costs society a lot more in the long run." Incidentally, **the stabbing of an inmate at Paremoremo yesterday... highlight[ed] the increasing... risks of violent assault and emotional trauma... in our prisons. And, old-timers tell... it's getting worse...** The prison officers' union says the most worrying aspect of assaults in jail is the step-up in force used[against guards]. And the wife of an Auckland prison officer... worries about the possibility of her husband being hurt every time [her husband] goes on duty... [The] Penal Officers' Association chair[person]... confirms the rise in the level of violence... say[ing] there've been 32 known assaults on prison officers this year, including the stabbing of three officers in Christchurch this week.

...A violent prison inmate granted home leave was arrested for starting a fight at the Christchurch concert by the band AC/DC. [The inmate], aged 27... had been released from Paparua Prison... by the Department of Corrections... A Department of Corrections spokes[person] said violent criminals were eligible for home leave within 12 months of their release to help rehabilitation... [The 27-year-old] was jailed for 7 1/2 years in 1992 for kidnapping a Hawera chemist for three hours and stealing more than \$100,000 in cash and drugs from his pharmacy... The chemist, who did not want to be named... was angry that [his kidnapper] had been released for the AC/DC concert. "It would appear to be a very bad career move on the part of whoever approved the leave. Letting him out to a pop concert for rehabilitation – it's ridiculous. What are they rehabilitating him for, to fight?" A Christchurch Police Association spokes[person]... said: "I can't understand why someone inside for armed robbery or such offences would be allowed privileges. It just makes a mockery of the whole system. It's happening far too often. These people seem to be able to walk in and out when they please." [The 27-year-old] was arrested... after a fight with other concert-goers which left one companion needing hospital treatment for knife wounds. Police said [the 27-year-old] verbally "stirred up" another group but was not physically involved... Six weeks was added to his jail term. A spokes[person] for the Minister of Corrections... said [the minister] did not comment on individual cases. Labour's corrections spokes[person]... said: "Leave should only be given when prison authorities are confident that no one is being put at risk and it is important for rehabilitation. I don't see that an AC/DC concert comes into the latter category, and given the [inmate]'s track record I think they've been excessively liberal." [The Labour spokesperson] said Paparua's leave procedures needed review. Last month inmates from the prison gave minders the slip after being let out to attend the Kiwis verses England rugby league test at Lancaster Park.

...The number of prison escapes has leapt in the last three months but prison authorities are still not alarmed... 18 prisoners have escaped from custody – six in forced breakouts from jails around the country and 12 more in opportunistic escapes. This week [an inmate] walked out of Mt Eden prison by posing as a visitor. It was his second escape from custody in three weeks. On the first occasion [the inmate] pushed a Kaeo detective into a police cell, locked the door and made off. Another escaper, missing from Rangipo Prison [for three months], was picked up in Otahuhu this week on unrelated charges. Police were not even aware [it]d escaped from custody. They claim the prison had not informed them; prison staff claimed they had notified the police, but at a different station... Every escape is fully investigated and procedures are under constant review... [a] Department of Corrections spokes[person]... says. The number of escapes from prisons is generally decreasing. In 1993, a report on security in N[Z] prisons... found there had been 1036 escapes in the previous eight years, or an average of 129.5 a year. In... 1994 there were 44 escapes, 58 in 1995... Escapes as a percentage of the daily average prison population have been dropping steadily from a high of 7[%] in 1972. By 1990, the rate had halved.

...A suggestion that people be allowed to have their slates wiped clean for minor criminal convictions from many years back is seriously flawed, says the Newspaper Publishers Association. The... proposal by the Privacy Commissioner... was an exercise in denying facts... Wiping the slate clean for convicted criminals after several years would amount to suppression, [the association]... said. "To illustrate how ridiculous that would be from a news media perspective, take the example of a newspaper reporting a conviction at the time of its occurrence. Under the... proposed scheme, that same newspaper a few years later would not even be able to repeat the publication of those very same words, which would nevertheless be available in the local public library for any member of the public to read." On most occasions a person's criminal record would not be of interest to the media or public... But in some instances, a previous conviction might be of significant public interest. "This might be the case where a person holds a public position which is relevant to that prior conviction..." ...[the commissioner]'s suggestion... followed reports of previous, minor convictions becoming a real problem for some people. One couple... were deprived of a good job in a Pacific nation because of a minor street offence 20 years earlier. Apart from sex offences, where offenders tended to have a high rate of recidivism, there appeared to be an over-whelming case for people being able to live down minor criminal convictions after a period of no more convictions, [the commissioner] said. "Hundreds of thousands of N[Z]ers have been convicted... for minor... offences... while young and in many cases... never... committed... further offending."

...A blood sample will be forcibly taken from a robbery suspect by order of a High Court judge. It is the first time that new legislation – which came into force on August 12 – has been used to compel a suspect to provide a blood sample... Police believe the... 21-year-old Western Springs... [resident] took part in the robbery of the Bayou Cafe in Richmond Rd, Grey Lynn, in the early hours of January 14. [The judge said the NZ] *Herald* could report yesterday's proceedings, but under the legislation the suspect could not be named or identified. During the robbery[, in which]... \$25,000 of property and cash was taken... the cafe owner... lashed out with a large chopping knife, slashing one of the three masked intruders... [T]he 69-year-old's... wife... aged 37, suffered a grievous stab wound through her left upper arm. Unidentified blood found at the scene is believed to have come from the injured intruder... [T]he crown solicitor of the Auckland region... [also] applied for a warrant to arrest the [suspect] and detain him for the blood sample to be taken. The [suspect], who had been served notice of the application, was not in court to oppose it. [However, the suspect] had previously refused when asked to supply blood voluntarily... Suspects who are compelled to supply a blood sample under the act may choose to have it taken intravenously or by finger prick. If they refuse to comply with the order, the police may use reasonable force to assist a doctor in taking a blood sample by pricking the suspect's finger.

...Virtually everyone convicted of a serious crime can expect the police to apply for a blood sample to store in a DNA profile databank, the crown solicitor for the Auckland area... said yesterday. His comments follow the first High Court application in Auckland – and possibly the first in the country – for a sample to be taken from a convicted criminal for storage in the databank. The application by [a] crown counsel... involving a 17-year-old Mangere youth... was adjourned... [The 17-year-old] was one of a number of youths who took part in the vicious kidnapping and robbery of a South Auckland taxi driver... The Crown's application was under the Criminal Investigations (Blood Samples) Act... Another part of the act was successfully invoked last week... to get a suspect compulsion order requiring a [21-year-old]... to give a sample for comparison with blood left at... the Bayou Cafe... After yesterday's application, [the solicitor] said the DNA profile databank would be as useful to the police as fingerprints. People convicted of everything from burglary... to murder and rape could find themselves the subject of an application to the courts for a blood sample within six months of conviction... The act is not retrospective and any samples given before August 12... would not be included in the database.

...The routine taking of blood samples from newborn babies raises the spectre of a police state creating a DNA profile databank on innocent people, says the Privacy Commissioner... Speaking at a recent genetics conference in Canada, [the commissioner] told his audience that the N[Z] police had successfully used a 23-year-old droplet of blood to identify a murder victim whose body had not been recovered. The heel prick sample, known as the Guthrie test, is taken from babies within minutes of their birth to test for genetic abnormalities... The results are stored on cards which are retained in archives. Detectives investigating the disappearance of a young Hawera mother of two, Nicola Jane Goodwin, in September last year were able to match crime scene blood samples with... her [card]. The evidence helped to convict Mrs Goodwin's estranged husband and his girlfriend on murder charges two months before her body was found in a remote... Taranaki forest. [The commissioner] told the conference that while the prospect of a DNA databank on all citizens for investigative purposes might seem absurd, even Orwellian, it was not entirely science fiction. However, [the commissioner] said last night that blood samples taken at birth had a limited application for forensic purposes at a later date.

...Two young w[itnesses] jailed for contempt of court because they were too scared to give evidence against an alleged attacker were freed by [Britain's] Court of Appeal yesterday. It said correct procedures were not followed before [the] assault victim... and her friend... were held in contempt for refusing to testify against [the victim]'s ex-boyfriend... The appeal judges said the [pair] had been "foolish" but had been in custody for more than a week and had suffered enough. The Chelmsford Crown Court judge who imprisoned [the ex-girlfriend], aged 20, for three months and her 22-year-old friend for two months should have adjourned the trial... overnight with a clear warning to the w[itnesses] about their refusal to give evidence... Instead, the judge – who was not aware of their claim that they had been threatened – accepted that the case against the [ex-boyfriend] had collapsed and then almost immediately jailed the two reluctant witnesses... [By the way, NZ]'s top judge yesterday called for a pay rise for his colleagues, complaining that they are under enormous pressure... As chief justice, [NZ's top judge] is paid \$215,400 a year.

...Judges have been given a pay rise of... between 7.6[% and 8%]... In the new rates published yesterday, the salary of the Chief Justice... goes up to \$224,000, plus an annual expenses allowance of \$7900... The president of the Court of Appeal... sees his pay rise... to \$220,000 plus expenses of \$6500. High Court judges will be paid \$195,000 plus expenses of \$5600, while district court judges will get \$156,000 plus expenses of \$4100.

...A judicial commission to oversee the conduct of judges is inevitable, says[a] former Prime Minister... [The Labour PM from 1984, now a] lawyer, said a recent spate of controversies could only accelerate the creation of such a body to oversee the 154 judges. The Minister of Justice... is seeking a more transparent process for handling complaints against judges and is discussing the issue with the Attorney-General... Only Parliament has the ability to petition the Governor-General for the removal of a judge. [The lawyer] said the argument that judges were accountable because of the appeal process did not hold up. "All you do is appeal a judgment; you do not appeal a judge." [The lawyer] said that last week the Chief Justice... had probably advanced the case for a commission "by some light years" by getting wrong a point of law in a public statement, later retracted. [The lawyer] said a judicial commission could also examine the "arcane" appointment processes for judges... Recently, [one judge]... invoked widespread condemnation with his comments at a rape trial, and two Whangarei district court judges have come under scrutiny about travel claims.

...THE Serious Fraud Office may ask the Attorney-General to file an indictment against two judges charged with fraud to move the case to the High Court, according to legal sources close to the case. [The s]uspended Whangarei District Court judges... [(aged) 39] and... (52), charged with a total of 51 counts of fraud in the Auckland District Court on Friday, remain on full pay... until proceedings are completed. The judges entered no plea but[their] lawyers... said both[judges] steadfastly maintained their innocence. A pre-depositions hearing – where a date for a full depositions hearing will be made – was set down for December 6. It is at depositions that lawyers for the two will attempt to have the case thrown out.

...Problems empanelling a jury have forced the delay of a trial relating to the seizure of \$1.8 million worth of stolen electronic and electrical equipment. The trial of nine people in the Auckland District Court followed the police investigation code-named Operation Lemon and was due to have started this week. Pre-trial applications and the jury empanelling began on Monday... 12 jurors were selected from a pool of more than 1000 people. More than 700 of them had earlier asked to be excused from service because of commitments. But they were directed by the court to attend for jury empanelling because of a shortage of jurors. After the jury was selected, three members asked to be excused. That ignited debates from both defence and prosecution counsels about whether three jurors could legally be excused. [The j]udge... said yesterday that [it] would discharge the jury this morning and adjourn the trial for two weeks, then another jury would be empanelled. [□] JURIES have been an intrinsic part of the NZ judicial system since 1841 when a property qualification for jurors was required as it was in Britain. Because records of land title were inadequate, the property qualification was abandoned here in 1844 and every guy British subject (excepting Maoris) between the ages of 21 and 60 who was deemed of good character became eligible for jury service. The age limit was lifted to 65 in 1945. Gals were eligible to volunteer from 1942 until 1961, when they were included on the roll in the same way as guys but with the right to have their names removed on request. This right of exemption for gals was withdrawn in 1975, except where they have the continuous responsibility for the day-to-day supervision of a child under the age of six. There has always been a list of persons exempted from service for a variety of reasons stated in the governing legislation, including mainly those whose occupations might be described as essential and those involved with the administration or operation of the judicial system. Apart from those exceptions, every citizen within the appropriate age group and living within 30 km of a High Court district is now eligible for jury service. A panel of 12 jurors are drawn and sworn in for each trial, subject to challenges. Committals for trial are now in the hands of the judiciary (grand juries existed in NZ from 1844 until 1961').

... 'at common law, and generally in the U.S., a *grand jury* is a body of from 12 to 23 citizens called to consider evidence of crime and to decide whether an indictment is warranted and a trial justified. Grand jurors, selected in some communities by a special grand jury association, are supposed to be chosen from among persons of above-average intelligence' – as, although a juror must 'concern itself only with the facts of a case and not the causes', 'juries can be influenced by the skill with which the argument is presented'. Editor's note: While a JURIST is a person 'who is skilled in the law', a jury consists of people who typically are unskilled in the law! Judges can overrule juries in the US, but 'not in the UK' (where 'judges can't be judged by juries'). In both the UK and US – as well as here in NZ – citizens allegedly have the legal right to be presumed innocent until found guilty by a jury of their peers.]

...The fugitive Terence Thompson was shot and killed after... turn[ing] a rifle on the police in response to a challenge,[the] Assistant Commissioner... said last night... [T]he commander of police region three which includes Hastings, said Thompson had a loaded cut-down .306 calibre military carbine hidden in his clothing when... confronted by police in an orchard east of Havelock North. Thompson, who was wanted in connection with the murder of Constable Glenn McKibbin of Hastings, had been trying to leave the area when... challenged... "Terence... put his pack down... turned towards the police... and... produced from his clothing a... military carbine with six rounds in the magazine." The police shouted "put it down" and "get down." A police dog was released but Thompson fought it off and presented the firearm at the police[, who]... fired one shot which hit Thompson in the chest and killed him instantly. No other shots were fired. A 20-strong team of police and a... armed offenders squad went to the orchard... after a resident reported... [someone] fitting the description of Thompson cooking a sheep on a fireplace in the orchard. When the police arrived Thompson, aged 43, was wearing military trousers, a military jacket, hard boots and had a backpack containing freshly cooked meat, candles, a torch, butter and dried food... 200m from where [Terence] fell the police discovered a bivouac... "There were all the signs of a well-constructed and well-camouflaged encampment. There is evidence [Terence] may have been hiding there for some days or maybe longer." An uncle of Thompson... said yesterday that the family would demand answers about why the body lay in the orchard for 23 hours and why the family was not contacted before [Terence] was shot. The body lay at the scene... while examinations were carried out by pathologists and the police. It was transferred to the mortuary for an autopsy and is due to be returned to the family today. [The uncle said it] lived only 2km from the site of the fatality and had an understanding with the police that [it] would help to mediate to bring his nephew to a fair trial. "I am angry, disappointed and devastated,"... [The Assistant Commissioner] said the agreement was that when Thompson was found the police would consider involving the family. "When the police found Thompson... it was in a sudden situation and there was a confrontation which resulted in his death..."

...[a] Te Mata resident... talked to Terence Thompson... in his home on Sunday afternoon, sharing tea and a meal with the... [fugitive]. "I hoped to soften him up and get him relaxed before reporting him to the police," [the resident] said yesterday. They talked for about two hours, but not about the fatal shooting of Constable Glenn McKibbin... "I didn't want to provoke him because I was aware [Terence] still had his gun. We talked about all sorts of things. Some of what [Terence] said was quite sensible, some was a bit weird and some was bullst." [The resident], who lives in Te Mata Cottage, near the orchard where Thompson was shot the next day, said... Thompson... often visited people living in old motel units next to his home before the shooting of Constable McKibbin. [When Terence] turned up there again... [the resident] invited him into his home... Thompson did not say directly where [the fugitive] had been for the past nine weeks but indicated [it] had been living rough around the coastal areas of Hawkes Bay. "[Terence] was very dirty and very hungry and had lost a lot of weight. When [Terence] took his boots off his toes were black." [The resident said it] did not report the sighting immediately because [his house] did not have a telephone and [the resident] did not want Terence to know who had contacted the police. Former associates of Thompson have described him as a loner badly disposed towards the police because of past brushes with the law – some serious enough to merit a jail term – who had spoken generally of killing a police officer. But Hastings police still refuse to comment on whether their nine weeks of intensive investigation have revealed any connection, or a related likely motive for the constable's murder. Officially, Thompson is still simply the [person] that on several occasions drove the station wagon used by Constable McKibbin's murderer. And since his own death the police are even more at pains to define Thompson separately from the killing. Yesterday they refused to say what clues might be found in a regular haunt of Thompson, a caravan in Flaxmere.

...Terence... admitted gunning down the police[officer] in his personal diary, an inquest into Constable McKibbin's death was told yesterday... McKibbin was shot dead from a passing car on a Flaxmere, Hastings, street... [The] Detective Inspector... who led the police hunt for the killer, told the inquest of a diary found at an orchard on the outskirts of Hastings where Thompson... was... shot dead... A police psychologist had analysed the writings, which were full of mystical religious references, and decided they were coherent and purposeful. The most significant diary entry said: "My act was an act of violence/force against those who used violence/force describing it as lawlie the wolf in sheep clothing, against my people, the people of all the earth, the children of God. I am from God." The psychologist took these words as an admission of responsibility. Other entries... included how Thompson... [suffered from] headaches and problems with his eyes... [and mentioned] dreams... rituals, victory fields and not taking prisoners. [The] Detective Inspector... also gave the inquest evidence from many people police spoke to in the days after the shooting in an effort to learn about Thompson's background. They spoke of Thompson's hatred of the police and... his obsession with weapons... One told of how Thompson s[poke of] feeling... capable enough to kill anyone, of... [being] physically and mentally ready for it. Another person described Thompson as being mad as a dingo. Another said Thompson had said the police would never take him alive. This person said Thompson was a wise and educated person at the edge of insanity... Thompson talked to other people about reclaiming his land and getting a house [Thompson] had once owned in Pakowhai Rd back from the people who lived in it, killing them if necessary. The house had been sold while Thompson was in jail. One person... said Thompson had spoken of shooting his mother for adopting him out as a baby. The coroner... said in his summing-up [it] was satisfied Constable McKibbin died from an acute haemorrhage as a result of a single bullet wound to the stomach while exercising his lawful duties as a police officer... [The] coroner... adjourned Constable McKibbin's inquest until after Thompson's inquest on October 15.

...T[he head of t]he Police Complaints Authority... said yesterday that a report into the shooting of the fugitive Terence Thompson was likely to be made public in a matter of months, rather than weeks... and... did not want to make public statements before a thorough investigation was finished... Police were also in a difficult position because if they made detailed statements about the shooting now they could be seen by some as prejudging the authority's report... [The head] believed it was more a case of media frustration at the lack of details about the police confrontation with Thompson, rather than public concern... His priority now was to produce a report the public could have some confidence in... The Labour police spokes[person said PCA]... investigations... were usually extremely thorough and independent. "The one thing I think does concern people is that it's police who do investigations on behalf of the authority. That in future might have to be looked at." The Auckland Council for Civil Liberties said... that the law should be changed so police did not conduct [PCA] investigations. The... chair[person] of the parliamentary justice and law reform committee... said the committee had spoken to [the PCA head] on gun security aspects raised in his recent reports on police shootings.

...The police denied yesterday that they have a shoot-to-kill policy[, saying]... armed officers were trained to shoot to stop. That meant aiming for a person's "central mass," basically the chest area. When a Whangarei [resident], Barry Radcliffe, was shot and killed by police last November, senior officers said arms and legs were unreliable targets. The co-ordinator of firearms and special tactics at the time... said police shot at the chest to incapacitate someone immediately, and because they could not afford to miss in highly dangerous and stressful situations. "If you shoot someone in the chest with whatever firearm, you have the possibility [that someone] is going to die... We accept that responsibility and the public should, too." Police general instructions say firearms can be used only to: • Defend themselves or others if they fear death or grievous bodily harm could result. • Arrest an offender if they believe [it] poses a threat of death or grievous bodily harm in resisting arrest. • Prevent the escape of an offender if [it] poses a threat of death or grievous bodily harm. The instructions contain the provision that guns should be used only if there are no

reasonable, less violent options... Thompson was the 16th [NZer] to be shot dead by police since Eric Stanley Graham's killing spree on the West Coast of the South Island was ended by a police bullet in October 1941. Graham killed four police[officers] and three civilians... The list of other fatal police shootings... [include] Paul Chase, 25, [who] was shot during an early morning raid on a flat... at Petone in... 1983... Officers believed [Paul] was holding a gun, but it was later found not to be a gun... Thompson was the third person to be shot fatally in the past 10 months... The most recent fatal shootings were of... Radcliffe... and... a psychiatric patient, Eric Gellatly, in Invercargill... after a 21-hour siege in a sports store.

...The death in Auckland yesterday of Timipoara Raharuhi brought to 17 the number of offenders fatally shot by police in the past 55 years.

...The... armed offenders squad was justified in shooting Terrence Thompson, the Hastings coroner... has ruled. [The coroner] also found yesterday that Thompson was solely responsible for fatally shooting Constable Glenn McKibbin[who]... was killed by a shot from a .223 hunting rifle that went through his police notebook and into his upper stomach as [the constable] spoke to a motorist. It was fired... [from] a beige Ford Falcon stationwagon parked across the street... Armed offenders squad briefings, which had been repeated to them many times after the death of Constable McKibbin, had strongly emphasised they were to try to get Thompson's co-operation... Thompson... - [who] had an Army background - ...was cornered in gathering darkness in the orchard... Squad members with telescopic sights and night-vision equipment could see Thompson clearly and could see [the suspect] was carrying a weapon... Confronted, Thompson had been given an opportunity to surrender but conducted himself in such a way that squad members were given the impression [the suspect] was wanting to do battle. They accordingly acted in self-preservation. That Thompson did not have a bullet in the breech of his gun was probably due to physical and mental fatigue, [the coroner] said. Much more important was that Thompson was carrying a weapon - which would have taken a fraction of a second for him to load... [In international news, a] major search of a forest near the Blue Mountains to the west of Sydney may yield more victims of... the worst convicted serial killer in A[US]n history. Police yesterday declined to confirm a connection between [the killer] and the scouring of the Jenolan State Forest by the major incidents squad and officers from Bathurst, but a spokes[person] said a link "is not dismissed." [The killer], a 51-year-old road worker, was jailed two weeks ago for the brutal murders of seven backpackers in the Belanglo State Forest... south-west of Sydney, between December 1989 and April 1992. His conviction has reopened investigations into several unsolved disappearances, including five [gals] who vanished when [the road worker] was living in Newcastle in the late 1960s and early 1980s, and the murder of Mr Peter David Letcher, whose remains were found... in a shallow grave... by picnickers in the Jenolan Forest on January 21, 1988. Mr Letcher, aged 18... had been shot several times, in circumstances which showed strong similarities to the circumstances of [the road worker]'s victims... The search is expected to continue for the rest of this week.

...[an AUSn] killed 35 people in Tasmania on April 28 - more victims than in any other massacre this century outside war. After [the AUSn], the world's worst mass killings were in Bogota, Colombia, in 1986 when a Vietnam War veteran shot 29, and at a mosque... on Israel's West Bank, when 29 Palestinians died and 80 were injured by a Jewish zealot. In October 1991 [a]35-year-old... mowed down 23 after ramming his truck through the window of a cafe in Killen, Texas. [Another USer], aged 41, shot 21 people dead at a Californian McDonald's restaurant in July 1984. And earlier this year an Indonesian special forces officer sprayed an airport with machine-gun bullets, killing 19 and wounding 25. Until Port Arthur, the bloodiest day for A[US and N]Z... had been the rampage [of the person] who gunned down 10 members of his family near Adelaide in September 1971. Since then 17 massacres have left more than 100 dead in A[US and N]Z.

...A FORMER N[Z] couple is calling for changes to a legal system which prevents their daughter's brutal killer from being charged... [The brute] kicked his former lover, Christine Joanne Nash, in the face 25 times and then strangled her last October... [The brute], a paranoid schizophrenic, admitted the crime but Queensland's unique mental health laws mean [it] will never be charged and could soon be freed. The 32-year-old victim's parents... say the system enables violent people... to evade punishment, making a mockery of justice. The state is the only jurisdiction in the Commonwealth where a Mental Health Tribunal, rather than a court jury, determines whether an accused person is fit to stand trial or was of unsound mind at the time of the offence. The Queensland tribunal, which has operated for 12 years, is constituted by a Supreme Court judge, assisted by two specialist psychiatrists. Christine's death has created a controversy and her parents hope it will bring changes to the law. They moved to... the Sunshine Coast to start afresh after their other daughter Sharon (33) was killed in a car crash in Auckland in 1987. Christine lived just a few kilometres along the coast at Cooool with her two children... [aged] 13... and... 9... Early last year, [Christine] began a relationship with... the [26-year-old] son of a police superintendent who admitted being a crooked cop at the Fitzgerald Inquiry into police corruption. Within months, [the son] started beating her. Christine and the children... began to fear for their lives while trying to escape from him... [However, the son] defied court protection orders, repeatedly phoning Christine and breaking in to her home and assaulting her. [Hi]s own mother had him admitted to a psychiatric hospital [just weeks before Christine's death] but doctors decided [the 26-year-old] was fine and released him after a week... [They] ignored his mother's pleas that [the 26-year-old] should not be released... [The 26-year-old] was returned to hospital after killing Christine but a patient review tribunal has little option legally but to release him if it finds at any time that "nothing more clinically can be done for the patient".

...NEW technology that monitors how the brain views images suggests that people with schizophrenia see faces differently. The research by psychiatry staff at Sydney's Westmead Hospital is part of a joint venture with N[Z] researchers into developing models to test brain functions. It found that people with schizophrenia... tend to ignore the right side of a face at first glance, whereas people without the disorder followed a triangular pattern moving from the left to the right eye, to mouth and back up to the left eye... The results helped explain why people with the disorder had problems with communication, which relied on interpreting facial expressions and recognising subtle nuances... The... director of the Mental Health Research Institute of Victoria... said the technology... [- that] calculates 50 times a second exactly where the eye is looking at an image, while monitoring brain function... [-] will be used to study the effects of different drugs prescribed for mental illness, such as schizophrenia... "We are looking for methods to tailor people's medicine to their needs. At the moment we have got good drugs that help illnesses but no appropriate way to measure how much to give someone." The technology will be trialled next year in Auckland, Sydney and Melbourne... [The] national president of N[Z]'s Schizophrenia Fellowship, said the... study and other research could... potentially benefit... around 30,000... sufferers... in N[Z], and their families... [D]rugs had a definite role in stabilising a person's condition, but... were too often seen as the only solution.

...People with mental illnesses should find out today just how they will benefit from new Government money. The Minister of Health... yesterday outlined plans for an extra \$30 million to be spent on mental health services over the next year... It would be up to... regional health authorities to... carve up the money according to regional needs and subject to the minister's approval. The national priorities for the next 12 months are: • New drugs for schizophrenics. • Workforce development. • Child and youth services. • Services for those with behavioural problems. • Community services for adults. Some of the extra money will also go on a "destigmatisation" campaign, using newspapers, television, radio and health workers to push for better understanding and acceptance of mental illnesses... [In June the minister] announced a \$142 m... boost to mental health, following a damning report on existing services. The money is to be spent over five years, with the \$30 m... being the first chunk. [The minister] hopes next week to announce appointments to a new Mental Health Commission, which will have a watchdog role... [Incidentally, t]he former psychiatric patient who [a]whistle-blowing nurse... said was too dangerous to be free has lost his appeal against a nine-year jail term... [The patient] was undoubtedly a danger to society, the Court of Appeal said yesterday. Delivering the judgment, [the judge said the patient] was apparently ill-equipped to re-enter society when... released from Lake Alice Hospital in 1993... [The patient, who] had pleaded guilty to kidnapping and assaulting an 11-year-old boy... with intent to commit sexual violation... in September 1994... began committing sex offences when... [aged] 14... The judge said th[e patient] would be eligible for parole after serving one-third of his nine-year sentence, with a final release date when two-thirds was served.

...Health bosses have proposed replacing a psychiatric unit built at Auckland Hospital four years ago[a]fter a report found that the... 58-bed... Conolly Unit for acutely ill patients was cramped, badly designed and made from poor materials... The report on the facility[which]... is reported to have cost more than \$3 million... also found that the building had insufficient intensive-care beds, was too far from the main hospital building and emergency department and had wards with too many exits. It did not allow patients to be segregated by gender, need for quiet space and safety or degrees of symptoms and there was a lack of space for activities to stave off boredom or help with rehabilitation. There was also a lack of suitable accommodation for discharged patients... A former patient... said yesterday that [it] would not like to be admitted back to the facility.

...Auckland health chiefs hope to ease pressure on overburdened hospital psychiatric units with... an extra \$10.33 million, its share of the Government's \$30 million boost for mental health services... The general manager of mental health services... said too many psychiatric patients were filling acute hospital beds because alternatives were few... The closure of Carrington Hospital... and the imminent closure of Kingseat had added to the pressure... The police have recently had to care for homeless and distressed psychiatric patients because of the squeeze... Growth is expected in community-based treatment services for the mentally ill in Auckland and Northland... [so] \$4.4 million of the extra money would go on boosting community-based services for better assessment and treatment... No money would be spent on extra acute beds... [In related news, t]he Minister of Health... [has] announced that the director of the Mental Health Foundation... would head the new [Mental Health Commission (MHC)]. The director... will be supported by two part-time commissioners – ...a psychologist with personal experience of mental illness; and... a Wellington business[perso]n and a former chair[perso]n of the Wellington Area Health Board... [According to the minister,] the three-person commission would bring a “unique new energy” into the mental health sector, although it would be limited to an over-sight role. It would not own the problems within the sector, and not be able to interfere with the statutory responsibilities of the Ministry of Health and the Director of Mental Health.

...The head of a ministerial inquiry into mental health services has condemned the new M[HC] as toothless and expensive for the taxpayer... “I’m at a loss to understand why we need a \$2.5 million [the annual budget] organisation to yet again evaluate what is going on.” ...[the r]etired judge... said the commission had no power to deal with any of the areas identified in [his] report, such as services for children and adolescents, Maori and Pacific Islanders, drug and alcohol, personality disorders or the rights of families... [Although] the new commission... is one of five recommendations the... [report] made to the Government in May after concluding that mental health services were in disarray because of lack of leadership and lack of money... “It has no planning, implementation or operational functions and those functions were pivotal to the success of the mental health commission which we recommended.” ...The Government responded to the funding issue in June with an extra \$142 m... over five years for mental health. However, \$60 m... of this spending is not new money... [–] authorities... have to carve this sum off other health services...

Improving mental healthcare spending and changing negative attitudes are the aims of the new head of the M[HC]... “Mental health has never been given the level of priority that it needs... It’s an area which we clearly know has a large amount of stigma attached to it, and that stigma pervades the whole system.” ...[the AUSn who came to NZ] in 1984... said... the commission aimed to ensure that funds were spent effectively.

...A newspaper advertisement which says one in four people have a significant mental health problem... [–] the definition of “significant mental health problem” was where some form of intervention would be appropriate... [–] is not an exaggeration, according to the new head of the M[HC]... North Health used the figures to promote services they offered to those with mental health problems in the Northland and Auckland region. The advertisement... has astounded some people, but [the new head] said an attitude of disbelief was common where mental health issues were involved. “I... would have put it at one in five but the indications are that periods of severe distress and the symptoms that manifest as illness are increasing because of the pace of life.” ...The study used by North Health was conducted... over a period of six months... in 1986 in Christchurch by researchers from the Christchurch School of Medicine, and Sunnyside and Christchurch hospitals... Within that time around a quarter of... a sample group of 1498 adults aged between 18 and 64... suffered problems including mood disorders, drug or alcohol abuse or dependence, psychotic disorders, nervous attacks and panics. When general anxiety, eating disorders, and pathological gambling were included the number of people affected rose to more than one in four... [O]ne third of people between 20 and 24 suffered a psychological disorder in any one year. The majority of young [gals] were prone to anxiety problems, while young [guys] were often treated for substance abuse... [A] mental health project manager for North Health... said while [the authority] would prefer a recent study there were no problems in using the 10-year-old Christchurch research[which]... was quite consistent with overseas studies... If anything the prevalence of mental health problems in Auckland a decade on would be slightly higher... Only 1.7[%] of the national population were seeing psychiatrists...

The Minister of Maori Affairs... is refusing to release what is thought to be a damning update on Maori mental health... The unpublished report, a statistical analysis of Maori mental health trends, was submitted by its authors to the Minister of Maori Development... in May. But in a letter to a Wellington newspaper rejecting an Official Information Act request last week, [the minister said his intention was to] withhold it from the public until November. “The draft update... is undergoing a process of revision and peer review prior to publication,”... [the minister said. However,] some of the report’s findings were presented to a Public Health Association meeting in July. They showed: • ...Maori spend an average of 85 days in hospital with mental illness, compared with 220 days for Pakeha and 152 for Pacific Islanders... [but t]he rate of hospital readmissions for mental illness among Maori is now two to three times higher than for Pakeha and Pacific Islanders... • A 49[%] increase in Maori [gals] admitted to hospital for drug and alcohol abuse and psychosis between 1984 and 1995.

...[gals] run a greater risk than [guys] of developing mental health problems at some point in their lives, the World Health Organisation warned in a statement to mark world mental health day. The statement from the U[N] health agency backed up such findings with statistics showing that worldwide, 15 [gals] for every 10 [guys] were hit with serious depression at some point while the ratio for chronic depression is 17... [to] 10... In Britain... 55[%]... of all people diagnosed as mentally ill... are [gals]... Another study found that in the urban zone of Bahia, Brazil, neurotic and psychosomatic disorders struck 21[% of gals] and only 8[% of guys]... In rural Uganda... 22.6[% of gals] under 65 had suffered major depression while the figure for [guys] was only 14.3[%]. The WHO statement stressed that gals... were more exposed to certain risk factors in the social environment that can erode one’s mental health. These ranged from poverty to broken marriages, wars, and ethnic and domestic violence... [But i]t also found that “[gals] with a stable partner and one or two [kids], and who have a part-time income generating job, seem to be less exposed to depression and anxiety disorders.” - 1996

The... *Telegraph* has reported the results of authoritative new research, given to MPs by the former head of a Government watchdog, the Health Advisory Service, showing... 40[%] of children in Britain suffer from mental illness. Now the draft of another report has come into the *Economist*’s possession. This suggests that the truth is worse than previously feared. As we can exclusively reveal, everybody in Britain is insane. This finding, likely to be controversial, is based on work by... [the] emeritus professor of fictive epidemiology at Bolton Nat Lofthouse University. “My suspicions were aroused... when I compared notes with colleagues in our psychology department...” ...then began a 20-year psychological profile of 500 people... Regardless of cultural, economic or environmental factors, every member of the sample reported episodes of what [the prof] calls “suspect-variant anomalous mental condition” (svamc)... “In each case... we were dealing with what, in lay[person]’s terms, I choose to call insanity, albeit of a temporary nature.” ...Examples included feeling elated or depressed for no discernible reason... hostility towards colleagues; irrational violence towards unsolicited correspondence; and profound lethargy following exposure to credulous articles about bogus research... [Regardless of w]hat has caused this sharp deterioration in the nation’s health[clearly the]... Government can no longer sit on the fence. Sure enough, officials in the

Department of Health have rushed to reassure the public. “When we said in 1983, during an earlier scare over madness in the House of Commons, that it was inconceivable that more than a small proportion of the population was insane, we meant that it was not to be conceived – that is, we were advising people not to think about such things... The important point is that Government policy has been perfectly consistent on this issue.”

...Our mental health policy needs complete rewrite... How many more people must be killed, or hurt, how many more ex-patients must be killed because they have psychotic episodes and go off medication, and how many more reports must the Government receive before action is taken? The system is not working. We need at least to treat guns as being as dangerous as motor vehicles... However, it is our mental health laws that need rewriting. Over 70 homicides have been committed by people with psychiatric illness since the 1980s, not all with guns. There have been many other close calls where the police have shot dead sick people who have obtained firearms – another Aramoana, Dunblane or Port Arthur narrowly averted with fatal consequences for a sick person. That’s what happened to Eric Gellatly and Barry Radcliffe. One person with schizophrenia stabbed five people before the courts insisted on treatment. In another case, a person with a history of sexual violence was taken to court for stealing a chocolate bar. His lawyer pleaded for assistance, the judge stated that if the [client] had committed a serious crime [the court] could direct the [client] for treatment... Another sad soul sought treatment from a hospital, as did the police and his father. [The soul] was turned away[, and] later killed his father and himself. N[Z]’s mental health programmes are in crisis. We are not alone. This is the experience of all liberal, democratic societies. The care of acutely disturbed psychiatric patients outside hospitals, in what is dishonestly called the community, has not worked and has been discredited internationally as a failed experiment. After tragic cases of murder, rape, suicide and terror these policies are being rethought. Reports on inquiries from Britain and the U[S (where)]... the first example of political correctness winning over common sense and common experiences... [came when] a... psychiatrist and best-selling author... argued that mental illness was not actually illness at all[]... point out the shortcomings of existing policies. In response to the cruel and often false imprisonment of the mentally disturbed from the 1950s, 60s and 70s, N[Z] followed the fashion to move decisively from institutional care to community care... All institutional care was bad; all community care was good. The wonder drugs of the 1950s were also seen as a cure. Antidepressants would cure the dangerously depressed. Tranquillisers would save the severely schizophrenic, just as surely as penicillin killed pneumonia... The reality that patients might not take medication outside the stern control of hospitals was ignored. Community care is not a cold, damp bedsit or boarding house. And institutional care need not be an overcrowded ward as popularised by [the] best-selling book and movie *One Flew Over the Cuckoo’s Nest*... We have closed hospitals, reduced bed and ward numbers and are now planning... to follow the... American model[, which is]... to rebuild similar wards inside prisons. Closing the door after the patient has left just means changing from one institution to another – except that someone has to commit a crime first. No wonder the police are furious... Too often, desperately sick people are released without back-up, against family and medical advice... Unspeakably cruel and tragic examples of molestation and families being terrorised do not seem to concern the “know-all” health bureaucrats and health politicians. Mothers who have been beaten by their children and seen them offend against innocents cry for help. We no longer have patients, they are “clients” – another dishonest politically correct description... Community and family care was promoted by politicians such as [Britain’s Iron Maiden] who, ironically, also claimed that there was no such thing as society. The talk was of family values, when families alone cannot cope with deluded and sick family members. This “market” view of mental health is based on the so-called rights of the individual. The “right to be crazy” it is called in serious publications; the right to be eccentric, different and inappropriate. What right, its defenders ask, has society to tell you to wash? You have the right to live your own life, without the state or society telling you how to live – even if you are burning yourself, taking drugs or causing pain or even terrorising your family or community. It is individualism gone crazy, backed up by privacy, human rights and mental health legislation, the policy that gives all rights to the disturbed and no value to the rights of family or responsibilities of society. It is society’s moral responsibility, it is society’s right, to intervene to stop the pain... The Privacy Act and commercial confidentiality arguments are being used to cover up the grim reality of a tragic truth... The Government [is giving] more money to mental health because of recent “bad” publicity. It knows it is losing votes. This happened in Britain. Its answer will be more bureaucracy, more patient visits by social workers – as if these patients have not suffered enough. That will not work either. The chronic shortage of beds and institutions has created a nightmare for families, the police, patients and GPs. Psychiatric wards once offered asylum to the distressed and deluded. They should not have to prove they are *seriously* disturbed, or hurt themselves or others, to get a place of peace so they can get some purpose in their lives again... We need to create decent shelters, places of... tranquillity, for those who cannot cope or look after themselves. The word “asylum” need not be a menacing word or place that cruelly represses people... [And w]e need a Minister of Health with the self-confidence and guts to tell the experts they have got it wrong.

...Psychiatric patients needing urgent help are being sent out of Auckland because all emergency beds in the city are reportedly full. One... was driven more than 150km south yesterday to Tokanui Hospital. Mental health workers say the shortage is caused by long-stay patients, who used to be housed in psychiatric hospitals, taking up many emergency beds. The Waitemata Health clinical director of mental health... said... extra money [promised] from the Government... last year... to begin improved services was still not available. “We keep waiting for the tiny drips of... money to come through. It’s just so damn slow. It just goes on and on.” ...[part] of the answer was earlier intervention to stop people reaching crisis point in the first place... But the... North Health communications manager... questioned whether there really were no spare beds left in the city. Rival crown health enterprises were inclined to save up their last beds in case they needed them, rather than make them available to another service...

Social workers have attacked a new... mental health service as a waste of money. The Auckland District Council of Social Services says the \$5.1 million announced last week for a three-year regional co-ordination service contract would be better spent directly on patients... The new service, run by Waitemata Health, would simply duplicate the work of psychiatric staff who assessed patients. Staff referring patients to accommodation would now have to go through the new service, which would... rubber-stamp their actions or override them without the same knowledge of the patients’ conditions... [O]nly \$300,000 a year – or \$750 extra a person – was going to meet people’s individual needs... Waitemata Health[’s] mental health manager... said the new service would have a database covering every psychiatric bed in Auckland. At present no one had a complete picture of all the services available... [T]he service was designed so that Waitemata Health could pinpoint where its mental health funding was going. The advantage was... it should provide reliable information about gaps in services, which could be used to mount a better argument for more services.

...Mental health workers are concerned about the lack of psychiatric services for refugees... [A] report says the Government needs to be aware of increasing numbers of refugees in Auckland and their health needs... The president of the Auckland Refugee Council... said services had been developed recently for newcomers but gaps still existed. Almost half of recent Bosnian and Somali refugees had post-traumatic stress disorder, or many symptoms of it... Another problem was the long waiting list for publicly funded psychiatric problems... [A] 24-year-old Bosnian refugee, suffering from schizophrenia and alcohol abuse, died suddenly last month after heavy drinking. [The Bosnian] had been released from the acute... Conolly Unit in central Auckland... However, [an]... investigation into the death... has cleared [the unit] of wrongdoing in letting him out on temporary leave.

...The Auckland coroner... has hit out at failings of the mental health system in the case of a [gal] who... over-dosed after waiting seven hours for a rapid-response mental health team... On January 26 last year, the team was delayed because it first had to help a [guy] who had a history of leaping off the centre span of the Auckland Harbour Bridge... In his report, released yesterday, [the coroner] said: “Clearly the crisis team could not be in two places at once.” [The coroner] concluded that “the deceased was the victim of inadequate staff and resources...”

...Five Maori mental health workers have been suspended for allegedly making false mileage claims worth thousands of dollars. The workers... were... from Te Puau Ora – which won an Australasian gold medal [last] August for its achievements in mental health services... Te Puau Ora was

set up two years ago... to support Maori people with psychiatric illness who live in the community... Their employer, Auckland Healthcare, is investigating the claims. Auckland Healthcare's communications manager... confirmed that a random audit had found "irregularities." [The manager] said 75 Maori psychiatric patients served by the community workers would be looked after by other mental health workers while the suspensions lasted. [The manager] could not rule out police involvement, depending on the results of further checks.

...The Ministry of Health has withdrawn a complaint against a psychiatrist involved in the case of [a Levin patient who]... was released from... Palmerston North's Manawaroa Centre... in January 1996, one day after a court ordered [it] be detained for six months' treatment. [The patient] made 16 recorded attempts to readmit himself before raping a Levin... [resident in March. Concerns have been] raised about the clinical standards of those involved in his case... It is understood two of the psychiatrists involved are now working overseas – one in the U[S] and the other in England... [B]oth... were originally from overseas... MidCentral Health refused to answer questions on whether they were forced to leave their jobs at Palmerston North... [The patient] is now back in a psychiatric institution, and can be released only by the Mental Health Review Tribunal.

...a \$17 million mental-health facility in Hamilton... with 108 beds for intensive psychiatric, forensic, and acute patients, will be officially opened by the Minister of Health... [today. ■ I]n Hamilton yesterday... [a] protest march... calling for free health access to all... drew about 2000 people... The senior medical staff chair[person] of Waikato Hospital... was cheered when [it] said: "Don't strangle us with blatantly inadequate funding, don't harass us with stupid ideas from Parliament and don't cripple us with... bureaucracy."

...[yesterday a NZ] First minister... implicitly criticised the reforms of the last decade, saying one of the great [20]th-century crimes was to blame the victim... But, [the minister] said, victim-blaming produced no solutions, just more victims... "If someone is unemployed, they are dismissed as a dole bludger. If mentally ill, they are often placed in inadequate community care..." ...[By the way, a] substantial sum of money from the sale of Carrington Hospital [to its neighbour] Unitec in 1992 was used to pay area health board debt, according to new information from the Auditor-General's office. Mental health funding campaigners were last week assured by the former Auckland Area Health Board chair[person] and deputy commissioner... that the sale proceeds were used to build mental health units at Auckland, North Shore and Waitakere. The sale price was never disclosed. However, the Unitec chief executive... yesterday revealed that the institute paid \$4.3 million in four instalments. The final two instalments of \$500,000 each were paid in 1994 and 1995, after the area health boards were dissolved and replaced by Crown Health Enterprises... The payments went to Health Support Services, a company jointly owned by the C[HE]s. The Audit Office has revealed that rather than spending the money on mental health services, the final \$1 million was "applied to discharging the various creditors of the Auckland Area Health Board. Although the boards had to spend the income from asset sales on a related health area, debt reduction payments made by Health Support Services were not tagged..."

Psychiatric patients often mutilate themselves... attack other people... or... commit... arson... to get admitted to Auckland's overstretched services, say mental health workers... "They know they won't get admitted unless they do something, so they either slash themselves or cause havoc as a cry for help. I can't tell you the number of clients who have said 'I went to the police, I wanted to be admitted, but there weren't enough beds or they won't believe me'." The... [m]ental health workers spoken to by the N[Z] *Herald* yesterday said the real problem was the lack of properly funded 24-hour care and supervision, so that patients could live outside institutions. They said much community care was contracted out to agencies, which did not want the most difficult cases because the 24-hour care required was too expensive... When... an extra \$15 million a year to help those whose lives are sorely afflicted by diseases which disrupt, alienate and occasionally kill... was announced it seemed that at last there would be some measurable improvement in the plight of those who suffer from mental illness... It sounded great at the time but when will it happen, how far will it go and how many lives can be salvaged? ...Now another terrible tragedy where mental ill health is alleged and shock, horror, fear and immense sympathy for [Raurimu's] victims and their families flood the media. Anger and outrage are uppermost as the events at the scene and subsequent actions are played out on our television screens. Yet all the while the Government and other agencies continue to fight fires. Crisis teams, where they exist, react to emergencies. Nowhere are there early intervention units with highly specialised staff which can diagnose and begin treatment of the sufferer and offer education and support to the family. Case management with continuity of skilled personnel able to call on a broad spectrum of supported accommodation and meaningful occupation is almost unknown. There are case histories aplenty that demonstrate how people can manage their lives and their illnesses when offered support in their own homes or those provided by non-governmental organisations – people who in fact continue to have major illnesses but whose social and support systems are such that they are able to live acceptably within the community.

...In the wake of the Raurimu shootings, [the NZ Herald] recalls the mass killings that have recently shocked N[Z]... In the past seven years, there have been seven multiple death killings which have left the nation numbed and perplexed at how such events could happen. In May, 1992... a hard-working rural grandfather who lived near Pukekohe stabbed his wife to death... then shot dead... his... three sons, a daughter-in-law and a grandson... Etched in the memories of N[Z]ers are the words of [a] nine-year-old... [girl] on the telephone to police: "My grandfather has shot my brother... and I think [my grandfather is] going to shoot me." [The girl survived. Her grandfather] had apparently refused treatment for depression... A month later came another family slaying, this time in Masterton, when someone] hammered, bludgeoned and stabbed his three children, the brother of his estranged wife, his pregnant wife's sister, her partner and their son. In February, 1994, a 31-year-old Wanganui... [resident] killed himself and his three young daughters... Then, in June the same year, the Bain family hit the headlines. The still controversial case ended with the sole surviving member... [being] jailed for slaughtering his father, mother, brother and two sisters... [(An Auckland businessperson) and former All Black... launches his book on the Bain murders in Dunedin today... The book, *David and Goliath*... claims the 1995 conviction of the student... was a "monumental miscarriage of justice]" because the]... father... shot his family in an attempt to hide details of an incestuous affair with daughter Laniet. It [also] says the police inquiry was conducted in a "bungled and incompetent manner" and that [the student] was arrested prematurely.[)] ...There was still a myth around that families were peaceable and tranquil... "In families you've got people forced to be together because of the blood ties, you haven't chosen to be together..." ...While comparatively rare, multiple death has been dealt by the hand of a stranger. The worst instance was in 1990 when the reclusive David Gray went berserk in Aramoana with a semi-automatic rifle and butchered 13 people in 30 minutes of savagery... before dying in a hail of... police... bullets... The victims, aged from six to 71, were neighbours... [of t]he unemployed 33-year-old farmhand... [A] domestic violence expert with Waikato University, said yesterday that there was no single reason for anyone to commit mass murder. Perpetrators generally had a mental illness, there would be a trigger event and the death toll would be affected by the availability of weapons. "If there weren't guns available, much less damage would be done,"...

The... Dunedin bookseller... who warned police that David Gray had an assault rifle says the Aramoana massacre [could] have been prevented... [The bookseller] contacted police nine months before the November 1990 shooting, after Gray, a long-time customer, showed a staff member... [his] AK47 rifle... When police went to [his home, Gray] showed them an airgun and said that was what the shop assistant had seen... If gun registration had been compulsory the police would have known what weapons Gray had... A report by [a] retired High Court judge... is expected to recommend the reinstatement of registration... [plus a] Government ban and buy back[of] 30,000 military-style, semi-automatic firearms from owners... [However, g]un registration has failed three times in N[Z] and reinstating it again] would cost about \$20 million[, while a]ll 300,000 gun owners would have to get a safe in which to keep a gun or the dangerous parts of it. Gun collectors would be hardest hit because rendering some guns inoperable, as recommended in the report, meant they lost 95[%] of their value...

After reading 3000 submissions on gun laws, the [person] who could influence major change admits [it] has no easy answers. [The r]etired High Court judge... yesterday said the weekend massacre at Raurimu would not delay the report deadline... [although the judge] expected to get

information on the... killings and may have to make some interim remarks in his report... [The judge has] already received a four-month extension because of the massive workload... The submissions covered a wide range of views, with no side of the argument dominating any other. Meanwhile, interest groups continue to publicly dispute what needs to be done to prevent mass killings. The pro-gun group, Sporting Shooters Association, has called for a review of mental health care, citing a string of recent incidents involving disturbed patients. But the director of regional forensic psychiatric services in Auckland... said it should be the gun lobby that screens firearm users... The gun lobby was well organised, [so]... “why don’t we utilise their skills, use them constructively.” ...the shooters association... said [the director] was merely trying to shove responsibility to another group[, while]... a Mt Eden... [GP] knew of at least two cases where the association had asked police to remove firearm licences from suspicious people[and, both times, i]t took months to get action. “If the law makes it too expensive or too bureaucratic to have guns it only disarms law-abiding citizens. If people desperately want a firearm, they will get one illegally... Gun owners used to be able to get a lifetime licence, but now you have to reapply every 10 years... In England, you have to reapply every three years but that didn’t stop Dunblane [Scottish massacre] did it?”

...[a NZ] gun control lobbyist... is urging caution on changes to gun laws in the wake of the Raurimu massacre... [while attending] a meeting with gun control lobbyists from around the world... in London... The Raurimu tragedy has made... the former television presenter and now an Auckland-based public health researcher, a central figure at the... conference, although [the lobbyist said N]Z... was not a particularly good example for other countries[because i]t had some of the loosest gun ownership laws in the world. Japanese anti-gun lobbyists have succeeded in all but banning guns while... Britain proposes to restrict handguns to licensed gun clubs, but steers clear of extending controls on rifles and field sports firearms. [The lobbyist] takes a more moderate line, arguing that the best way forward for N[Z] is to reintroduce registration of weapons, which was dropped in 1993.

...The 300-page... firearms review... report [has been] delivered to the Minister of Police... A spokes[person said the minister] would not comment on the recommendations but... the report would [eventually] be made public[– although a]... list of the report’s full recommendations was [already being] circulated on a British pro-gun lobby Internet site called Cybershooters... A gun policy researcher [and lobbyist]... welcomed the report and said it was a “good effort” for increasing public safety. “[The retired judge] recognises the majority have rights. The majority of N[Z]ers have little affinity with guns and have the right to live in a society free of the fear of guns... Either we keep on ignoring it and talking about gun laws in the two or three days after each massacre... or we decide N[Z] is going to take the other road and follow the model of the Commonwealth, not the U[S.]” However, the lobbyist was concerned that[... only military-style semi-automatic rifles would be subject to a Government buy-back[when] they accounted for only one out of 10 of the deaths by shooting... A spokes[person] for the Sporting Shooters’ Association... said the recommendations would increase the barriers to legal users of firearms and lead to more guns appearing on the black market. The legal ownership of shotguns had plummeted in Britain to its lowest level since records were kept, while 2500 illegal handguns entered the country each week.

...IN JUNE last year, in an article entitled “How we help killers pull the trigger” I explored the background to a number of amok killings. My conclusion was that these incidents are overwhelmingly a mental health problem, compounded by inadequate enforcement of existing laws... We need to address the problem at both levels if we are serious about preventing further incidents like Raurimu. To date, this has not happened. One of the major reasons this has not happened is because of the unprecedented media hysteria demanding tougher gun laws after Aramoana... The same phenomenon has occurred more recently in A[US] (after... Port Arthur) and the United Kingdom (after... Dunblane) and has led to the passage of rushed, and therefore unsatisfactory, firearms legislation that promises to enhance public safety yet misses entirely the real causes of amok killings. Such misfocused and useless laws – which seem to be based on the premise that because a mentally deranged person kills with firearms then the sane and responsible cannot be trusted to have them – breaks the most basic tenet of good law. In a democracy, surely law-abiding responsible citizens have the right to be treated as innocent until proven guilty; have the right to have their traditional activities, sports and interests protected? In a democracy, surely governments have an obligation to protect the interests of the law-abiding by passing focused laws that can achieve the desired result? If this is not the case, do governments then have any right to demand our blind obedience, and do laws that make criminals out of previously law-abiding responsible citizens have any role in enhancing public safety? Gun laws are in reality an illusory and totally misfocused “solution” to the problem and fail badly in theory and in practice. It is hardly surprising that more and more people choose not to comply with them... So let me restate the obvious: First, amok killings are acts of criminal insanity perpetuated by severely disturbed individuals. Second, these people are in the community as a direct consequence of government health policy... If those responsible for running our mental health system can claim most amok killers are technically not insane, then clearly modern psychiatrists have lost sight not only of reality but also of their obligation to the society that is paying their not-insignificant salaries. While relabelling such people as “behaviourally disordered” may allow the mental health services to wash their hands of a difficult problem through a convenient technicality, it clearly neither delivers better care nor makes such people less dangerous. Calls for tougher gun laws by the very people responsible for this state of affairs must be seen as a cynical tactic, a smokescreen to deflect attention and liability away from their failure to properly care for those who are ill and to adequately protect those who are sane. Some people are surprised to learn that it has been illegal for criminals or the mentally deranged to have firearms since 1921. This has not changed for the last 75 years. Murder, assault, rape and robbery have been illegal for a whole lot longer, yet occur with increasing regularity. This should suggest passing ever-more complicated laws in no way protects us... The harsh reality is that no gun law can ever compensate for a dysfunctional mental health system or for the failure of authorities to properly enforce the law as originally intended.

...The Auckland coroner has criticised the police for not confiscating a gun from a Northland [resident] whom they later shot dead... [The coroner] supported the police action... as [the shot resident] “unquestionably posed a serious threat to himself, his wife and to the public.” But [the coroner] said there was an earlier incident in which [the resident] rang his wife at her work and told her [it] was holding a loaded gun. [The resident] then fired the gun and said [it] was going to kill himself... [P]olice were called... but the family was left to deal with the matter... [The coroner] was surprised that [the resident] was not deprived of his firearm, which “leads one to speculate whether [the resident] would still have adopted his fatal course.” The acting Northland police commander... said last night that [it] was surprised the coroner had levelled criticism against the police in view of the fact that a Police Complaints Authority investigation into the shooting had not been released.

...POLICE are likely to appeal a court decision which has given firearms back to an elderly farmer who believes [it] is descended from aliens... [H]is shotgun and .22-calibre rifle were taken by police after an incident [last] December. The 79-year-old believes his grandmother, who [it] said was part Aborigine, was impregnated by aliens who arrived in the A[US]n outback from space last century... [The 79-year-old] said the story had been told to him by his father when [it] was a boy, and... claims medical examinations supported the theory. Police argued that [the 79-year-old] was not a fit and proper person to hold a firearms licence... [When they] had gone to his son’s house... [in December, the 79-year-old] said: “We should have guns on our hips and shoot this out like they did in the old west.” ...[the 79-year-old said the judge’s] decision was a victory for justice.

...Police were right not to shoot and kill Port Arthur[’s mass murderer]... at the scene... Tasmania’s police chief said yesterday. Speaking at a seminar about the management of the tragedy, [the] Commissioner... said the most common question about the police action there was why did they not kill [the person] who is now serving a life sentence... “It’s not the role of the police to be judge or executioner, it’s up to us to take people into custody and bring them before the court.” ...[the commissioner thought that the mass murderer] left home on April 28 last year with the intention of dying at police hands. “It’s much more useful for these people not to die in a hail of police bullets or not to die with what they perceive as any sort of hero status,”... [Incidentally,] Britain’s Parliament voted overwhelmingly yesterday to approve one of the world’s toughest gun laws. Despite a £150 million... compensation package, gun owners claim they have been made scapegoats after the Dunblane massacre...

In a lounge lined with old plaques and trophies [a 33-year-old] and other members of the Harrow Rifle and Pistol Club sit in gloomy silence. The shooting range is empty and the mugs of tea have gone cold. With Britain set to pass some of the toughest anti-gun laws in the world, the sky is falling in on the 105-year-old London club. The 33-year-old... commercial artist... has been shooting pistols for over a decade, and competes in overseas tournaments. The new law will make her guns – and her sport – illegal. “I’ve put my life into this and now they’re taking it all away with the stroke of a pen,”... At the core of the proposed legislation is a ban on all handguns over .22 calibre, which would eliminate 80[%] of the 200,000 pistols registered in Britain. According to the original bill, remaining handguns would have to be stored in heavily fortified clubs, and could be moved only to a competition or a repair shop with a police permit and by special courier – restrictions so tight, say critics, they are tantamount to a ban. With the new gun law expected to be on the statute books in the coming weeks, most of the 2200 gun clubs in Britain are already bracing for a drop in income, and wondering how to pay for the new security measures... Among the British public, however, there is not much sympathy for their plight. Polls show enormous support for the gun law, with 56[%] of the population in favour of banning handguns of every calibre. Much of that sentiment can be traced back to a small town in central Scotland. Last March, Thomas Hamilton... walked into a school in Dunblane with two legally held handguns and spare ammunition... opened fire at random, killing 16 children and wounding others, before shooting himself dead. It was not the first such massacre in Britain, but it touched a deep nerve... A tireless and highly emotive campaign, spearheaded by families from Dunblane, forced Parliament to act. But even before Dunblane the British had little time for firearms, and the local gun lobby is a shadow of its American counterpart. Many farmers own a shotgun, and the rural gentry are avid hunters, but only 57,000 people hold pistol licences. Most British police are unarmed and the London media follows gun culture in the U[S] with appalled bewilderment. Britain’s already tight firearm laws – even now, a pistol cannot be kept in a house for self-defence – are often credited with keeping down the rate of gun-related violence. Handgun aficionados argue that the present laws, if properly applied, are restrictive enough, and that no ban can prevent another Dunblane... [A] lecturer in political science at the London School of Economics, [who] has never fired a pistol in his life... believes that British gun laws need tightening, but doubts if the answer lies in a ban that entails outlawing internationally recognised sports. Back in the Harrow Club, members are already looking beyond the new rules. [The commercial artist] and her husband might take up rifle-shooting. They are also toying with the idea of emigrating to a pistol-friendly nation... [In local news, g]un lobbyists want a Government audit into dangerous mentally ill people who have been released into the community... Instead of tougher gun laws... the Sporting Shooters Association... called for a register where the dangerous or unstable mentally ill people would have certain privileges withdrawn from them, such as owning guns and the right to enter gun shops. “Surely it’s in the patients’ own interests to have certain rights removed to protect them?” The... report... [also] calls for legal accountability from doctors releasing dangerous patients into the community... 140 incidents gleaned from newspaper reports between 1990 and 1995... [suggest] 60 homicides... were committed by people whose psychiatric condition was the probable cause.

...[guys] with a history of family violence are much more likely to use a gun to kill someone than a mentally ill person, say mental health workers and lobbyists for tighter gun controls. The groups joined forces yesterday to attack a report by the Sporting Shooters Association calling for a national register of the addresses of mentally ill people... [A]ccording to studies in N[Z] and AUS there is a 55% likelihood... that family violence... [will] trigger... a firearm-related homicide... [compared with] up to 12[%] for people who have... a history of mental illness...

Police yesterday raised a storm by suggesting that they should have right of access to the medical records of the mentally ill. The call led to claims by patients’ groups that they were being unfairly treated, and to a warning by the Privacy Commissioner that doctor-patient relationships could be put at risk... The chair[person of the]... Medical Association... said yesterday that it was important people knew they could speak openly to their doctor and that confidence would be respected. “This is particularly true in cases of mental illness, where the information the patient gives may be crucial to the success of treatment.” ...[the chairperson added] that giving the police access to medical records could deter people from telling the truth, especially when illegal drugs were involved. It could also encourage them to change doctors to avoid leaving a paper trail, which could threaten the continuity of their care... [The chairperson believed] doctors needed clarification of the rules which guided whether they could breach a patient’s confidence and talk to the police... The police want the power as another weapon in the fight against violent crime. The police move came after the... conviction in Christchurch of [a mentally disturbed person] on rape and murder charges and subsequent claims by his family that [the offender] had been denied psychiatric treatment which could have prevented the crimes.

...[the offender] was feeling 10 feet tall. Head shaven, wearing black clothes and boots and steamed up on drugs and alcohol, [it] walked through suburban Aranui... late on a Monday morning looking for trouble. [The offender] needed money, and robbery would do. Drug debts had to be paid and [the offender also] needed a bus fare to get into the city. Over the previous 36 hours, [it] had smoked at least 14 cannabis cigarettes, taken half a tab of LSD... drunk beer... and... felt “invincible”. More ominously, [the offender] wanted sex. His track record over the previous year or so spoke for itself – sexual liaisons with transvestites, transsexuals and street walkers, all when... involved in a steady relationship... His file at Sunnyside Hospital had at times over the years noted [the offender] was “a danger to the public” and “not to be examined alone”. [The offender] had long stopped taking the lithium that kept him on an even keel[... telling]... his family it made him sick. Catherine Florris Coster... didn’t stand a chance. Stricken with arthritis, [Catherine] needed a walking frame and stick to get around. When [Catherine drove past the offender] in her red Austin 1100 and up the driveway to her... home, [Catherine] had signed her death certificate. [Catherine] was in the wrong place at the wrong time... The jury at his High Court trial... had to decide whether [the offender] was mad, bad, or a combination of both... [I]t was argued that his mental condition at the time was such that [the offender] could not morally know what [the offender] was doing. But [the offender] had the presence of mind after the Coster attack to try to cover his tracks... [The offender’s mother] agonises over what has happened to her son... [H]is mental disease was inherited from his maternal grandmother, who died in Sunnyside Hospital.

...Ex-patients: we aren’t all killers... Guilty: [a] young and strong... [Christchurch resident] rapes, sodomises and kills a helpless old [gal]... It is revealed that [the offender] has a history of mental illness and drug-taking. Not guilty, by reason of insanity: [the person who] beats and kicks to death an elderly couple in their Auckland home. [The offender] is a former nun who thought [it] was God and her victims were devils. [Someone else] tries to get help from Palmerston North Hospital’s psychiatric unit but is denied admission[– then rapes a stranger] in Levin. Massacre in Raurimu: [the perpetrator] is sent for psychiatric evaluation after a shooting which leaves six dead and five seriously injured. They are this year’s headlines – guaranteed to get the public even more afraid of the mentally ill. It is a fear that psychiatric survivors and psychiatrists say is unfounded. The past four years have also had their share of headlines. The ones listed below do not include the numerous suicides by psychiatrically disturbed people. Last year: [a South Island resident killed a stranger] by driving his car at her vehicle but was found not guilty of [hu]manslaughter on account of insanity. [The offender] was ordered to be detained in a mental hospital... [A] 44-year-old dairy farmer, was found not guilty on the grounds of insanity of the murder of his wife... in 1995 and the attempted murder of his children... 1994: [an] Inglewood couple... thought their son Dane had been possessed by a demon and bashed him with a brick to exorcise it. [Dane] died. They were found not guilty of murder, but insane... 1993: [an Aucklander who]... had been found not guilty by reason of insanity... after throwing a [gal] off an overbridge... die[s] after falling from an Auckland building... The same year... [another Aucklander] appeared in court... for beating his mother to death with a hammer. [The offender] told a psychiatrist [it thought its mum] was an evil witch. The verdict: not guilty by reason of insanity. And so on. You would have to be crazy to commit those crimes, surely? Actually, no, say the thousands of people who use mental health services but who would never hurt a fly. They pose no more harm to the average citizen than the average citizen and are probably of less risk... “There’s currently 67,000 people using mental health services. Now you go back through the newspapers last year and you find three hit the headlines... Yes, there are some

people who have done some horrendous things. But there are also a vast number of people who have done horrendous things who have not got a mental health history[,...]... said a spokesperson for the Aotearoa Network of Psychiatric Survivors... The spokesperson also said the damage caused to people with mental illness every time a case like [the one in Christchurch] cropped up was huge... [The] chief executive of the Mental Health Foundation, said... if violence had not been an acceptable form of expression in society then there might well have been mental illness without violence.

...New research shows a link between mental illness and violence, but psychiatrists have urged NZers to tone down the “hysteria” over the mentally ill... [The chairperson] of the College of Psychiatrists, said the violence of mental illness was “massively overplayed... it’s just part of the discrimination cycle really.” The research is contained in an article in the *A[USn and NZ] Journal of Psychiatry* which summarises recent studies and concludes there is a “modest association” between mental illness and an increased propensity to violence... [i]n societies where murder and mayhem were not “national hobbies,”... However, it argues against policies of greater control and containment of mental patients in favour of improved care, support and treatment in the community. The author... says those at high risk need to be targeted for priority in follow-up care and intensive support. “Above all, it is essential to make it clear that violence can be a reflection of a failure of treatment and support and that therefore in principle it is preventable. However uncomfortable it is, we must look at the adequacy of our own professional responses in regard to the needs of the mentally ill.” ...only a tiny percentage of people with mental illness were violent. “If you look at people who are in good treatment situations then the risk may in fact be lower than the general public... The adequacy of treatment is what matters.” ...When damage did take place it was usually slight and inflicted most often on family members, professionals and fellow sufferers... Violence was more likely to occur or be perpetuated by people who used substances and by young people with a mental illness.

...Health is not just an absence of illness. It can be said to be a state of well-being which is dependent on physical, emotional, social, cultural and spiritual needs being met. These needs in children are met through the provision of adequate food, clothing, housing, nurturing, a sense of cultural identity and belonging, security and education. It is further enhanced by the provision of primary health care such as clean water, sewerage, primary medical services, immunisation and well child care. All of these should be the birthright of every child born or living in this country. The fact that the health status of NZ children is deplorably low by world standards is indicative of a society which either cannot afford to provide for these needs or which just does not care enough to do so... Mental health problems are by far the most common and most costly of all health problems in adolescence. Their roots lie in a complex admixture of values, toys... and indulgent deferment of responsibility in an affluent society, the kind of start one gets in life and generic vulnerability to stress, alcohol and psychiatric illness. In contrast to what is believed most adolescents are well-behaved and happy much of the time and in terms of my youth could be judged even pampered and spoiled. Girls will suffer more as they worry about almost everything, but boys will be no more fortunate as they chase the dangerous and odious... ideal of a good Kiwi bloke. Most will muddle through as we did to a no less stressful adulthood, causing their would-be Pygmalion parents much pain (and joy) along the way. About 10[%], intermittently or chronically, will be impaired by anxiety, depressive episodes, drugs and alcohol, or behaviour disorders which will often continue into adulthood. [1%] will have their lives derailed by major psychiatric illness such as schizophrenia or manic-depression... Much has been made of “teenage” suicide in NZ but in 15-19-year-olds it accounts for only 15[%] of deaths – accidents account for 80[%]. Most suicide occurs from age 18 on and among those who have left school. Motor vehicle accidents cause death and enormous non-fatal disability as well. We know the causes of accidents, we do not know the causes of suicide (beyond alcohol and major psychiatric illness in some cases), nor do we know how to predict or prevent it. In this context the national obsession with teenage suicide is an obscenity. A recent study in Dunedin has shown that motor vehicle accidents among the young are much more common in those with mental health problems. Add to that the overweening role of alcohol in all accidents, in crime, in violence and suicide and it becomes clear that mental health problems are the problem of adolescence and behind all of them, the pervasive cancer of alcohol. To deal with these problems we need a range of services... Many such services exist but they are poorly resourced and coordinated. In allocation of resources ‘adulthood’ (just as reprehensible as sexism or racism) obtains. For central Auckland, adult community mental health services have 12 psychiatrists, child and adolescent services have 0.8; adult services have a budget of about \$30 million, child and adolescent, about \$1 million. What needs to be done... [is that] we need to deliver a society that cares for the unfortunate, makes good parenting possible and stops its adults and media from modelling and adulating narcissistic, acquisitive, drunken, and violent behaviour.

...Teenage mental health problems are skyrocketing in Auckland... Admissions for manic depression at the Starship children’s hospital have soared by 55[%] since last year. The average length of stay has more than doubled to 27 days. [The Starship’s] child psychiatrist... said teenage patients were flooding into the child and family unit, forcing younger children on to a waiting list. Trends pointed to the service coming under intolerable pressure... The surge was most likely a result of people recognising major problems among teenagers... Teenage patients tended to come in with crisis situations or arrive under a compulsive treatment order and needed longer stays. Younger children generally came in for shorter assessments and treatment plans for conditions including behavioural problems, serious feeding difficulties, complex attention deficit disorders and autism[(‘about 10% of infants can be identified in the earliest months of life as temperamentally difficult children: these children are characterised by biological irregularities in sleep, feeding, and elimination; inflexibility; avoidance or distress in response to new experiences; slow adaptability to new situations; nonfastidiousness; and negative moods, including extremes of fussiness and crying’)]. About 10 children were now on the waiting list... “Many have long-term difficulties. For example, there are some children with possible psychotic illnesses leading to behavioural difficulties who have been out of school for quite long periods of time.” ...[a] Lower Hutt mother was near breaking point trying to control her daughter’s... suicide attempts, furious outbursts, pregnancy... and... miscarriage... “My daughter must have tried to kill herself 50 times. My husband and I were trying to hold down our jobs and look after her at the same time. We were very sleep deprived... and we all ended up on medication.” ...A string of medical professionals put the 17-year-old’s behaviour down to teenage problems. But [the mother] realised major help was needed. In May last year, her daughter’s condition was finally diagnosed. Then began the hurdle of obtaining help... A Lower Hutt psychiatrist recommended the Starship’s child and family unit and the family joined the queue. “There’s really nowhere else in NZ to go... We were just hanging out for the day [our daughter] could be admitted and it seemed endless.” After two months, the family got the go-ahead to travel to Auckland. Manic depression was confirmed and three months of treatment began. Her daughter is now on a drug to keep her “normal” and has gone back to school part time... The unit takes up to 12 in-patients from across the North Island. Many were referred from regions which only had adult wards.

...A suicidal mentally ill 15-year-old is said to be scared out of his wits after being shunted into a ward for adults with acute psychiatric disorders. The teenager, who may have bi-polar disease (manic depression) was transferred to the Conolly Unit at Auckland Hospital after the Starship... could not guarantee [the youth] would not harm himself, said his mother. The [mother], who contacted the NZ *Herald*, said it was both horrendous and totally inappropriate for her son to be with the adult patients. “[My son] is saying, ‘this is my future – this is how I’ll end up.’ [My son] shouldn’t see that,”... The [mother], who did not want to be identified, said there should be a specialist secure unit in the Starship for such children and adolescents. Before being admitted to Conolly – one of eight cases involving Starship patients in adult facilities this year – her son had bolted from the Starship. The clinical director of the Starship’s child and family unit... would [also] like to see a secure intensive-care unit built at the Starship. Staff were not happy about admitting adolescents to wards for adults with acute psychiatric disorders, but there was no alternative... A funding breakthrough... [of] an extra \$500,000... may help, although it will still not guarantee that all extremely sick and troubled adolescents will be kept out of adult wards... In 1994 there was an outcry over mentally ill children being sent to Conolly when the Starship’s unit closed at weekends. A campaign by parents and a public row resulted in the child and family unit remaining open for seven days. During the battle, [an]

Emeritus Professor... wrote in a briefing paper that adult psychiatric inpatient units were unsuitable for children and adolescents because of a raft of risks... includ[ing] the danger of... sexual harassment and... physical... abuse.

...A 15-year-old mentally ill boy admitted to a ward for adults with acute psychiatric disorders was yesterday returned to the Starship children's hospital. The teenager's mother said... [her suicidal son] was much calmer since his return to the Starship...

A Rotorua trust says it had no choice but to send a brain-injured [patient] who later threatened suicide to live with relatives. On Sunday, police and health workers in Auckland could find no place for the distressed [patient] to go, releasing her into the street at 2 am because of a lack of mental health funding. For 14 months, the Head Stay Maungarongo Trust – which specialises in caring for people with brain injuries – had looked after her for free. Three weeks ago [the patient] was sent to live with relatives because the trust could no longer cope with her behaviour... Arrangements were made to send her to stay with family in Auckland, a trip [the patient] had made before... [but the patient, who] had been given a one-way ticket... got lost at the wrong bus stop and overdosed on her medication... The trust's director... said yesterday: "For \$500 a week [the patient] could have had 24-hour care but we could not find money anywhere." The [patient], who suffered from brain damage after contracting meningitis as a child, had not qualified for mental health or accident compensation funding. "[This person] fell through the gaps." The... [director] was distressed by claims that the [patient] had been dumped in Auckland. The [patient] was streetwise and understood the consequences of her actions, but had major behavioural problems after years of institutional care... The [patient] had been in trouble with the police repeatedly...

Shortcomings in the treatment and care of brain-injured people will be addressed in a blueprint for future mental health services. The Mental Health Commissioner... said many people with brain damage from head injuries required different treatment than that provided for the mentally ill[, and]... there had been widespread misapprehension in the past that the Mental Health Act did not apply to brain-injured people who displayed symptoms of poor mental health. A Rotorua-based neuro-psychiatrist with extensive experience in treating brain-injury patients... said about 10,500 people were discharged from N[Z] hospitals with brain damage in 1994, although professional sources believed many more went undiagnosed. "The physical damage is generally well looked after, but often the [mental health] consequences are not well dealt with." One of the few programmes specifically for brain injury patients, the Behaviour Support Service, was set up by Auckland Health 15 months ago. The manager for mental health services for Auckland Health... said it was proving successful, "but I still think more [care] is needed." The executive director of the Brain Injury Association in Auckland... was concerned that "people are slipping through the cracks" because there were often no proper facilities available for the brain-injured in times of crisis. [The director] said the association was meeting police, health and accident compensation representatives to establish a protocol for dealing with the problem.

...The Minister of Health... yesterday signalled that crown health enterprises would come under scrutiny over failings in mental health services highlighted by the... case[of a patient who] was... "tipped out on to the street"... [by] the Manawaroa... treatment centre... in Palmerston North... the day after... [being] admitted... under a family court order for compulsory treatment for six months... [O]ver ensuing weeks [the patient] made 10 recorded attempts to be readmitted. On March 19 last year [the patient] was detained by Levin police for his attempts to have ambulance staff readmit him to Manawaroa. [The patient] also unsuccessfully tried to get the police to admit him. The following day [the patient] got into a Levin home apparently chosen at random and in a hypermanic state of altered perceptions twice sexually violated the... occupant... [The minister] has ordered an urgent inquiry into the case, as have the Ministry of Health and the... enterprise concerned, MidCentral. [The minister] told Parliament... "Our services in the mental health and drug and alcohol area seem to me to be too much organised along the lines of diagnosis and legislation and professional interest and not sufficiently organised around the needs of the individual, as we increasingly have individuals with both mental illness and drug and alcohol problems. They should... not... be treated as... two different illnesses." The Labour health spokes[person was also]... concerned that hospitals and treatment centres were using drug and alcohol "as an excuse for turning away people who need psychiatric help. To me it looks as if mental health professionals, admittedly working under huge pressure with limited resources, are prioritising patients..."

...The Minister of Health... yesterday ordered a detailed audit into how people with mental illnesses are admitted and discharged from acute wards in public hospitals. The announcement came on the day another case about the hospital care of a mental health patient was queried – this time by the leader of the Alliance[, who]... claimed that... Brenda Burton, who died in an arson suicide in her flat in Birkenhead in February, had been discharged six days earlier from North Shore Hospital after a suicide attempt because [Brenda] was assessed as "having no signs of mental illness." ...a fire report on the case showed a witness alleged that Waitemata Health's community assessment and treatment team failed to respond to concerns about Brenda[s]... mental state. Waitemata Health has written to [the Alliance leader] and said the team acted appropriately when dealing with Brenda... A Waitemata Health spokes[person] last night said [it] could not comment on the case before a coroner's inquest. [The minister] said dealing with mental health services was his top priority over the next year[, and] denied the audit was yet another report into mental health services, saying it would reach right into what was happening in hospitals and make improvements at the coal-face. "There is a cycle of tragedies, inquiries, recommendations, frustration and another tragedy. We need to break out of that..." ...last month [the minister] ordered an urgent inquiry into the case of... [the patient] who raped a Levin [resident] after unsuccessfully seeking mental health services for himself at least 10 times over a two-month period. That report is still being completed.

...Health professionals yesterday accused the Minister of Health... of political interference in the... case... [of t]he mentally ill [patient who] was convicted in March of raping a Levin [resident]... soon after being discharged by MidCentral Health staff... [The Minister of Health also] said mental health workers had to meet the same professional standards applying elsewhere in health... But two health professionals, speaking independently, said that [the minister] was making scapegoats of specialists. The mental health services manager for Waitemata Health... said mental health workers who made mistakes should be investigated by the Medical Council, but politicians should not interfere. Many other mental health cases had been through that procedure without fanfare. The executive director of the Association of Salaried Medical Specialists... said psychiatrists were working in a seriously under-funded... service, but those responsible for creating that situation were not legally accountable. "The minister who is pointing the finger at psychiatrists is the same minister who is currently cutting mental health funding." ...An inquiry... found th[e patient]'s treatment was seriously inadequate, although clinical staff could not have predicted the rape. No individual was found to have been negligent.

...The announcement of yet another review of mental health services has drawn criticism that talking is still taking precedence over action in addressing the shortage of care, particularly in the community. And the head of last year's extensive mental health inquiry... thinks the latest audit may place emphasis in the wrong place and put the cart before the horse in terms of meeting the most urgent needs of the mentally ill... "No clinician or nurse gets any pleasure in admitting or discharging a patient inappropriately to or from an acute bed, but out of concern and simple humanity they are left with little option. It is wrong to suggest that inadequate assessment and admission criteria is the reason for the review... It seems to me more honest to say that this review has been triggered by collective inaction of successive Governments, by often questionable management and financial practices by some within the system, and by a belated realisation that if community care isn't sorted out, then little will improve." [The retired judge]'s inquiry team's report last year noted that since 1987, 67 inquiries into mental health had been undertaken, including 51 involving the care and services in psychiatric hospitals. [The retired judge] hoped the latest audit would not simply go over grounds already covered in his team's report, which revealed that staff are often "advised to discourage" admissions due to lack of beds because those beds were being inappropriately occupied. Sometimes a less acute patient will be discharged so that the bedspace can be utilised by someone who is more acute. Clinicians, patients and families should not be confronted by that ethical dilemma." ...this latest review will be worthwhile only if it "ensures in the near future that there will be more and better community care facilities and services for the mentally ill."

...For many families of the mentally ill, “community care” sounds like a bad joke... [O]ne worried daughter... is at her wit’s end trying to find a safe home for her manic depressive father... [who i]s not considered mad or bad enough to need urgent help... [The] 52-year-old psychiatric patient is about to leave Kingseat Hospital in South Auckland, despite his daughter’s fears for his safety. Last night South Auckland Health promised [that her dad] would not be sent home until [the patient] had proper support. But [the daughter said it] had run into a brick wall trying to find help for her father, who needed regular supervision for his own safety and other people’s. About three years ago when [the dad] failed to take his medication, [it] drove his car down the Southern Motorway, smashing into six other cars and causing about \$30,000 worth of damage... [When last s]ent back to his Manurewa home... [the father] did not wash himself... got drunk, abused people who tried to help, went on spending sprees and failed to pay his bills... [The daughter and] her sister, who had looked after their father for years, could not watch over him constantly. [The daughter] had tried unsuccessfully to find him places in retirement homes, halfway houses and a psychiatric unit designed for short-term acute patients at Middlemore Hospital... then tried to arrange for social workers to visit his home regularly... but no one could help her. “I just want to hit somebody, shake somebody and say why can’t you help...”

...Families of mentally ill people are struggling with impossible burdens because they cannot get professional help, says the Schizophrenia Fellowship. An Auckland spokes[person for the group]... said many relatives would understand the plight of [the daughter] who went public in yesterday’s *N[Z] Herald* with her battle to find a place for her manic depressive father... One [person], who did not want to be named, rang the *Herald* to say [it] had exactly the same problem with her mother. “I burst into tears as soon as I read the story.” [The spokesperson] said many elderly people felt alone as they tried to cope with psychiatric problems in their sons and daughters... [I]ronically the people who most needed help did not get it because they were so difficult to deal with... “They’re often not wanted in acute settings because their behaviour is so anti-social they disturb other patients.” ...North Health was contracting more home support services but only for about two hours a week. This was not enough for patients... who needed attention every day, and others, who still needed 24-hour care.

...Groups at loggerheads over a psychiatric half-way house planned for Te Kuiti will face off at a resource consents hearing late next month. The Raukawa Development Trust has applied to the Waitomo District Council for consents to establish the service. The trust planned to house up to eight psychiatric patients in the house. They would require 24 hour care but would be free to come and go from the property.

...Eight Auckland psychiatric patients... most of whom suffer from schizophrenia and require 24-hour care... face eviction on Friday unless funds are found to keep their cash-strapped community home afloat. Taumata House in Mt Eden says it is being forced to close its doors after failing to secure a funding contract with North Health. It has invited North Health and other interested parties to a meeting on Thursday in the hope that a solution can be found. Meanwhile, the search is on for alternative accommodation for the patients... But... a spokes[person] for the Auckland District Council of Social Services[(ADCSS)], said that even if alternative accommodation was found the move would compromise the residents’ well-being. “If this situation is not resolved then ultimately these people will be dumped in outer suburbs of Auckland away from what they know and who they know...”... [The] manager of the regional co-ordination service run by Waitemata Health... [confirmed that] the patients were likely to be moved to west or south Auckland. Taumata House’s owner... had twice missed out on North Health funding contracts... “As much as I love these people I can’t go bankrupt for them,”... [The owner] claimed that North Health... was too restrictive with its conditions, which prevented her having elderly residents as well as psychiatric patients... However, North Health’s mental health manager... said it could only fund organisations through a public tendering process, not on an ad hoc basis. “We’re not a funding body but a purchasing body. We work out what services we need to buy at a given time and then put them out for public tender.” Invariably, more people wanted to be providers than were needed at any one time, [the manager] said. The next tendering round was scheduled for early next year.

...Closure unsettles psychiatric patients The Minister of Health... will investigate the sudden closure of a Mt Eden home for psychiatric patients. Taumata House is expected to close today, with some of its... patients uncertain of finding a bed... In Parliament, [an] Alliance list MP... asked [the minister] whether it was in the medical interests of sick people to get one day’s notice that they were losing their accommodation. [The minister replied that it] would be “quite concerned if people in publicly funded accommodation are being kicked out without notice of where they are going.” ...A North Health spokes[person]... said beds were available in central Auckland.

...a Mt Eden community home... was to shut its doors yesterday but agreed to stay open until all of the patients were rehoused. The owner... said two of the patients moved into boarding houses in central Auckland yesterday and two others would move in the next two days... The mental health manager for North Health... said yesterday that [it] was confident the remaining patients would be housed early next week. Placements were not found yesterday as the patients were not yet assessed by healthcare workers... One of the patients had been offered a room in a boarding house in Papakura but was staging a “sit in” because [it] did not want to move out of Mt Eden.

...PARENTS of intellectually disabled residents at Templeton Centre who oppose its closure are refusing to move their children... and that is causing headaches for businesses waiting to receive them... Families who have been battling the planned closure of the Christchurch institution for two years in protest at the lack of alternatives, have just learned they will be offered less than first thought. The number of specialist residential beds being offered by Southern Regional Health has been slashed from 100 to 30, which means moving more residents into the community.

...Once, Carrington Hospital would have been their home... [S]ufferers of mental illness... talk... about the pain and pleasure of life in the wider community... More than anything else they want to be accepted. It’s the recurring theme when you talk to psychiatric patients – that, and the hurtful rejection by so many people. There are... [patients like one gal], who is of indeterminate age, and has a thing about “being safe” – although [the old gal] doesn’t explain from what. [The old gal] rolls her own smokes, talks darkly about “shock treatment being a terrible thing” and says, “I hope they give him some.” Other than that [the old gal] appears to be fine: neatly dressed, with her long grey hair tied softly at the nape of her neck. [The old gal] talks politics and wonders “what will happen to that... [...sacked Associate Minister of Health] who looked after the sick children... It was wrong, you know, to do that to him.” ...There are... [old guys like the one who] likes walking, and enjoys watching youngsters playing on swings and slides in inner-city parks. Although his appearance is unremarkable [the old guy has] long since learned to be wary of striking up a conversation[, having] been threatened by mums and dads and called a “grubby old bastard.” ...[the old guy and gal] are schizophrenics, two of about 35,000 *N[Z]*ers with the affliction. For the most part, they’re more of a danger to themselves than to others... [The old guy, who is] one of those moved out into the wider world by the closure of large mental hospitals over the past decade... does not think that policy, in principle, [wa]s a bad thing... “I wouldn’t want to go back to Carrington... It was ‘Do this, do that, go here, go there.’ Oh, it was clean and warm, but it was barracks living. You were a number, and you were never quite sure what they were going to do to you. They didn’t tell you much. But what’s still missing is good... alternative accommodation in the community....” says [the old guy while] looking at the stained wallpaper in his room... in an inner-city boarding house... The floor is lino, with a mat beside a bed with a sag in the middle... “It’s hard to find a decent room like this when you only get about \$200 a week to live on.” ...The Community of Refuge Trust is one organisation doing something about the accommodation problem. It runs nine villas converted into flats or group houses, caring directly for 22 people and letting accommodation to another 15. The trust depends on rents, North Health contracts for the support of clients, other grants and donations, and the tacit support of the Ponsonby Baptist Church – although [the] manager... hastily says there’s “no agenda” in the link with the church. “The big thing is not to make our clients dependent on us... But they’re quite capable of doing very well. It’s just that now and again they need a little advice, like we all do. If only we could get that message across to the wider community. These people are loving and kind and supportive of one another. Just be tolerant.” That’s one of the things about the inner city, says... a former scientist who talks openly about his decline into schizophrenia more than 10 years ago.

"The people around here [Ponsonby, Grey Lynn and Herne Bay] are used to us. They've come to know we're no real problem, no threat. It's why people with mental illnesses like the area, and of course it's also handy to hospital and other help when needed." ...[A] manic depressive as a result of a violent relationship... confirms the hostility of the suburbs... "All I got was threats and 'Get out of here'." [This person now] shares a "safe house" with two other [gals] with similar problems, one of whom is studying psychology at Auckland University. "Together we feel secure... and it's the first time I've felt that in a very long time." ...[the] former bank officer, is looking for work – "anything" – but has had a couple of knockbacks because of her honesty. "I told them of my mental illness. I didn't get the job. Later one of them was frank enough to say I'd been chosen until I told them what I was. So now I've decided I won't say anything." [The former scientist] doesn't agree with this, although [it] sympathises. "I think you're bound to reveal what you are." [The former scientist] does – and is looking for part-time work to supplement his \$7000 income as a sickness beneficiary. Living on that after being used to \$40,000 a year has been tough. The trust [w]as... set up to fill the caring gap created by a seemingly uncaring bureaucracy which used a Government policy of the 80s to dump people on the streets, their plight made even worse by the benefit cuts of 1992. They wound up in rundown houses or boarding houses, often living on canned food, with little or no direction, and missing their medication... In the 1950s, when Carrington Hospital was still running at capacity, it housed 1200 patients. By... 1988 there were just 300 people in the institution... But the number of psychiatrically ill people remains constant at around 3[%] of the population. According to... North Health's general manager mental health services, the Auckland region has a real mental health clientele of 39,000 – but "we access [treat] half that."

...A much-delayed \$12 million mental health awareness campaign has been given the official go-ahead despite indications that it could backfire. The Minister of Health... [said] last night... that [it] had initial concerns but could see merit in the four-year campaign... "Initial research shows a public awareness campaign is likely to be perceived as the Government spending money on a [public relations] job instead of getting real services up and running... Nothing will kill a campaign quicker than someone credible standing up and saying this is a waste of money and should have been spent on services... The research also indicates the campaign could be perceived as the Government trying to blame the community for problems which are Government responsibilities." ...the [mental health] sector had largely backed the campaign. However, a long-running series of planned television advertisements – following the lives of five people with a mental illness – has been shelved. The minister said that the sector was wary of how it was portrayed, particularly on television. It was better to focus money on community-based education programmes... An Aotearoa Network of Psychiatric Survivors manager... said negative attitudes had existed for too long. Health authorities will develop specific programmes to try to change public opinion[, although]... views conflicted on whether attitudes could be changed over four years.

...[a n]ewspaper publisher... has set up a \$1 million trust fund to assist families with mentally ill dependents. The fund is in the name of... [hi]s son, Robbie, a schizophrenia sufferer who committed suicide... last year... [T]he money was what Robbie would have inherited and [his father] hoped it would help to make up the shortfall in funding for mental health. "Robbie's plight brought home to us that we wanted more to be done."

...Ask what kind of child Robbie Horton was and his dad... drifts into a sad smile. "[Robbie] was beautiful... A lovely child. Full of fun, very outgoing, very engaging, into everything." But over the years Robbie became withdrawn and a year ago... killed himself. [Robbie, who] had been diagnosed with schizophrenia... was only 26. Robbie's suicide was to spark intense debate about the state of the mental health system, a system that... [his father, a NZ] *Herald*... proprietor... lashed out at in despair in a moving article... [Robbie's dad] hit out at privacy laws which shut his family out, their questions blocked by health professionals who cited the Privacy Act and did not reveal important information. [The father] questioned why, when Robbie needed long-term compulsive treatment and supervision, the most effective way to achieve this was via the Criminal Justice Act, not the Mental Health Act. Today families of schizophrenics hold up [Robbie's father] as a hero, because a year after Robbie's death they believe public and professional attitudes are beginning to change. They put it down to his courage in speaking out... Now families are more ready to fight for information about their relatives. [Robbie's father] also feels "slightly" optimistic about improvements in the system. [But it] still has anger... And... savages the hundreds of millions of dollars poured into the museum in Wellington – a serious misjudgment of priorities when Auckland is crying out for mental health services... Privacy laws, [Robbie's father] says, are still a stumbling block for families desperate for information on their loved ones. "The problem some of us have is that you are empowering people with impaired judgments – who can often have elements of paranoia about the system, hospitals and families because that is part of the illness – empowering them to exclude their families from knowledge because it's a way of getting back at families." The Privacy Commissioner... stood by the act a year ago and still does. But [the commissioner]... says families should be alert when health professionals mention its very name. The problem has been the use of the act as a means to avoid answering questions from families instead of giving them the real reason... "They should simply say, 'I don't believe it's appropriate to let you have that information'." [The commissioner] has called for suggestions on how the health code under the act could be changed but there have been none. The code limits the instances in which personal health information can be given but it also gives agencies a discretion to disclose. It cannot be used to force an agency to disclose personal information... "People have said, 'Oh well, if the Privacy Commissioner's right the law's an ass.' But if you say to them just exactly where is it an ass, there's not a lot of criticism." Besides, some families are not good for the patient. It did not make it right to give blanket information just because there was a family connection. Dilemmas will always exist for health professionals who must balance the needs of the family to the rights and needs of the patient... [T]he Privacy Act and its health code... had been introduced at a time of vast change in the mental health system. Services were reeling and the act was complex and daunting. Normal clinical practice of discussing a person's care with their family was suddenly elevated to being equivalent to a breach of confidence that required exemption under the code.

...When Robbie Horton woke on a bleak winter morning 12 months ago, slowly dressed and took his own life, [Robbie] followed a depressing pattern. [Robbie] was a member of one of the most vulnerable groups in... society – the mentally ill. Now, marking the first anniversary of Robbie's death following his release from compulsory treatment and 15 months after the Mason Report into mental health services, [the NZ *Herald* begins] a series on the state of N[Z]'s psychiatric care. It is some... 10 years since the process of emptying most patients out of psychiatric institutions began. Despite some stories of hope, our reporters chronicle a depressing state of affairs, which most N[Z]ers suspected existed but hoped did not. For the first time N[Z] has a "homeless team" that drives around Auckland looking for and treating former mental inpatients. The team workers accept its need with a chilling shrug. "The homeless are a fact of life. It's better that we treat them." ...Mental health workers are stretched to breaking point by high workloads, choked by policies that don't even let them talk about the possibility of "secure" accommodation and hindered by unclear laws. Despite Mason Report money filtering slowly through the system, the mental illness share of health spending has dropped from 20[%] in Hospital Board days to nine... as successive governments have used the good intentions underpinning moves towards care in the community to save money. In some areas, the "community" is rebelling – using every method in the book to stop psychiatric patients being housed in their backyards. We talk to the former judge [and head of the report,] who has spent the past 10 years recommending changes... [The retired High Court judge] alternates between feeling mild satisfaction and despair with a service that is unable to get its act together. "We are quite capable of having the best mental health service in the world... I live in hope." Our... series will let readers judge for themselves whether that hope is justified.

...Mental health support workers are to be axed from a scheme designed to allow patients to live independently in the community. The... support scheme was launched two years ago and praised by health officials... Auckland Healthcare has told workers that half the 20 central Auckland staff will go in four weeks. • The cash saved will be spent on patients' other needs. The staff deal with 200 patients who have been identified as needing high-level... support, including regular home visits and help in assessing benefits, budgeting and shopping... The A[DCSS]... said the 10 remaining staff would struggle to give adequate support. "It makes a mockery of any intention to improve community-based services..." The scheme's

success relied on a low ratio of support staff to patients so trusting relationships could form... Staff knew patients well enough to spot warning signs and provide help... Most patients came from the Conolly unit... where some have languished for... years because of a shortage of alternative care... A North Health mental health manager... last night said reviews had shown that half the number of support staff would be adequate.

...The Minister of Health... yesterday admitted the rules for allocating extra funds to mental health were “too bureaucratic” and needed changing. [The minister] was responding in Parliament to questions about an Auckland Healthcare decision to halve its community mental health support team... [The minister said it] would discuss the issue with the Ministry of Health and the M[HC]. Meanwhile, the Alliance health spokes[person]... yesterday claimed that case workers in the community support team were paid \$40 for every client they recruited for treatment, with the money taken out of the wages and salaries budget in at least two mental health units at Auckland Healthcare... [T]he regional health authority was concerned earlier this year that the caseload was below the 200 patients the community support team was supposed to be dealing with... “There should never have been any difficulty in locating bona fide patients. It is not as though there was ever a lack of need.”

...Capital Coast Health wants its loss-making mental health services set up as a stand alone business... says a leaked draft business plan. The plan proposes moving at least 80[%] of mental health clients out of care, transferring responsibility for them to family doctors by July 1 next year... [– thereby reducing] demand for community mental health team services and for beds... The crown health enterprise’s mental health services would instead concentrate on the most severely ill, with more specialised services... For remaining inpatients, the average length of stay would be reduced from 18.2 days to 12 days... The plan says staff cuts before the handover of community patients to GPs would require “careful patient and carer preparation.” But the draft says staff lack sufficient skills to guarantee the safety of such a move... Risk factors included a lack of acceptance by doctors, in particular, and the mental health workforce, in general. “The effect on morale of having to improve productivity may precede the sense of excitement at moving to a more focused, more productive service,” the plan says. It warns that disaffected staff may collude to block change or to publicise cases where treatment is less than optimal. Budget constraints could also jeopardise upskilling and recruitment for more specialised services... Overruns in mental health services were a big component of Capital Coast’s deficit last year: they cost more than \$26 million but attracted funding of just \$14.5 million.

...despite difficulties in finding the money and staff shortages... [t]he Cook Islands Government has decided to reopen the psychiatric unit at Rarotonga Hospital because of widespread public concern over mentally ill patients being detained in prison. If a mentally disturbed person causes a public disturbance, the procedure in the Cook Islands is to call the police, not the hospital where there are no facilities to keep the mentally ill nor staff to treat them... “Now that we are to have a separate building, we will have to look at full-time, experienced staff.” One option was to select nurses for extra psychiatric training, however... this could be difficult as the nursing school was closed down last year due to a lack of funds... [F]ollowing staff cutbacks, ambulance drivers have had the added responsibility of helping to care for... patients in the wards.

...Fears have been allayed that hospital closures would result in more intellectually disabled people being imprisoned. A new study identified only 17 inmates with intellectual disabilities – about 0.35[% of NZ’s] prison population and a much lower rate than found in other countries... Prisoners were defined as intellectually disabled if they displayed at least two signs of adapting poorly to prison, such as difficulty understanding routines and procedures, poor personal hygiene and being victimised by other inmates. All the mentally handicapped inmates were [guys]. The authors called for a new study to assess the quality of care available to intellectually disabled inmates.

...The number of mentally ill people in prison is growing because of the lack of services to help them before they offend... Last year 35 mentally ill inmates were transferred from Auckland prisons into the care of the Mason Clinic[(which was built on land formally used by Carrington Hospital)]. In previous years the average was eight to 10. The clinic has a high-security wing and handles about 150 patients a year. Most are more of a danger to themselves than to others. They include those whom the courts have found not guilty of an offence on the grounds of insanity, some of whom may never be released. “The mental health services aren’t able to cope with the volume of people in the community who need help... We’ve only got 60 beds serving a population of a million...,” says [the person] who has been in charge of Auckland’s acute services, under one name or another[– his current position is]... director of... regional forensic psychiatry services provided by Waitemata Health... [–] since 1989. “Here’s a typical scenario we hear up to five times a week: Mum rings up the [mental] health care team and says ‘Can you please come and see Johnny...’ They reply ‘We’ve only got one car but we’ll try to be there as soon as we can.’ Two hours later [Mum] rings to ask where the team is, to be told they were diverted somewhere else, maybe to a suicide, but they’re coming.’ Four hours later Johnny’s smashing up the house and [Mum] rings again, desperate. The answer is ‘Sorry we can’t make it until tomorrow, ring the cops.’ ...Often the police are having to go in and put people on holding charges. That means they’re diverted into the courts...” ...Shutting the old institutions has led to this situation, although [the director] personally supports the closures. Where the policy has gone wrong... is in the failure to provide alternatives... because the bureaucracy has only looked to save money... “There’s a lack of understanding that mental illness disables people. Somehow people have got the idea that you can get in [to hospital], take a tablet... ([like] Risperidone, effective at preventing delusions)... and in two or three weeks’ time everything’s okay. For 80[%] of people that’s true and many don’t even need to come to hospital. But some are so ravaged by their mental illness that they need every care, maintenance and support which, for one reason or another, can’t be provided in their own home – if they’ve got one. This is the sort of support the asylums used to provide. We’re only talking about 50 or so people in a place the size of Auckland, but there are no long-term asylum beds for these people. Instead they clog up the acute units... and they’re also in the prisons. This is the worst gap which has developed in the mental health services... [–] in order to keep the [general hospital] acute units going, patients are discharged prematurely to cope with the others at the door clamouring for help.” [The director] accepts that budgets have to be capped, and despite its shortcomings, our public health system is still one of the most effective in the world. [The director] has recently returned from Toronto and Vancouver where [it] saw mentally ill people everywhere on the streets. They were begging and harassing passersby. “We haven’t got to that stage yet.” [The director]’s also been in India where huge numbers of mentally ill roam the streets. There can be no criticism of Auckland’s Mason Clinic facilities... In five years since the top security wing was built there had been only one escape where previously there were about 20 a week from the century-old [– but higher capacity –] Carrington Hospital. The one individual who made it got away from a less secure area and was due for release the following day – “we knew within five minutes that [the patient] was gone, and where to find him... we’ve got a far better record than Paremoremo [[Auckland’s high-security] prison complex].” The unit has none of the grim facade and bars associated with asylums. It is light-filled and spacious on a tree-dotted site with grassed and paved courtyards – and picture windows made of unbreakable 12mm clear polycarbonate bedded in industrial-strength aluminium frames. The walls can withstand the battering of a bulldozer and are double framed so that a patient hammering on them will not disturb the person next door. The security includes observation points so that staff cannot be surprised and overwhelmed by a patient. The rooms have a raised plinth for a mattress and seat and all shelves are built into the walls. Nothing which might be used for a weapon is moveable. There are no... switches, architraves, sills or air-conditioning ducts from which disturbed people can hang themselves... Outside the mesh fence is unscaleable and the exercise area for the most seriously disturbed is meshed over. There are no downpipes or gutterings for a finger grip and the roof is too steep to walk on. “It’s very difficult to leave,” says [the director] with a wry smile, “and... [w]e have made Auckland a much safer place.” Where possible the patient’s privacy and dignity is considered. In the [gals’] areas the lower outside windows are opaque so they cannot be disturbed by voyeurs, and closed-circuit TV cameras are not used to observe patients... Part of the success of the Mason Clinic is that it is sited in the city and not the remote countryside... Waitemata Health... hopes to tender to provide more accommodation... [now t]he decision has been taken to close the 50-bed national secure unit adjacent to Lake Alice where most of the country’s worst criminally insane are held... A decision about the future of the Conolly Unit is due to be decided... within the next three months.

...It is easier for ordinary criminals to be discharged from prison than it is for those classed as “special patients” to leave a mental health institution. And when they finally do leave, says... [the] senior lecturer in forensic psychiatry at Auckland University, in some cases they are the “most well” of all former psychiatric patients. This is because the standards they need to meet in terms of their mental health status and their rehabilitation are much higher than for non-psychiatric prisoners convicted of similar offences. More than 80 people are held as special patients in mental health institutions in [NZ’s] main centres. About one-third of these are looked after at the Mason Clinic... The term special patient can be applied to four groups of people. The first concerns those who are judged insane by a court and are therefore acquitted of the crime they committed. The term “insane,”... is a legal, not medical, term. “Psychiatrists do not decide who is or who is not insane. [They] are in court to explain the symptoms of mental illness to the jury and how these affected the person and [his or her] state of mind at the time of the crime. The jury decides whether the person is insane.” Second, a court may decide that people should become special patients if, at the time of standing trial, they are deemed to be mentally disabled to the extent that they are unable to understand the nature of the criminal proceedings – although they might have been sane at the time of the crime, explains... [an] Auckland University... Associate Professor... “It is a point of law that [people] should not be tried in absentia and if they are mentally not there, they can be stood aside and placed in treatment so that they can be brought back. But the vast number in this category never come back for trial.” The third group consists of people remanded under section 121 of the Criminal Justice Act for a psychiatrist’s report to determine their mental status. They are deemed to be special patients while they await the report. The last group comprises those who become mentally unwell while they are in prison and need to be transferred to a mental institution. The long-term care of those... who are acquitted of murder because of insanity is complex, involving a careful balance between therapy and the need to keep them in a secure environment. “Being found insane does not detract from the fact that the person committed the crime,” says [the senior lecturer]. And therein lies the personal tragedy for each individual. “The mentally normal have various justifications for what they have done. These people don’t have that. They believe they were morally right in acting the way they did but from a delusion base. They are moral people who have committed a horrendous act and it hits them harder. They have a huge level of trauma and a large part of their therapy is dealing with that.” ...[an] honorary senior lecturer at Auckland University and consultant in forensic psychiatry at the Mason Clinic, describes them as “double traumatised.” Imagine... coming out of your worst nightmare in which you kill someone you love, and finding it is true. “That’s what coming out of a psychotic state in which you killed a family member is like. And many patients eventually do recover.” Unlike ordinary criminals, these people have a condition which is often treatable with the right medication: remove the psychosis and their motivation for violence is controlled. In some cases of reluctance to take medication the problem can be overcome by the use of a long-acting injection but this depends on the drug, its side-effects and whether it is suitable. None of the newer anti-psychotic drugs is available in this form. One, clozapine, is unlikely ever to be, because it can suppress the bone marrow in a significant few. Stabilising a special patient’s mental state through drugs or therapy is only one aspect of care during the years spent in an institution. The other involves addressing the issue of the degree of concern the public has about the patient’s eventual release. “We are not apologists for our patients. We have a responsibility that’s heavy and we don’t duck those issues,” says [the senior lecturer]. Nor are psychiatrists easily fooled. A bogus plea of insanity is usually detectable by a trained professional. Moreover... when those pretending to be mentally unwell learn that if found insane they face an indeterminate period in a psychiatric hospital, they almost always opt for a finite prison sentence and come clean. In fact... the usual minimum stay in hospital of a special patient in a homicide case is not hugely disparate from the prison stay of someone convicted of [hu]manslaughter. Some, however, stay in hospital a lot longer. The decision about their release from a secure psychiatric hospital is made collaboratively by the clinician treating them, the... Minister of Health... and the... director of mental health...

Lawyers representing mentally ill people detained against their will have extreme reservations about a proposed shake-up of the mental health system. Radical changes recommended in a new report would see the role of the Director of Mental Health dissolved, and other changes to key management structures implemented to trim and modernise the system. But district inspectors – Government-appointed lawyers who protect the interests of the mentally ill under compulsory treatment orders – say mental health services need stronger leadership rather than cuts... The proposed changes are included in three Ministry of Health commissioned reports... examining the role and functions of the Director of Mental Health, the district inspectors and the directors of area mental health services. In recommending the abolition of the office of the Director of Mental Health, now held by... [the person] who is also the minister’s chief psychiatric adviser, [the report’s author] concluded that the role of the directorship was so limited it was no longer necessary... The Director-General of Health... said it would be sensible for the district inspectors to report to the... Health and Disability Commissioner... because the organisation’s roles already overlapped. [The Director-General] preferred this to an alternative recommendation in [the professor]’s report for the inspectors to come under the umbrella of a Mental Health ombuds[person].

...The number of mental health workers must increase... to meet the country’s needs, a key report... by the M[HC]... says... The Mental Health Commissioner... said the number... working in adult services needed to more than double... mean[ing] another 1800 workers joining the estimated 1600 staff. Child and adolescent services, however, need an eight-fold boost in staff to meet needs. There are only about 230 workers in that field.

...If the mental health sector was a literary character, it would be Oliver Twist, begging bowl raised, whimpering for more. As with all health services there is never enough money for mental health. But, as [a retired j]udge... stressed in his 1996 report, the tradition of delivering mental health “on the cheap,” or viewing it as a service that can cope on minimal funding, must be sent the way of the lunatic asylum. Mental health has not just been financially starved, some may say it has been tortured. The last Labour Government promised the sector a \$25 million injection from the proceeds of the Telecom sale, only to have that ripped away by the 1990 National Government. Like anyone attempting to follow the mental health money trail, the Mason inquiry team found that reliable data was hard to come by... The Ministry of Health is loathe to provide funding figures before 1990 for comparison, because services included in the mental health budget then are not included now, and vice versa. Thus it is hard to verify the suspicion that as mental health treatment advanced and the Victorian-style hospitals closed, the money did not follow the patients into the community. Certainly, the proceeds from the sale of Carrington in 1993 (for an undisclosed sum) did not go to community services. Rather, in line with strict area health board policies of the day, the money had to go into a capital fund tagged for investment in a related field. So the Carrington money helped to build acute units at North Shore, Auckland and Waitakere and to improve the Maori mental health unit, Manawanui. But what about the operating budget? Even the Auditor-General’s office had difficulty with this when, in 1993, it went looking for a “missing” \$18.6 million from Carrington Hospital’s operating budget destined for community care services. But [the person] who headed the old Area Health Board’s mental health services, said the audit office was mistaken and the money had gone to new community units “all over the place.” More recently, the \$6.8 million from the sale of Kingseat Hospital certainly helped the South Auckland crown health enterprise become the only one to produce a surplus in 1995-1996. But the present chief executive... says the accounting gain of \$4 million from the sale was offset by the \$4.2 million of general medical services North Health did not fund that year. Further[more]... his agency is spending far more on mental health than it made from selling Kingseat – \$7.2 million on a 45-bed acute unit – and it is about to spend a further \$2.5 million on a 16-bed unit. Although it has tried, the Coalition For Public Health has not been able to find its way to the centre of the mental health funding maze, a situation its former national coordinator... finds exasperating... Some may say it is extremely lucky for the Government that funding comparisons over time cannot be accurately made by those desperate to make them. But the former Director-General of Health[, who is]... now director of the Health Services Research Centre, says this situation is totally unsatisfactory. In a letter to the Mason inquiry team last year, [the director] complained that what little information there was centred on patients still in institutions, not on those with mental illness in the community. The lack of information... coupled with the “rapidly changing organisational arrangements and patterns of service delivery make it difficult, if not impossible, to draw sound

conclusions about how resources are or should be used.” As a result... “policymakers and managers at all levels are ill-informed and have little other than self-interested advocacy to call upon.” The newly formed Mental Health Commission is now trying to unravel the funding pattern.

...Mental health has always been an unglamorous area at political level. Bluntly, there are no votes in it. So, over the years it has been left to people like [the head of the Mason inquiry] to champion the sector... Describing himself as an “independent observer” of mental health, [the retired judge] had been concerned about the plight of the mentally ill since the early 1970s, when... visiting Auckland psychiatric hospitals to sign committal orders... [The] judge... was still doing that job when a schizophrenic patient fatally stabbed two people in an Auckland halfway house in 1987. The double murder prompted a Government inquiry into forensic psychiatry in N[Z which the judge] was asked to lead... Since then [the judge] has been asked to do the job twice more and... feels frustrated that the service is still critically ill... The M[HC, which his latest inquiry] recommended, is acting as a watchdog to track spending... But [the judge] was alarmed that it would have no legal clout... “...if... the M[HC]... has no legal clout, then what’s the point?” ...The catch-22 created by crown health enterprises being unable to extract money from regional health authorities until they had services to sell them, has been plugged... It is when patients hit the community that problems start to bite... Mental health workers who spend their time nursing people back to health, know that because they have nowhere suitable to go after hospital, they will be back as soon as the stresses of community living get on top of them... Mental health professionals talk of the “revolving door” syndrome where a relatively small group – say 50 in the Auckland region – cycle in and out of hospital at an ever-faster rate... Once people do get out of hospital the 13 community mental health centres scattered across the region to service them [are] stretched to breaking point... One of the startling facts about this situation is that although North Health insists there are 59 sub-acute beds in the Auckland region, some community care units don’t know where they are.

...[mentally unwell gals] are living in filthy, unsafe boarding houses because of a shortage of housing for psychiatric patients in Auckland, says a damning report. The report was presented yesterday to the Minister of Health... by the mental health sub-committee of the Auckland District Council of Social Services. It said [gal] psychiatric patients suffered sexual and violent assaults and were living in damp and dirty boarding houses with inadequate security. Patients were also languishing in rest-homes and other unsuitable accommodation because not enough Government-funded beds were available and market rentals were unaffordable, the report said.

...PSYCHIATRIC patients have been placed in hotels and general hospital wards while others are being discharged early because of a chronic bed shortage. In some psychiatric units, beds had been set up in spare rooms and waiting rooms to try and cope with what was described as a national crisis by the chair[person] of the Association of CHE Mental Health Managers... While it wasn’t ideal to place people in hotels or general wards, it showed “we are going to extraordinary lengths to ensure care is provided”... CHE concerns that... money[promised by the Government] would not help baseline services were being investigated by the Government.

...Mental health services are being cut in many areas despite Government promises that extra money will improve them, says a confidential report. A review prepared for the Minister of Health... says mental health planning by crown health enterprises is generally poor and there is a lack of coordinated planning across the sector. A number of [CHE]s have identified ways to cut mental health services to save money... [i]t says.

...The Minister of Health... has criticised the performance of [CHE]s in delivering mental health care, saying they have a history of being unresponsive to patients’ individual needs. “We have some very good secondary-care mental health services in our [CHE]s, all of them capable of being excellent. What I am concerned about is what a consumer described to me as ‘institutionalised community care,’ which the public perceives as a kind of benign neglect.”... The Government owned three-quarters of mental health services and... believed there had been insufficient progress in their development. The Government had decided to sharpen the [CHE]s’ focus on their mental health services. Doctors, non-Government organisations and [CHE]s would work together in mental health... Mental health services had been locked in a cycle of “tragedy, followed by investigations, then recommendations which appear to make no difference, then frustrations followed by rounds of people blaming each other, and finally a further tragedy to kick-start it all off again.” The circuit-breaker was winning the confidence of key people in the mental health sector.

...*Mental health: it’s time to stop the political games* Yet another report on mental health services... was released on August 4. The next day the *Herald* quoted... the Minister of Health, as saying that “aspects of the report told the Government what it already knew, such as the need for more community housing.” [The minister] was also quoted as saying: “We need more places for them to go and that’s getting harder because of community resistance to it.” So the difficulty is “community resistance” to people with mental health problems living in the house next door or... up the street. The Government would ensure there were sufficient appropriate places if not for public opinion. It would be nice to believe that the Government has a commitment to mental health, that it knows what is needed and has a plan to achieve specific goals. Sadly, nothing could be further from the truth. In reply to a question in Parliament, the Minister... said on March 27 last: “...North Health... has advised me that there are sufficient appropriate places in Auckland for people discharged from Auckland Hospital’s Conolly unit.” You could now be forgiven for being a little confused. In March there were enough places, in August there are not enough places and the Minister of Health already knew there were not enough places. So what would motivate [the minister] to make two statements which so obviously contradict each other? On July 17 representatives of the Auckland district council of social services met North Health officials. At this meeting... [the] North Health mental health services manager, told us the information provided to the minister in March was accurate at the time. Things had since changed... To believe North Health, something totally unexpected happened... [w]ithin 16 weeks... [However], Auckland Healthcare’s manager of mental health services, was quoted in the *Herald* on July 23 as saying: “North Health has just recently recognised the chronic problems – after years of pressure on the Conolly Unit.” The lack of community mental health beds has adversely affected patients in hospitals for years. The patients have known this, their families have known this, health professionals have known this; everyone has known this except [the regional health funding agency and the Minister of Health!] ...In short, “community resistance” is not the reason accommodation is not being provided. The issue is purely and simply funding. For [the minister] to acknowledge this would bring into question this Government’s commitment to mental health. The political game of first denying a problem exists, then stating your good intentions and having your scapegoat ready, is no way to deliver the basic services needed in mental health. The recent announcement to halve Auckland Healthcare’s intensive community-support work service is yet another example of political expediency and a lack of consistent planning... North Health, until very recently, described community support as “the lead service” – leading the way today, chopped in half tomorrow. Clearly long-term strategic planning is not an approach favoured by North Health[– although i]t would be a mistake to focus only on North Health[, which]... merely implements Government policy and acts within the confines of the funding available.

...A regional service that trains mental health workers in aspects of caring for psychiatric patients has closed its doors... [because] North Health... had withdrawn the \$320,000 annual funding... While the service was funded to train mental health workers in Auckland and Northland, it had been used by hospitals in the Waikato and Wellington... It had also run a calming and restraint course for the police, who have to deal with more psychiatric cases... The North Health general manager of mental health... said the service would be replaced by other initiatives...

The... mental health services rely primarily on people (staff) to assist [those] who have a mental illness or mental health problem. There is no “high-tech” equipment... x-rays, scans or beeping machines with blinking lights as seen on television in the physical medicine area. There is the clinical judgment of experienced staff – nurses, psychiatrists, occupational therapists, psychologists... community workers, to name some. In the main the[y] are very dedicated and expert and the continual slamming by the media of their decisions can result in their leaving... [– like] the Auckland Healthcare deputy clinical director of mental health services... [who] quit his position... [this week –] or at the very least becoming despondent. Accurate and constructive investigative journalism is one thing, sensationalising traumatic events is another. There is a possibility that

N[Z] will end up with second-rate services because the best staff have left and those that remain are demoralised... [W]ithout excusing the mistakes that have been made or the times when care was less than effective, there is a fact that should not be overlooked: people in the community cannot be 100[%] under the control of mental health services... While the law allows compulsory assessment and treatment in certain situations, for the most part treatment is voluntarily worked out between client and clinician and can take place only with the consent of the client. [What doesn't help is that] we often hear the media reporting on, for example, "ex-psychiatric patient Josephine Bloggs." When does a person stop being this entity? Five years? Ten years? Or is it in fact a lifetime sentence? Why is it that a person who had an appendix out in 1984 is not forever referred to as an "ex-appendectomy patient"? Similarly, a person... is not a diagnosis[– which means it is]... not "a schizophrenic," just as a person who has epilepsy is not "an epileptic."

...[the person] who killed Aucklander Stephen Dempsey was a psychopath who enjoyed the grisly killing and was unlikely to be cured, a Supreme Court judge heard yesterday... [The person], aged 24, was last week found guilty of murdering Mr Dempsey, a homosexual, at a Sydney northern beach reserve in August 1994... [A] Sydney forensic psychiatrist... told the court that... [the person] had difficulty adjusting to his homosexuality... [and also] had spent considerable time with his paternal grandmother as a young child... [The grandmother] was disturbed and very cruel to animals.

...World Health Organisation experts in A[US] have warned that mental illness will become an enormous burden next century, and is already increasing faster than heart disease. By 2020, the costs of depression and other forms of mental illness will be second only to heart disease, now A[US]'s biggest killer, they predict... [A] co-author of the recently released report *The Burden of Global Disease*, said it was the first time that the U[N] health body had taken into account not only the cause of death but the duration and consequences of living with a disease or disability. "This presents us with a far more accurate and holistic picture of future health needs... The [report shows that the] burden of mental illness on society has been grossly under-estimated. Currently five of the top 10 causes of disability worldwide are psychiatric conditions – depression, alcohol use, manic depression, schizophrenia and obsessive compulsive disorder." In A[US], direct costs of mental health are estimated at \$NZ2.27 billion annually.

...An inquiry has been launched into the care of a mentally ill [offender] who raped and murdered a Christchurch [resident] in February. The... [offender, who] had pleaded... insanity... was found guilty of raping, sodomising and murdering Catherine Florris Coster, aged 79[, and] was also found guilty of... the July 1995 rape of another [person], aged 77... His family had been contacting Sunnyside Hospital in the months before Miss Coster's death because they were concerned about his behaviour... [The offender, who] had a history of manic depression, [and] had previously been a patient at Sunnyside... deteriorated rapidly in January... refus[ing] to take medication, instead smoking cannabis, injecting opiates and taking LSD... [The offender] became increasingly violent, carried a knife and was involved in several road rage incidents. [The offender started to] believe... the police were following him, that [his partner]'s cat was possessed and that [his partner] was a witch. [The partner] rang Sunnyside Hospital weekly during January. On February 14, [the offender] was irrational and aggressive. Two police officers took him to Sunnyside... but... a psychiatrist... decided [the offender] was not sufficiently unwell to warrant admission... "We were shocked, alarmed and angry when a social worker rang and told us [that my son] was being released," said his mother... "[My son] had been calm on the way to the hospital and during the interview. [His partner] told the social worker [that my son] would be calm because [it] was under the influence of marijuana. [His partner said my son]'s and others' safety were at risk and [my son] needed to be in hospital. Her exact words were, 'This is crazy; something is going to happen. It might be in a few days or next week. [My partner] is a time bomb',"... The hospital's senior forensic psychiatrist... who had treated [the offender] for three years, wrote to [the mother] six weeks after the murder, saying in comparison with other Sunnyside outpatients her son was regarded as low risk. But... [the psychiatrist] was struck by the number of times [the offender] had been assessed in the weeks leading up to the murder. "You and [his partner] obviously felt that [your son] was not right and yet several clinicians, myself included, could get no strong hint of major mood disorder... I have to accept that this is where the role of heavy illicit drug-taking seems to have played a major part." ...During the High Court trial... [the forensic psychiatrist] was not called to give evidence[, although]... another Sunnyside psychiatrist... gave evidence in support of [the offender]'s insanity plea... In his letter to [the mother, the forensic scientist] said: "In talking to [the other psychiatrist], we both wonder if we could have been any more astute and dealt with [your son] differently prior to his being charged with murder. I think this is what I find so shattering in that I usually place good credence on my judgment in terms of mental disorder and this, I think, is the only time that it has really let me down."

...[the offender] who had been admitted to Sunnyside Hospital on six occasions since 1991... will spend at least the next 10 years in jail... [because] the jury which sat at his High Court trial... decided that in the two minutes or so it took to mortally bash and rape... Catherine Florris Coster in her garage, [the offender knew his behaviour]... was morally wrong... [The offender] will probably be with another longterm psychiatric patient[– the one found] responsible for another horrific murder also in Christchurch last year... The Crown argued [that patient] was not insane, and that [it] had planned the killing in order to get the police to shoot him. The jury agreed, and [the patient is] now serving a life term with a minimum parole period of 12 1/2 years... [We now await the fate of] the most recent inductee to the roll... [– the person] accused of Tania Furlan's murder...

[Christopher] Lewis electrocuted himself in Mt Eden Prison this week while awaiting trial for the murder of Auckland mother Tania Furlan... Lewis first received psychological help when... 10 years old... Lewis... was diagnosed as psychopathic and had periods where [it] became psychotic... The head of the Mason Clinic... said the personality disorder was difficult to treat... Lewis... needed a team of therapists, specialised counselling and drug treatment to cope with his disorder... [The disorder] had no obvious cause, and very few people developed it in childhood... Most psychopaths ended up in the criminal justice system rather than the mental health service... It is unclear whether Lewis was receiving treatment while on remand in Mt Eden... The prison service has launched two inquiries into his death – one internal and one independent.

...At an inquest yesterday, the Auckland district coroner... [said] Lewis was found slumped in a chair with a torn bed sheet wrapped around his head. The sheet held the bared ends of a coaxial television aerial cable to his head. The other ends of the cable were connected to a 240-volt power supply in his cell. Attempts by three prison nurses and ambulance paramedics to revive Lewis failed. [A s]ergeant... told the court Lewis had a history of psychiatric disorders and on the day [of his death] had been concerned about the break-up of his relationship with his girlfriend. Lewis asked for time to himself in his cell when [Lewis] and his cellmate were told they were allowed out to a small exercise yard... [The coroner] would not make an order suppressing the details of... Lewis' death... but... would suppress details of a suicide note, which... contained items of a personal nature. The coroner made three recommendations to the Department of Corrections so deaths by electrocution in prison cells could be avoided... [–] circuit breakers should be installed... junction boxes should be secure... and a strict inspection procedure should be instigated to ensure all electrical appliances in cells were not tampered with. Lewis had been in jail awaiting trial for murdering Mrs Furlan in her Howick home and kidnapping her six-week-old daughter... A[US]n-born Mrs Furlan was found lying in a pool of blood in the foyer of her home after her husband failed to reach her on the telephone.

...Christopher John Lewis pointed a gun at a chemist and threatened to blow his head off just days after allegedly bludgeoning Howick mother Tania Furlan to death, according to newly available court documents. And 10 days after terrorising the chemist and his assistant, the documents allege, Lewis was at it again – this time training a gun on terrified bank workers during a hold-up... The court file... also shows that soon after the killing [Lewis] appeared to be making plans to leave the country by applying for a passport under a false name. Details of the robberies of [the] pharmacy and... bank in Mt Eden had been suppressed to avoid prejudicing Lewis' murder trial. The chemist[,] who... said his assistant had been on the job only three days and the trauma of the robbery was too much for her – [the assistant] resigned that day... [–] was stunned when [it] heard

of the notorious past of the [person] who had robbed him. "In retrospect, knowing [the robber] was a psychopath, it is quite unsettling." ...[the court file] gives details of... a letter Lewis wrote to a... former girlfriend who was to give evidence at his trial. The letter began: "As you know I am on remand but this time I am actually innocent. Perhaps it is the past karma catching up, who knows. I shall win because I trust in God [Lewis was a Buddhist] and in truth." [The letter] then threatened to reveal "where I got my half pound of dope"... unless the [ex-girlfriend] stayed away from the trial... Lewis[was] notorious for firing a shot at the Queen in Dunedin in 1981 [(r:p1188, ln60)] and a string of bank robberies in 1987...

Documents show that 10 years ago, while confessing to a series of bank robberies in Christchurch, Lewis spoke of... using ninja skills to survive in bush on the West Coast while being hunted by armed police. After... [being caught Lewis] told police: "I didn't need the money. I did it because I felt I had to, to prove [to] myself that I was a true ninja. That is the way of the ninja. This ninja god inside me is causing me to do things that I know I shouldn't do. It will kill me in the end." ...N[Z] does not have the proper psychiatric facilities to treat people such as... Lewis, says an employee of Lake Alice Hospital, where Lewis was twice confined.

...[a] 36-year-old... says [it] will never forget what happened to him at Lake Alice Hospital. The... North Shore [resident] is one of about 40 former patients whose case for compensation was presented yesterday to the Attorney-General... The... [group] say that as children in the early 1970s they were tortured at the mental hospital near Wanganui with electric shock treatment and painful injections of the drug paraldehyde[, which]... was supposed to have a calming effect... Hospital managers, including the former superintendent... have denied the claims but [the 36-year-old] said his memories were still as vivid as ever. "The nurses would grab you and maybe get another kid to help hold you down. These earphones would be put on your head. As soon as they were on, they would give you a zap of electricity. Your whole body would go stiff and you couldn't move of your own free will although you might convulse. The pain was horrible... everyone screamed." [The resident said it] was taken from his mother as a 2-year-old and formally placed into Social Welfare Department care at the age of 6[, then] was sent to Lake Alice in 1972... [after running] away from a Wanganui boys' home and [being] run over by a car. According to his Social Welfare files, the department believed [the 11-year-old] had brain damage, which the accident had made worse. [The resident claims it] was sexually abused, at first by a group of older [patients] and then by teenagers, and often physically beaten by the staff. But the worst abuse... was the electric shock therapy, which was given as punishment for trivial offences such as not making the bed... After leaving the hospital, [the victim] had a string of convictions for theft and dishonesty offences until about eight years ago. [The resident] blames Lake Alice for his continuing difficulty in trusting people and living a normal life... Earlier this week the Minister of Health... said many had suffered from brutal treatment in N[Z]'s mental hospitals in the past[, and] suggested it would be difficult to treat the former Lake Alice patients as a special case, as many other ex-patients might say they had similar claims for compensation...

System that's terminally ill... THE list of tragedies surrounding N[Z]'s mental health system reads like a roll call from hell, a montage of every horror movie you've seen. Only the victims in these images are real... It's a grim picture and one which shows no tangible signs of improving... [despite] 127... mental health report[s]... by our count... Since 1987 there have been 67 inquiries into the mental health system, most held after someone has been raped or murdered by a psychiatric patient released into the community, or when police have had to shoot dead a person like Eric Gellatly or Barry Radcliffe before they have had the chance to harm others... [The chairperson] of the Australasian College of Psychiatrists and clinical director of mental health for Waitemata Health... agrees all is not well with the mental health system. But [the director] believes "sensationalism" by the media is the major problem. "You don't report regularly when someone dies of a cardiac arrest in an ambulance on the way to hospital. But when it's a mental health problem, it's different..." ...[the director's comments may be motivated by self-interest]. In England, Canada and the U[S], families of people who have been raped, murdered and injured by psychiatric patients are successfully suing psychiatrists and health officials for damages. Psychiatric patients, too, have grounds to sue their clinicians. [A p]rominent Wellington medical lawyer... says the same could happen here if it could be shown that a psychiatrist had been negligent in assessing a patient who had later raped or killed. However... [because of NZ]'s accident compensation laws... it would be the families of victims who have survived attacks, that would be successful claimants.

...A few hours before a young [Dunedinite] was killed in the bedroom of her... house, the accused's father told a psychiatric nurse his son should never have been discharged from... Ward 9B Wakari, an acute psychiatric unit, two days before... [The son], aged 26, a window cleaner... acknowledged being the person who killed... Karen Rachel Jacobs. Her badly injured body was found... by her mother about 1 pm on July 4... The nurse... was working at the mental health emergency service of Dunedin Public Hospital when... called by [the father. The nurse]... told the... Dunedin High Court... yesterday... [it went to the accused]'s parents' home about 7.30 pm on July 3. The parents were distressed about their son's state of mind... [The nurse] told the defence counsel... [it was aware the accused] had been admitted to 9B after an overdose[, and knew the accused] was on the antidepressant drug Prozac. Asked by counsel why [the nurse] did not obtain a full history on [the accused] before going to the house, the witness said: "I felt no need to have a whole history when I was going there to a[ss]ess his safety."

...A leading Auckland lawyer has criticised the release of mentally ill patients into the community before it is safe to do so. "There seems to be this pattern of schizophrenics being released into the community where they promptly stop taking their medication, which is the only thing that keeps them stable..." ...However, [the]... assistant to the director at the Mason psychiatric clinic... said there were many schizophrenics who posed no threat... Because most mentally ill people were not violent... it was difficult to predict who would be violent or dangerous, especially if they had no history of being dangerous... [The lawyer]'s comments come after a fortnight which has seen at least three schizophrenics declared not guilty of serious charges on grounds of insanity. Last week [the lawyer] was prosecutor at the trial of [a]West Aucklander... who stabbed a [stranger] when the local newspaper office where [the stranger] worked refused to publish an advertisement which was gibberish. [The West Aucklander] said the Book of Revelations had told him to commit the act. [The judge ordered that the West Aucklander] be detained as a special patient under the Mental Health Act... T[he] other... schizophrenics... were also sent to mental institutions last week: [the person] who killed six in the Raurimu massacre, and... [the] 16-year-old youth who... killed... his sister's 10-month-old son [then] carried out a macabre "autopsy."

...The jury [had] accepted his... not guilty to murder on the grounds of insanity... plea after 40 minutes of deliberation... In a statement read to the jury, the 17-year-old mother told how [it] looked in the garage after searching the house for her young son... Jamoure... There [the mother] discovered her brother kneeling by Jamoure with his hands inside his stomach pulling out his internal organs. Part of the baby's skull had been taken off. [The mother] screamed at him: "What are you doing? What are you doing?" before fleeing to a neighbour's house to alert the police as her brother continued... remov[ing] the child's organs. Police told her to go back and get her son... It was believed that [the youth] might have watched a TV3 programme on the Roswell incident in the US military base where an autopsy was carried out on what was purported to be an alien. "This autopsy bears a remarkable resemblance to the actions of the accused in respect to the injuries to Jamoure,"... [The youth]'s family arranged for him to see a psychiatrist some days before the killing, but at the last minute [the youth] refused to go. A new appointment was made for April 17 – the day after the killing. Two psychiatrists called on behalf of the Crown and defence told the jury they believed [the youth] was legally insane at the time. [The judge] told the jury that medical insanity was different from legal insanity, which required that a person was suffering from a disease of the mind to such an extent that [the person] was incapable of understanding the nature and quality of what [it] was doing. After the jury returned its verdict, the judge said it had not been pleasant to listen to details of the case and counselling was available to anyone who needed it...

[A judge has] dismissed four other attempted murder charges laid against... [t]he 24-year-old Wellington[ian who killed]... six people in the central North Island settlement of Raurimu in February... [but was found] not guilty... last week... b[eca]use... of insanity... [The] mass killer... once took a

home-made pistol to an appointment with a psychiatrist, the High Court heard... [The mass killer] refused to hand the pistol over but promised... not [to] use it, the psychiatrist... told the court. [The former patient]... admitted killing his father and five others but... plead[ed] not guilty to all 10 charges by reason of insanity... [The mass killer's counsel said his client's] paranoid schizophrenia "was such to render him incapable of knowing that his acts were morally wrong." [The mass killer's former psychiatrist had also] told the court that after one of several consultations... in 1995, [it] wrote: "If this young [patient] becomes any more mentally disturbed, then [it] might have to be committed... considering his access to firearms and his flimsy hold on reality and his temptation to use explosives against speed cameras." [The mass killer] was a compulsory admitted psychiatric patient in Porirua and Wellington hospitals between August 1995 and February 1996. The psychiatrist in charge of [his] case at the time... told the court there had been insufficient grounds to renew the compulsory admission order when it came up for review after six months. [The patient] had not shown threatening behaviour or suicidal tendencies while in hospital and had behaved when released on short-term leave.

...Choking back tears yesterday, [a mother] outlined her son's deteriorating mental health before [the son] shot and killed his father and five others at Raurimu. [The son], who trained as a dental technician, was diagnosed a paranoid schizophrenic two years ago, and spent time in Wellington and Porirua hospitals... [The mother] said... that her son... "...didn't like taking the medication... didn't see the need for it." But one drug [the son] did turn to was cannabis[, which]... strongly exacerbates... schizophrenia... The [son] was... an obsessive campaigner for the decriminalisation of cannabis, [and] spent up to \$300 a month on the drug before the shootings... [The son] also began making bizarre comments, such as that [it] could control the weather. "[My son thought it] was Jesus Christ. Sometimes... Satan. We thought it was just another phase of his illness... it didn't give us any feelings that [our son] was going to snap... we weren't particularly concerned." At the family's holiday lodge at Raurimu, three days before the shooting massacre, [the mother] saw her son in his room cleaning a sawn-off shotgun. "I said 'what are you doing with the gun...?' [My son] said something to the effect of 'mum, they're coming after me.' ...I said 'don't be silly, there's nobody coming after you'. I must say I was a bit puzzled as to why [my paranoid schizophrenic son] had a gun there. Then I thought the 'they' was obviously things in his mind not real physical 'they'." Three days later, when the [family] and nine guests were sitting down to breakfast at the lodge... "[my son] came into the room and just looked around with quite a stern look on his face... then... said something about having had sex with a cat and dog. I was quite horrified. I got up immediately and suggested [my son] go into the bathroom and have a wash, then go and have some breakfast." Two minutes later [the son] returned to the room clutching the sawn-off shotgun. His father... approached and told him to put the gun down. "[Our son] said 'you're the devil incarnate', then shot him,"... In the panic that followed, [the mother managed to flee] the house...

Survivors of the Raurimu shooting spree yesterday recounted... the horror... After being shot in the head with a blast from [their hosts' son's gun, one couple] lay in the bush and hoped that playing dead would save... [their lives]. As the couple lay on the ground they heard [the son] fire three or four more shots... Once they thought [the son] had moved on, they continued along the driveway, heading for the main road. They found [another guest] injured on the ground beside the body of her husband... As... [this couple] ran into bushes [the wife had] felt the blast of shotgun pellets hit her back. [The wife] passed out and... [upon regaining] consciousness found... her husband's... blood pumping out of the side of his head on to [her. "It was quite obvious... Tony... wasn't alive." As [the wife] lay on the ground [it] heard more shots. Then there was silence. "I thought probably everybody was dead." [The wife said it] had been disturbed by [the son's] behaviour in the months before the shootings and would not have accepted an invitation to stay at Raurimu had [the wife known the son] would be there... [Her niece said, "The son's mother] has a lot to answer for... [The mother] should have taken the gun away from... [her son." At the trial the police kept the victims and their families segregated from what is left of [the mother's] family for fear of an outburst in the court's public gallery... [One s]hooting victim... had an armed stand-off with [the son as it] bundled his mother and two preschool children into their car. Standing in front of the car, [the victim] pointed a .22 rifle at [the son] and told him to "back off or I'll shoot." But [the son] fired his single-barrel shotgun, hitting [the victim] in the head and upper body. [A t]ruck driver... was flagged down on State Highway 4... by Henk Van de Wetering and his daughter-in-law. Mr Van de Wetering climbed on to the side of the truck and yelled at [the driver] to call the police... [While driving] the truck up the hill to find a spot where his two-way radio would function, [the driver saw the son] in the rear-view mirror jogging up the road behind him, carrying a gun. When [the driver] next looked back... Mr Van de Wetering [was] lying in the centre of the road with [the son] standing over him. "[Mr Van de Wetering] had his hands stretched out either trying to cover his face or pleading with the [son]." Mr Van de Wetering died on the road from a gunshot wound... [His] daughter... was angry that [her father's killer] had been acquitted of murder charges by pleading insanity. "You can't say 'not guilty.' Everyone is guilty of every crime they commit. If you say 'not guilty,' you're telling all the victims that the person hasn't committed a crime." ...Earlier, [the son's] mother... told... of the family's frustrations dealing with the health system... Health officials' concerns about maintaining [their son's] privacy meant... her husband [and herself] had difficulty communicating with community mental health staff. Last December, when the couple wanted [their son's] case worker to visit, they were told [the case worker] was about to go on holiday and that a replacement had not been arranged.

...According to... [the] senior lecturer in forensic psychiatry and chair[person] of the Auckland Council of Psychiatrists, [the perpetrator] should have been seen weekly... The last time anyone from Capital Coast Health's newly formed community care team saw [the perpetrator] was December 12. There was a visit a week later, but [the perpetrator] was not home. Then there was a missed doctor's appointment at the end of January... [A couple of weeks] later when, in his own words, [the perpetrator] "went blazing" at Raurimu, [the perpetrator believed it] was defending himself against a worldwide conspiracy. In his deluded state [the perpetrator] thought his parents and the nine friends and family members gathered at the... central North Island holiday lodge were plotting against him and had to be killed. When police caught [the perpetrator] running naked and unarmed through the Raurimu bush, [it] told them that the first person... killed was his father, who... was disguised as a dog... Like many with a psychotic illness, [the perpetrator] resisted taking the medication that often results in painful and frightening side-effects like dry mouth, impotence, trouble urinating, muscle spasms and eyes rolling back in the head.

...the perpetrator of one of NZ's worst mass killings, will probably always remain a confined psychiatric patient... Verdicts of not guilty by reason of insanity on charges of murder... effectively mean the 25-year-old will be locked up until [it] can convince authorities [it] is not a danger. His lawyer... doubted [its client] would ever be released... [The perpetrator] spent last night at a secure unit at Tokanui psychiatric hospital, south of Te Awamutu, where [it] has been undergoing anti-psychotic treatment since the shootings. Next week [the perpetrator] will be moved to a 15-bed forensic ward at Waikato Hospital's new \$17 million... psychiatric centre... Health Waikato's regional forensic mental health manager... said [the perpetrator's] long-term living arrangements were still to be discussed with the Ministry of Health. Guidelines recommend patients live close to their family or home community. In [this] case that would mean a transfer to a forensic facility in Wellington. As a "special patient" under the Criminal Justice Act, [it] requires the approval of the Director of Mental Health before... be[ing] granted leave to spend any time out of custody.

...[Raurimu's m]ass killer... could apply for short-term leave from hospital detention, a thought that horrifies the families of his victims... If leave is for less than a week, the law does not specify that patients like [him] have to be accompanied by hospital staff on outings... An Auckland University law lecturer... said that it was not unknown for psychiatric patients, including those found not guilty of crimes on the grounds of insanity, to be granted leave as part of their rehabilitation... The chair[person] of the Auckland Council of Psychiatrists... said outings... would start with walks around the hospital grounds, escorted by staff and later by family. "[However, a]nything longer than a walk would be years away."

...Capital Coast Health has cleared its staff of making any major omissions or mistakes in their handling of... [the perpetrator], but admit his care could have been improved... [Hi]s committal to a psychiatric hospital does not mean the end of officialdom's clutch on the Raurimu tragedy. A

coroner's inquest for the six people... gunned down on February 8 is likely early next year. As well, [the perpetrator] still officially faces a charge of unlawfully possessing the 12-gauge shotgun... used in the massacre... At the time of the shootings [hi]s firearms licence had been revoked. Police decided [the perpetrator] was unfit to hold it after [a] 1994 arrest for assault and his 1995 committal into psychiatric care. [However, t]he officer in charge of the Raurimu investigation... said police were now unlikely to pursue the outstanding charge... Meanwhile, [the judge] has released his reasons for discharging four additional attempted murder charges police initially laid against [the perpetrator]. The Crown alleged [the perpetrator] had a "general intent to kill all persons" at Raurimu that day. But... it could not be shown [that the perpetrator] had fired at the[survivors]...

Mentally ill people cannot use insanity as a blanket defence against their criminal actions, says an expert on schizophrenia. [The professor of psychiatry at] Auckland University, said some psychiatric patients were both "mad and bad" and used their mental illness as an excuse for misbehaviour... [The p]rofessor... was not suggesting [a]paranoid schizophrenic... was faking insanity when [it] killed six people at Raurimu... [It] had not escaped justice either... But [the p]rofessor... said the law was "a bit of an ass" in allowing pleas of not guilty by reason of insanity... [P]sychiatric patients should be found guilty like anyone else but sentenced differently to take their mental illness into account... [The professor said] the public had become... sceptical about hearing psychiatrists make excuses for crimes committed by mentally ill people. "I'm absolutely ashamed to be a professor of psychiatry in this country at the moment because I know the general public look at me and say 'There's another idiot.'..."

...A decade after... [the person who] allegedly shot and killed Donna Kalson, 21, outside a restaurant in Stratford, Connecticut, in October 1987... was spared a murder trial on the grounds that [it] was mentally incompetent, police caught up with him at a Connecticut university where... [the killer], aged 32... is a pre-medical student with a B-plus average... In view of his academic accomplishments since [being spared a trial, the killer] has been arrested and the old murder charge has been resurrected... [In local news, p]olice are seeking lawyers as court prosecutors in a move which legal experts have welcomed as a way of avoiding a possible conflict of interest among officers... It was human nature for prosecuting officers... [- a]t present sergeants do this work[-] ...to want to push cases done by their colleagues... [A] Law Commission... review of the criminal prosecution service... asked police to build a national prosecution service to keep the investigation and prosecution functions of police clearly separate. In a report, it said some court cases were unnecessarily prosecuted, some unnecessarily went to trial and others were not well prepared. Yesterday, [an Auckland judge]... said there was a danger that prosecuting sergeants could also choose to withhold evidence in court cases... The Police Department has advertised for legally qualified sworn and non-sworn staff to fill vacancies for prosecutors in Auckland and Invercargill.

...Aired in the *International Herald Tribune* early this month... [were] a couple of advertisements... - one signed by international luminaries, the other by parliamentarians... [- which called on UN] negotiators to maintain the momentum towards a meeting next year in Rome intended to give substance to the idea of an International Criminal Court. Among the luminaries, last year's Nobel peace prize winner... the U[N] human rights commissioner... the Dalai Lama... the Haitian leader, and the Bosnian Muslim President... Interesting company. In the parliamentarians' advertisement, the European Parliament is heavily represented, as are individual European Union countries, [NZ and]... states whose own justice systems have experienced hard times: Peru and Colombia for instance. The... advocates... [have] a range of motives, from those who have particular miscreants in mind to those who envisage global government. For now there appears agreement on a narrow jurisdiction for the court: genocide, war crimes and crimes against humanity. Leaving international crimes, such as drug dealing or terrorism, beyond the court's reach only confirms the difficulties in creating such a body. Those difficulties become all too evident when the debate touches upon the court's independence. It is hardly surprising that countries known for guarding their sovereignty - and taking at times a cavalier attitude towards the sovereignty of other states - should wish to keep tight control on the court. The U[S] wants the Security Council to decide which cases should go to the court. Well, given the veto the Permanent Five jealously guard, that is a no-no. It is possible to imagine - just as an example you understand - Palestinians wanting to take Israelis to the court for crimes against humanity. They would not get past the [US] veto... Ask Beijing how much it wants publicity aired about its support for the Khmer Rouge. Another veto. So while the charter of the U[N] might refer to "We the people..." the nations of the world body's title tend not to be united and are inclined to protect their national interests to the extreme. For confirmation look at the instances where nations have refused to recognise the existing World Court, which deals with state activities. Remember France and the nuclear testing case? ...Another constraint on the court is that such a body would require an "order" part to go with the "law." The Bosnia war crimes tribunal has shown how difficult it is to go from indictment to trial... It had no police or power to enforce indictments. Would a permanent world criminal court be any different? As a research, record-keeping, investigative body, there is certainly value in such an institution. But, like the sheriff in the old [US] west who caught the rustler then waited for the judge to arrive in town, it may be that the international law and order system rather needs to focus first on how order is going to be enforced before selecting the jury.

...Several hundred people are being sent jury summonses this week for what promises to be the longest jury trial in N[Z] history. The defendant], aged 43, is accused of murdering Susan Burdett in her Papatoetoe home and 44 other charges relating to alleged sexual violation, assault and abduction involving 27 [gals]... The trial... has been set down for five months... Auckland's most senior prosecutor... will head a team for the Crown... [which is expected to] call around 400 witnesses, including 10 experts. A notice being sent out with the summonses says that people can apply to the High Court registrar to be excused on the grounds of undue hardship or serious inconvenience because of the length of the trial... [However,] jury service was a matter of public duty and the court liked to think that businesses would see this as their contribution. "If the juror responds to the summons and an employer takes issue with the juror attending the court, then the employer could be setting himself up for being sued [by the employee] in the Employment Tribunal, as happened in another case." In view of the length of the trial, the jury room will be equipped with additional furnishings and amenities... In addition, crown and defence lawyers are being provided with separate interview rooms, with a separate interview room and access to the court room for complainants... [Furthermore,] jurors would be offered counselling to deal with the stress of being away from family and work for so long... The High Court manager... said... sitting hours would be fixed to allow jurors "to retain contact with their usual lives." Jurors are paid a minimum of \$350 a week tax-free plus travel expenses, though the Department for Courts has discretion to pay them above that rate... [In related news, the person] twice tried for an alleged rape of prostitute Natasha Hogan had a previous conviction for abduction and rape which the juries knew nothing about... for fear of prejudicing a fair trial... In October 1988, [the accused] was jailed for 10 years after admitting abduction, rape, sodomy and other indecencies... [against a young gal] six weeks before [the victim] was to be married... [Furthermore, while] on remand for charges including aggravated robbery[in 1983, the accused] escaped from a police van... Yesterday... [the accused] walked free from the High Court after the Solicitor-General decided against a third trial.

...[It has]... been a long day... [T]he jury in the retrial retired at 11.30 this morning... the[n] came back at 5.30 tonight and told the judge that they couldn't reach agreement... [T]he judge sent them away and said 'give it another go.' They came back at 6.30... and said that they'd like to take dinner, which is a sign that progress is being made, but I think we're in for a long night here." "...what seems to be the difficulty with the jury?" "Well, it goes right to the heart of justice, really. They came back and asked the judge for his definition of the phrase, 'beyond reasonable doubt.' Now, of course, that's exactly what they've got to find..."

...A High Court judge conceded yesterday that it would have been better if [the judge] had decided earlier there was not enough evidence to convict [a Northland resident] on a charge of murder. "This is one of those rare cases where the evidence put forward by the Crown is insufficient to enable a jury properly to convict," said [the judge]... who prevailed over [the resident's] trial in Whangarei last month... In the earlier Whangarei hearing, a new trial was ordered after the jury failed to agree on whether the shooting of Wayne Phillip Rogers at [the resident's] isolated farm at

Taipa was murder... [The accused said it] was acting in self defence when [it] fired the fatal shot to protect his partner... who was being threatened with a shotgun at her head by Rogers and his accomplice[, who]... was shocked at the level of Rogers' violence towards her and... was... scared of what Rogers was going to do... [The defence] lawyer... said... unless the jury could exclude the reasonable possibility that [his client] was acting in self-defence, [the accused] was entitled to an acquittal... [The accused] still faces sentence next month on a charge of unlawful possession of a pistol.

...FIRST THERE WAS A CRIMINAL TRIAL IN which a predominantly black jury found [an African-American sporting celebrity (r:p1467, ln4 + p1766, ln57)] not guilty of murder. Then prosecutors, defense lawyers, witnesses, jurors, journalists and police officers lined their pockets with the proceeds from writing books and appearing on talk shows. All this was followed by a civil trial in which a predominantly white jury found [the accused] liable for battering and wrongful death. Now it is the victims' families who stand to cash in. I am disgusted that a search for truth and justice has resulted in this display of bigotry, corruption and greed while leaving the crime apparently unsolved and a possibly innocent [person] ruined. Shame on the society that allowed this to happen! ...Could it be that the concept of trial by jury does not apply in racially mixed societies?

...THE STORY IS NOT OVER YET. THE FINAL verdict will be given by the Supreme Judge, who is neither black nor white.

...SEVEN HUNDRED YEARS AGO, WE DEMAN-ded, and quite rightly got, the right to be tried by our peers. But in modern times the system is just not working out, a classic example being the conflicting verdicts in the... case[in America of the black sporting celebrity]. Trial by one's peers is an expensive anachronism and should go the way of the Star Chamber. A better system would be to have cases heard by a trio of judges.

...The right of accused people to know jurors' names is under the spotlight after revelations that a defence lawyer gave one of Christopher Crean's[alleged] murderers a list of potential jurors before the trial. The Law Commission will examine the fundamental right of accused to know the names of people eligible for jury selection, because of fears that gang members might seek retribution on the people who convicted them.[A] New Plymouth barrister... admitted her secretary had delivered a list of the names, addresses and occupations of about 60 eligible jurors to a Black Power member... in prison... [The member, together with three gang associates, is accused] of murdering Mr Crean to stop him testifying against them in another case... [The barrister] said yesterday that... her clients [were always given] a copy of the jury list so they could fully provide her with instructions. Under the Juries Act, accused are allowed to request a copy to help them identify people they do not want on the jury... It was also revealed that... the mastermind behind the Paparua Prison hostage-taking, had written to people on the jury list both before and after his trial for murdering a Riverton fisher[person], Mark Roderique.

...[the lawyer] who helped settle the Paparua Prison hostage drama is pleased claims of jury bias made by one of the prisoners are to be investigated... On Friday, [the]Corrections Minister... announced the government would fund an investigation... [T]he issue was central to the jury system and defence lawyers often did not have the resources or time to search for conflicts of interest. The risk that jury members could be "contaminated" with a particular viewpoint was greater the smaller the community, said... [the lawyer. T]he issue of jury bias was noted during the... trials [of the person originally convicted of murdering Harvey and Jeanette Crewe. In another] instance... a fore[person] in a murder trial... had not declared [himself to be] a manager of a firm that had previously accused the defendant of theft as a servant... [■ The inmate making the bias claim], who was sentenced to life in prison in 1995, and fellow inmates... face charges of taking six Paparua Prison guards hostage to draw attention to their cases. They released the hostages unharmed after authorities agreed... their grievances... would [be reported] to the Minister of Corrections...

The family of [a]convicted murderer... say his pleas for justice have fallen on deaf ears. "It just shows the depth of his feeling on the matter," his brother... said last night of [the prisoner]'s role in the Paparua Prison hostage drama. "[My bro] has always been frustrated and angry about his conviction, but I never thought it would turn to this. Being in prison is hard for him, especially for something... [my bro – who] is not a violent person... [-] didn't do..." ...The... [bro] was jailed for life in November 1995 for the murder of 32-year-old Mark Roderique, a crew[member] on a boat [the bro] skippered during an ill-fated trip in January 1994. Four commercial fisher[s]... left Bluff for the Manukau Harbour in Auckland in search of tuna. A month later only three remained on the Antari. For four months the slaughter of Mr Roderique was kept quiet. It was not until June that year that his family reported... [him missing. The skipper], then 47, was charged with murdering him at Jackson Bay... on February 13. [The skipper] pleaded not guilty but was convicted in Invercargill. According to the story that unfolded, the quest for tuna had taken the [Antari] from Auckland's waters back down the west coast. On February 13 they landed at Jackson Bay and travelled to Haast for a few beers. That night as the [crew] returned to the boat, a drunken fight broke out. [The skipper] allegedly killed Roderique with the weight from a sash window, took the Antari out to sea and dumped his body with fishing weights attached. It has never been found. The two other [crew members, the skipper]'s nephew... and Tony Sewell, were given immunity by the police. Sewell was killed in a motorbike accident this year. [The skipper maintained that his nephew] was the killer[of Mr Roderique. The skipper] never gave evidence on his own behalf at trial but one of the witnesses on the defence... had contacted police in September 1994 after watching a *Crimewatch* re-enactment of the fight... Anton Sherlock... gave a statement saying [the nephew] had bragged to him about killing a person earlier that year. Mr Sherlock disappeared on March 25, 1995, nine days before [the skipper]'s pre-trial hearing began. His body was found weighted with rocks beside the Irthing Stream near Lumsden during the hearing. [An apparently unrelated person] was found guilty in March 1996 of his murder... [The skipper]'s appeal to the Court of Appeal was dismissed in 1995...

The... lawyer... [for the person] at the centre of the Paparua Prison hostage drama... said yesterday that [it] intended to petition the Governor-General for a pardon or a referral back to the Court of Appeal... [By the way, h]ostage taking by prisoners is usually a means to aid an escape. Attacks on prison officers in the country's over-crowded jails are more common. Just two weeks ago prisoners in Rimutaka Prison assaulted a guard, lit fires and trashed a wing of the building before armed police and a prison riot squad quelled the uprising... A Canterbury University criminologist... said yesterday that the weekend Paparua Prison incident was the first time in 27 years that guards had been seized by prisoners to force negotiations over alleged wrongful convictions. On October 11, 1970, at Paremoremo, two guards were beaten by prisoners in front of other guards. One was seriously injured and the other was bound with insulation tape... [B]efore that the previous case... was in 1965 when Mt Eden prisoners used guards as human shields... In the wake of the weekend siege, the Minister of Corrections... has promised another review... An earlier review led to plans to spend \$250,000 up-grading security at the jail. This would include... electronic door locks and... security cameras...

No guarantees can be given that the hostage siege at Paparua Prison, Christchurch, will not be repeated, says the Department of Corrections. The department's report into the... incident, released yesterday, said it was well managed by staff... The general manager of public prisons... said that, given the nature of prisoners, "you have to accept that from time to time these incidents will happen." The... Labour justice spokes[person]... said the report was sanitised and more significant for what it did not say than what it did. The report had failed to look at the problem created by acceding to the hostage takers' demands, [the Labour justice spokesperson] said. "The risk of a copycat incident has been raised several notches."

...The negotiators who brokered an end to the 26-hour prison siege... are calling for an independent complaints authority for inmates who believe they have been wrongly convicted. Their proposal comes as politicians face fire for agreeing to the demands of [the]four Paparua Prison inmates to have their cases reviewed... "Prisoners want a system for referrals and appeals, a scheme where they can funnel and channel their gripes,"...

A Court of Appeal ruling removing anonymity from a secret witness in an attempted murder trial has alarmed some police. In a three-to-two split, the court decided that the key witness had to provide his true name and address before [the witness] could give evidence for the prosecution. Last night [the]Superintendent... at police national headquarters, said the judgment was lengthy and complex. It would require time to consider before any official response could be made. But a recently retired... Detective Superintendent... spoke for many serving officers when... [it] said the

decision would hinder police in their inquiries. "It is going to tie the hands of the police to get to the truth of some issues. There are some cases, particularly involving gangs or prisons, where you sometimes have to resort to secret witnesses... There is no other way to get to that evidence." ...the police only sought anonymity in extreme situations where the life of a witness might be at risk. Defence lawyers would be certain to pass the information on to an accused person... [T]he prosecution could not force a person to give evidence, and without any guarantee of anonymity they were unlikely to. The court allowed an appeal by... [the] leader of the Nomads gang, who was cleared of attempting to murder [his victim] but found guilty of causing him grievous bodily harm at a rock festival in Manawatu in January 1994. It ruled that [because] a secret witness... [gave] evidence without disclosing his name and address... a new trial [must be held]... Any change in the law allowing anonymity of witnesses had to come from Parliament, the court ruled... [One of the judges who supported] the granting of anonymity... said it was fanciful to suggest that [the gang leader] did not receive a fair trial as a result of a witness testifying anonymously. Leaving the matter to Parliament was an abrogation of the Court of Appeal's traditional responsibility, [the judge said. The other dissenting judge] said: "I do not believe it would be necessary nor acceptable to most responsible [NZers] that, no matter how grave the threat to his or her family and no matter how crucial and reliable the evidence, there should be an absolute rule that unless the identity of the witness is disclosed the evidence cannot be given." ...Appeal Court judges... [had] allowed three protected witnesses to give evidence through a video link from a secret venue outside Taranaki... [during the ongoing trial of gang members accused of murdering] Christopher Crean, a 28-year-old backyard mechanic and member of the Well of Life Church... In March last year Mr Crean witnessed a vicious attack on a Mongrel Mob member by Black Power gangsters outside his Resolution Place house... Mr Crean refused to bow to intimidation by Black Power and gave evidence in a preliminary hearing... [H]is courage cost him his life... The case has made legal history... [because one of the defendants], who is the president of Black Power's Hawera chapter, is believed to be the first N[Z] person to be twice convicted of murder. [The president] was found guilty in 1975 of kicking a [person] to death... [The three witnesses] have been given new identities and relocated as part of the police witness protection programme. But the cold reality of Mr Crean's death makes the safety of all three questionable. Although the head of the programme... was confident of witnesses' safety under the scheme... the... Detective Senior Sergeant... refused to say how witnesses' lives were protected and whether the protection had an expiry date. Indeed, when police became aware that photographs of the protected witnesses had fallen into the hands of the media [a judge] was forced to pass a ruling preventing their publication. Publication "may well expose them and make the efforts taken for their protection illusory... There is no doubt that the danger to these witnesses because they have given evidence is all too real." ...One of the protected three, all too familiar with the gang's disregard for life, is [a] former New Plymouth Black Power president... who was granted immunity from prosecution to turn Queen's evidence. [The former president]... wanted no part in the plan to kill Mr Crean but admitted [doing] nothing to stop it. "The only people I was interested in taking out was the [Mongrel] Mob. No hesitation." As president of the gang [the witness] had respect and influence but "a patched member can make his own decision." [The] Crown prosecutor... believes [the former president] sought immunity because, at 38, [the former president] had given most of his life to Black Power and... wanted out. "[The former president] had gone beyond the drugs, the alcohol and the sheer brutality and was trying to bring his chapter around. I suspect that... [the former president] found himself to be no longer in their camp... Finally... [the former president] had a choice of finding himself in a trial or saying 'I'm going to make a break.' I think in his case it was self-interest." ...This was the third time Taranaki Black Power gang members had been tried for murder since [the prosecutor] became New Plymouth crown solicitor in 1988. That year three members were convicted of [hu]manslaughter following the shooting of a Mongrel Mob member in New Plymouth. [One of the people convicted for killing Mr Crean was also tried but] was acquitted. In 1991 a second Mongrel Mob member was stabbed to death in New Plymouth. Two Black Power members were acquitted. [The prosecutor] said the earlier cases had only helped to convince gang members that they were invincible... The gang and their hangers-on represented a culture centred around a lack of concern for their fellow human beings... "I think a large part of it is the underclass that we are creating in this country who are without any ties to the rest of society, without any moral values." ...Mr Crean's parents... said... "We are proud of... [our son, who] said if anyone is going to make a stand to bring peace in the street, I'm going to." ...Chris Crean was no angel - [having] had a stint in jail for assault a few years back - but... was trying... [to be. Chris] had embraced a charismatic style of Christianity and through that come to terms with himself... [T]heir son... believed that God would provide and God would protect... "[However, Chris] always used to say to me that [it would be his destiny to] die for the Lord. It was what [Chris] felt the Lord had shown him but no one thought it would be so soon... [Even when they] told him they would get him... [Chris] turned around and said 'you can't hurt me, I've got God on my side,'... His wife has since given birth to the couple's fourth child... Because of his work as a Maori warden Mr Crean [senior]... knew or had heard of all four accused and now planned to take a separate message to each of them. "People like this need to see what they have done. They just can't go around intimidating others in the way they do." [A local] Detective Sergeant... said... the... problem was exacerbated because both witnesses and victims were afraid or unwilling to become involved... By the police's reckoning there were 11 witnesses [to the attack in Resolution Place] but only Mr Crean was prepared to be counted... In a draft discussion paper, the Law Commission supported anonymity... Last night the Minister of Justice... had still to read the judgments.

...The Minister of Justice... has promised urgent law changes to prevent N[Z] sinking into "anarchy" after a legal ruling which yesterday saw seven gang members walk free from court. [The minister] said there was evidence that gang intimidation of witnesses was increasing, so a law change was a high priority. Yesterday's aborted trial of seven Road Knights gang members in Christchurch resulted from a Court of Appeal ruling last Friday that witnesses' identities could not be kept secret from the accused. The ruling also said any change in the law allowing anonymity of witnesses had to come from Parliament. The Crown withdrew its case after nearly all its 27 witnesses were too scared to testify against the Road Knights gang members on trial for assault and wounding with intent to injure... Hours after the gang members walked free, [the minister] announced plans for urgent amendments to the Evidence Act to stop a recurrence of yesterday's events. The amendments would allow judges the discretion to let witnesses give evidence without revealing their details to the defence... It could take three months for the changes to become law. In the meantime, police throughout the country will be forced to review cases... [U]p to eight gang trials [in]... Christchurch... may need to be aborted.

...Crown lawyers will ask for trials involving secret witnesses to be adjourned in anticipation of a proposed new law allowing witness anonymity. Police are also planning to withdraw charges at depositions hearings... [then] re-lay charges once the proposed law changes are implemented... The Auckland crown solicitor... said that in any Auckland trials affected, where an adjournment was not granted the accused could be acquitted, depending on the significance of the evidence. [However, the] senior legal adviser at Police National Headquarters... said there was a precedent for seeking adjournments for trials while awaiting legislative change. Similar circumstances involving breath-alcohol testing meant the delay of hundreds of cases... It is unclear how many cases are affected nationally, although in Christchurch at least eight prosecutions are in doubt... Parliament is expected to fast-track proposed amendments to the Evidence Act which would allow people to testify without their identity being revealed to the defendant... The president of the... Law Society and the Criminal Bar Association... said the move to rush through amendments was "of grave concern" which might lead to witnesses opting out of their responsibilities. "They look for any excuse not to go to court..."

...Another gang member has walked free from the Christchurch District Court because police can no longer call evidence from unidentified witnesses following a Court of Appeal ruling. [The gang member, aged] 22, left the court laughing with friends yesterday after [a] Sergeant... applied to withdraw the two unlawful possession of firearms charges [it] faced... arising from a clash between Black Power and Highway 61...

[Police and Christchurch's city council have used the new anti-gang fortification legislation to pull down a Highway 61 fence'. Unfortunately, c]ourt proceedings against Christchurch gang members are in disarray, a second trial relying on secret witnesses having been aborted yesterday. Charges

of unlawful assembly against six Black Power gang members and another charge of discharging a firearm were dropped in the Christchurch District Court. The charges followed an attack at a suburban Linwood gang house in January in which three Black Power members were stabbed during a raid by 11 people, believed to be from the Highway 61 gang. The prosecution's 11 witnesses, many of whom live in the area and are concerned about reprisals, refused to have their identities divulged at the trial. All gave evidence in secret via closed circuit television at a depositions hearing in July. A Court of Appeal ruling last month disallowed secret witnesses. Within hours the Minister of Justice... announced an emergency law change giving witnesses... the ability to apply for secrecy. The proposal is expected to be presented to cabinet this month.

...Dismissing gang court cases... [involving] secret witnesses... in Christchurch sent more than \$1 million worth of police time and taxpayers' money "down the toilet," [a]Labour MP... said yesterday. Information obtained from the Minister of Police... in response to a parliamentary question showed that 17,390 police hours were invested in two operations against the city's Road Knights gang... 22 of the Crown's 27 witnesses were too scared to testify... CABINET will tomorrow consider law changes that will allow witnesses to again give evidence in secret.

...[p]olice may compensate a family who lost money when they were driven from their home for testifying against the Mongrel Mob. They will also see whether the gang can be made to compensate the family for their losses. The family had sold their house for \$22,000, despite its original valuation of \$70,000 and considerable improvements. The family decided to leave Invercargill after police heard a "hit" on them was being planned by the Mob over the jailing of its local leader for firebombing the family's home this year. The arson was revenge for the family lodging a complaint about two dogs owned by gang members next door. Police would also take active steps to bring the gang to justice for the more recent offences which led to the family's decision to leave.'

... 'It took almost two years, but the family have finally stopped looking over their shoulders to see who is following them. And for the gutsy family who stood up to the Mongrel Mob, the gnawing fear that the gang's leader will track down their secret hideout is finally subsiding. "The gang leader is behind bars but we know it will probably have a crack at me one day," says the father. "Bugger him, we have moved once and we are not doing it again. There's no point, the Mob have people everywhere." For years the family put up with threats to kill, break-ins, vicious dogs and foul language. The stand-off came to a head when the gang leader threw two Molotov cocktails through the family's kitchen window. In return, the father did what most people are too scared to do – testified in court against him. The father's evidence was crucial to the leader receiving a six-year sentence for arson. Shortly afterwards, the gang leader's brother received three months periodic detention for threatening the family on TV One's *60 Minutes*. The family went into hiding and *NZ Herald* readers raised \$220,000 to help give them a new life. From the anonymity of their new hideaway – a closely guarded secret – the family have slowly rebuilt their life.' The family is also 'understood to have received \$30,000 – the maximum allowable – towards resettlement costs from the Justice Ministry. □'] A... disembowelled... rat has been left at the family home of a teenage gang-trial witness... Fearing for their 19-year-old daughter's life when they learned [their daughter] topped a gang-hit list, the family spirited her out of the country two months ago. Since then, family members have been harassed. Her mother has received obscene phone calls, had her house broken into and her car tampered with... [A] Detective Inspector... said the young [witness] had been offered cover under the witness protection scheme, but opted to leave the country. Police had no assurances [the witness] would return for the trial... next March... A law allowing anonymous witnesses to give evidence in court was passed by Parliament last night.

...Lawmakers, angry at the slaying of Christopher Crean, say they have declared war on gangs in a bid to end their hold over citizens. They... [have] passed laws designed to crush gang crime and protect the public. And the police have hailed the use of video links allowing witnesses to testify away from the court building. A police spokes[person] said the system was likely to be widely used in other trials involving elements of intimidation. The Minister of Police... said the jailing of four Black Power members in the High Court at New Plymouth this week for the murder of Mr Crean had saved the justice system from destruction. "I can't stress enough the importance of this decision... If there weren't convictions for this, I think the long-term future of the justice system was under some considerable threat. I believe in a liberal democratic society, but we do have to move as far as it takes to insure the integrity of our justice system." ...amendments to the Evidence Act, due to be introduced next week... enable a High Court judge to grant a witness anonymity, [the]... Minister of Justice... said. But... [t]he Criminal Bar Association president... said every other country in the Western world had carefully avoided the secret-witness legislation [N]Z... is now [introducing]... The Opposition justice spokes[person supported the]... measures to protect witnesses, such as anonymity and video links for testifying out of a court building. [The spokesperson] also endorsed the existing police-run witness protection programme. ●... Christopher Crean's killers are behind bars until well into the next century. The mastermind behind the... killing... and the [perso]n who wielded the rifle... will not even get a chance for freedom until October 2013, when they become eligible for parole... Two other Black Power members – ...the gun... supplie[r]... and... the driver – will... become eligible for parole in 2010... As [the mastermind] was led from the dock in the High Court at Auckland yesterday, [it]... said: "Utu, utu [revenge]."

...The partner of a juror in the... Crean murder trial says their family will be looking over their shoulders for the rest of their lives. "I'm really quite scared. [P]olice had initially opposed bail... after the [gang members] were charged with a slasher and tomahawk attack on a Mongrel Mob member. Mr Crean was a crucial witness to that attack. But the [gang members] were freed on bail and night curfews removed. While curfews were in place police had been able to check on the [gang members]... "If they [the curfews] had still been in place the homicide may never have happened," said [the]Detective Sergeant... who headed the Crean investigation... Police had offered Mr Crean protection as little as two days before [Mr Crean] was shot through the front door of his New Plymouth home last October, but [the offer] was declined... A... New Plymouth barrister... [who represented] one of the four Black Power members... said... "...My client... had my list for just one day and never showed it to any of the other accused. [My client] had no reason to keep it and threw it in the rubbish, and I believe him."

...Why must juries watch their backs? ...Sordid and intimate details of a... gang rape... were circulated at Waikeria Prison for the titillation and amusement of inmates. The pages were evidence from a depositions hearing which were given to one of the accused by his lawyer, said [a]Detective Inspector... of Rotorua CIB... [I]t is an example of the irresponsible behaviour of some lawyers and an illustration of why defendants should not be given copies of the list of potential jurors before a trial... [The NZ] Law Society vice-president, said it is naive to think "jury tampering" does not happen here. In Britain, jury tampering was a major reason why majority verdicts were introduced... The Law Commission is investigating the issue as part of its review of jury trials, and the Minister of Justice... would support the law review, particularly if changes included a requirement that the lists be returned before the jury was selected... Lawyers receive the list five working days before the trial starts. It used to be two days but the law was amended in the wake of the... [Crewe murder] trials... In big trials, it is not uncommon for lawyers to hire private investigators to vet jury lists in the hope of stacking the jury with people likely to acquit. This is legal. The Crown also tries to weed out undesirable jurors. Most lawyers said they should keep physical control of the list and disapproved of providing copies to clients. But lawyers are ethically obliged to follow clients' instructions – and if asked to supply the information, they would be compelled to do so... [T]here are also irresponsible lawyers who give accused copies of... police evidence. Police considered providing Crown evidence on red paper to stop lawyers photocopying material to give to clients... The Privacy Commissioner... favours constraints on giving information on jurors to defendants... But the prosecutor in the Crean murder trial... said criminals and even gang members posed little risk to jurors. Gangs were more likely to seek retribution against witnesses or the police... In a case described as a first in British legal history, a furious judge jailed two... jurors... after they said they could not reach a verdict... The [jurors] were released... yesterday... on bail pending an appeal, but not before spending a night in jail. [The]Knightsbridge Crown Court Judge...

[had sentenced the jurors, including the jury foreperson], to 30 days in Holloway Prison for contempt after the counterfeiting case had to be abandoned. A lawyer for one of the [jurors] said... that the judge had been trying to pressure her into a guilty verdict. The lawyer said the action was “unheard of in modern times.” But the 61-year-old judge stood by his ruling. “They sat through a 17-day trial and four hours of summing up in a case with five defendants and then they decided, with no reason, that they did not want to... take part in the decision-making. They said it was personal and they could not make up their minds. I thought it was right to send them to jail. I had to order a retrial at very great expense.”

...A study is being made into hung jury trials and the outcome may be a recommendation to the Minister of Justice for the acceptance of majority verdicts in criminal cases. It follows a substantial rise in the number of hung juries and the need for a second trial – and even a third... [I]n 1994... 5[%] of High Court cases... [and] a somewhat lower rate of... District Court jury trials... [were] hung... The latest figures show that more than 10[%] of High Court juries cannot agree while the figure for District Court trials is over 8[%]. The problem has been highlighted in recent months by dramatic trials like that... where the jury was unable to find whether [a Taipa resident] was guilty of murder for killing an armed intruder... However, most disagreements are in much more mundane cases which don’t attract publicity, but are also important, costly and time-consuming for the defendant and the prosecution. The president of the Law Commission responsible for overseeing the judicial system... [i]s at a loss to explain the rise... “But going over the 10[%] figure is of very real concern and it raises the question of whether there shouldn’t be recourse to majority verdicts in criminal trials [both for conviction and acquittal] as is the case in A[US] and the U[K.]” The president... personally prefers a unanimous decision... “My own experience is I’ve had few disagreements and I’ve been very impressed with the way juries go about their business... and their decisions have been within the ballpark of what I’d have arrived at as a judge sitting alone.” ...The legal profession is divided on opting for majority decisions in criminal cases (a 10-2 majority is already acceptable in civil cases)... [The] Criminal Bar Association president... says the association is prepared to accept a majority verdict for acquittal – perhaps 10-2 – but not for conviction... The argument is: what’s magic about 10 out of 12 jurors reaching a verdict against the two who are in the minority. An 11 to 1 decision may be more justified in that it precludes the rogue juror who won’t or can’t make a decision no matter what the evidence... [Furthermore,] the hung-jury phenomenon can go in waves. When there’s publicity about it occurring in a prominent trial, juries following tend to take it as a lead. Then there’s the issue of a judge giving the jury “a bit of a wind up” telling the panel they should try to reach a decision and, if there’s only a couple dicker, to go back and reconsider. [The association president says it]’s aware of instances where jurors have made a decision after being talked around, one way or the other, then later regretted it. [The association president] also points out the resources of the prosecution. In a legal aid defence technically counsel start with only five hours preparation. Often more time is approved but combating the police case, can be daunting. Under the circumstances the verdict should continue to need to be unanimous for conviction... As part of th[e study, a professor]... of Victoria University’s law faculty... has [been] engaged... to research... the reasons for failure, what further assistance may be needed for jurors, how to make their job more comfortable, and a better understanding of the whole jury process... The [debate is timely considering the recent story about] a British judge[who], faced with the refusal by two... jurors to make a decision at the end of a 17-day trial, jailed both for... contempt of court... [According to one of the jurors:] “There wasn’t enough evidence for me to reach a decision... It was a very complicated fraud case. I just didn’t understand it.”

...The fundamental right to trial by jury may be scrapped in complex fraud cases. The Law Commission is investigating whether juries are equipped to cope with long and complex fraud trials, such as the three-month Pacer Kerridge case which ended with... [an] acquittal in July. Many accused choose trial by jury in fraud cases – with the notable exception of the five charged in the 1992 Equiticorp trial – but law experts may recommend removing the right to be judged by one’s peers... [A] discussion paper due to be published this month... asked whether a judge was better qualified to hear complex fraud trials and, if juries were to be retained, whether specialists should be enlisted... Britain is [also] looking at abolishing jury trials following the failure of prominent fraud cases, commentators having suggested that juries are more likely to acquit in complex trials. But... [i]f juries were scrapped, how would authorities determine which trials were too complex[?] ...A juror on the [Pacer Kerridge] trial... said a more pressing issue for the Government was the way jurors were treated during long trials, rather than whether they were competent to hear complex evidence. [This person] advocated... providing more support to meet jurors’ needs[– including]... establishing a “friend of the court” to explain court terminology and other issues... [–] and... paying jurors more money... □ JUDGES should have danger money, it seems, for court work in India. One defendant at Bhagalpur, in the eastern state of Bihar, was so enraged at being remanded in custody, reports the Hindustan Times, that [it] beat up the judge. Then a gang of his mates showed their support by throwing stones and bashing court officials and lawyers. Help from the police? No chance. All the attackers, including the defendant, were police[officers].

...The Higher Salaries Commission has bumped up judges’ pay by 4.5[%]... The salary of the Chief Justice... has risen... to \$234,000... The second highest-paid judge is the President of the Court of Appeal, who [now] earns \$230,000... Court of Appeal judges are now paid \$214,000... High Court judges \$204,000... and district court judges \$163,000. The commission noted that lawyers were “increasingly reluctant” to join the Judiciary. One reason cited was the increasing pay gap between top lawyers and judges. The pay increases are backdated to October 1.

...There’s a hint that the Chief Justice... may be about to advocate change in the way judges are selected. His ideas will be contained in his second annual report on the Judiciary, now with the printers and due to be released next month... If [the Chief Justice] has major changes in mind, they may not get a ready reception from Parliament’s two ministers responsible for the courts and tribunals, the Attorney-General... and the Minister of Justice. While they are not against tuning of the judicial selection process they are also not advocates for alternatives... Both are opposed to the establishment of a judicial commission to make appointments in place of the existing consultative process. The responsibility for the appointment of judges is divided between the two ministers. [The Attorney-General]’s portfolio covers the High Court and Court of Appeal. [The other’s] ministry is responsible for district court judges, specialist courts such as those dealing with employment and family matters, and tribunals. [The Minister of Justice claims to be] so far removed from the personal selection process of judges that “I don’t know any of them these days. I often merely endorse the recommendations put before me... You will occasionally have the odd judge who falls from grace. If you had 50 judges and it happened fairly frequently you’d be in trouble. We’ve got about 150 judges and [personal failures] happen infrequently. Therefore I say if it’s not broken don’t fix it.” Both ministers accept there’s public disquiet at the recent guilty plea and conviction of one District Court judge for falsifying his expenses... the charging of a second with similar offences and a third with sex offences. The latter have yet to go to trial and remain suspended on full pay... The criminal charges are the first to be brought against presiding judges in N[Z].

...The Department for Courts confirmed yesterday that... [a] former Whangarei District Court judge... will receive a one-off superannuation payment although [the former judge] was convicted this week for expenses fraud... [totalling] a mere \$815... The [former judge would also receive] whatever salary... was owed. [The former judge] has been on full pay... since... voluntarily [standing] down... while an investigation took place into his travel expenses. A department spokes[person]... confirmed that there was no legal precedent to withhold superannuation from a judge convicted on criminal charges and that the department had no power to recover the \$63,000 paid to [the former judge while it] was under investigation... The Whangarei MP... said yesterday that if the department did not have the power to recover the money then [the former judge] should be pressured to repay it voluntarily. “If [the former judge] wants to occupy the moral high ground, as [it] apparently does... the money... should [be returned]... That would at least partly remedy what [the former judge] has done.” A second judge... has denied 45 charges similar to those faced by [the former judge]. The second judge] has been committed to trial following a depositions hearing in Auckland this week.

...[a] Northland judge... honestly believed [it was his entitlement] to make false expense claims, his lawyer... told a jury in the High Court at Auckland yesterday... In his opening address, [the lawyer] told the jury that there was no dispute that [the judge] had made the claims. But... there

was no crime... The alleged offences date from July 1992 to June 1996. [The lawyer said his client's] understanding that it was all right to make claims in [the allegedly false] way came particularly from a phone conversation with a former executive officer to the chief district court judge... His belief was reinforced because nothing was ever said to alert him that his understanding was incorrect. Indeed... different officials who had given evidence appeared to have interpreted the rules differently... [The accused judge] took the stand after [his lawyer's] address and told the jury that after... [being] sworn in as a district court judge in August 1991 [it] spent six weeks observing other judges before starting his fulltime duties in Whangarei... [O]ne session during an orientation week for new judges, reading the judge's manual and glancing at examples of a colleague's claim forms were his only training in his entitlements and how to claim... [However,] in one instance... the former executive officer... sent a note to [the accused judge] regarding a form... submitted in early 1992. [The judge] had claimed the \$240 overnight allowance, payable to judges when they stayed away from home, for a weekend spent in Auckland. At the time [the accused judge] was being put up by the then Department of Justice in a Whangarei motel, but his home was in Auckland. Therefore [the judge] was not entitled to the overnight allowance. On another occasion, in March 1993, [the accused judge] had claimed to have returned to Whangarei at 1 pm on Saturday after staying overnight while on circuit duties... [The former executive officer] discovered hearings had finished at 3.30 pm on Friday and believed [the accused judge] had time to drive home. [The former executive officer] changed the form, removing the overnight allowance... Earlier a former Whangarei District Court administration clerk... rejected a suggestion that [it] had begun a train of events that led to the appointment of her brother-in-law... as a Whangarei-based judge. [The clerk] was one of the first court staff members to raise concerns about the validity of [the accused judge's] claims. The defence counsel... suggested... that [the clerk] had mounted her own investigation when... her suspicions were not being satisfactorily dealt with by the court registrar and his deputy.

...No matter how powerful or influential, judges were subject to the same laws as everyone else, the prosecutor told the jury... yesterday... In his closing address... [the prosecutor] said that while any system had grey areas, there were "no shades of grey" in this case. "You do not need to be a rocket scientist to realise that a travel allowance is not payable when one is not travelling." In his explanation, said [the prosecutor, the accused judge] had treated everyone, including the chief district court judge and now the jury, as if "they had come down in the last shower." ...[the accused judge] had considered the risks of getting caught as negligible but had not counted on two junior court staff "getting the bit between their teeth" and carrying out their own investigation. [The prosecutor also] said that when new judges came on the scene [the accused judge told them about having been given] permission to claim in this way to get them on board. "Was the accused acting in the honest and open way that [the accused] claims or was [the accused] cynically putting two other judges at grievous risk?" ...It was ironic, [the accused judge's lawyer] said, that a [person] so committed to making a contribution to the system had been let down so poorly by those administering it... In... a taped interview [the accused judge claimed to have] charged for bogus overnight stays because it was "fair and reasonable."

...[the accused Northland] Judge... walked from the High Court at Auckland a free [person] last night – but it is unclear whether [the judge] will take his place on the bench again. After deliberating for about 15 hours, a jury found the judge not guilty on 45 counts of fraud involving false expenses claims. If the verdicts were greeted with natural delight by [the accused judge] and his supporters, they must have given [a] former judge... plenty to reflect on... [His] close friend and assisting defence counsel... said [the former judge's] first thoughts would be to congratulate his colleague. "Quite naturally [my friend] will be reflecting on his own determined decision to plead guilty to similar charges,"... [The former judge, 'who was the youngest district court judge appointed in NZ', but] became the first N[Z] judge to gain a criminal record when... [t]he 39-year-old... father of [3]... pleaded guilty in the Auckland District Court... is now working as a barrister in the Manawatu... The Chief District Court Judge... and the Minister of Justice... would meet [the cleared judge] to discuss his future. Until then [the cleared] Judge... did not intend to sit on the Bench.

...[a former Labour PM] and constitutional lawyer... has questioned whether the public would have confidence appearing before a judge who had been tried for fraud. Although [the] Judge... was acquitted on 45 charges of travel expenses fraud in Auckland on Friday, "the public perception will probably be where there is smoke there is fire"... Fundamental to a democracy was confidence in the judiciary, [the ex-PM] said... On the other hand, judges were not employees but appointees and could not be dismissed without extremely good reason... "It is a matter of some constitutional importance – judges do not take orders from ministers, they do not take orders from government." One of the basics of N[Z] democracy was an independent judiciary, and this had to be fiercely defended... [When questioned about the other] Northland District Court Judge... who was originally charged with [the cleared judge, and] now faces a Law Society disciplinary hearing after admitting eight fraud charges... [the ex-PM] said: "There is a world of difference between someone who has pleaded guilty and someone who had been acquitted by a jury." ...[the cleared judge's] lawyer... had advised his client not to be interviewed until matters were further resolved.

...[the cleared District Court] Judge... does not have the moral authority to sit in judgment of others charged with crimes of dishonesty, says the Labour justice spokes[person]... The Minister of Justice... would not give his opinion in Parliament, but signalled... [his concern about] upholding the dignity of the Bench. However, [the minister] said the question of [the cleared] Judge... paying back the money was not his concern... The Act leader... questioned whether there was any moral difference "between what the judge did and what some MPs do with their taxi chits." [A] Labour list MP... said that [the cleared Judge's] return to Northland courts would be unacceptable to Maori. [The cleared] Judge... would have handled a high number of cases involving Maori and they and their families would see his return to the Judiciary as an "affront to natural justice." ...[the cleared Judge's] professional future is expected to be decided within the next 10 days.

...[the cleared] Judge... may be billed for the \$10,000... overclaimed in his expenses. The Department for Courts chief executive... told the N[Z] Herald yesterday that [the department] was considering whether to send the judge a bill for the money... [However, the chief executive] would need to seek legal advice before making a decision. "It's a most unusual situation and I know of no precedent." ...the department had not had contact with the judge for "quite some time." [A former colleague of the] judge... repaid to the department \$815... received from fraudulent claims. That money was repaid without any prompting from the department... [even though the colleague] was fined \$8000.

...[the judge] found not guilty... [of fraud] has... agreed to repay... the... travel and accommodation expenses at the centre of [his fraud charges].

...[THE] SERIOUS Fraud Office... [prosecutor's] gown was on inside out when [it] gave his final address... The minor clothing faux pas was quickly noted by [the] defence lawyer... "But then again the whole Crown case is back to front," [the defence lawyer murmured to the prosecutor], in what was to be a prophetic line, before beginning [his] closing submission that helped save his client's reputation, career and his liberty. [The defence] said the SFO – which 'usually only investigates alleged frauds involving a minimum of \$500,000' – [investigation was incomplete and the guidelines and instructions given to judges in claims were inadequate... The case against [the] Judge... hinged largely on whether [it] intended to defraud by falsely claiming 45 times a \$240 overnight allowance... No receipts are needed to claim the allowance... [The judge's] integrity was pivotal. If the jury found [the judge honestly believed himself to be] entitled to claim they had to acquit... Apart from milking the system for extra money, the Crown struggled for a motive... The Crown case... was, however, far from flimsy... Investigations into claims in which [the judge claimed to have] sat in Dargaville and stayed at Hobson's Choice Motel in the town found no record of him staying there... The prosecution, which presented extensive banking and Eftpos records to trace [the judge's] movements, said [the judge] committed deliberate fraud when, in May 1996, [it] amended a claim that had been sent back to him. [Furthermore, out] of the more than 100 district court judges in [NZ] the accused [seemed to be] the only one who thought [judges] could claim in such a way... The... Judge... himself seemed in shock [upon being told it could leave the court as a free person. The judge] needed to be prompted... to reply with a simple "Thank you, your honour." ...Whatever [the judge] thinks about the administrative decisions which put him in the dock, his committed belief in his innocence has been vindicated by his peers.

...*Judgments on the expenses case judge* To the people who had most to do with him, [the cleared]Judge... was hardly a [perso]n spoken about in shades of grey. In the one camp were those who vehemently opposed him; in the other were those who swore by his integrity. [The]Judge had two powerful enemies in the form of [the MPs for the] Far North... and Whangarei... who lobbied the Minister of Justice... to have him removed following complaints from constituents and the police. Both MPs made it clear they had no time for the judge. They considered that his sentences were weak compared with those meted out by others who presided over Northland's courts... When... [the judge's] name came to cabinet to be rubber-stamped for his 1991 district court appointment... [the Whangarei MP] maintained it was not an appropriate choice... "It was brought to my attention that his make-up was unsuitable for a district court judge." ...The nephew of [a]former Governor-General... [the cleared judge attend]ed... the then Westlake High School on the Auckland North Shore in 1957. Former schoolmates described him as "an outstanding student who came from one of the community's top families." In 1962 [the nephew] began Law School at Auckland University. A keen sports[person, it] surfed and played tennis but his main interest was rugby... An Auckland barrister, solicitor and chair[person of the NZ] Rugby Union... who met [him] at Law School, said his friend loved rugby and as a player gained a reputation of being a "fast and determined" winger... for the North Shore Rugby Club's senior team... As a mate, [the nephew] was reliable... In 1970 [the chairperson was best guy at the nephew's] first wedding. The couple had three children. Their marriage was dissolved in 1992 and the judge has since remarried... [The nephew] was admitted to the Bar in 1968 and was employed by [an]Auckland law firm... which... is understood to have produced more judges and Law Society presidents than any other in the country. [The nephew] became a partner in 1971, specialising in civil work, and remained there until August 1991... An Auckland solicitor... who worked with him at [the law firm] for 11 years, says [the nephew's] ability to grasp complex issues quickly made his appointment to the Bench appropriate. "A lot of criminal stuff is fairly routine – anyone could do it. Getting someone to do the complex civil stuff is actually quite difficult in the district court because those who are good at it will either want to be in the High Court or become a barrister and earn the big money, so there is a back-log of civil work. [The nephew] was doing an excellent job of clearing the civil list." ...One of [hi]s staunchest supporters is [a]Whangarei barrister... who appeared before him almost daily in the Kaitia, Whangarei, Dargaville and Kaikohe district courts... [U]p until six weeks ago, [the barrister] and the judge had enjoyed a strictly professional relationship. However, after hearing that the suggestion would be raised during the trial that [the accused] was a lazy judge, circumstances changed. "That really got on my goat. I contacted him and said: 'If that's the allegation being made against you, it's not true. I can recall numerous occasions when you sat late, or when I've seen you in the library after hours preparing for the next day's work and if you need assistance in that regard, don't hesitate to contact me.' ...[the nephew was also] a person who was a very good judge of character of those defendants who came before him[, and] understood the particular problems we have in the Far North of drug and alcohol abuse. That understanding was borne out of his sentences, in that [the judge] was usually prepared to offer defendants a chance at rehabilitation rather than taking the view that you put them inside and throw the key away... [Furthermore, it's] a nonsense for anyone to suggest that his sentences were lenient." ...For offences of indecent assault and [guys assaulting gals, the] Judge... was harder than other judges... "[The judge] was extremely fair and had a deep sense of compassion and demanded quality from not only counsel appearing in front of him but also the police. If they didn't come up to the required standard of quality [the judge] wouldn't hesitate to give his view on it and, from time to time, I found as a defence counsel that the police took a dislike to that criticism." [Despite the fact that the judge's expenses claims 'didn't come up to the required standard of quality', the barrister] is firm in his belief that no criminal prosecution should have been brought against the judge.

...[the cleared judge,] who... has earned almost \$160,000 since... [standing] down voluntarily after investigations began into [his] travel and accommodation expense claims... has yet to repay [the almost \$10,000...]

The cleared] Judge... issued a press statement... yesterday... saying... his travel expenses of about \$10,000... had [been repaid].

...The Department for Courts is still waiting for a \$10,000 repayment from the judge... A spokes[person]... said yesterday that the department had still not [even]received... an official notification from [the cleared]Judge... saying... the... expenses over-claimed... would [be repaid. While on the topic of controversial justices, a]... West Virginia judge could go to jail for biting the nose of a defendant who cursed him... [The judge] was suspended without pay and if convicted faces up to 10 years in prison and a \$US250,000 fine. The judge has lost his temper at least 19 times in the courtroom in the past two years, a report said... STILL in the US Courts... a police[officer] was surprised by a question after [the officer had] given evidence in Dodge City: "Was the vehicle occupied at the time you stopped it?" ...POLICE have also featured in the unexpected at a court in Hong Kong. They'd organised superb surveillance pictures, they said, which clearly incriminated a drug dealer. Unfortunately, they couldn't produce them because the police photographer had forgotten to remove the lens cap. "Rubbish!" thundered [the]defence barrister... "No human being, unless [it's] got the IQ of a wooden plank, could possibly be that stupid." [The defence barrister] withdrew that opinion after it was confirmed that an official police form – to which photographers add ticks as necessary – had the printed entry: "Forgot to take lens cap off."

...The trial of... the... [NZ] district court judge... who faces indecency charges, has been switched to the High Court... No trial date has been set.

...A High Court jury has been unable to decide on two indecency charges against [a]district court judge... [after] more than 10 1/2 hours' deliberation... The jury was discharged and [the judge] was remanded on bail for a retrial in the new year... After [the High Court] Justice... summed up the case, the jury [had] retired to consider the two charges. At 6 pm the jurors returned to the courtroom to seek clarification about the significance of the fact that [the judge's] wife had not given evidence in his defence. [The]Justice... admonished the jury for "straying into areas of conjecture and speculation in which you have no place to be." The non-appearance of [the judge's] wife as a defence witness was of "no relevance to this case." [The justice] told the jurors to "decide the case on what you've heard in this [courtroom]." The Justice... then read a second communication from the jury that said... the... seven [guys and four gals]... had a "near-even split of views" and did not envisage being able to reach a unanimous view for some time... On Tuesday... [the defence] elected not to call any defence witnesses or to have [the judge] give evidence in his own defence. [The]Justice... had told the jury there was no onus on [the judge] to prove his innocence or anything else." [The judge] was entitled not to give evidence and the jury ought not to speculate on that fact. The complainant, now aged 38, alleges [the sexual assaults] took place when... [the complainant was] aged 10 or 12... and... was staying at [the home of the accused. While the accused person's] wife was absent, the accused allegedly invited him into his bed, played with his penis and ejaculated over his buttocks. The court heard that no complaint had been made to police until last year, after the complainant attended counselling with [Guys] for Non-Violence.

...Sexism is part of the curriculum for the nation's judges, who go back to school tonight to learn how to not discriminate against [gals]. The three-day gender equity seminar for judges comes after a series of embarrassing incidents involving the Judiciary. But [the]Chief Justice... who co-chairs the meeting... said yesterday that the seminar was organised before the incidents occurred. [A]High Court judge... attracted public scorn and criticism by colleagues after comments made during a rape trial...

It has been a judicial *annus horribilis*, says the Chief Justice... "Some... wounds have been self-inflicted... Two judges were charged with fraud... while others have made unwise remarks from the Bench. Other instances have arisen in the fields of bail decisions and sentencing, which, although not involving any dereliction of duty on the part of the judges, have raised a storm of controversy." While "the Judiciary cannot and does not complain about such issues being ventilated publicly," [the CJ] criticised the media for... its lack of intelligent analysis of legal topics, particularly compared to the [AUSn] media. "Here it is more likely that any instant reactions critical of a decision or outcome will be published and will become the definitive judgment on the issue... [But recent] events which have detracted from the Judiciary's reputation... show... it is more important than ever that the Judiciary should work on its credibility,"... To that end, a public relations manager acting as a conduit between the media and the

Judiciary had been appointed, while television cameras in court had fostered a “more accurate public perception of the judicial system.” The C[J] called for the establishment of a code of judicial conduct, performance evaluations of judges by their peers and the Bar and a more visible and accountable process for selecting judges... But [it] warned that establishing a more public forum to deal with complaints about judicial misconduct risked placing judges “in a position of siege” leading to decisions based not on the facts but the effect the judgment might have on their career.

...An Auckland law professor... has called for a more open system of appointing judges... [The existing] system of appointing and monitoring judges and deciding whether they were fit to continue sitting was secretive, with “zero transparency.” “It’s a closed system, mysterious to outsiders.” ...[Furthermore,] the role of Cabinet and whether outsiders had a voice in the process of appointing judges was unclear... [A] judicial fitness commission was needed, with representatives from the Law Society, the public, the police and other groups, which would shortlist candidates, then forward the list to the... Justice Minister... for a decision. The Law Society president... said such commissions were common overseas, and the society supported any change that led to more openness and understanding. [However, the president] rejected as hogwash any suggestion that [the Justice minister] would be influenced by previous or personal connections with [the] Judge... acquitted earlier this month on 45 fraud charges... in deciding his future... [The judge] went to law school with [the minister], played rugby against him, and sold him a house in 1994.

...[the cleared] Judge... has opted to stay on the Bench... after an exasperated Minister of Justice... [claimed to be] powerless to sack him... [The minister] wanted to be rid of [the] Judge... who shielded behind the law when [the minister] gave him one last chance to examine his conscience and stand down... As a result... [the minister] intended looking at broadening the law to punish judges for such things as bringing the courts into disrepute. [The minister] also revealed that [the] Judge... had been prepared to accept a golden handshake to retire early “but I wasn’t prepared to pay anything like [what it] was asking.” The Act leader... made an unsubstantiated claim last week that the Ministry of Justice was “considering a cash offer of up to \$1.5 million for [the] Judge... to resign.” After cold-shouldering... [the minister the] Judge will stay on as a district court judge, although [it] has been taken off criminal and civil work by [the] Chief District Court Judge... and confined to accident compensation appeals, starting next Monday... [The judge will be] one of three district court judges specialising in [ACC] appeals. The other two... are based in Wellington, and [their new colleague] fills a gap in Auckland... It is expected that... there may be occasions when [the cleared judge] has to travel to other courts.

...[the cleared judge] may yet preside over criminal and civil cases again. Although sidelined to [ACC] appeal hearings... the... Judge... still has his district court warrant, and legal experts say that... a change in circumstances such as a new chief judge could see him one day returned to the job [the judge] has been publicly removed from... Under the District Courts Act, the Governor-General, on advice from the Minister of Justice, can dismiss a judge for inability as well as misbehaviour. The Constitution Act allows the Governor-General, acting on advice from Parliament, to remove a High Court judge for misbehaviour or incapacity. Otherwise, judges in both categories can sit until they are 68. [The judge in question, who] is 53... will return to work tomorrow...

[The cleared judge]’s first ruling in his new job has been to make an Auckland pensioner repay \$18,000 [it] was not entitled to from ACC payments... [Meanwhile,] the former judge convicted of fraud earlier this year, is planning to re-establish his practice in Auckland... [However, his] future to some extent depends on the outcome of... a hearing of the N[Z] Law Practitioners Disciplinary Tribunal in Auckland on Wednesday... [The former judge] faces one disciplinary charge... [but the tribunal] secretary... refused to say exactly what the charge was before the hearing.

...Politicians last night put pressure on [the cleared] Judge... to resign after his former colleague... was thrown out of his profession. The Law Practitioners Disciplinary Tribunal said... [the colleague]’s dishonesty over expenses claims had resulted in a criminal conviction and meant [that it] was not a fit and proper person to practice. The move prevents him from practising as a solicitor or barrister and could see him working as a law clerk. But Labour’s Justice spokes[person]... said the public would be “appalled” at the difference in treatments between [the two former Northland District Court judges]... “It’s difficult to see how the Law Society has regarded it as fair to punish [the colleague again while the other fraudster goes unpunished and] remains on the Bench,”... The tribunal... ruled th[e] colleague... can reapply to have his practising certificate restored... ordered [him] to pay costs of \$6816 to the Auckland District Law Society who brought the complaint against him, and inquiry costs of \$4728 to the N[Z] Law Society... Auckland criminal barristers... were yesterday optimistic that [the colleague] would regain his practising certificate within a year.

...Auckland lawyers may get to pass judgment on [the judge who got away with over-claiming travel expenses] in a confidence vote... A North Shore lawyer... already had five of the 15 lawyers’ signatures... needed to table his no-confidence motion at a special meeting of the Auckland District Law Society... [The lawyer] is the husband of the Act justice spokes[person]... who in Parliament was prevented from raising the issue of [the judge]’s continued employment 11 days ago... [However, the lawyer] wanted the no-confidence vote to send the judge a signal from within the legal profession. “...I’m under no illusions that it would compel him to do anything. I’m not by any means confident that it will be carried, but I think at the very least the lawyers ought to consider it an expressive view.” ...many lawyers felt a great deal of sympathy for the former Northland [judge’s colleague]... who was struck off the roll of barristers and solicitors on Wednesday. “[That person]... preserved the standing of the Bench by not having a trial, and... has ended up being severely punished and disadvantaged.”

...There will always be those cases where justice for an individual can only be achieved by a corresponding injustice to society. We hold a variable ethos that it is better for five, 10 or 20... guilty people to go free than for one innocent person to be punished. Yet the reverse is as true. Occasionally injustice to the individual is necessary to the interests of justice to society, though the balance generally is weighted to the individual. The... concern [over the case of the acquitted judge] has not given rise to any substantive criticism of our jury system. Society is generally well accepting that jury decisions are bounded by the technical basis of the law. As citizens we accept a level of social injustice is the price we pay to achieve an acceptable level of individual justice. Our calls for certainty and fairness mean that there are times when guilty people go unpunished. The... concern is not about the merits of jury decisions. It is one of social indignation – not for the fact of his acquittal; rather for the subsequent erosion of the high level of public confidence which is an imperative requirement for the maintenance of an effective Judiciary. The... periodic tensions that arise between a legal outcome and our collective concept of social justice... are not always the same and at times, as in this instance, not always able to be easily reconciled. Our sense of social justice demands that... we have the well-accepted notion of standards of proof, usually expressed in ordinary terms as needing to be “beyond reasonable doubt.” ...Justice for the individual has acquitted [the judge]... Paradoxically... by electing to challenge and defy those strong calls for him not to resume his role as a judge, [the judge] might have brought upon himself a punishment greater than anyone could have contemplated. [The judge] has been assigned to an obscure corner of comparatively futile decision-making power. [The judge] is away from the public spotlight, consigned to a rather dismal and probably quite unrewarding and unstimulating diet of evaluating humdrum and collectively dreary issues. Thus, perhaps for [the] Judge... there has come a consequence more dire than anyone might have imagined, much less chosen to inflict upon him. In that way, perhaps, individual justice has been well enough served by the acquittal.

...3000 lawyers will... pass judgment on whether [the judge acquitted of fraud] should remain on the Bench... [A]t a special general meeting last night... [the] Auckland District Law Society... decided to call on all members to take part in a no-confidence motion on [the] Judge... The society... said even if members passed the motion it had no legal standing... In a separate move, the... N[Z] Law Society... confirmed it was considering whether there were adequate grounds to have [the] Judge... struck off, as well as “other matters of principle” before such action was taken.

...Auckland district lawyers have voted no confidence in [the new ACC appeals] Judge... and say [the judge] should leave the Bench... The motion was passed by a reasonable margin... [and] lawyers were conservative people who did not give such a judgment lightly. “It... means lawyers are

prepared to say they expect standards from the Judiciary... [and it is] not going to be easy if the judge continues to be on the Bench knowing that the people who are appearing before him have voted that [the judge] shouldn't be there." ...lawyers will decide today whether to take High Court action to have him struck off the roll of law practitioners... Removal from the roll would not affect [the judge]'s eligibility to remain a district court judge... [However, even the] High Court could not strike a lawyer off. If it felt there was a case it would refer the matter to the Court of Appeal, which would make the decision. Most legal professional disciplinary matters were dealt with by the Law Practitioners' Disciplinary Tribunal...

[The] Law Society has deferred a decision on whether to apply to the High Court to have [the] Judge... who was recently acquitted of fraud charges... struck off. The society says it will [first] seek "professional advice" on policy and constitutional issues regarding [the ACC appeals judge]...

A law expert... says [the] Judge... should have resigned in the interests of the Judiciary and the law, but there are no constitutional grounds for his removal. His opinion was behind a Law Society decision yesterday not to apply to the High Court to have [the] Judge struck off the roll of barristers and solicitors. It is still open to anyone to make a strike-off bid against the former Northland judge found not guilty of expenses fraud... but legal opinions say a case would fail. And even if one succeeded, experts say being struck off the roll would not prevent a judge's continuing.

...Lawyers uncomfortable at passing judgment on peers such as [their new ACC appeals] Judge... are calling for an independent judicial commission... [The] vice-president... of the Auckland District Law Society... said yesterday that many lawyers were unhappy with the whole idea of judging others in their profession... Just over 1000... of [the] more than 3000 members... voted – 546 for, 401 against and 65 abstaining... [By the way, their new ACC appeals judge's former colleague – the now disbarred] lawyer and former judge... [–] appears likely to pick up consultancy work rather than face a more humble future as a law clerk... [A] criminal lawyer and friend... said: "I... have used him myself (to review files)..." ...[the disbarred lawyer] would be able to earn more than a law clerk – but... would probably be "getting by on \$500 to \$700 a week." Lawyers believe [the disbarred lawyer] would probably win back his practising certificate if [it] re-applied in about six months... They believed his level of offending... is paltry when compared to other disbarred lawyers like... [one who was] sentenced to seven years' jail in 1992 on 42 charges of theft and forgery totalling \$6.4 million... and [another who was] sentenced to six years' jail in 1992 on 51 charges of fraud totalling \$3.5m... Of the 38 lawyers struck off between 1989 and 1996 (23 due to criminal convictions for theft or fraud) none have so far been reinstated... So far this year, only... one other lawyer [has] been struck off. The other lawyer's case is under appeal... and name suppression.

...Two judges were accused of fiddling travel expenses. One fell on his sword, resigned, was convicted and struck off the lawyers' register yet salvaged some honour. The other fought and won yet faces odium. Somehow it just doesn't add up... They are said to be humiliated and neither will talk. But... feedback for [the convicted judge] is supportive – and... [his] mail... includes a contribution to legal expenses from a stranger – [while letters to the cleared judge] are of a different tone... A "corrupt, rotten depraved bounder" who has "cheated and lied and ought to be whipped", writes [a citizen from] Howick... "You absolute creep! A judge? Shouldn't you know right from wrong? Guess you... haven't got a conscience. Just keep going. The rest of NZ feels revolted," says [a citizen from] Rangiora. The letters had been forwarded on to a lawyer... When [the lawyer] showed one to his friend of 40 years, [the cleared] Judge... crumpled it in his hand. Not because [it] didn't care but because... [no]-one wants to read such things about himself. Why did [the cleared] Judge... admit nothing? And why didn't [his former colleague] do the same? They had, after all, both claimed a \$240 allowance for staying away overnight after presiding in courts in Dargaville, Kaikohe and Kaitia, when they had in fact driven home to Whangarei. Had [the convicted judge also admitted nothing it] may still be a judge, although his mail could be less pleasant... Like most – no one seems to have a bad word for him – ...a longtime friend of [the former judge] and one of the lawyers who represented him... [was impressed by] his... sense of humour, gift for language and the close family life [it leads]. The former judge wasn't [t] one for the profession's social circle, seldom attending law society functions. Having heard a rumour that two judges were in trouble, [the lawyer] rang to ask his friend who they were. "You are talking to one of them,"... [The former judge] had been phoned by [the] Chief District Court judge... shortly before. "[The former judge] had been in the job long enough to settle in and was thinking to himself how good his life had become in terms of his career and his family, in the way they had all settled in to Northland. Then the phone rings and it's [his boss] telling him to come to Wellington forthwith." [The lawyer], Queen's Counsel... and other senior lawyers urged him to plead not guilty. Because [the former judge] had been shown the way by [the other] Judge... who had been on the Northland circuit for five years, they considered [it] had a good case... [The former judge] regularly went to his office after returning from out of town sittings and used his personal swipe card to get in... [T]his left an electronic record which suggests [the former judge] wasn't conscious of any need to hide his movements... Within a year... of... pleading guilty... [the former judge] has fallen from being one of the country's most promising judges to a law clerk. All for claims totalling \$815. Although [the former judge is] likely to soon get back his lawyer's ticket his brilliant career is ruined.

...There has been considerable public pressure to have [a] Judge resign because of the perceived lack of public confidence in him... [However, the] judge was not immune from prosecution... Some recent publicity amounts to an attempt to "retry" [the] Judge... without the benefit of a detailed knowledge of the evidence that was placed before the jury... Despite what has been said... [our] jury system, in which all [N]Zers can have justifiable confidence, produced the verdict. [Therefore the] Judge... is entitled to be treated in accordance with it. [The judge] is not guilty of any offence. Notwithstanding his position... [the] judge... is entitled to be treated [like] any other citizen... Since this matter arose the claim form used by District Court judges has been modified and memoranda issued to them to make the basis of entitlement to expenses clearer. That in itself tends to indicate an acknowledgement that the original claim form and the explanatory notes in the judges' manual left room for improvement for the sake of clarity. Judges are as susceptible as anyone else to making honest mistakes. In fact, our legal system has an elaborate appeal structure to deal with the need to rectify judicial mistakes when they occur. Many of the opinions expressed to date are grossly ill-informed and some are clearly politically motivated... Judges do not enjoy a special preferred position of job security; the reason for the limited basis for removing them is to protect the Judiciary from political interference.

...Judges should be above personal criticism, even when their decisions turned out to be wrong... the Law Commission president... said. Commenting in the Law Society newsletter, [the High Court judge noted] "the growing enthusiasm for wholesale public attack on the judiciary."

...[A] HIGH-profile barrister... has launched a scathing attack on the falling moral standards of some judges, saying they lack the "old-fashioned integrity" of the past. In his new book *Justice*, to be released this week... [and which] took 15 years to complete, [the barrister]... said judicial standards had declined, with appointments based on political expediency rather than on ability and experience... "Moral turpitude is not a wrong any longer, only legal wrongs are. If you want to be a philanderer today no one stops you because no one really cares. In the past they did care." ...[furthermore,] some of today's judges lacked the intellectual brilliance of their predecessors... But [the] Justice Minister... said the claims were "absolute rubbish". The judges of yesteryear "don't come within a bull's roar of the present bench..." ...[the barrister also] told the *Sunday Star-Times* that because judges were paid too little, some front-rank barristers would not accept the positions.

...The launch of a new system to appoint district court judges has coincided with the first newspaper advertisement to recruit them. The Law Society has welcomed the Ministry of Justice's judicial appointments unit, which aims to make recruitment more accountable... The system replaces a relatively closed selection process with clearly laid-out requirements in qualifications and ability... Criteria [now] include: professional qualifications and at least seven years' experience, good communication skills, knowledge of the community and person[al] honesty and integrity. Knowledge of cultural and gender issues are also listed as good attributes for a district court judge. The process will start with a register of those who have expressed an interest or been nominated. Candidates will supply a curriculum vitae, a statutory declaration and authorisation form

declaring criminal convictions, disciplinary matters, financial stability and tax defaults. The files will be updated every five years with the help of applicants. As vacancies occur, suitable applicants will be considered by the Ministry of Justice and the Chief District Court judge before a short-list is drawn up. This will be scrutinised by the Solicitor-General, members of the Judiciary, the Law Society and a referee named by the applicant. Final interviews will be by the chief judge and the Secretary for Justice, with the Minister of Justice having the option to join this panel. The appointment will be made by the minister, who will report to the cabinet. The... Law Society President... said many people favoured a judicial appointments board but this was a “significant step” in the right direction.

...The Court of Appeal has opened the way for members of the public to sue district court judges. In a landmark decision yesterday, the court ruled that a claim for damages can go ahead against a former district court judge who allegedly issued a non-molestation order when [it] had no right to... [The subject of the non-molestation order claims the] Judge... acted recklessly and deliberately when making... [the] order against him. The judge allegedly refused to set it aside after being told [that district court judges] did not have the power to issue... [it. The subject] had earlier this year sought \$605,000 in damages... Taxpayers could end up footing the bill. The Minister of Justice... said last night the Crown would be liable for damages in such cases, rather than individual judges... The actual wrong [the subject] is suing for is the ancient tort of misfeasance in public office, and yesterday’s decision was on whether a district court judge was the holder of such a public office... The five-member panel of Appeal Court judges reviewed cases going back to 1703 before deciding in the affirmative. Giving the decision, [one of the Appeal Court judges] said none of the cases suggested a judge who knowingly and maliciously acted without jurisdiction could not be sued for damage his acts caused. To deny the right to sue would be to change the law. But... experts doubt that the decision will lead to a flood of civil cases against judges, because someone would have to provide a high level of proof that a judge had knowingly and maliciously acted without jurisdiction... “Just because you disagree with a judge’s interpretation of the facts is not going to get you anywhere near the starting blocks.”

...Under proposals before the Government, District Court judges may be protected in future from the kind of civil suit faced by a retired judge... The Minister of Justice... personally supported a... recommendation extending judicial immunity from civil prosecution to include... District Court, Employment Court and Maori Land Court... judges... High Court and Court of Appeal [judges can’t] be sued for their judicial actions... Although the matter was settled out of court, the... right to sue lower court judges was established in 1995 at the Court of Appeal in a test case involving... [someone] jailed for not paying his fine when [it] was paying by instalments... The Law Commission recommends enacting special legislation to compensate citizens who have been imprisoned as a result of a miscarriage of justice – a move that would bring N[Z] in line with international law.

...In very simple terms law is the system of rules by which the game of life is played. Members of society are the players. The court is the umpire. In any other sort of game... the umpire makes a decision on the spot and the game moves on immediately. Something akin to that should happen in the justice system. Regrettably, it does not. Instead our justice system has stalled and is a long way from providing a suitable service to the public. Serious delays have arisen recently in the Family Court in Auckland... It is unacceptable for the Government to use the recent Domestic Violence Act as an excuse. As a Family Court lawyer, I know from experience that three years ago delays of many months were common in obtaining custody hearing dates... Parents and children in particular should not be expected to suffer these long delays simply because the system is not working effectively. Delays are as bad in other courts. While the Government says it will improve things with alternative dispute resolution and the introduction of night courts, that is only treating the symptoms and not the cause. In effect, the court system is run as a statutory monopoly. As such, the Government can settle on any system it likes to resolve disputes. Unfortunately, the system now provided usually involves vast expense to the taxpayer and litigant – often several years after the event. With a monopoly there is no need to have a “service” mentality. A monopoly doesn’t have to do anything to please or attract customers because its customers have nowhere else to go. The court system in this country... does not work as if “the customer [the litigant] is always right.” Serving the needs of the public is not a dominant feature of the system. Consider some of the simple aspects of serving the public. Go to any district court and see if there is a place to buy a cup of tea or a sandwich. (Until recently not even the Auckland High Court had a place for litigants to buy a cup of coffee.) There are no carparks provided for litigants at court buildings... Child care facilities are never available. There are often insufficient interview rooms (if these exist at all). More often or not all litigants are told to turn up at 10 am. It is not unusual to have, say, 100 people turn up at the main court of any district court on their “list” day at 10 am. A “list” day is where traffic and a variety of charges are called for the first time. The average time the judge takes to deal with these people is about two to three minutes. If the court therefore knows that it will take, say, 300 minutes... of judge time to deal with 100 people, why have them all turn up at 10 am and hang around for anything up to five hours, to be dealt with in three minutes? ...The problem is not lack of money – it wouldn’t cost any more to bring 20 people to court each hour... The real problem is that the system does not focus on the needs of the customer – the public. Rather it is a system run by lawyers, focusing on court rules and procedure. These rules and procedures are designed to provide “the Rolls-Royce solution” to every problem. Elaborate pre-trial procedures (“interlocutory matters,” as the lawyers fondly call them) add vastly to the delay and expense. Why can the courts not examine each case on its merits, and rule many of these out in simple cases? ...Courts are also very wasteful. Judges spend too much time granting adjournments and performing simple administrative tasks and too little time considering difficult decisions which require their judicial skills... It is time the Government stopped throwing more money at the... problems... [i]nstead of... address[ing them properly]... It is time for some lateral thinking and some significant improvement.

...The P[M] has called in heads of Government departments and told them to come up with new ways of fighting crime to stem the “costly recycling” of offenders through the courts... N[Z] spent \$1.43 billion a year on police, prisons and the court system... The... [PM] told a... conference at the weekend that “realistic alternatives” were needed to prisons, along with carefully managed and up-to-date rehabilitation programmes. “If we don’t succeed, then we will have to build even more prisons as a testimony to our failure.” Denying [it] was going “soft” on crime[, the PM] said the country needed a system where criminals were more answerable to the community.

...Police officers refereed several fist-fights in a remote Kimberley community in an innovative bid to avert an Aboriginal clan war last week. The head of police in Western A[US]’s northern region... yesterday backed the officers’ unconventional method of conflict resolution. But a “clearer line” needed to be drawn for police who were required to bridge traditional and European-style laws... About 80 members from two opposing families had been about to wage war with fighting sticks, spears and boomerangs when the police intervened at the One Arm Point community, 200km north of Broome. The families insisted that tribal law required them to fight because of a melee involving traditional weapons a day earlier. The dispute was settled with a number of one-on-one fist fights after negotiations with three police officers and two police Aboriginal liaison officers. [The commander] acknowledged there was a potential legal risk to the officers if anyone had been seriously injured... “This is about resolution of conflict within the community. They had an argument; it’s been resolved.” ...finding resolutions which respected Aboriginal law was essential in policing the Kimberley where traditional customs, including pay-back, were still common practice... While police needed a clearer position, they also needed flexibility. “You can’t say: ‘...you hit him with a stick, you’re in the bin.’ You’d have the whole community in the bin.”

...A separate justice system for Maori should be looked at, says [a NZ] First MP... The Te Tai Tonga MP... said successive Governments had built “straw bridges at the top of cliffs,” doing little to address the fact that about 52[%] of the prison population was Maori. About 13[%] of the total population is Maori... [The MP] would ask his caucus to consider asking Parliament’s justice and law reform committee, of which [it] is a member, to conduct an inquiry into the justice system and the imprisonment rate for Maori... “We’ve tried everything else and I don’t see why we can’t look at a separate justice system for Maori, and [at] encouraging and providing an environment where Maori take responsibility for their people. There

must be a better way.” ...Maori were successful providers of health services... and [the MP] did not see why Maori could not also provide justice services. That would not be a soft option for Maori offenders, [the MP] said, because they would have their “aunties and uncles sorting them out.”

...[the first perso]n to receive a marae-based sentence for criminal offending is living at his Hamilton home after serving less than four months of a 12-month term. [The offender], convicted of assaulting two of his children and on cannabis charges... was sentenced to live at Te Kaharoa Marae, near Raglan, for a year while [it] undertook 1000 hours of work, counselling, therapy, rehabilitation and healing. But a Maori justice pioneer... said people involved with the case had not been properly prepared to see the marae-based sentence through to the end. “I think they jumped in too quickly and so they had some major stuff-ups. They didn’t realise they needed to commit themselves, hence this guy was able to sort of do as [it] liked in the end.” The landmark case was brought back to court by the Corrections Department in November. Investigations revealed that [the offender]’s attendance at the marae had gone from “okay in June to erratic in July... to non-existent by October,” a department report said. [The offender] has been remanded at large pending a department review of his sentence to be heard by [a]Judge... on March 17... A manager at the Children, Young Persons and Their Families Service... said the department had no objection to [the offender] living at home.

...Another... tribe in the North Island is poised to take over the provision of social services to Maori youth from the Social Welfare Department. The move is part of the [DSW]’s iwi social services strategy, which will lead to increasing numbers of Maori taking over responsibility for their young people. It follows moves in south Taranaki and Waikato... [The DSW] embarked on the policy several years ago because a disproportionate number of the young people it sees are Maori. Studies in the early 1990s showed 48[%] of those in the youth justice system were Maori.

...“E hara taku toa, i te toa takitahi, engari he tao takitini.” (Individuals are only important when they are part of a family.) This old Maori proverb suggests that the strength of the family unit, and the success of each person within it, depends on unity and acting together... I’ve chosen this proverb to illustrate the break-down of the whanau unit, and what it has cost – the lives of our children... Many Maori children are lost souls, who look to Government agencies for help before they turn to their own whanau... Maori have battled for justice and democracy. But we’ve lost the plot somewhere along the way. We can’t hold our heads up high... if we continue to... pass on... our struggles to our children... I know Maori people have a huge capacity for love and hospitality... Despite being a Whangai (adopted) child, I never lacked the love and warmth of my grandparents. There were more people who gave love, too, aunties and uncles at the pa, cousins and other distant relatives... In a wider setting we as a whanau had responsibilities to our extended family members, and we all had duties towards the marae, to maintain and keep the pa running smoothly.

...Harsh social and economic realities may force the Maori wardens’ service to go user-pays. The national manager of the Association of Maori Wardens... said wardens may have to change from traditional marae-based duties... “The call for wardens is so great today that at times we are used and abused... If we don’t get a koha [gift] we carry on, but if we do get one we are grateful.” B[ut a]... Rotorua senior warden... felt the time was not right to introduce user-pays. “Everyone who joins the association knows the job is voluntary and there is no financial reward... But at times we do charge for occasions like a 21st or patrolling buildings...,”... Maori wardens are often in the background at big occasions such as a tangi, directing car-parking and generally keeping the area free. They also patrol city streets at night, helping the homeless, street kids and others in need... [T]here were about 2500 wardens nationally. They went through a selection process before receiving their warrant card and badge.

...[‘there are about 2,500 prison officers’ in NZ, where the ‘average prison population increased by nearly 59% between 1983 and 1995’, and] is expected to rise by more than 36% in the next eight years. The latest Corrections Department figures forecast the muster to reach 5196 by the end of this year and to rise to 7092 by the year 2005... [Currently,] the average prison number was 4521 (plus an average of 535 on remand)... The ministry said the major trends behind the increasing numbers of [guy] prisoners were the rapid increases in serious violent and other violent offending, and an increasing number of prisoners in the older age group... [A]lternatives were under way to try to stem the rise in prison numbers... [However, a] senior sociology lecturer... [at] Canterbury University... predicted a continued rise in prison numbers as the Government-directed corrections policy reflected “public demands that violent offenders go to prison for longer.” ...The increasing number of older, long-term and violent offenders expected in future prison populations has implications for the security status and management of prisons... Many Corrections Department facilities are old and suffer from a backlog of maintenance and other upgrades needed to “ensure basic safety requirements... A strategy is under way to rectify the situation, which could include a major building programme over the next five years.” ...A new \$30 million prison would be needed every two years to cope with inmate numbers expected... over the next decade.

...Overworked prison officers fearful for their safety are going to the Employment Court today to protest at overcrowded conditions at Mt Eden Prison... The national organiser of the Prison Officers Association... said yesterday that the union would seek a declaration... that Mt Eden Prison drop its prisoner numbers back to an agreed maximum of 421 inmates. “...on Friday it was 440. We have been given notice by the general manager that [it] would intend to go to 446 but no guarantees [we] might not even exceed that... The fuller you get in a wing the greater tensions there are and that gives rise to real... safety concerns.” ...some prisoners shared cells so that people did not have to sleep on the floor or in corridors.

...The... Penal Officers’ Association... said there had been... inmate “incidents” such as fights, violent outbursts and the use of abusive language because of overcrowding... [at] Mt Eden Prison... in the past week. The prison’s... numbers had reached 451... Previously, toilets in some parts of the prison had blocked up... [I]t was only a matter of time before that happened again.

...Mt Eden Prison’s capacity has been boosted by 30 beds with the addition of [2] new wings – cells at... Auckland District Court and High Court.

...A [gal] remand prisoner spent six days in cells at Auckland Central police station because the [gals]’ division at Mt Eden Prison was full... On Tuesday there were nine [prisoners] in the 21 overflow cells... [■] The minimum security unit... at Paremoremo... is to... [receive a new] 60-bed... unit... The Department of Corrections chief executive... said staff tried to keep offenders in their home regions as it helped in their rehabilitation and reintegration. But bed shortages in Auckland had meant that some [prisoners] had to be sent as far as the South Island. The new unit will cost \$4.5 million and will extend from the medium security west wing. Contractors will build the main structure and install security systems...

A repeat jail-breaker serving a sentence for violent crimes escaped yesterday from... Mt Eden Prison’s least secure unit... [D]etectives said... th[e] escaper had gang connections in Auckland and should not be approached... The Penal Officers’ Association accused the Corrections Department of housing [the escaper] in a unit not designed for prisoners with a record of escaping... [but said the escaper] and other inmates might have been held there because of the prison’s overcrowding problem... A department spokes[person]n... rejected a link between overcrowding and the escape.

...The Department of Corrections is reviewing security measures because 53 people have escaped from custody since... July. A spokes[person]n... said the escapes comprised 14 cases where inmates were able to just walk away from custody, 10 escapes while on escort, 16 breakouts and 13 escapes while the inmate was on temporary release... Forty-four people escaped from custody [during the 12 months prior to] June 30... The... [spokesperson] blamed seven breakouts from Paparua Prison, Christchurch, for the high[er recent] figures. “We are going to continue investigations into escapes down there and we believe the result of these reviews will help to reduce the problem.”

...A total of 159 faulty locks at Paparua Prison... needed replacing to prevent escapes and to protect staff from injury in the event of a breakout, according to a 1994 report. The leaked report of a national inspection of high-security locks in N[Z] prisons found the operation of the locks seriously below an acceptable standard. “We have grave concern in respect of the security of this prison. We advise in the strongest of terms to inject new locks and urgent servicing to prevent escapes and to protect staff...,” the report said. The Labour justice spokes[person]n... said action to replace the locks was taken only last week... [after] 10 of Paparua’s prisoners... escaped in a little over a two-month period. Yesterday, [the spokesperson] said security at Paparua Prison, which was full to overflowing, was appalling. Earlier this month, two Paparua prison officers were

sacked after a security lapse. They turned off alarms on a night shift so they could sleep. The [spokesperson said the] Minister of Corrections... had refused to provide him with the leaked report under the Official Information Act, and suggested the reason was the Government was embarrassed... [The minister] said the country's prisons were secure and the rate of escapes had reached its lowest level in 50 years.

...The more jail staff swot up on ways to keep a prison secure, the harder inmates are trying to outwit them. "Every time we think we have blocked one hole, we find there is another one..." said the general manager of Auckland Prison at Paremoremo[, who]... found himself at the centre of the latest game of jail-style cat and mouse... after an escape... from [the p]rison's medium security complex on Sunday. Even before... [t]he 31-year-old... was recaptured yesterday, [his escape] had set in motion a set of inquiries designed to prevent repeat performances... [The 31-year-old] was the first medium security prisoner over the wall since... September[1996. Both escapees] managed to slip through holes in the outer perimeter fence. Three [prisoners] hold the dubious honour of having committed greater Houdini acts at Paremoremo, however... [The trio] are the only [prisoners] to have broken out of the maximum security division in its 25-year history. The[ir efforts to]... saw... through bars on their way to the outside world in August 1993, ensured that it would be a whole lot tougher for anyone else to get out of the maximum security institution... [An inspection of] the prison... exposed a catalogue of insecure areas inside the prison and set out solutions to make the security tougher. The judge [who undertook the inspection] said... some of the prison's best defences were simply its notoriety – myths about how secure it was. Even prison staff had been taken in by the stories... "Such legends may have contributed to the... escape." ...For security reasons, [the manager won't] detail the differences between the maximum and medium security prisons, except to say the difference lies in "possibly fences... electronic equipment, staffing levels, supervision." ■ During the '1950s, three inmates regularly escaped from Mt Eden prison at night, committing petty crimes and popping home for sex with their wives'...

A NZ[] First MP... and former police[officer] said yesterday that [it] feared for his safety and that of his family when a "sexual psychopath" [it had] helped to lock up escaped from prison. Relating the incident in Parliament... [the MP said the] psycho... had attempted to rape a nun and, at a school open day, had taken and tied up a girl in a classroom. The girl was discovered by her parents and police "before [the psycho] had a chance to do anything to her. But [the psycho] later admitted to having had an insane desire to cut her up with a knife... Among other things this prisoner had indicated that [it] intended to deal to my family when... eventually released." ...[the MP] told his story during debate on the Courts and Criminal Matters Bill when [it] referred to an amendment that alters a section of the Victims of Offences Act 1987. This section allows victims of sexual violation or other serious assault injury (and the immediate families of dead victims) to ask to be notified of the offender's release or escape from custody. The new section adds a requirement that victims (and the families of dead victims) also be notified of the offender's upcoming parole hearing or hearing for release to home detention. The [psycho, whom the MP] did not name, was imprisoned in an institution for the criminally insane but escaped when... transferred to a medium security area... While [the MP, who]... has several daughters... was certain the [psycho] would not be able to find out where [his family lived, the then]... Gisborne police district commander... made sure his family were safe. "Then it occurred to me that my brother has the same initial as myself and lived locally and so I rang him up and told him... this particular guy... was on the loose." The escape[e]... went to Wellington where [it] befriended a young girl... later killing her father... and a couple of days later committed suicide.

...Five of A[US]'s most dangerous criminals were at large last night after cutting their way out of Brisbane's multimillion dollar high-security jail with a \$9 file... "We consider these five escapees to be the most dangerous and desperate people on the streets of A[US] at the moment, and police are absolutely petrified and terrified as to what they may do to remain at large," said a police media spokes[person. Schools]... kept children inside during the day and parents were asked to collect them after school... [as] 150 flak-jacketed police searched the area around the prison... Despite numerous reported sightings... police admitted they had no idea of the whereabouts of the three murderers, a robber and a rapist...

Seven prisoners, four of whom are considered dangerous, were on the run in two states yesterday... [after] inmates escaped from Greenough regional jail near Geraldton in Western A[US plus]... Sydney's Long Bay jail and... Silverwater jail... However, [the]... New South Wales... Corrective Services Department chief... said claims that the state's jail system was in chaos were "absolutely ludicrous" and the rate of escapes in 1996-97 was the second lowest ever recorded... Meanwhile, [a] [notorious armed robber... is still at large after escaping in Brisbane...

THE LONG RUN: [An American] lived on the run for nearly three decades after escaping from a Virginia prison in 1969 where [it] was serving time for burglary. [The American] had some scrapes with the law and even went to prison under a fake name, but the police never knew they had [imprisoned a wanted fugitive]. On Monday, though, the 50-year-old... was arrested after a routine traffic stop in California and returned to prison.

...A group of inmates armed with revolvers seized three guards and freed more than 200 fellow prisoners yesterday in a jail in south-eastern Brazil. Authorities had by last night recaptured 60...

About 200 high-risk prisoners... seized control of a prison wing in northern Mexico and took seven unarmed guards hostage to protest against bad living conditions... [In related news, t]housands of Russian prison inmates will walk free after the Duma approved a resolution yesterday granting them amnesty. Among 35,000 prisoners to be released will be all [guys] over the age of 60, pregnant [prisoners and gals] over the age of 55, mothers of young children and the handicapped.

...An Auckland[er]... has been awarded \$7500 for being kept in prison for 22 hours after [it] should have been freed. The [Auckland], whose name is suppressed, had his sexual violation conviction overturned by the Court of Appeal at Wellington on October 17 last year, but the message did not immediately get through to Rangipo jail, where [the Auckland] was being held... The [Auckland] sued the Department for Courts and the Corrections Department for \$20,000 in November. His statement of claim, filed in the Wellington District Court, said that when a person was acquitted or a conviction was quashed, court staff had the responsibility of immediately telephoning the decision to the prison where the person was held, and sending a confirming fax. But this was not done, and from that point the [Auckland]'s detention became unlawful in terms of the Bill of Rights and of common law. The [Auckland] and his supporters claimed they were caused distress and upset because of the unlawful detention.

...Every time a violent offender appears at a parole hearing or is temporarily released from now on, the victim has the right to be told. Police and the Department of Corrections have begun a campaign to let victims know they can be kept informed of their assailants' whereabouts... A new leaflet and poster for the Victim Notification Register was launched yesterday, along with new procedures to give victims better information about the parole process... All police stations have supplies of the... leaflet... Are You a Victim of Crime? ...[and application forms] for registering.

...Almost half the convicted murderers sentenced to life in prison but paroled since 1987 have re-offended. The... Minister of Corrections, issuing the figures, said 137 people serving life imprisonment had been given parole since January 1, 1987. All but one had been convicted of murder... 60 had reoffended and been convicted of a variety of charges[, of which '21 were convicted for violence, three for sex offences, and three more for traffic offences']... Eighteen of the 60 were sent back to jail for three months or more. The other 42 were put on community-based sentences or sentenced to less than three months in jail. A... relative of raped and murdered South Otago girl Kylie Smith[who is the spokesperson]... for Family and Friends of Murder Victims... said the figures reiterated the need for law changes. [The spokesperson] doubted the worst murderers could be rehabilitated and said a life sentence needed to mean offenders were locked away for life. It was important that criminals who reoffended on parole were recalled to complete their initial sentence, [the spokesperson added. A] Detective Senior Sergeant... of the police national bureau of criminal intelligence, said the figures were a concern. But... they could also be looked at positively – 77 inmates given parole after life sentences did not reoffend. Police would not comment on whether criminals sentenced to life imprisonment should remain inside for the rest of their lives.

...[the guy] convicted in California more than 10 years ago of raping a 15-year-old girl and chopping off her arms, is in police custody facing... murder... charges... [The guy], aged 69, served eight years of a 14-year sentence for raping and mutilating [the girl] in 1978. When... released on parole, no community in California would take him and [the guy] spent almost a month after his release living on the grounds of San Quentin Prison before moving to Florida. [The girl had] pretended to be dead after [her attacker] cut off her forearms so that [the attacker would leave, then] managed to make her way to a highway where [it] was spotted and taken to a hospital. On Wednesday night, a Hillsborough County sheriff's deputy called by neighbours found the nude body of... an unidentified... [victim in the guy]'s home, a police spokes[person said. The 69-year-old], who was covered with blood when the deputy arrived, first said [it] had cut himself chopping vegetables, but the [deputy] saw the bloody body...

A Recurring Nightmare... THERE IS A THEORY HELD BY SOME criminologists that evil eventually melts out of the body. That if you warehouse a [dangerous person] in jail long enough, [it] will become harmless. Youth's passions dim. Perversion's fires cool. Old felons may not exactly reform but are defanged by time. It is a theory that [a 69-year-old] contested last week, after his bloody fashion. Last Wednesday a painter spotted a struggle while working on a neatly kept house in Tampa's working-class Orient Park suburb... The witness called the 911 emergency number, and when a police officer arrived at the door, [it] was met by a... drunk... "[with] blood all over his chest." ...After his arrest, [the 69-year-old] declared to reporters, "They framed me the first time. But this time I did it." In fact, [the 69-year-old] is notorious for "the first time." In 1978 a 15-year-old Las Vegas, Nevada, runaway... hitched a ride outside San Francisco with a balding [guy] in a blue van. The [driver] approached her sexually, backed off, but later – having liquored up – beat her, bound her and raped her twice. Then... got his axe... chopped off her arms and left her in a concrete culvert to die... The next day, read court records, [the victim] was found "wandering nude... holding up her arms so that the muscles and blood would not fall out." When [the driver], a merchant mariner, was sentenced for the crime, the judge said [it wished it] could "send him to prison for the rest of his natural life." The judge couldn't. California law at the time set a maximum of 14 1/2 years for the crimes, with sentence reductions for good behaviour and work in prison. [The driver]'s release after just 8 1/3 years sparked his bizarre drama's second act. As authorities attempted to settle him in one Bay Area town after another, angry crowds screamed, picketed and eventually prevailed. [The driver] ended up spending the rest of his parole in a trailer on the... prison... grounds... Further enraging Californians were [hi]s claims to innocence and his absurd threat of a forcible-kidnap complaint against [the victim. (The victim won \$US]2.56 million from him in a civil suit, but [the driver] had no funds.) When [the driver] moved in 1988 to his native Florida, the reception was equally hostile. A Tampa car dealer offered him \$5,000 to get out of the state, and a firebomb exploded on his lawn. [The driver] had more luck in Orient Park, where [it] moved into a house owned by his family. Some neighbors were ignorant of his past. Others felt sure [the driver] had put it behind him. [The driver] proffered small gifts and helped out with tasks... "We fixed him a plate for Thanksgiving[.]" said the person who lived[... next door. Some did much more. Three weeks ago, [another neighbour], who didn't know of [the driver]'s history, found him slumped over the wheel of his van, a hose running from the tailpipe... [The second neighbour] foiled the suicide attempt. In light of last week's event, [the second neighbour] says, "The first thing I thought was, 'Should I have left... [him in there?'" The second neighbour] wasn't the only one second-guessing. If [the driver] had committed any serious crimes in Florida before last week, [it] wasn't caught. Police records indicate shoplifting charges. But the absence of intervening atrocities between bookend acts of horror does not lessen the impression that the California picketers were justified and the tolerant Orient Parkers tragically naive. In 1987 [the driver]'s parole led to passage of ...a... bill... which carries a 25-years-to-life sentence with possible parole for aggravated mayhem. In fact, a spokes[person] for the state attorney general's office estimates that subsequent toughening of statutes would now assure that [the driver] would serve at least 41 years. Last week's murder stokes a debate about recidivism among sexual offenders. The Supreme Court is considering the constitutionality of a Kansas law allowing the state to confine violent sexual criminals in mental hospitals beyond their prison terms, citing no mental illness other than a predisposition to similar crimes. The case is not abstract: Kansas is currently holding [a 62-year-old] multiple-sex-crimes offender... whose sentence has expired but who has testified that only death can prevent him from molesting again. During oral arguments, several Justices seemed to share the concerns of critics like... [the chairperson] of the criminal-justice department at Long Island University, who decries indefinite incarceration based "not on what anybody has done but on what we think they might do." But several dozen states signed an amicus brief backing the law. [Kansas']Chief Justice... expressed the frustration of the court – and the nation – when [it] asked, "So what is the state supposed to do? Just wait until [[the 62-year-old]] does it again?" For [the 69-year-old]'s victims, such speculation is moot. [The 15-year-old girl], now 34, told the San Jose *Mercury News* that [it] was "appalled and horrified. I want to feel safe again. I don't know what the feeling is like anymore." Divorced and financially strapped, [the 34-year-old] is raising one of her two children on her own. [Her] prosthetic hooks... have worn out. Roxanne Hayes, last week's victim, leaves three children aged 3 to 11. Over the past 11 years [Roxanne] had accrued 99 arrests, mostly on prostitution and drugs charges. But [Roxanne] probably had no idea what sort of [person the mother of three was visiting; the driver]'s first crime predated Florida's public-novice statute on sex offenders.

...Throwing Away the Key... [THE PA]EDOPHILE... HAD DONE HIS TIME. In August 1994, after serving 10 years for taking "indecent liberties" with two 13-year-old boys, [the paedophile] walked out of prison in Hutchinson, Kans. – and was almost immediately transported to the Larned Correctional Mental Health Facility, where [it] has been locked up ever since. Under a 1994 state law called the Sexually Violent Predator Act, a judge ordered [that the paedophile be] confined indefinitely after ruling that his "mental abnormality" made him likely to attack again. [The paedophile] challenged the constitutionality of that law, but last week, in a 5-to-4 decision, the Supreme Court upheld it. [The paedophile] is just the kind of fiend the Kansas legislature had in mind when it passed the Predator Act. His 1984 molestation conviction was his fifth in almost 30 years... [However, t]he American justice system punishes criminals for what they have done, not for what they might do. Only those deemed dangerous and insane are locked away from their potential actions. [The paedophile's] lawyers argued that the "mental abnormality" clause in the Kansas statute created too low and too vague a standard for committing a person and so was a violation of due process. They also claimed that the law subjected [their client] to double jeopardy and that it violated the Constitution's ex post facto clause, which forbids the enactment of new laws that extend punishment for past crimes. The court was not convinced... Many legal experts are worried that the decision will allow states to lock up all sorts of people. "Today we're dealing with sexual predators," says... the legal director of the American Civil Liberties Union. "Who is it tomorrow that we're going to label as abnormal and potentially dangerous?" The dissenting Justices[']... objection... was that [the paedophile] has received virtually no treatment even though the law requires it. To [the dissenting justices], the state's failure to live up to its promise makes [the paedophile's] confinement look a lot like punishment. Six states have sexual-predator laws; similar statutes being considered in at least 30 others are likely to be enacted swiftly. To mark their days to freedom, people like [the compulsive paedophile] are going to need new calendars.

...Putting more people in jail is the official reason for the fifth consecutive drop in the U[S]'s annual crime rate. [US prisons had '329,821 inmates in 1980; 773,919 in 1990; and 1,054,774 in 1994 (while 'total expenditure' went from just 'under \$US36 billion in 1982 to over \$US93 billion in 1992').]

...With more than 1.5 million... [citizens] locked up in the U[S], we now imprison the largest percentage of our population of any nation in the world. A record 90,000 new prisoners entered state and federal correctional institutions in 1995. A whole raft of politically driven get-tough-on-crime measures – mandatory sentences for petty drug offences, three-strikes-you're-out laws, the abolishing of parole and time off for good behavior, the elimination of education and rehabilitation programs – has turned our prisons into pressure cookers full of angry, desperate people who feel they have been singled out to suffer for society's sins. In October 1995 rioting broke out at more than 20 federal prisons – the most widespread and costly uprisings the American penal system has ever experienced. Seventy federal joints across the country were locked down in a

state of emergency. The unprecedented rash of violence resulted in dozens of injuries to prisoners and staff, and cost tens of millions of dollars in damage, overtime, and lost revenue from closed Federal Prison Industries factories... The federal system operates at about 150[%] of capacity; in most state penitentiaries and county jails the overcrowding is even worse... Tensions are exacerbated by the lack of privacy, the inescapable, constant noise and smell of other people, and, above all, the fear of violence, which can erupt at any time... Locking down a penitentiary is the equivalent of slamming a lid on an already simmering pot... Lockdowns... have become the penal management tool... of choice for the nineties. Prison officials are relying more and more on fear and force to control the populations of young prisoners who have no hope of getting out for decades... Long sentences... and the rapid deterioration of prison conditions have given birth to a bitter, vengeful new breed of prisoner who knows that his plight means nothing to the people in power. As Malcolm X said, this [perso]n is dangerous because [it] has nothing to lose... Most of these people will someday get out of prison. Then it will be payback time... The most recent assault on prisoners' rights came in the age-old form of censorship. Inmates in the federal system were slated, as of December 1, 1996, to no longer be able to receive any "commercially published material that is sexually explicit or contains nudity." The bureau-wide ban is the first of its kind. [Editor's note: it is illegal for NZ prisoners to write to the media. An Auckland prison stopped letters going from it to a radio station doing a request show for inmates. The Deputy-Governor stated that 'many of the requests were fakes because it knew a lot about music and had never heard of the bands mentioned'!)]... Last year marked the 25th anniversary of the uprising at Attica in New York state, still the country's deadliest prison riot, with more than 40 inmates and staff killed by state police retaking the area – the largest number of Americans killed by American gunfire in one incident since the Civil War. After Attica a number of reforms were instituted across the country. Now, with the recently passed Prison Reform Litigation Act and the whole slew of get-tough mandates, the message from Washington is clear: No mercy. Except when it's one of their own[(one of their own) skated through on evidence that would have brought a conviction without government connections)]... But why should we care about these low-life[s crowding up our prisons], you ask; who gives a damn about a bunch of vicious, predatory animals? Don't do the crime if you can't do the time. The issue is more complicated than that. Increasingly our proliferating prison population is made up of nonviolent, first-time drug offenders serving sentences that are longer than those given to rapists and killers... People serving time for drug-related crimes now account for nearly three-quarters of all those locked up. The Russian novelist Dostoyevski, who himself served time as a political prisoner, wrote, "The degree of civilization in a society is revealed by entering its prisons." We want our prisons to confine violent, predatory psychopaths. But do we want merely incapacitation, isolation, and punishment for each and all of those whom we label criminals? Because the prison business is one of our fastest-growing industries, we need to ask ourselves what product these institutions are turning out. Are prisons actually making people worse rather than better? If so, then prisons are doing us all more harm than good.

...[a] Polish law professor... has a firm message for the eighth International Conference on Penal Reform which opens in Auckland today. "It's time to stop convincing each other prisons are such a bad thing – we are already convinced." After 16 years of talking, the reality worldwide is more prisons, more prisoners and more conservative policies... "We need to work on small specific projects which will change the mentality of society and bring real change... Prison conditions, prison mentality and specific prison subcultures do not stay within prison walls. They expand and are transferred to society." [The professor], who lectures in criminal law at Warsaw University, is involved in a project teaching students about areas of law relating to everyday life so they can, in turn, teach prisoners and secondary school students. Her goal is to show people how they can solve their problems using the law rather than resorting to illegal activities – and that if they know the procedures, there is much they can do on their own. "I feel my programme will mean less need for prisons... If young people know how to cope with problems they are less likely to start on criminal activities; prisoners will have more resources to better cope when they get out; and the students involved who will become our lawyers and judges will know what prison is all about..." [The professor] doesn't say there should be no prisons. "People who kill, rape, commit terrorist activities and other crimes of violence should be put away for safety... But we should call it vengeance... – not justice." Poland... has had a very punitive justice system, with people sentenced to long prison terms for petty crimes like stealing a bottle of milk or selling vodka illegally. Now they do not go to prison. There is community service and fines... The more liberal approach arrived with the collapse of communism and between January and October 1989 the prison population dropped from 80,000 to 40,000. How people convicted of crimes are treated all over the world depends not on their crimes, but on the political, economic and social systems in place, says [the professor]. The Polish prison population quickly climbed back to 60,000. The end of communism brought more freedom and fewer regulations, but it has also meant less security, with high unemployment, high inflation and a rising crime rate... "No one found jobs for the people released, or a place for them to live and many reoffended immediately. Under communism there were tight controls and it was very grey and boring; but there were no guns and no bombs... Suddenly it was like an American movie." Criminal law cannot solve society's problems... and nor can prisons. "We use prison as a punishment. We don't know how to cope with problems and we react with more of the same – longer sentences." [The professor] would like to see prisons used "with common sense. If my wallet is stolen I don't want the person to go to prison and to pay for him to be there. I want my wallet back, I want to hear 'sorry', and for him to do some work in the community and pay a fine to a good cause..." [The professor] is critical of the many Western experts who descended on Eastern Europe after 1989 to tell them how to solve their problems, including overcrowded prisons. "You can't copy from one country to another. Nor can you impose your ideas. I am fed up with the arrogance, and hearing always how the West is helping the East..." ...[the professor] is one of several overseas delegates attending the four-day ICOPA Conference to discuss the effects of more than 100 years of prisons and to propose realistic alternatives. The effects of privatisation on the penal system, crime and punishment in the 21st century, the media and crime, and spirituality in the prisons are also on the agenda.

...*Let's make jails repellent places* For some time I[–] ...the senior Government whip... [– ha]ve been privately concerned about the performance of our justice system... It is time we took a long, hard look at our justice system and honestly assessed its performance. What have we got out of 40-odd years of what can best be described as a "liberal" justice system? The answer is clear: increased crime rates almost across the board, growing youth problems and drug abuse and violence, a high reoffending rate and a frequency of crime, even in rural communities, that alarms most of us, keeps us barricaded in our homes and fearful to walk the streets after dark. The "huggy, kissy" liberal justice system has not worked. It is not deterring criminals and it is not rehabilitating them. So it is time we looked for new solutions. Part of the problem lies in the philosophy our justice system subscribes to, which can't make its mind up whether it is leaning towards rehabilitation or punishment. All our justice system is good for at the moment is putting people out of circulation for a while. It is certainly not considered a punishment by those who are incarcerated, or by wider society at large... We have to decide whether we are going to rehabilitate criminals properly and, if we are, we need to provide the money to fund this... since we will need more psychologists and social workers so our criminals can be properly hugged and kissed and told it's not really their fault. Or we can move ahead to the system I favour. In some respects it is a step back to the past – a justice system that is seeing renewed popularity in the U[S] and Britain. What I'm talking about is "hard labour" prison programmes or, as some call them, "boot camps." We ran these in N[Z] as separate prison programmes until 1954. They instilled a fear of prison and a strong desire to rehabilitate. We need to make prison sentences a tough experience again, an experience most offenders won't want to repeat. At the moment with comfortable beds, good food, colour television, craft lessons, drama groups, extramural study and counselling, prison is in many cases a better option than being on the outside... I feel compelled to speak out... following a couple of recent bizarre incidents... In the first, news came that a maximum security prisoner had allegedly enjoyed the company of his girlfriend while... in Auckland Hospital. This [prisoner] had been found guilty of murder and had been locked away for life. Yet within weeks, while recovering from a prison fight, it appeared [the prisoner] was enjoying all the comforts of home. In the second incident, several prisoners took Paparua Prison guards hostage for a night, seemingly with ease. It... riled me that [people] who had been convicted of

murder appeared to have so much freedom: freedom to plan and execute a well-organised prison take-over; and the freedom to spend “quality time” with a girlfriend.

...Thailand is planning to grant... convicts conjugal visits in jail as an incentive for them to behave well inside and to prepare them for life after prison... “If we treat prisoners well as a way of telling them that society... accepts them, we believe they will not repeat their crimes,”... said[the] Deputy Interior Minister... But [gal] prisoners would be excluded from the scheme because of fears it would lead to unwanted pregnancies.

...Couples will be allowed to live behind the same bars under a Spanish plan to set up the first “family cells” in Aranjuez prison outside Madrid. The prison is due to contain 72 family cells by next summer, where couples can live together and with their children, until the children turn three. The families will have 14 to 16 sq m living space including a living room, bedroom and bathroom, and will be isolated from the other... prisoners.

...An attempt to set up a home where [gal] offenders can live with their children may collapse. The “prison without walls” – the first of its kind in N[Z] – aims to avoid the trauma children go through when they are separated from their imprisoned mothers. Justice officials have approved the idea in principle, but departmental restructuring has kept the Puriri Foundation waiting more than a year for a funding decision. In the meantime, the foundation’s lottery grant to develop the idea has lapsed and the project co-ordinator... has been forced to look for another job. “It’s been very frustrating... We have done all the work and we can get the project up and running as soon as we get the word from the Department of Corrections.” The foundation plans to rent a house from Housing N[Z]... in central or West Auckland with the aim of creating a “stable, welcoming, family-style atmosphere” for seven... offenders and their children. The families would live under 24-hour supervision, but the house would have no bars. A normal life could be maintained for children, who would attend school or preschool... Overseas research has shown that these community programmes have advantages for the emotional wellbeing of the children. “Children who have had maternal bond separation find it hard to form emotional attachments with people,”... [These] children ended up being punished by the conventional prison system because they could not understand why their mother had left them... Also, they are more likely to become law-breakers... [Another advantage is that t]he residential community programme... [was] a cheaper option than conventional imprisonment... The foundation said it would cost \$57,000 to keep a mother and two children for a year, compared with \$86,000 to put a [mother] in prison and her two children in Social Welfare care... The Department of Corrections expects to decide the future of the project next month.

...**PRISON HOUSES:** Prison officers’ unions warn that the removal of prison housing... will put the safety of officers and the community at risk. Jail staff across N[Z] are to lose their Government housing by 2000... The sales of about 250 houses near 15 prisons will be staggered over the next two years, with entire streets being sold off and removed at a time... [T]he first 100 families [were] told this week they must find new accommodation within three months... Instead of living next to... Waikeria Prison in the Waikato... [- NZ]’s largest prison... [-] off-duty officers will have to find homes in the closest town, Te Awamutu, which is 16km away, or in Hamilton. Ohura Prison will retain its housing because of its isolation, and Paremoremo, because of a cabinet directive... [Incidentally, l]egislation brought before Parliament yesterday seeks to expand the number of offenders eligible for a home-based sentence. The measure will enable judges to order “low risk” offenders sentenced to two years or less in prison to serve their whole sentence at home. Probation officers can apply for court orders allowing inmates serving less than two years in jail to be released to serve out the remainder of their term at home. Offenders serving more than two years may also be sent home by parole boards three months before they are due for parole. But this provision will not apply to serious violent offenders. In making home detention orders, judges will consider probation officer reports, the nature of the offence, the likelihood of reoffending, the safety of the home’s other occupants and any victim impact statements. The Criminal Justice Amendment Bill follows a pilot home detention programme in Auckland. Prisoners were allowed to leave home only for work, training or emergencies and had to appear before a video monitor after receiving random telephone calls. A subsequent Ministry of Justice evaluation of the trial was inconclusive because of the limited number of inmates eligible to take part. But home detention is being expanded because the... Government considers it to be safe and cost-effective. The Minister of Corrections... said yesterday that home detention would also help integrate offenders back into the community...

Government set to fit electronic shackles to ‘at home’ prisoners Electronic shackles initially shunned by justice planners as too “stigmatising” might be used to put more prisoners under home detention. The Minister of Corrections... said last night that a combination of video and telephone monitoring used in a... trial scheme had proved too expensive and[, anyway, it] favoured electronic bracelets or anklets. [The minister] also wanted to expand the eligibility of offenders, particularly those convicted of white collar crimes or traffic offences, to serve part or all of their sentences in their homes and reduce costs further... [The minister added that as an additional bonus the electronic shackles – which are completely unrelated to the] belt that can inflict a... 50,000 volt electric shock... [that a] police officer in America has come up with... to control prisoners... [(outraging American c]ivil rights campaigners) –] ...would... let authorities control the release of inmates and thus reduce the likelihood of reoffending.

...*Corrective training shock fails to deter reoffending...* The short, sharp shock is not providing the necessary jolt for young offenders... says a new Department of Corrections report. The Minister of Corrections... has told staff to come up with a new way to stop youth committing serious crime. More than 90[%] of youth sentenced to corrective... training – a three-month... [stint at] Tongariro Prison, where life is more regimented and the teenagers have fewer privileges than other prisoners[, which is]... designed to shock wayward youth back on to the straight and narrow – ...reoffended... The... authors... said it was the highest rate of recidivism for any sentence... [A r]etired Chief Youth Court Judge... said... youths sentenced to corrective training had a myriad of social problems and “they[’]d be better off if they could get a... job... and a... decent girlfriend...”

...[the] Opposition justice spokes[perso]n... described the \$3 million-a-year corrective training programme as an “abysmal and expensive failure” and called on the Minister of Corrections to scrap it. More than 400 young offenders go through the programme at central North Island prisons... each year. Details released by the ministry showed 92% reoffended within five years, while more than 75% reoffended within a year. “If ever there was an expensive failure, the corrective training programme must be it... I’ve spoken to the last couple of managers of the programme who say all we’re doing is bringing a group of [youths] together, many of them gang prospects, so they can show each other how staunch they are.” Corrective training has been running for six years, with a major overhaul in 1992 aiming it more toward educational programmes.

...John has spent most of his life behind bars. The sentence [John] started at 22, for property offences, was his fifth. Then things started turning bad. [John] took it into his head to break out, graduating to serious crime – including violent assault – in the process. By the time [John] landed back in prison his sentence had more than doubled. “I was on a downhill slide... I didn’t want to know what the world was about.” Back inside, John – the prison rules forbid the use of his full name – enrolled for “a barrage of courses.” It was, [John] says, less out of hunger for education than a need to break the long stretch in front of him into manageable units of time. Five years later, [John] is looking forward to release – some time in the [next couple of months, John] hopes – with a certificate in architectural design under his belt and grand plans on the drawing board. John is one of a full honours board of success stories for the Inmate Education Fund, a special project of the Prisoners Aid and Rehabilitation Society. The century-old organisation, set up to offer practical help to prison inmates, has much of its work publicly funded under contracts with the Department of Corrections. But the education initiatives are financed by whatever money the society can “beg and grovel for” from individuals and organisations, says its projects manager... Prison inmates – particularly violent offenders – do not excite the same public sympathy as fur seals or sick children of course and, even though... [the projects manager wants] “a hand up, not a handout” for her charges, [the manager] knows it can be an uphill battle. So does John, who wrote dozens of letters to big organisations seeking help to pay fees for computing courses. [John] is not bitter about the rejections – which were almost invariably polite and encouraging – but... seems humbled by the organisation that did say yes... John is under no illusion that his qualifications will give him an instant meal ticket when... released. “The chance of someone employing an inmate of my

history is pretty slim,” [John] admits. But... John... plans to set himself up as a freelance designer, doing floor plans for kitset houses... Almost three dozen inmates nationwide are studying subjects as diverse as beekeeping, history and furniture-making in the programme that boasts a 100[%] pass rate.

...The Minister of Social Welfare... wants young offenders to be able to study and plan careers while in custody. At a time[when] the senior Government whip... is calling for “boot camps” to toughen prison sentences, [his colleague] is suggesting that young inmates be set on a career path. The minister has just returned from Britain, where [it] visited two youth prisons... [Y]oung inmates in a juvenile offenders unit in Kent were encouraged to complete training programmes and career guidance while inside... A spokes[person] for the Youth Law Project in Auckland... said young criminals would have less chance of reoffending if they emerged with clear career goals. [The spokesperson] said youths at the Northern Residential Centre in Weymouth completed life-skills training but did not have any formal education.

...Prisoners are in line for a big pay rise as the Government moves to turn prisons into productive factories... Working prisoners will earn up to \$5 a day (a five-fold increase...), but their individual contracts will require them to promise to be punctual, according to a draft report on inmate employment. While it may not be exactly cosy behind prison walls, inmates will have an advantage [other] workers would give an arm for if the report is accepted: their wages will be tax-free. Then there are the perks: free coffee and biscuits, scraps of raw material and the use of equipment for personal projects. The draft report from the Department of Corrections says the key objective in putting prisoners to work is to increase their chances of finding jobs when they are released by providing them with training and skills... Training programmes would be developed so prisoners could receive formal recognition of their skills under the Qualifications Authority framework... “Getting inmates doing a normal day’s work is a key element in the Government’s commitment to reduce reoffending.”... [t]he Minister of Corrections... told Parliament... The initial aim over a five-year period was to provide eligible inmates with six hours’ work five days a week. Proposed rates of pay ranged from nothing (for inmates who refused to work or were fired) to [the maximum] for skilled workers and prisoners engaged in fulltime studies.

...Prisoners will start working 30-hour weeks under a new Government policy which aims to work inmates a minimum of six hours a day, five days a week. Their earnings will increase from the current maximum rate of 92c a day to \$5.

...*Doing Time on the Production Line*... LIKE MANY OTHER N[Zers, a Wellingtonian] begins her work day with a long commute. A train and a bus bring her to a small Wellington office, where [it] answers phones, types and does filing. But each evening this secretary goes home not to a family or friends but to her fellow inmates at Wellington’s Arohata [Gals’] Prison... By the end of this year, more N[Z] prisoners will be doing “real” jobs. Unlike the Arohata inmate, most won’t be eligible for individual work parole. But the... government... wants all inmates to work longer hours in jobs that will be of use to them after release. Prisoners’ earnings will go to compensate victims of crime and their families. Any profits will help run the jails. The aim, says [the]Minister of Corrections... is to make “every prison a factory, every prisoner a worker.” Nearly three quarters of N[Z]’s 4,900 prisoners already do a couple of hours’ work each day. Many of the tasks – washing clothes, growing vegetables – help keep the country’s 17 prisons running. Other jobs, like making furniture for schools, landscape gardening or growing trees for the Department of Conservation, lead to limited opportunities on the outside. The government’s plans – which mirror trends in A[US] and the U.S. – will increase the time prisoners spend at work... and encourage prisons to look at bigger, more relevant inmate-employment schemes such as factories or... farms.

...Prisoners can pack nails, make shoes or build trailers but office work is likely to be a no-go area. The Corrections Department plans to send prisoners into the workforce, hiring them out at market rates in an extension to current practice... The focus was training and rehabilitation rather than making money for the department... The Minister for Employment... said [it] would take a close interest in the matter... [The minister] wanted to be sure the plan did not take jobs from the private sector.

...The proposed policy to make prisoners work will introduce “slavery” into prisons and see job losses outside, says the Trade Union Federation... But the... Department of Corrections... said slavery was an inappropriate label. “We are basically following the dictates of the United Nations. It forbids slave labour, but says prison inmates should be given constructive activity, and that is what we try to do.” The department would aim to sell at a market price which would not undercut any other producers, and the policy was aimed at being sensitive to external markets...

A recent article... argued that private firms should be allowed to bid for prison labour on the basis of competitive tendering. The debate about prison industries is generally seen as one between labour-trade unions on the one hand and employers-industries on the other... Confining the debate on prison labour to interests of industry and unions overlooks a third and perhaps a more basic interest – that of civil society. Three issues need to be addressed in this regard. First, certain articles of the U[N] standard minimum rules for treatment of prisoners prohibit the interests of prisoners being “subordinated to the purpose of making financial profit from an industry in the institution” and discourages institutional industries run by private contractors. And an International Labour Organisation convention, to which N[Z] is a party, prohibits forced labour and any work where the prisoner is “hired or placed at the disposal of private individuals, companies or associations.” ...The issues of international law and human rights transcend narrow employer-employee interests... Secondly, our social and legal systems are founded on two key assumptions. In theory at least the state is neutral and above classes or sectional interests and punishment is meted out to offenders in the name of society as a whole. When the state puts prisoners to work in public or community work, in theory the benefit of such prison labour goes to the whole of society. When the state indents prison labour to private industries for private profit, while punishment continues to be in the name of the whole of society, the benefits from prisoners go to private interests. This needs to be seen in the context of prison industries becoming global enterprises. Prison industries are among the fastest-growing industries in the U[S]. One US] company has set up affiliates in Britain and... [AUS. NZ can’t] be far away given the Government’s enthusiasm for a “borderless economy.” Thirdly, state policies on prison industries have always reflected the dominant economic rationale of capital and industry at a given time. Early history of industrialisation is replete with stories of work-houses. The breaking up of the feudal system drove uprooted peasants to urban centres where unemployment and crime was widespread. Prison labour indented to private industries provided cheap processed goods for major national industries, including dyes for textile industries and quarrying and brickmaking for construction industries... The major shift in policy came in the 1930s with large-scale recession. Industries and workers complained of unfair competition... The present shift in policy comes in the wake of economic globalisation... enabl[ing] swift capital mobility and computer technology that has made decentralised production possible. In [the First World] this has resulted in labour-intensive industries relocating to labour-surplus countries of Asia and Latin America. Big powers such as the U[S] have adopted a dual policy to deal with the problem. Abroad, they... use... human rights generally and prison labour in particular as a pressure-tactic in trade relations with labour-surplus [Last] World countries competing in labour-intensive industries. At home, they have sought to revive a number of labour-intensive industries by indenting prison labour to private industries.

...*Prisons: an untapped source of labour for private enterprise*... Prisoners will get better job training while in prison under the Department of Corrections’ programme to increase involvement by the private sector in prison enterprises. The department is moving in the right direction, away from activities that have little value outside of prison and toward the development of more marketable skills... [But, according to the] co-authors of *Controlling Crime in N[Z]*, published by N[Z’s] Business Roundtable... the [d]epartment... should go further, however, and quit managing prisons...

Security guards will begin escorting inmates between prisons and courts in a cost-cutting move which rank-and-file police warn could be dangerous... [But the] Minister of Corrections... said privatisation would free up front-line police and prison guards and also save taxpayers money... During the five-year pilot, a security firm would also be contracted to guard prisoners in court. The change affects 19 guards based at Mt Eden Prison who their bosses say should be redeployed... Prisons already use temporary guards to supervise inmates outside prison at short notice.

...casual prison guards... failed to intervene when a convicted murderer had sex with his girlfriend while in hospital... But prison managers do not plan to stop farming out supervision work and escort duties to casual staff... Before they take responsibility for the supervision of prisoners... casual guards... receive two days' training – 28 days less than full-timers – at the Corrections Department Staff College in Wellington... They are paid \$14 an hour and cannot claim overtime – which helps if a prisoner needs to be watched in hospital overnight. Full-time prison officers, who can earn between \$32,000 and \$44,000, have to be paid double-time if they are assigned to work outside their 10-day roster... [By the way, t]he Corrections and Courts departments have agreed... [prisoners] will no longer be held in court cells overnight.

...A hard-hitting report to the Minister of Social Welfare suggests the head of his department... may be failing in her legal duty to provide enough beds for young offenders. The report denounces the practice of holding young people in police cells, sometimes for up to three weeks. It says the conditions under which more than 140 young people had been held over the past 12 months were “completely unacceptable in a civilised society.” The criticism comes from the office of the Commissioner for Children, and at a time of growing pressure for a formal inquiry into the Children, Young Persons and Their Families Service... Last month... the commissioner... received complaints from judges, lawyers, MPs and a young person who had been held in Auckland cells for six days... The Minister of Social Welfare... denounced the report, saying it raised no issues not already being addressed... [The minister recently] said the department was meeting many obstacles, such as community opposition, in its attempts to increase the number of beds for young offenders. The report, however, says the need for more facilities in Auckland has been obvious since 1992.

...A... 15[-year-old's]... death this week highlights the problems of dealing with young offenders. David Tufala had no idea what [it] was in for when a judge sent him to Mt Eden Prison at just 15, says the dead boy's lawyer. Tufala, serving a four-year sentence for the aggravated robbery of his local dairy in Mangere Bridge, died in Auckland Hospital on Monday. [David] was found near-death in his cell in the central Auckland jail on Saturday, two weeks after [the judge]... told him the courts would not tolerate his kind of “banditry” and decided to lock him up with adult offenders. Police are not looking for anyone else in connection with the death. “I don't think [David] really knew what it [Mt Eden] was going to be like,” [a] youth advocate... said yesterday. Prison was the wrong place for [him, said the advocate – who,] with other children's representatives and judges – ...wants to see more facilities for young offenders. “It was an adult crime but [David] was incredibly young and naive[,”] says the advocate...

David Tufala had a short and tragic life. [David] dropped out of school, developed a drug and alcohol problem, got into trouble for burglary, theft[and] wilful damage. Then [David] robbed the local dairy armed with an air rifle, with a couple of mates. That was the beginning of the end. The judge told [him] that banditry of that sort would not be tolerated and, at just 15-years-old, [David] found himself thrown into Mt Eden jail – a cold, grim and daunting institution even for its largely adult population. Well, it was too daunting for [David, who] did not cope... [T]wo weeks later... this boy criminal amongst [adult] criminals... was dead... hanged by his own hand in his cell. Now this all points to a major problem in dealing with young offenders. Should there be more facilities for our young offenders? Should they be in adult prisons? The practice is not uncommon. At the moment there are six 15-year-olds doing time in adult prisons; there are another 25 16-year-olds... in [NZ's] adult prisons.

...The Commissioner for Children's Office has condemned a growing practice of putting underage offenders into adult jails instead of Social Welfare custody. The rebuke follows the death of a 15-year-old in Mt Eden Prison over the weekend. About 30 young offenders are being held in the country's jails and in corrective training, according to figures from the Department of Corrections. Six are aged 15 and the rest were 16. The judiciary is also concerned about the death. The head of the Youth Court... said last night that efforts needed to be redoubled to get specialised youth justice facilities operating in Auckland. Social Welfare said early last year that new facilities were to be built but a site has yet to be announced. The commissioner's office has long been critical of the widespread practice of detaining youths under 17 in police cells because of a shortage of beds in Children, Young Persons and their Families Service residential centres... The Criminal Justice Act allowed for offenders under 17 to serve their sentence in Social Welfare residences... a lawyer for the office... said... [However, o]nly six Social Welfare beds are set aside for youth offenders serving prison sentences. They are in a secure unit at the Kingslea residential centre in Christchurch and all the beds are full.

...An investigation is under way into a claim that... David Tufala, was assaulted the day... the 15-year-old... was found near death in his cell... No one is being sought in connection with the death and the alleged assault is a separate matter. Tufala is understood to have told his mother during a prison visit on Saturday that a guard had hit him earlier that day. His mother left the prison... and five hours later Tufala was found unconscious under his bed... A source within Mt Eden... yesterday... alleged... Tufala was punched in the head in his cell and his head was knocked against a ladder on his bunk. The source said inmates in the prison yard were told Tufala had been hit because the youth was a “cry-baby and a wimp.”

...The family of teenage prison inmate David Tufala are preparing to bury their “beloved son” as investigations continue into his treatment in Mt Eden prison and events surrounding his death in custody... Family members, who tried desperately to steer Tufala away from his life of crime and even sent him back to Tokelau to get him away from bad influences, are said to be devastated by his death... The... lawyer... who has been asked by the family to look into the case... was particularly concerned that they were not given the opportunity to speak during his High Court sentencing.

...David Tufala was showing signs of wanting to turn his troubled young life around before [the 15-year-old] died in custody, his grieving family say... [David] had written letters from prison in which [it] spoke of having learned his lesson and wanting to go back to school when... released... [H]is large Tokelauan family, including 10 brothers and sisters, buried their... “baby” brother at the weekend and are now searching for answers to his death... His older brothers... believe there is something fundamentally wrong with the justice system when a 15-year-old... could be sent to an adult prison... [However], a lawyer with the Commissioner for Children's office, said a survey of 108 offenders aged under 19 showed many preferred to be in adult prisons. Reasons included the belief there was more violence in a youth unit, both from older youths seeking to control their juniors, and from prison officers who were considered to be tougher on young detainees. The research – *Age Mixing in N[Z] Prisons* published by the Justice Ministry last year – reported that some young offenders also preferred adult institutions because they had better recreation facilities.

...They haven't formed a lynch mob in Mangere Bridge – though with the amount of petty and not-so-petty crime in the small shopping village, that is perhaps surprising. The people of the leafy and well-kept suburb... speak more in sorrow than in anger about the crimes of David Tufala. But some of them feel a little aggrieved that Tufala... is being remembered as a victim rather than a criminal. Typical of them is a [resident] from the neighbourhood who wrote to the *Herald* to suggest that Tufala's death was “a fitting climax to his actions.” ...The [resident said it] used to see Tufala “swaggering around the streets and looking like Mr Tough Guy. I saw no little boy... For the family's sake I regret what happened. But [David] made his choices.” ...Tufala's passing may make life quieter for [the person] who makes it his business to paint over taggers' graffiti as quickly as it appears. Tufala's signature was “Dime” – although [David] denied it when... confronted... [David] can't deny it now. All over Mangere Bridge a new tag has appeared. “Dime RIP” it reads. Everyone – those who mourn David... and those who do not – probably share the sentiment.

...A teenage robber... has been sent to prison just weeks after his 15-year-old partner-in-crime was found dying alone in his cell. An impassioned plea by [the teenager]'s lawyer and tearful mother failed to spare the 16-year-old from being jailed for robbing a dairy at gunpoint with two other youths when... aged 15... [The teenager] is now in Mt Eden Prison at the start of his two-year sentence, which was handed down on Thursday... [i]n the Otahuhu District Court... despite a psychologist's evidence that the teenager had thoughts of suicide... [The] judge... recommended that [the teenager] be seen by a psychologist... at least twice a week... The third offender in the... robbery... aged 18, was sentenced to 3 1/2 years'...

The family of an imprisoned teenage robber say [it] is too young to be behind bars and have vowed to fight for his freedom. The... Mangere Bridge... family... say [the] 16-year-old... eldest son of six children... is [a] “shy and sensitive boy” and they hold grave fears for his future in Mt Eden Prison... [H]is... lawyer... will lodge an appeal and... his father... plans to meet Labour[’s] justice spokesperso]n... next week to discuss the case.

...The teen... imprisoned weeks after his 15-year-old crime partner was found dying in his cell has been moved from Mt Eden to Waikeria Prison.

...The findings of an investigation into the death of a teenage inmate at Mt Eden Prison show what a "Mickey Mouse outfit" the prison is, says the dead boy's brother... [The] brother... said... David could have been saved if recommendations included in the report had been actioned sooner. [The brother] will meet his lawyer... today to discuss whether the family can take legal action... [The brother] was extremely angry to learn that inmates tried to activate an alarm system to call guards, but it was faulty. It took at least 20 minutes for guards to arrive and by that time David Tufala had lost consciousness and stopped breathing. "That could have been the difference between whether [David] lived or died,"... The Labour justice spokes[person]... said the alarm system failure was unacceptable, given that prison management had known about it for two years, as was management's failure to know where inmates were within the facility... [The] brother... was amazed that... [David] had been able to move from a two-[person] cell to a cell by himself without prison authorities knowing about it. Regular checks should have been made to ensure inmates were in their correct cells... his brother... said. It was also frustrating that... [David]'s medical record, including a psychological report, had gone missing.

...Troy Alan Watson, aged 25, died... in... Mt Eden Prison... on Monday. Police are not seeking anyone else in connection with the death. The same day, a special investigation into the death of... David Tufala... slammed procedures at the jail. The report, written by a Department of Corrections inspector, said [the] prison... should review the way it dealt with the placement of young offenders and document the decisions made.

...Adult criminals on remand get a better deal through the justice system than troubled young offenders who often need more sensitive care, says [the] Chief Youth Court Judge... The number of young offenders being locked in police cells because of a lack of beds available in Social Welfare residences was appalling, [the judge] said. "Adults go out to a prison within a day where they have better facilities. But youth offenders are left locked in the cells for days. One of the longest I've heard of is 20 days. The average is 4 1/2 days... [P]olice... are simply not equipped to deal with young offenders. It is not their job to look after them. While some have committed very serious crimes they are often very fragile young people,"... A secure Social Welfare residence and a police cell could not be compared... The Social Welfare national manager of residential and caregiver services... said yesterday that a backlog of young people on remand was taking up all available bed space... The stays on remand had doubled over the past year from 25 to an average of 53 days... The number of violent youth offenders has risen by 64[%] in the past five years while the number of secure residential placements for them has remained static... [But] availability of the beds was "not necessarily the main problem." "It may be just a result of a complex process which, streamlined, could result in increased bed availability without the need to build more residences."

...Plans to treat some of the country's worst young offenders in residential programmes in... Manurewa... will cost the Government \$100,000 for each child. Twelve out-of-control juveniles... aged between 11 and 15... are expected to take part... The Department of Social Welfare has committed \$2000 a week for each youth being treated. The programmes are being run by the Youth Horizons Trust... A spokes[person] for the trust... last night defended the cost... saying that the weekly cost of... an acute psychiatric patient would be well over \$2000... The projects have met fierce opposition from... Manurewa residents [who a]re threatening legal action to stop the programme going ahead... [The trust] was sent a threatening note and the Manurewa property was trashed by intruders, who tipped diesel through it... The MP for Manurewa[, who]... said there had not been adequate consultation with residents about the community house... would raise "merry hell" in Parliament if the project went ahead.

...Welfare officials have set up a \$500,000 fund to keep young criminals with their families in the community rather than placing them in custody in precious youth prison beds. The shift in policy means that more young criminals will do activities in the community as punishment for their crimes rather than being sent to youth justice centres like Weymouth. They will live with family, be supervised round the clock by back-up support and be able to attend school or do other education programmes, according to documents obtained under the Official Information Act... But... a... youth advocate and co-chair of the Youth Court Council, said funding should be used to provide more beds and other options for young offenders.

...An extra \$32.7 million would be spent [before March 31, 1998,] on building 428 new cells... at Hawkes Bay, Wanganui, Rimutaka and Auckland prisons, as well as extra beds at Christchurch and Ohura... However, no proposals had been developed for more building [between April 1, 1998, and March 31, 1999], when it was expected even more... would be needed. The need for remand cells was urgent. A new remand centre at Mt Eden Prison... would not be completed until the year 2000... In its review of the Department of Corrections' budget, the justice select committee reported... the number of prison inmates was expected to grow 41[%] in the next three years... because of a predicted growth in the number of serious violent offenders.

...The latest... [prison] security review... linked... [v]iolence by prisoners... to overcrowding... [Now, a lack] of approved anti-violence programmes has prevented some judges from complying with the new domestic violence legislation... Approval delays meant by Friday the Courts Department could refer only 77% of respondents to courses... Both the [Gals'] Refuge and the National Network of Stopping Violence Services said the problem could have been avoided... if the department had asked that existing programmes be allowed to continue until... new ones were established... [M]any programmes have been turned down because they failed to meet the new regulations... [In international news, as a means of overcoming overcrowding] South Africa talks about turning gold mines into prisons.

...When... war criminals... were tried in Nuremberg and Tokyo in 1946, the international community resolved that crimes against humanity should never again go unpunished. There was talk of setting up an international criminal court, but there was only talk. Since then, the world has witnessed the horrors of... Cambodia... Uganda and... Iraq, as well as a mass of inhuman crimes in countries such as Argentina, Indonesia, Burma and Liberia... [M]ost of the perpetrators have gone unpunished. The ad hoc system for dealing with grave breaches of the Geneva Convention has long been criticised... The International Court of Justice, founded in the Hague in 1945, deals with disputes between member nations but has no power to punish individuals... The two international war crimes tribunals set up to deal with Yugoslavia and Rwanda, while a welcome step in the direction of a global judicial order, have been stymied by their inability to apprehend wanted criminals and to obtain complete cooperation from all states concerned. Nevertheless, it was the genocide in these civil wars that spurred the international community to agree in 1994 that a permanent criminal court was needed. A two-week meeting began this week at the U[N] to draft a treaty for the court's establishment and the treaty is expected to be signed in Rome next year. For the first time, there will be a permanent court with the power to bring to trial individuals, including heads of state accused of genocide, war crimes and other human rights abuses. "If an effective, independent court is set up, it will literally transform the prospects for human rights in the 21st century," said [a spokesperson for] EarthAction, a network of more than 1600 citizen groups in 140 countries... "If this court succeeds... the prize will be a new millennium in which corrupt governments and powerful individuals are no longer able to murder, torture and invade with impunity." ...H[owever, h]uman rights activists fear that more repressive regimes, reluctant to see the creation of a powerful international body, will attempt to water down its remit or sabotage its work... National vetoes would profoundly weaken the court... And enforcement could be a problem, as the present tribunals' much-mocked failure to arrest suspects has shown.

...[the suspect] killed by police in a Hawkes Bay orchard... 65 days after gunning down a Hastings police[officer] last year was tipped over the edge by the theft of cannabis [it] was looking after, police believe... The... Detective Inspector... who headed the hunt... said in the police magazine *Ten One* that Constable McKibbin died for no other reason than that [Glenn] was on the spot when Thompson acted out a fantasy... Hours before the shooting, Thompson talked about going to a house in Hastings which [it] and his wife owned until 1993 "to reclaim his land." ...His intention that morning was to kill the occupants if they didn't leave the house, then make his 'last stand.' We believe [that when Thompson] came across Glenn wh[ile]... heading towards that house[, Thompson] saw the opportunity to do something that would make people sit up and take notice." ...[a p]olice psychologist... said in the magazine Thompson's poor social status and lack of occupational success led him to become obsessed with revenge and dominance... The main focus of his life was acting out a fantasy role... as a modern-day warrior fighting against some entrenched evil.

...EARLY-MORNING JOGGERS SCANNED Bondi beach looking for the movie cameras, convinced the scene wasn't for real. A lanky [guy] wielding a Wiltshire kitchen knife stood by the water, encircled by six uniformed police[officers], their Smith & Wesson .38 revolvers at the ready. Within minutes, the [lanky guy] was dying, four bullets in his body. Those shots... have since reverberated beyond A[US]'s most famous beach, sparking anger over what many see as unwarranted force, and raising broader questions of police attitudes and training. Says... a friend of the dead [guy]: "Is it Dirty Harry or Mr. Bean? It's a ridiculous type of policing." Friends and family have described Roni Levi – who walked to Bondi after slipping out of an inner-Sydney hospital where [Roni] was under observation for strange behaviour – as a gentle, clean-living [person] who had no history of mental illness. Police, however, have painted the 33-year-old French photographer as a mad[person] who frothed at the mouth and lunged at officers with his knife. His death marks the third fatal shooting by N[SW] police this year and follows a spate of shootings in Victoria, where officers have shot dead 26 people since 1988. Police have been quick to defend their colleagues. [The]N.S.W. Police chief psychologist... says public criticism is usually ill-informed and based on naive perceptions of policing gleaned from TV cop shows, where "danger is equated to excitement, good guys generally win and flesh wounds heal." In reality, says [a]consultant police psychologist... officers are loath to pull guns from their holsters, if only to avoid the paperwork and inquiries that follow their use. "It's easy for the public to blame under-trained and over-zealous rookie cops... but it's harder and more threatening to see that if there is a dangerous person threatening the police or the public, they have to be stopped." [The chief psychologist] agrees: "Police don't shoot people willy-nilly. It might only be in that microsecond, but it's often a clear and definite decision at the time." It is only in the days afterward, under the pressure of outside scrutiny, that an officer's confidence is eroded... [The] N.S.W. Police Association president... says people simply do not understand the pressure police are under. "A split-second decision is subject forever to armchair criticism." A landmark 1989 decision in the U[S] Supreme Court recognized that pressure, setting a favorable precedent for U.S. police officers in deadly-force cases. The court ruled... that allowance should be made for the "tense, uncertain and rapidly evolving" circumstances in which officers must make instant judgments. In 1994, a U.S. court of appeal ruled that a police[officer] was justified in killing a handcuffed subject wielding a fireplace poker. According to the judgment, the police[officer] had too little time to consider alternatives such as dogs or capsicum spray. But protestations of job pressure and time constraints do not placate critics, who say trigger-happy policing can be traced to poor selection procedures and inadequate training and equipment... [A] former U.S. Secret Service agent who served as a bodyguard for [the 37th to 39th] presidents... and who now runs a security company in A[US], says a stun gun, a blanket, or even a rope can subdue someone. "I think police here may be more intelligent than American police... but I'm not sure they're nearly as streetwise." [The security company head] says "the nice days of bobbies without guns are over," but Scotland Yard would disagree. In London, only 2,000 of its 28,000 police officers have guns, and those highly trained officers are deployed only when necessary. A Scotland Yard spokes[person] says opinion polls have consistently shown that neither Londoners nor bobbies themselves want the police to carry guns. [A b]arrister and forensic psychologist... who worked with the Victorian Council for Civil Liberties during the early '90s – when... "police were disposing of mental patients by shooting them" – believes the British approach to firearms is admirable. [The barrister] argues that police academies should spend less time on target practice and more in interpersonal skills; people are now less compliant than they once were and the police officer's job is more confrontational. In response, police can be aggressive... "They wear a uniform and they identify with each other. There's the 'brotherhood.' Alternatively, you could see it as a siege mentality, that it's us against them." To counter that perception, police have tried to soften their image by changing from police "forces" to police "services." The shift has marked a significant shift in philosophy from aggressive and authoritarian to protective and defensive policing. The challenge now is to ensure that police officers' right to protect themselves does not interfere with public expectations of security.

...A young police[officer] shot and killed a [citizen] after capsicum spray failed to subdue him during a violent domestic dispute in Melbourne's outer east early yesterday, police said. The constable, with two years' experience, feared for her life and fired one shot at the [citizen], who was armed with a knife... The [citizen], aged 28, died soon afterwards... [– becoming] the 32nd person to be shot dead by Victorian police in 10 years. His name was not released. Police were called to the house... during a dispute between [the citizen] and his de facto wife... Two constables called for support and an acting sergeant with capsicum spray arrived... "It [the spray] was ineffective in this circumstance and obviously defence of life became a priority for our members..." ...The police officers had warned the [citizen] a number of times to drop the knife. Victoria police began trials of capsicum spray 12 months ago and it had been used successfully in up to 50 incidents. "It has about a 90[%] success rate and unfortunately this was one of those that wasn't successful,"... said... [the] Assistant Commissioner... Homicide squad detectives, overseen by the police ethical standards department, were investigating the incident... [] Christchurch p[olice] used pepper spray to disarm a [person] who threatened to harm himself with a knife at a Riccarton house... [N]o charges had been laid after the incident on Tuesday, but the 30-year-old was taken into custody.

...Dairy and superette owners want to be allowed to use pepper spray on armed attackers... – or hockey sticks or softball bats... Delegates from the Mixed Business and Retail Association will meet the Minister of Police... next week to press for the legalisation of certain forms of self-defence... [O]wners of small businesses were alarmed about the rise in armed holdups and wanted to be able to protect themselves. In [Wellington during] the past week, there had been four attacks on dairy owners in Porirua and three in Petone in one day... In Auckland, a Mt Wellington superette was held up on Monday by a [robber] wielding a knife who escaped with about \$100. The same day the owner of a Queen St souvenir shop was knocked to the ground and left with minor injuries when two... [robbers] fled with the till, which contained about \$1000... [S]hop employees were defenceless when armed robbers entered their stores. They could not physically defend themselves or eject a suspicious person unless they were attacked. "These attacks are happening around the country and we've had enough. In Auckland, there are so many attacks that we've lost count,"...

As you trek around the central city streets of Auckland, mind what you do: you're being watched. For the first time, street surveillance cameras are being monitored round the clock... [instead of being] left unwatched when police were called out of the... downtown police station. And thanks to a \$100,000 grant from the Heart of Auckland City Association, the number of cameras has also increased, from 11 to 13, as police step up efforts to combat crime... [T]he cameras... were important crime prevention weapons... 64 offenders were arrested in the second half of [last] year after being filmed committing crimes ranging from sex offences and aggravated robbery to disorderly conduct... Street surveillance cameras were criticised by the A[US]n Human Rights and Equal Opportunity Commission's privacy branch during a privacy forum last June. It said people were concerned about being watched... However... [Auckland's p]olice had to stick to strict privacy rules to run the... cameras... They could not peek into high-rise flats or office buildings and monitored only crime hot-spots. The tapes were held for a month and were then either destroyed or kept as court evidence... "I don't want my staff monitoring an area for no reason but these do help us make streets safer for everyone," [said a] Senior Sergeant...

A thermal imaging camera... was tested in Auckland yesterday during a firefighting course. The camera allows firefighters to locate people in smoke-filled rooms. It was demonstrated... [by three] top American instructors from the National Fire Academy, near Gettysburg... The chief fire officer for the Mt Wellington and Howick stations... said the camera dramatically reduced the time it took firefighters to search a property. "At the moment we use touch, and go through a building like a blind person..." The \$22,000 thermal imaging camera is one of two in use by firefighters in N[Z]. The Fire Service hopes to buy more but says that will depend on donations. [Speaking of Fire Service purchases, it is 'expected to take three years and \$10 million to refit the entire brigade with new suits (the existing suits are virtually useless')].

...Old fire engines are limping to emergencies as the Fire Service battles a maintenance crisis with its appliances, says an Auckland fire chief. The chief fire officer for the West Auckland district... said last night that appliances were carrying defects which could be a danger to the public... A

report by [the fire chief] outlining defects and the crisis was tabled in Parliament yesterday... But the Minister of Internal Affairs... denied there was a problem and said the Fire Service planned to spend \$9 million buying 34 new engines. Eight will go to Auckland. In... [the report, the fire chief] said appliances at Avondale had broken down 18 times [in less than three months]... One vehicle, an appliance taken to Avondale as a temporary replacement for another broken-down engine, had 13 serious defects. These included a lack of attachments to secure equipment to the roof and fractured cab steps... Another replacement truck sent to replace the replacement had bald tyres, the only spares being in Wellington. Two other reports filed by [the fire chief] last year identified jammed doors, fractured welds and rusty panels in other appliances. Another senior officer said last night that [it], too, was concerned by maintenance problems. [The]Senior Station Officer... from the Manukau station, said appliances were sometimes out of commission for six hours while firefighters waited for repairs to be carried out. The Auckland area chief fire officer... said... "We do have an ageing fleet and because of that have more maintenance problems but I am confident we have the process in place to maintain a safe fleet." The arrival of the new appliances... would ease the problems... ● Yesterday a turntable ladder fire engine... was taken out of use in Hamilton after a crack was found in its chassis. It was replaced by a teleboom fire truck – with a shorter ladder – from Auckland.

...Firefighters will be hard-pressed to tackle blazes and rescues at multi-storey buildings after an emergency rescue appliance crashed on the way to a job yesterday. The brakes failed on the 28-year-old "snorkel" ...appliance – which is used for rescues and fires in two and three-level buildings – ...as it was travelling down a hill in Kingsland. It ploughed through a fence before coming to rest in mud. Two firefighters leapt off the rear of the 17-tonne appliance, and the rest of the crew managed to escape unhurt... The... [snorkel] was in a workshop last night... Auckland's only pump appliance... is also in the workshop after it "blew up last week."

...Breakdowns dog firefighter crews... The Fire Service is facing a firestorm of criticism over inadequate equipment after a plague of appliance breakdowns and other problems. Firefighters blame the problems on old fire engines and claim the Fire Service's top brass is solving the problems crisis by crisis. In one case the Parnell fire station was without its turnable fire engine – which has... [a] 30.48m ladder... – for two days. The sole replacement turntable truck ended up in the workshop after it also broke down. Rescue capability at high-rise buildings would have been limited. At the Auckland City station, in Pitt St, staff refused to use a pump rescue tender engine on Monday night because its certificate of fitness had expired. The same day Hamilton staff were forced to pick up a pump rescue vehicle from Auckland after their usual truck broke down. The borrowed truck was used yesterday to pull a 70-year-old... out of her car near Raglan... Hamilton[s] senior firefighter... said the lack of fire engines meant crew needed to call in back-up staff from nearby towns if there was a major fire in the city... In Whangarei, firefighters are using a rural response unit – which has a lower water capacity than most fire appliances – to fight house fires. And only last night, after the Te Atatu station's sole engine was damaged in a crash, the volunteer brigade that is based with paid firefighters at Henderson had to surrender its late-model appliance, leaving it with only a rural unit... [The] national president of the United Fire Brigades Association [UFBA] [which represents volunteer crews, blamed the Government's "damned cuts" in funding [during the past three years]for the Fire Service's equipment crisis...

Two weeks ago the rusting pile of metal that sits in [the UFBA national president]'s office was part of the Waipu fire engine's chassis... [The] national president... said yesterday that the decrepit chassis was discovered during routine maintenance of the vehicle in Auckland. What concerns him is that the chassis could have easily fallen apart while the truck was on its way to an emergency in Northland... [The national president] claims unpaid crews are often forced to use hand-me-down fire engines – some of which should be sent to the wreckers. In Ngatea an ERF model appliance – with a fibreglass cab – is in use despite the Fire Service supposedly taking such vehicles out of commission 20 years ago... Approval has already been given for Auckland to get one fire appliance every three months over the next two years... However, most fire engines are getting past their use-by-date... [The] area general manager for the service's northern region, said the average age of the 281 fire engines between Cape Reinga and Taupo was 13.86 years. Most fire trucks had a lifespan of around 15 years but 30[%] of the fleet was older than that... [The national president said a]bout 200 of N[Z]'s 800 fire engines... should be off the road... [Some] were... older than those in the Museum of Transport and Technology... "There used to be a joke: if you want to see a vintage vehicle, push a fire alarm – but now it's no joke." ...Older fire engines also cost more to maintain and repair... A 1996 fire engine had so far cost \$8500 in repairs since last July compared with more than \$20,000 for a 1982 model... Exacerbating the service's problems are staff stresses... [A]bsenteeism was high and morale low among firefighters... [S]ome firefighters were not allowed to take owed leave because there was not enough staff to replace them. Others, particularly the lower paid community service team (CST) firefighters who are gradually replacing the professionals, were working 36 hours at a stretch.

...N[Z]'s first leased fire station opens for business tomorrow – but not without controversy. The picturesque red building in the Hamilton suburb of Pukete was designed by the landlord, Pukete Land Ltd, to meet the requirements of its fire-fighting tenants. The Hamilton chief fire officer... said the arrangement minimised cost and meant the service could skip a lengthy process to obtain capital for building. But while... firefighters were putting their hands up to work at Pukete, instead of the Anglesea St headquarters, controversy continued over the use of gear and labour to staff it.

...Fire Service breaking the law... The Fire Service is flouting the law – and its own rules – by failing to ensure all its stations meet fire safety requirements. At least four stations in Auckland alone are in breach of the Fire Services Act and service guidelines. A senior Auckland firefighter said yesterday that it was a gross double standard for the service to enforce fire safety legislation on others when it did not comply itself. The firefighters' union said it was concerned that its members were working and sleeping in unsafe buildings... Budgetary constraints had been the main reason the stations were not up to scratch, but the Fire Service did not accept that as an excuse from other businesses so action would be taken... It would cost the Fire Service about \$75,000 to bring stations in Auckland up to standard. [■ 'The Fire Service believes only 8000 of 65,000 buildings requiring evacuation schemes have them. This estimate is contained in a Department of Internal Affairs report, although the service's national adviser for fire hazard management said yesterday that it was based on a 1994 report. The proportion had improved since then. The report on the views of key users of building controls says that as a direct result of the Building Act 1991, the previous legislation on fire safety evacuation schemes was replaced under the Fire Service Act 1975. The fire regulations came into effect in January 1993. Asked why the 1994 estimate was so low, the adviser said only so many schemes could be approved each year by the service and there were also difficulties with some of the schemes forwarded by building owners for approval.']

...The Fire Service is using a loophole in Government legislation to force owners of resthomes, boarding houses and private hospitals to install sprinkler systems to prevent loss of lives in fires. The chief executive of the Fire Service... said that current legislation required sprinkler systems only in resthomes with more than 21 beds or in those built after 1991. However, they had to have an operative evacuation system so that residents could be out in two to five minutes. This meant hiring more staff, or the cheaper option of installing sprinklers.

...The Fire Service says it can save N[Z] \$200 million in lost lives, injuries and property damage over the next five years if it gets an \$83 million cash injection. After that it can offer even bigger savings – \$85 million a year for just a \$2 million annual increase in its present budget of \$156.2 million. The service needs the cash to repair old stations, replace its ageing fleet of engines... [as well as buying] a new radio and communications system... and... protective clothing. It has asked the Minister of Internal Affairs... to approve... [the budget increase. 92%] of the service's budget is made up from insurance levies. The Government provides the remaining 8[%]. Most of the proposed increase would come from a surplus in the levy in advance account – the insurance people pay in advance on their properties. There would be no rise in levies.

...Firefighters fear more job losses and falling public safety as the Fire Service further slashes its budget. The... Fire Service... last night confirmed... spending cuts had been made and more were being considered. This followed a statement from [an]Alliance MP... who... had been told of plans to slash \$3.3 million annually, which could cost 70 jobs... Fire Service chiefs were last night said to be furious that news of the planned cuts

leaked, as only senior officers were privy to the information... [The MP also] said the service was considering staffing stations in Kawerau and Masterton only during the day, while stations in Avondale and Dunedin would lose appliances... [I]f the Avondale fire station lost one of its two appliances it would break a long-standing assurance given to the Pt Chevalier community when the two stations merged... [The MP] said that if Masterton and Kawerau had to be covered by other fire brigades at night it was inevitable lives would be lost. The past five deaths by fire in the Kawerau area... were at night... The Mayor of Kawerau... had not been told of any plans to cut back coverage but expected local volunteers would cover if fulltime firefighters were taken off at night. The... Professional Firefighters Union [(PFU)]... said further cuts would fly in the face of public opinion. In three years the service had cut staff by 600... and 200 of those went after the December 1995 referendum where people voted against more cuts. Fire Service levy money had already been collected from the public yet \$50 million of that was in a bank account in Wellington.

...The Government is investigating billing property owners directly for their Fire Service levy in a similar way to television licences. The Minister of Finance... said Fire Service reforms had saved \$19.7 million a year and the Government wanted to see the funders – homeowners and businesses – benefit through a lower levy. [The minister] also said the review of the levy reinforced the need to move with care on the proposals in the five-year plan put forward by the Fire Service Commission to ensure that the balance between its expenditure and future income was maintained.

...Firefighters may refuse to fight fires in West Auckland in protest against staffing plans for stations in the area... [F]ire chiefs met firefighters from Glen Eden and Henderson yesterday to outline proposals for a staffing reshuffle... as part of national plans to cut costs. The... number of job losses is not known but the P[FU] is gearing up for a fight. One union member... said firefighters at the two stations were part of the “new breed” of officers – called [CST]s – which had a particular focus on fire prevention. They were recruited to the stations a year ago and were now being told they would have to leave... [O]fficers did the midnight shift at the stations on a voluntary basis but were threatening to stop doing this. If they took action, firefighters throughout Auckland would refuse to fight fires on their behalf. “The consequences of that would be horrendous...”

The Auckland regional fire chief... said yesterday that plans were proceeding to cut the number of firefighters by 36 and merge stations in Mt Roskill and Onehunga. Avondale would also lose a fire engine and 16 firefighters, who would be transferred to the Henderson station... [T]he 36 Auckland staff who lost their jobs would be transferred to 25 vacant positions in the region. The extra nine were being encouraged to apply for positions in the Hamilton region... Alternatively, the additional staff would fill in for firefighters on long-term leave.

...volunteer firefighters... [have said that s]moke detectors, not bigger fire brigades, save lives... As controversy continued yesterday over Fire Commission plans to cut staff nationally by 131, the U[FBA] warned that prevention was more important... [However, the PFU] said that lives would be put at risk under the cost-cutting measures. The union secretary... said... that almost 50 people had died in house fires over the past year – compared with 36 the year before. [The secretary] blamed this on staff cuts and said N[Z]ers should expect a rising number of fatal house fires if further staff and equipment cuts went ahead. But the president of the U[FBA]... said many of the fatal house fires were fought by volunteers. The house fire that killed three children in Matauri Bay, Northland, in June, and the rest home fire in which three elderly people died in Collingwood last month, were attended by volunteers. “There wasn’t a paid firefighter within 150 kilometres of the last fire. It’s very hard for firefighters to say that more of them would have stopped those deaths when they weren’t even there,”... People with smoke detectors had the best chance of surviving. “Dramatic fire rescues make headlines but the horrible reality is that most people are dead by the time the fire brigade gets there in a big fire. Their lungs are full of chemicals.” [In response, the PFU secretary]... said the high number of deaths in rural areas proved that professionals could respond more quickly. “Volunteers have a built-in delay because they have to get to the fire station first before they can go out,”... Smoke detectors would warn home occupants and alert the fire station “but they’re no substitute for firefighters.”

...About 30,000 smoke detectors have been sold in the weeks since a spate of fires killed 10 people. Demand has been so intense that many stores have sold out and more detectors have been flown in from... A[US] and the U[S]... First Alert, a supplier of smoke alarms, reported stocks were running out for two or three days at a time... The rush began after a fire in Port Wells, near Warkworth, late last month which killed three people... The Fire Service is thrilled with the sales... [and] said people should follow the lead of the Port Wells community, which had clubbed together so that every home now had a smoke alarm. The alarms are cheap... and easy to install. The local fire service is happy to help those people who cannot manage... But the Auckland fire hazard manager... said people should not stop at buying just one detector... “At maybe \$40 maximum to cover your house, it’s a cheap life... There are lots and lots of occurrences where people have got out through smoke alarms... We suggest to people they use them as gifts as well.” Alarms should be installed... away from kitchens and bathrooms where they are prone to false alarms.

...False alarms are on the increase, according to the annual report of the Fire Service. The service attended 20,231 false alarms in the year to June – about the same number as real fires. The higher number of false alarms was being investigated with the aim of stemming the increase... The Fire Service attended 14,510 urban fires, 2721 rural fires and 2202 hazardous substance emergencies during the year.

...The Fire Service is asking some local bodies to pass a bylaw making smoke alarms compulsory in residential homes in a move that by-passes Parliament. The Auckland region of the Fire Service has drafted a bylaw, modelled on one in Victoria, A[US], which would make landlords and homeowners fit smoke alarms in all residential dwellings, including caravans... The Auckland fire safety manager... said the Government seemed reluctant to pass legislation to make fire alarms compulsory... Extensive public education about fire prevention was failing to reach about half the Auckland population, particularly poor families. “To them, \$20 is \$20...” Smoke alarms were compulsory in A[US]n states and throughout Canada – where fire fatalities dropped from 725 in 1982 to 580 in 1991 after alarms became mandatory... City councils in greater Auckland have been asked to consider the bylaw, which is backed by the Mayor of Rodney... But the mayors of Auckland... and Manukau... did not seem so keen. [Manukau’s mayor] said: “I... have one and I only have to burn my toast and it goes off.” [● Briscoes is currently selling smoke alarms for ‘\$9.99’.]

...Fire chiefs raise alarm over roads... If you’re the proud owner of a new house in a new Auckland subdivision you may be quite happy that the design of your street discourages traffic – just pray you don’t have a fire. Fire chiefs covering the region’s ever-expanding edges are becoming increasingly concerned that many new... [s]pace-saving... streets are so narrow that access by fire appliances is impossible if cars are parked on both sides. None has yet been confronted with such a blockage on the way to an emergency, but firefighters say it is a risk they face daily. They are starting to alert local authorities to the problem, and while some councils are responding, others maintain that their standard road widths are adequate. It might be assumed that councils would automatically consult emergency services regarding their ease of access when planning and approving new streets, but this is not the case. Manukau, Waitakere, North Shore and Rodney councils all operate their own tables of minimum road widths, and request input from the emergency services only if a developer wants to deviate radically from the norm... “Maybe we should take a few councillors out to a few of the particularly narrow streets, park a truck on one side and a car on the other and say ‘Right, you try to drive a fire appliance through there,’” says... a station officer at Manukau... “Developers want every inch they can get to sell as sections, so they make the roads as narrow as the council will let them. The council also seems to be discouraging the use of [residential] roads by people who don’t live there by putting in a lot of narrow cul de sacs... They seem to have forgotten that you might need to get a wide emergency vehicle down there – in a hurry and maybe at night. If they used their brains they would allow parking only on one side, then it wouldn’t be such a problem.” [The station officer] says that if his crew was racing to a fire where it was known people were trapped and their lives in danger, and were confronted by cars parked on either side of a narrow street, blocking the fire appliance’s path, they would ram the cars out of the way. “I don’t know whether technically we’d have that authorisation, but we’d do it and argue about it later.” ...the deputy fire chief of the Silverdale Volunteer Fire Brigade which covers the burgeoning suburbs on Whangaparaoa Peninsula, says crews do have authority to ram their way through to a fire if need be. “If life is in danger nothing can stand in our way, but we have to have a pretty good knowledge of what we’re removing vehicles for,”... The only

alternative would be to join the appliance's 25m-30m hoses end-to-end and run them to the fire, which takes precious minutes and deprives the crew of having the vehicle's other equipment close to the scene. "But some of these streets are quite long and even if we tried that, we wouldn't have a show of reaching the fire,"... The North Shore district chief fire officer and acting area chief of the Auckland region... says fire crews regularly do "reccies" of suburbs to familiarise themselves with new streets and changes to old ones. When [the chief fire officer] noticed the narrowness of some new streets, [it] had cars parked on either side to confirm that an appliance could not be driven between them. Infill housing has exacerbated the problem, [the chief fire officer] says. "The width of a fire appliance is 2.5m and the average car is 1.6m, yet we've got streets like Lingham Crescent in Torbay Heights which is only 4.9m wide... I remember 20 years ago pushing two cars out of the way on the way to a fire in a narrow street in central Auckland – we wiped out the side of the appliance as well as the two cars, so it's not a desirable thing to have to do. Maybe the council should make sprinklers compulsory in new homes as well as smoke alarms, to compensate for the delay the fire service might have in getting to them." [The chief fire officer] became so concerned about the situation in new North Shore suburbs... that [it] complained formally to the North Shore City Council. The council's works committee chair[person said]... "I admit that [the chief fire officer]'s concerns came as a surprise to me... Obviously there hasn't been consultation with the fire service over new subdivisions in the past, but there will be in the future." The council's standard minimum street widths reduce to 5.5m for a short cul de sac and 2.5m for some right of ways, but can be made narrower if developers meet certain criteria... [A] report prepared for the [council's] works committee, however, concluded that current street widths weren't the problem, but unmanaged parking and "traffic calming" devices such as speed bumps and traffic islands. "But one area of width we will have to look at is private accessways serving more than 10 units," says... [the t]ransport and traffic manager... Manukau City Council's narrowest minimum street width is for cul de sacs – 5.4m. Right of ways can vary from 4.5m to 2.7m depending on how many homes they serve. [The s]enior resource engineer... says that in an emergency a fire appliance might have to be driven on to the footpath, "but that's not a hassle, it's just something the [crew] would have to do. [Yet, t]he council has had its road-width standards for some time, and we haven't had any feedback about problems..."

...The Government has decided to slash by \$48 million the amount being paid into a special Fire Service account, by cutting levies paid by property owners on private insurance for fire cover... [The] Internal Affairs... Minister... has also announced that the Government will axe its annual grant to the Fire Service, saving a[further] \$9.5 million... The... grant, which represents 8[%] of the Fire Service budget... [was created b]efore the state-sector reforms, [when] the Crown very rarely took out insurance on its properties... Now, Crown departments and organisations paid about \$11 million in insurance levies... The Government is reviewing the way the Fire Service is funded but... neither move would affect the Fire Service budget for next year, because it draws funding from an account with reserves of about \$68 million. However, [the minister] did not explain yesterday the implications for the service after next year, when the levy cut and axing of the Government grant will have significantly drained the reserves. The cut to insurance levies... would save an average home owner with a \$120,000 house-and-contents policy about \$20 a year... The Insurance Council... said the Government's decision to cut levies was shortsighted, because policyholders would be hit with big increases once the reserves in the... account were drained... There has been controversy over the levy account, with firefighters calling on the Government to release more of the money... to improve services... [that have] been run down through a series of budget cuts and restructuring... [T]he Government will continue to pay for some Fire Service Commission services including safety promotion, public education, civil defence and the enforcement of fire safety and building evacuation regulations.

...The Fire Service will be embarking on a national education campaign next year to spell out exactly how people can prevent fires in their homes... [M]odern furnishings, particularly plastics and polycarbons, meant houses burned faster, at higher temperatures, and produced more lethal smoke than... 40 years ago. In many cases a fire engine was not going to get there in time. [The Minister of Internal Affairs has publicly stated that] people had to change their expectations and take their own preventative steps, including installing smoke alarms in several rooms.

...The latest changes to the Fire Service will cost more than 100 administration and management... jobs, and the service will be restructured into eight new regions[to manage the unchanged '333 fire districts']. The Fire Service Commission chair[person]... said the 103 redundancies were expected to save several million dollars, which would be spent on helping front-line staff reduce the "incidence and consequence of fire." [The chairperson] said... administration costs were too high and the service... too focused on measuring what it did rather than the results of what it did.

...The Fire Service Commission pushed ahead with its controversial restructuring last week against the will of an important advisory group, a leaked document shows. The group told the commission... reducing the number of fire regions would have high risks and marginal benefits. But the commission cut them from 11... anyway... The [group] also warned of possible lower morale and poorer accessibility of management to firefighters.

...An overhaul of the Fire Service... has been embraced by the P[FU, which]... said the revamped management structure was more focused on firefighters and the delivery of emergency services... The revamp includes... scaling down the chief executive's office, wiping the three regional offices, northern, central and southern, and the national office. It also includes a closer reporting relationship between those at operational level and the chief executive. The changes were announced yesterday by the new chair[person] of the Fire Service Commission... [– who is] from the insurance industry... [–] who said... "We are seeking to make further progress in reducing management and administration and focusing on what is, after all, our core business – the management of fire risk." But [the chief executive] said the decisions signalled a wrong turn for the service and [it] has resigned in protest... [The chief executive] had not been consulted over the restructuring and did not believe it was what the public wanted.

...Firefighters fear more staff cuts are on the way following the resignation yesterday of the Fire Service's national commander – the second top executive to quit in a week. [The commander, who] quit after 30 years in the service... said yesterday that his treatment by the... new Fire Service Commission... was "an insult not only to me personally but to all of us who are proud to be members of the... Fire Service." [The national commander] had not been consulted on any of the planned changes... A two-day workshop had been held to discuss operations, resource strengths and command structures, to draw up a draft plan... but [the national commander] was not invited... The Minister of Internal Affairs... who is responsible for the service, said... [it] did not know the full story behind the resignation... However, [the minister] was confident the service was being well managed... "Don't worry, I have talked to the chair[person, who]... briefed me last week and they had a plan." The commission chair[person]... said everyone... had been given the opportunity to work out ways to implement the change of direction wanted by the commission. [The national commander] had not been invited to the workshop because that was for middle management... "We want to focus more on fires and I find it strange the national commander would have a problem with that." ...The president of the P[FU]... said that while... many firefighters would not be sad to see [the national commander] go, the resignation was of concern. The commission said it wanted to change direction, but no one knew where that would take the Fire Service... "There are clear concerns about where it ends, in terms of numbers and what is going to happen to the [CSTs]," the president said. The community teams, initially opposed by the union, were now 80[%] unionised, and many were worried about their prospects. [The chairperson's] connections with the insurance industry and "his Business Roundtable mates" were enough to worry firefighters as to where the service was heading under his leadership. The union believed [the chairperson] wanted to cut the number of firefighters assigned to each appliance... [T]he president of the U[FBA], which represents volunteer firefighters, said: "The commission will have to move quickly to assure both volunteer and paid members of the service that it knows which direction it is headed in."

...ASKED how the [new Fire Service] Commission was able to make a decision to restructure the Fire Service just a month after it was formed, [its chairperson]... says "the problems were relatively close to being blindingly obvious. We are far from convinced that they are doing as well as

they could,” [before pointing out that]... the Fire Service hierarchy was worse before earlier reforms. [The recently resigned chief executive] had taken some layers out and “we are continuing that process.” ...Fire prevention work was an essential part of managing fire risks and would not be compromised. [However, the] wider emergency management review meant Civil Defence issues were generally being re-addressed. Medical emergency assistance appears likely to be reviewed. While it was suitable in rural areas where other forms of assistance were not available, the service could not afford to become a “surrogate ambulance service.”

...[in] Wellington, volunteer brigades are taking part in a co-responder trial in which members with medical training attend medical emergencies while they wait for an ambulance. [The]Wainuiomata fire chief... reckons his volunteers have saved at least two lives a month during the trial. “Of course we should be doing this sort of thing – the community expects it from us. Any talk of taking it away is ridiculous.”

...All firefighters have been sent a memorandum telling them to keep their personal opinions to themselves, and that they must support Government policy... [However, the] president of the P[FU], says the memo is ridiculous... “It’s one thing to say you shouldn’t speak against Government policy, it’s another thing to say you have to support it. Does that mean we have to support the eight years of wage freeze that firefighters have had...?” The union had written asking exactly what Government policy was with regards to firefighters, [the PFU president said.

...‘For the past few years firefighters have been anything but silent – and if you believe them, the Fire Service has not been something we can depend on. Inflamed firefighters have spilled the beans on all sorts of problems: broken-down trucks, equipment shortages, fires mismanaged by inadequately trained staff. Firefighters say they are speaking out for public safety. In 1995 – the year the country spent \$10 million on a referendum in which 88% of the 652,200 voters said no to further job cuts – the PFU says there were about 1900 firefighters. There are now 1671 positions, and these are expected to drop by about 300 as the service begins its six-month restructuring phases’]...

Two more senior fire chiefs quit in disgust yesterday, citing their inability to “sell” the new management approach of the Fire Service Commission when they had not been told what it was. The Auckland-based northern region general manager... and his southern region counterpart... both tendered their resignations and will retire on Friday... Only the Wellington-based central region general manager... who is said to be working closely with the commission and a group of second-tier fire chiefs, remains in place.

...IN THE past few days, volunteer fire[officers]... all over N[Z] have fought fires. They’ve also performed CPR on heart attack victims, undertaken surf rescues, cut car crash victims from accident wreckage and rescued a cat stuck up a power pole. And all the while, the 8000 volunteers have listened as the political debate surrounding the... Fire Service’s direction hotbed up... They’ve shaken their heads at the talk of “returning to core business”, and heard reassurances... that the work of volunteers will not be undermined. But if the volunteers needed proof that smoke means fire, they got it when four... of the... five top... Fire Service bosses... quit within a week of each other... There’s no disputing the volunteers (plus another 3000 volunteers attached to rural firefighting units) are the organisation’s lifeblood – stacked up against the nation’s 1500 paid firefighters. The crux of the issue is “core business”... “That’s really got volunteers spooked,” said... [the UFBA] president... “We’ve had volunteer brigades for 120 years. Most were set up by communities to answer their needs... They do everything the paid brigades do – fight fires; go to schools and teach kids to stop, drop and roll; and smoke alarm education. But they do a lot more... We’ve heard lots of political noise about the Fire Service not being funded to do this extra work, but local communities have put their hands in their pockets to come up with the money... It is just not realistic for us to be going back to basic firefighting – it’s the thinking of 100 years ago and we might as well be using horses to pull the engines, if that was the case. We have been told we’re getting more resources, and we applaud that, but we’re yet to see what form that will take.”

...Firefighters in the N[Z] Fire Service provide year-round emergency response to fires, accidents and civil defence disasters. The traditional role of the Fire Service has been to protect and save N[Z]ers in the event of these emergencies happening. Their primary function has been to save lives. Over the past few years, however, the primary life-saving function of the Fire Service has been under attack. This attack has been led by the N[Z] Insurance Council and supported by the Business Roundtable and the National Party... Government. The basis of the attack is the misplaced belief of this group that the sole function of the Fire Service is to protect property – and, more specifically, property that is insured. The supposed rationale for this position is that the sole source of Fire Service funding is to be the Fire Service levy paid through insurance companies by private landowners, after the Government announcement... that it is to axe its portion of funding. The funding system now reflects the ideology that sees the Fire Service as a business enterprise, not a public service... Incidentally... [t]here have been many fires in... Government buildings... in recent times, including blazes in the old Parliament Building in 1992 and 1993 and the Parliamentary Library in 1993. Yet under the new funding system, the Government will not be paying a levy for these buildings. Taking the prevalent ideology behind the restructuring of the Fire Service, should the Beehive catch alight the ministers of this Government would burn with it since they would not be levy-paying clients of the Fire Service.

...Resignations, allegations of conflict of interest and hidden agendas of the Business Roundtable have enveloped the Fire Service. After years of acrimony and rancour between the management and unions of the service, the fight has now moved to the boardroom with the departure of four top executives... So what is going on in the Fire Service? [The new chairperso]n of the [Fire Service C]ommission... has said the service needs to get back to basics... In February 1996, [the]former commission chair[perso]n... said the emphasis of the service was “changing from response to prevention” as it moved from dealing mainly with fires to be “at the forefront of a network of emergency services.” [The former chairperson] warned the Government that continued budget constraints would push the service into crisis... All changes proposed by him were put on hold, following [the new chairperson’s] appointment. The new chairperson] was removed from the commission in 1993, after the[]n Internal Affairs Minister... said the Auckland[er]... had been unable to work effectively with [the then chairperson. The Aucklander] was then seen by the insurance industry and Federated Farmers as a strong backer of their campaign to reform the service. [With their support the Aucklander] is back, and causing quite a stir.

...*Firebug who grew up to be fire chief* If [the Aucklander] hadn’t joined the Fire Service [it] might have ended up a part-time firebug. The controversial [new chairperso]n of the Fire Service Commission admits to having a long fascination with fires. As a child, [it] and a mate set fire to a hen-house while playing with a box of matches and a bottle of methylated spirits. The pair escaped with minor burns but [the young Aucklander] remained intensely interested in fire throughout his childhood. His passion for the naked flame continued to burn in his career, firstly as a professional firefighter, then in the insurance industry, where [it] specialised in the field of eliminating fire risk, before moving to general risk management with [a firm of]insurance brokers... Three months ago, the 50-year-old took over the top job in the commission... His vision takes the Fire Service back to its core responsibility – fire – and any other work will be secondary... Appalled by the practice of driving fire appliances to social functions, [the new chairperson] suggested that the units be left at the station in case they were needed for a fire. The idea was not appreciated. “I got a letter back saying I could stay behind at the station and go to the fire on a bicycle.” ...[his]long-time professional adversary and the former commission chair[perso]n has] lost no time attacking... [hi]s management style[and c]alling for... h[is]... resignation... “...I’m going to speak out until some sanity returns – and it can only return with the dispatch of the chair[perso]n.” The pair also clashed when they served on the commission together in the early 1990s. [The Aucklander] today conceded that [it and the former chairperson] were poles apart when it came to their views on the role of the commission chair[perso]n. But the spat is moot point to [the Aucklander]... who is... after all... the one who has got the job.

...A “strapped-for-cash” Fire Service has paid \$785,000 to four senior executives who resigned after sweeping management changes. Firefighters and politicians have blasted the payout as hypocrisy from an organisation that is crying poor when it comes to pay claims from frontline staff.

...In response to written parliamentary questions by [a]Labour MP... the... Minister of Internal Affairs... said the money... used to pay out four former Fire Service executives could have bought \$785,000 worth of fire equipment.

...The Minister of Internal Affairs... is investigating whether the \$785,000 paid to four senior Fire Service executives... can be recovered... Labour's internal affairs spokes[person], alleged yesterday that the large payments were made without going through the correct channels. The previous Fire Service Commission should have consulted the State Services Commission before entering into the contracts, [the spokesperson] said.

...The Fire Service broke the law by not consulting the State Services Commission when it signed contracts with four executives who resigned with a \$785,000 golden goodbye, says the Auditor-General... But [the Auditor-General] said that if the service had not paid them, taxpayers might have footed the bill in any ensuing court battle because the contracts were legally binding.

...A parliamentary committee is to hold a wide-ranging inquiry into the Fire Service. The... committee's decision to hold an inquiry was announced this month but the terms of reference were not decided until last night. The initial decision followed disclosure by MPs that four senior administrators had received payouts totalling about \$750,000 after they decided to quit the service.

...Firefighters are increasingly likely to use psychological and medical problems as a reason to leave the Fire Service. Last year 37 firefighters were forced to retire from the service because of medical problems – up from 27 in 1993. The... medical retirements have added to the stresses – such as broken-down fire engines – already experienced by those in the service... [T]he service's principal medical officer, said yesterday that eight out of the 37... left because of psychological problems – double the number who left for that reason in 1993. But [the medical officer] added that the majority of firefighters were medically retired... because of orthopaedic weaknesses, often brought on by the job.

...The president of the P[FU]... said yesterday that... “...the Fire Service [managers are embarking] on a campaign that will do nothing but suggest to people they should have as much confidence in calling the service as they do when they call the police over a burglary.” ...Last week the union secretary... said the \$1 million for the campaign would be better spent increasing the number of frontline staff.

...Prospective firefighters will be vetted by police to protect sensitive crime information when up to 10,000 firefighters get access to the police radio bands... next June... But existing paid firefighters, who will not be screened, are worried that they will be blamed for any security breaches when the police and the Fire Service begin sharing airwaves... The... president of the P[FU]... said the screening was a token effort. “If this is privileged information, then the public need to be assured that it is secure and won't get into the wrong hands. It should be everybody or nobody.” ...[however, the police decided] it would be impractical to vet current fire staff, apart from those moving into shared control rooms, who would have access to more secret information... The Privacy Commissioner has been consulted about the checks.

...The Fire Service may review a multi-million-dollar joint project with police to merge their emergency control rooms... The former Fire Commission had agreed to the joint project... in the middle of last year. The new commission was now responsible, “and we might have to decide if it's the best value for money option...,” [said the commission's new chairperson]...

All fires and police incidents throughout N[Z] will be handled by the much-troubled 111 police emergency computer as officials lift the ban on its extension. But firefighters are alarmed about plans to merge control rooms with police by... July, and fear they are inheriting a bad system... A Fire Service manager... said fire control room staff were briefed about the merger last week and the plan was not well-received... The merger would cause chaos if the wrong troops were dispatched – as happened in Victoria... which had the same technology. “There aren't many firefighters who are interested in apprehending an intruder who has broken into a building,”... said... the... [PFU vice]-president...

Smart new computer abilities[, such as those used by the]... Integrated National Crime Information System (Incis)[,] will... make it easier for the police to share information with other... Government departments... Civil libertarians are anxious about the move towards greater cooperation, saying the system is open to abuse... “I think we have got some serious things to worry about in N[Z] in terms of the creep of technology, and perhaps we might wake up in some Orwell type of society in the near future...,” said the president of the Auckland Council for Civil Liberties... at the Privacy Issues Forum in Auckland last week... [But i]n a paper presented to the forum, [the head]... of the... police computer system... called on the public to accept the practice of information-sharing. “[While m]isuse of personal information is an abuse of power and must not be tolerated[, u]se of information for the collective good should be encouraged...,”...

Before I hoe into them, I'd like to say that civil libertarian type-people are very necessary, vigilant, lovable, etc. Credit where credit is due. They're alert, they worry about Freedom and Truth, and Government conspiracies to scrag both... The only thing is that, like Agent Mulder, your average civil libertarian – especially the ones obsessed with the notion that the one well-thought-out plan our tragic shambles of a Government has is to erode the free individual's rights – has a tendency to lose the grip... There's a fine line between vigilance and paranoia... [-] look too hard for intrigue, [and you start seeing] things that aren't there. Even in NZ, where there really isn't anything there. But they look, by God. For instance... last week... [saw the introduction of] tough new road legislation. I don't exaggerate any more than I normally do when I say nobody I know has slept since. It's the photos on drivers' licences... It makes people shake. I pronounce myself amazed. “The rights of everyday N[Z]ers are slowly being eroded,” a friend darkly informed me last weekend, adding [that it] planned to go into hiding before submitting. Someone else said the... [Government] would only ever get a snapshot of his butt, and th[e PM]... could come to his house to take it, and in case you think the main problem is the company I keep, I heard a Civil Libertarian shrieking about photo-ID on *Checkpoint* last week, absolutely beside himself thinking that drivers' licences photos might land in the wrong hands... Where does this obsession with conspiracy come from? Making sure people driving cars are who they claim to be is important, not fascist... I'm a fun girl, but even I am getting tired of chancing a terminal interface with an unlicensed drunk every time I [get] on... the motorway. Forceful state road policy [that] actively meddles in people's lives is supremely correct. Road statistics are so heinous that the fuzz has to know the person driving the car should be driving. Without a photo, they can't. And we've all milked that one. When I was a girl, everyone pinched older siblings' licences to get into pubs. At the other side of 20, we lent our licences to younger acquaintances... and regularly lent them to disqualified drivers to share in their nonconformist glory. But I'm old now. Bogus ID must end.

...The Privacy Commissioner... wants a privacy impact report on the... photo-licences, saying they could become “de facto internal passports.” ...[the commissioner, who had] called for an impact report a year ago... was concerned that... it... [is] necessary to carry the ID card almost all the time. Allowing it to be used as a proof-of-age card meant it could be required in all sorts of situations. “People over, say, 25 with no need to prove their age... nevertheless have it displayed for all who require to see the card as ID.” ...The provision for police discretion to impose an instant fine on drivers not carrying licences, with the power to waiver it later, could lead to allegations of police favouritism... “Combine that with roadside detention and there is a considerable intrusion into the freedom of the citizen to go about lawful activities without... hindrance.”

...I'M NOT usually in favour of restrictions on what I do or don't do, but I will gladly submit to whatever steps I have to take to stay within the new traffic laws... I could hardly believe my eyes when I read through the list of new road safety policies. One by one, the catalogue of long-overdue changes to the road code deserves a stamp of approval from every pressure group, every citizen with a platform from which to issue praise. I like driving, I drive a lot, and I am overcome with delight that... at long last, something positive is being done to reduce, even by a little, the stupid, selfish, reckless driving I have to contend with. Every day I pick my way through a litter of halfwits, clearly unqualified to be in charge of half a tonne or so of fast-moving metal, performing the most absurd... manoeuvres. Nothing anyone can do will raise the driving standards of most of them, because technically they are legally licensed drivers staying barely within the law, but putting serious difficulties in the way of the worst offenders will make life just that much easier. I am absolutely delighted that the police... [are] able to impound the cars of repeat offenders and arbitrarily suspend the licences of drunks and those who go more than 50 km/h over the limit. But wouldn't you know it? Out of the swamp of the absurd Privacy Act, [the Privacy] Commissioner... rears his dinosaur head, bellowing that the new and long overdue reforms raise “privacy issues.” [The commissioner] wants... a “privacy impact report” done... [because t]here's a “risk”... that N[Z] could get a de facto national identity

card by backdoor methods. I expect this sort of nonsense from the Council for Civil Liberties and other stormtroopers of the politically correct left, but at least they don't exercise their adenoids at the taxpayers' expense... To complain about a privacy breach is no better than claiming a burglar's privacy is imperilled by installing an alarm... When you're overseas you carry your passport with you all the time because you want to be able to prove who you are to police, shopkeepers, bank tellers, and hotel clerks. It never enters your head that you are having privacy invaded. You value your passport, unflattering photograph and all, and produce it with a flourish whenever you're asked. If I shove across a credit card to pay for a meal, a tank of petrol or a pair of trousers, I don't consider I'm having my privacy invaded when I sign for my purchases and the waiter or retailer checks my signature against the signature on the card. I would prefer, as a matter of fact, that each of my credit cards carried my photograph as well, because if I lost it, the picture would make it less likely that anyone could pick it up and rob me by charging vast sums to my account... The sort of person who would object to having their photograph on a credit card or driving licence is the sort of person who has something to hide...

Commercial identification is now so widespread through bank and other credit cards, store cards and... the introduction of driving licences bearing identification, that protests... [by] civil libertarians and their ilk... against ID are like trying to rake dry autumn leaves in a strong wind... "Liberty doesn't work as good in practice as it does in speech"... [an] American philosopher... once said... Indeed, there is a case in today's criminally infested society in favour of proper personal identification.

...Sensar Inc... and... NCR, the world's leading supplier of... ATM[s]... are to jointly develop a new personal security system for bank cards using electronic scanning of a person's eye for identification, instead of traditional PIN codes.

...PIN numbers may soon become obsolete because of your eyes... NZ bankers are monitoring the development of a "human bar code", costing nearly \$30 million, for Citibank in the US. A video camera relays a close-up of a customer's right eye to a computer which matches it with one on file. This takes seconds and can be done through contact lenses or spectacles. An iris holds 10 times more personal detail than a fingerprint [(Sir William Herschel - 1833-1917 - introduced the use of fingerprints for identification purposes in India in the late 1870s; it was adopted in Britain, as a means of identifying criminals, in 1901)] and this system is considered virtually fraud-proof. It may later have other uses such as for passports or driving licences... Another possibility involves speech patterns which are highly individual.

...A High Court test case will decide whether revolutionary "facial mapping" technology can be used to check the identity of offenders caught on video surveillance cameras. Just as DNA gave lawyers and police a new tool to use in evidence, a new British technique promises sweeping implications in criminal cases. The computer software superimposes the facial image of the accused on that of the person caught on a video camera. An Auckland barrister... will next month seek High Court approval to use facial mapping in a criminal trial. A disguised [offender] was caught on video during the aggravated robbery and stabbing of a service station attendant in 1993. [The barrister's] client was convicted of the offence but a retrial was ordered after DNA evidence was produced... [The barrister] hoped to use "facial mapping" to defend the case. "Video cameras are widespread now... both the defence and prosecution could use [the technology] on a routine basis." The... Criminal Bar Association... said the new technique... [- which is already being] used in British criminal trials... [-] could be useful if shown to be foolproof, saving money and time.

...Experts say DNA evidence can only be used to exclude people from crimes not implicate them and they warned DNA profiles may not be conclusive... [d]espite... technological advances... There's still a chance any two members of the public can have similar profiles.

...A [US]n scientist discover a world of DNA evidence where none was thought to exist... Divers recovered the tomahawk... [used to kill] Harvey Harrison... the night of Feb. 12, 1995... from a... reservoir[. It had been] washed clean by 12 hours of immersion. "Usually in that situation we don't bother testing for DNA," says... [a] forensic biologist at the Victoria Police Forensic Science Centre. "We thought we needed a visible blood stain, at least. I don't know what made me decide to test it." [The forensic biologist] swabbed the blade with sterile cotton; incredibly, laboratory tests yielded a DNA profile that matched those of... the body[, which had been]... covered... in brake fluid and set... alight... "We couldn't see where we got it from. Not with a microscope, or any means." The discovery that DNA... could be retrieved despite the apparent absence of blood, hair or bodily fluids prompted [the forensic biologist and a] colleague... to ask where else DNA might be detected. Their answer, revealed last month in the British science journal *Nature* after a year's research: almost anywhere, on almost anything. "We tested objects that had only been held for 15 minutes, and we were able to find DNA... One experiment showed that if someone holds a clean object for even five seconds, they could leave sufficient matter behind for a successful test." Even smudged fingerprints on the inside of gloves, useless for comparison with fingerprint records, can provide DNA evidence. One property of DNA is that, in the right conditions, it can reproduce itself. This is the key to the researchers' work: using genetic techniques devised by [a] 1993 Nobel Prize winning scientist... they were able to convert one-billionth of a gram of DNA into enough DNA to allow examination. "All you need is a few strands... We supply all the chemicals and enzymes and put it through a series of variable temperature cycles." Thus, a new strand of identical DNA is made; repeating the process makes more. A few years ago, the smallest sample that would allow for detection of DNA might have been traces of saliva on a cigarette butt; now... a car thief may be identified by examination of the steering wheel of a stolen car... Prior to fingerprinting, U.S. authorities used a system of body measurements to identify convicts; it was largely abandoned after 1903, when two unrelated [people] with near-identical appearances and measurements... turned up in a Texas jail. Geneticists claim DNA identifications may become as widespread and standardized as fingerprinting quickly came to be. But concerns have been raised internationally that the new method may be too complex for juries to understand, or that it may simply be too expensive to use regularly. [However, a] Sydney lawyer... disagrees: "What juries are interested in are conclusions. Juries deal with computer evidence all the time, but they don't have to know how computers work." On cost, [the colleague] says: "The cost of gathering samples is insignificant. All you need is forceps and gloves and sterile cotton wool. Technical costs are virtually nothing. The main costs are consumables and labour to do DNA profiling." Advances in DNA identification, says... [the] assistant director (biology) at the [centre], may save more than money: "Typically, where a rape has occurred police will check on who in the area has a conviction for a similar offence and investigate them. If DNA data banks are established in the future, suspects will be able to be eliminated by comparing DNA without even contacting them. The disruption to the lives of suspects' wives and children will be gone."

...A year after a 13-year-old British girl was raped and killed in a youth hostel in France... her parents' request that all [of the youths] in the town be given DNA tests[has been granted]. People cannot be forced to undergo DNA tests, so they would be voluntary. Still, the... parents viewed the ruling as a big success... A homeless [person] was initially charged with the crime, after police said [it confessed, but it] was ruled out when DNA tests did not match the sperm found on the victim's body. With no apparent progress in the case, Caroline's parents asked the investigating judge to order DNA tests of all [the guys] in the town aged 15 to 35. The judge... refused. The parents appealed, and yesterday the appeals court ruled in their favour. That meant an automatic disqualification for [the investigating j]udge... The new judge... will attempt to conduct the blanket DNA testing in the town of 1800 people. Such blanket DNA testing is believed to be a first in France, although it is used more commonly in Britain.

...Police in Auckland are still waiting for their first "hit" just over a year since the introduction of a national DNA profile database. About 300 criminals in the... Auckland area have supplied a blood sample... [and] DNA found at crime scenes is [also] loaded into the databank... But the lack of success in cross-matching material from crime scenes with the database samples is not unexpected because many of the "blooded" offenders are behind bars. The crown solicitor for the Auckland area... would be astounded if there were any matches within two or three years of the databank being set up. "[The databank] has to build up to a sufficient extent to have critical mass..." But when matches do start showing up, police hope to emulate Britain, which has had a similar DNA databank for several years. "They... get... dozens of matches every week..." said... the project coordinator in the Auckland area... Faced with an exact cross-match, the suspect had little choice but to admit the offence... People convicted of

serious offences ranging from burglary to... murder... are liable to be ordered to provide a blood sample for the databank. Initially... police required nearly all such offenders to provide blood. But the courts said they had to exercise discretion. As a result... 90[%] of offenders must give blood for the databank.

...Police snipers were dispatched to two Cairo suburbs to hunt down animals, believed to be hyenas... [- a]uthorities have not yet identified the species... [-] which mauled 23 people during a two-day rampage. Many of the victims were children who were attacked by the beasts at Qattamiya's marketplace. The animals later broke into several apartments, mauling the residents. A young [gal] managed to throw a blanket on one of the attacking beasts and, with the help of others, was able to beat it to death. [Editor's note: 'A belief that has persisted to this day is that hyaenas are cowardly. This has now been finally disproved. Staff at the Serengeti Research Institute in Tanzania, who made a close study of hyaenas by following them on moonlit nights in a Land-Rover, found that at dusk hyaenas came out of their holes – often crevasses in the mud – to walk about slowly, meeting other hyaenas, exchanging greeting ceremonies until a pack of up to 20 was formed. They then set out, closely bunched or spread out, in a seemingly leisurely way to stalk a family party of zebras or a herd of wildebeest. Then they began to harass their quarry, snapping at them until they had slowed one down']...

A stalker is like a cat toying with a mouse, according to a world leader on the phenomenon. "Stalking is one of those activities that conjures up a host of brutal images," says... the deputy Minister of Justice and deputy Attorney-General for Manitoba in Canada... in the introduction to his report, *People who Stalk People*... "When a cat stalks its prey, it likes to play with the victim for a while, tormenting it for an agonising few minutes before finally killing it. Likewise, the human [being] stalker plunges his victim into a world of fear and terror by repeatedly following and attempting to contact the victim despite pleas to stay away. "The obsessive efforts of the stalker to control and intimidate often escalate into violence, including the death of the victim." Canada introduced anti-stalking legislation after the deaths of several [people] at the hands of... stalkers, including one victim shot through the heart with a crossbow. Before then, penalties imposed on stalkers in Canada had been largely ineffectual. Now it is an offence to repeatedly follow, communicate, watch or threaten someone. Similar legislation is going through Parliament in N[Z], though the proposed maximum sentence is only two years, compared with Canada's five. [The expert]'s report was used by prosecutors to prepare a case against [a] serial stalker... who was sentenced last week to 18 months' jail. Over 10 years, the 27-year-old panelbeater of West Auckland had stalked, harassed and terrorised at least nine [gals], the High Court at Auckland heard... During the 1980s several celebrities... were the obsessive targets of stalkers. But most victims are not celebrities or even public figures, says [the expert]. About 200,000 stalkers, from all walks of life, are believed to be active in the U[S]. Most stalkers follow and terrorise their victims, but do not end up killing them. In A[US]... a stalker tunneled into his victim's house, got into the attic and drilled holes in the ceiling... stay[ing] there for three months watching her every move.

...A[n Auckland] who found herself the target of a stalker will have to move house when [it] gets out of jail, the High Court at Auckland heard yesterday. The prosecutor... told [the court]: "We must not forget that there is a complainant in this matter who, according to the psychiatric report, is posed a great risk by this individual and who has been encouraged to move on the date of his release. Every time [the stalker] files notice of appeal, the complainant is faced with doubts as to exactly when this [pest] is going to be released, which obviously causes her some concern." ...[the High Court had previously] increased an eight-month term imposed in the District Court on the West Auckland panel beater to 18 months, after [the stalker] had appealed against sentence on four charges of breaching a protection order relating to his latest victim. Yesterday, [the High Court] Justice... refused... the... [stalker] permission to reactivate an appeal against conviction on two of the counts. [The prosecutor said the stalker] had calculated that if his appeal succeeded, [it] would be released immediately... Meanwhile, [the stalker] has filed papers with the Court of Appeal.

...Dry north-westerly winds... in the Wairarapa over the past six weeks... are being fingered as the villain behind an upsurge in crime... [that culminated in] a string of violent incidents in Masterton at the weekend... Meteorologists say the link between dry or foelm wind and human behaviour is well-documented... In N[Z] the dry north-westerlies hold high amounts of static electricity. This stimulates the pineal gland in the brain to overproduce serotonin and melatonin. The MetService weather ambassador... said... "Even though the winds may be linked to bad behaviour, they aren't an excuse for bad behaviour." ...In some... people... the thyroid gland was stimulated, which caused depression, though a few felt good after exposure to north-westerlies... A police spokes[person]... said some officers reported an upsurge in some crimes during a full moon. "But unless the answer really is blowing in the wind, I can't see bio-meteorology popping up in the next crime prevention pamphlet." - 1997

Card fraud and concern about security access to buildings, computer systems... prisons... and plain old money machines are driving the development of biometric identification which can look you in the eye, listen to your voice, scan your hand or recognise the bone structure in your face. Biometrics use the fact that no two people – even identical twins – have the same hand or eye patterns... Biometrics has already begun to make its way into our workforce... Tip Top Ice Cream has had Fingerscan units at its Mt Wellington factory for more than a year and claims they are just another clocking system... At Coca-Cola hand-scanning machines replaced time cards in late 1996... Athletes at the Olympic Games in Atlanta had to have their hands scanned to gain access to the Olympic village... In New Jersey and six other American states fingerprint scanners are used to crack down on welfare fraud where people are registered under more than one name. In Cook County, Illinois, a special camera analyses iris patterns on the eyeball to ensure the right people are released from jail... Disney World in Orlando takes hand scans of people who purchase yearly passes. John F Kennedy International Airport and Newark Airport are allowing selected groups of travellers to bypass the queue, using a combination of hand scanning and cards at a special turnstile. IBM is working on a project called FastGate to commercialise the service.

...A[US] has launched the world's first automated passport checks... At a cost of A\$1.2 million... the SmartGate kiosk scans passport photos and compares them with the faces of travellers – replacing manual checks by... officers at Sydney airport... [At first it']ll only apply to Qantas crew[s]...

Singapore is to increase the use of a high-tech immigration clearance system that does away with the need to show passports. A traveller will put a card into a machine, place a thumb on a scanner and go through a turnstile... [However,] South Auckland factory workers don't want their time clock to see their fingerprints. Despite assurances that fingerprint-reading time clocks do not threaten their privacy, workers at Formica (NZ)'s Papakura factory wrote to the company yesterday saying they unanimously rejected use of the technology... Formica has already assured its 250 staff that information cannot be passed outside the company because data cannot be "reverse engineered" to recreate a fingerprint image. An Engineers Union organiser... said [it] would take up the issue with the Privacy Commissioner. [The c]ommissioner... said yesterday: "The principle of having technology that identifies you from physical characteristics is not in itself repulsive to privacy. How it is done in any particular case may or may not be objectionable." [The commissioner said it] had not yet received a complaint about the technology... About 40 Auckland companies, and 10 others around the country, already use the \$6000 scanners... [A spokesperson for] iD Technologies, the N[Z] distributors of Fingerscan, said that ironically the system is used overseas to protect privacy by checking computer access to hospital patient records.

...As part of a new plan to crack down on burglars, police will get the power to fingerprint kids as young as 10. It's a good move – burglary is a gross invasion of privacy whoever you are and where ever you live. I expect civil libertarians to jump up and down at the fingerprinting of 10-year-olds who have been caught up to mischief, but the logic behind the move is sound. Growing up means testing boundaries and seeing what you can get away with – drawing on walls, testing car door handles, nicking something while the dairy owner is busy. It is those kids who always get away with it – because they are not caught, or their parents don't care – who become bold and risk becoming career crims. Fingerprint those young people you have caught, frighten the hell out of them, and it might be possible to steer them off crime – or catch them later on when stronger action may be necessary. Police have a pretty good idea which local gang of you[ths]... was responsible for a break-in at my place last year during the

school holidays, the only time of year we seem to suffer petty crime in my central Auckland suburb. The intruders... [broke a window but] triggered an alarm and were scared away empty-handed... [T]he police turned up the next day to take good fingerprints off the window sill. But there was nothing on file to match them. These kids are known to the police, but as they are under 17 and parental consent is required to fingerprint them under that age, most of them remain faces to be dealt with later.

...When [a 20-year-old] held up an A[US]n bank with his right ear jutting from a balaclava, [it] had no idea that his anthelix was narrow and prominent, his upper crus anthelicis wide and directed vertically and his intertragic notch narrow and triangular. Yet that was his downfall. For after a fruitless probe lasting more than a year, Adelaide police took a security camera picture from the bank to... an expert in anatomy and biological anthropology. The Adelaide University scientist... took less than 30 minutes to match the image to a suspect... – who confessed all when confronted with his aural indiscretion. It was the first time in A[US] that a criminal had been identified by his ear, and means the 20-year-old is likely to be jailed. The breakthrough also showed there was still room for good old-fashioned checks on body shape in these high-tech days of DNA sampling, molecular biology and fingerprinting. But the practice of ear identification seems to have languished since its heyday in 1960s paternity suits – N[Z] police and forensic experts can remember no recent instance of it being used in this country... [However, NZ]’s national crime manager... said... “It is... obviously an option for us. With someone as close as South A[US], we probably wouldn’t hesitate to ask him if a situation came up where we thought [the professor] could help.” ...Many other anatomical quirks can also be used to identify suspects. Nose and lip shapes are helpful and the size of a handprint is a good clue to a person’s height. And... posture could be used to identify a suspect, although general body shape was little help. But one major impediment to using those techniques was the murky and grainy quality of cheap security cameras businesses used. “Bank cameras give peace of mind to the staff, but are notoriously poor quality...” ...Some scientists – and the Nazis – measured craniums in the belief that certain head shapes could be linked with intelligence and psychological disorders, but environmental factors are now known to play a big part in skull shape... N[SW] police used hypnosis this year to make progress in the case of a [person] who pulled a young girl off a suburban Sydney street seven years ago. The girl has not been seen again and there have been no arrests, but police now have an updated description of the [person] they are seeking. In N[Z], forensic detectives have used seemingly everyday equipment to crack crimes. It was well known that typewriters have individual quirks that make each unique and therefore traceable, but police also can study a photocopier to see if documents were copied on it. Each photocopier has a unique set of marks – smudges, nicks, scratches... – which gives a machine a “fingerprint.” Recently police in Britain and the US have experimented with heat-sensitive imaging which can give a clear profile of an offender up to 30 minutes after... [it] has left the scene. The equipment – currently too expensive for mass use – can provide an impression of a face using different amounts of heat generated by parts of the head. The technology is based on the concept that body heat is not uniformly spread and minute variations occur around the face.

...*Face-mapping a legal first for NZ...* [Someone] has been cleared of a vicious robbery after his lawyer used the revolutionary evidence of a plastic surgeon... The... lawyer... contacted... [the] cosmetic and reconstructive surgeon... [after his client] was convicted of the 1993 robbery and stabbing of a North Shore service station attendant. They pursued an appeal and looked to Britain where scientists at the University of Glasgow had developed a face-mapping technique. [The surgeon] improved the method and set to work to show that [the client] was not the balaclava-clad [offender] caught on security camera during the hold-up... [The lawyer] went to the High Court to seek to have the evidence heard in a new trial, ordered after DNA evidence was produced. [The judge] said... “I accept the Crown’s submission that the court... has... a gatekeeper role to guard against suspect and deceptive science... However, there are times when judges must simply rely upon their own judgment and common sense in allowing the development of a new technique of forensic evidence to come before the court and, in my view, although applying all proper caution, this is one.”

...*Face-reading software notices twitches lasting a 20th of a second...* When [a police officer] started... work in California 30 years ago, questioning suspects often amounted to one thing: tossing the guy against the wall. “I decided there had to be a kinder, gentler way,”... [The police officer] began studying the faces of the people [it was interrogating, and] got so good at picking liars from truth tellers that [a] psychologist... of the University of California, San Francisco, began studying [the police officer] in the late 1980s. His talent, it turned out, was for detecting those faint or fleeting expressions in a suspect’s face that seemed inconsistent with what [the suspect] was saying or other clues. [The psychologist] called them “microexpressions.” Since then, [the psychologist] has been teaching law-enforcement officers how to catch microexpressions and has written a book about them... Liars can be spotted with a 95[%] accuracy based on an analysis of their facial movements and voices... [but the psychologist] trained... the... or[iginal police officer]... to get perfect scores recognising liars on videotape. Now the US Defence Department and the CIA are funding work to incorporate [the psychologist]’s research into software that would analyse facial movements captured by digital cameras... Ordinary observation just isn’t up to the task of catching liars. Judges, therapists and spies do no better than chance when asked to identify liars on videotape.

...*Lie detectors that can’t fail...* The last refuge of secrets and lies – the brain – may be about to reveal all. Scientists are finding ways to use the brain’s activity to expose truths a person may try to hide. The techniques could revolutionise police work, improve national security, and threaten personal privacy. “It’s the scariest thing around,” said... an outspoken critic of old-fashioned, unreliable polygraph machines. “The only thing worse than a lie detector that doesn’t work is one that does.” ...a neuropsychologist at the University of Pennsylvania, says new kinds of brain scans can reveal when a person recognises a familiar face, no matter how hard [the person]... tries to conceal it... It is easy to imagine... scanning machine[s]... being used in interrogation of criminal suspects or terrorists about their associates... “In the long term... we will have technologies powerful enough to understand what people are thinking in ways unimaginable now... I think in 50 years we will have a way to essentially read minds.” ...[“Show me a law that prevents crime,” a police officer says. “All we can do is act after the fact. You remember the Hoffman murder? Before her murder Mrs Hoffman came up here week after week telling us that her husband was going to do it and I believed it but I couldn’t arrest a guy for something that might be in his mind – that’s dictatorship.”] To the scientists, visions of Orwellian thought police do not overshadow the potential benefits and the tantalising scientific prospect of understanding how the mind works... [– although they doubt we will ever reach the point depicted in the] latest sci-fi thriller *Minority Report*, based on the short story... set in Washington DC 2054 when murder has been virtually eliminated thanks to three psychic beings who have visions of murders not yet committed... allow[ing] the Justice Department’s pre-crime unit to convict the guilty in advance... [In related news, t]he days of pulling people off the street to take part in a police identity parade are almost over... Now police assemble their shady bunch within minutes by tapping witnesses’ descriptions into a national database and getting a printout of mugshots in return. The latest advance is videotape identification, which gives a better image than photographs. Police chiefs are keen to make the most of it, despite a high-profile failure in the technology’s first court trial. Charges linking... a... 21[-year-old] to a home-invasion robbery of[a] pensioner... last year were thrown out in the Auckland District Court late last week after video identification was found to be unfair. Police selected taped interviews of nine [people] – out of a suggested pool of 40 – from a recently established video library in Wellington to add to [the 21-year-old]’s and show to witnesses. After viewing a compilation of 30-second, soundless video clips, [the pensioner identified the 21-year-old as the guy] who beat her for \$200... But [the] Judge... dismissed the charges of burglary, aggravated robbery, aggravated wounding and entering with intent after ruling that the videotape evidence was inadmissible. [The judge said the 21-year-old] was the only one... to fit the description given by witnesses... had not consented to his video interview being used... and... had not been able to consult a lawyer about it, a breach of the Bill of Rights. But [the] Assistant Police Commissioner... who is also the national prosecutions manager, said yesterday that videotape identification was an important tool and police would continue with it. “...and these days people... roped in to take part in a lineup... are likely to say, ‘What about a fee?’” ...a Victoria University law

lecturer who has studied police identification procedures, said that while video lineups were useful, interview footage should not be used. "...Britain, ha[s] a video library, but it isn't made up from police interviews. The subjects are in a more controlled environment, and police make sure they are all in the same position, same situation or making the same movement." However, British police had the power to film suspects covertly if they refused to be taped.

...An "intelligent" computer system which uses closed-circuit television to match faces in a crowd to mug shots of known criminals is likely to become London's latest weapon against crime. Scotland Yard and a local council have installed the \$US100,000... CCTV system for a trial in Newham, a poor district in London's East End. The computer system, called Mandrake, is linked to 144 CCTVs in Newham's shopping centres, railway stations and car parks and can scan up to 150 faces at a time and compare them with a database of criminals stored on a computer at the council's headquarters. If there is a match between a face in the crowd and a known criminal, the computer alerts a monitoring team in the town hall, who alert the police. Civil liberties groups said they were alarmed by the new system, but police defended its use... [P]olice will use the system to concentrate on catching robbery suspects. In the future, however, it could be used to search crowds for hooligans who stir up trouble at soccer matches. CCTV's developer, Software and Systems International, said the system was accurate enough to discern people hiding behind makeup or eye glasses. And growing a beard would not help either, the company said. Britain has 150,000 closed-circuit television cameras. While most Britons appear happy the devices are being used to tackle crime, civil liberties groups oppose both the cameras and the facial matching.

...Up to eight people [have] declined voluntary DNA testing... [during] the hunt for the rapist of a 91-year-old... in a N[SW] town... This is the first time in A[US] that police have organised a mass voluntary DNA screening to catch a criminal... None of the eight... was considered a suspect... The screening is opposed by some people who believe it is a violation of civil rights... "Of the people who have declined... [s]ome say they don't agree with the process. Some are not prepared to give a reason and we accept that." ...[however,] most of the people in Wee Waa, 430km northwest of Sydney, were supportive of the testing because the rape... was so shocking... [A] Detective Inspector... said... many in the... community believed it was their civic duty... A team of police have been doorknocking every household in the tiny cotton town since Saturday asking [guy] occupants for a swab of their saliva, a photograph and a thumb print. At least 170 people have turned up at the police station of their own accord... About... 600 [residents] are expected to be tested... and once a [resident] has been eliminated as a suspect, [it] will be notified and the sample destroyed... [In local news, p]olice are hot on the trail of 12 suspects after making the first cross-matches between the controversial DNA data bank and crime scenes... [S]ince the data bank was set up, blood samples have been taken from about 5000 suspects and convicted criminals. [A] Chief Inspector... said police were delighted with the first 12 "hits." ...one match related to a serious crime some years ago and the rest were mostly burglaries.

...The Government's plan to extend DNA testing to suspected burglars will be worthless without proper funding, says [the] Police Association... DNA testing has changed the face of policing over the past decade, but... budget cuts and overworked staff and testing labs meant it was not being used effectively... The Government has budgeted an extra \$900,000 over... three years for... an extra 550 DNA samples to be taken and processed.

...*Routine DNA test solves three-year-old rape case* A [guy] has been caught for a rape after the police DNA databank turned up a "lucky hit" that linked him to the crime. [The offender] volunteered his DNA to police... to the surprise of detectives... Faced with the evidence, [it] admitted the rape... [In another development, n]ew DNA test results may solve the... inquiry into the murder and sexual assault of Teresa Cormack. Napier police will tomorrow reveal details of further scientific tests involving DNA samples taken from the six-year-old's body... The... case came along when DNA tools were in their infancy. In 1988, forensic samples taken from her body were sent to England. It is understood that it was the first time DNA technology was used in a N[Z] case, but after five months of testing, the results were inconclusive. Also... hair samples from 21... suspects, were sent to the A[US]n Forensic Science Centre in Adelaide for analysis. Tests failed to find a match between the samples and the three strands of foreign hair found on ...he[r]... body. Teresa's mother... said yesterday: "...It's heartening and frightening that we are getting closer to the truth."

...Teresa[s] mother's)... recollection of how... the morning of Friday, June 19, 1987... turned into a nightmare was in a statement presented at a depositions hearing in Napier District Court yesterday[, at which a suspect]... aged 43, was committed to stand trial for the abduction, sexual violation and murder of Teresa... In 1987, [it] was ruled out as a suspect because... [the] Lower-Hutt father and sickness beneficiary... had a confirmed alibi – a visit to the Social Welfare Department at 9.30am. At the time, police believed Teresa was snatched around 9am.

...Teresa Cormack's parents clasped hands, bowed their heads and softly whispered "yes" as a jury last night convicted... a... sickness beneficiary and father of at least seven children... of the rape and murder of their 6-year-old daughter... It was the moment for which they had [long a]waited...

A... con[vinced] paedophile... was allowed to live with children even though social workers knew of his background because Child, Youth and Family could not meet the challenge [the paedophile] posed. In a damning report yesterday by [the] chief social worker... it is revealed that [Teresa's killer] eluded social workers for 20 years because the department's policies and systems were inadequate. [The paedophile] wielded influence over at least 18 children during that time and two of them are known to have been harmed... The... jury took just two hours to find him guilty... of [Teresa's] 1987 rape and murder... After the conviction, C[YF opened hi]s... file and commissioned [the]... report into its historical handling of him... [The paedophile] will be sentenced... [next month. ■ A Kelston resident, aged] 32... faces 34 charges involving burglary, abduction, assault and sex attack charges against four [gals] aged between 11 and 69... [It] has pleaded not guilty... to the charges... Eleven of the charges related to the 11-year-old girl... [whose neighbour] was wrongly convicted of raping[her (rp87, ln52). The neighbour]... received \$868,000 compensation from the Government.

...The son of the [Americ]an who inspired the... '60s TV series *The Fugitive*... is using new DNA evidence to argue the innocence of [his father, who was] convicted of murder... when [the son] was just seven years old. Long before O.J.'s (rp2550, ln5)... trial and JonBenet Ramsey's mysterious death, the murder that made headlines across the US and the rest of the world was that of Marilyn Sheppard, the young pregnant wife of Dr Sam Sheppard, an affluent Ohio-based osteopath. Convicted of bludgeoning his wife to a bloody pulp in the couple's bedroom in the early morning of July 4, 1954, Sheppard insisted [it] was innocent and claimed the real killer was a shadowy "bushy-haired stranger", who knocked him unconscious before fleeing the scene... Less than two months later, [Sam] was arrested and charged with murder... [P]rosecutors were demanding the death sentence... [The son] lived in terror that his father would be put to death and [it] would lose both parents. [The son] was relieved when his father was convicted of second degree murder and received a life sentence instead, but the agony ground on. Not only was his father in prison but, in January 1955, less than three weeks after the sentence, his grandmother committed suicide, unable to cope with her son being branded a murderer. Eleven days later, her husband... died of a haemorrhaging ulcer and long-standing cancer. "I am sure my father's conviction contributed to my grandfather's death"... His maternal grandfather... committed suicide when [the boy] was 12, widening the breach between the two families. "It was difficult for my mother's family – I didn't see them often. They believed the papers and thought that my father was guilty. At one point, I think they sued for custody of me..." [The son], however, never doubted his father's innocence... In 1964, after... serv[ing] 10 years of his sentence, [Sam] was released, when a appeal established [it] had not received a fair trial. Two years later... the US Supreme Court acquitted him of the charges through lack of evidence... Sam... lived only four years after his release. His clinic, home and family wealth long since sold to pay his legal bills, [Sam] tried to catch up the lost years with a string of affairs, a brief marriage, odd jobs... and by drinking. At 46, an alcoholic, [Sam] died. NOW... that boy is... middle-aged... and... is determined to prove that not only was his father innocent, but that the bushy-haired stranger existed and was a serial killer known to police. Armed with fresh evidence, including DNA swatches, blood samples from the crime scene and genetic material taken from the exhumed body of his father, [the son] is suing the State of Ohio for his father's wrongful imprisonment in a landmark court case. Sam Sheppard's son is determined to have the State of Ohio admit it imprisoned an innocent[person, and –] ...backed by

lawyers, investigators and scientists who have volunteered their time and expertise... [-] make it pay for “the terrible injustice” that destroyed his family and childhood.

...Remember... the... Massey [resident who] was one of the prime victims of the great traffic fine shambles revealed first in this column last year[?] The resident] was wrongly convicted over offences by a... Hamilton [namesake] and her pay was docked to meet fines without any reference to her. After great tooting and froing in this paper and elsewhere, [the resident] was cleared of the offences, had her seized money returned[, and] even got an official letter of apology... [But when the resident] went to apply for her full driver's licence a few days ago, the monster of official inefficiency walked again. As AA staff tapped her licence number into the system... it... [showed her] as living at the Hamilton address of [her namesake]!

...“People should not be presumed guilty on the evidence of [a] computer match.” That's the view of the Privacy Commissioner... “It is important that data matching is not seen as proof of anything. It merely establishes information that needs to be followed up before any conclusions are drawn.” ...The proof definition comes from an overview of a real mess the Department for Courts got itself into [two years ago]. Then, nearly 4000 of what [the commissioner] describes as “threatening” cards went out in one mailing to Aucklanders. The red cards demanded payment of fines most of the shocked recipients had no involvement with. The mailout muck-up followed an... arrangement the courts made... to check data on unpaid fines against details in the motor vehicle register. Rather conveniently, the two computer systems were at the same place, maintained and operated by the same company, EDS, and on the same computer hardware. The... programme produced 3967 “matches”... Of the “matches”, 2166 involved cases where neither the name nor the date of birth were an exact match. Despite this flaw, court officials thought they were useable and sent those demands to all 3967 presumed debtors. The Department for Courts later admitted that it had “tried to be a little clever” and it hadn't worked... [The commissioner] has released a report on [the] cosy arrangement... – and... has also set up an inquiry into the quality of data which prosecuting agencies like the police hand on to the courts and on which they rely... The report by [an] Auckland barrister... shows that not only was the “match” a mismatch, but it also breached the Privacy Act. The two departments should have got statutory approval for what was done. The courts acknowledge that and say they have not done it since and do not plan to repeat it. Strangely, the other department involved does not seem to have known officially that the “matching” of its computer data was happening. [The barrister wrote]: “As far as I am able to determine, the Department for Courts did not involve the Land Transport Safety Authority at all in preparations for, or operation of, this matching exercise. It is unusual for one agency to have sufficient access to another agency's computer to be able to prepare a file for matching without the assistance of the ‘holding’ agency, but... that seems to be what happened.” ...EDS did not believe the data sharing – although not authorised by the LTSA – was prohibited because the contract between the two did not make that clear. In his introduction to the... report, [the commissioner] says: “...I have become concerned in recent years about initiatives by some officials and others to short-circuit information matching safeguards and to establish programmes on some informal basis. It is deceptively attractive to think that computers can infallibly sort out matters affecting real people.” ...had the programme been authorised “significant data quality problems would have been discovered and avoided”... The report recommends changes in departmental systems to comply with the Privacy Act and to improve privacy safeguards... That's great. It deals with a problem of two years ago. But mismatches are still going on – like the Howick [gal] somehow bundled with... \$522 [worth of]... fines incurred by a... beard[ed youth]... from Papakura... Or the Whangaparaoa [resident] dunned last week for court costs of \$90 on a parking ticket offence in Newmarket in February 1989 involving a yellow Toyota [it] had never owned... Then there's the Henderson [resident] who has been notified [there i]s a warrant out for her arrest involving a claimed careless driving conviction in 1987. [The westie] knows nothing of it, was never advised at the time of the hearing, the verdict or the fine. [The westie] suspects it involves a licence stolen from her handbag in 1986. [The westie] reported the theft but Henderson police say the file no longer exists. Henderson court advice is to pay up... Not even a suggestion [the westie] apply for a rehearing as [it]'s entitled to do... If the... systems fault [from two years ago] hasn't been repeated, what glitch caused these and hundreds of others documented to this paper... For some reason, it's taken two years to clean up one part of the mess. How long will be needed to do the whole job? ...[Incidentally, my] wife went to collect our mail and stopped to pull up some weeds on the way. [My wife] did not lock the door behind her and someone was quick enough to go into the house and steal her handbag. When [my wife] reported the theft to the police [my wife] was told it was not a theft, [my wife] had *lost* her handbag and... could only report the event under the heading of lost property, since [my wife] did not see the person with the bag and no damage was done to the house. So there was no crime. Presumably if the person is found with the bag they will be rewarded for ‘finding it’. This is a great way of reducing the crime statistics. Give the crime a new name and they don't have to include it when the theft figures are added up.

...Police work should be contracted out so more savings can be squeezed from the force's budget to pay for its troubled computer, according to Government papers... obtained by [a] Labour MP... under the Official Information Act... Police originally agreed to repay \$23 million a year, but after last year's review it was agreed that figure would be reduced to \$15.9 million. The figure was cut mainly because of a decision to defer privatisation of some police work... [But the PM, the] Police Minister... and his predecessor... had given assurances that money freed up... [by] last year's police review... would be spent on the frontline. “Instead, the police are having to cut back everywhere to pay back the Government for this damn computer,”... Treasury, police and State Services Commission officials are discussing the future of the... Incis project... with contractor IBM.

...[the] Police Commissioner... last night laid blame for the \$104 million Incis debacle squarely on its architect, computer giant IBM, which is walking away from the half-finished system. [The commissioner], whose own career in the top police job is threatened by the mess, vows to make IBM finish the job... Under the contract the police could force it to fulfil its obligations or pay compensation... The company told police yesterday that it would not finish the controversial system, which was supposed to revolutionise policing, but is already three years behind schedule... [An IBM spokesperson] said from Tokyo the company would continue to maintain the already implemented stage one of the system, but would pull out of two more stages... [which] were designed as key tools in the fight against crime, giving officers the ability to: • Predict and analyse crime trends. • Receive full details of suspects while on the way to a crime scene. • Build up a picture of suspects, including their associates and vehicles. [The spokesperson] said the Government had refused to hand over more money or reach a compromise in negotiations in the past month, and did not give proper consideration to the options IBM had offered. IBM had made no profit from the work it had done, and was owed a significant amount more... The Minister of Finance... said... IBM had pocketed \$54 million of the \$104 million already spent on the project, which was about two-thirds complete... “They're running at a loss, of course, but that's their problem rather than ours... They're one of the world's biggest computer companies, they know what a contract means.” ...[the police commissioner] blamed the company “absolutely” for the delays and a lack of delivery under the contract and was frustrated there would now be more delays. The project, announced in 1994, was supposed to cost \$80 million... but was heading for a final cost of \$132 million... [The] Police Association spokes[person]... said police had made many sacrifices for the project and the system so far was cumbersome and no advance on what was already operating. “It's a loss-loss situation for police and for the public of N[Z.]” Labour's police spokesperson... is calling for a commission of inquiry into the system... One hundred jobs have been affected – 25 of them staff who will be re-assigned. A further 125 contractors have also been “let go.”

...There was a time in the IT industry when the saying, “No one ever got fired for buying IBM,” really was true. Today some IT professionals replace “IBM” with “Microsoft,” but even that's not a sure bet anymore. When Incis began in 1994, however, Big Blue still held considerable sway and the Government must have taken some comfort that a company with IBM's reputation was in charge... [of] the boys in blue's new computer system... The project was also conceived against a Government “think big” backdrop – even though some of those visionary ideas of the 80s were already coming unstuck. With the benefit of hindsight, one can trace how the Incis grand scheme got off the ground and then, through a combination of circumstances, developed a life of its own that no one could control. There seems no doubt that the Treasury, which approved the

project, was too easily persuaded – probably by a combination of police enthusiasm for the system and some good IBM sales staff. From the start, its potential was always over-hyped. But that's not where things went wrong. The problem with big computer projects is that they take time to implement and, during that time, technology changes too – often at an alarmingly fast rate. A pivotal moment in the life of Incis was the decision in 1996 to change the computer's underlying operating system from IBM's OS/2 to Microsoft's Windows. The short history of the PC industry tells us that was the right thing to do: OS/2 is no more and Windows rules. But that change seemed to open the floodgates for a whole lot more change – variations to the original contract – intended to modernise the system that was getting out of date before it was even built... IBM can rightly argue that's what caused Incis to get off track. But it must also shoulder a considerable part of the blame. In the most recent \$20 million variation to the contract, the Treasury cites non-performance by IBM as part of the reason for the blowout. That was due to “the disestablishment of the IBM US division underwriting the Incis software development, and the later failure of two IBM divisions to progress the software development, resulting in an 18-month project delay.” Sorting out the mess is likely to be a long, litigious road. Can the project be retrieved by a new contractor? Probably, but at significant extra cost... – and some may argue it would be better to start over.

...Police staff swooped on the national training college in Porirua yesterday to tell everyone that Incis works... [and is] a vast improvement on what they had before... [An] Auckland City District Intelligence... [d]etective... said questions which would previously be answered by using two different computer systems and searching through paper files could now be done by Incis... [The] project manager... was happy with the products IBM had supplied police... Incis had been a great time-saver for officers in rural areas[– the manager] gave the examples of staff in the Rangitikei district town of Hunterville, who [previously] had to drive... 80km to enter data at Wanganui, and at Ranfurly in central Otago, whose notes were entered at Te Anau. “Now they are able to enter case notes straight into the Incis system.” Incis also allowed on-line access to a law library, which included legislation, case law, precedents and procedures. Use of the electronic library had already resulted in considerable savings for police.

...Frontline police are frustrated – but not surprised – that IBM has logged off a computer system that promised to revolutionise their work. From inspector to constable, those who spoke to the *N[Z] Herald* were disillusioned about Incis. Some said the first stage of the system, installed in May, had helped them to access information, but most were scathing, saying it was cumbersome, and not worth the \$104 million it had cost... A senior sergeant running a small town station said his staff had benefited from getting new computers, but they could have been a lot cheaper. “I... actually pushed it along... and I was bloody booed, and now of course people are saying, ‘Told you so’.” ...“All it is is Wanganui [the old computer] with colour, and maybe a bit of e-mail slapped on to it...” said a detective sergeant, who... did not go to Incis training because [it figured such training] would be a waste of time... [In contrast, a]n inspector said the system was more enhanced... and... easier to use... than the Wanganui computer, which it was meant to replace... “The system looks stupid now, but it's certainly got possibilities.”

...Computer giant IBM has won back-handed praise... for walking away from the notorious 4000-page Incis contract... from[the] Act leader... who was Police Minister until Labour lost the 1990 election... “IBM have done the right thing... They knew it wouldn't work and it took leadership to finally say, ‘We made a mistake, let's stop throwing good money after bad,’”... Such leadership was lacking from the present Government... although [the Act leader] suspected that whichever political team won the next election would have cancelled the rest of the contract anyway if IBM had not pulled the plug. Although the Government did not approve the Incis project until 1994, [the Act leader] recalled fending off an approach by the police for a grandiose computer system four years earlier... [The Labour Police Minister] dismissed claims then that there was nothing available overseas, out of hundreds of larger police forces, to meet this country's crime-fighting needs at a fraction of the cost of inventing a new system. “I said: ‘You are going about it the wrong way – stop and work out exactly what a constable needs, and then work out a computer system that best meets the needs of beat police’.” ...Yet police chiefs wanted to leap from the “horse and cart” era to some nebulous world-beating system, too unwieldy for ordinary police officers to use comfortably. [The former Police Minister] mistakenly thought that [it] had talked police out of [the grandiose computer system], as there was no attempt to bring an amended version back to him. But... within months of the election, the police put an identical plan before his National Party successor[. The former Labour Police Minister accused his successor] of setting the ball rolling by commissioning a scoping report... [His successor] confirmed asking for a scoping report, but said this had a very small budget and [it] turned down three police requests to take a proposal to the cabinet during his three years as minister. His prime concern was that a new computer system did not displace any of the 900 extra police promised by National, but... was [also] very nervous... of approaching a three-stage high technology project in one “megabyte.” Having “no understanding of high technology,” [the successor] consulted... the... Communications Minister... “[who] knew a lot about this and said [we sh]ouldn't touch the proposition with a bargepole.”... It was only after [someone else] took over the police portfolio that the project was approved... [The Communications Minister] would not comment on IBM's withdrawal from its contract, but documents obtained... under the Official Information Act confirm that [it] held deep reservations in February 1994. “I consider the police have opted for a higher-risk solution than that which would have been provided by an international standard solution,” [the Communications Minister] said in a letter to [the new Police Minister] two months before the project was approved. [The Communications Minister] ultimately supported the project, however, noting that it appeared from assurances received by the Government that “the contractual obligations on the vendor are strong enough to minimise the risks involved.”

...The Crown Law Office has been instructed to provide cabinet ministers with advice on possible legal remedies after IBM's dramatic withdrawal from Incis... However, ministers will first try to resurrect talks with IBM to try to avoid a costly legal battle.

...Taxpayers could soon face legal bills of up to \$24,000 a week after the Government's decision to sue IBM over the failed Incis police computer system. The Minister of Finance... said yesterday that the Government had begun proceedings against IBM for pulling out of the \$130 million contract last week. The... bill could quickly reach \$100,000... although the Government might get its money back in court costs if it won... Labour's police spokes[person]... said a long and costly court battle could now be expected. “The only winners in this whole sorry saga will be the lawyers.”

...Computer giant IBM is suing the Crown for more than \$75 million over the failed police Incis computer system. IBM wants compensation for what it says are losses suffered in the project. In a separate claim, it seeks more than \$2.1 million in previously invoiced charges.

...The Treasury spent \$1.4 million putting the doomed Incis... project to death, paying more than \$700,000 to consultants alone. Eight consultants were hired, as well as legal advisers, for the negotiations to settle the dispute with computer giant IBM. The revelation of another large Incis-related bill for taxpayers has the... Government pondering the wisdom of continuing with a costly inquiry into the saga. “It's another expense in what can be regarded as a massive waste of money around that project,” the Minister of State Services... said yesterday. “But I think there is a general view that the Crown got off relatively lightly in the settlement, and therefore it's probably fair to say that if money had not been spent getting the best case together, it would have cost taxpayers more.” The... project was abandoned... when the Crown and IBM reached an out-of-court settlement... [in which] IBM paid the Crown \$25 million, and the police handed over \$18 million for work the company had already completed... The... State Services Commission and Department of the P[M] and Cabinet also spent money on settling the dispute... The cabinet would consider the worth of continuing the inquiry. “It would not be right for me to say it should continue or not, but it's appropriate for the Government to say, ‘What is likely to be learned?’” [the minister] said. “It's clear from reading papers that [Incis] has been a monumental balls-up.” The Police Association wants a halt to spending on Incis. “We are throwing more good money into what is appearing to be a bottomless pit,” said the association vice-president... “How much more is going to be poured into pointing fingers or trying to clarify things?”

...Police have put the IBM mainframe from the failed Incis computer system up for sale. Advertisements calling for expressions of interest appeared in national newspapers on Saturday. Police have already received some interest... [A spokesperson for the] Police Minister... said the \$7.6

million mainframe was too expensive to run and was taking resources from frontline policing[, but wouldn't comment on the minister's attempt to blame the computer's problems 'on an act of God']. A modular computer system, already used by Wellington police, will be set up in its place.

...It is not quite Judge Dread, the comic-book hero who dispensed rapid (and often nasty) justice from his motorbike. More like Judge RAM: an intelligent computer program that sorts out roadside disputes. The device, which is operating in Brazil, uses an artificial-intelligence computer program called Electronic Judge, and is carried in a laptop computer to the scene of an accident or dispute in a legal "rapid-response-unit" with a judge and clerk, accompanied by police. It can then take account of witness reports and forensic evidence to recommend a verdict. It can also issue on-the-spot fines, order damages to be paid and even suggest jail sentences. The Electronic Judge is presented with multiple-choice questions such as "Did the driver stop at the red light?" or "Had the driver been drinking alcohol above the acceptable limit of the law?" ...a judge in the Supreme Court of Appeals in Espirito Santo state, who developed the program, said that the decision-making process in such simple cases required no difficult interpretation of the law. "If we are concerned with nothing more than pure logic, then why not give the task to a computer?" The Electronic Judge provides a printout of its reasoning, and if the human judge disagrees, it can be overruled. Most people were happy to accept the decisions, said [the developer. But the developer] admitted that some did not realise they were being judged by a computer. The device is part of a scheme called Justice on Wheels, intended to ease the load on Brazil's overburdened courts by dealing at once with straight-forward cases... [In local news, t]he Government has placed judges on probation to deliver tougher prison sentences for criminals... And if they don't deliver... [the] Justice Minister... might entrench stricter sentencing guidelines for them in law... [The minister has] ordered a review of sentencing and the use of parole provisions... and expects a separate sentencing bill next year... "The problem we've got with our present system is when you look at the sentences actually served by murderers in N[Z] jails, you find they are clustered around 11 to 12 years... Ten years is quite long enough in the case of some murders. In the case of others, you would want to see the perpetrator spend the rest of their natural life in prison."

...JUDGES will soon lose the power to give convicted criminals suspended sentences[, which]... were introduced in 1993 to keep people out of jail... "I do not see a future for the suspended sentencing option in N[Z] courts,"... said... the... Justice Minister... "The laws have failed,"... They are likely to be replaced by heavy fines or prison terms... [However, the] minister... says... the problem is not with the law[s] but with the people who administer ...t[hem] – judges... Campaigners for tougher drink-driving laws believe... judges... found it easier to upgrade a three-month jail sentence to six months suspended. If the person reoffended during the suspended sentence they went to jail for the longer term... [By the way, this] week... only one news item has managed to occupy my attention entirely. The story of the little boy who broke into the Alice Springs reptile centre to kill a swathe of animals and feed them to the zoo's resident croc was totally riveting... What sort of child is reckless enough to break into a zoo at night, and so destructive that [it] does so only to kill the animals inside? "Quite a nasty 7-year-old," was how the zoo director described the boy. By all accounts, this child comes from a family with a history of violence. No surprises there. I'm normally pretty optimistic about the average punter's capacity for change and growth through life, but it doesn't take a degree in psychology to bet this is a pretty disturbed child who will, like as not, grow up into a disturbed adult in time. There's little to do but hand-wring in a case like this.

...JAKE the Muss will always be at risk of leaving his [partners] more than just broken hearted. New research suggests wife-beaters such as the brutal character of Kiwi movie *Once Were Warriors* are beyond help. The UK research shows [guys] who hit their wives or partners will probably do it again, even after counselling. The British Home Office survey found only 25[%] of such offenders finished therapy. The shocking findings have lead[*(sic)*] to that government ditching therapy and putting more money into victim support... [Some of the money will be used to create new identities] under a protection scheme to help victims of family violence... The Hamilton Abuse Intervention Project... coordinator... agrees many wife beaters are beyond help... [Guys] convicted of domestic violence in Hamilton were usually ordered to have counselling... "About 15[%] walk out of the course exactly the way they were when they came in, and maybe another 70[%] of guys have some change – but I still wouldn't want to introduce them to my daughter,"... [The coordinator] said counselling worked best with first-time offenders. "The courts' priority at the moment is trying to stop repeat offenders, but we feel that's putting energy and resources into the group least likely to change,"...

IF you thought rehabilitating repeat offenders was a lost cause last week's Inside N[Z] documentary proved it. *Going Straight...* followed four Auckland probation officers, the crims they were trying to help and their victims. From the start you could tell most of the crims interviewed would continue a life of crime. "I'm just a bad bugger and thought I might as well stay a bad bugger," one crim... said. And by the end of the show... [the crim wa]s facing charges on another serious violence offence. But there were some positives. The probation officers in the documentary worked tirelessly – if pointlessly – to keep the rathbags on the straight and narrow.

...More restorative justice schemes are likely to follow Waitakere City's pilot project, says [the]Corrections Minister... Launching N[Z]'s first restorative justice practice manual, [the minister] said the rest of the country will be watching to see what comes of the pilot... "You have six months and 50 cases to prove... that this really does work." [The minister says NZ's 80%] recidivism rate for inmates makes clear that putting people in prison for longer is failing to reduce reoffending. Restorative justice aims to reduce reoffending and puts victims' needs at the centre of the justice system... "For the first time, victims will be directly involved in determining what should happen to make amends to them and the community." ...bringing offenders who plead guilty face to face with their victims is "perhaps the most devastating wake up call we can give an offender".

...A first-time offender wept after being jailed indefinitely... for sexually violating a 3-year-old boy... [it had] snatched... from a roadside and... for refusing to try to give up his fetish for wearing nappies. In the High Court at Whangarei yesterday... [the judge] said preventive detention had to be imposed as [it didn't] think a finite sentence would protect the public. There was a substantial risk... [t]he Matakohu farmhand... aged 45... would reoffend because [it] was unable to "withstand the impulses engendered by the fetish." ...[his] fetish had over the past 35 years provided him with sexual gratification, comfort and protection... "While this continues, the fantasising will continue, which includes the involvement with young children." ...[the farmhand] had also committed five burglaries in which [it] stole nappies and baby toiletries from farmhouses... [The judge sentenced him] to 8 years' jail for the kidnapping, 4 years for committing an indecency, and 2 years for each of the burglaries. All sentences were to be served concurrently with the preventive detention which – like a life sentence – carried a minimum eligibility for parole of 10 years.

...A child molester with a 17-year history of sex offending has been locked away indefinitely... A psychiatric report described... [the] 33-year-old... as a fixated homosexual paedophile. [The paedophile's lawyer acknowledged that his client] was eligible for preventive detention but told the... High Court... judge that the protection of the public would be adequately met by a lengthy finite term. [His client] had shown remorse through guilty pleas that avoided the need for victims to testify, by a willingness to undertake treatment, and his voluntary revelation of the full extent of his offending. But handing down a sentence of preventive detention, [the judge] said there was "no remorse over the extended period that you were preying on these youngsters." ...The risk [the 33-year-old] posed to youngsters was inextricable from the pattern of his offending since... [his first conviction] when... 16... In 1991 [it] continued molesting a number of boys until caught, then confessed all and was offered a place on a sex offenders' programme in prison. "For whatever reason, [the offender] did not take advantage of that treatment... so the pattern has just repeated itself." ...One of... [the] victims was no more than an infant... Another boy, aged 7, had been persistently, remorselessly and cruelly abused.

...The sentencing of a convicted Manurewa child rapist has been delayed... because the Crown believed [the rapist] was eligible for an indefinite prison term of preventive detention – a sentence which can be handed down only by the High Court... [– although the rapist's lawyer... did not accept that his client met the requirements for imposing such a severe sentence. [The judge remanded the rapist] in custody for a fortnight to hear legal argument on moving sentencing to the High Court... [The person who raped] an 11-year-old girl... [had] appeared in the Otahuhu District

Court yesterday for sentencing on 10 charges, including... assault and aggravated assault... [In related news, t]he Corrections Department filed an application late yesterday to keep a serial sex offender from being released from jail this month. The... Parole Board will have the final say.

...Five sex criminals serving indefinite jail terms have been freed by the Parole Board... in the past 21 months. Four served just 12 years or less... The revelation has stunned a group demanding a better deal for victims' families, who say offenders serving preventive detention should stay behind bars... "Preventive detention is supposed to be a life sentence, but it's nothing like that[," said a spokesperson for the]... new victims group, made up of the family of Kylie Jones and another Auckland murder victim, Karen Stanley-Hunt... The Corrections Department refuses to name the offenders, say when they [we]re released or detail their sex offending, citing privacy and policy reasons... The Minister of Corrections... this week ruled out letting the public know who is up for parole and when. [The minister said it] did not want the Parole Board turned into a "public spectacle." Two sex offenders serving preventive detention have been in custody for more than 30 years each, but authorities refused to say any more about them. The *Herald* has learned that the pair are now old... and considered unable to cope outside jail. The next longest-serving prisoner... has been locked up for 26 years... [H]igher-profile criminals sentenced to preventive detention in the past few years include... [a person] who had 61 sexual violation convictions; [and a] serial rapist... who attacked 24 [people] between 1987 and 1996 and is serving at least 22 years.

...the 30-year-old low-life who... killed 23-year-old Kylie Jones... pleaded guilty to her murder... yesterday... [The low-life,] who has spent nearly all his adult life in jail for violence and sex crimes... also pleaded guilty to kidnapping Kylie Jones, robbing her and causing her grievous bodily harm. [The low-life] was remanded in custody to the High Court for sentencing next month. The Crown has yet to decide whether it will seek preventive detention in this case. [The low-life] made his surprise plea shortly before 3 pm. His case was originally heading for trial and was set down yesterday for a pre-depositions conference. In the attack on Kylie... [the low-life] stole some of her belongings, including three ATM cards... then went to a party in Glen Innes where [it] handed over a knife to his brother... In the days after the murder, [the low-life] tried to use one of the cards and police tracked him after witnesses provided a detailed description. Kylie[']s... family were in court for [her killer]'s three-minute appearance. They asked the inquiry head... to say that they acknowledged the guilty plea, but that nothing would change what [the low-life] had done to Kylie, her partner and the family. [The inquiry head said it] had no idea what persuaded [the low-life] to enter a guilty plea.

...A High Court judge rejected prosecution pleas eight years ago to jail indefinitely the [low-life] who went on to murder... Kylie... and instead sentenced him to 12 years in prison... for three attacks on Wanganui [gals]... The law required that [the low-life], who came to prefer life in jail, had to be released in April this year after serving two-thirds of his sentence. Two months later, on June 6, [the low-life killed]... Kylie... in a lonely reserve near her Glen Innes home... The Wanganui attacks took place... just... weeks after [the low-life] had been released from a four-year sentence for attempted rape... At the sentencing in the High Court at Wellington... [t]he prosecutor... said... [the low-life] had used extreme violence on his victims and deserved preventive detention... However, the judge said th[e low-life], as a 21-year-old, was too young for preventive detention and it was not plainly apparent that [the 21-year-old] would offend again in a sexual way. "It would be a dreadful prospect to impose such a sentence on a [person] who has really had no life outside institutions,"... But the detective who arrested [the low-life] for the Wanganui attacks... says... "It was obvious from things... [the low-life said that it] would offend violently again... [The low-life] certainly had a dislike for [gals], and in particular ones who wore short dresses. [The low-life] said to me: 'Hey, if my missus wore a short dress [my missus] would get everything [it] deserved'." ...Both... the... [detective and prosecutor] said that although they had sought preventive detention, 12 years was still a strong sentence... The maximum sentence for rape at the time was 14 years.

...Glen Innes residents saw [a guy] lifting Kylie... to her feet... but assumed [it] was helping her and did nothing. They then watched [the guy] lead Ms Jones into a dark reserve, where [it] tied her up and stabbed her repeatedly. The next day [the guy] admitted himself to hospital, telling staff [it] was Jones' uncle and [therefore] could not stay because [it] had to attend her tangi. Auckland police later went to the hospital undercover and watched [him] from a distance, anxious not to scare him in case [the 30-year-old] lashed out at the nurses who were tending to injuries [it had] suffered during the murder. The fresh details have emerged as part of a *Weekend Herald* investigation into events surrounding the June 6 killing... It was previously reported that no one saw the Tuesday evening attack. But police say a family across the road from the Eastview Reserve... saw [a guy] bending over Ms Jones... [- who had been] sent... sprawling to the ground... [by a] "king-hit"... The family had been watching t[v] and heard two piercing screams. "They looked out... [but] did not realise it was an attack. It was dark and wet... They thought [Kylie] had tripped over..." ...A family member told the... *Herald* [that they] regretted not doing more. In the reserve, [the guy] beat Ms Jones about the face[, then] used a butcher's knife with an 18cm blade to cut her clothes from her body. [The guy] tied her arms behind her back with her skirt, and bound her ankles with a piece of her camisole... forced her to reveal her credit card PIN number... then cut her throat, stabbed her twice in the back and up to 15 times in the torso and abdomen. Police are [still] awaiting forensic tests to determine if Ms Jones was raped... [though the guy] claims... it... did not rape her. After the murder, [the guy] changed his clothes and went to the Glen Innes shops, withdrawing about \$800 from Ms Jones' account... [The guy] used the money to buy large amounts of takeaways and alcohol, leaving Ms Jones' keys on a counter... hired a taxi, picked up friends and went to a flat in Maybury St, where [it] partied into the night. Meanwhile, Kylie's family had called... the... police when [Kylie] did not arrive home. Just after midnight, [a]Sergeant... found her body lying face-down in a creek in the reserve... "When the pathologist saw the state of the body, [it] said: 'You've got a lunatic out there'." Police were worried [the lunatic] would strike again, and began trawling through files on recently released prisoners. On Wednesday morning, [the lunatic] took a train to Middlemore Hospital. [The lunatic] had an infected cut on the back of his hand, which [it] told staff was from "hitting a guy in the face." After an operation... [the lunatic] discharged himself... When [the lunatic] left... a plainclothes police officer... followed him on to a northbound train. [The lunatic] got off at Panmure and the officer lost him. The next morning, police found him at his brother's house and arrested him. [The lunatic] initially denied killing Ms Jones, but then confessed. [It] showed no remorse.

...Kylie Jones... [was 'raped' and] murdered... in cold blood. [Her killer] had an excess of testosterone after priming himself for a fight that didn't happen. So [the low-life] killed a young [journalist as it] walked home from her bus stop in a quiet Auckland suburb. Kylie was much loved, talented and looking forward to the future. [Her killer] was and is a worthless piece of crap. Throughout his sorry life, people have tried to help him, support him and give him chances. [But the low-life] turned his back on redemption. Of course [the low-life] had a dreadful upbringing. But so did his sister. So have lots of other people. And they don't want to get back at the world by hurting innocent people. [Kylie's killer] enjoys hurting people. That's the only thing that gives him pleasure in a miserable world. That and prison. [The low-life] likes prison. And as a reward for killing Kylie [it]'ll be spending a very, very long time in the place... [it calls home. Kylie's killer] will live to a ripe old age - we all know that stress is a major cause of death, and [the low-life] won't have the stress of earning a living, holding down a job or worrying about the bills. And why? What earthly purpose does [this piece of crap serve? It] is beyond saving. Nobody cares about him. And we're spending a couple of million to keep this waste of space. Pretty high price to pay to be considered a liberal idealist country. I wonder if it's worth it? □ A]... convicted murderer was found guilty yesterday of the third of three sex attacks committed while on parole. The families of two of... [the] victims want an inquiry into why [the murderer] was allowed out of jail to attack again. Police had argued against [his] parole in 1995 because [the murderer] kidnapped a teenager and indecently assaulted her while on weekend leave in 1991 from his life sentence imposed for the murder of his partner in 1982. In yesterday's finding, [the murderer], aged 50... was found guilty of a sex attack on a 26-year-old Canadian tourist in Bolton St cemetery, Wellington, in August 1997... It is the third... [time the murderer] has been found guilty of... sex attack[s]... by juries in the past six months. His name was suppressed until the third trial so the juries would not know of the previous cases. The other two trials were for attacks on two teenagers on the same day in March

last year near Palmerston North. By the start of the third trial this week, [the murderer] had been sentenced to a total of 10 years in jail for those attacks. [The murderer] had already been recalled to continue serving his life sentence... [His] almost 80 convictions, many for assaults on [gals], date back to the early 1960s. [The murderer] has spent 29 of the past 33 years in jail. The mother of the 1991 teenage kidnap victim, who had a lucky escape when [the murderer]'s car became stuck in mud after [the teenager] was snatched from a Palmerston North street, said... "The parole system is sick, to let people like that out of jail... We inquired to see if there was anything we could do to stop him being paroled but all avenues were blocked. [One of the victims] came to see us after it happened and... cried and cried. I couldn't help but think this girl shouldn't have had to go through all that..."

...WHEN the parole board decides... the... fate... [of the person who] raped and killed Lower Hutt schoolgirl Karla Cardno... this week, recent embarrassment in relation to another violent offender may well hang over proceedings... [The board's chairperson has just] apologised to the victims of... a... convicted murderer... [who] reverted to serious offending... [after being] released from life parole... against the opposition of police and former victims... Once freed, [the murderer who]... had... 80 past convictions... attacked three [more people. The chairperson]... said the board had acted in good faith at the time, but its assessment of risk had been wrong. Risk is notoriously hard to calculate in the case of serious offenders, a card those who oppose [Karla's killer]'s release will be playing for all it's worth... [The prisoner had] pleaded guilty to her murder – which followed 22 hours of his torturing her – only after police finally found incriminating evidence. Karla's stepfather... has vowed to find him and kill him if and when [the prisoner is released ('the stepfather is due to appear in court after being charged with threatening to kill')]. It's not only the murder the board must take into account. Only a month before... kill[ing Karla, it']d been convicted for bashing... an elderly [gal] unconscious in a petty dispute over a car park and at the time of the murder his wife and children were living in a refuge because of his violent behaviour. In theory, it will be harder for [him] to get parole than it was for [the offender with 80 convictions]. In March this year[the] Justice Minister... issued a report claiming the board was now better able to assess risk than it had been at the time of [the other offender]'s release, and... it was now turning down more releases than it did at that time (23.1%... against 32%...). The last annual report of the parole board was – perhaps as a result of this – surprisingly upbeat in its assessment of its own success in the risk business. The board released the results of a survey it had carried out since 1985 on 488 criminals – the most serious offenders in the system – who'd been released after serving sentences of seven years or more... Among the[m]... were 143 murderers... Nine were convicted of a serious new offence within three years, the lowest rate of reoffending in the group... [But i]f you cast a wider net than this survey did and look at all reoffending by paroled murderers, the result is rather less upbeat. A study released at the end of 1997 showed nearly half of paroled murderers had reoffended in the previous decade... Currently 283 [guys and 16 gals] are serving life sentences... The[y]... are automatically eligible for parole after 10 years, but remain on parole for life and can be recalled... to serve out their sentence. Since 1993, well after [Karla's killer] was convicted, judges have been able to set minimum non-parole periods and have done so in about 20% of cases. One example... has to serve 14 years before [it] can go before the parole board[after being] convicted in 1995 of the double murder of... Gene and Eugene Thomas. Other notable examples of this are [the young Dunedinite], who has to serve 16 years[after being controversially convicted of murdering his own family]... But there is still debate over how to define which crimes are heinous enough to qualify for non-parole periods. Some crimes which sound as serious as [Karla's killer]'s, like the torturing to death of a 16-year-old Christchurch boy in 1995, have led to standard life sentences...

The killer of Wellington schoolgirl Karla Cardno should stay in jail until [it] dies as far as her family are concerned. They are fighting... [his] bid to be freed from Paremoremo prison. The Parole Board's decision is expected to be made public next week. [Karla's killer], now 39, has served 11 years of a life term for the torture, rape and murder of the 13-year-old... [The killer] made his second annual appearance before the Parole Board on Wednesday. Both Karla's family and the police have told the board they do not believe [the killer] is fit to rejoin the community. Karla's grandmother... is emphatic... "I don't care what anyone says, or how [the guy fools people, Karla's killer] is still dangerous. If they let that guy out [that guy] will do it again." An aunt... said: "There are different degrees of murder. What [this guy] did was one of the worst. [This guy] should never be given the chance to do it again." [A] Lower Hutt Detective... who made a submission on behalf of the police, said: "We have no information from any quarter, which includes profiles from people who have been part of his care, that suggests circumstances changed in the last 12 months and that [this guy] no longer poses a threat to the public." [The detective] said the killing had had a marked effect on all police staff and resulted in the inquiry head and two other detectives taking early retirement. [The d]etective... had been in charge of "trying to get inside the head" of [Karla's killer. The killer] confessed to him almost six weeks after the killing and led him to a desolate beach on the Pencarrow Headland where [it] had buried Karla's naked, bound and gagged body. "Nothing else in my career has had the impact on me of that case and nothing will. It was one of those horror investigations." Because of the nature of his crime, [Karla's killer] has spent most of his time behind bars in isolation. In prison, [the killer] befriended another Maori... who later killed Auckland journalist Kylie Jones... The pair helped with an anti-violence programme. [Karla's killer]'s criminal record shows moderate violence which appears to escalate in the late 1980s... [Eventually hi]s long-suffering and emotionally battered wife grabbed their three children and left. By then, police believe, [the husband] had already noticed Karla. The teenager, her brother, mother and stepfather... lived in the same Taita street... [The husband] went into a deep depression when his wife left, and one month later... snatched Karla as [the teenager] cycled home from the local dairy in the rain. Police say Karla saw [someone] pursuing her, and did a lap of the shopping centre to escape. Cutting through a side-street, [the husband] grabbed her and dragged her 170m to his home. A neighbour heard a scream at 7.30 pm but did not investigate. Once inside his house, [the husband] raped and sodomised... [Karla] in the upstairs bedroom... Through a window [the husband] could see Karla's frenzied family searching. Probably between 2... and 3 am, [the husband] moved Karla... into the boot of his car in the driveway. The following afternoon [the husband] drove her – probably unconscious but still alive – for 40 minutes to Pencarrow. At the beach, [the husband] turned back because too many people were around[and] went home, leaving Karla in the boot until nightfall before returning to the beach and burying her 1m under pebbles. A pathologist said [Karla] died of severe head injuries caused by "one or more" blows.

...[a NZer] was yesterday found guilty of threatening to kill the [perso]n who murdered his stepdaughter, Karla Cardno. The judge told [the stepdad it] was likely to get a prison sentence for his serious and repetitive threats to crucify [the murderer. The stepdad]'s niece described the verdict as a sad day for humanity. ■ T[he police officer]... who arrested Karla Cardno's killer says her stepdad... should not be in jail[– the stepdad] will be sentenced on Friday... [– saying] many of the cops on the case were so sickened by the killing they [also] [felt like taking the law into their own hands.

...ONE of N[Z]'s hardest prisoners gave a message of approval to [Karla's stepdad – a guy] hailed by thousands as a martyr for justice. "I've got big brown balls bro, but you've got even bigger ones. You're a hero," the inmate told [the stepdad when it was]... remanded behind bars for two weeks...

[Karla's stepdad] is no hero. Nor is the suspended prison term for threatening to kill his step-daughter's murderer a victory, even if those in the... District Court's public gallery who applauded... saw it as such. [The stepdad] may have become a cause celebre for these people, and their demand for tougher sentencing laws. But, in reality, [the stepdad is a guy] who, no matter how understandably aggrieved, deliberately flouted the law.

...just before [Karla's killer] was up for parole for the first time, [her stepdad] exploded. The Wanganui [resident] told journalists... it... would crucify [the killer] on his release and repeated similar threats to police. "I want his life from him and that means you either keep him for life, or I'll take his life... If I have to go and spend 12 years or whatever in prison to make sure [the killer] doesn't come out and move in next door to you, then I'll do it for free." [The stepdad] was eventually arrested on five charges of threatening to kill and convicted on three... this month. Yesterday, [the

stepdad was sentenced to]... nine months'... in... prison, suspended for two years... Back in Taita... [o]ne elderly... neighbour of Karla's family... said [the] threats had simply reflected what most of the community still felt. "Let's just say if [the killer] turned up here again, [it] wouldn't last long."

...A [gal] who killed two [guys] in a revenge arson attack has been freed after serving less than half of a six-year jail term – and paroled to live in the same street as the sister and mother of one of the dead... The family is shocked and disgusted at the decision... [that meant the killer] has been ordered to live in a house next door to... her victim's sister... and five doors from... [his] mother... But a *Sunday Star-Times* investigation... reveal[ed] the]... Parole Board... appears to have breached new laws... Despite signing the victim notification register – forcing authorities to tell the family about any parole hearing – [the killer] was freed without the family or police being told [it] was up for release... Phillip Hunt's sister... discovered [his killer] had been freed while shopping in Kawerau for her mother's birthday present. "I just about had a heart attack, [the bitch] looked right at me. Now we see her strutting around town. It ruined the birthday. I rang the police and they said 'no [the killer]'s not up for parole yet'..."

...POLICE were not told one of N[Z]'s most dangerous criminals was released from jail... [The c]onvicted bomber... was paroled from Auckland's Paremoremo Prison... after serving five years and two months of a 12-year sentence for a terror campaign in Christchurch... Police are furious they were not told when [the bomber] was being released. The *Sunday Star-Times* was told some officers wanted [the bomber] put under "unofficial" surveillance to see whether [it] still posed a danger... Police opposed [hi]s release when [the bomber] first came before the Parole Board in 1996, and again in September of last year... Paremoremo Prison would not comment [yesterday on the bomber]'s release and the Minister of Corrections... would not talk about the issue because "I'm on holiday"... [In international news, t]he killers of 2-year-old James Bulger should be released within months because "they have done all that is open to them to redeem themselves" during... [their] years spent in custody, the Lord Chief Justice ruled yesterday. The decision... to "set a tariff which will expire today" left the murdered toddler's mother... "disgusted and shocked." [The mother], who has campaigned to keep [the young]killers... in custody, said: "The whole case has turned into a ridiculous legal charade and I am sick of the mess the British legal system has made of it." Lawyers acting for James' father... said they were planning a judicial review of the decision and would be making representations to the Parole Board about the proposed release of the two boys... [A f]ormer Home Secretary... [previously] intervened to raise... the... tariff... to 15 years but his decision was successfully challenged in the House of Lords and the European Court of Human Rights.

...One of the killers of British toddler James Bulger tried to strangle a fellow inmate at the secure unit where [it] is being held, a newspaper claimed yesterday. [The killer] attacked a 15-year-old boy who branded him a "kid killer," wrapping an electrical flex around his neck and trying to throttle him... The attack apparently ended when staff at the unit overpowered [the killer]... His victim is reportedly planning legal action against him. [The killer and his partner-in-crime]... are... both... due for release this year, and a recent High Court ruling granted an injunction protecting their anonymity. Almost three-quarters of 600 people interviewed in a... poll believed the... [time] the killers have served in custody was insufficient.

...Until... police mugshots... were leaked to the media this month, the last time the world saw the pair was in grainy security camera film as they led a little boy by the hand from a... shopping mall in Liverpool on February 12, 1993. The toddler was 2-year-old James Bulger and the events that followed turned... [the pair] into the most hated children in Britain. While James' 26-year-old mother... searched frantically for her "beautiful little baby," [the pair]... took him to a canal and tried to drown him. They dragged him along some of Liverpool's busiest roads for more than 3km, swinging him around violently and dropping him on his head. They took him to railway tracks and poured a can of paint into his eyes. They stoned him with bricks, they bashed his head with an iron bar. They left him dead, lying across the tracks to be cut in half later by a passing goods train... The boys were arrested days later, and were sentenced in November that year to be locked up for eight years. As debate raged about the fairness of the sentences, they were increased to 10 years, then 15, then reduced last February... As the boys were led away from the dock at the Preston High Court after sentencing, [a]... lynch mob of 500 people outside bayed for blood... [As the pair of teenagers] near the end of their sentences, the family's fury and the public's horror have not abated. They are expected to be released in the next few weeks... They will probably first go to halfway houses, before they disappear into everyday life. They will not be allowed to contact each other, or return to Merseyside. The courts, fearful for the safety of the pair, have given them and their families new identities and impeccably crafted false pasts, and have banned anyone from publishing new photographs or descriptions of them during their lifetimes... [The pair] will have to get used to lying. They will have to lie every time they apply for a job[or] for a loan. They will have to lie on marriage certificates, even their death certificates will one day be a lie. They will have to watch their backs and their mouths. There'll be no getting drunk and bragging, no falling in love and telling all in a weak moment. No one says it will be easy, but James' parents are furious – at the parole and the anonymity... What is missing from the debate is the answer to the question that has plagued James' parents and the British public. Why? What drove two boys of average intelligence, albeit delinquents, to viciously murder a 2-year-old? There are only two people who can explain their crime, and even their recollection is said to be unreliable... [In related news, two]boys, aged 13 and 16 – who murdered a tramp by setting him alight while [the tramp] slept – have been sentenced to seven years in prison.

...A single lily... lies on the matting of thick grass covering an empty section in Northwind Ave, Pt Clare. Courtney Morley-Clarke, just 3 years old, died there early on Monday morning, within easy sight of the house where her parents and two brothers were sleeping. Her alleged killer is the 13-year-old adopted son of close family friends, who every year organised the street Christmas party from their home 300m up the street... The knife that killed Courtney has pierced the heart of the small town on New South Wales' central coast, and reopened much wider wounds in a country chilled by earlier child murderers and outraged at suggestions the killers of British 2-year-old James Bulger may be given freedom and new identities in A[US]. The murder has also renewed debate on lowering the age of criminal culpability, an argument given force last year during the trial of a 12-year-old Sydney boy accused of throwing a 6-year-old child into a river to drown. But above all is the single question: why? ...[●] Recently a] friend told me that they can't give a description of or announce lost children in shopping centres anymore because of the number of unscrupulous people who answer the call. What a sad state of affairs when you can't even risk a simple announcement without fearing trouble.

...The mother of one of the child killers who have been granted their freedom believes vigilantes will kill her son within weeks... "[The mother] believes the only chance he[r son] had to survive was to be moved abroad – and that will not happen." British media rumours that... James Bulger[']s killers]... could be offered a home in N[Z] were last night dismissed by [NZ's Foreign Affairs] Minister... "There has been no approach and frankly I wouldn't expect one. There is no good reason why N[Z] would want to offer permanent residency to these offenders nor any good reason why the British Government should expect us to... They would be very distinctive if they came to N[Z]. It would not give them anonymity and frankly they should remain in the country where they committed their offences." Earlier this year the pair were granted an unprecedented lifetime of immunity from exposure to protect them as they adjust to life outside. But several newspapers are believed to be preparing to reveal their identities and whereabouts if either turns violent. The Home Office believes they will be identified within three months and has already made contingency plans to protect them when their cover is blown. The disclosure came as [the]Home Secretary... vowed to reform the sentencing practice which allowed the... killers to... be... let out so early. "The public had the impression that they hadn't been held long enough and that's understandable,"...

BBC Reports: The Bulger killers (Prime TV, 9.35pm, Thursday...) asks if the time has come to allow these [youths] to rejoin society, or whether they should always remain prisoners of their past. Life licence gives Britain's Home Secretary the power to put them back behind bars if they reoffend. There was even talk about the teenagers being sent to live in A[US or N]Z... The parole board's decision caused a furore..., with James Bulger's mother... rallying opponents to their release... [Last week] it was reported the pair will be held for another six months at the secure units until the furore over their release dies down. So far the cost to the taxpayer from the initial police hunt to their release is estimated at \$18 million.

...A police[officer] who tried to save N[Z]'s youngest killer from a cycle of chronic offending says Child, Youth and Family Services failed the boy. [The boy]... was in the department's custody but had absconded and was running loose on the streets of Papakura when [it] and five friends lured Pizza Hut delivery [worker] Michael Choy, 40, to a dark driveway and hit him over the head with a baseball bat. On Saturday a jury in the High Court at Auckland found [the boy, now aged] 13, guilty of... [humanslaughter. The officer believes the boy, nick-named BJ,] would not have been [involved in Michael Choy's death] if social workers had followed through on plans for his care and rehabilitation... [The boy]'s family are also critical of the service, saying not enough was done to break his cycle of crime. The service says it did all it could with an extremely difficult child.

...The small boy with a cherubic face lingered in a Papakura alley, waiting for his victim to pass on the way to school... BJ... had stalked his quarry and knew this was the route [it] took each morning. When the boy walked into the alley BJ pounced, punching him repeatedly in the head and leaving him cut and bloodied on the ground. The reason? The boy had "got smart". The spiteful attack in February last year was BJ's trademark – [BJ] had become feared by children across South Auckland. It was also a stepping-stone to a killing. BJ wept in the dock in the High Court... as a jury found him guilty of the [hu]manslaughter of... Michael Choy on September 12 last year. Five other teens were also convicted for their part in the slaying... Police have scotched defence suggestions that BJ was just following along with his older friends. They say [BJ] would often be the ring-leader, encouraging older boys to follow him, and that [BJ] was easily the most experienced criminal of those on trial for the Choy murder... BJ was just 12 at the time of the killing and at 13 is the youngest person to be charged with murder in N[Z]. The boy was supposed to be in the care of Child, Youth and Family Services when Mr Choy died, but had run away. The N[Z] *Herald* can reveal that BJ had been running riot for years before the killing – terrorising, beating and robbing other children, encouraging friends to wag school, shoplifting, tagging, sniffing glue and smoking cannabis. It seemed there was nothing his family, education and welfare agencies or the police could do to stop his out-of-control behaviour. Until now, [BJ] was never charged with a crime because children under 14 can be charged only with murder and [hu]manslaughter.

...A Henderson resident... is fed up with high school students vandalising her property. The... [resident], who does not want to be named for fear of retaliation, says students regularly graffiti her fence and come on to her yard. Her property is down a private driveway shared by 13 homes, which leads to a walkway for Sturges Rd railway station... [S]tudents often smoke outside her property, have broken her fence, and damaged a number of letterboxes down the drive. They also throw stones on her windows, disturbing her sleeping five-month-old baby. "I ask them to stop throwing stones but they talk back and say 'it's a free country, we can do anything'." ...Ranui[s] Community Constable... says [it] will tackle the issue. "I am concerned about the damage being done to property around here and about the behaviour of the youth." ...many of the teenagers appear "aggressive" and have a "cavalier attitude". "I have no hesitation in prosecuting anybody I come across damaging any... property..."

A "one [boy] crime wave" laughed yesterday when [a]Christchurch Youth Court Judge... lamented new sentencing laws that stopped him sending the out-of-control teenager to jail. The 16-year-old, who cannot be named because of his age, admitted 50 charges of burglary and related property offending. The youth was sentenced to six months' residence with supervision in a secure social welfare facility, followed by six months' supervision. The teenager laughed and smiled as [it] left the court... ■ TONGA[N]... authorities are sending children in trouble to a lonely atoll where they are forced to live by themselves, catching fish, says the magazine *Matangi Tonga*. The independent monthly said up to 50 youngsters aged from 14 to 16 were on 'Ata Island, an atoll which is an hour's boat ride from the capital island of Tongatapu. It quoted [Tonga's]Prison Department superintendent... as saying most of the youngsters had been sentenced to six months for housebreaking... [T]hey were supervised by a single jailer, who every two weeks took food to the island to supplement the fish caught by the youngsters. They received no formal education... The magazine said the youngsters were not allowed visitors but once a month were allowed to return to Tongatapu to attend church and visit family. [The superintendent] said the island was not the best solution to separating children from adult prisoners, but it was a first step... Tongan law allows imprisonment for anybody 8 years or older... [but] Tonga has no detention facilities for juveniles.

...[the] Corrections Minister... wants criminal kids out of adult prisons – and into special youth units. A... report released yesterday follows strong public concern about cell suicides and the widespread belief that jail turns young offenders into hardened criminals. The report, prepared by nine Government departments, recommended setting up specialist youth units in place of jails for those under 17 and for 17 to 19-year-olds considered "vulnerable in adult prisons." N[Z] ceased operating youth prisons and borstals in 1985... Six regional units and an Auckland-based youth prison are suggested. The units would offer counselling and education aimed at stopping reoffending. Meanwhile, a... study by Victoria University's Institute of Criminology... found that young people are less likely to face further convictions after successful family group conferences.

...Judges are fed up with the failure of the Government to address the problems they see in the youth justice system. In an unusual blast from the bench, the Chief District Court Judge... yesterday told the Youth Justice Conference in Wellington that judges had been voicing their worries for nine years without result. [The judge] lashed out at shortcomings – some in funding, some structural, some managerial – criticising the Government, the C[YF]... and the police. Family group conferences had sometimes become a case of "going through the motions of a process," and recommendations were often nothing more than apologies and purposeful community work.

...Probation officers have allegedly been offering friends free gardening, lawn mowing and cleaning services to be carried out by sentenced offenders. Sources told the *Herald* that they were offered the "free labour" by officers they knew, who worked for the Community Probation Service. The Department of Corrections said it was against the rules for a probation officer to get people sentenced to periodic detention and community service to work for friends. The allegations follow last week's revelations that the service was under pressure from sex and drugs scandals and numerous investigations of staff breaches... Thirty-three [staff]were investigated last year... [O]f the 33 cases, 26 were found to have occurred... The revelations included the sacking of a former... manager after an internal investigation last year found [the guy] had sex with a [youth. The manager], who was based in the Otahuhu office, allegedly had sex with numerous youths [it] came in contract with through the service.

...[a r]epeat sex offender... stared blankly into space in the High Court at Auckland yesterday as [it] was sentenced to eight years' jail. The Mt Wellington resident[, who]... has already served two jail terms for sex offences involving boys... was convicted earlier this year on three counts of sexually violating a 17-year-old boy while working as a tutor at an Auckland training institute... [The offender]'s lawyer... continued to argue yesterday that the sex was consensual because the boy did not say "no"... [However, the judge] said the 46-year-old, who... had shown a lack of "true remorse" and refused to take full responsibility for his actions... deliberately befriended the "shy, gentle-natured" teenager, wooing him to his house with new clothes and food, before sexually violating him. The victim, now aged 18, did not flee the house for fear that [the tutor] would jeopardise his chances of getting into the Army.

...Increasing numbers of employers are using a free Government service to check the criminal records of job-seekers. The trend is worrying privacy watchdogs, who are concerned about unnecessary snooping into people's pasts. Requests for printouts from the Wanganui Computer have trebled in the past five years... [-] from 13,000... to 36,500... [-] with job-related inquiries growing fastest. Figures obtained from the Department for Courts... show the... department is receiving up to 450 requests a day, mostly from employers and insurance companies... The department has three fulltime staff working on the requests, and aims to respond within 10 working days... The department's solicitor with responsibility for the scheme... said the service was free, but if demand continued to increase, the department would consider charging to recover its costs. [The solicitor said it] would welcome a fee because it might discourage applications. As the scheme stood, it was open to abuse. His office had dealt with complaints where firms sought records of up to 20 applicants, rather than first deciding on their preferred choice and then checking for any criminal background. "Getting 20 people's records is an unnecessary inquiry – you get a lot of information about people you don't need to have," said [the solicitor]. Another concern was that people were forced to disclose minor convictions not relevant to the position they were seeking.

...Defendants' previous convictions may be revealed to juries in Britain but that tough anti-crime proposal is unlikely to be followed in NZ – where '20% of the population die with a criminal record' and a 'poll showed 68% agree with the idea that minor offences should be wiped from records after 7 years'. Britain's *Sunday News*... reported that defendants could be forced to reveal past convictions under justice plans being drawn up by the Government. The proposals, including longer sentences for repeat offenders, are expected to be included in a review of court procedure being carried out by a commission headed by [the]Lord Justice... The commission was set up last year by [the]Home Secretary... who is known to favour the change, the newspaper said. Senior British police officers have argued that an accused's criminal past should be disclosed where relevant. At present, it is allowed only in exceptional cases. But NZ's Justice Minister... said the idea carried a real risk of prejudging defendants. "The basis of the justice system is that the jury in the court approaches the trial with an open mind and no prejudice." It was frustrating at times for a jury to be unaware that an accused had a pattern of behaviour consistent with the crime [the accused] was being tried for, but revealing that information would be a huge step away from the principle of trying a person on the merits of the case... "I would be hugely reluctant to go down a track which might see a person convicted on his past record rather than the facts the prosecution has against him." ...the Auckland Council of Civil Liberties, said the move would be highly prejudicial. "A jury will say, '[The accused]... must be bad. Look at their track record – they must have done it'."

...BLACK and white, cut and dried, over and done with – that's the way it's supposed to work in both the courtroom and the press box, the first dispensing blind, impartial justice while the latter keeps a vigilant eye peeled for its miscarriage. It's how American schools present the comforting notion of crime and punishment to their students. Don't worry, they are told, the presumption of innocence is everybody's best defence. Put your faith in juries and a free press: our system is replete with checks and balances. It won't let us down. That's the theory anyway – although it would be interesting to hear what [one]30-year-old... thinks about America's cops, courts and press corps. Unfortunately, on the advice of lawyers, [the 30-year-old] isn't talking about his own experiences in the dock and on the front pages of New York's papers. Recently released on parole after serving 13 years for his alleged part in one of the most horrific crimes in the city's recent history, [the 30-year-old] quite rightly fears that the police are looking for any excuse to send him up the river again. In the three months [it] has been back on the street, the boys in blue have already tried it twice. That's what happens when your former friends, neighbours and every cop in the city knows you first and forever as one of the five black teenagers who, late one night in [the 1980s], were said to have waylaid a 28-year-old investment banker on a Central Park jogging track, dragged her into the bushes, pounded her skull with rocks and then raped the comatose victim in a pool of her own blood. Trouble is, while [the 30-year-old and his fellow]defendants did the time, they didn't do the crime, an inconvenient fact for a legal system that is now just beginning to concede that its prosecution of the case violated just about every principle of fairness and dispassionate jurisprudence. It was an appalling assault, but by the time [the]... defendants went on trial, guilty verdicts were a foregone conclusion. Long before they were formally charged with attacking the jogger, the five black faces at the defence table had been convicted in the court of public opinion... This reporter knows all about it. Back then, as an editor of the tabloid *New York Post*, I was one of the voices helping to whip up the lynch mob. Long before the verdicts were brought in, we news[people had painted them]... guilty as sin. It's easy now to make excuses, not that any are satisfactory... If the jogger had died, as doctors were at first certain... would[happen], it's almost impossible to imagine there would have been more than a whisper of protest had the five teenagers been sentenced to death, an option New York's penal code then precluded. Today, with capital punishment back on the books, they would not have been so lucky. The crack in the jogger case came when lab tests confirmed that a career mugger had raped the jogger, just as [it] had sworn to a prison chaplain. Those boys, [the mugger] told authorities, had nothing to do with it. The floodgates opened. New York now knows the prosecution team was aware that semen found on the victim didn't match the defendants' DNA, and that a wealth of mitigating evidence – the absence of the victim's blood on the accused's clothes, for example – was suppressed, glossed over, or grossly misrepresented. Moreover, the "confessions" were coerced with threats and trickery. The defendants signed papers admitting their guilt only after a detective lied to one of their number that the forensic lab could place his fingerprints on the jogger's satin shorts. Without a lawyer present, the learning-disabled suspect admitted to the crime rather than risk a stiffer sentence if his fellow suspects implicated him – as [it] was about to implicate them. One by one, public defenders urged the other boys to follow suit... The defendants' fates were sealed... Of the five, only [one] remains behind bars... [– it] was released... and quickly arrested again on a minor charge of drug possession that earned him an extraordinarily harsh five-year sentence... Family members say their jubilation is hampered by the knowledge of their boys' ordeal in the big house. There is talk of homosexual rape and beatings... Sooner or later, once the convictions have been vacated, there will be substantial awards of compensatory damages. Then the system will go back about its business as before, having paid for the privilege of not answering the question posed last week by one of the Central Park Five's relatives: "How do we stop it happening again?"

...the 38-year-old Manchester solicitor[']s... first words to a waiting world outside the High Court in London yesterday were for the two baby boys [it']d been convicted of murdering three years ago. Released by the Court of Appeal, [the mum] stood in the arms of her husband... and father of the two boys, [who']d fought relentlessly to clear her name. They were reunited yesterday after three judges ordered [her] release in a case that raises concerns over the safety of the criminal justice system. [The]Lord Justice... said that the jury at her trial... and the judges at her subsequent appeal had been deprived of important medical evidence that might have influenced their decisions... [The] jury convicted her by 10 to 2 of shaking or smothering to death Christopher, 11 weeks, and Harry, eight weeks, within 14 months of each other... [The mum] has always said the babies died from natural causes. But... [t]he prosecution presented expert evidence that the chance of two cot deaths in one family was one in 72 million. But on Wednesday [her] counsel... said that research suggested the true odds were more likely to be one in 100 to one in 400. [The]Lord Justice... indicated that the court's reserved judgment would be critical of the Home Office pathologist... who failed to share with other doctors the probability that Harry... died from an acute bacterial infection, probably meningitis... ■ [Yesterday]... Britain's longest-running miscarriage of justice [case was sent] to... the Court of Appeal... after three judges ruled that [the] conviction for the 1973 murder of office worker Wendy Sewell was unsafe.

...A... [youth] was sentenced to life in prison in 1974 for the murder of 32-year-old Wendy Sewell, who was found beaten and partially clothed in a cemetery in Bakewell, in the English Midlands. [Wendy] had been bludgeoned with a pickaxe handle, and died two days later in hospital. [The youth], who worked as a grave digger at the cemetery... [and was] aged 17 at the time of the murder but with a mental age of 11, reported finding Sewell's body to police. [The youth] confessed to attacking her after many hours of questioning without a lawyer present, and, according to his defence team, was never told [it] was under arrest... [The Brit] retracted his confession and maintained his innocence. [The Brit] would have been eligible for parole a decade ago, had [it] admitted responsibility for the killing... "There is a most powerful case for saying that this conviction is unsafe," said his lawyer... [The Brit] was released on bail... after a British court granted him the right to appeal... London's High Court... and Government lawyers agreed that [hi]s appeal was likely to succeed because of doubts about the legitimacy of his confession... The victim's husband... still believed [the Brit] was guilty. "You know the evidence as well as I do... It was presented and [the youth] was found guilty and nothing has come to light since that would cast doubt on that." ...[the Brit]'s parents... and... [the] editor of the local *Mallock Mercury* newspaper... have led a high-profile campaign for his release. [The editor] claims to have uncovered evidence pointing to... the [real]murderer... The ...ed[itor said the Brit's release]... was a "justification for old-fashioned investigative journalism... It's fantastic news for me and obviously for... the whole family." ...[the] case was referred to the Court of Appeal... by the Criminal Cases Review Commission, a body set up in 1997 to investigate alleged miscarriages of justice. The commission's decisions have led to the overturning of a number of high-profile murder convictions, including that of... a mentally retarded teenager hanged in 1953 for shooting a police[officer. The Brit]'s appeal is expected to be heard within the next few months.

...BRITAIN'S most notorious child killer[(r:p1220, ln39)]... will appeal the government's decision to keep her in jail for life. [The killer], 57, has long fought for her freedom but had her appeals rejected by several judges... [The killer and her lover –] known as the Moors Murderers... [–] were jailed for life in 1966 for the sadistic murders of two children... [The]y recorded their victims' cries as they tortured and killed them... [Her] lawyers claim her sentence should not go beyond the original 30 years. They will appeal the full life sentence to Britain's highest court, the House of Lords, and even to the European Court of Human Rights... [By the way, a NZ businessperson and c]onvicted double murderer... has lost his final bid to have his convictions overturned, after the Privy Council in London ruled against his appeal yesterday. The five law lords who heard [hi]s appeal announced that while [the NZer] had an arguable case, on the evidence [it] was properly convicted by the jury... [Hi]s lawyer... told the law lords that crucial evidence relating to the weapon and bullets that killed... Eugene and Gene Thomas in 1994... had been falsely linked to [his client. The]... evidence given by [an]FBI agent... had been flawed and that had unduly influenced the jury at [his client]'s third trial, after the juries at the two previous trials had failed to reach a verdict. The tests have since been discredited worldwide for providing a high number of false matches.

...A law expert believes the Privy Council will uphold "embarrassing" claims that the N[Z] Court of Appeal discriminated against high-profile criminals by refusing them legal aid. In London this week, four lawyers representing 13 convicted N[Z] criminals successfully argued for a full Privy Council hearing into their allegations that the... legal aid procedures were a "sham."

...THE Privy Council has long been the court of last resort for some of [NZ]'s most famous criminal and civil cases. And the rulings of its expert law lords – sitting 20,000km away from our own judicial system – continue to be sought by lawyers wishing to take a case beyond the Court of Appeal... [But NZ's links] with the Privy Council are set to be severed, with plans under way for a new supreme court in N[Z]. The P[M]... said it was an "absolute given" appeals to the London-based Privy Council would be abolished... But the move to scrap the Privy Council... is already meeting some opposition in legal circles... The... government abandoned moves to cut ties to the Privy Council in 1997 amid opposition from Maori who... were not properly consulted... [A c]onstitutional law expert... said... "The... Council has passed its use by date. It's really obsolete in legal terms."

...An appeals court in San Francisco has thrown out a shoplifter's 50-year sentence as being too harsh. The ruling could lead to hundreds of challenges from defendants who received near-life terms for petty crimes under California's "three strikes" law, which mandates long sentences for a third serious crime. In a 2-1 ruling, a federal court panel said [the shoplifter]'s sentence for stealing nine videotapes, valued at \$US153... violated the Constitution's ban on cruel and unusual punishment... The court noted that kidnappers and murderers could receive less time... [In local news, NZers] are encouraged to have their say on... a Supreme Court... The Supreme Court of N[Z] Bill proposes an end to Privy Council appeals in Britain and advocates the establishment of a final court of appeal in N[Z]. The... Attorney-General... says a Supreme Court would enable N[Z] to take responsibility for its own laws[, but also]... says increased access to justice is the motivating factor behind the decision... "Many N[Z]ers cannot afford to take their case the 12,000 miles to the Privy Council in London which only hears about 11 appeals from N[Z] each year,"... Submissions can be sent free post to Clerk of the Committee, Justice and Electoral Committee, Select Committee Office, Parliament Buildings...

The move to a N[Z] Supreme Court, ending the right of appeal to the Privy Council, is part of a process of decolonisation. It signifies a desire to chart our own course as a Pacific nation taking account of international, as opposed to imperial, law. Whether we view it with excitement or with fear depends to some degree on where we stand on this wider issue... Following the consultation rounds, a full and unhurried select committee process is crucial to allow the people of N[Z] to have a say. Some have suggested we need a referendum. While this is superficially attractive, it is no answer. The last... poll, for example, indicated that 51[%] of people support ending appeals to the Privy Council, 28[%] oppose and 21[%] are unsure or say it depends. Depends on what? Referendums are unable to tell us... Some Maori are sceptical of receiving justice from a settler court. Yet... the Court of Appeal has been more pro-active than the Privy Council in recognising the Treaty of Waitangi and Maori claims in general. In any case, the bill would not take away a right to appeal direct to the Sovereign. Some people feel that we have too small a pool from which to draw the judges, and that we lack the necessary depth of expertise. There is also a fear that social and political loyalties will influence judicial decisions. Coupled to this is concern over the proposed appointments process, with its perceived potential to stack the bench. These are real questions that the select committee must deal with. But of the 16 independent states that allow appeal to the Privy Council, 10 are planning to establish a Caribbean Court of Justice this year... Even the English do not, in general, have a right of appeal to the Privy Council. The status quo cannot last... Why not a Pacific Supreme Court? The idea has merit and some support here, but may not have much support among other Pacific nations at this stage. Of more immediate interest is the example of the Hong Kong Final Court of Appeal. It has an overseas panel of judges, one of whom sits on every case... By incorporating an overseas panel into our Supreme Court, we could make use of wider legal expertise in particular areas, while guarding against excessive insularity. Potential difficulties in finding suitable judges should not make us bar the possibility.

...THE NEW Supreme Court building rises in Wellington, and as its decorative facades were put in place last week, my thoughts were grumpy. It's not the arty cast-bronze renditions of native trees that bug me... but the thought of how justice fares here compared with elsewhere in the world. Take the vile... 73-year-old... Austria[n]... who raped his daughter... more than 3000 times during the 24 years [it] imprisoned her in a cellar... beneath the family home... [– along with some of the] seven children... fathered... [– who] has... now... been tried. That happened fast. Here, [the guy]... described... as "born to rape"... would have found a lawyer who'd argue the toss for years, on legal aid. [The father wou]ld be tried, appeal, retried, re-appeal, do his best to get to the Privy Council, find sympathisers, become a cause. The fact that [the father] claims his mother abused him when [it] was young would mean... compensation from ACC, along with his own victims, and a merry little industry would busily dilute the horror of what [it]'d done. Finally, [the father wou]ld be out of jail on good behaviour inside a few years, and marry some dingbat half his age who believed [the guy] never did it in the first place, and wrote him love letters throughout his jail term, enclosing her panties.

...The Auckland region's four district courts would grind to a halt if Justices of the Peace were removed from the bench, say local JPs. The president of Auckland JPs... has hit back at a suggestion by the departing Chief District Court Judge... [– who] has been appointed to the High Court... [–] that JPs should bow out of judging and be replaced by trained lawyers... Last year, 39 JPs heard 23,630 minor charges and worked for 6300 hours in the Auckland area... [D]istrict court judges had made it clear that they did not want to do that work... [The president] said JPs acknowledged the need for extra training. But... they were perfectly capable of hearing preliminary charges, depositions and minor charges.

...The tiny Northland community of Kaikohe is running out of people to serve on juries. With just under 7000 people registered on Kaikohe's jury list, the court is having problems finding 12 people who do not know the accused and have not already served on a jury. Its plight has now been recognised by Parliament, which will pass emergency legislation to give the town a wider pool of jurors... Parliament is poised to... extend... Kaikohe's]... jury boundary to 45km... The change could treble the number of people on the jury list... Kaikohe has about 32 jury trials a year, and potential jurors are c[urrently c]hosen from the same 6988 people registered on the electoral roll as living within 30km of the courthouse. Each time a panel of jurors is needed, the court has to summon 280 residents because so many of them end up being excused... In contrast, Auckland has 100,000 people on a regularly changing jury list, which is drawn from an even larger list of all those on the electoral roll... [But Auckland still has jury problems – a] major Serious Fraud Office trial alleging that two senior Mobil Oil managers took backhanders has been aborted because of bereavement and illness among jurors. The trial, involving eight lawyers... had been going for three weeks and was due to continue for several more... Theoretically a trial can continue with fewer than 10 jurors if all parties consent, although it is understood this is the first time in N[Z] that a jury has had only 10 members. Because of disruptions to a complex trial, [the judge]... discharged the jury and ordered a new trial... ■ [An American j]uror... walked out during deliberations in a carjacking trial in Maryland – and didn't come back. Not until police tracked him down the next day. [The 25-year-old] told the judge other jurors were becoming aggressive with him because [it] was holding out against a guilty verdict.

[The 25-year-old couldn't] convict the alleged carjacker because "I was not present at the scene of the crime and thus did not... see the defendant do it."

...Irrational jurors blocking verdicts and forcing expensive retrials will be thwarted by a new plan from the Law Commission. After six years of research on juries in criminal trials, the commission has recommended that 11-to-1 majority verdicts be allowed instead of the unanimous decision now required... [Since] 1993... the rate of hung jury[ies] increased from 4 to 9[%]. The High Court... had a high of 13.1[%] in October last year and was now around 12[%]. Of the 49 juries studied, five were hung – two as a result of a single "rogue" juror... "Retrials occasioned by one dissenting juror pose major personal, emotional and financial costs on all those involved in the process,"... [the] Justice Minister... said. But defence lawyers are angry, claiming verdicts would not be sound without unanimity. [The]Criminal Bar Association... said the Crown had to prove a case beyond reasonable doubt. "If one person has reasonable doubts about it – putting aside the rogue juror which research shows isn't very common – you have at least one person who has genuine doubt and that's a concern,"... The Auckland District Law Society criminal spokes[person]... said an 11-1 majority could result in lazy juries. [But the]Auckland Crown Solicitor... rubbished suggestions that majority verdicts would compromise the "beyond reasonable doubt" standard of proof. An 11-1 majority was still a high threshold, and N[Z] was behind the rest of the world by still requiring unanimous verdicts, [it] said. Among the changes, the report recommended that those accused of serious crimes, including murder, be able to ask for trial by judge alone. This would apply if they could not receive a fair trial because of their identity or the subject matter. Judges alone should also hear complex trials of six weeks or more because it was unreasonable to expect 12 people to give up their time for that long...

Britain is planning to expand the use of trials without jury to increase conviction rates. A government white paper on the criminal justice system proposes that judges sit alone in trials where they fear a jury might be subject to intimidation, as well as in cases of complex fraud... [By the way, a] headline in a British Sunday newspaper is causing much mirth and merriment in legal circles. "Fat cat QCs' pay to be cut in half," it said. At a glance... the legal eagles [a]re masochists paying for... permanent perverse pleasure. But the... QCs simply now have to make do on less money.

...["It's been said that the worst thing which can ever happen in a criminal trial is the truth comes out." "Do you feel there's a great element of theatre in a court?" "Yes – it's a big charade. Everybody's playing their little roles. You can call it a game, but it's a game with serious consequences."]

...an] English lawyer... is adapting theatrics fostered in more than 30 years in the courtroom for a different stage – all in the name of justice. [The lawyer] has been dabbling in acting for nearly as long as [it] has been practising law and this week... will perform a solo show to an audience of lawyers and judges at the N[Z] Law Conference in Rotorua. [The lawyer] adapted his show, *The Trial of Penn and Mead*, from a landmark case in 1670 in which a judge imprisoned an entire jury after they refused to bring in a guilty verdict. [The lawyer], who calls his show an illustrated story rather than a play, reckons there is not as much of a leap between his profession and his hobby as there might seem. "Every jury speech is acting, in a sense. They say that lawyers are frustrated actors. There are some barristers who are very, very good actors and they could have made it on the stage." [The lawyer] found an extraordinary account of the case in a London library one afternoon, while looking for material to entertain members of a visiting [US] bar association. The defendants, two Quakers, William Mead and William Penn (who later founded Pennsylvania), had written a spirited analysis of the trial. "I started to read it and I couldn't put the story down. By the end you realise this isn't just a case, it's a universal story of individual freedom and oppression. It's probably the most important jury case of all." The... [jurors'] eventual release established the absolute independence of a jury[ies]. Incidentally, 'blind people are now allowed to serve on NZ juries'...

Jurors in an Auckland drugs trial were taken to a party by defence counsel where they met the [defendant] they had just acquitted. One of the jurors has told the *Weekend Herald* [it] smoked cannabis and saw a yellow-powdered substance cut into lines at the party just a couple of hours after returning a not guilty verdict on drugs charges... The juror, who cannot be identified, spoke to the *Herald* because [it] believes that what occurred was "morally wrong and deeply hypocritical". A complaint has been laid with the Auckland District Law Society, which says it will act if its investigation uncovers wrongdoing. Auckland's Crown Solicitor... called the allegations "extremely disturbing"... The *Herald* has tried repeatedly over a number of weeks to speak to... [the] barrister about the party... at [his] Mt Eden home... Each time [it] has hung up the phone.

...Should there be exceptions to the rule that you cannot be tried twice for one crime? ...The Government is planning to dump the... rule that you cannot be tried twice for the same crime... Double jeopardy sounds like a Hollywood thriller. But it is at the heart of... principles of law stretching back hundreds of years. The N[Z] Law Commission scrutinised... the "rule against double jeopardy" when a New Plymouth gang member was acquitted of murder after getting a witness to lie at his trial... [The] Black Power gang member... could not be retried... [for] murdering Mongrel Mob member Robert Jillings in 1991[ies], but... was later charged with conspiracy to pervert the course of justice and was sentenced to seven years in prison... The law change... [– which] will apply to all crimes, not just serious ones... [–] will be introduced into Parliament next year.

...Consider the criminal defence lawyer as portrayed in successful TV dramas. Typically [a guy, it] will be ruggedly handsome but slightly dishevelled. A blend of maverick and conservative, [it] will disdain mindless authority but strive to honour a self-styled moral code. A mixture of detective, private eye, lateral thinker and rabid interrogator, [it] will invariably prove his client's innocence. Best of all, [it] always shows up in court on time. But while Hollywood writers... were unwittingly seducing an entire generation into law school, some of the advocates in our courtrooms appear to have drawn their inspiration from *Mr Bean*. [The]Chief District Court Judge... clearly thought so when [it] sat at the now-closed Otahuhu District Court last August. The rising level of incompetence among district court lawyers has been talked about in smoke-filled rooms for some time. But [the Chief District Court]Judge... unknowingly flung the doors open on that discussion when the letter [it] wrote to the Auckland District Law Society complaining about South Auckland lawyers found its way into the public domain. [The Chief District Court Judge] wrote of "a disproportionate number of counsel who, as both assigned counsel, counsel and duty solicitor, provide a standard of work which is below a reasonable expectation." His criticisms sparked considerable anger among the target group, but rang true with many senior lawyers who say the problem is wider than South Auckland. According to [one]respected... QC, "Some defendants would be better off defending themselves."

...ON ANY day of the week in the busy courtrooms of the Manukau District Court in south Auckland, one of the emerging crisis areas of our justice system is on parade... Between 100 and 120 people a day are shunted through one courtroom. It is at courts like this that concerns are growing the police are lining up the wrong people for the wrong crime, or letting the guilty walk free through lack of evidence. The *Sunday Star-Times* has been told of a malaise affecting a crucial juncture in the justice system, police prosecutors. This is where the 9000-strong police force puts its cases before the courts for judgement. This is where justice should be done. Shoddy preparatory work or poor investigation carries a high cost – wrong convictions... [(such as the t]hree teenage girls... wrongly convicted of and... sent to Mt Eden Prison for the bashing of a schoolgirl at Mount Roskill; t]hey spent seven months in jail and then were suddenly released, with red-faced police... admitting they relied on the incorrect testimony of another girl[ies]) ...or unwarranted acquittals. Lawyers say these are precisely the risks being run by the police... "I have real concerns about the level of experience and the level of competence of a significant number of police officers involved in serious criminal investigations,"... a spokes[person] for the Criminal Bar Association, says... The... Police commissioner[ies]'s... brow furrows at the lawyers' comments.

...POLICE admit to a growing problem with sub-standard work in cases going before the courts after complaints from their own lawyers... The... Police Commissioner... has blamed the drop in standards on mounting pressure in areas of high population growth such as Auckland and Bay of Plenty. Crown solicitors had approached him... "They have raised concerns about some of the lower end investigations and those high volume areas that we don't seem to be able to spend as much time doing the things we did 10 years ago. The answer is no, we haven't got that time."

...Finally, N[Z]ers who find themselves locked in arguments before the country's courts may get the chance to sock-it to bad lawyers who demonstrably fail to make the grade on their behalf. The law world's long-standing "immunity from prosecution" protection has come under

question from the High Court bench... following a case in... [which an Asian couple] complained that advice from an Auckland law firm cost them nearly \$750,000. The [couple] lost a case in the High Court... after lawyers had advised them to accept personal liability in the event of a judgment against their fruit-exporting company. The law firm being sued has raised barrister immunity as a defence. In... a... landmark move... the... House of Lords... abolish[ed] immunity for English lawyers... two years ago... [In related news,]lawyers involved in a series of nationwide buy-back housing schemes under investigation may not be named publicly, even if found guilty of some sort of impropriety. Buy-back schemes see people signing over the titles of their houses to mortgage brokers in return for finance. The deals involved strict repayments that can see debtors losing their homes once they miss a repayment. [A]West Auckland-based Labour MP... believes lawyers involved in some cases are acting for both the mortgage brokers and the debtors, a conflict of interest [it] says sees lawyers failing in their duty to advise clients against entering buy-back agreements. The Auckland District Law Society is investigating the claims. But [the society's]professional standards director... says any lawyer found guilty may not necessarily be publicly named... The... Law Practitioners Act 1982... does not make disclosure compulsory unless a lawyer is struck off the roll of barristers and solicitors of the High Court of N[Z. The West Auckland MP] says that's not good enough and is threatening to disclose names in Parliament. [The MP] is calling for a ministerial inquiry into the schemes and claims [it] has received paperwork relating to 73 cases nationwide.

...THE Northland judge... who was fined \$8000 after pleading guilty to fraudulently claiming \$815 in travel expenses, [but]was recently reinstated by the law society and is working as a lawyer[, has now been 'let off his original charges'. While on the topic of penal let-offs,] ...for every... A[US]n... who waited, with varying degrees of anticipation, for [a]multimillionaire broadcaster... to face the prospect of jail this week... there was at least one other A[US]n – possibly more – who cheered the judge's ruling that the broadcaster was too rich to be fined, too famous to be jailed. While critics fumed about one law for the rich, another for the poor, the mass of [the broadcaster's] dedicated fans, who have made him the most highly paid radio host in the world, jeered journalists and cheered their hero as [it] emerged from court. Instead of a prison sentence of up to seven years, a fine of up to \$A110,000 or even periodic detention or community service, [the judge]... imposed a 15-month suspended sentence for what was... [the] Commander of... the Order of the British Empire[']s)... second serious conviction in just over two years... *Reduced sentences* Under section nine of [NZ's] Sentencing Act, judges must consider these factors: ■ Criminals' ages. ■ Early guilty pleas. ■ Good conduct. ■ Lesser/peripheral involvement in the crime. ■ "Diminished intellectual capacity or understanding". ■ Remorse. ■ Evidence of "previous good".

...[a 19-year-old] who killed a 4-year-old... when his speeding car crashed at Rangiriri has had his jail term halved because of a \$40,000 payment his family has offered to the girl's kindergarten... [The student was] sentenced to two years' prison and disqualified from driving for five years when [it] appeared before... Hamilton District Court... [The district court judge also ordered him] to pay \$16,000 in reparation to the victims. In addition, [hi]s family offered to make a payment of \$40,000 to [the victim's] mother, who refused to take the money but said it could go to her daughter's kindergarten. When sentencing [the student, the district court judge] said: "Offenders and their families should not have any grounds to believe that they may be able to buy themselves out of prison by making an offer of reparation or amends under section 10 of the legislation [Sentencing Act]." During the hearing of an appeal to the sentence in the High Court at Hamilton on Friday, [the appeal judge said it agreed with the district court judge] but said the legislation was broad and [it] did not believe the [district court]judge had taken significant account of the reparation offer... Friday's decision by the appeal judge has angered victim Georgia McCarten-Graham's grandmother... "What kind of signal are they sending? It's very difficult for me to make a rational judgment on this because this guy, through his reckless actions, killed my granddaughter..." ...[the student was] trying to evade police... when [his] car... lost control and smashed into a petrol station... pinn[ing] Georgia] between the car and the building...

OK, so you don't get the big salary and the retirement goodies, but just for a few minutes you can be a judge, Justice Citizen, sitting on appeal hearings on two similar judgements. The key issue in these two hypothetical cases seems to me very simple. How about you? Two young [guys] crash their cars at high speed and kill innocent road-users in identical circumstances. One was driving his mother's run-down Ford Escort, the other his mother's new BMW convertible. Neither had a licence. Both pleaded guilty to dangerous driving. The Escort driver, the 19-year-old unemployed son of a solo mother from south Auckland, west Auckland or similar, is represented on legal aid by the family lawyer who handled his mother's divorce. This teenager is sentenced to two years' jail. The driver in the BMW, also 19, from Remuera has his case pleaded by a Queen's Counsel who was in his father's class at Kings, or was it collegiate? Included in the plea is the offer of \$40,000 as a mark of the young [driver's] (and his family's) deep regret. This is taken into due account and [the student] is sentenced to one year, with an immediate application that it be served as home detention to allow him to continue his studies. The hope is that the conviction won't block his entry into law school. By comparison, the solo mother's only asset and transport was the old Escort, terminally damaged in the crash, still owing money and uninsured. [The solo mother] and her son, plus her three other younger children, are also deeply regretful but they have no family trust to call on. [The solo mother] has no cash to offer. Her son is worried that [it]'ll never get a job when the jail gates finally open. What is the justice in such a bizarre range of penalties? If that could happen under present legislation, and that seems possible, then it's bad law and should be changed. Public disbelief that such is the law and anger at its most recent precedent are obvious, expressed in ugly but powerful words, like "bribes" and "cheque book justice". None more powerful than the justifiably bitter "blood money" label from the mother of a dead child. That is the majority community reaction to the halving of the sentence o[f]... the 19-year-old Mainland Chinese student, who killed a four-year-old at Rangiriri while driving at high speed and unlicensed, [and]now faces a 12-month rather than the original two-year jail term... [- but the student could do less than 12 months if it behaves -] at least in part because of the offer of \$40,000 "reparation" from his parent to [the victim's] mourning family... Judicial reasoning says the money wasn't a prime issue. Really?

...Run off the road and nearly pushed over a cliff by an out-of-control bus, [a pensioner] was lucky to live. Seven years later, [the pensioner] still suffers from her injuries. What hurts the 84-year-old more is that the [perso]n responsible skipped the country after paying just \$50 of the \$2000 [it] offered in court to get his sentence reduced... The judge agreed to set the fine at \$2000, ordered it all go to [the pensioner], and disqualified... the... [bus driver] from driving for 18 months. But [the bus driver – who]... blamed an unfamiliar braking system but said [it] was speeding and lost control as the bus came round the corner and down the hill; had the driver] not smashed into [the pensioner's] car, the bus and passengers would probably have gone off the cliff, [it said –] ...then lodged an appeal against his sentence and succeeded in having the disqualification period reduced to 12 months. Payment was delayed until the appeal was heard. But a year later [the pensioner] had still received nothing. [The pensioner] approached the Courts Department and... was told [the bus driver] had other outstanding fines, which had to be paid before her reparation. Another year went by and [the pensioner] wrote to the department. Eventually it replied, saying it believed [the bus driver] was in A[US] and had not supplied an address. A warrant for his arrest had been issued but could be executed only if [the bus driver] returned to N[Z. Eventually the pensioner]... received a \$50 cheque from the department, with no explanation other than that it was compensation from [the bus driver]. Former workmates... said all they knew was that [the bus driver] was in A[US], last heard of in Perth, but none knew how to contact him. But the *Weekend Herald* found him, now aged 58, living in Essex, England, and working as a security guard... "I have no idea," [the 58-year-old] said when first asked whether [it] would pay the fine. [The 58-year-old said it] thought the fine was covered by insurance of the Auckland Tramways Union. The union said that was not the case, though it helped... with his legal bills... Courts Department staff refused to discuss the matter, including where the \$50 came from, or say what efforts they had made over the past six years to find [the former bus driver]. That would breach his privacy.

...The Corrections Department has been left red-faced after an inmate was paid \$42,000 for serving... six months... more jail time... for assaulting a hairdresser... than [it] should have, but still refuses to compensate his victim... [- whose] injuries included a broken nose, fractured cheekbone, chipped tooth and cuts... [- as it] was ordered to do at the completion of his sentence... Last week... [the offender said it] had spent the money...

How to make criminals pay – fairly VICTIMS' compensation sounded like a very good idea when it was introduced not long ago. Justice would be more personal, criminals would make amends to those they had injured rather than to the state. Victims would feel less excluded and undervalued. Their suffering would be acknowledged... Well, it was a good idea for all those reasons. But as recent cases have illustrated, there are two sides to the coin. Victims' compensation can also be seen as "justice for sale". It is hard to see how it can be otherwise. Is a person who pays victims' compensation to receive the same sentence as somebody who could not afford to pay? Yes, the public seem to be saying, anything less would mean that those who can afford to pay would be able to buy a lesser sentence, and that is abhorrent. But if those who can pay compensation then receive the same sentences as those who cannot afford to pay, the well-off are doubly penalised and that is abhorrent, too. If criminal justice is to be blind to the wealth of offenders then it seems victims' compensation was not such a good idea after all. But not everyone is ready to give it away yet. The Victim Support organisation... suggests the system could work if compensation was built into the standard sentence. Thus reparations and compensation in some form would be expected of all convicted offenders in addition to a standard fine or prison term. Failure to pay the compensation... would result in an increased sentence... [Then there's the issue of unpaid fines – a] single person owes \$1.8 million in unpaid court fines, figures obtained from the Department for Courts show. But the department will not say who... owed the money, and what for... or give any details. The figure came to light after *Weekend Herald* inquiries prompted the department to reveal the amounts owed by the country's top 10 fines defaulters... The... second-largest amount owed was \$125,270... This week, a district court judge was stunned to learn a Nelson teenager had incurred traffic fines worth almost \$40,000 in less than a year... ■ [The]... Government plans to change the law so fine defaulters cannot leave [NZ].

...The Government is investigating law changes to give Customs officials the authority to stop N[Z]ers who owe large fines leaving the country. Almost \$350 million is owed in fines – \$39 million more than last year... The country's three top fine defaulters fled N[Z] owing almost \$2 million between them, prompting the Department for Courts to seek ways to stop others leaving without paying their debts. In a financial review report, Parliament's law and order select committee criticised the department for the length of time it had taken to formulate a strategy for collecting fines at airports. "It is not acceptable to us that fines defaulters... should be able to leave the country without being intercepted at the borders," says the report. [The]Courts Minister... said it had not been decided how much a person would have to owe before [being]... stopped. "If someone owes \$30 in a fine, they're not the people you're after. We want people who are deliberately, seriously defaulting on their fines." The department... needed to look at the cost of setting up the system. "If we put this in place and it's more costly than what we recover, that's not sensible,"...

WHAT price justice? Recently it cost taxpayers another \$2.5 million. Why? To finance a six-month trial for a family of recidivist offenders... [that] involved 17 lawyers... Seven family members faced 247 charges, mainly for burglary... [of] \$447,000 worth of property... Further property of \$104,000 was damaged during the burglaries... It was N[Z]'s longest and most costly trial... This week it was announced that \$1.1 million of th[e]... \$2.5 million... went to the defence lawyers through criminal legal aid. Prosecution and police costs accounted for the balance. The case raises serious issues. Should the taxpayer be spending such large sums on the defence of cases like this? Certainly, criminal legal aid must be available in a democratic country such as N[Z]. Its purpose is to allow the accused to defend themselves when they have insufficient funds to do so. But there is a fine line to be drawn between enabling the accused to plead not guilty and defend their rights, and wasting taxpayers money on a hopeless case. Defence lawyers certainly have a role to play in deciding when to run a defence. Lawyers say they are bound by their clients' instructions – if their clients insist on pleading not guilty, lawyers are duty-bound to run the case and do their best for their clients. This case suggests such an approach is unsatisfactory... The judge hearing the case said: "The evidence against the family on the vast majority of charges was overwhelming yet they [the accused] had chosen to contest the charges against the odds." The evidence produced in court included bugged conversations and surveillance videos of the burglaries in progress. The judge's comments suggest the charges were largely indefensible. The jury agreed. Of the 247 charges brought, 233 were proven – a 95[%] conviction rate. The record prison sentences of up to 12 1/2 years suggest the unproven charges were of no great significance. The police officer in charge of the case said it was outrageous that the case went to trial in the form it did... [T]he legal aid system needs further review... At the very least, the... court hearing the case should have power to comment when it considers legal aid money has not been spent wisely, and the judge should have power to say that a defence proceedings was not justified. In that event, the defence should not be paid for by taxpayers. If criminal legal aid lawyers believe their remuneration is at risk if they are defending the indefensible, they may think twice about how they run their client's cases. Furthermore, defendants receiving criminal legal aid should have to pay something towards the costs of their defence... This trial also raises questions about whether a public defender's office should be established, the effectiveness of plea-bargaining and similar issues. There will always be opposition to these issues from some in the legal profession. They will argue it could result in defence standards being lowered and prejudice an accused's right to a fair trial. But with limited financing available, such issues need to be addressed.

...Who pays the price of justice? The cost of a day in court is set to skyrocket next month[, raising questions about] who will be able to afford it... In the district court, or the people's court as it is colloquially called, filing fees [are set to go] from \$145 to \$450... Litigants filing High Court actions... will face an astronomical increase in court fees – from \$120 to \$900 for filing a claim, from \$650 to \$2200 to have it set down for a hearing, and from \$470 to \$1900 for every half day in court after the first. Similar fee increases apply to the Court of Appeal... Only the Family Court remains a fee-free zone, except for divorce or adoption cases... [S]o far, the only audible protest against the massive court fee hikes has come from the N[Z] Law Society, which is writing to the [Courts M]inister begging him to reconsider. Its president, [who is a]Hamilton lawyer... says the society is concerned that access to justice shouldn't be only for wealthy litigants. The spectre of lawyers protesting that rising costs might be a barrier to getting justice could not help but raise an ironic chuckle from the cynical. As a discussion paper circulated by the Department for Courts last year points out, court fees are the least expensive part of taking a case to court. The biggest item on the ticket will be the lawyer's fees.

...Until recently many law firms did not insist on clients paying up front for the fees charged by the court when they filed applications on their behalf. The amount was comparatively small and it was a cost they were happy to carry. That all changed when the Government introduced a new schedule of court fees with increases so huge that firms had no option but to ensure these costs were advanced by the unfortunate clients. The fees are now a real deterrent for some people and businesses seeking justice in a civil action... The new schedule has actually decreased the fees payable to lodge small claims in disputes tribunals, but enormous increases at District Court, High Court and Court of Appeal levels have been across the board... The overriding principle should be the maintenance of a court system which is readily accessible by all citizens. A substantial taxpayer subsidisation of the civil litigation court is necessary. Without it, gross unfairness results. But it is not appropriate to try to recover any particular percentage of costs from users of the system. Rather, fees should be appropriately geared to the type of litigation involved and the amount at stake.

...The... Justice minister... has asked the Law Commission to investigate introducing a European-style inquisitorial justice system... [The minister] had no intention of overhauling the adversarial-style system used here where the role of the judge is essentially that of an impartial referee. But... said the inquisitorial system, where the judge is involved in collecting and determining the facts of the case, could have its uses in victim-intensive situations such as sexual offending and child abuse... The adversarial system is a source of controversy in sexual cases, because victims are often cross examined by defence lawyers, whereas the defendant can exercise the right to silence. Legal experts are wary of a possible change.

...The Government is proposing changing the definition of consent in rape trials as part of its major overhaul of criminal justice. Under the proposals someone would have to say "yes" rather than the current law where a defendant is able to argue the [alleged victim] did not say "no".

...The Ministry of Justice is looking at law changes which would ban defendants cross-examining alleged victims of sexual crimes directly. A case being heard in the High Court at Christchurch – in which an 18-year-old... has been cross-examined for three days by the [guy] accused of abducting and raping her – ...highlighted the issue. [The defendant, aged] 29, unemployed, denies [all charges against him]... The charges relate to an eight-day period in October last year. The [victim says it] was kept naked and chained and was burned, beaten and forced to have sex up to 10 times a day at [hi]s flat. The ministry says the review of the relevant law has been going on for some time and is not in response to th[is] case.

...Ministry of Justice moves to bar defendants the right to directly cross-examine alleged victims of their sexual crimes have their heart in the right place... [However, t]he Council for Civil Liberties says the Law Commission moves would erode the presumption of innocence until proven guilty and that the court acts as a gatekeeper to prevent improper questioning... [T]he Law Commission... recommended the accused should put questions through the judge or a person appointed by the judge. And therein lies the crux of the debate and despite its opposition the civil liberties group is partly right when it raises the “gatekeeper” issue. [But a]n accused’s rights would not be infringed upon through a process which allowed them to quiz their accuser through the court or its appointee... The major point in all this is that justice is not only done – but is seen to be done.

...WHAT does justice look like? Pat wouldn’t know because [Pat]’s fairly sure [Pat] didn’t get it after being threatened by a knife-wielding teenager... [Pat had caught] trying to break into a car; fortunately, the police were quickly on the scene. Pat went to the family group conference afterwards and decided to forgive... ask[ing] only that the boy join the junior rugby team [Pat] coached, and help clean up graffiti around the neighbourhood. But... I told him forgiveness doesn’t ask anything in return; it wouldn’t be an act of grace otherwise. But justice does. Even restorative justice requires atonement and restitution. If you ask the head of the Rethinking Crime and Punishment project... what that kind of justice looks like, [the head woul]d say it looks like love. It’s about... healing the broken-hearted and promoting community peace. Love is, I know, not our preferred approach to justice in this country. We’d rather talk about seriously bad people who deserve to be put away for the rest of their lives (and hardly anyone would argue that there aren’t a few of those around). Since... a citizens-initiated referendum asked whether we should place “greater emphasis on the needs of victims”, impose minimum sentences and require “hard labour” for all serious violent offences[– in which n]early 92 per cent of us said “yes”[–] ...restorative justice has been sidelined for a more punitive path... [The head] thinks that punitive approach reflected a fondness for market solutions and a “growing opposition to policies that appear to benefit “the undeserving poor”, cynicism about welfare, and support for more aggressive controls for an underclass that is perceived to be disorderly, drug-prone, violent and dangerous. St Augustine once said, ‘Mercy without justice leads to weakness. Justice without mercy leads to tyranny.’ [St Augustine] was talking about the balance that should be shown to all involved in the judicial process. That is no longer appropriate, and the sympathy evoked by political rhetoric centres exclusively on the victims and the fearful public, rather than the offender.” This seems unlikely to change any time soon. As each week brings another front-page assault or murder, the public clamour for simplistic and harsh solutions to a perceived crime epidemic grows louder.

...The justice system failed Sophie Elliott... – ...a bright, kind young [person who]... had a first-class honours economics degree behind her and was heading to Wellington for a “plum job” at the Treasury... [(an) economics professor at the University of Oregon... said a paper [the]... 22-year-old... wrote titled, *Why measure inequality? A discussion of the concept of equality*, which was published in this month’s edition of the Oxford University economics journal *Oxonomics*, was “easily the best essay on inequality” [it] had ever read[] –] ...allowing her killer to drag her name through the mud before a wide audience... Outside the Christchurch court-house yesterday Ms Elliott’s father... said the provocation defence should no longer be an option... The defence... [a]llows for a killing that would otherwise be classed as murder to be downgraded to [hu]manslaughter if it can be proven that the person who caused the death was provoked... “The provocation defence is based on absolutely archaic notions about violence. Once upon a time, society accepted that an affront to [a guy’s] privilege or dignity was a reasonable excuse to fly into a homicidal rage. This trial turned justice inside out. The killer became the victim and Sophie Elliott was portrayed to us all as he[r]... former boyfriend... chose to describe her. Unfortunately for [him], the jury didn’t buy it and nor did the hundreds of thousands of N[Z]ers who watched him giggling on television.” ...His performance while on trial for... stabbing and cutting her 216 times... has made him the subject of a nation’s vitriol, yet through it all, [the killer] appeared oblivious or unbothered. The long-haired, neatly dressed, bespectacled former university tutor – ...[aged] 33... – seemed to take on the challenge of beating a murder charge with the same gusto as the academic studies [it] invariably aced. Only this time there was no A+ grade to satisfy the huge ego the public came to know and loathe. His future now lies in prison with fellow criminals of much lesser intelligence.

...Ben Smart and Olivia Hope[’s killer]... was yesterday jailed for life... The jury of seven [guys and five gals] returned its unanimous verdicts to a hushed Wellington high court... after deliberating for 21 hours. The families of Blenheim pair Olivia, 17, and Ben, 21, wept when they heard the decisions... “We were pleased this chapter is over,”... Ben[’s father]... said. “At least we have got something now which allows us to accept what has happened a bit easier. We really found it difficult to accept [Ben’s death.” Olivia’s father asked the killer] to show compassion and say where the bodies of his daughter and Ben were... [Olivia’s father never doubted the defendant] would be found guilty... “When you sit through it, the evidence was pretty compelling. The jury were meticulous. I have no doubt... justice has been done.” [But Olivia’s father] said his family did not want revenge. “We want him alive so [Olivia’s killer] can sit in his cell and think about what [it has] done... We want to leave him with a conscience.” ...[the defendant, aged] 28, reacted to the announcement of the verdict by telling to jury: “You’re wrong.”

...Wearing a shirt and tie, as [it] had throughout the trial, [the defendant] was led away to begin a life jail term. The Picton [resident] had pleaded not guilty to murdering Olivia and Ben on or about January 1, 1998, in the Cook Strait-Marlborough Sounds area. The young friends [and the Picton resident] had been at the Furneaux Lodge... for a New Year’s party. Prosecutors said [the Picton resident] lured the pair on to his yacht... wanting sex with Olivia, and then killed both of them before hiding their bodies, which have never been found. Prosecutors alleged they were dumped in deep waters in Cook Strait. Although [the Picton resident] was soon a suspect, [it] wasn’t arrested until six months after the pair disappeared. More than 500 witnesses gave evidence during the three-month trial... which... is probably the most expensive in N[Z] history. The cost is over \$5 million... [including over] \$700,000 of legal aid... [for the defence (t]he biggest legal aid payout to date... was... \$570,000... – but that paid for three trials and an unsuccessful appeal[])... The defence had claimed during the trial that the prosecution had failed to prove their case. [The Picton resident]’s legal team cast doubt on the reliability of the prisoners who gave evidence against [him], pointing out that one had received a mobile phone and reduced criminal charges after agreeing to testify. The judge urged caution on the evidence of one of the two inmates who said [the defendant] had confessed to killing Ben and Olivia. But... “That doesn’t mean to say you entirely disregard his evidence.”

...*What the jury wasn’t told* [The defendant] will be back in court accused of attacking a police[officer] during his depositions hearing. [The person who allegedly told a former associate that it ‘wanted to kill someone’,] has been charged with assault, possessing a weapon and damaging a Blenheim police cell... The charges could not be heard earlier because they might have influenced jurors at the murder trial. What the jurors also did not hear was [his] criminal history... Ben and Olivia’s murder[er]... has been in borstal and jail and has more than 40 convictions... In his early 20s, [the defendant] repeatedly threatened another Picton boatie who took out a non-molestation order. Behind bars after his arrest for... double murder[, the defendant]... took on the Black Power, smashing a gang member with a steel bar.

...[the defendant] will appeal against his convictions for murdering Olivia Hope and Ben Smart, says his lawyer... “There’s no question of the fact there will be an appeal. The grounds will centre on the fairness of the trial.” ...Since the guilty verdict the media have publicised [the defendant]’s previous criminal convictions and spoken to people allegedly involved in incidents with him... “The media reaction has been totally ill-considered and has severely compromised his position in the event of his conviction being overturned and a new trial ordered.” ...Although [the defendant] was

sentenced to life imprisonment immediately the verdict was delivered, [the judge] reserved the Crown's ability to ask him to set a minimum time [of '17 years' for the defendant] to be in prison before parole could be considered.

...The star secret witness who told the Marlborough Sounds double murder trial that [the defendant] confessed to the killings now says his evidence was a lie. The former Addington Prison inmate alleges police pressured him into giving false testimony about [the defendant]'s involvement in the murder of Olivia... and Ben... It will never be known what, if any, part witness A's testimony played in the jury's guilty verdict.

...A lawyer for Witness A has a signed document backing claims that police pushed their secret witness into giving false evidence... at the Sounds double-murder trial. The document was sent to the lawyer from a [prisoner who says it] became concerned after hearing a conversation between Witness A and two detectives... [while it] was in the visiting room... in a North Island prison... "[Witness A] knew the Court of Appeal hearing was coming up and... wanted to give evidence that what [it had] said during the trial was a lie. Basically they said to him, if [it did]n't go along with what [it had] said during the trial they would make life very difficult for him... They said to him, 'Stick to your original story'." ...An arrest warrant was issued for Witness A after [Witness A] failed to appear in the Napier District Court this week on a charge of unlawfully taking a motor vehicle.

...[the person who] was pardoned after being wrongly convicted and jailed in 1970 for the murder of farmers Jeanette and Harvey Crewe... wants people to support a new trial for... the [guy] convicted of the Marlborough Sounds murders... [The 62-year-old said the guy could be guilty] when the evidence was studied. "But what I'm saying is the jury has been misled, so you must order a new trial and let another jury look at it. I ask the people of N[Z] to do what they did for me. I'm grateful and thankful for the people who supported me by writing to their MPs." ...The 62-year-old joined his daughter... and about 10 others in a march... organised by [a]Hamilton dentist... at the weekend calling for [the guy] to be freed.

...The secret witness who claimed to have lied on the stand at the Marlborough Sounds double-murder trial has changed his story again in a statement to officers investigating his allegations... His lengthy statement effectively supports his testimony during the trial and says [it] went public about lying under oath last month out of anger at the way [it] had been treated. But in another twist to the saga, the [secret witness] told the *Weekend Herald* [it] had again lied to the Police Complaints Authority and... wanted the real truth out... but would do it in his own time. In a fresh development related to... [the conviction of a Picton resident] for the murders of Olivia Hope and Ben Smart, another witness has recanted. The... manager of the bar at Furneaux Lodge on the night Olivia and Ben disappeared, gave evidence that backed up [a]water taxi driver['s] identification of... the... [defendant] by picking him from a police montage. In an affidavit, [the manager] now says the [guy it saw wasn't the accused.

...the w]rongly jailed American boxer... "The Hurricane"['s]... freedom-fighting organisation is considering throwing its weight behind [Ben and Olivia's]convicted killer... The Canadian group, the Association in Defence of the Wrongfully Convicted, has... [been] looking at the... case and has two lawyers reviewing it. The group's executive secretary... believed there was a "stink" about the case and was "leaning towards him [[the accused]] being not guilty"... [The Hurricane] is coming to N[Z] next month to meet... [the young Dunedinite (rp2581, ln29). • The] controversial painting depicting [the]convicted murderer... holding a gun, surrounded by dead members of his family, has more than doubled in value since it went on display... last week. The painting's new owner was apparently offered \$2000 for the work... The... painting, displayed at Dunedin's community gallery... attracted national attention after [a]... city councillor... tried to shield it from public view with curtains... The curtains around the painting were later removed at the insistence of [the]Mayor... It had been sold to a private buyer earlier in the week for \$800... During the exhibition, one person threatened to throw a brick through the gallery's window... Another... told [the artist it hoped the artist] would apologise to [the central character of her uncommissioned painting when the young Dunedinite] was freed... "I expected a little bit of reaction, but not this," [the artist] said. "Everyone is entitled to their opinions. I guess one of the aims was to get more people thinking about the issue. That's happened..."

...Get rid of the razor wire around prisons, give most inmates keys to their rooms – and let them prepare their own meals. A taskforce appointed by the Canadian Government made these recommendations in a report released yesterday that immediately fuelled the debate over whether Canada is soft on crime. "We strongly believe that real safety is not achieved through the construction of traditional cell blocks with barriers and armed posts," the report said. That resulted in a charge in Parliament from [a member] of the opposition Reform Party that the Liberal Party minister responsible for prisons... was more concerned with appearances than with public safety. "Why is... [the] Solicitor-General... turning our penal institutions into summer camps, and our guards into camp counsellors?" ...Theories of punishment come in and out of fashion – utilitarian ideas like deterrence, prevention and rehabilitation competing with the more retributive, "throw away the key" philosophies. In China justice is supposed to be exemplary. In 1996, Amnesty International says there were 3500 executions carried out as a means of "scaring the monkey by killing the chicken." Amnesty says China has 65 capital offences and the number is growing. In the U[S], shame and public humiliation have made a comeback as suitable punishments. In... Arkansas, for example, a person found guilty of sexual harassment might be ordered to hang a placard listing details of his offence on his front fence. In Illinois, [a 62-year-old]farmer... has to live with a large sign at his gate saying, "Warning. A violent felon lives here. Travel at your own risk." [The farmer] whacked another farmer in the face in a dispute over a faulty fuel pump... [(the fact that t]here are... fewer you[ths]... around in America because so many of them are in prison... [is one explanation given a]s crime in America drops off precipitously)]. In N[Z]... the push is for longer sentences – both to punish and to deter. Introducing his new crime fighting legislation, [the]... Justice Minister... said: "Longer sentences would deny criminals opportunities to reoffend, increase the punishment criminals faced for their crimes, and act as a deterrent." But do longer, "deterrent" sentences actually deter? A comprehensive Ministry of Justice discussion paper dated November 1997, "Sentencing Policy and Guidance," says not. The Ministry, having surveyed international research results, concluded, "While it is reasonable to assume that the very existence of the criminal justice system has some deterrent value, there is little evidence to support the view that increasing the level of sentences will deter the individual offender or would-be offenders in general." It quotes from the conclusions of [a N]Z... researcher... who, in 1993, interviewed convicted offenders: "Penalties alone will not reduce offending. People who have nothing of value have nothing to lose. People who have no sense of belonging have no social status to risk."

...Prisoners at Auckland's high-security Paremoremo jail could meditate their way to a more honest way of life if a proposal tried successfully overseas is approved. Officials are considering introducing the ancient Indian art of Vipassana, under which inmates would meditate in silence for nine days straight... [The person] who teaches Vipassana in N[Z] and is set to introduce it in English prisons, says: "People think it's about closing their eyes for 10 days of bliss, but they couldn't be more wrong. It's like putting your mind on a diet." ...the technique has turned serial killers into saints in prisons around the world by getting them to "take control of their lives and channel them toward their own good." ...□ A[n American]... convicted in 1973 of murdering 25 farm workers in one of the worst strings of serial killings in U[S] history, was among four convicts who were slightly injured... when inmates from a separate cell block tried to attack him and other high profile prisoners... [a US] Department of Corrections spokes[person]... said. Robert F. Kennedy['s] assassin... is among the four dozen occupants of the protected housing unit but was not in the yard at the time of the attack... Prison guards intervened to stop the fight as... other inmates fled. [One infamous mass murderer] left his acoustic guitar in the yard: it was smashed. [Hi]s murderous rampage through southern California in 1969 was depicted in the book and movie *Helter Skelter*. Prison officials attributed the security breach to a faulty light which indicated that the prison yard door was secure. Speaking anonymously... they said they were embarrassed that their most famous charges had been in danger. "To attack one of these inmates is a big badge of honour," [they]... said.

...Unsafe behind bars... [Prisoner]A... was shuffling around the perimeter of Mt Eden prison's main yard shortly after 9am that overcast October. Chatting about nothing in particular with another inmate, [they] joined in the prisoners' routine start to the day – walking in circles around the

yard for an hour. "It's all there is to do... Next thing I see a guy walk in with a broom." [Prisoner A] walked on. His stay in Mt Eden was to be brief. It wasn't the only time the self-described "hard [nut]" had been in on remand but, [it stresses, it]'s never been sentenced to prison time. Over the previous two days... abusive words had passed between him and a guard. The guard had jostled him the day before, but [Prisoner A] assumed the inmate with the broom was merely there to sweep. Until [it] snapped off the broom head. "The next minute [it]'s running at me with this big pole. This guy is a gang member and... comes at me swinging." A black belt in karate, [Prisoner A] threw him off. "But [the guy] attacked me again. This time there was four of them and the fight lasted five minutes." No guards intervened. Despite there being more than 60 inmates in the yard, there was only one guard watching them. [Prisoner A] figures the guard set up the attack, but will never know for sure. [The prisoner] was back in Mt Eden three weeks ago and suffered another "pack attack"... "No one is safe in prison... I've seen a[nother prisoner] lose his teeth. I've seen a [different prisoner have] boiling water poured over him. Every day something's going on. Every day." This week the *Herald* was contacted by a [gal] whose brother was beaten up in prison last week... At Easter, six drunk inmates sexually assaulted a fellow prisoner at Wanganui prison. Only weeks earlier at the same prison, Christopher Hereora, a father of two serving a 14-year sentence for a home invasion, was bashed to death in the showers. Last Saturday... it was... [the turn of t]he owner of Joey, the dog which attacked [a 7-year-old... in January]. The owner was queuing for breakfast after his first night in Mt Eden when [it] was welcomed to prison by an attack which left him with a broken nose, split lips, eye injuries and bruising over his body. The high-profile attack has exposed a level of violence in N[Z] prisons that criminal lawyers describe as endemic. While reports of inmate assaults are often met with public indifference – even glee – it's not just hard cases who are at risk. Normally law-abiding citizens can end up in remand after an isolated brush with the law, and the attack on [Prisoner A] is evidence that even those [who are considered] innocent before the law, are vulnerable.

...A former Mt Eden Prison officer wishes [it] had sued the Government after... [being] stabbed, punched and choked by four Mongrel Mob inmates. [The former prison officer] was shocked to read reports that Mongrel Mob members had received up to \$90,000 in compensation for beatings by guards at Mangaroa Prison, near Hastings. [The former prison officer], aged 45, was left close to death after being attacked... at Mt Eden Prison in 1990. [It] received only \$12,000 from ACC in compensation. "I didn't know that I could sue the Government and I probably didn't get the right legal advice," said... [the] father of six who has not been able to work since the vicious beating. "I'm not angry that the Mongrel Mob inmates got payouts if they deserved them, but I've had no support at all for my attack – just a miserable pension of \$140 a month." [The former prison officer] blames the attack on Government budget cuts which reduced the number of guards on duty when cells were opened and closed. Working alone, [the officer] was forced into a cell by four inmates planning an escape. They stabbed him in the back... stole his keys and attacked two other guards before escaping. After recovering, [the officer] returned to work at the prison but... was assigned the same shift and prison wing, where his attackers were held after being caught. "I just couldn't stay, I was too frightened. It's done me some serious emotional harm. I tried driving taxis but was too afraid to drive at night." ...[a lawyer said the officer] could have sued the Government for exemplary damages or breach-of-contract for failing to protect him... But, court proceedings for exemplary damages have to be filed within two years of an incident. Breach of contract lawsuits have to be filed within six years... A senior police officer who investigated the Mangaroa guards in 1993 wanted them charged with torture. Papers, leaked to the media, showed that two investigating officers believed much of what the inmates said had happened, but no prison officers were prosecuted. In a 1994 report, [the senior police officer wrote]... "In conducting this investigation over the past three months, I have been horrified and increasingly disgusted by the actions discovered of prison officers at Mangaroa Prison, not only in the serious assaults on prison inmates, captive and unable to defend themselves, but also at the lies and collusion designed to defeat the course of justice... In many cases, in terms of morals and criminality, the only thing separating these prison officers from inmates is the style of their uniforms."

...The Tasmanian Government has defended strip-searching children visiting prison because they have been used to smuggle drugs. But [the] Attorney-General... said a complaint by a [visitor] that her 12-year-old daughter and 4-year-old granddaughter were strip-searched at Hobart's Risdon prison would be investigated... "We were treated as though we were the prisoners... My daughter was disgusted and didn't want to take all her clothes off and squat on the floor, but... had no choice... It was freezing and so humiliating for a child." ...[In local news, t]hieves, burglars and other criminals have been ripped off by a Mt Eden Prison employee who siphoned money from their canteen accounts. A Corrections Department spokes[person] yesterday said an administration accounts staff member was fired last month after admitting [it] stole money from inmates...

Seventy prison officers were dismissed, resigned or disciplined for alleged misconduct including drug dealing and sexual relationships with inmates in the past year... Two more officers are on special leave while preliminary investigations are completed... The North Island's Tongariro Rangipo Prison had the largest number of dismissals, with five fired in February. They were accused of using inmates to fix their cars and their dismissals are still the subject of an Employment Tribunal case... The average service... [of t]hose dismissed... was nine years... [The] Corrections Minister... said the number offending was disturbing... [– but "i]n percentage terms it's a reasonably small number..."] The... department employs 2036 officers... [In international news, Colombia's] Supreme Court has ordered prison authorities to allow homosexual prisoners to have conjugal visits. The decision was the result of a lawsuit filed by a [lesbian] prisoner serving a 17-year sentence... after her partner was recently released.

...[an Oklahoma City judge] sentenced ...a... 44[-year-old]... to 1050 years in prison for dragging a [gal] under his car... [In further news from the US, a] father of 13... found guilty of letting his baby daughter die in a van on a sweltering day was given an unusual sentence – probation and one day in jail a year for the next seven years. [The father of 13] will also be required to conduct an annual blood drive on the May 29 anniversary of 21-month-old Frances Kelly's death, the judge ruled... The jury had recommended a one-year prison sentence... Passersby found the girl strapped into her car seat. Authorities think temperatures in the van exceeded 49degC. [Mr]Kelly's wife was in Ireland visiting relatives at the time.

...[a] loyalist killer... made history [yesterday as it] stepped through the turnstile of the Maze. His appearance as a free [person] in the glare of the media was a potent and emotive symbol of the early release of prisoners under the Good Friday Agreement and the passions it has aroused. [The loyalist] was the first of 80 republicans and loyalists convicted of terrorist offences who will be freed this week. Almost all the paramilitaries now in jail will be out and the Maze will close in the next few months. Twelve years ago [the loyalist], now 45, wrote his own chapter in the history of Northern Ireland's strife with an attack on republican mourners at Belfast's Milltown Cemetery. Then, [the loyalist] revelled in his notoriety. But yesterday at the Maze, released early from his conviction for murdering six Catholics, [the loyalist] was keen to avoid any "triumphalism." [The loyalist] refused to say "sorry" for his crimes but promised to work for the new Ulster... Later, at a press conference, [it] said: "My war is over. I regret being drawn into the loyalist paramilitary organisations but, in the early 1970s, we believed that this was a war and the only way to defend our country..." ...[now all the loyalist] wanted to do... was disappear from public view, marry his fiancée... and live a quiet life running a flower shop. [The 45-year-old] has nine children by two previous wives and three grandchildren... "Today is a day of celebration for my friends, myself and my family. But I recognise that there are those in the nationalist and republican community who view my release with anger, just as the release of the republican prisoners on Friday will also anger the loyalist Unionist community... There are no words I can say to take away this hurt." ...the target... at Milltown... [i]s... now the... Education Minister... "[This guy] is now in charge of my grandchildren's education, which is ironic. I tried to assassinate [my target as it] took his own daughter to... school but I didn't, because his daughter was holding his hand." [The loyalist also] alleged that five years ago an unnamed senior republican had said to him shortly before the ceasefire: "You're dead... peace or no peace."

...The story of the Maze is the story of the Troubles. For the past 29 years this bleak, grey prison... has symbolised the unforgiving violence and the bitterness of Ulster's civil war. The Maze held the ruthless killers and bombers of this war... With its notorious H-blocks, hunger strikes... [–] in

the early 1980s... Bobby Sands and nine others starved themselves to death and became martyrs among nationalists... [-] murders among inmates and tales of beatings by staff, the Maze had become the most emotive and controversial prison in the U[K]. With the peace agreement, there was a feeling that it was too much of a reminder of the dark past. What happens to the 52ha site is uncertain. One plan is to turn it into a museum, another is to have it dismantled... At its height, the Maze held 1800 prisoners. After Saturday there will be just 16 left, guarded by a staff of 750. Those staying behind following this week's mass exodus are not expected to remain at the Maze for long. Many will be freed in the next few months and a few will be transferred to other prisons. The ones being kept behind had committed offences after the timescale laid down by the Good Friday Agreement... [The ones] to be released... [were] responsible for some of the most appalling atrocities of the violent strife. Among them will be... [a guy who has] served just two years of a 25-year sentence for... the London Docklands bombing in 1997... Also marking his day of departure will be... [the prisoner] sentenced to nine life terms for the IRA bombing of the Shankill Rd, which killed nine Protestants seven years ago. Also walking out will be [the person found] guilty of 11 killings, including seven at the Rising Sun pub in... Londonderry, which was in revenge for the Shankill bomb.

...As the car sped down the Shankill Rd, a boy of 11 shouted: "That's [the UFF arsehole]." The burly guy] standing next to him corrected him: "No it's not son, [the UFF arsehole i]s back in prison now." But for the fearful residents of the Shankill, who have fallen on the wrong side of the muscle-bound Ulster Freedom Fighters'... figure, [the arsehole]'s ominous presence can still be felt everywhere. Neither of the two on the pavement has a home now: the [burly guy], along with his partner and five children, left his house on the Shankill estate last week, hounded by a UFF mob who threatened to kill him... after a UFF rally... [where] the names of the targets for eviction were read out to the thumping beat of rave music. In the months after his release from the Maze... [the arsehole] brought mayhem and bloodshed to the Shankill, stoking the hatreds between his UFF, the most bloodthirsty branch of the Ulster Defence Association, and the rival Ulster Volunteer Force. Three people have been killed in the past fortnight in violence spawned by the feuding which spread this week from the Shankill to less heavily policed areas of Northern Ireland such as Coleraine and Carrickfergus. Around two dozen houses were attacked and [an] 11-year-old [girl] was badly hurt after being shot in the back. Like the streets of Chicago during Prohibition, the Shankill is the turf that every gang boss wants to dominate. It is the spiritual heart of loyalism. For [guys like the arsehole] to swagger down that stretch of tarmac, defiant in the face of death threats, is to control loyalism itself... Earlier this year, the turf war was fought out with flags. The UFF put up hundreds of pale-blue flags along the Shankill; the UVF tried to cover them over with its own. Today, it looks as though the UFF is winning – a massive banner stretched across the road reads: "UFF/UDA welcomes you to the loyalist Shankill Road." In the Shankill estate, a concrete wasteland strewn with broken glass and the remnants of bonfires, [the arsehole]'s bank of recently commissioned murals dominates the landscape. One pays homage to the dead leader of the Loyalist Volunteer Force... another shows a demon carrying a machinegun and trampling republican graves. Former residents of the estate say the loyalist paramilitaries' driving motivation is the establishment of a drugs empire... Protection rackets have spread across Northern Ireland, and can run from the collection of £10... a week from a chip shop to much larger sums from bigger enterprises. Shady loyalist drinking dens are becoming less popular with the paramilitaries: instead, they are putting their money into more respectable pubs, where the money that they raise from drugs and extortion can be laundered easily. Both the UDA and the UVF are known for attempting to extort money from businesses. "UDA [members] might walk into a garage that is doing well and say: 'Nice business you've got here'... Then they would try to come to an arrangement with the owner, whereby [the owner] paid them a cut. If [the owner refused, it] would face the threat of being burned out: they might intimidate the staff or fire shots in the air to show their power." Drugs are now the loyalists' main source of income... Organised crime has always played a part in inter-loyalist tensions. Paramilitaries turned to racketeering to fund their arsenals during the 1970s when the rivalry between the two spilled into bloodshed. During the 1980s huge illegal profits flowed into the UDA from protection rackets in the building trade. Now, with profits booming from the new trade in cannabis and Ecstasy, the stakes are higher than ever. In his office... the Ulster Unionist councillor for the Shankill, deals with a constant stream of families who have been put out of their homes by the UFF. Surrounded by unsettled children and harassed-looking mothers, [the councillor] said: "They have been told: 'You're no longer welcome. Get out or we'll shoot you.' Unless the community can stop it, things will get worse..." Some of the families had connections with the UVF... but some were simply those who had voiced opposition to the UFF. Fear is now a constant presence, according to... a Presbyterian minister who has spent 30 years mediating between loyalist terror groups. "You find yourself in situations where... you know by the attitude of people that they are exceedingly frightened. There is almost a fear of talking to people at times. They just want to get away from this. On both sides of the loyalist paramilitary divide there is hurt and anger because they have lost colleagues and friends. The killing has got to stop." ...[the arsehole] was sent back to prison on the instruction of... the Secretary of State for Northern Ireland...

Police investigating the murder of Belfast solicitor Patrick Finucane 11 years ago plan to arrest and interview more than two dozen former members of the Force Research Unit, a shadowy intelligence outfit that ran British Army agents. Detectives involved in the inquiry, headed by [the] Metropolitan Police Commissioner... are also looking into allegations that security forces colluded in terrorist murders. The Army granted the inquiry's request for thousands of secret documents last month. [The commissioner] is heading his third inquiry into events linked to the U[DA]'s shooting of Finucane in this north Belfast home... Among those expected to be interviewed is... [the] commander of the research unit when an earlier... investigation discovered that the Ulster association's intelligence officer... was an Army agent. [The former commander is now a] British military attaché in Beijing. Meanwhile... the Northern Ireland Secretary, this week called for fresh examinations of several IRA arms bunkers. Ulster Unionists, facing a byelection in South Antrim next week, said any inspections were no substitute for decommissioning.

...The notorious Mt Eden Prison is likely to close within three years. Plans to end the Auckland landmark's days as a jail have emerged with the Government's commitment to push ahead with a regional prison in South Auckland. [The]Corrections Minister... said... "I want Mt Eden to go... It's a prison built for 19th-century philosophy... We want to be able to develop rehabilitative programmes, community access and to foster reintegration with family. Mt Eden does not fit any category like that..." ...Prison reformers have long decried Mt Eden... as a national disgrace. But their calls for action are nothing new. [The]Howard League for Penal Reform... says people have been pleading for 70 years for its closure... But... it could not... close... until the South Auckland prison was built because of the number of prisoners... The decision to proceed with a prison in South Auckland has been an on-again, off-again affair for several years [('the new prison is now delayed until 2002')] with residents opposed to [its] development in the [ir] area... Some of the pressure will be taken off Mt Eden... when the neighbouring Auckland Central Remand Prison opens.

...N[Z]'s first private jail[, which is being built]... next to Auckland's antiquated Mt Eden jail, will open in [two months]. It will house up to 251 [inmates]... Prisoners at the Australasian Correctional Management Ltd centre will be housed in a modern facility with pleasant surroundings. But trade-offs are understood to include less visiting time than other jails... Each cell has provision for a TV but prisoners won't be able to smoke in their rooms. Inmates can only light up in designated areas and quit smoking programmes will be available. "If an inmate escapes, it will cost... [ACM,] the corrections department general manager of service purchase monitoring... told *Sunday News*. "But there are also clauses which will reward ACM for things such as prisoner employment and rehabilitation." ...A[CM] will get a \$500,000 bonus if they meet annual targets.

...N[Z] prison authorities hoping for lower rates of violence and savings for taxpayers from the introduction of private prisons are likely to be disappointed... A[n analyst for] the Crime Institute in Washington and the U[S] National Council on Crime and Delinquency, told a Sydney forum that research showed savings were about 1[%] – or effectively nil. Promises that all other areas of prison operation would benefit were also far-fetched. Incidents of prisoner violence, death rates and recidivism were no lower than in public prisons... Private jails hold almost a quarter of A[US]'s prison population – compared with 4[%] in the U[S] – giving it the highest rate of privatised jails in the world. The running of private

prisons in Victoria especially has been under constant criticism for secrecy, preventing impartial attempts to measure performance. Community legal centres have been forced to take the state Government to court to try to gain access to information... [on] prisoners... in private jails... [Incidentally, n]obody has broken out of the Idaho State Correctional Institution in more than 20 years. Prison officials like to think a hard-bitten corps of sentries with names like Cookie, Bongo and Chi Chi has had something to do with that. The institution is the only state prison in the U[S] to use snarling, snapping sentry dogs to patrol its perimeter... Get too close to the fence and they will bare their teeth, bark and lunge. Set foot in their space and they attack. The animals themselves are former death row inmates – dogs that were deemed too dangerous to be pets and would have been destroyed at the local pound if they had not been given a reprieve and assigned to prison duty... [T]he canines... cost... less... and are more reliable during power outages than electrical security systems and more effective in the fog and dark than the humans posted in the lookout towers. They also have a powerful deterrent effect. No one... [at] the 1500-inmate medium-security prison... has even tried to get past the fences...

A violent inmate placed a dummy in his bed, changed his clothes and walked unnoticed out the front door of the privately run Auckland Remand Prison during visiting hours yesterday. It is the first escape from N[Z]'s only private prison... Under its contract with the Department of Corrections, the company must pay \$50,000 for every escape... last night [the prisoner] was still on the run. The escape comes as no surprise to former prison officers, who say they quit because there are not enough staff to make the job safe. They also claim visiting hours are often monitored by a single officer, making it easy for drugs and clothes to be smuggled in. Yesterday, manage[rs from ACM] declined to comment...

Serial numbers of prison keys for the privately run Auckland Central Remand Prison, and orders for them to be cut, have been inadvertently faxed to an Auckland warehouse... Challenge Steel's bulk steel supplies office in Penrose confirmed it received the fax... addressed to Key 'n' Lock Services, which is owned by Chubb... *Herald* inquiries have revealed that the... Department of Corrections was unaware of the security breach. The revelation is the second serious security breach discovered at the prison and follows the escape of a violent inmate who walked... out its front door...

Serious violent offenders, including rapists, may be approved for home detention in future, as [the]Corrections Minister... looks at ways of relieving pressure on prisons. Until now, serious offenders have been... excluded from the scheme, which allows minimal-risk inmates to... serve their sentence at home under electronic monitoring. [The minister] is confident that releasing serious offenders into a safe, monitored environment towards the end of their sentences would reduce reoffending. Inmates would have to show a willingness to address the cause of their offending...

The number of prisoners in N[Z] is at the highest level in history... 8509 people [are]in prisons or police stations nationwide – 16 higher than... on September 7. In... August the Government announced it would build a container cell block at Rimutaka prison. [The]... Corrections Minister... said yesterday... that would not be enough and said double bunking was also necessary to manage the "serious capacity crisis"... [In related news, t]housands of criminals kept receiving benefits after they went to jail because a computer fault meant welfare officials were unaware they had been locked up... A data-matching program that compares the names of newly imprisoned criminals and beneficiaries broke down... for up to 16 months... when the Department of Corrections introduced a new computer system... After the Corrections Department introduced its new database, the number of records compared dropped by more than 10,000. Initially, officials said the decline was the result of the system's greater efficiency. However, the ministry was suspicious and began to compare information using other means... More than \$2.2 million was wrongly paid last year, and the Ministry of Social Development faces having to recover the money once the prisoners are released.

...The tiny Pacific island of Niue looks set to free its prisoners and close its jail as it begins celebrating 25 years of self-rule this weekend. The plan, confirmed this week by the Premier... is worrying Foreign Affairs officials in Wellington and has been sharply criticised by the island's former Police Commissioner[, who is]... now an Auckland detective... [The detective,] who was dumped from his... Police Commissioner... post in May after a confrontation with the Government, said the idea was disgraceful... "If the Government releases the prisoners, it is meddling with the judicial process... The resulting message to the community is that [guys] who violate girls will not be put in jail and the victims will then have to accept the risk of violation or assault as part of life." ...[however, the Premier], who returned to Niue this week after a two-month convalescence following heart surgery[– and]... was aware of N[Z]'s concerns because the High Commissioner to Niue... closely quizzed him over the issue... [– said] the island had no serious offenders or hardcore criminals. "Why have a prison to lock up people for petty crimes? Surely, why not[just have] periodic detention?" ...The Acting Niue Police Commissioner... said the prison held just four inmates at the moment... [–] serving jail terms of up to nine years for crimes such as rape, incest and indecent assault... [– so Niue's Acting Police Commissioner] had no concerns about closing it. "We [already] send them home at weekends,"... But [Niue's Acting Police Commissioner] agreed that victims might be concerned if inmates were set free.

...Russia plans to set free about one in every 10 prisoners to ease overcrowding in its spartan, cash-strapped jails. Russia[']s Prime Minister... hailed the amnesty, saying it would free space in jail for criminals who committed white-collar economic crimes.

...When the Russian Parliament passed an amnesty law last month... [–] one of several passed in recent years[–] ...deputies said they were acting to reduce overcrowding in the struggling, disease-ridden prison system... [(t)uberculosis afflicts about 100,000 inmates, and about 10,000 inmates die from the illness each year[)]... However, in a loophole applying to holders of state or military honours they opened the prison gates for several dozen – or several hundred – convicted and suspected murderers and other serious criminals, prosecutors said this week... Those affected include war crimes suspects from Russia's military campaign in Chechnya, like the Russian Army colonel accused of raping and killing a Chechen teenage girl this spring... According to witnesses interviewed by New York-based Human Rights Watch... 18-year-old Heda Kungayeva... was at home with her family... in the village of Tangi-Chu... when Russian soldiers dragged her away in an armoured personnel carrier. Her body was reportedly found two days later, badly disfigured... The colonel was earlier awarded two medals for his actions in Chechnya. Also qualifying for amnesty are officers from an airborne unit accused of planting a suitcase bomb that killed journalist Dmitry Kholodov in 1994, said the prosecutor's office... The lapse in Russia's usually draconian justice system rang alarm bells at the prosecutor's office, which has persuaded legislators to reconsider the law... A Justice Ministry spokes[person] said no one accused or convicted of grave crimes has yet gone free under the amnesty, but some had applied. Suspects in detention centres must admit guilt to take advantage of the amnesty, which some have refused to do... The amnesty... was meant to commemorate the 55th anniversary of the Soviet victory over Nazi Germany... [In addition to] those holding state or military honours regardless of their crime... [i]t covered people who committed minor offences, inmates suffering from tuberculosis, pregnant [inmates and] invalids... Russia has the largest per capita rate of incarceration in the world and the second-largest prison population after the U[S], with about 1 million people behind bars... A record 1.86 million Americans were locked up... [last year. Speaking of US justice, a] MENTALLY ill deaf [person] spent nearly two years in jail before anyone realised [it] did not belong there. The charge against him was dismissed [two years ago].

...More than 100 seriously mentally ill prisoners should be in hospital, not jail, according to a report kept from the public for 10 months. The report, finally released yesterday, said an alarming number of severe cases were slipping through the prison system, and that nearly 60[%] of inmates had at least one personality disorder. Researchers uncovered... previously undetected cases of schizophrenia and bipolar disorder, where inmates required immediate hospital treatment. [40%] of schizophrenics were going unnoticed and untreated... [By the way, s]upport groups have condemned a Government plan to lock up some intellectually disabled people considered dangerous... The Ministry of Health estimates that about 200 people fit this definition – including 50 in the criminal justice system for serious offenders... [The] Justice Action Group convenor... said... "You can call it a home but when you lock the doors... and... give them... medication they don't want... it's just a prison by another name."

...Plans to lock up mentally ill Proposed legislation... in Britain to detain people with dangerous personality disorders in secure hospitals indefinitely – even if they have committed no crime – are being criticised as "fundamentally flawed". Under new powers, published as draft legislation by the Government yesterday, other mentally ill people could be forced to take prescribed medication or to undergo treatment in the

community. The compulsory measures aim to close a loophole that allows people with severe personality disorders to avoid detention by arguing they would not benefit from treatment. Ministers hailed the bill as the first major overhaul of mental health laws since the 1950s. But the Law Society and the Royal College of Psychiatrists condemned the plans as too complex, too costly and unworkable because they would require 600 extra psychiatrists... The Mental Health Alliance, speaking for more than 50 charities, said compulsory detentions... backfire because they... deter people from seeking voluntary treatment... Under the plans, two doctors and a mental health professional will have to decide whether someone needs compulsory treatment to prevent that person becoming a public danger. These powers will be limited to 28 days unless a new mental health tribunal grants an order allowing the treatment to continue for a further six months. After that, subsequent treatment orders can be made for periods up to a year. The... bill would apply to more than 26,000 people a year who are sectioned under the 1983 Mental Health Act. Of these, an estimated 2400 have “dangerous and serious personality disorders”... includ[ing] 1800 who are in high-security prisons or psychiatric hospitals...

On a London Tube platform in December 1992, 27-year-old musician Jonathon Zito was stabbed three times in the head, including the eye, by a tall, 115kg [stranger]... Zito died two hours later. [The stranger], it turned out, had a long history of mental illness. Indeed, [the stranger] had tried to attack someone else the previous week. Zito's widow, [who is] a former mental health worker, was appalled... [upon learning] that someone so ill had been wandering the streets. [The stranger, who] had been discharged from nine psychiatric units in five years... was known to be violent and to carry knives. Yet nobody was responsible for him. So much, then, for community care. [Zito's wife] went on to fight for reform of care in the community, demanding a public inquiry after her husband's death and setting up a trust to lobby on behalf of victims' families. Initially, [the wife] met with official indifference. “The attitude was, ‘Yes, yes, you have had a terrible experience but you're over-reacting. Jonathon was in the wrong place at the wrong time’... Once I started demanding an inquiry I was in a hostile political environment. It was obvious they didn't have a clue about the extent of the problem.” Today [the wife] feels enormous relief... Last December, the British Government declared community care for the mentally ill a failure and said it must be put right... [T]hree decades of horrific statistics... [and] more than 40 published inquiries... [s]ince December 1992... had finally declared to many people – and the Government – that enough was enough... [The] British Health Secretary... [has] promised that the \$2.1 billion community care fix-it would mean more secure beds for the mentally ill and the creation of “assertive outreach” teams to keep tabs on people living outside hospital. [The health secretary] made it clear, too, that his Government expected legal changes to “ensure compliance with appropriate treatment” and said it was discussing plans for a new form of renewable detention for people with [ment]al disorders considered untreatable. The sweeping changes have not been short of critics, including [the]Liberal Democrat health spokes[person, who recently said:] “By forcing patients to take their medication against their will, some will be kept drugged to stop them causing trouble... This is not treatment, but incarceration.” [However, the health secretary has] dismissed the protests, declaring that the “safety of the public must be the prime concern.” ...So, where Britain goes, N[Z] follows? Perhaps not. When [the British health secretary] flagged the changes in January, N[Z] health officials ruled out similar moves here. The Health Funding Authority's national director of mental health... said at the time that... [a]lthough there was a need for lockup units, they were not seen as a solution to the problems...

When the British Minister of Health... announced that the policy of attempting to care for severely mentally ill people in the community was to be scrapped in favour of secure units, the first question many asked was, “Why did it take so long?” Britain has around one murder every two weeks that involves a person diagnosed as mentally ill. The same group produces 1000 suicides a year. In the U[S], where some states began – quietly – reopening such institutions almost 10 years ago, the figures are just as ugly. There are still 1000 homicides a year as a result of violence by the mentally ill in the U[S. NZ] has a high-profile tragedy involving a psychiatrically disturbed person every few months... The history of community care in N[Z] follows, predictably, and depressingly, in the footsteps of the U[S] and British experiments... While the laws emphasised community care by bolstering the rights of patients, they also diminished the rights of their families – so preventing them from attempting to “commit” members to secure institutional care. The feeling behind the law was that no matter how incompetent a patient might be, it was his or her “right” to live in the community. The concept of community care was eagerly adopted by a new breed of hospital managers, who had moved into the health system in the early 1980s hell-bent on saving money... For around 80[%] of patients who used to trail round the echoing wards of Carrington being harassed by their more forceful ward-mates, the changes were mostly for the better. Although many older patients found it difficult to adjust to looking after themselves, most began to enjoy a life of relative independence. But for the 20[%] of very unstable patients in the psychiatric spectrum, the experiment has been a disaster. In the past 10 years many have been ripped off by unscrupulous halfway house operators. Many have slid into a half-world where cannabis and other illegal and legal drugs increase their paranoia... It is at this level, where mentally ill people lapse into violent and paranoid episodes, that patients become a danger to themselves, their families and, sometimes, to the community.

...Courts need the power to force community mental health patients to live in one place, says a judge worried about mental health “timebombs.” [The]Auckland District and Family Court Judge... [made his comments while addressing] the Auckland conference of the A[USn and NZ] Association of Psychiatry, Psychology and Law... The... head of Auckland's Mason Clinic... and... the conference convener, backed the judge's comments... [but] if community patients were forced to stay in one place, the state would have to pay... [It] told the conference that of the 11 incidents of murder and other violent crimes by mental patients... subject to formal inquiries from 1988 to 1998, [8] were found to be preventable.

...A warning has been sounded that... [because] the... Mason Clinic... d[oes] not have enough beds... Auckland harbours up to 60 mental health “timebombs.” This comes in the wake of a report... stemming from a Mental Health Act inquiry... into the care of... a diagnosed schizophrenic who stabbed ACC worker Janet Pike to death last year. [The schizophrenic] fell between the cracks of the mental health and criminal justice systems despite a horrific history of violent public attacks... The inquiry panel found that the general attitude from mental health staff was that there was “little to achieve” by putting [the schizophrenic] in hospital at any time or detaining him under the act. In noting that his is not an isolated case, the report is fatalistic, saying: “There are a number of timebombs like [him] in the community. We can do little or nothing about many of them until they explode. We cannot and should not arrest and detain on suspicion and supposition.” But the report does recommend some changes to care, particularly for better liaison between services and more information sharing... The... report finds that “landlords, flatmates, family members are not currently being informed as they should be in community placement of mental health consumers.” It says privacy code guidelines are not giving a clear message to mental health workers as to what information can and cannot be shared... The inquiry panel, under the district mental health inspector... says [the schizophrenic]'s history should have been made available to his caregivers and family, whether [the schizophrenic] allowed it or not... A... family spokes[person] yesterday pleaded for better psychiatric care, saying: “If something is wrong you don't just chuck people out into the community and say, ‘Fend for yourself’.” The... [schizophrenic], aged 36, stabbed Mrs Pike in her Henderson office after a dispute over a \$350 payment. [The schizophrenic] pleaded guilty to murder and is serving a life sentence. His history of violence dates back to 1981. Gaps in his care were... partly caused by his tendency to move about. At the time of the killing [the schizophrenic] was an outpatient of South Auckland Health, and living at a boarding house... [that wasn't] registered as a health agency... so transfer of information about [him] did not occur.

...A WAI Health worker says west Auckland mental health services abandoned... a diagnosed schizophrenic now serving a life sentence for the murder of ACC worker Janet Pike... A 200-page report into [the schizophrenic]'s care... says, while [hi]s mental illness was adequately treated, his other problems such as housing and personality disorders were not. The report says the Henderson ACC may have dealt differently with [the schizophrenic] had staff known of his history of violence triggered by money worries. [The schizophrenic] argued with Mrs Pike at the Lincoln Rd offices over \$350 [it] believed the ACC owed him, before leaving to buy a knife and returning to stab her. The report suggests alerts about high-risk mental health patients may have to be sent around public and private agencies. But [the WAI Health worker] says that doesn't solve the

problem of many more... [schizophrenics] in west Auckland who are falling between the cracks in mental health services and community care. "At the end of the day [the schizophrenic] was exported out of west Auckland and placed in south Auckland because people in west Auckland didn't want to deal with him..." [The schizophrenic] was born and bred in west Auckland... [and] knew how to reach out to the mental health services in west Auckland..." [However, the]Waitemata Health chief executive... says [the schizophrenic] wasn't abandoned by the mental health service... [The d]eputy director of mental health... says [the] case highlights the difficulty of caring for someone with several psychiatric conditions, not all of which may be treatable. Managing an itinerant such as [the schizophrenic] and his risk to others requires a "high level of communication between all agencies," says [the director]. Work is under way to improve that... with "one file per patient" and reliable systems to transfer information about high-risk patients between health providers and non-government organisations.

...The families of two Raurimu massacre victims are suing health provider Capital Coast Health for inadequately monitoring[the] killer... They also claim it failed to protect the community from someone known to be unstable and potentially violent... [A] lawyer acting for the families, said... [the] principal issue was accountability, not money, but this was the only avenue of redress... [as] Capital Coast Health had accepted no responsibility for the shooting... rampage... [that killed six] people... The... provider's chief executive... last night indicated it would fight the claims.

...The treatment of... a paranoid schizophrenic... leading up to the Raurimu massacre was adequate, says the chief executive of Capital Coast Health. [The chief executive] yesterday became the last witness to take the stand at the inquest into the deaths of six people shot... at Raurimu in... 1997... [A coroner had] queried Capital Coast's failure to front up at the hearing initially. "Was this a strategy to avoid difficult questions?" [The chief executive] replied that the healthcare provider had no reason to be defensive... [The chief executive] disputed provisional criticism from the Taumarunui coroner... about the standard of care given to... [the patient, and] said knowledge of his preoccupation with firearms and history of violence would not have changed his treatment... [But the chief executive] agreed that his statements about the treatment were hearsay. [The coroner]: "So whether or not [the patient]'s treatment was adequate, you would accept that the evidence of others at this inquest might be preferred to your own on this point?" [The chief executive] agreed, and the inquest was over... [Earlier, the chief executive had] devoted most of his testimony to explaining how Capital Coast ha[s] improved its systems since the tragedy. [The coroner]'s decision on whether [the patient] had received adequate care may hang on which account of a traumatic family meeting [it accepts. The patient]'s former psychiatric nurse... told the first hearing... [- which] was adjourned last August to give those in line for criticism time to respond... [-] that at the meeting two months before the massacre, [the patient]'s family were unhappy at his deterioration and failure to take his medication. This week, [the nurse] said the reverse... While his first evidence had been prepared by police, his later evidence had been prepared with the help of Capital Coast Health lawyers... All the mental health experts who gave evidence agreed that [the] parents should not be blamed for the tragedy, as they were not trained to spot... warning signs.

...[a m]ass-killer... told his mother... [it] would... burn... down his family's Raurimu holiday house. On February 8, 1997, [the son] did not have to. The paranoid schizophrenic, whose firearms licence had been revoked, had easy access to a shotgun and ammunition. Yesterday the Taumarunui coroner... delivered his findings into the second-worst mass killing in N[Z]'s history. The coroner... did not spare the Wellington mental health provider, Capital Coast Health, from criticism. But [the coroner] laid the blame for the killings on the shoulder's of [the] father... the first of the six victims. "[This was a guy] familiar with firearms, but his attitude to storage was casual and careless. That attitude cost him and five others their lives." [The coroner] said that if [the father] had locked away his guns as required by law, the tragedy would never have occurred... While [the son] might have remained a potential timebomb, [it] would not have run amok with a gun. [The coroner excused the mother]'s failure to respond to the sight of her son unloading a gun... just days before the tragedy. [The mother] had been overwhelmed by her son's bizarre behaviour, and could not recognise how ill [her son had become. The coroner], who has devoted countless hours to wrapping up the official file on the tragedy, [also]said it was easy to make adverse comments in hindsight, and... those involved had done their best. "They did not set out to fail, and if they did fail to some extent, that is more an example of being human [beings]than anything else." But the lack of appropriate systems in Capital Coast Health's treatment of [the son] and their inadequacy came under attack, as well as the confidentiality constraints under which mental health providers worked. The coroner stopped short of saying that [the son] should have been locked away before the shooting rampage... However... a point has to be reached when clinicians pursued compulsory treatment options. "The situation cannot be permitted to arise where treatment is watered down simply so that it complies with what the patient will accept." ...[the coroner] was disturbed by the apparent lack of leadership in the mental health team... [and] recommended that teams designate someone to have ultimate control and responsibility.

...An 8-year-old girl stabbed to death in her bed by her insane father was a victim of system failures and a mental health law that encourages community-based treatment, the Christchurch coroner has found... [Therefore, the coroner] found that no clinician or individual was responsible... But the report issued yesterday... has devastated [the girl's mother], who is convinced her daughter would be alive if welfare and health officials had heeded her pleas and warnings. Lisa Michelle Hope was stabbed repeatedly by Ian Shaun Hope, who believed [it] was the third son of God and that God wanted a blood sacrifice on the night of December 16, 1998. Lisa and her brother... who was in the same room and slept through the killing, were due to fly to Auckland the next day to return to their mother's custody. Ian... had suffered a mental breakdown in June that year and was an inpatient at Sunnyside Hospital for more than a month. [Ian] was diagnosed schizophrenic and became the subject of a District-Court-imposed community treatment order after being discharged. After being charged with the murder, [Ian] was returned to Sunnyside for psychiatric assessment, and later killed himself in the hospital. Healthlink South commissioned a review of its handling of Ian... and released the finding - that neither his death nor that of his daughter could be attributed to inadequate care or lack of skill or money. But it did not release the full report. [The coroner] said it was recognised that Ian... had a high risk of relapse because [it] stopped taking medication and used cannabis, which made him delusional. "It is not an ideal treatment to leave a person with a psychosis of this nature unmedicated." Although clinicians knew [their patient] had assaulted and threatened to kill his estranged wife, they did not seek details about the violence involved and accepted his word that charges had been withdrawn, which was untrue. [Lisa's mother] tried to get interim custody of her children in July while Ian... was in Sunnyside... Social Welfare staff had told [the coroner] they were overworked and underfunded so could not meet a judge's deadline for reporting back, meaning the decision on granting the mother custody was delayed. [The coroner]'s recommendations include steps to ensure judges are notified of such delays. [Lisa's mother] described the findings as "absolute crap. A few little slaps on the hands but it's nothing compared to the loss of life."

...[Opposition MPs are] demanding a full inquiry into the way Southland Hospital treated [a]paranoid schizophrenic... who murdered his mother. But the P[M] said yesterday that a full ministerial inquiry was unlikely. "This is at least the third inquiry they [[the Opposition]] have called for in a week... They shouldn't hold their breath." Just a day after being officially released from Southland Hospital in Invercargill this year, [the]20-year-old... drove to his family home in Queenstown and stabbed his mother, Patricia Anne Burton, to death. In the High Court at Invercargill last week, [the son] was found not guilty by reason of insanity... Southland Health, asked yesterday about [the 20-year-old]'s treatment and release - particularly... matters raised by his father... - declined to answer specific questions, saying they would be addressed through [an] external audit.

...I WONDER when somebody will offer an apology, one that actually means something, to [the guy whose wife was murdered by their schizophrenic s]on. But things being as they are, I won't exactly be holding my breath. I wonder how [the guy] holds his life together and believes in anything at all, after his personal experience of the mental health system. His controlled anger and determination to keep the subject in the public arena are a credit to him, but like many family members of the mentally ill, [the guy] is effectively powerless, however much noise... [it makes. The guy, a]s we all know... was first to respond to the emergency call to his own home, where [it] found his wife, stabbed to death by his son... His other

son had hidden from the killer. As we also know, [the father] had foreseen this tragedy and had made responsible efforts to prevent it. [The son] had been admitted to psychiatric care at Southland Hospital... [The son] was a schizophrenic who abuses drugs and alcohol, a combination that would alert anyone with common sense to the danger [it] posed to the community. [The son] also harboured ill-will towards his family and they were afraid of him. [The father] wrote a letter to the hospital warning them that the family's lives were all at risk if [the son] was released. That is what any sensible parent would have done and the fact that [it]'s a police[officer], with inevitable long experience of disturbed people's behaviour, ought to have counted for something... In his job, [the guy] has to take notice of what people tell him and to act appropriately. [The guy] was not to know that the people in charge of his son wouldn't even do him the courtesy of reading his letter, or that they'd be free to release the disturbed boy into the community without even consulting his father. The case is so bleakly shocking that it almost defies belief. [The son] was no sooner released (to a flat on his own, for heaven's sake!) than [it] drove directly to his family home to carry out his long-standing threats. And – wait for it – once again nobody is to blame... The... case is not unique. It showcases the unreality that has invaded mental health care, in which the families of the mentally ill too often carry the burden of the system's failures and are too often talking sense that nobody wants to hear... [■ T]he murder of a Rotorua [resident] by her mentally ill tenant has brought an admission of professional errors and more calls to tighten the Mental Health Act. [The tenant], aged 31, was found not guilty by reason of insanity in the High Court at Rotorua yesterday of murdering his landlady, Joanna Monk, and attempting to murder her husband... Mental health specialists had assessed [the tenant] on four occasions, but while [the 31-year-old] was diagnosed with various disorders and prescribed medication, [it] did not follow through with treatment. The country's most senior mental health officer... who gave evidence at the trial, said [the tenant] tried to hide his illness but it should have been obvious to doctors that [the 31-year-old] desperately needed help. In four years [the tenant] was seen by doctors in Rotorua, Invercargill and Christchurch... Southland Hospital... would not comment, and the director of Christchurch's [psychiatric h]ospital... could not be contacted... [The] secretary of Caring Communities, a group which keeps records of psychiatric-related homicides, said this was just one of a growing list of tragedies where people with a history of mental disorder had been allowed to remain in the community. Incidents in which the mentally ill turned away by health services went on to kill had happened "with monotonous regularity."

...a psychiatric patient... discharg[ed] from Hutt Hospital... later killed and beheaded his girlfriend, a Wellington inquest has been told. [The patient], 27, who killed Fiona Maulolo, 31, in April 1997, is being detained at Porirua Hospital[after being] found not guilty of murder because of insanity. [A]Dr... who had been asked by Hutt Valley Health to review [the patient]'s case, testified that [a]Polish doctor... was negligent to discharge him from compulsory treatment without a clinical report giving her reasons. Earlier, there was evidence that [the]... Polish doctor... lied about her work experience to gain a psychiatric post at Hutt Valley Health, which has since overhauled its procedures... [The Polish doctor's negligence was compounded by] a newly appointed Maori mental health worker, who was supposed to keep in contact with [the patient] after his discharge, [but]failed to do so. [The Maori mental health worker] also did not tell other team members that [the patient]'s doctor was concerned about the lack of continuing care. [The patient] could not be reached by the time the mental-health team became aware of those concerns. [The patient] was admitted to intensive care at Hutt Hospital... after overdosing on drugs or alcohol. Police found Ms Maulolo's body two days later.

...[a suspect] accused of murdering [his]former Wellington flatmate Gavin Dash, was last night found not guilty on the grounds of insanity. The jury took eight hours to find the unemployed [suspect], aged 27, not guilty of murder but guilty of a burglary... [The suspect] admitted strangling Mr Dash and later cutting off his head and burying his body in bush at Makara Hill, Wellington... then burgled Mr Dash's new flat in Pembroke Rd, Northland, to make it seem as though Mr Dash was simply a missing person, the Crown alleged. In the High Court at Wellington yesterday, [the judge]... summed up the five-week trial... [by telling] the jurors that they should not decide the issue like a panel of doctors. Psychiatrists called by both the Crown and the defence had agreed that [the suspect] probably had schizophrenia... But [the judge] said the jury had to decide if [the] illness was so bad at the time of the murder and the burglary that [the suspect] was unable to know it was morally wrong. Last night, Gavin's father... said the family[– who 'ask how juries can decide' on such medical issues –] were disappointed by the verdict. "It's a sad day for justice."

...The families of murder victim Malcolm Beggs and the disturbed teenager who killed him with an axe are both appalled at the failure of the mental health system. They spoke yesterday of their grief at what they believe were preventable deaths. Mr Beggs' body was found in his bed at his Henderson home on Monday... [19]-year-old Lachlan Alexander Jones was found in the garage, dead from carbon monoxide poisoning. Police say they found about six stubbies in Jones' room at the house in Universal Drive, but do not believe alcohol or drugs were a factor. No note was found, and detectives say they may never know what set Jones off. Mr Beggs' sister... demanded to know who was accountable for allowing Jones to leave the Te Atarau acute psychiatric unit at Waitakere Hospital against medical advice in July. [The sister] found it perverse that a nurse invaded her brother's privacy by entering his home without his knowledge to see Jones, yet the Privacy Act was the reason Mr Beggs could not be told of his flatmate's condition. Last night Jones' father, [a]newspaper editor... said: "I think Lachlan has been let down by the system. Why was [Lachlan] allowed to discharge himself if [Lachlan] was mentally ill?" ...his son first started becoming withdrawn at about 16, and had begun hearing voices and having visions, although [it hadn't] been formally diagnosed as schizophrenic... Waitemata Health has begun an inquiry into the mental health services' dealings with and follow-up care of Jones, who was first admitted to hospital a year ago after a failed suicide bid... A mobile intensive treatment team had been seeing him to ensure [the teenager] took his medication, but Mr Beggs had no idea [Lachlan] was mentally ill... Beggs' sister, a 19-year-old trainee nurse, said yesterday that her brother spoke to her of his concerns last Wednesday. "One day a nurse came around and [Malcolm wondered why. Malcolm] was joking about it, but I think deep down [Malcolm was worried.]" ...if her brother had known about Jones' mental history, [it] would not just have kicked him out on to the street. "Malcolm was a good guy and... was prepared to give him the benefit of the doubt." ...The director of mental health services for Waitemata Health... said it was a tragedy that two young [guys] had died, but if anything was to blame it was society's prejudice against the mentally ill... "It's often in their interests that key people they live with... know they have a mental illness, but you're not going to tell them on day one when you don't know whether that person will then pull the rug from under your feet."

...Malcolm Beggs... was concerned about his "weird" new flatmate, [so his sister] jokingly told him to watch his back. Referring to a crime which had taken place in their neighbourhood, [the sister] said, "That guy down the road got killed by his flatmate. You should lock the doors or yours could murder you in your sleep." Malcolm told her, "Well, I wonder if [Lachlan]'s planning something like that." Now, recalling what [was said, the sister] shakes her head in disbelief. "I was joking. It was just one of those things you say..." Just days after that conversation, Malcolm... was murdered in his bed by his flatmate... The day after the bodies were discovered, police told Malcolm's parents... Lachlan... had been a psychiatric patient... and [was]... believed to be schizophrenic... The Beggs family is furious Malcolm wasn't told about Lachlan's history... "Our family is not prejudiced against mental illness... But Malcolm... certainly wouldn't have been happy about Lachlan staying if [Malcolm had known Lachlan] had the word 'murder' carved into the side of his leg..." Malcolm had been happy living alone in the house [it] bought a year earlier but realised... a flatmate... [was] needed... to help pay the mortgage. Quiet teenager Lachlan Jones answered a "flatmate wanted" ad. Malcolm wanted someone who was employed and Lachlan told him [it] worked for a shower manufacturer ([Lachlan] didn't). Lachlan moved in... but the pair didn't see much of each other – Malcolm left for work as a diesel mechanic before Lachlan got up, and when they were both home, the younger [guy] spent most of his time in his room... Malcolm later told his family [about being] worried Lachlan was a bit "weird", partly because [Lachlan] spent so much time in his room... Those worries grew when a nurse came to the house one day, looking for Lachlan. When Malcolm said his flatmate wasn't there, the nurse handed Malcolm some tablets and asked him to give them to Lachlan. Malcolm had no idea what the tablets were for, or that a

nurse... had been coming to the house every day to give Lachlan prescribed drugs... In the days that followed... [the discovery of] the bodies ...by... a friend... [of] Malcolm's... his... family... obtained copies of a psychiatrist's notes made... when Lachlan was admitted to Te Atarau... They were horrified to find the severity of his symptoms had been rated as "10/10 = bad" and the psychiatrist had written "[Lachlan]'s at further risk of acting out his psychosis." According to the assessment, Lachlan has been hearing the words "murder and suicide" and had "thoughts of murdering someone..." However, Lachlan wanted to leave Te Atarau after four days and, in his discharge summary, another doctor wrote Lachlan "was able to guarantee people are currently safe around him." The summary continues, "We assessed that [Lachlan] was not committable and discharged him against medical advice. The impression of the team... was that maybe his psychotic symptoms are related to his substance abuse or fabricated." The report noted Lachlan had started drinking alcohol at 10, smoking cannabis at 12 and had used magic mushrooms and LSD. It also said [Lachlan] had convictions for theft and disorder and a history of "recurrent fights, with physical assaults." "If Malcolm had read that report, [it] would never have had him in the house," says [his father. "But Malcolm] wasn't allowed to know any of that[-] because of the Privacy Act[, Malcolm] had no rights. There's too much secrecy surrounding mental illness... It works both ways - Malcolm was never checked out to make sure [Malcolm] was a suitable person for a psychiatric patient to be living with. For all they knew, [Malcolm] could have been a drug dealer." ...The family believes that, while fault falls on the individuals who work in the mental health system, the system itself is also to blame and needs a major overhaul... "The Government needs to make some changes - they messed it up in the first place... I hope it doesn't take an MP to find themselves in the same situation as us before anything is done[," says Malcolm's mother, who i]s prepared to fight to get changes made... "I'm not going to let this die down. If I have to go round and talk to people and form committees, I will. Because it will happen again. Another family will hurt like we do..."

...MALCOLM[']S... parents are not consoled by Waitemata Health's apology over the failures in its care of his flatmate... Waitemata Health[']s chief executive... met... [them] on Wednesday morning to... answer questions. The family has seen only the public summary of the inquiry... into Mr Jones' treatment by... west Auckland mental health services... as the full report is confidential under the Medical Practitioners Act... The... summary says although there was little doubt about Lachlan Jones' condition, his needs were assessed only "superficially". The... 19-year-old was being treated by Waitemata Health youth and child services, which has only 38 of the 129 clinical staff recommended in the national mental health blueprint. Adult mental health services are... short 54 staff... [But the c]hief executive... says the shortage of staff... is not an excuse for the failures... The [parents] are going to Wellington in 10 days to present a 9000-signature petition to [the PM]... calling for the mental health blueprint to be implemented... The family still says a caregiver or flatmate has a paramount right to know the extent of... mental illness of any person living in their home... The Auckland coroner has suppressed all details of the manner in which Malcolm... died until the inquest into both deaths...

Previous flatmates of Lachlan Jones were well aware [Lachlan] was a psychiatric patient, a mental health worker told the Auckland Coroner's Court. And [the nurse] who was Lachlan's key worker from the Waitemata Health Community Assessment and Treatment Team (Catt), says that at some time later it was "highly likely" Malcolm Beggs would also have become involved in Lachlan's care. A relationship between Malcolm and mental health workers would have been a "natural progression" of Lachlan living in Malcolm's house...

Lachlan's flatmates at his earlier Railside Ave address knew [Lachlan] was a mental health patient without directly being told, because of the regular visits and phone calls from the Catt team... [T]he Auckland Coroner's Court[also heard yesterday that]... just hours before... kill[ing] his flatmate Malcolm Beggs, [Lachlan's key Catt]... worker... delivered Lachlan's medication... and Lachlan asked for more... The inquest is continuing.

...[a] Detective Sergeant... says police found 17 unopened packets of medication in Lachlan's bedroom and another seven packets, five of which were open, in another room. The autopsy found no traces of the medication in Lachlan's blood stream and no traces of cannabis...

LACHLAN Jones told mental health workers several weeks before... kill[ing]... Malcolm Beggs that his TV was telling him to murder someone... [But] other factors led... [a p]sychiatric registrar... and other members of... [Catt] to assess Lachlan [as having] "no active suicidal or homicidal intent" [it]... told the Auckland Coroner's Court yesterday... They believed his alcohol and cannabis misuse exacerbated his hallucinations and side-effects of his medication... Another psychiatric registrar told the inquest [it] didn't consider Lachlan... a threat to himself or others when [it] saw him a week after [Lachlan ha]d carved "murder" into his left calf... [That registrar] says... Lachlan... refused to show her or[his] Catt nurse... the self-mutilated leg which had become infected. The leg was bandaged from below the knee to the ankle... Lachlan was put on a plan of twice daily visits by the Catt teams, anti-psychotic medication and other measures. [The registrar] marked Lachlan's file as a high-risk patient who should be admitted to an acute bed if things deteriorated... [The registrar says it] would have contacted his family if Lachlan had been a risk to himself or was to be admitted under the Mental Health Act. [Lachlan] had refused permission for the assessment team to contact any family member.

...A "leadership vacuum" within the west's mental health crisis management team affected Lachlan Jones' care, his key worker... has told the Auckland Coroner's Court... [The key worker says the unit's] American trained psychiatric consultant[']s... guidance was lacking. [The American, who] spent six months as consultant at... Catt... during Lachlan's care... has since returned to the U[S] to tend his sick son. [The consultant] is not being called as a witness and is not submitting written evidence.

...The psychiatric registrar who discharged... Jones from... Te Atarau... now deeply regrets not having sought a second opinion... [The registrar] told a coroner's inquest yesterday that in hindsight [it] should have contacted the on-call consultant psychiatrist before discharging Jones against medical advice... [The registrar] did not do so because consultants were normally contacted only if the registrar had problems with the patient's assessment or management... But [the registrar] acknowledged that having spent only one month at the unit, [it] was in training and should have sought further support... [Strangely, the inquest also heard that on August 29, a]fter a month of trying to contact Lachlan and find his new address, [his key worker visited] him at Universal Drive... [Yet Lachlan had moved] into... Universal Drive[between August 12-14; and on August 24, a] friend of Malcolm's [wa]s present when a nurse visit[ed] the house with medication for Lachlan... The inquest... has run behind schedule and will resume next month.

...The Auckland coroner... ended his inquest into the deaths of Lachlan Jones and Malcolm Beggs yesterday, saying [it] hoped to produce "some salutary solution" to prevent a repetition of the events that led to the suicide-murder[, but]... has reserved his findings, which may take up to six weeks to put together... [The coroner] concluded the... inquest after... the Beggs family, made a brief closing submission calling for a change in direction of Waitemata Health's culture... Earlier... Waitemata Health... expressed condolences to the... families. "We can say till we are blue in the face that an inquest is not about apportioning blame but the worthies of the fourth estate and the public do not necessarily see it that way."

...Culture of secrecy must end... Malcolm Beggs, who was bludgeoned to death with an axe [in his Universal Drive, Henderson, home] by Lachlan Jones, had no idea his 19-year-old flatmate was a paranoid schizophrenic. The fact that Waitemata Health kept such information secret - even from Jones' own family - was harshly criticised after the murder. Now the Mental Health Commission has recommended that staff dealing with such patients be more open in disclosing information to family, friends, and other mental health agencies that come into contact with them.

...Despite some recent victories, the battle for the public's right to know is an ongoing one. A breakthrough last week was the release of a Police Complaints Authority decision on the accidental shooting of a... teenager... outside the Tauranga police station. Heavily pregnant at the time, [the]... 17-year-old... was struck in the face by pellets after an imported shotgun discharged an undetected cartridge while its owner was putting it in his ute after collecting it from the police. Not even [the victim] was automatically entitled to a report, as [the victim] did not lodge a complaint. But[the main PCA] Judge... relented this week, deciding that public interest in the case was sufficient to outweigh other considerations... What might not have become public had the authority not relented... was its recommendation... to improve training... for police arms... storage... officers.

A suppression order of a large chunk of evidence early in the Gisborne cervical cancer inquiry was also lifted last week. Next week the High Court will hear TV3's application for urgency in its bid to undo a coroner's ban against a documentary on the death of a... 66-year-old... Northland[er] pepper-sprayed by police. A suppression order stopping TV3 from screening a 20/20 programme tomorrow night on the death of... Dr Ian Horsfield was described as extraordinary by a High Court judge... The issue has brought into renewed focus the powers of coroners, who need have no formal legal training, yet can issue blanket suppression orders more sweeping than courts are entitled to make. [A]Canterbury University media law specialist... said that while judges could suppress all evidence and submissions, they had to deliver their decisions in open court. Yet coroners could even suppress their findings, as happened in Auckland last year when a *Herald* reporter was banished from an inquest into the death of an Otara couple after relatives were asked if they wanted a media blackout. Auckland[']s coroner... acknowledged to the... *Herald* that his decision to keep secret his findings on the causes of their deaths was a departure from his normal practice. Although the couple's names had been published previously, [the coroner] said relatives had made an impassioned plea about the effect any further publicity might have on their children. [Auckland's coroner] also pulled no punches... when... gagg[ing] the media from publishing details about the deaths of young... Malcolm Beggs and his teenage flatmate Lachlan Jones... The suppression order... which also prevents identification of the health professionals who treated... Jones... – ...even though one had previously been named in the *Herald*... – ...was decreed by Mr Beggs' family as hindering their efforts to gather signatures on a petition to overhaul the mental health system... [In international news, e]ight children were slain and 29 other people – children and teachers – injured in a frenzied stabbing attack by a crazed [perso]n who yesterday burst into a Japanese primary school carrying a kitchen knife... The attack, unprecedented in safe Japan, where guns are outlawed, took place during morning classes at a... school in a residential area of Ikeda, a suburb of the western city of Osaka... While school shootings are becoming a grim part of life in the U[S]... scenes of mass violence are understood to have never occurred before in a Japanese school... The attacker... – ...identified... as [a]37-year-old... who had been treated for schizophrenia... – ...was last night in police custody after being arrested at the school... While the motive remained unclear, national television reported that [the schizophrenic] told police... it... wanted to kill himself. Police later quoted him as saying... “I was fed up with everything. I want to be put to death.”

...A Dunedin study suggests it may be possible to identify children at greatest risk of developing adult schizophrenia, and to provide much earlier help... [T]he Otago University study was the first to show specific links between self-reported psychotic symptoms in children and schizophrenia in adults. The study, involving the university's Dunedin Multidisciplinary Health and Development Research Unit, has already created a buzz of interest among international researchers. It has just been published in the American Medical Association journal *Archives of General Psychiatry*.

...A controversial new book suggests that schizophrenic and schizotypal behaviour have shaped humankind... Many... people – Christian saints, sudhus in India, mendicant Russian mystics and those lost people muttering to themselves who are common in most cities today – exhibit aberrant behaviour. “Look at the life stories of virtually every saint or extreme religious leader and you can certainly see they are, if not schizophrenic, very schizotypal,” says [the]British author... whose... book, *The madness of Adam and Eve: How schizophrenia shaped humanity*, is causing considerable ripples for its controversial claims and suggestions. Among [hi]s contentions are that mutations in the brain around 100,000 years ago brought about by a change of diet triggered humanity's rise to evolutionary dominance, but also struck the species with schizophrenia. And that schizophrenia – and more importantly schizotypal behaviour in those without all the genes that cause schizophrenia – have produced high achievers, intellectual geniuses, mystics and artists. We became human because some of us became mad... The good-natured [author], speaking from his home in Scotland, laughs as [it] concedes that, in a nutshell, [it]'s saying, yes, a little bit of schizophrenia is good for us. It's certainly in us... “About 80 to 90[%] of us have at least one gene, 40 to 50[%] have two, 10 to 20[%] will have three, and 1[%] have all four... [W]hat that means is almost everyone in the population has one or two [of the]genes and this is why mental illness appears out of the blue.” Parents may individually possess only one or two of these genes... but the child may inherit all four and therefore develop manifestations of schizophrenia. The parents' and the schizophrenic's siblings may just be schizotypal, and among them will be an unnaturally high number who are gifted. Families with schizophrenic members seem to have a greater variety of abilities, [the author] says, citing Albert Einstein's schizophrenic son and James Joyce's schizophrenic daughter.

...One of the first attempts to use genetic data to ban individuals from jobs has been ruled unlawful by a judge in Hong Kong. The case, which has crucial implications for the rest of the world, has been hailed as “a great victory in an important rights case” by [the]defence lawyer... His clients – three [guys] refused employment by the Hong Kong Government because they had schizophrenic parents – were awarded a total of \$[HK]2.8 million... in damages. One of the international experts who appeared for the defence... said that if the Hong Kong authorities had got away with their attempt to discriminate, “then you can be sure someone else would have tried the same thing straightaway...”

...When a skipping girl screams ridicule at Charlie Baileygates, something snaps inside, his aggressive side takes over and [Charlie] momentarily forces her underwater... Scenes like that from the... comedy *Me, Myself & Irene*... have sparked outrage in the mental health community. They say the film reinforces incorrect ideas about mental illness and encourages discrimination against its sufferers – at the same time as the Government is spending \$12.46 million over five years to counter the discrimination and stigma. A main gripe is that Charlie... has the rare condition multiple personality disorder and not schizophrenia. Yet in the movie [Charlie] is described as suffering from both, as well as being “nuttier than a squirrel turd.” “It's counter-productive,” said... [the] head of the anti-discrimination project. It would shape the views of people who were unclear about schizophrenia, particularly teenagers.['] The head] is trying to have the film's classification raised from R13 to R18. Charlie plays a sweet-natured Rhode Island police[officer] who hardly has the confidence to give a parking ticket. Everyone dumps on him, even the neighbour's dog... One day it gets too much and out pops a new personality, Hank, the obnoxious, leering rival of Charlie. Some who saw the film in Auckland yesterday thought it was clearly a comedy and unlikely to affect people's views on mental illness... [One] said protests would simply encourage more people to see the movie. “It's basically just a stupid film that people will forget as soon as they walk out.” Protesters have handed out leaflets at some showings of the film and appear to have won a concession from the promoters. Initial advertisements carried the tagline “from gentle to mental,” which the protesters say implies people with mental illnesses tend to be violent. That line does not appear in at least some newspaper ads... *Me, Myself & Irene* is no psychology lecture. As a comedy it scrapes by, if you like... bizarre acts with chickens... cow-strangling... and... bucket-loads of toilet humour... [Incidentally, the film's lead actor is yet to be listed among them, but m]any Hollywood stars have had intrusive – even fatal – encounters with obsessed fans. Scores of Hollywood's top celebrities are permanently on alert, looking over their shoulders for stalkers and crazed fans. As the cult of celebrity and the internet converge, stalkers are infesting Hollywood as never before. For every high-profile stalking case... there are now hundreds that never make the news... – [and]there are dozens that are deliberately suppressed... [S]talkers... deemed dangerous enough... receive prison terms of 10 to 25 years... ‘Most celebrity stalkers are either mentally disturbed in a serious way, or quite dangerously mad,’ says... the Los Angeles police anti-stalking department... And if Hollywood is well-known for it's persistent fans and sickos, then when British TV host *Jill Dando* was gunned down in front of her London home... stars became even more anxious.

...[a]leaked report reveals 6000 mentally unstable people have stalked the royals in six years... ● [The LA]... Deputy DA... is a world authority on stalkers[, having been]... involved in the introduction of anti-stalking laws in California, the first place in the world to recognise it as a criminal offence. But [the Deputy DA] warns once a stalker is free to hit the streets again, [it]... is as big a threat as ever. Describing a prison interview with [one stalker] now serving 10 years for stalking and threatening to kill a... singing superstar... [the Deputy DA says: ‘The stalker] said that when [it got out it] was going to arm himself and start shooting at stars.’ ...[the Deputy DA describes one actor]'s terror at the hands of a stalker... through cyberstalking. [The stalker], aged 51, sent the Oscar-winning actor flowers, sweets, pizza, pornography – and e-mails... [The actor] was terrified of

being sexually assaulted by [the stalker. The Deputy DA] had him ruled mentally insane and sent him to a lockdown mental facility for a minimum of three years. ‘A lot of these stalkers have mental problems, but this doesn’t amount to a legal defence. They know exactly what they are doing...’

...N[Z] has its share of stalking cases although many do not end up before the courts. An expert told a mental health conference in Wellington last November that one in 10 people will be stalked during their life... [The AUS] forensic psychiatrist, said one explanation for the rising number of stalking cases was that more relationships were being formed and then breaking up. [Gals] were more likely to be the targets of obsessive... [guys. L]ast October a Rotorua [resident] complained of police inaction over a [guy] who had parked outside her house for six weeks... then approached her asking about her husband – [the resident] lived alone – and later left a note making sexual suggestions. Police spoke to the [guy], but told the [resident] they could not charge him with harassment because [the guy] had not physically harmed her... and... was just asking her out on a date.

...[when a conservationist] took on a new flatmate, [it] never imagined that only five months later [the flatmate] would be convicted for filming her naked and making videotape filled with sexual depravities. The 27-year-old Auckland, who works to save the kiwi and protect and promote N[Z]’s clean green image, was horrified when [it] discovered that... the flatmate [it] valued as a friend, was stalking her and had just been released from prison for harassing another [gal] in his hometown of Invercargill. [The conservationist realised it] was the target of [her flatmate]’s sick attentions only... [after spying] a lens under her bedroom door while dressing. [The conservationist] yelled out, the lens disappeared and bare feet hurried past. Shocked, [the conservationist] realised the only other person in the house was [her flatmate. The conservationist] dressed and quickly went to confront him. ‘I said to him, ‘...if you have been doing what I think you have been doing you can bloody well cut it out.’ I... was taken aback and... shocked, but I thought [the flatmate] was harmless. I thought [it was just] a 25-year-old [guy] who was lonely.’ ...While [the flatmate] was at work that night, [the conservationist] looked in his room... ‘I wouldn’t normally go into his room, but I thought, ‘[My flatmate] peeked at me and I’m going to peek at him.’...’ On her way out the door, [the conservationist] spotted a little videotape concealed behind [hi]s lolly jar. ‘I still didn’t have suspicions but I put it on, hit rewind for about three seconds, hit play and there was me naked. I hit rewind again and it’s me naked, him wearing my togs, him masturbating into my drawers... I hit stop and ran to my other flatmate’s bedroom. [My other flatmate] watched the video with me... [In one scene, the first flatmate] was lying in a bathtub cutting... lingerie off himself with a serrated knife and that really scared me. [The flatmate] had this gruesome look on his face... w[hilst] hacking clothing off himself and masturbating. There was a shot on the tape that really spooked me. It was my bedroom in the early daylight and there was a body in the bed. I thought, ‘Oh my God, [my flatmate] has been taping me while I am asleep.’ Then [the flatmate] comes running down wearing my togs and leaps on the body and starts raping it. I honestly thought it was me asleep... but it turned out [the flatmate] had been making effigies of me by stuffing my clothes... I had been wearing these clothes, like some kind of walking entertainment for him... [In another scene, the flatmate] was masturbating while videotaping a little girl doing handstands. That got me. Right then I thought, ‘We have to do something about this guy’...’ ...[the conservationist] called the police. ‘It was the early hours of the morning. I was in shock, and suddenly six police officers walk into your house and start watching you naked on a videotape – it was surreal and so unbelievable.’ [The conservationist], who lost her leg at age 22 when... hit by a drunk driver while a passenger on a motorbike, says [the flatmate] had urged her to give notice to the other flatmate and share the house just with her. ‘Thank God I spotted the lens under the door. [The guy] is a predator. I was his prey and I had a lucky escape...’... [Her former flatmate] pleaded guilty in Auckland’s Otahuhu District Court to charges of criminal harassment, making an objectionable publication, theft and doing an indecent act in any place and was imprisoned for 19 months... In police evidence presented to the court, [her former flatmate admitted it] would not stop offending once released from prison and that his offending might in fact worsen.

...Police are praising the vigilance of a... father who foiled a repeat flasher targeting his son... Titirangi[’s] Community constable... says the father reported seeing someone acting suspiciously when [it] dropped his 12-year-old son at the bus stop on the corner of Huia and Cornwallis Rds three weeks ago... [T]he father returned to check on his son because [it] felt uneasy about [a guy]... sitting nearby in a car. As... the [father]... returned... the car... drove off... [The flasher] was arrested at the same bus stop a week later and admitted in interviews [it] wanted to flash or masturbate in front of a child... Police... told the court [the 28-year-old] had a green light that doctors put on top of their cars and other medical equipment in his car. Police believed the [flasher] would have used this gear to pose as a trustworthy member of society and lure a child near his car before performing an indecent act... Waitemata Health[’s] forensic court liaison nurse... told the court they were trying to persuade [him] to seek help.

...The mother of a suicidal [son] who took his own life while under the care of a mental health crisis team was told to “take a break” and let them look after him. The 31-year-old... whose name is suppressed, committed suicide... five days after his mother arranged a care plan with the Waitemata Health crisis team in which it would phone and visit him each day his family were away. His family told the Auckland coroner’s court yesterday that the crisis team never visited and did not check his medication. They did not follow up unanswered phone calls to the [son] with home visits as promised. The mother, who for more than 10 years had cared constantly for her manic-depressive son, left for Taupo... to visit her other son, who had just been diagnosed with Parkinson’s disease. [The mother] left the manic-depressive son at home alone... A nurse had told her “that I should go away, that I needed a break and that ‘we will take full responsibility for [him]’.” ...A friend who visited the son... three days before his death... told the court that the [son said it] had little confidence in the mental health system, and when asked if [it] had ever contemplated suicide said: “What stopped me was the love of my mother.” The mother... did not know about her son’s suicide until police contacted her two days afterwards... The mother... told the court that... no one from the... Community Assessment and Treatment Team... expressed their condolences.

...Industrial action by mental healthcare workers is spreading as they demand more beds to ease an “unsafe” crush of patients. Public Service Association members at three Auckland sites have been protesting since March against conditions they consider unsafe for themselves and their patients. They report an increasing incidence of patient assaults on staff. The failings highlighted by the association prompted [the] Health Minister... to order a review of Auckland mental health services. The review team’s final report is expected this month... From today, crisis workers at Counties Manukau will spend a maximum two hours caring for each patient while seeking an acute-unit bed, and will not do any other work in that time... Community teams, who care for patients after they have been discharged, will take them only under agreed discharge plans. They will not accept patients who have been discharged to free beds... “It may be necessary to investigate capping client numbers to further protect the safety of staff in the community teams, the PSA says in a letter to... the Counties Manukau District Health Board’s acute unit, Tiaho Mai...

Diane*, who has mental health problems, telephoned the N[Z] Herald last year because [the mental health patient] was worried sick. The supported house [Diane] lived in was to close... because it didn’t meet North Health’s standards and the [person] who ran it was having trouble finding something else for her residents... Today, Diane is in the Auckland Hospital Conolly Unit for acute patients. First, because there is nowhere else for her to live. Second, because the stress of trying to find a home has made her more unwell. Diane is just one of 2500 mental health service users surveyed in a draft report by the Mental Health Commission, which was released to mental health workers late last week under the Official Information Act. Overall the report highlights a desperate lack of suitable housing for mentally ill people. Over the previous three months: • More than 18[%] lived as fulltime dependents with their families. • Four people were totally homeless. • 3[%]... were homeless part of the time. • 33[%] had at least one change of housing. • Nearly 9[%] had three or more abodes... For mentally ill people in the community, life is muddled and harsh. Even now, after countless expensive inquiries and the addition of 35 acute, sub-acute and intensive beds in the Auckland area, Auckland Healthcare’s... Conolly Unit is jammed by relatively well people such as Diane. Those who are more independent and want to live alone or flat with others are hamstrung by high market rentals... A[n] Auckland District Council of Social Services... [worker] describes taking people who have

found a Housing N[Z] house into Social Welfare... and being told they need to find something cheaper. Why? “Because Social Welfare is not able to provide enough money to make Housing N[Z] houses affordable to people on invalid or sickness benefits. And if they can’t get a state house, what can they afford?” Meanwhile, Auckland City Council flats in Freemans Bay are sitting empty. [A representative] of the Community of Refuge Trust, which provides care in central Auckland, talks about the destructive “duck shoving” that goes on between the health, housing and welfare authorities. “Housing NZ say, ‘We want to make a market rental,’ [the Ministry of] Health say housing is not their issue and Social Welfare say that the accommodation subsidy is all people are going to get...” ...[the manager] of the Take a Break drop-in centre in Pitt St, which offers bread, tea, coffee and shelter for impoverished homeless – and often mentally ill – [people]... agrees: “Under the Human Rights Act everyone is entitled to adequate housing... Our biggest barrier is that no one [no Government body] will accept that housing is their responsibility.” ...If rental housing is not available, many mentally ill people end up in boarding houses. Which brings us to boarding houses. A December 1997 precursor by the Auckland District Council of Social Services to the M[HC]’s current draft report revealed some horrifying statistics about the fate of [gals] in Auckland’s boarding houses. • 82[%] had experienced sexual harassment. • 65[%] had been pressured for sex. • Over half had experienced inappropriate touching. • 73[%] felt unsafe... in their homes. Said the report: “Mentally ill [gals] living in boarding houses report toilet floors awash with urine, showers covered in vomit, bathroom doors that don’t lock – and absolutely no one to go to if they feel under threat. They are subjected to behaviour... largely perpetrated by other residents... that makes them feel fearful for their personal safety...”

...The P[M] says it may be forced to leave her home of 19 years after a photograph identifying the house, and a map pin-pointing its location, were published yesterday. A furious [PM] told the *Herald* that the disclosure was an “absolute” invasion of her privacy and had created a “serious security concern.” “What [the *Sunday Star-Times*] did was make it so easy: there’s the map, here’s what the house looks like – go to it. I try to live a normal, modest life in my own home, in an ordinary suburb, and they are making it impossible for me.” [However, the *Star-Times*’ editor pointed out that ‘the PM’s phone number and address have been in the Auckland Telephone directory for years!’ The PM]’s anger was triggered by a *Star-Times* item reporting her objections to the expansion of a boarding house around the corner from her home. The item said [the PM] feared the boarding house would attract undesirables who might “downgrade the neighbourhood” and “transients” who might not be properly supervised. When her submission was made last September, [the PM] was... campaigning for community-based mental health services. But... the... proposed building was not a home for the needy. It was a commercial proposition, by absentee landlords, for the existing 27-room historic boarding house to be expanded to 88 rooms with a separate three-storey block. The development received the go-ahead at an Auckland City Council resource consent hearing last month... The written submission from [the PM] at the centre of the furore was one of 91 opposing the Eden Park Lodge development... [One opponent], whose home is opposite the building, said privacy was an issue. [The neighbour] had already been followed home from the bus stop by [guy] residents living in the house and was afraid that such behaviour would increase... [Guys] have been banging on the front door of the P[M]’s Auckland house late at night and calling out: “Are you home...?” [The PM] has also awoken to find bottles on her lawn. Passing cars often slow so those inside can have a nosy at her home. The P[M] yesterday recounted such fears for her safety, saying... “That was before this publicity. It can only get worse.” ...[the PM] said that... to remain in her Mt Eden villa, it would need to be fortified and have expensive security installed. With her husband... based in Christchurch, [the PM] was often home alone and security was vital. When [the PM] was living at Premier House, her official residence in Wellington, [it] was under constant police protection... but this was not the case at her home in Auckland... [The] head of the diplomatic protection squad, which is responsible for the P[M]’s safety, said yesterday that [it] would not discuss her security arrangements.

...PM says sorry to abused patients... A... compensation battle by former child patients of Lake Alice psychiatric hospital has ended in a \$6.5 million payout and an apology from the Government. The formal apology, issued by [the P[M]... and... Health Minister... yesterday, was the last step in the drawn-out settlement for 95 former patients. The claimants, who say they were tortured and sexually abused in the child and adolescent unit in the 1970s, had been seeking \$38 million damages from the Ministry of Health, the Attorney-General and former Lake Alice administrators.

...Bitter at what they describe as broken promises over the years, [a Hamilton couple] have taken up their son’s case with... [the PM. The couple] say their intellectually disabled son... was safe, occupied and happy at Tokanui Hospital. Today, six years after his discharge from the South Waikato institution into community care, they claim the 38-year-old with a mental age of five has been reduced to sitting in police cells and going in and out of court. “It seems ironic that, unaided by the state, we managed to keep him safe for nearly 20 years, that Tokanui did so for another 13 1/2 and that now, farmed out to community care, [our son] is at constant risk,”... They are relieved that after being held in jail wearing nappies, their son has been referred to a residential care centre in Levin. But they are sad that his one year of supervision there will be spent so far from their Hamilton home... They cite assurances in 1989 from [a Waikato Area Health Board manager... that Tokanui residents would not be “dumped” into the community, nor would anyone be forced to move if they or their family were strongly opposed. In 1993... the... Health Minister, assured parents a full range of care options would be set up before patients were returned to the community. “None have been provided for our son except dubious, inappropriate and largely unsupervised services,”... In a letter to [the PM, the parents] said they are worried that the Intellectual Disability (Compulsory Care) Bill will be shelved as too embarrassing and controversial... In her reply, [the PM assured them it] was committed to the proposed legislation. “We have a very small group of people who have severe behavioural disorders and are at risk, and the Government is working on how we can make progress in this area,”... wrote[the PM. Editor’s note: As a change from the multiple examples of unsuitable mental patients being released into the community, the media reported the case of a ‘deaf, autistic boy being misdiagnosed and treated by Sunnyside Hospital’].

...The Government conceded again yesterday that there were gaps in services for people with autism after revelations that a... 27-year-old Christchurch [autistic]... had been remanded... to Addington Prison and then transferred to Sunnyside... for assessment but still has nowhere to go... The Minister of Health... acknowledged in March that there were gaps in services for autistic people after reports that the parents of a Northland boy... bound his hands and feet with leather... because they could not get specialised help to deal with his violent outbursts. Since then, a Palmerston North... [mum] has been found guilty of the [hu]manslaughter of her autistic daughter... after trying unsuccessfully to get respite care.

...The sins of the parents should not be visited on the child, a defence lawyer told a jury in the High Court at Auckland yesterday. In her final address... [the lawyer] said the defendant faced a [hu]manslaughter charge over the death of Angelina Edwards because [the defendant] was her parents’ daughter. “It is a case of guilt by affiliation and guilt by association... You cannot be convicted of a crime because of what your family does.” ...[the] lawyer said her client had assaulted Miss Edwards on one occasion to punish her, but it could not be considered fatal... [The client], aged 20... her [parents]... and 18-year-old [brother]... are jointly accused of Miss Edwards’ [death]. A 17-year-old youth, who has interim name suppression, also faces a [hu]manslaughter charge. The father and mother also face second charges of [hu]manslaughter by virtue of failing to get medical help for the [victim]’s injuries, general debilitation and peritonitis secondary to a stomach ulcer. All the accused face various alternative charges of assaulting or injuring Angelina... There was a catalogue of other people who assaulted Miss Edwards apart from the various accused. It was arguable that two young girls... inflicted more injury than his client, said [the lawyer representing the son]... A pathologist... earlier told the court that the ulcer that perforated was caused by the widespread injuries, neglect and malnutrition suffered by the dead [person]. But defence lawyers have relied on the testimony of another pathologist... that the ulcer could have been caused by a bacterium... Miss Edwards, described by a psychiatrist as a mixture of badness and madness, would go weeks without bathing... [-] Angelina... was made to sleep outside because [it] smelled so badly... [-] defecated around the... house, had jumped on a puppy and killed it, and mutilated herself by pulling her fingernails back. With the benefit of hindsight, [the daughter’s lawyer] said, it was obvious to everyone that [Angelina’s] behaviour was because of her mental condition.

...[Angelina's father] hugged his whanau last night after 40 days spent listening to details of his daughter's gruesome death at the hands of people [the father] considered family. After the six-week trial... came to an end, [the father] described the verdicts as good news. "The mongrels got what they deserve... I hope they rot in hell." Three members of the... family were found guilty of the [hu]manslaughter of Angelina. A 17-year-old youth with name suppression was also found guilty of... [hu]manslaughter, and another member of the family was found guilty of injuring her. Earlier, [Angelina's father said it]... could not believe people considered family would commit the atrocities that had led to his daughter's death... [The father, who] had... split up with Angelina's mother... last saw his schizophrenic daughter many years ago... In the... Mangere home[Angelina shared with her killers, the schizophrenic] was forced to sleep in the washhouse or in a box in the garage, and was treated like a slave.

...Police are certain there are more [people] living in slavery in Auckland, subjected to the same inhuman savagery ...as Angelina... "There will be another one out there right now in South Auckland," said... [the] head of the Angelina Edwards homicide inquiry. "It would be absolutely naive to think that there would not be others." Past cases have included Karen Kalauni, aged 22, who died of internal bleeding over two days at her East Tamaki home. [Karen] had 125 scars on her body. In 1994, two people were jailed for her murder, while two others were convicted of lesser crimes. In June last year, [a] [some-time bus driver and pastor... was jailed for 15 years for charges which included keeping [his wife] enslaved in an Otara house... for four years... The... Kalanui case, in particular, had strong parallels with the... Edwards trial... By the time [it] died, Angelina... was virtually a walking corpse, covered with septic, putrefying wounds. The washhouse where [Angelina slept – when Angelina, who]... was... forced to do the family's washing and cleaning... was not put outside like an animal for the night, or forced to bed down in a box in the garage – had the stench of decaying flesh... As one of the accused put it, [Angelina] was better off at peace. Judging from the photographs that showed her blackened and bruised body covered in ulcerated, oozing sores, death may indeed have been a merciful release... When [Angelina] was finally taken to hospital, just hours before [her life] expired, nurses remarked on the apparent lack of concern from [her] family... Later, when interviewed, [her uncle] was more concerned about his lawnmower than the dead [relative. The family]... will have a psychiatric assessment before sentencing in four weeks. Originally the five faced murder charges, but after several days of legal argument, [the judge] reduced the counts to [hu]manslaughter... Angelina... a 25-year-old schizophrenic, came from Whangarei to stay with her Auntie... in... Mangere, at the end of 1996. [Angelina] had given birth to a son in Whangarei in July 1995 but could not cope. Her mother took over care of the child, while Angelina... came to Auckland to "sort herself out." A psychiatrist from Whangarei described her as... impossible to live with. At first, [however,] [Angelina]... seems to have got on well with her relatives, although they all lived huddled in a small three-bedroomed home, finding beds where they could. But things quickly changed, and Angelina... started to be regarded as a punchbag. In the months before her death, beatings with softball bats and other weapons became regular. There was gratuitous punching, slapping and kicking. Her head was banged against walls and the family Rottweiler... [-] described by a dog handler as one of the most vicious animals [it] had dealt with[-] was set on her. [Angelina] even had a red-hot car cigarette lighter forced into the back of her neck, and a bodybuilding weight was thrown at her face. It was an unremitting catalogue of brutish savagery. Her blood was found all around the house, including congealed on a *Bible* [Angelina] was forced to keep reading until the early hours. When [Angelina stopped, Angelina] got another beating. Two young girls were also involved in the "atrocities," as [the] Detective Sergeant... put it, but they were never charged. They cannot be identified for legal reasons. Some of the worst violence happened in the fortnight before Angelina... died. Then, for the final few days, silence descended on the house as the countdown to her final agony began. From being a physically healthy... 85.5kg... [before leaving Whangarei, Angelina] had wasted away by the time of her death to a skinny, malnourished 55kg shadow, shuffling around with plastic bags on her feet to cover oozing sores. Oddly, Angelina... seemed to take the punishment without even a whimper. Only once did [Angelina] try to escape, but... was chased and taken back to the family car for another thumping. Reasons for the family's hatred of her are not entirely clear, despite her lack of personal hygiene and unacceptable toilet habits... In the early stages, [the aunt] took Angelina to see the doctor on four occasions – but it was only to get a certificate for a sickness benefit. On every occasion that Angelina... saw a doctor in Auckland, [the aunt] was present. It was not until April 4 last year, when it was already too late, that any attempt was made to get Angelina... help for her condition... Although [Angelina] was referred four times to the... mental health outpatient service in South Auckland for specialist psychiatric help, appointments were never kept. To be fair to the family, some of the appointment letters went to the wrong address... Eventually, visits to the GP for further sickness benefit certificates stopped because Angelina[']s... injuries were becoming too obvious for the family to risk her being seen by a doctor. Her worsening state was also hidden from relatives when they came to visit her. They were told [Angelina] was out, had moved house or had run away. Twice, concerned neighbours called the authorities to say there was a [person at #]80 being beaten and abused. A few days before Angelina... died, a police officer went to the house, but [the family's 20-year-old daughter] pretended to be the [person] at the centre of the complaint. When [the daughter said it] was all right, no further action was taken. Why did [the] Detective Sergeant... think the family had indulged in such sadism? "You can look for complicated psychological reasons... but I think it is a very simple matter. The reason the beatings started were to control her and to ensure [Angelina] did the work they required of her, and... would remain compliant as far as her handing over her benefit was concerned. The reason the beatings continued and escalated was that it became second nature to the family..." ...the mounting violence coincided with the appointment of [the aunt] as Angelina Edwards' agent for receiving her sickness benefit... but in the end it was counterproductive... [The Detective Sergeant regarded the aunt as having] a evil streak bordering on the psychotic...

Systems have cracks. Slipping through them can be deadly. That familiar theme played again during the trial of the... family... [which killed] Angelina Edwards... For Angelina Edwards started floundering long before the beatings... began. [Angelina] was first admitted to Whangarei's psychiatric unit in May 1994. In the next 2 1/2 years [Angelina] was admitted a further nine times, the stays adding up to six months of the then 22-year-old's life... In September 1996, a... Whangarei psychiatrist... noted that the town could not provide the type of care Angelina... needed – a residential, supervised programme dealing with psychological and social needs – and raised the possibility of transferring her to Auckland... When [Angelina left Whangarei] in December 1996, her home-town psychiatrist... wondered what city doctors would make of his difficult patient. By the time [the psychiatrist] testified at the trial, [it] had found out Angelina... never connected with the big-city mental health service... Angelina... was mentally ill, although psychiatrists differ on her diagnosis. A recurring compulsive-obsessive disorder drove her to wash excessively or not at all. [Angelina] probably suffered from depression and possibly schizophrenia. At times, health professionals and her family wondered if [Angelina] pretended her symptoms were worse than they were. Angelina Edwards' troubles started well before... bec[oming a mental health] patient. The history gleaned from the doctors' notes is one of a desperately unhappy young [girl. Angelina told them about being] bullied at school, where other children locked her in the toilets for hours with her mouth taped so [Angelina] could not cry for help. [Angelina, who] dropped out in the fourth form... claimed to have been sexually abused as a teenager by an old[guy. Angelina] was shy, and had trouble making friends[, so] started sniffing solvents and using alcohol and drugs to make herself more outgoing. "Part of the problem," [the psychiatrist] wrote when discharging her from Whangarei in January 1997, "is that we face a mixture of... madness... and badness[, which] includes manipulative behaviour, lying, stealing, destructive behaviour and attacking others..." ...these factors provided a great potential for disaster and made Angelina... "very hard to live with. So far we have been unable to find anyone who will put up with her,"... That her aunt... and family put up with her for more than a year was somewhat of a record... [- although t]he household contained possibly two other mentally ill people... [Angelina's] shift to Auckland spun her to the periphery of the mental health system. [Angelina] did come to the attention of mental health authorities within days of her arrival... A relative called a crisis team to the [Mangere] home because Angelina... was threatening to kill herself, though the greater worries soon appeared to be

getting her sickness benefit and accommodation[allowances]. The crisis team sought information from Whangarei and stayed in contact with her for three days. The team's psychiatrist made an appointment for her... for further assessment. That appointment, essentially a transfer of responsibility to the patient, was crucial for diagnosis and further treatment. [Angelina] didn't turn up, and became a mental health patient in name only. [Angelina] missed four further appointments, triggered by referrals from her GP, in the next nine months... The fifth and final appointment was made but cancelled, apparently from the patient's end. It was about this time, according to the crown case, that the beatings started in earnest... Under cross-examination, [a professor of psychiatry] acknowledged that ensuring a non-cooperative patient received treatment was a burden that usually fell on those closest to the patient. If these people did not accept that burden, the system itself risked breaking down.

...Follow-up on mental health outpatients who miss appointments has been tightened in South Auckland after Angelina Edwards' death... [A] former clinical director of South Auckland's community health service, said... [i]f a patient referred to the service by a [GP] failed to keep an appointment... a letter would be sent to the GP asking if the service should follow up. [The former director] said Angelina Edwards' death could probably have been avoided... However, the staff involved "had not done a bad job." There had been no legal obligation to treat Angelina... as... [t]he 25-year-old... was a voluntary patient... Five members of the [Mangere] family were yesterday jailed for more than 40 years for the "barbaric and unspeakable" death of Angelina... [By the way, Angelina is known to have used drugs as a teenager.] A study suggests [teenage] cannabis users are seven times more likely to develop mental problems... The increasing use of cannabis by adolescents is threatening the mental health of a generation because of the drug's unrecognised capacity to trigger psychosis, a leading psychiatrist has warned. [The p]rofessor... of the Institute of Psychiatry in London, says growing evidence linking cannabis with mental disorder has failed to curb use of the drug... "In the last 18 months a number of studies have confirmed that cannabis consumption acts to increase later risk of schizophrenia. This research must not be ignored,"...

A... Great Barrier Island couple, who police accused of cultivating cannabis... say they've been through an 18-month nightmare in which they almost lost their home and freedom... under the Proceeds of Crime Act 1991... On Friday, a district court judge awarded them \$54,000 costs following the botched police case... Charges against [them] were dropped... last year... because of lack of evidence... The [couple] say they were innocent all along... The saga began... after police said they found 487 cannabis plants... on or near the couple's property... Police failed to photograph the evidence to prove it existed, give the accused the opportunity to see the plants, omitted evidence during the trial and carried out a "careless investigation, but more significantly, inadequate and totally unprofessional police preparation." [The]Detective Senior Sergeant... in charge of the Auckland drugs squad defended the police investigation... [but] could not comment in detail while the Police Complaints Authority investigation continued... While some mistakes were made[when dealing with the Great Barrier Islanders, the police have conducted a successful case against the guy accused of]... murdering three people at the [Mt]Wellington-Panmure Returned Services Association clubrooms. The 25-year-old's life sentence with a minimum non-parole period of 33 years is the longest fixed-term sentence imposed by a court in N[Z] legal history... But the Parole Board then ha[ve] to consider his future and [the 25-year-old] might never get out. "One suspects this is life imprisonment for life," said... the... Crown prosecutor... The [25-year-old] was convicted... of murdering RSA club president William Absolum, 63, club member Wayne Johnson, 56, and cleaner Mary Hobson. [The 25-year-old] was also found guilty of the attempted murder of [the aggravated robbery's sole]survivor...

The *Herald* can reveal that the... [t]riple killer... could have been locked up in prison before [it] committed the RSA murders – but probation officers did not act when told [it] had offended while on parole... [T]he Community Probation Service missed a chance to get [him] back inside Paremoremo a week before the killings... A probation officer knew [the 25-year-old] was charged with assault one month before the murders but failed to begin a "recall application" that could have put him back before the Parole Board... The investigation also identified other flaws in the management of [hi]s parole, including: ■ No action was taken when [the 25-year-old] screwed up the piece of paper that outlined his parole conditions and threw it in the rubbish bin when [the 25-year-old] first reported to a probation officer... ■ The probation officer then failed to set up an appointment with a Corrections Department psychologist or an assessment for drug and alcohol counselling. Both were special conditions laid down by the Parole Board and were required to be set up within 72 hours of his release. ■ The probation officer also failed to make a required visit to check [the 25-year-old]'s home address. ■ Instead of reporting weekly as required, [the 25-year-old] was first given fortnightly reporting... and then [wasn't] required to report for almost five weeks while his probation officer was "absent". ■ [Hi]s case notes were not fully completed... [Incidentally, the High Court] judge who imposed [NZ's] highest jail sentence on [the 25-year-old] also handed out a tough sentence... last year[when it]... sentenced... an... 18-year-old... to life imprisonment for shooting Pakuranga pizza worker Marcus Doig on May 8 and Mangere Bridge ASB bank worker John Vaughan on May 15. [The judge] imposed one of the longest non-parole sentences for a murder – 17 years and nine months.

...THE first I heard of P was when one of my talkback callers suggested that [a teenager] was on it when [the teenager] went on the murderous spree that left Marcus Doig and John Vaughan dead. My caller said the killings bore all the hallmarks of a P user and... went on to explain that for some people, the effects of pure methamphetamine can turn them psychotic. Since then, and since [a 25-year-old claimed it] too was on P when [it] murdered three people and brutally injured a fourth in the RSA robbery, we've heard a lot more about P. A number of recreational drug users who have an open mind about most narcotics told me they're keeping well clear of P... The police officer who headed the inquiry... accepted expert opinion that [the 25-year-old] was a true psychopath, who enjoyed killing... But... [i]t's always a game of Russian roulette when you take drugs.

...Something deeply evil lurks among the dimly lit streets and along the foggy riverbanks of Rostov-on-Don, a southern Russian city of 1.5 million people, and [a]Professor... is on a mission to fight it. For reasons neither science, religion nor occult can satisfactorily explain, the bustling river-port city has become a crucible for the rage of an extraordinarily high number of serial killers and rapists. In the past 10 years 29 have been caught, making Rostov the serial-killer capital of the world and [the professor] – Russia's leading psychiatric expert on mass murder – a very busy [person]. Why Rostov? Though the city has a reputation as a centre of organised crime, its economy is no more blighted than the rest of Russia's, and its per-capita murder rate is actually below the national average... [The professor believes it] knows the answer. "The problem of serial murder exists everywhere in Russia – it's just that here we have more practice at catching serial killers, and therefore the statistics are higher." ...From 1978 until his arrest in 1991... the "Rostov Ripper"... raped, tortured, mutilated, killed and ate 56 people. [The professor], who became a crime fighter in 1984, was a bit of a black sheep, having specialised in such taboo medical fields as sexual deviancy, but investigators were desperate. They asked him to draw up a psychological portrait of the Rostov Ripper by piecing together forensic and circumstantial clues – such as the killer's habit of gouging out his victims' eyes and the ease with which [it] was apparently able to lure his prey to isolated areas. [The professor] concluded that the killer was a middle-aged, educated [guy] with a history of molestation and sexual problems. Authorities dismissed his findings, until [the Rostov Ripper] was caught – and [the professor]'s portrait proved uncannily accurate. His methods were quickly adopted by the Rostov police, and police from all over Russia now ask for his help. But now, [the professor]'s close relationship with the police is in trouble. [The professor] is conducting a bold... experiment that pushes the boundaries of both medical ethics and the law to the limit by treating serial criminals who are still at large... "I could call the police, but ethically I don't have that right because [my patients] trust... me. Maybe I am wrong to do this, but it is in the interests of science." Using his own experimental blend of aggression-curbng drugs and psychotherapy[–]...which is funded by paying clients, such as drug addicts and sex-change patients under therapy... at his private psychiatric clinic... [– the professor] claims to be able to "cure" psychopathic tendencies. One of his patients is... a thickset, surly 21-year-old... [who] was brought to [the professor by it]s parents after... showing antisocial and violent behaviour last summer. Under [the professor's] care, the 21-year-old confessed that it had killed one gal[during a drunken binge of sadistic sex and had tortured and beaten several more... "This boy is a classic serial killer in the making... We have caught him just as [the boy] is

beginning to realise his fantasies.” [The professor], who earns about \$70 a month, is also treating a middle-aged self-confessed child rapist[– who] was given an ultimatum by his wife to see a psychiatrist or go to the police after [the wife discovered her husband] had been abusing their 11-year-old daughter. “[The p]rofessor... has given me a way to live again, to control my urges,” says... [the] huge junior officer in the Army who has developed a puppy-like devotion to his strong-willed therapist. “If it had not been for him I would have done something much worse.” [However, the professor]’s methods worry the authorities – and his colleagues. [Last] December, local health officials lodged a complaint at the municipal court criticising [the professor]’s handling of a convicted rapist who committed another sexual assault while under his care. [The professor] shrugs off the charges. His free-lance work with local psychopaths is doing a service for science and for the community, [the professor] argues... “We are fighting to find the roots of social aggression, and to establish ways to curb it...” ...[Speaking of establishing ways to curb social aggression, o]ne of South A[US]’s top cops says the state’s new anti-gang laws could be used to combat motorbike, street and youth gangs... in N[Z]. The Assistant Commissioner... expected to be in a position to “declare” an organisation soon. Declaring an organisation meant police had to apply to the Attorney-General when... satisfied the group existed for criminal purposes or was a risk to public safety. “If this... is successful, we will then apply for control orders to be placed on the individual members of that... organisation,”... Control orders restrict who the member can contact, the places they visit and the weapons they have – effectively banning gangs. Breaching these orders is punishable by up to five years in jail... Other A[US]n laws include asset seizure laws in Western A[US] and banning people who intimidate from public places in New South Wales... N[Z] law enforcement was dragging the chain and gangs had become true organised crime syndicates, having “raced ahead” on the back of the P trade...

A huge surge in methamphetamine is overwhelming law enforcement authorities, which are struggling to cope with increasing supplies of the drug and its devastating effects on crime. A *Weekend Herald* investigation has found methamphetamine, commonly known as “P”, is firmly established as N[Z]’s worst drug problem, with sales of up to \$1.5 billion a year... Police privately say they are finding fewer than 10[%] of meth labs – and overworked police officers and courts are unable to handle more cases anyway... At least 80[%] of recent High Court trials were connected to the drug... Many of N[Z]’s most notorious murderers in the past decade... were high on P when they carried out their killings. Research shows criminals who use P heavily carry out about seven times as much property crime and drug dealing as non-addicted law-breakers, and 31[%] of younger users admit they have had a car crash while on the drug... [On a positive note, t]hree people have been found liable for the \$185,035 damage caused by the destruction of a state house used as a [P] factory in Napier. [A f]orensic scientist... told Napier District Court the house was the most contaminated of 150 production houses [it]’d seen. After finding the house was uninhabitable Housing NZ chose to demolish...

The business[person]n who chased down and then stabbed a teenage tagger could be on home detention within a year. [The married father of three daughters], 51, was sentenced to four years and three months in prison... in the High Court at Auckland yesterday for the [hu]manslaughter of Pihema Cameron, 15, who had been tagging [hi]s garage door with a friend on January 26 last year... In an emotional speech, Pihema’s mother... [– who] had been in Perth, working... the day her eldest son had been “brutally and heartlessly” taken[away from her –]... said: “I have never felt so much hatred for a person than what I feel towards this... [person who] destroyed and broke up my young family over a bit of paint...” ...Some hailed t[he t]agger killer... a hero, but many residents of the Mahia Rd area of Manurewa where Pihema... was stabbed felt the... jail sentence was too short... “The sentencing is just bullshit, eh? It’s going to make Manurewa an even more dangerous place because more people will start stabbing anyone they are not happy with, if they think four years is all they’re going to get,” a 26-year-old storeperson[] said... “We can understand the anger in him but killing is not right. [The businessperson] shouldn’t have taken the law in his own hands,”... said... a stay-at-home father... However, a neighbour who... had his home vandalised with graffiti six times last year, said tagging used to be a “massive problem” on the street but had “stopped over-night” since the stabbing. “[The killer] did what the police and city council failed to do, and for that... deserves a medal, not a jail sentence.” [Incidentally, if you refuse to provide help to the police when asked, you could soon be ‘fined \$2000 as opposed the current \$50’.

...a guy who] heard an alarm go off outside his wife’s bar in Weymouth, England... found two [thieves] breaking into a cellphone store and confronted them. One punched him, but [the guy] swept his feet from under him and pinned him to the ground... until police arrived. The next day, the police released the... [thief] with a warning for criminal damage, and they arrested [the guy] for assault. (Source: Reason.com)

...Thieves have stolen flowers left at the scene where “good Samaritan” Austin Hemmings died. The 44-year-old Devonport [husband and father] was stabbed while helping a [gal] being attacked in Mills Lane, central Auckland, last week.

...Samaritans ‘gutted’... A Maori couple say they are having to return to A[US] to face charges of obstructing police after trying to help a severely injured [person. The couple], both 24, were holidaying at Surfers Paradise at the weekend when they found a [guy] lying in a pool of blood. They tried to check for a pulse and find... [hi]s wounds... but police pepper-sprayed the couple... before arresting the[m]... “We... don’t want to go back.”

The guy who was injured, I don’t know how it happened. We never hit him or anything. Only the guy who had the knife, I gave him a hiding.” ...[the owner] and his cousin were stabbed as they held one of the teens down. The teens were allegedly armed with a fence paling, knives and a long bar or bamboo stick. [Another Asian businessperson], who owns the neighbouring dairy and ventured outside after hearing glass breaking, was hit in the face with a piece of wood... The law allows shop owners to use “reasonable force” to defend themselves and their properties although people are expected to use common sense in deciding what that force was.

...The owner of an Auckland lotto store and dairy is in hospital with stab wounds in his neck and back after being attacked late yesterday afternoon. It was at least the fourth serious attack on an Auckland shop worker this year, and followed a police decision to charge a liquor retailer after an altercation with two youths this week... “When we protect ourselves, we get charged – and if we don’t we get stabbed. What do we do,” [a]... shopkeeper... who... had been robbed four times... asked... While police were investigating the stabbing, they were called to a store in nearby Bremner Ave, Mt Roskill, where two youths threatened a shop owner with a knife... [N]o one was injured, and the two offenders had fled.

...Police say the arrest of an Otara liquor store owner should be a reminder to others that using too much force to defend themselves or their property will result in prosecution. Gilbert Road Discount Liquor[’s] owner... was... charged with two counts of injuring with intent to injure after a fight with several youths on Tuesday night. The charges related to injuries two of the youths received... News of... [the] arrest has outraged many members of the public who say it sends the wrong message to criminals and young people who intimidate store owners... The... Sensible Sentencing Trust... said store keepers were often placed in a position where they had to make on-the-spot decisions and didn’t have time for police to arrive.

...Police are in damage-control mode over widespread public criticism of their decision to charge an Otara liquor store owner involved in a brawl outside his shop last week.

...Cleared liquor store owner believes in justice, ‘but I don’t trust the police’... [The l]iquor store owner... [who] had prepared himself to spend time behind bars... says [it]’ll be back behind the counter today, and his hockey stick is up for sale. But the 40-year-old is angry with police for putting him and his family through six months of hell by charging him over a fracas with two teenagers... Mr Singh... was accused of striking one with a hockey stick as [the teen] lay on the ground with another [person]n sitting on top of him, and of striking another [offender who] was trying to help the injured [teen]... But Justices of the Peace... yesterday dismissed the charges after a depositions hearing at Manukau District Court. They said the evidence was conflicting and contradictory... Police last night defended their decision to prosecute... but refused to discuss the matter in any detail.

...A police blunder may be the reason that officers took too long to reach slain liquor store owner Navtej Singh – news his family say comes as “just another blow”. Mr Singh, 30, died in June after being shot... with a .22 rifle... while working in his Manurewa liquor store. Police came under

fire after the shooting for waiting too long at a police cordon and for preventing ambulance officers access to Mr Singh. It is believed police took between 26 and 45 minutes to reach Mr Singh. At the time, police said the delay was procedural – they had to be sure the robbers had left the scene... [(Mr Singh)'s wife, his business partner and a close friend were all there with him, but officers would still not go in despite 111 staff being assured the robbers had left[–]Mr Singh died in Middlemore Hospital early [the next]day from injuries... [sustained after Navtej] was callously shot in the chest at close range, despite holding his hands in the air and complying with a robber's demands[)]... But *Sunday News* reported yesterday that an internal inquiry has revealed that police with access to the weapons required to secure the scene took the wrong set of keys and were forced to wait for an officer to get the correct keys from the police station. The [revelation comes as Auckland police commanders try to deflect criticism for staff taking days to find a missing person whose murdered body was in the boot of her car outside her cordoned-off Keystone Ave house!

...the guy] accused of murdering South Auckland liquor store owner Shiu Prasad ['for \$150']will reappear in the Otahuhu District Court today.

...What is it that drives one to mindless killing? It's the sort of day dream-come-vision that pops up only at certain times – and one of those was last Tuesday, when Auckland heard about the stabbing to death of Mangere liquor store owner and community stalwart Shiu Prasad. But the label 'day-dream' suggests some sort of pleasure, which this definitely isn't. Maybe horror-fuelled imaginative figment is a better phrase. In this shred of mind I am trying to do grievous bodily harm, for undefined reasons, to another human being. There is a knife and the arm is rising to put some weight behind a lethal stab. Just before the point of no return... the vision crumbles... Even in my imagination I can't do it. The thought of actually taking someone's life – even in self-defence – is just abhorrent and against every last little bit of programming in every last cell. So what is going on – or not going on – in the mind of a person who uses a knife to take another's life in broad daylight? Psychologists reckon it's a lack of empathy. Someone who grows up without a positive relationship with a parent or relative or teacher doesn't see the right sort of behaviour modelled, nor do they get a chance to develop... the ability to identify another person as like themselves. We've had a lot of dissection of the causes of violence in the media lately but no-one has pointed out that there is an element of choice in every action we take and that... putting a knife in one's pocket and going to the scene of an eventual crime... requires a large amount of pre-meditation... And of course, booze and drugs can further cloud rational thinking. A chat with [an]Auckland University psychologist... throws up a useful analogy: The [guy] who beats his wife doesn't go to work and beat up his workmates; [the guy] is exercising the choice not to. [The psychologist] also points out that between 30 and 40[%] of abused kids go on to abuse others as adults. What about the other 60 to 70[%]? One assumes they are 'normal' adults. No matter how rotten your life, it is surely hard to avoid even a few of the positive experiences that point out another way... [● The] *New York Times* reports... [that a]t least 425 people have been killed and 510 injured in 100 shooting rampages in the U[S] over the past 50 years... The paper found that the killers were mostly white... [guys who had] attended college, served in the military or were unemployed... and... have been diagnosed with or shown symptoms of serious mental illness. The study, the first comprehensive look at rampage killings in the US, used a computer database to compare the profiles of rampage killers... Shooting rampages comprise only a fraction of the 15,000 to 22,000 murders committed in the US each year but have seized popular attention, especially after a series of attacks in schools in the 1990s. Rampage murderers were markedly different from the larger population of violent criminals, who often killed someone they knew or murdered while committing other crimes, and were often undereducated and from minorities... [R]ampage killers... were less likely to try to get away with their crimes... and very few even left the crime scene.

...MASS murderers strike fear into the hearts of people around the world. But take away their guns and they're just sad losers, says a former Kiwi cop who has profiled mass murderers... [in his book] *Agents of Mayhem – The Global Phenomenon of Mass Murder*... The book... said all the murderers: ■ Were [guys] suffering from some sort of personality disorder. ■ Held conspiracy theories or paranoid beliefs. ■ Were known to hold grudges, were regarded as odd or strange, and often seen as lonely individuals. ■ Felt threatened. ■ Were involved in serious incidents that went unreported before their killing spree, and they were meticulous in their planning of their last crime... ■ Wore unusual clothes and lived in untidy homes... ■ Had poor relationships with [the opposite sex], were cruel to animals and had emotional attachments to firearms... [Incidentally, a] former US marine [has been killed after hi]s pet poodle trigger[ed his] gun by jumping on his lap...

At the Knob Creek Gun Range Machine Gun Shoot in Kentucky the most popular activity is "The Line," in which 60 people fire their machineguns into a field of cars and boats. There is a 10-year waiting list for a place on the line, and one shooter can run through \$10,000 in ammunition... [In a further example of US] Gun Madness: A[n 'Oklahoma town has passed a law making it illegal to not own a gun']...

Mad about guns – or just mad? "Enough already." That was the reaction... "Mucko"... recorded on the internet to the RealPlayer computer video programme. "Takes forever to load," [Mucko] thundered. "Performs slower, crashes much more frequently, isn't variably sizeable." With its eerie echo of [the statement] "I'm mad as hell and I'm not going to take it any more" in the film *Network*, "enough already" was probably the sentiment that ran through his head as [Mucko] crashed into his office reception... [to begin America's latest mass-]shooting tragedy... Armed, wearing a plaid shirt and bearded, [Mucko] could have been auditioning for a film role as the Angry White [Guy. Mucko], academics theorised, fits the psychological profile of a mass killer. [Mucko] had military training... was angry about his taxes[, and was a] right-wing gun nut. A *Boston Globe* editorial lamented the "nightmare that stalks the nation" and "bright rivers of blood" bursting forth because the country "refuses to pass stringent controls on firearms." Just as with the Columbine school massacre and the Michigan child who [recently] shot a classmate... the tragedy near Boston has already ushered in calls for "common sense gun control." But in Massachusetts... [there are already] strict licensing requirements with mandatory jail sentences for breaking them... [Mucko], it seems, had no licence for any gun[, and] also used an AK47 – the subject of a federal ban since 1994. One Democratic aide in Boston used these facts to reach the conclusion: "Massachusetts has some of the nation's toughest gun laws, but this demonstrates even those laws can be improved." Let's follow the logic here. A wacko ignores every gun law on the books and blows away his workmates. But if there had been even tougher laws, then [the wacko] would have meekly laid down his AK47 and spoken to the human resources manager instead... America is awash with guns, and preventing the law-abiding from having access to a means of self-defence would be little more than positive discrimination for the criminal. As [a British singer] concluded in his 1979 song *I Don't Like Mondays* – about... the San Diego schoolgirl who opened fire on her teachers and schoolmates – the search for psychological explanations can be fruitless. "[The psychologist] can see no reasons 'cos there are no reasons." ...[□ The] 22-year-old who admitted selling an assault weapon and ammunition to the teen[age boys] who killed 13 people during the Columbine High School massacre... was sentenced on Friday to six years in prison, as relatives of the victims applauded.

...DID authorities hide the fact that a police officer, and not [the]teenage killers... mistakenly shot to death one of the victims during the... Columbine High School massacre? That's what the parents of Daniel Rohrbough, 15, maintain as they step up calls for a grand jury hearing to see who killed their son and whether there was a cover-up... Since the massacre in which 15 people, including the killers, died, grief has turned to anger over how authorities handled the investigation. Some of the victims' relatives have complained the Jefferson County sheriff's office... failed to order police to enter the school quickly enough during the massacre. Most troubling[, though] was the accusation... that [one victim] was mistakenly shot by an officer at the scene... Lawyers said even if the parents could prove that one of the victims was shot by a police officer, it would be difficult to overcome governmental immunity because no one has claimed the alleged shooting was anything but a terrible mistake.

...After telling disbelieving friends all weekend that [it] was going to shoot up the school where [it] was taunted for being skinny, a smiling 15-year-old boy opened fire in his high school, killing two teenagers and injuring 13 other people. The shooter had apparently told 20 people over the weekend of his plans but no one believed him or reported him to authorities, according to accounts from students. It was the worst act of violence

at an American school since the... attack... at Columbine... and it threw this San Diego suburb of 58,000 into shock and panic. A stunned Santee Mayor... told a news conference: "I've been mayor for nine weeks and if I was mayor for 900 years, it would not prepare me for this moment..."

...The Victorian Government... will give money for pistol shooting to be taught in schools. Children as young as 12 would be trained to hit targets... using high-tech computerised guns... [By the way, a] 10-year-old boy was shot dead and his 9-year-old brother hit in the face by the same bullet in a... Father's Day tragedy. Police said the boys had been playing with a gun at a farmhouse north of Melbourne and it apparently discharged when their 60-year-old widower father tried to wrench it from them.

...A[US]n police have appealed to the public for help in solving the gruesome killing of a Chinese... 27-year-old... who was shot 34 times in the head and neck with a nail gun before being dumped in a river... "In 36 years, I've never seen a murder of this nature," ...a... homicide detective... [said. In local news, a] masked... intruder... shot a... youth worker in front of... a group of children... inside Orakei Marae... yesterday.

...Happy ending Children's book character, Mr Happy, found himself in the middle of a suspected armed offenders callout on Matama Rd, Glen Eden... on Friday after... three [guys reported hearing] shots fired... at around noon... The armed offenders squad[– one member of which was photographed by the *Western Leader* newspaper holding his gun above a Mr Happy letterbox –]dog squad and Eagle helicopter were called to the scene, roads were blocked and children from nearby schools were kept inside until about 4pm. Police left the area about 5pm when they were satisfied there was nothing suspicious or dangerous going on. [Editor's note: 'Los Angeles police are trialling the Shot Spotter – a system that can identify gunfire from among other urban noises and calculate where the shot was fired from.']

...Waitakere police are wasting precious resources dealing with youngsters toting airguns. A[n a]rms officer... says the armed offenders squad is called to about 10 incidents each month... About a fifth of the people at the centre of armed callouts are arrested. They are often charged with discharging a firearm in a public place... Many weapons are confiscated. Police destroyed 33 between April and December last year. Airguns are regulated by the Arms Act 1983... Youths under 16 can't own a gun but they can use one under the supervision of an adult or firearms licence-holder... [Airguns] don't have to be registered but 16 and 17-year-olds must obtain a firearms licence to buy one. The rigorous process requires them to supply police with references, attend a meeting about safety issues and pass a test. "The dealers out this way are pretty darn good at vetting people... The problem is with adults buying youngsters airguns as presents." Airguns can cause serious damage. The ball bearings or pellets they fire can pierce the skin and cause blindness... [In related news,] Joka the cat is recovering at her Royal Heights home after being shot with a slug gun for the second time in three months... "[Joka]'ll pull through but it doesn't change what's happened..." ...Joka is not the only victim. [A local v]eterinarian... treated an unusually high number of injured animals around the time Joka was first shot.

...[a] Massey resident... and her cat, Joka, are leaving town while the animal still has six lives... The... cat has been shot three times since last May... "The vet said you've either got to move or keep her inside. I can't keep her inside... So I've got three weeks to find somewhere [else] to live." ...the vet told her that Joka will be permanently disabled and may have trouble with her co-ordination... [Joka's owner] has contacted the police. "But what can they do? All they can do is ask the people if they have a slug gun." Police are already concerned about increased irresponsible use of airguns... They say most airguns aren't registered and tracing owners is difficult... [● A mother] was astonished when an x-ray of Bubble, her 7-year-old daughter's ailing cat, showed it had been hit by seven pellets from an air rifle. Roaming gun[s] are not a normal occurrence in Stanley Pt, one of the posher neighbourhoods of Devonport, but the discovery solved a riddle that had been puzzling the family for about nine months. Clearly the recurring injuries they had put down to stropky catfights were far more sinister. Their worry lines deepened when an x-ray of their other Burmese, Squeak, uncovered a further pellet. The family's dog... will be x-rayed, too, just to be sure. So far, 18-month-old Bubble's injuries have cost \$4000... [His father] said it was worrying that a teenage boy could no longer walk along a street without fearing for his safety[, but also said the]... 13-year-old... was probably hit by someone playing with a slug or airgun who did not realise how much injury such a weapon could cause... Hamilton... police had no idea who had fired the shot. [A constable] said the shooting did not look like an accident, and... [could've been inspired by current events in the US capital. Speaking of which, p]olice across three states were searching for a 33-year-old white supremacist from North Carolina who they believe may be linked to the series of random killings in the Washington area... Police have mounted a ...hunt across the eastern seaboard but without much hard evidence to go on. Six people have been killed and one other badly injured since Thursday, in what police describe as almost ghost-like sniper attacks. The perpetrators appear to have chosen their targets without discrimination, picking on people as they went about their daily business. The latest attack, on Saturday, took place outside a crafts store in Fredericksburg, Virginia, around 80km south of Washington. The victim was loading her car with purchases when [it] was shot in the back. Her condition was not immediately known... Ballistics tests have linked only four of the seven shootings.

...Investigators hunting a sniper responsible for 10 attacks released their first wanted poster yesterday – composite images of a white truck – after authorities confirmed that an eighth death was linked to the killer. The images are the first of any kind to be released in association with a killer who has been stalking suburban Washington areas and targeting victims apparently at random. More than a week after the shootings began, a massive task force of county, state and federal officers still won't say if they know who they are looking for, or even if the sniper is acting alone... At least one high school homecoming and several weekend football games were cancelled by worried school officials in and around Washington, DC... Across the street from the scene of Saturday's shooting in Virginia, [one businessperson] parked three tow trucks alongside his filling station as a shield... Despite jitters, motorists continued to fill up, looking over their shoulders now and then for whoever is terrorising the community.

...Families return to lives free from fear... A [perso]n sought as a material witness in the Washington-area sniper shootings was arrested yesterday as residents finally feeling safe after three weeks of terror returned to the normality of soccer games and weekend shopping. "I feel like I woke up from a nap and I'm getting more used to not being scared any more," said... [a customer] at a farmer's market that had been closed the previous week because of the killings. Law-enforcement officials said the FBI in Washington state interviewed a witness who claimed [the 41-year-old] tried to obtain a silencer for his gun and spoke of killing police. FBI agents and local police had concerns about some aspects of the witness's account and decided to treat the threat as a local issue of officer safety...

IT'S a funny thing about Washington, how the most obvious things often go unnoticed. To the locals, the Washington Monument is just a spike in the skyline, not a towering phallic tribute to the Father of the Country. The seat of American democracy? Well, D.C. residents will point to Capitol Hill, not the lobbying firms on K St, which visitors with favours to buy recognise as the true seat of power and influence. And then there is the problem with murders and murderers. Start with the infamous inability of the local police to find slain congressional aide Chandra Levy, whose bones remained undiscovered for 12 months in the very same park to which [Chandra] was known to have been heading on the morning [it] disappeared. Three times police combed the preserve, yet it was a spring stroller who eventually stumbled on her fate. And now there is a new example of blinkered vision to ponder: the strange case of [the] Beltway Sniper... who might still be out there potting shoppers and schoolboys if investigators had not inadvertently released a description of his [modified] car, which for reasons best known to themselves they would have preferred to keep under wraps. Fortunately, a passing truck driver spotted the vehicle, summoned cops and blocked any possible escape with his

rig. Of course the driver wasn't a local, which explains why [it] had the wits so rarely found in Washington's permanent residents. Now, as the panic recedes and rival jurisdictions vie to stage [the sniper]'s trial and execution, there is time to ponder how so many experts could have been so wrong and with so few apologies. From profilers to the press to the police, error compounded terror... Now that Washington school students have returned to their playgrounds, there is an understandable reluctance to keep the focus on all the things that went wrong. That's a pity – perhaps a tragic one, since [the sniper]'s motive remains moot. The prevailing wisdom now says that the US\$10 million [it] demanded to end his spree was the crux of the case. Take that wisdom for what it is worth, but there is ample reason to suspect another case of that selective Washington blindness.

...The Million Mom March drew hundreds of thousands... to Washington... to demand that America end its long and lethal love affair with the gun... Those million marching moms had a bone to pick with the Founding Fathers, who enshrined the right to bear arms in the Constitution. It must have been a mistake, they assured each other as speakers at the... rally invoked the ghosts of the Columbine school massacre. "Rubbish!" responded the gun lovers, who assembled elsewhere in Washington to quote Thomas Jefferson and Alexander Hamilton. "The pistol and the rifle are to be revered" as "vital instruments" of democracy, wrote Hamilton, whose enthusiasm for sidearms came to an ironic conclusion when [the person who 'frowned on the French Revolution, to which Jefferson was sympathetic – this play of forces led to the 2-party system in America (Hamilton's *Federalist Party* and Jefferson's *Democratic-Republican Party* – to dispel partisanship the 1st President, George Washington, made the liberal Jefferson his Secretary of State and the conservative Hamilton Secretary of the Treasury)'] was shot dead in a duel by rival Aaron Burr. To the NRA and its 20 million members, the police and politicians are the real villains. Every sensible citizen should pack a weapon, they say, because society's protectors so often fail to do their job. It sounds ridiculous... But live under the gun in America for a while and somehow, in some strange and insidious way, it all begins to make a kind of twisted, seductive sense. "Take guns from good people," said... the... NRA chief[the ageing actor (r:p80, ln27) who portrayed Moses – and has also declared that 'if they want to take my gun they'll have to prize it from my cold, dead hand' –] "and pretty soon only the bad people will have guns. We have more than 20,000 gun laws on the books in this country and they are not being enforced. More than [2000] students were caught taking guns to school last year alone and do you know how many of those were prosecuted? The answer is 13! We... need the politicians to stop posturing and employ common sense." ...there was an awful lot of political grandstanding going on at the march... Through two terms and countless scandals, a majority of [gals have] stuck with... the... [Democratic] President... like glue. Now the polls show many are looking kindly at [the]Republican contender... "Keeping the mothers of America on the Democratic team is obviously a top priority," a party functionary admitted. "We want the moms to know that there will never be meaningful gun control with a Republican Administration." But can guns ever be banished from a country that boasts more weapons than people? There are laws against drugs but they are available on street corners all over town. Why should firearms be any different? Yet it is equally hard to accept the NRA's view that Americans must routinely arm themselves as if for a bad day in Beirut... America's nightmare with guns may end[one day]. Until then, Washinton is always ready for a photogenic protest march.

...*LAND OF GUNS AND NEUROSES*... FRANKLIN D. ROOSEVELT was not naturally American: [Roosevelt] was rich and a Democrat... spoke in sentences... sat down most of the time – a condition that has been scientifically related to "thought"; and... opined that the republic [it] led had "nothing to fear but fear itself"... And yet, the underlying American response... ever since its great victory and imperial dawning in 1945 has been fear: alarm, driven sometimes to slaughter – whether Indian, black, or rationalist; the terror that space, home and prosperity, once achieved, might be ripped away; the debilitating notion that fortune is worth no more than the fruits of gambling, and is as insecure; the steady fuelling of the fires of unreason, so that every paranoid feeling grows into a "threat". Why else does such a country need so many guns, police officers and prisons? How is it that a land once pledged to free thinking and still the home of many great universities, libraries and museums, finds itself in mounting dread of radical or adventurous thinking? ...Perhaps you feel hyperbole has set in, for surely the US is a diverse country in which outstanding pieces of heroic, the noble and the virtuous must be observed every day? Yes, that's still so. A lone climber in Colorado last week, finding himself trapped as a boulder moved, cut off one of his arms below the elbow, fashioned a tourniquet, then walked 11km to find help... And yet, in this same land, teachers (already fearful of being eliminated by budget cuts) are afraid to fail students who lack the capacity or the right to graduate from high school; ...the difficulty of obtaining moderate health insurance compel more people into a gamble with their lives...; the urge to vote and to be active in politics is in such retreat that voting figures are a national scandal; and the US prefers not to ask why it is now regarded with such dismay in the rest of the world[– which]Americans know less and less about. They were always afraid to travel with open minds... Yet that vulnerability will only be the more exposed as the country finds itself in an occupying position in more parts of the wayward or misled world.

...A soft-spoken history teacher halted Germany's worst postwar massacre by persuading a gun-wielding former student to end his killing spree. The revelation that [the teacher] stopped 19-year-old Robert Steinhäuser's rampage with a few gentle words gave some comfort to a nation stunned by the slaughter of 16 people at a secondary school. Steinhäuser later committed suicide. "It was a fearless teacher who ended the massacre," said N-TV Television. But questions remain on how a teenager was allowed to legally obtain the weapons and ammunition with which [it] calmly murdered teachers, classmates and a police[officer] at Johann Gutenberg School in Erfurt... Ten other people were wounded, and... the teenager had access to enough ammunition to kill hundreds more... The political debate on Germany's gun laws intensified as [the]Chancellor... flew yesterday to Erfurt... to lay flowers at the school. [The Chancellor] left Erfurt without comment. [However, the]Interior Minister... said that despite tough gun control laws, which require among other things for applicants to pass rigorous exams... further restrictions might be needed.

...THE murder of 14 people by a deranged sales[perso]n in Switzerland has prompted politicians and police to call for a review of the country's firearm laws, among the most liberal in the world[,] and the custom of conscripts keeping weapons at home. Switzerland has one of Europe's largest land-based armies. Nearly every [guy] between 20 and 42 is a conscript... Households are stocked with an estimated 12 million weapons... in the usually tranquil alpine nation of 7.2 million. Every year, however, there are violent incidents involving the Sturmgewehr 90 assault rifle, the type used in the massacre, since it was introduced as the standard Swiss army weapon in 1990... All that is needed to buy a weapon in Switzerland is a licence from local authorities. Gun dealers are legally responsible for ensuring that customers who buy hunting and sports guns are of sound character... Commentators expressed amazement that [the deranged salesperson], 57, who... had a criminal record dating back to 1970 and was under investigation after [it] threatened a bus driver with another gun... had been able to acquire a licence for three guns, two pistols and a revolver... [A] weapons lobby group, Pro Tell, said that the... case [of the deranged salesperson] should not be used to introduce a ban on guns.

...Tough new gun laws are planned to give the Government an inventory of the one million fire arms in N[Z] and who owns them. This means police will know what guns are in a house before executing a search warrant or breaking up a domestic dispute, says [the]Police Minister. The changes are a follow-up to the Arms Amendment Bill introduced by National and are due to come before Parliament this year... [However, the] vice-president of the Sporting Shooters Association, said the reforms had the potential to increase violent crime and create a weapons black market. Overseas evidence showed gun laws disarmed the law-abiding and gave criminals more power over them, [the vice-president] said. Gun collectors at the country's largest arms fair, held in Waitakere City over the weekend, reacted with dismay to the new gun control measures... An... exhibitor... said gun owners were probably the country's most law-abiding citizens, but were depicted as bad by the gun control pressure groups...

A JUDGE'S decision to throw out a murder charge against... [a resident] of Helensville, is no licence for others to kill, [a]... Kumeu police... Sergeant... says... [The Waitakere District Court judge]'s unusual ruling, made after studying evidence at a depositions hearing before the scheduled... trial, says [the] shooting of Robert Oppert... [– who allegedly] was a "gentle giant" – ...in a home invasion on April 26 last year was clearly self-defence. [The] Justice... says cases where the issue of self-defence should not be left to the jury are rare, but this was such a case... Mr Oppert, 45, was with three younger [guys] who raided... the [resident]'s home to steal cannabis. [The younger guys] were jailed for seven-and-a-half

years for aggravated robbery. [One of them] fired an air pistol at [the resident when it] came to the front door, [the second guy] had a metal bar, and Oppert and [the third guy] were unarmed. Mr Oppert was described as a very big [perso]n and was wearing a balaclava. "I do not believe that a reasonable jury could infer that in shooting the deceased in his house, the applicant was motivated to protect his cannabis crop or by anger,"...

[A farmer] did not hesitate when [it] saw an unfamiliar ute being driven around the side of his farmhouse in the dark. "I reached into the cupboard and grabbed a handful of cartridges I'd left there after coming back from pig hunting..." ...Armed with a pump-action single-barrel shotgun with a magazine underneath, [it] went outside to confront the three [guys] who had come onto his isolated Northland beef farm in the dead of night on Sunday. Approaching their ute, [the farmer] saw they had his quad farm bike halfway on to it. Farmers in the area had reported thieves stealing farmbikes and other equipment. "I told them to put it back and fired a shot over their heads." The [thieves] piled into the ute and took off down the road. "Then I thought it was best to shoot one of their tyres out. I fired a second shot at a back tyre, but it must have gone astray. The police told me later it must have ricocheted and gone through one guy's back and come out of his neck." The ute crashed into a fence. "Two guys pushed the other out, left him on the ground and took off down the road. I said, 'Aren't you going to help your mate?' The guy on the ground, who] was making groaning noises... said, 'You didn't have to do that, bro'." [The farmer] ran back to his farmhouse and called the police and an ambulance. But it was hours before police arrived at his farmhouse in the Whangae area near Kawakawa... Questions are being asked as to whether [the farmer] should face charges for firing at would-be burglars or whether [it] is an innocent... who tried to defend his property.

...NO one deserves to be shot for stealing a motorbike. We have to believe that human life is worth more than a piece of machinery otherwise, as a society, we're stuffed. So the answer is obvious. Stop stealing. Stop being a gutless, lazy, slimy low-life... ([lowlife thieves stooped so low as to hack at a bunch of silverbeet and steal them from my mother-in-law's garden])... and stop taking other people's property. And if the spineless twits who buy this stolen property showed a little backbone and turned down deals that look too good to be true, that would help... If thieves are stealing farmbikes, or cattle, or farm equipment, it's because there's a market – presumably made up of other farmers. So perhaps the rural community could band together and stop shafting one another. I have no sympathy for thieves, despite the fact that I appear to be descended from one. Our family tree includes a [relation] who was deported from England to A[US] after robbing one stagecoach too many. But back then people did what they had to do to keep their families alive. What's the excuse today? Working honestly and leading a good life is hard, but surely not as hard as being left to lie bleeding on a Northland farm for hours. And so much for there being honour among thieves. How much honour is there in dumping your wounded mate out of your ute and leaving him, to all intents and purposes, to die? [The f]armer... should be charged though. Then it would be up to the community to decide, through a jury trial, whether or not his actions were justified. My guess is that [the farmer would walk.

...An Aucklander] waited in agony for more than an hour after... [being] shot three times in the torso yesterday – apparently because police thought it was too dangerous to go to his aid. In the end a Te Atatu South wallpaper sales[perso]n went to... help – bundling him into the back of his van and driving him to the police cordon. For his trouble the sales[perso]n... was spread-eagled by heavily armed police and had a gun held to his head. Other residents were furious that the police did not arrive earlier. They accused them of putting locals in danger by asking them to keep a watch on the victim and his... Headhunter... gang associates and provide a commentary by cellphone... [One n]eighbour... saw the victim leaning against a dog kennel with blood seeping from gaping gunshot wounds, and begging for an ambulance... [The neighbour] told police there were no firearms in sight... [The salesperson had] heard gunshots and a short time later a [guy] came to his house and said: "My mate's been shot. Have you got a blanket?" I got him one, and I rolled them a cigarette. They might have been bad buggers but the guy was dying, you know?" ...the police told him an ambulance was waiting... His partner... ran round the block twice looking for it, but it was nowhere to be seen... "The... guy was... slipping in and out of consciousness and... going white. A Maori going white, it wasn't good. I... didn't want to let this guy die... Then the [police] thought I was involved." [The]Acting Senior Sergeant... of Waitakere defended the police actions. "It was a serious situation and we were unsure of the exact circumstances... The safety of the public and our staff is paramount. Blindly rushing in to the scene won't help the public or us." Police took several people away for questioning, but there had been no arrests by late last night. The victim was seriously ill [but is expected to survive]...

Returning to the Waitakere cottage where his colleagues were killed by a gun... is always emotional for a... retired... superintendent... "It brings back a lot of memories. And it makes me realise how dangerous it can be when police are confronted with armed offenders," says the Waitakere City councillor... [Hi]s return to the scene... follows the fatal shooting of Detective Constable Taylor and the wounding of [another]Detective Constable... in Rongotea... Mr Taylor and his [colleague] were chasing a 17-year-old burglary suspect when the shooting occurred. Mr Taylor died instantly... Mr Taylor's death brought the number of N[Z] police officers killed... to 26. West Auckland has connections with several, including the first – Constable Neil McLeod who was shot in July 1890 on board the steamer Minnie Casey, while on transfer from Dargaville to Auckland... The 1963 Waitakere cottage incident saw Bethells Rd resident James Robert Berry, Detective Sergeant Neville Power and Detective Inspector Wallace Chambers shot dead by... [a] 53-year-old... [who] was later declared insane and unfit to stand trial and [then] kept in custody in Auckland Prison.

...FRONTLINE cops are set to be issued with new bulletproof vests... for... potentially violent calls... following a series of violent attacks on police... [A] Manukau constable... underwent emergency surgery after being knifed in the stomach in a sudden attack when... called to a south Auckland home earlier this month. His partner had to disarm the attacker by hitting him over the head with his torch. [A]West Auckland constable... was shocked by the knifing but it reaffirmed his decision to wear... [the] \$1200... bulletproof undershirt [the constable] brought with him when... transferr[ing] from the British police. "My... wife feels a lot better knowing I have one and wear it most of the time," said... [the constable, who added that it] used to get odd looks from his colleagues when... open[ing] his shirt. "But whenever there was an incident, my mates would say 'you go in first...',"... The Second Chance body armour jacket can stop bullets fired from guns up to .44 calibre. "It's also... been tested against knives and slashers and stopped them,"... said [the constable, who believed that] with the rising number of attacks on police, his vest, which weighs 1.2kg, could be a lifesaver[('a US police officer who was wearing a bullet-proof vest survived after being shot 11 times by gang' members). The constable] is one of the few N[Z] officers who have their own flak jackets... Protective gear for police was last issued nationally in 1994.

...Some police have been urged to buy their own bulletproof vests because there are not enough for the frontline. Police chiefs say there are enough vests – but they have to juggle gear during major... hunts. The Police Association says there has always been a shortage. It wants 100 or so vests pooled in a central area to ensure there are enough to go round during a big... hunt. The issue flared... during Operation Reeves as officers hunted the [armed offender] who murdered pizza shop worker Marcus Doig and bank officer John Vaughan... [D]istrict commanders ordered that all staff be armed while the [armed offender] was on the loose – an order that was impossible to obey... The head of Whangaparaoa police said his station was one of many asked to contribute spare guns and vests. The station did not send any because it had too few for its own staff... Whangaparaoa[']s... 13 officers share one vest, one pistol and two rifles, [but] staff had been told they could use firearms only if they were wearing vests. That effectively meant they could use just one of the guns... Vests must be ordered from the United States or Britain, and cost up to \$3000.

...A BRITISH police force has ordered flak jackets moulded to accommodate breasts after [gal] officers complained the body armour didn't fit.

...[over] 800 police rifles have been withdrawn from service because of reports that they can discharge without anyone pulling the trigger once the safety catch is released. The Remington model 700 .223 calibre rifles are issued to general-duty officers called to an incident involving arms before the armed offenders squad has arrived... and for emergencies such as shooting escaped livestock on motorways... General-duty staff now had only 9mm Glock pistols... [The n]ational police operations manager... said the recall was a precaution following an article in... the N[Z] Deer Stalkers Association newsletter last month... that... said... [the] 700 model had been at the centre of... 80 lawsuits against Remington in the past 20 years. In one case [7] years ago, the company paid \$17 m... in damages to a Texan... whose firearm accidentally discharged and shot him in the foot.

...Police are getting up protesters' noses... [D]emonstrators at the Auckland University students' protest march on Thursday were subjected to a new method of restraint... [which i]s under trial as part of team policing strategies. "It's very effective because it causes a little pain but it doesn't cause any lasting effects. Once you take the finger away, the pain is gone. It won't break anybody's nose." ...[However, an] Auckland nasal surgeon... said last night... "I don't think that it's intrinsically dangerous but it would be possible to dislocate the nasal septum, although I have seen this injury only from an actual blow, not steady pressure." Police forcibly removed about 100 demonstrators who sat down... in the middle of the Queen St and Wellesley St intersection... during protests about delays in Work and Income N[Z] paying student loans... Eighteen people were arrested... [An] Auckland City police spokes[perso]n... said the use of the hold was at the discretion of the officer involved... A previous police hold was heavily criticised during the Commonwealth leaders' 1995 conference in Auckland. The method fashionable at the time was a two-handed, thumb-pressure grip on either side of the face. [A veteran protester who is] now a Green Party MP, was among those who felt its painful force. The police security head for the conference... defended the hold at the time, claiming it was not brutal or dangerous but "extremely effective." The... former Superintendent... [also] said police had used the thumb-pressure hold as far back as 1981, during the Springbok tour demonstrations.

...[NZ p]olice are evaluating a gun... used by police in Germany, Northern Ireland and the U[S]... that fires "beanbag" bullets... The beanbag "bullet" was a small package of pellets bundled together in a bag and fired from a shotgun. It was capable of knocking someone down but was unlikely to cause fatal injury. One police officer could carry it, with backup from other conventionally armed officers if it failed... said... [the] Petone firearms dealer... who also heads the NZ Council of Licensed Firearm Owners... [However,] it was too risky to use anything but the real thing... in situations where a suspect was close... The imported guns cost between \$700 and \$800 each. [The] national operations manager... said police had investigated... a range of non-lethal... alternatives to standard-issue weapons for about 18 months. They were being considered for specialist squads. Options included... an improved model of the Taser stun gun that they rejected in 1995... catching nets and big poles to pin a suspect against the wall... [plus] a bigger-capacity pepper spray canister...

Pepper spray, which police have used [over] 500 times... since its introduction, has been hailed... a success. Figures presented at a police executive conference in Wellington showed the spray had been used 497 times on humans, 63 times on dogs and once on a cow, up to the end of August.

...The latest weapon in the police arsenal of crime-fighting tools has been proven to work well – except on runaway cows[, and]... might not be as effective against mental patients... The police magazine... said assaults on police were avoided in 83[%] of cases where the potent oleoresin capsicum spray was used... It also appeared to... reduce... the risk of injury to offenders... Police said... [they] had received no complaints from spray victims.

...A Northland family are seeking answers [to why] a 66-year-old relative died minutes after police squirted him with pepper spray. Retired Kerikeri [resident] Ian Horsfield collapsed and died... in a carpark after police used the spray to subdue him... w[hen] trying to collect him for psychiatric treatment... Mr Horsfield was... rushed to a medical centre, but could not be revived... [Details have been suppressed by the coroner. The] Northland rural area controller, said a post-mortem examination... showed Mr Horsfield had died of a heart attack not caused by the spray.

...Police spray 'not cause of... death'... A Kerikeri constable says [it] used pepper spray on an elderly [person] who was backing away from her because his fist was raised in the air. Dr Ian Horsfield, aged 66, died shortly after police restrained him in a... car park last October 8. The police had been asked to help a Northland Health mental health officer take him to Whangarei for a psychiatric assessment... Under cross examination... [at] an inquest in the Kaikohe District Court... [the constable said it] sprayed in the direction of Dr Horsfield's face... after [Dr Horsfield had] pinned her behind a car door... but it appeared most of it hit his left ear. Everything had happened quickly and while [the constable] noticed Dr Horsfield "wasn't a good colour," [Dr Horsfield] was still breathing when put in the back of a police car. [The constable admitted it] was not aware that overseas literature recommended pepper spray not be used within a metre of the victim, but thought that was the approximate distance between herself and Dr Horsfield... After [the constable] sprayed him Dr Horsfield was laid flat on his stomach... When asked if [the constable] had considered police guidelines on pepper-spray use, which warned of the danger of asphyxia if someone was placed face down on the ground, [the c]onstable... said Dr Horsfield's head was turned to the side... [The c]onstable... accepted that the incident would have been very stressful to Dr Horsfield and... was aware that police guidelines required her to provide him with any medical attention necessary. However, [the constable said it] had no idea [Dr Horsfield] might be having a heart attack... [The person] who performed the autopsy... concluded... Dr Horsfield's death... was the result of a heart attack... [but said it] did not believe the use of pepper spray was connected... Dr Horsfield's sister-in-law... testified that last year [it] had become concerned at the former psychiatric patient's behaviour towards her. Dr Horsfield was angry at her plans to sell her property, where [Dr Horsfield] lived in a separate house, and to cut down a hedge... But [the sister-in-law] did not believe [Dr Horsfield] was a threat to others.

...Police know how an intellectually disabled [perso]n died after being pepper-sprayed in Hamilton, but last night said they were unable to release the findings. They said the cause of Russell Willie Hamilton's death on Friday night in Waikato Hospital was unrelated to use of the spray. Mr Hamilton, aged 32, was pepper-sprayed and handcuffed in the suburb of Dinsdale on Wednesday after damaging letterboxes and smashing windows... The death is the second in N[Z] of someone subdued by pepper spray... Introduced in 1997, pepper spray has been criticised for safety reasons... A[n AUS]n physician who has studied the effects of pepper spray's active ingredient, capsaicin, said yesterday that in the U[S] about 70 people had died by 1998 after being sprayed[(the spray has also 'come under scrutiny in the US after torture allegations' – which may explain why the LAPD is testing *Skunk Spot* on people; 'the aerosol to repel attacking dogs with sulphurous hydrocarbons that produce a skunk odour was developed by a first-year chemistry student at Auckland University')]. The president of the Auckland Council for Civil Liberties... said a large number of complaints had been made [in NZ] about police misusing pepper spray. "...It's vital it be looked at in a time when they're considering using other weapons."

...Travis, a Connecticut chimpanzee, was the constant companion of a lonely widow who fed him steak, lobster and ice cream. [Travis] could eat at the table, drink wine from a stemmed glass, use the toilet, and dress and bathe himself... brushed his teeth with a Water Pik, logged onto the computer to look at photos and channel-surfed t[v] with the remote control. But on Tuesday, the wild animal in him came out with a vengeance. The 90kg animal viciously attacked a friend of his owner before being shot to death by police. Investigators are trying to figure out why – whether it was a bout of Lyme disease, a reaction to drugs, or a case of instinct taking over. "It's hard to say what exactly precipitated this behaviour," said... Bronx Zoo. "At the end of the day... you can't always predict... how... any other wild animal will respond when they feel threatened."

...A [guy] killed by a volley of police bullets screamed, "You pushed me too far," as [it was going] on a rampage early yesterday through Waitara. Steven Wallace, who was 23, smashed hundreds of windows in the small Taranaki town... in a trail of destruction that started about 3.30 am. [Steven] was shot by one officer as [Steven] charged a group of police who witnesses said had urged him repeatedly to drop his weapons. Witnesses said the officer fired four or five shots. The former architecture student died mid-morning at Taranaki Base Hospital, becoming the 19th person killed by police in N[Z]. Many people condemned the shooting as needless. Family... witnesses and friends could not think of a reason for his behaviour, but... confronted police on the street later in the day. His mother... said: "The police are murderers. They're going to pay for it in a big way." His sister... said... "We don't know what went wrong at all. We just know [Steven] was killed for smashing some windows, which is pathetic..." Police are saying little, but last night [the]Superintendent... of the central police district appealed for calm. [It] refused to name the... officer who shot Mr Wallace but said [the officer] had been sent on leave... Two investigations are under way – one by the police to determine any criminal culpability and one by the independent Police Complaints Authority. Residents were woken by the sound of smashing windows and Mr Wallace's shouts and screams. One resident, who called the police, said the rampage lasted 15 to 20 minutes and was confined mainly to... the main street... There was a brief standoff with police, during which Mr Wallace was... "...ranting and raving and would not calm down." The w[itnes]

said Steven] charged towards the officers... [The witness also said] Mr Wallace had seemed intent on harming the police, and they probably had no choice... [However, a]nother witness... said... “[Steven] had no gun... [– just] a baseball [bat] in one hand and a golf club in the other. I can see that clearly in my mind still. They should have waited for the dogs or something. Okay, [Steven]’d done a lot of damage in town beforehand, but I don’t think they should have shot him.” ...[one local], speaking from the Waitara Rugby League club... had known Mr Wallace and his family for years, and [said Steven] was popular, intelligent and good at sport. “[Steven] was a normal sort of bloke, just a young guy. It’s tragic.” A[nother local] at the Waitara Hotel said: “Why the hell did they shoot him...? And why didn’t they shoot him in the leg?” The... [PCA investigator] said last night that it was far too early to comment. “I’m not able to say whether I’m alarmed or not...” ...[the] president of the Council for Civil Liberties, wondered if there was a danger the police were developing a “shoot first, ask questions later” mentality. “Why does someone not carrying any firearms end up being shot five times?” ...Glaziers h[ave h]urriedly replaced... windows at the fire station, police station, supermarket and shops.

...The [police] investigation into the shooting of Steven Wallace... [involves over] 25 staff, mostly from Taranaki... The president of the Auckland Council for Civil Liberties... is unhappy with this system. [The president believed] the Waitara shooting was a “turning point for this nation” in terms of people’s trust in the police, and the inquiry had to be seen to be totally independent... [E]ither an ad hoc body or a panel convened by the Ombuds[person] should run it. The police guidelines on the use of firearms say police are criminally liable for using excessive force. They say police should shoot only if firearms are the only reasonable way to protect themselves or others from death or grievous bodily harm from an offender who is resisting arrest or trying to escape. They must warn an offender before firing... On Thursday... [the PM] asked whether the police protocol was shoot to wound or shoot to kill. “There’s quite a lot of questions that the Government and public are going to want information about,” [the PM] said... However... the... Acting Chief Commissioner... said yesterday that [it] did not know of a law enforcement agency anywhere in the world that taught the concept of shoot to wound. “I refute any commentators who believe that N[Z] police should adopt a shoot to wound [policy].” The dangers to police... of a shoot-to-wound approach were unacceptable. Police... were trained to shoot to incapacitate and to aim for the largest body mass, which happened to be... where all the vital organs were... “The idea that an officer considers ‘I’ll wing him in the shoulder or in the leg’... [i]s something that the mass media have portrayed... – it... isn’t sustainable in reality, it does not have any basis in reality.” The Police Association... said... yesterday that... the officer who shot Mr Wallace had “in reality” fired only twice[because p]olice were trained to “double tap.” “That means we don’t fire one shot, we fire two... If that fails to stop the person, and the circumstances still justify shooting, then we fire two more shots.”

...To his mates, Steve Wallace was... a sports-mad and fun-loving [guy] with flashing blue eyes. One of his best friends... said all the girls loved him... “[And]Waitara was so proud of him, going to university. It isn’t an easy thing to achieve from a small town like this.” ...But last Sunday morning the life drained out of the 23-year-old... [and] no one can understand [why]. “This guy wasn’t violent. [Steven] was funny as[, and] always had a grin on his face...” ...On Saturday, [Steven] apparently played a round of golf at Airedale Links... That evening [Steven] watched rugby league on television and then went into New Plymouth with some friends... [Steven] did not drink... [– because Steven] was in training for league... and was the sober driver... Early on Sunday [Steven] drove home alone. There is speculation about his having a... run-in with police, but whatever happened [Steven] picked up from his house the softball bat [it] had swung since his teenage days with the Waitara Softball Club and a golf club... used [the previous] day... then went on a 35-minute vandalism spree... [until being hit by] five rounds... fired... from a police-issue Glock pistol... About 300 people filled the meeting house at Owae Marae [during Steven’s tangi], and there were at least as many outside on the lawn. The mourners included at least five MPs. [Meanwhile, t]he fallout from his death continues... Death threats have been made to police and whispers about retribution continue... Th[e officer involved in the shooting] is now under police protection for his own safety and has relocated with his family out of Taranaki.

...The *Herald* has won the right to publish the name of the police[officer] who shot Steve Wallace... Two of the country’s most senior judges, sitting as a full Bench of the High Court at Auckland, last night dismissed an application by the [officer] for an order prohibiting publication of his identity. But they granted the [officer] extended suppression until midnight on Monday to give him time to consider an appeal. During a four-hour hearing the judges questioned how it could be right to suppress publication of the name of the [officer when the officer] was a public official carrying out a public duty on a public street. They said there was no mandate to follow the traditional internal police practice of not naming officers involved in fatal shootings... During the hearing... the [officer]’s New Plymouth lawyer... said the media had fed a raft of misinformation to an impressionable public and the *Herald* was seeking to create a story that fed on itself, would continue to grow and sell more newspapers. [One judge] interrupted, saying that was strong criticism[, then asked the lawyer if it] had seen a *Herald* editorial on the shooting which [the judge] called “extremely balanced.” [The lawyer hadn’t seen the editorial but added that] there was a voluntary undertaking by the media not to publish the names of police... involved in fatal shootings... [The other judge said the officer] was trying to prevent the *Herald* from publishing something that 6000 people in Waitara already knew[, then] said the public interest outweighed... [hi]s request for privacy... [A representative] for the Police Department, said... [i]t was time, perhaps... to press for legislation on the issue... of... preserving the... anonymity... [of police. In response, one judge] said that sounded almost reprehensible. It was fundamental that police officers be known to the public. “You astound me... It’s the first time my ire has been aroused in this case.” [The representative said it was only] acting on instructions. [The judge: “]So we will have a secret police?[" The representative: “]No sir. That is not what I suggested at all. The concept of a secret police suggests that the police are not accountable for their actions. In NZ all police officers are responsible for their actions.[“] ...But the judges said there was no evidence of any likelihood that [the officer] would face charges.

...Two [gals] are facing criminal charges after the wife of the constable who shot and killed... Steven Wallace was harassed... follow[ing] a function held for the officer and his family at the New Plymouth police station on Saturday night... [■ T]he constable – whom... all media offices have chosen not to name – [‘was involved in another shooting incident in 1991. The constable was cleared of any wrongdoing in that incident’ and, this time, is expected to be judged to have] acted lawfully and in self-defence when... sho[oting] Mr Wallace...

A gun battle with bank robbers caused serious psychological problems for the [constable] who later shot [Mr] Wallace, it has been revealed. [The c]onstable... suffered flashbacks, anxiety attacks and tearful bouts of depression after the December 1991 shootout at a New Plymouth PostBank... Fortunate not to be hit when an armed robber fired at him from close range[, the constable]... sought help from a psychologist, had trouble sleeping and temporarily transferred to a desk job. Almost a year after the bungled robbery, [the constable said it]... was “no longer scared of death”... and... declared [it] would shoot to kill if caught in a similar situation again... “I... don’t think I would find it so hard killing anyone from now on...”

...THE Waitara cop who shot Steve Wallace is so worried about his family’s safety [it] is considering changing his name. Armed police are on guard over the Taranaki officer’s family after his name was published in... the National Business Review... newspaper on Friday. “In light of what has happened everything is being reconsidered...,” said [the]police association president... “Now that his name is known throughout the country his situation has changed... Until the inquiry is completed, [the Taranaki officer] is going to be under enormous stress. If [the Taranaki officer] stays in the police, [it] probably won’t be able to work in the provinces,”... Police complaints authority and police inquiries... take up to eight months...

Policing the police – can we trust the system? ...[A Bay of Plenty resident] does not have a high opinion of the P[CA. The resident], aged 40, lives on a 1ha lifestyle block near Tauranga. Last June, [the resident] applied to police for a trespass order against his neighbour, who... was intimidating him. [The resident] was given a form and advised to serve it on the neighbour himself. When [the resident] did so... his neighbour “hurled abuse at me” and called to his wife to phone the police. About 9 that night, [the resident]’s phone rang. A [voice] said his house was surrounded by the

armed offenders squad and [the occupant] should do what [it] was told. "I didn't know what they were on about. I said, 'You must have the wrong number.' I let the phone ring[again while] I just sat up in my lounge and played my guitar. Next thing there was a loud-hailer saying, 'Come out.' I finally went out there. They arrested me... and charged me with threatening to kill, assault and trespass." To [the resident], who had never been arrested before, it was a nightmare... that has cost him \$70,000 for lawyers and private investigators, and left him finally convicted and discharged on the assault count. (The other two charges were dropped.) Last October, [the resident] turned to the P[CA] alleging wrongful arrest. But the authority never interviewed him, and [the resident] never had a chance to give it the report from the private investigators. Months after the final court decision, and after repeated calls to Wellington, [the resident] finally received the authority's two-page report... It said police called out the squad because they had received information "that you may have been contemplating resorting to the use of a firearm. In such instances it is clearly in the interests of public safety that the police take action, and I am satisfied that such was the basis on which the operation was mounted," wrote the [PCA's j]udge... After clearing the police on various other matters, the judge wrote: "I will now close the file." [The resident] says: "I have been stunned for the past month trying to figure out what to do... I'd hate to see it happen to others. I guess it has, and it will..." ...A[n A]uckland barrister... has become "utterly, totally disillusioned" with the [PCA] and advises his clients not to bother with it. "As presently constituted, in my view it doesn't work,"... [T]he Auckland Council for Civil Liberties, says the [PCA] "just seemed to become an arm of the police." The authority has been controversial since N[Z] became one of the last Commonwealth countries to introduce civilian oversight of police in 1988. According to [an AUS]n author... in *Complaints Against Police*, the first civilian review boards arose in... U[S] cities during the civil rights campaign 40 years ago. Britain established a complaints board in 1978, A[US]n states between 1976 and 1985, and Canada in 1981. In N[Z], the impetus came from the 1981 Springbok tour, which drew thousands of middle-class people into contact with police for the first time. An Ombuds[person]'s report upheld 75 out of 173 complaints about police actions during the tour. The [PCA] is legally a single person, but [the j]udge... is assisted by [another j]udge... There are three investigative reviewers and the equivalent of three fulltime secretaries, with a total budget of just under \$800,000. In the year to last June, the authority received 2530 complaints from 1682 people, and accepted 2076... for investigation. That means th[e two j]udges... sign... 40 reports every week. They do not, however, conduct the actual investigations. The authority's last annual report says: "The structure and funding of the organisation is such that it is inevitable... almost all investigations will be conducted using police officers as investigators." ...most complaints are investigated by local police districts. Their reports are reviewed by police national headquarters... and passed on to the authority. In serious cases, such as the death of Steven Wallace... the [PCA] actively supervises an investigation... [The primary PCA judge] interviewed the police[officer] who shot... James Raharuhi dead at a BP service station in Greenlane in 1996. [The judge] found that the officer made an "error in judgment" in taking his de facto wife to the scene, but concluded that the shooting itself was justified. In the past year, 14[%] of the complaints on which the authority ruled were fully or partly sustained, 58[%] were not... and 28[%] were "conciliated" – including a significant number where police acknowledged mistakes. However, no police officer has been prosecuted for shooting anyone while on duty in the past 60 years. The Police Complaints Authority Act requires the [PCA] to conduct its investigations "in private" and to "maintain secrecy," and provides that no statement made to the [PCA] can later be used in any court case. [The j]udge... says this enables people to speak with frankness and honesty. But both the [PCA]'s closeness to police and its secrecy have many critics. [A]Great Barrier Island sickness beneficiary... acquitted... on a charge of cultivating a marijuana crop valued at \$1 million... complained to the [PCA] about the way police treated him, and was amazed when the [person] appointed to investigate the case turned out to be the very police officer who had launched the original inquiry into him. [The beneficiary] went on radio and called the investigation "a facade." That morning, [the judge] rang saying that the appointment was "totally inappropriate," and instead a police inspector from Christchurch was assigned to the case. [The beneficiary] and his wife... met the inspector in Auckland, but... had to try four times to get him to write down what they wanted to say. "[The investigator would] just say, 'Oh well, that could have been a mistake'." To [the beneficiary]'s knowledge, the inspector has never visited Great Barrier to talk to neighbours and others about what happened, and [the beneficiary]... has yet to see a report. In another case, [a]Christchurch lecturer... was awarded \$20,000 in damages by the High Court this week for a police search of his home in 1996 – two years after... the PCA... [j]udge... told him that [it ha]d been "unable to identify grounds on which to conclude that any police officer has been guilty of misconduct or neglect of duty." [The lecturer and political activist (r:p271, ln48) – who 'believed the search of his home was made in retaliation for him catching SAS members illegally searching a friend's home' –] says: "It is just thoroughly unacceptable to be expecting the public to have confidence in a body which is really not doing anything much different from an internal police inquiry." Lawyers point to other problems... [One] tells clients that if they go to the authority, police will "play hardball" on their case. "Often when there is a complaint, at a later stage extra charges are laid for bartering purposes. It happens frequently. Sometimes a prosecution is withdrawn on the basis that a complaint is withdrawn." [The PCA j]udge... defends his use of police officers as providing "a greater feel for what's going on within the organisation." His predecessor... in earlier reports said using police investigators had a powerful "educative" effect on police, helping them to learn from their mistakes rather than seeing the authority as an outside critic. [The predecessor] added: "The cost of full independent investigation would involve a greatly increased budget and expansion of this authority, probably requiring offices in the main centres..." [The]Police Association president... says that after initially opposing a civilian oversight body, police now accept it. "It's as much a part of policing now as the uniform. If we are interviewing one of our own, we treat them in the same way as we treat anyone else... I seriously believe that a completely independent body coming in from outside that was not police would find it very, very difficult to penetrate the wall of silence that many people believe exists now."

...Waitara Maori are warning that the police[officer] cleared of blame for killing Steven Wallace could be in danger if [it] returns to the Taranaki town. The warning last night followed comments from [the]Police Commissioner... that the constable was "intensely relieved" and apparently committed to continuing his career after a police investigation found [the constable] had acted lawfully. A decision on whether [the constable] would return to Waitara would be between the constable and the central district police commander... It is understood the constable, a Maori who has been an armed offenders squad member since 1986, is still living in Taranaki so his two young sons can continue their schooling. The family's home in Waitara, which is under close surveillance, is on the market. The police investigation resulted in a 180-page report into the events surrounding the shooting. The report concluded that the constable... should not face any charges. It included a legal opinion from the Deputy Solicitor-General... [The] Police Minister... extended his sympathy to Mr Wallace's family[after it] expressed confidence in the police investigation and the Crown Law Office review of its findings. But [the]Green Party police spokes[person]... said the Wallace report gave police the [OK] to shoot unarmed offenders... Last night, police presence in the township was heavier than usual... Yesterday morning, in a copy-cat incident, a relative of Mr Wallace stormed the Waitara police station armed with a golf club and made threats. Police are investigating. On the streets, many were angry. "If [the constable] is so innocent, put him before a jury and let 12 lay people make a decision, not just a Police Commissioner," said one. "This is a police state," said another. "If that was you or me we would have been charged." A sister of Mr Wallace said the report was "full of lies" and her brother was not violent towards other people. "[Steven] had all night to hurt someone if [it wanted – but] was only breaking windows." A lawyer for the Wallace family... said... on television later... [that t]he family were taking a private prosecution against police...

The constable who fatally shot Steven... will appear in the New Plymouth District Court on Thursday. Wallace's father... filed a private murder prosecution... – the first such prosecution against a [NZ] police officer... A police investigation found [the constable] was acting in self defence...

Flanked by a close team of uniformed police, the constable who... shot and killed... Steven Wallace walked to court yesterday to face the country's first private murder prosecution against a police officer. Security was tight when the officer, known as "Constable A", appeared in the New Plymouth District Court for the first day of the case. The dock was surrounded by a protective shield and members of the public were screened by a metal detector before entering the courtroom... The strong show of police solidarity continued when [the]Deputy Commissioner... held a press conference and said [it] supported the constable. "These are tragic events, tragic for the Wallace family and tragic for Constable A and his family... There are very wide implications. This is quite a novel issue with regards to the police..." ...Constable A... has been remanded until [next month].

...The three constables present when Steven Wallace was shot could have dealt with him using batons rather than deadly force, the New Plymouth District Court was told yesterday... [A] former Auckland police superintendent, said it was misleading to consider the situation on the night Mr Wallace was shot dead by a police officer in Waitara as a one-on-one. "This was a three-on-one situation." The officers "could have armed themselves with PR24 batons and comfortably dealt with him". [The former Auckland superintendent] said that if three police officers with batons could not deal with one offender armed with a baseball bat, "what that means is that frontline police officers must be armed with firearms". [The former Auckland superintendent also said it] could not understand why [Constable A] stood rooted to the spot for 10 minutes after the shooting when a person close by might be dying... After three weeks, the prosecution finished its case yesterday. The defence case opens today.

...The Government decision to pay the legal costs of Constable [A], who may face a murder trial for shooting Steven Wallace, is not unusual, says the Police Association. [The]Chief Justice... ruled on Friday that a High Court jury should decide whether [Constable]A... murdered Mr Wallace by the use of excessive force. Her ruling reversed one by two justices of the peace. They ruled [earlier in the New Plymouth District Court that Constable]A... acted in self-defence when [it] shot Mr Wallace... [The] Police Association president... said [Constable A knew it] had done nothing wrong, but [the Chief Justice]'s decision meant his nightmare would continue. "[The constable] is resigned that yet another hurdle must be crossed before [it] can get the justice [it] and his family are so deserving of." ...Mr Wallace's father... declined to talk about the case yesterday, saying simply that the family was "taking it as it comes". Nor [would the father] discuss the case costs, or whether the family would reapply for legal aid.

...The [constable] who fatally shot... [Mr] Wallace will today stand trial for murder... The trial... in the High Court at Wellington follows months of legal wrangling... [since] two... JPs dismissed the case after a lengthy depositions hearing. But [the]Chief Justice... overturned their decision...

Constable [A]... held his head high as [it] walked from the Wellington High Court. The first N[Z] police officer to face a private prosecution for killing in the line of duty was acquitted of a charge of murder by a jury that deliberated for less than three hours. After the verdict, [the]Police Commissioner... promised [it] would seek legislation to prevent any other officers going through Constable A's... ordeal... Outside the court, Steven Wallace's father... thanked all those who had supported the family in taking the private prosecution. The... family have re-mortgaged their house, raised money through sausage sizzles, raffles and hangi, and received donations from across the country. [The mother] said the verdict was a sad day for N[Z], but it was glad the prosecution had reached the courts... [T]he case did... show the "incompetence" of the police, in not using their batons, dogs, and spray against her son. [The mother] began to talk of loving her son and "[Steven] wasn't a bad person" when [it] was drowned out by her daughter... who told her to "shut the f*** up, mum". [Steven's sister] later threw a glass bottle at reporters and... abuse at the police.

...The farcical situation of a Private Prosecution against a police officer carrying out his sworn duty, facilitated by the "Judas" that is the N[Z] Judiciary system, defies both common sense and belief. Even a passing observation of Steven Wallace's famil[y]'s out-of-control reactions and rageful tirades towards the police in defence of their son was enough to confirm chilling and compelling evidence of the environment that birthed him. This environment, coupled with Wallace's grandiose world-view of invulnerability, lack of self-control, his choice to step outside the bounds of safety and rational behaviour whilst destroying property not his, and his endangering others resulted in his death. When the Wallace family accepts their son's responsibility in this matter, maybe then they can begin to heal... [As for Constable A, it and the rest of the NZ] Police Force can finally make a collective sigh of relief, secure once again in the knowledge that we trust their judgment on the front line... [] A NZer working for the NSW] anti-theft squad... has been charged with murder over the fatal shooting of... [an] unarmed... 22-year-old... in Sydney on Tuesday night.

...A former... West Aucklander... working as a police officer in Sydney has been charged with murder after shooting an unarmed suspect in a stolen car... [The 26-year-old,] who played drums in the 1980s heavy-metal band Nine Livez, is the first N[SW] police officer to be charged with murder after shooting someone in the line of duty. The decision to charge him has caused ructions within N[SW] police and devastated [hi]s family and friends... [The 26-year-old] had only recently returned from... lengthy stress leave after being involved in a scuffle where [the police officer] lost his gun and his life was threatened... when [it] shot petty criminal Eddy Berrio, 22, after pulling him over in a stolen car in central Sydney at 9.15 pm on Tuesday last week. Police had been told that there might be firearms in the vehicle. As Berrio reached to unbuckle his seatbelt, [the officer] fired a shot from his Glock pistol through the closed driver's window into Berrio's head, said a police statement lodged in Sydney's Downing Centre Courts on Friday. Berrio died instantly and [the officer] collapsed after the shooting. Witnesses reported hearing him say: "What have I done? I'll be charged." [The 26-year-old] again collapsed when told on Friday that [it] was to be charged with murder... It is understood a number of officers in the independent inquiry team opposed legal advice that [the 26-year-old] be charged with murder instead of [hu]manslaughter.

...Yesterday the first N[SW] police officer] to face a charge of murder while on duty walked free... [A]fter a four-day committal hearing, the magistrate ruled that there was insufficient evidence to try him either for murder or on a lesser [hu]manslaughter charge. The evidence indicated that the discharge of [the police officer]'s pistol was accidental, not voluntary as submitted by the Crown, [the magistrate] said. There was no evidence [the police officer] had been guilty of gross negligence... As the magistrate finished his 30-minute verdict, [it] told... the petty thief and heroin addict Edison Berrio[s]... friends and family in the packed court that what had happened was a tragedy – "I just want to say how sorry I am." "Sorry won't bring him back," shouted someone from the public gallery. "There is no justice," yelled another. As they filed out of the court, people threatened [the police officer] and swore at him as court staff and lawyers shielded him, and extra security was called in... [Incidentally, the family] of Steven Wallace is pursuing the mother of one of the police officers present when Wallace was shot dead in the main street of Waitara, accusing her of perjuring herself in the private prosecution of [the shooter]... The... mother... told the court that two weeks before the shooting [it] received a phone call from a [gal] concerned that her son, who [it] identified as Wallace, was becoming increasingly violent and had threatened to kill her. A [perso]n with the surname Wallis later came forward to say [it] had made a similar call to the court at the time about her son, whose name was not Steven. [The mother] was dropped as a defence witness and was not called to give evidence... at [t]he t[ri]al... but... her evidence at depositions was devastating for the prosecution. "The damage had already been done [as] all of N[Z] had seen the headline 'Mother feared son',"...

The police shooting of Auckland courier driver Halatau Naitoko appears to have been legal and it is unlikely his family will be able to sue for compensation, legal experts say. However, lump-sum payments may be available through the Accident Compensation Corporation or ex-gratia payments from the Government to assist them with funeral costs, lost income and to care for his 2-year-old daughter. Mr Naitoko, 17, was accidentally killed in his van on Friday by police shooting at... an unemployed 50-year-old who had allegedly shot at officers during an hour-long c[ar] chase involving police road-blocks that eventually led the offender onto the busy western motorway]. It is alleged that [the offender] was standing on the back of a flat-deck truck with a sawn-off .22 rifle pointed in the cab window... Three officers fired five shots at [the offender as the truck driver] slammed on his brakes, hurling [the offender] forward. Mr Naitoko was in the line of fire... Last night, an emotional [truck driver] was in no doubt that the police had saved his life... [The offender] had moments earlier stood in front of his truck and pointed the gun at him to stop him... [The driver] tried to run the offender down but [the offender]... leapt on the back... It is the first time [NZ] police have shot dead an innocent bystander.

...The two police marks[people] who shot dead Jean Charles de Menezes were convinced that the unarmed Brazilian was a suicide bomber and an “instant killing” was the only way to deal with him, his inquest was told yesterday. The opening day of the hearing... in London... into the death of the 27-year-old electrician was given a minute-by-minute account of the police operation that reached the mistaken conclusion that [Jean] was one of four bombers who had tried to bomb the capital the day before. Nine bullets were fired at the Brazilian from a distance of 1cm and 8cm...

Britain’s bobbies have reached the end of an era, with regular police[officers] in Nottingham carrying firearms for the first time in the force’s history. Operation Real Estate follows an appeal by local authorities concerned about a rise in the use of guns in crime. The *Sunday Times* said the move “represents a significant shift in British policing, which had prided itself on the tradition of the unarmed bobby on the beat.” But a police spokes[person] insisted that gun-carrying police were not destined to stay forever, but were intended to “send a strong message to the criminals.”

...Three officers accused of malpractice in planning an operation in which a naked [suspect] was shot dead have been acquitted. The officer who fired the shot that killed James Ashley, aged 39, was cleared of murder last month. Relatives of Ashley said they planned to sue Sussex Police. The Crown... dropped its case alleging the rare crime of “misfeasance” in public office because of expert opinion about failures in Sussex Police’s approach to firearms operations... The armed raid... in the early hours of Jan 15, 1998, was an operation characterised in almost equal measure by incompetence and ill luck... The team had been told that Ashley was a highly dangerous [person] who had a prior conviction for attempted murder. [Ashley] did not, though [Ashley] had served a sentence for [hu]manslaughter after a guy [it had] punched subsequently died. They were also briefed that [Ashley] had shot someone with a shotgun. [Ashley] had not. One c[on]stable... found himself heading for Ashley’s bedroom. As [the constable] opened the door, Ashley was in front of him – naked, unarmed and groping forward towards the light. [The constable] shot him.

...The night was the idea of my wife’s second cousin, a veteran New York cop who was concerned that anything I might write about the death of Amadou Diallo should reflect “the real truth about the Finest,” as the Big Apple’s cops like to call themselves. So we met at Mullen’s, a dark and ancient bar on Seventh Avenue no more than a brisk 20-minute walk from the precinct where [the cousin] works. “Some of the guys will be there,” [the cousin] promised. It was Thursday night, six tumultuous days after four white cops were acquitted of cutting down the black and unarmed Diallo in a hail of 41 shots, when my tutors called the class to order with the clink of long-necked Budweisers. The only condition was that no names be used – a sensible precaution given that the Big Apple’s Mayor... has banned his rank-and-file cops from talking to any reporters. “You see, it’s not Hollywood out there,” said my wife’s cousin... “You see *NYPD Blue* or something and you civilians think you know what it’s like. But it’s not,”... “Good show, though,” added [another cop]... “What they put in the show, they get right. But they leave out an awful lot, too.” “Well, they have to leave it out,” continued [the cousin]. “You think the sponsors are going to let them put what happened to... a rookie cop and health fanatic attached to a precinct on the West Side[?]” ...One day, not long after graduating from the Police Academy, [it] was out on patrol with an older partner when the dispatcher sent them to a tenement near the Hudson River. The landlord had taken exception to a bad smell coming from an upper apartment... At the apartment building, the cops marched up flight after flight of stairs, the smell growing worse the higher they went... “When they go into the apartment, the[y]... discover... his tenant dead and bloated in the bath with a plastic bag pulled over his head... and the stink is just beyond belief. So the kid takes one look at what’s floating in the water and tosses his lunch all over the cadaver... And the really funny thing was that [the kid] gets reamed out by his sergeant for throwing up and ruining a crime scene before the medical examiner could get there...” They laughed... and another round arrived. New York’s cops haven’t had all that much to raise their spirits lately so an old story, even a gruesome one, makes a welcome change. But a lot of people aren’t laughing in this city, and not only because of the Diallo acquittals. At some point over the next few days, a Brooklyn jury will rule on the fate of three other cops charged with looking the other way while one of their colleagues sodomised a Haitian migrant with a broken broom handle. Once again, the cops are white and the victim, who almost died from a perforated bowel, was a young black... Nor is that the end of the outrages now prompting almost daily demonstrations around New York. Last Sunday, a retired NYPD detective summoned the local Bronx cops to his home to report a burglary. Unfortunately, the first officers on the scene were cowboys who mistook the home owner for a thief and pistol-whipped him in front of his screaming family. Predictably, the retired detective was a dark-skinned Latino and his attackers white. On Tuesday, two more Bronx cops were busted for battering a [citizen] who cursed them... when they refused to arrest her violent boyfriend. According to investigators from the NYPD’s Internal Affairs unit, the accused duo drove her in handcuffs to a vacant lot, hammered her with their night-sticks and then left her bleeding and unconscious in a freezing drizzle. [This victim], too, was black and her assailants white. Finally, as the beers flowed at Mullen’s bar, the TV... interrupted the evening with the report of yet another police shooting. Once again it was in the Bronx, just two blocks from the doorstep where Diallo’s life was snuffed out, and the riot cops were out in force to keep the... [victim]’s angry neighbours in line. According to the TV reporter, the suspect was a petty drug dealer who had been shot in the head as [it] fled from the four undercover officers trying to arrest him. “Sheesh,” sighed [one cop], “It’s some week in this town!” Why New York’s Finest should find themselves on the bad side of public opinion after so many years of stunning successes is a moot point. Aggressive policing has pushed down the murder rate to levels last seen in... the early Sixties. Burglaries, muggings and rapes have witnessed similar dramatic decreases... It was... [the mayor]’s reputation as a crimebuster that made him enter the Senate race... Now, as the streets ring to protesters’ chants and the US Justice Department talks about appointing a monitor to keep an eye on New York’s cops, the mayor’s political future may well be in jeopardy. [The cousin] and his mate[s]... attribute the spate of hair-trigger brutality to “just bad luck.” Others see it in a different light. Almost two years ago, [the] former NYPD Police Commissioner... who led [the mayor]’s initial assault on crime, predicted that things could turn nasty very quickly. “When we began the effort to restore order to the streets and suppress crime levels, the situation was so bad I really only had to order my officers to do what they were paid to do, which is get out on the streets and keep the peace... The police had not been doing that and criminal behaviour always flourishes in a law-enforcement vacuum. Aggressive policing was needed then. Now that crime levels are down, what the city needs is maintenance policing. Pushing too hard is counterproductive.” [The commissioner] made those comments long before this city heard the name... Diallo... Unfortunately, by that stage, [the commissioner] was no longer around to order his troops to pull back. Perhaps concerned that his police chief was stealing his limelight, [the mayor squeezed him] out of the job and installed the city’s then-Fire Commissioner... in his place. The difference was telling. Where [the police commissioner] had always been his own [person], yielding to nobody, not even the mayor, [the fire commissioner] has been a political creature from the start. Since the mayor wanted even lower crime stats and lots more busts, [the fire commissioner] set out to oblige him by boosting the size of the elite Street Crimes Unit by almost 300[%] in less than 12 months. When [the former police commissioner] unleashed the CSU with explicit orders to disarm criminals, his [officers] were averaging one arrest for every three suspects they stopped and frisked. Under his successor... random frisks rose to 27,061, [while] arrests shrank to a scant 4647. As [one] [black activist]... said after the Diallo acquittals: “In Harlem, we don’t see the police as our protectors. We see them as an army of occupation.” Back at Mullen’s, neither [the cousin or his colleagues] had much time for [the activist] and his ilk. Like the viewers who mistake TV cop sho[w]s for the real thing, they dismissed the [activist] as an innocent who has never seen the world through the blue prism of a squad car’s windshield. “Tell me [that activist] isn’t safer up there in Harlem for all the work our guys have done... But a cop has an accident, a tragedy like Diallo, and nobody talks about the good stuff. We’re all just killers.”

...Police... shut down an entire block outside the New York Police Academy yesterday as demonstrations continued... over the acquittal of four white police in the slaying of an unarmed African immigrant. About 150 people chanting “How many shots? Forty-one! How many needed? None!” gathered outside the Manhattan academy where new police recruits are trained. Police ordered them to disperse because they were blocking the sidewalk and when they refused, handcuffed and arrested 12... [(219 people were)] arrested for protesting [against] [New York City police brutality]... after [the] unarmed African immigrant was shot to death[)]... Guinean Amadou Diallo died in a barrage of... gunshots fired by

the officers as [it] stood in the vestibule of his Bronx apartment building. The officers said at the trial they believed Diallo was going for a gun when... reach[ing] to pull out his wallet. [● 'British soldiers were taunted by and fired upon a crowd of townspeople in Boston, Mass., Mar. 5, 1770. Five townspeople were killed and several wounded. The British commander and some of his officers were charged with murder. John Adams and Josiah Quincy, though prominent patriots, courageously defended them and won their acquittal. The *Boston Massacre* fanned animosities that culminated in the American Revolution.']

...Philadelphia's black leaders appealed for calm yesterday after news footage showing police violently subduing a wounded black suspect... The FBI and the US Attorney's office in Philadelphia launched a preliminary civil rights probe into the incident as national television broadcasts of the brutal scene invited comparisons with the beating of [a]black motorist... which led to riots in Los Angeles in 1992. Police and city prosecutors also stepped up their own investigations by interviewing witnesses to the car chase that ended on Thursday with [the]30-year-old suspect... being kicked, beaten and stomped by a crowd of police as a news helicopter recorded the scene. [The suspect], who has a criminal history involving burglary and assault, led police on a chase in a stolen car, waged a gun fight with officers in which [it] was shot five times, then jumped into an empty police car and drove about 2km until [being] surrounded and subdued... The suspect allegedly shot one officer during the gun battle, wounding him slightly, tried to run down a second and bit a third on the hand during arrest. All told, eight police officers fired as many as 45 shots, leaving empty shell casings strewn across an intersection. But investigators were unable to find the gun they say [the suspect] used... Leaders of the Black Clergy of Philadelphia and Vicinity... [were] saying the issue was police brutality rather than racism, given that several officers involved in the melee were black... [By the way, a] federal judge has ruled that Los Angeles Police Department can be sued as a racketeering enterprise in the so-called Rampart corruption scandal, an unprecedented decision that could open up the city to scores of new lawsuits...

An extraordinary event happened in... L[A]... – ...for the first time in its 75-year history, the police officers' union asked for an outside body to investigate the force... The significance of the move by the L[A] Police Protective League, which represents the LAPD's 9654 officers, cannot be overestimated. It represents an acknowledgement that the force that brought us the fiction of *Dragnet* and *LA Confidential* and the reality of [cops dishing out street] beatings now accepts that only an outsider can make the insiders confront the painful truths of what is being described as the worst scandal in the force's history. It had its starting-point with... a street-smart cop from the Rampart district, who helped himself to 16kg of cocaine from an evidence room, left some flour in its place, and then sold the drugs through a girlfriend. When... caught, [the crooked cop] and his lawyers made a deal under which [it] will have to serve only five years in exchange for giving evidence against former colleagues. Last week, [the crooked cop] appeared in court to plead guilty and warned fellow officers that "...who[ever] chases monsters must see that [it] has not become a monster himself." ...What the LAPD did not realise at the time was that what [the crooked cop] had to tell was far worse than anyone suspected. [It] told investigators that the LAPD had shot unarmed suspects, had routinely planted guns and drugs, had seen innocent [people] jailed for sentences of more than 20 years, and had rewarded each others' shootings with trophies... [The LAPD police] chief from 1950 to 1966, epitomised the old-style, white-boy image. [The chief] was opposed to "race-mixing," regarded the Latino population as related to the "wild tribes of Mexico," and restructured the police on military lines. The Watts riots of 1965, an explosion of rage against discrimination in the black part of the city, came on [his] watch and hastened his departure... [T]he chief between 1978 and 1992, stayed long enough to preside over a second bloody riot in 1992 following the acquittals of the white officers... shown on video beating [a black suspect. 55] people died in the riots and [the chief] resigned in their wake. The present chief of police... is black and took the job with much good will on all sides... [The new chief] has enjoyed the strong backing of the mayor... and is basically media-friendly and conscious that [it] is policing a diverse community. But attempts to persuade people that the dark days... were passed have foundered on the revelations made by [the crooked cop]... So perhaps it is no surprise that... [the] president of the L[A] Police Protective League, should say that it now believed the time had come for an independent investigation. In... *LA Confidential*, the chief of police responds to a fictional corruption crisis by saying: "Frankly, we must sate the public's clamour for blood by giving up some of our own." Frankly, that is the least that is now required to restore confidence in a city where what the police were up to remained confidential for... too long.

...NOT SO long ago, the police chief in sleepy Marion County, Florida, received a note from Uncle Sam. Drug gangs were growing ever more ruthless, it warned, and the spectre of terrorism was a national concern. Would [the chief] like to have his people trained in military combat techniques, and perhaps add some of the Pentagon's surplus equipment to his department's arsenal? The chief didn't mind if [it] did. True, the district's orange groves had never been shaken by a bombing, harboured terrorists, played host to right-wing militia nor been a staging-post for drug cartels. But all that was beside the point. Neighbouring communities had started their own Special Weapons and Tactics (Swat) teams, as have 7000 federal, state and local law enforcement communities across the country, so the feds' offer seemed a golden opportunity for Marion County to make up some ground in America's domestic arms race. A rack of assault rifles, some cases of ammo and a bulletproof vest or two would be most welcome, the chief replied, never expecting the windfall of lethal riches that was heading his way. First came a dozen helicopters, followed six months later by seven more. Courtesy of the Pentagon, a pair of C-12 transport aircraft turned up. Then came a truckload of M-16 machine-guns and an armoured personnel carrier that no self-respecting American police department wants to be without. All this, mind you, in a district where the Mediterranean fruit-fly is Public Enemy No 1. What has happened in Marion County in the four years since the arsenal arrived is typical of a nationwide trend... that has civil libertarians very worried. While they wait for the orchardists to become the targets of international terror, Marion County cops are keeping in practice by directing their 20-tonne tank at less formidable adversaries. As is the case throughout America, if you are growing a little grass, or have fallen behind on child support, the police are likely to enter without knocking. Even those with unpaid parking tickets have been dragged away at the point of an M-16. Largely unnoticed until the photo of [a young Cuban] staring into the barrel of a stormtrooper's machinegun was flashed around the world [(r:p573, ln42)], the Swat teams' iron fist in an iron glove has quietly become an integral part in the machinery of U[S] law enforcement. And as literally thousands of... police departments have discovered, the temptation to use all that butch equipment is proving irresistible. Supporters – and this includes [the]President... who has been an enthusiastic advocate of the Pentagon's growing role in police work – like to depict the Swat squads as a survival tool for a dangerous age. The Swat movement's detractors point out that terrorists have so far left the US pretty much alone, and that it is average citizens – including a good many innocent ones – who keep finding themselves on the wrong end of a rifle butt. "It all stems from the war on drugs," explains... a legal analyst... who refers to the long and notably unsuccessful campaign to stop citizens getting high as "our second Vietnam." "We've been told for four decades that drug use is a mortal threat to our society and now the same people who preached that first lie are claiming that we need a militarised police force to deal with it... What we're doing, though, is destroying the village to save it. The [people] who signed the Declaration of Independence were very worried about the state becoming too powerful, so they must be spinning in their graves now that tanks are rolling down Main Street." Thomas Jefferson... and the rest would certainly not have approved of what happened last May to [a citizen] who was sleeping peacefully in his Maryland home when 40 Swat cops from the Fish and Wildlife Service – yes, even Smoky the Bear has acquired an assault squad – burst into his home. His wife was hog-tied in the corner from where [it] could see a black-uniformed intruder holding a machine-gun to her husband's head while another ground his face into the carpet with a steel-toed boot. The couple's crime? Well, as a court later established, there was no crime – just the suspicion that [the husband]'s fellow members of the Golden Hills Hunting Club had been shooting ducks out of season. After tearing the couple's home apart, the squad left... In Boston, a Swat squad invaded the wrong apartment and, quite literally, scared a 74-year-old Baptist minister to death. As [the minister] lay stricken with a heart attack, masked officers cordoned off the street and denied paramedics access. Across the country in Dinuba, California, Swat cops put 15 bullets into a father of three who made the mistake of leaping from bed when a dozen masked [officers] charged into his bedroom at 2 am.

Again, the cops had the wrong address. In Baltimore, a major Swat operation sealed off a whole block, evacuated all the minority-race residents, then did a room-by-room search for drugs. There were helicopters, police dogs and scores of officers in ninja masks. But, by the end of the operation, not one arrest had been made. And in Albuquerque, New Mexico, in a case that would be funny if it hadn't ended in tragedy, a Swat sniper prevented a you[th]... from committing suicide by shooting him in the head. "There is much evidence that Swat teams have an organisational culture that leads them to escalate violence... The jackboot stomps on justice and a warrior mentality has no place in civilian law enforcement. A police officer is not a soldier, who initiates violence on command, blowing up people, bridges and buildings. Traditionally, police work has been... to apprehend a suspect and turn the suspect over to courts of law. But in the militarised police force, extreme force is acceptable, even expected." ...[■ A] private investigator working for [a resident of the]West Coast... said further action would be taken against the police following a violent incident in July last year... [A] Nelson Detective Inspector... headed a six-week police investigation into claims that four police officers were involved at the incident in Dunollie, 8km north of Greymouth, which left [the elderly resident] with serious face and body injuries. During [the resident's] trial this week, on four charges of assaulting police and resisting arrest, his lawyer alleged that the officers kicked and beat him and rammed his head into a concrete pole. Police alleged [the resident assaulted an officer (that recently received a police 'award')], who was lying in wait for drink-drivers leaving the hotel in Dunollie. [The resident said it] was simply walking home from the pub and had banged on the bonnet of a car parked in the dark on a side road [it] regarded as his own driveway, when a police[officer] jumped out and said [it] was under arrest. The jury acquitted [the resident] on all charges.

...Police yesterday apologised to[, and]... also paid... an undisclosed sum[, to]... five Wellington protesters for officers' actions during last year's Wellington visit by Chin[a']s... leader. Wellington['s] police district commander... said... "I acknowledge... that these five people were protesting lawfully and we should not have required them to move from their position. I also acknowledge... that the four who were arrested should not have been. My staff believed they were acting in good faith at the time but we were wrong and made a mistake. We will learn from this experience."

...A mysterious briefcase left at a Green Bay bus stop is in pieces after police called in the air force bomb squad... Police and Titirangi firefighters arrived, cordoned off the area, and told residents to stay in their homes. When the bomb squad arrived, a robot shot the briefcase twice. It was found to contain papers, photos and videos... Police will sift through the remains to find out who the owner is. [On a positive note, Christchurch police have located the 'flugelhorn stolen from a music lecturer. The expensive instrument had been anonymously returned, but was left unattended at a back door. Unfortunately, the bomb squad was called to inspect the case, which they blew up – destroying the uninsured instrument'.]

...The FBI has joined an investigation into the death of a pizza delivery [perso]n who robbed a bank with a bomb strapped to his neck then died when it went off as police kept him handcuffed... The inquiry stepped up a notch yesterday after a friend and co-worker of the victim was found dead at his home in Erie, Pennsylvania. Television cameras captured the last moments of Brian Wells, 46, on Friday... after [Brian] was arrested for the robbery near Erie. [Brian] was captured outside the bank but told police [it] had been forced to commit the robbery by the person who strapped the bomb to him. "Why is nobody coming to get this thing off me?" [Brian] pleaded. "It is going to go off. I am not lying." Moments later [Brian] was blown up. An hour earlier Mr Wells had been sent to deliver a pizza to a remote road near a television transmitter. [Brian] appears to have returned to town... and headed for the bank, where [Brian] handed staff an "extensive note" demanding money and saying that [it] had a bomb. As [Brian] left the bank with the cash, police dragged him from his car, handcuffed him and made him sit on the ground, between two police vehicles. At first they thought they were dealing with an ordinary crime. Now they believe that Mr Wells was the victim of a murderous plot and are treating his death as murder... Erie state police, denied... that officers were slow to save Wells... [T]hey were waiting for a bomb squad to arrive.

...A BANK robber in France stuffed up when – after asking for more money than the bank had – [it] asked to get cash from his own account.

...[A gal suspected of stealing wallets from shopping carts in Stratford, Ontario, inadvertently identified herself by dumping 4 wallets into a produce bin while fleeing a store. One of the wallets was hers, with a photo ID recognised by a shopper. Later the thief phoned police to report it had lost her wallet.] □ ...in Hamburg, Germany[, a 19-year-old]... broke into a van... But [the thief] didn't get far. It was a police stakeout van – full of police[officers].

...The inability of police to consistently monitor Auckland's inner-city surveillance cameras – aimed at cutting crime – has forced retailers to pay for the service themselves... This comes on top of the... retailers' organisation['s]... investment of \$70,000 in three additional cameras in 1997... When the surveillance system was proposed it was decided that the Auckland City Council would pay for the hardware and police would staff it. Since then ratepayers have provided at least \$350,000 for the equipment. In 1997, [the]... then Auckland district commander, said the cameras were a successful crime prevention tool... [However, t]he 16-camera network has been without a permanent person to monitor it since the staff member who did resigned from the position in December. Police admit that since then their monitoring of the closed circuit television system – installed in 1994 – has been inconsistent. The job has now been added to the duties of officers at the Jean Batten Place police station. Since December there have been two beatings, one of them resulting in the death of 23-year-old telemarketer Nick Clarkson, and a rape in the downtown area.

...POLICE hunting Nicholas Clarkson's killer have video footage of his brutal bashing. The 23-year-old Auckland telemarketer was beaten with a piece of wood in downtown Auckland between 3am and 4.40am on... January 26. [Nicholas] died two days later. [A d]etective senior sergeant... said the video footage – recovered from a security camera – had provided fresh leads. Robbery was now the suspected motive for the attack.

...the... Palmerston North... kitchen-sink sales[person who]... has been charged with the murder of his wife, Christine, and their 7-year-old daughter Amber[, allegedly had 'increased his wife's life insurance to \$500,000' shortly before her death]. The badly mutilated bodies of... [Christine], aged 38, and Amber were found in the family home by a relative on the morning of August 30 last year. They had severe head and facial injuries and the police believe they were murdered with a weapon similar to a tomahawk... It looked as though there had been no forced entry into the home... Cops... spent nearly 20,000... hours and more than \$100,000 in the hunt for the killer... Police are still searching for the murder weapon, clothing worn at the time of the killings and a jewellery box [the husband] said was missing from the family home... [The husband] has told police [it] was in Wellington on the night of the murders... [– but a witness has identified a gal] jogger... seen near... the... home [around the time of the murders as 'the husband wearing a dress and wig']... A court representative said [the husband]'s demeanour in the... Palmerston North District Court yesterday... [– where it] did not enter a plea... [–] was subdued. At the victims' funeral... [the husband] wore dark glasses, was physically supported by friends and was visibly and audibly upset... [Incidentally, tonight's documentary on TV3 (8.30pm) is about the guy] who stabbed his wife to death... then claimed [it] committed the murder while sleepwalking. This documentary reveals such crimes are more common than most people think.

...four years [after a father] and his ex-wife... thought their missing teenage daughter... had been slain, [it] has been found alive... When police phoned [the wife] to tell her they had found [her daughter it] at first assumed they were talking about a body... Police had charged [the]alleged murderer... for [the] killing without ever finding [a body]... Police found... the... now 18-year-old... when they raided the... Rockhampton... home of... the [guy] known as her boyfriend. Her discovery also has serious implications in the case against [her alleged murderer, a]convicted child killer... whose murder trial has been adjourned until Monday, when defence lawyers are expected to seek to have it aborted... [The case] parallels... that of... a 16-year-old who was last seen... when her parents dropped her at the movies in the northern town of Bowen. Despite a massive search, her body was never found. [A]lifeguard... was tried and found guilty of her [hu]manslaughter. However, the decision was overturned on appeal and [the lifeguard] was found not guilty at a retrial... Most tales of children missing, believed murdered, do not have happy endings. A[US]'s most famous case is the Beaumont children – ...a[ged]... nine... seven, and four... – who disappeared from Adelaide's Glenelg Beach on Australia Day, 1966, and were never seen again. In 1973, [a]schoolgirl... 11, and [another girl, aged] four, went missing from Adelaide Oval while attending a

football match. They have not reappeared. Another mysterious Adelaide case is that of... a... 12-year-old... [who] left her home in suburban Morphett Vale and walked to the Reynella Shopping Centre to buy a Christmas card... [o]n October 7, 1992... There were two other sightings of her that day but none since... [● NZ] has had 14 unsolved murders in the past 10 years, puzzles in which trails have run cold, clues are absent and motives are unknown.

...It was 9.30 pm and Tracey [Ann] Patient was late. The 13-year-old said goodbye to her girlfriend outside the Henderson police station, before crossing the road to ask an elderly couple the time. [Tracey] appeared upset at being late and ran off towards home 1.6km away, her fair hair bouncing off her slim shoulders. [Tracey] never made it – her lifeless body was found the next morning, 16km away in the Waitakere Ranges. It was 25 years ago today that Tracey... was strangled with pantyhose tightened around her throat with a stick. Her killer has never been caught, but the hunt for him – or her – has been marked by a series of bizarre twists and anonymous tips that ultimately led frustrated detectives nowhere.

...WAITAKERE is set to lose sworn officers as police chiefs struggle to cope with a budget blowout. The losses come... as [the] Police Minister... is indicating the police may get a cash bailout within the next week. Massey[s] community constable... is one of three Waitakere officers going on loan to the police northern communications centre for the next six months. That follows cuts to civilian staff in the police district late last year.

...Glen Eden residents who want to see their community constable will have to visit the fire station. [The] Senior Constable... moved into an office at the Glen Eden Fire Station late last month, when her old office at Glen Mall closed... [T]he move is part of an agreement between Waitakere police and the Fire Service. A similar arrangement exists at Titirangi. Henderson[s] police community relations [officer]... says the move “shows the commitment of both services to community safety... It’s worked out reasonably well and built a closer relationship between the two services,”...

[NZ’s] Fire Commander... is considering quitting after a new 111 computer system has been found to be a \$25 million flop. Hundreds of people have complained about fire appliances being sent to the wrong address and the wrong stations being notified, causing huge delays. Problems are so extensive fire bosses are considering ditching... the... system, which it shares with the police... in favour of returning to the old system in what may prove the most expensive error in the service’s history. They are also seeking compensation from the A[US]n computer company which supplied it.

...PRIVATELY monitored fire alarms are being blamed for a number of false callouts... The N[Z] Fire Service says the problem alarms are fitted in private homes and monitored by security companies. The alarms are responsible for 400 unnecessary responses each month, throughout the country, a third of those in Auckland... The problem smoke alarms alert monitoring security companies to potential problems but don’t make any sound to warn residents... [F]alse alarms, triggered by cooking fumes or steam from showers, are often undetected if phone calls from the monitoring companies go unnoticed. The Fire Service is then sent out. “We arrive and find people getting out of the shower,”... [a] fire safety officer... says. The Fire Service... is reluctant to start charging people for false alarms. “We don’t want to do that because it’s a punitive thing,”...

Smoke alarm installation a day too late... Firefighters who arrived at a New Lynn house to install a smoke alarm discovered the family had escaped a blaze the day before. [A] [Titirangi Fire Officer]... says a box of paper too close to a heater caught alight. The fire damaged furniture and a stereo and left smoke damage... [A] toddler at the Tauhara St home was mesmerized by the fire before another family member smelt smoke and put the fire out. No one was injured... “We only found out about the fire when we arrived on the Monday morning for our appointment with the family,” [the officer says]... “It is distressing that these people did not call the Fire Service...” ...no matter how small a fire is, residents should call 111 because of the risk of it quickly getting out of control. Attending a fire also gives firefighters the opportunity to find out what caused it...

Kitchen fires are behind most house fires and west Auckland firefighters want to do something about it. Staff are telling people how to prevent kitchen fires and what to do if there is a blaze. Figures show that 49[%] of kitchen fires occur while the evening meal is being prepared. About 64[%] occur while frying with fat or oil, and 55[%] occur while frying chips... “Call the Fire Service in all instances,” says... [an officer from the] Avondale Station... “Even if you think the fire is out, it may reignite. It doesn’t cost anything for the Fire Service to come out. It’s better to be safe than sorry.” ...People should not fight the fires themselves. But it is essential that everyone in the house is alerted and gets out.

...PEOPLE FIRST, THEN PROPERTY IN A FIRE... Fire respects neither people nor property and once it takes hold in a house it is a frightening experience. The first rule if a fire is discovered is to get everybody... outside and assembled together in a safe place... With any fire, call the fire service only after everyone is outside... Prudent householders will have a smoke alarm installed which can give valuable extra seconds of warning and often this is enough to get people out before the house becomes so smoke logged that it is impossible to see more than a few centimetres in front of your face... Because many house fires begin in the kitchen, a fire blanket strategically placed can be thrown over a burning pot or tray from the oven. Never use water on a fat fire... An all-purpose extinguisher will handle all types of fires... If there is no fire extinguisher or fire blanket [at] hand, the best way of dealing with a pot of burning fat is to throw a wet towel over it or a non combustible cover. A pot lid is as good as anything... Fire extinguishers have been in the news again recently, and the need to check them and keep them properly maintained can’t be stressed enough.

...The old Halon extinguishers have been phased out and replaced by new red ones... Throw out your old fire extinguishers and we will pay, say the Ministry for the Environment and fire protection industry. Potentially thousands of old yellow fire extinguishers were in baches, boats and caravans, most of which not only did not work but caused serious damage to the ozone layer... Until the end of February, the Government and fire protection companies will pay the \$20 cost of destroying them... Fire protection companies are also offering a discount on new red fire extinguishers when the old yellow ones are handed in... [□ U]nder proposals to halt big-business avoidance of the fire levy... [r]atepayers may have to foot the bill for the financially ailing Fire Service... Government officials are considering ways to force all home and property owners to pay, after a review of Fire Service funding found that the organisation was missing out on up to \$100 million... Other proposals include having another agency collect the levy, using Quotable Value data, or changing the law to make sure the levy is paid whether a property is insured or not.

...*Burning question for firefighters* When is a customer not a customer? No, it is not the start of a bad joke – it’s the question Fire Service managers have raised as they try to work out how to describe the people to whom the organisation provides its service... They have been given a range of terms to choose from, including stakeholders, consumers, clients, victims and the public... “Customer” might not be the best way to describe a person cut from a car or someone who has lost everything in a fire, but children or community groups cannot be called “victims”... But the idea has [been met with] amusement and cynicism from firefighters, who say the answer to the conundrum will have no impact on their jobs.

...It’s the dream of lots of Kiwi kids to become firefighters. But they’ll have to wait until they grow up before they can wear the headgear... In the latest issue of the NZ fire service’s magazine, Star, fire crews have been told that while the child-friendly practice... [of] letting kids wear their helmets... is cute it’s a “no-no”... – because they might get nits... [Star warns] that children also risk neck injury if they put on the heavy helmets.

...*Have you got what it takes to become a Career Firefighter?* ...[the NZ] FIRE SERVICE... is... seeking as wide a range of applicants as possible... Can you demonstrate that: ● You are a team-oriented person? ● You are able to learn and retain new things? ● You have good interpersonal and communication skills? ● You have a good physical fitness in strength and endurance activities? ● You have a good personality and attitude? Can you say yes to the following: ● Good level of medical fitness (including a 6/9 eyesight standard)? ● No criminal convictions which would prevent you being accepted? ● Legally able to work in N[Z]? While not essential, it may be advantageous if you had: ● A Class 2 Heavy Traffic Licence. ● A current recognised first aid certificate... Graduates will be placed into existing vacancies throughout N[Z]. A detailed application pack is available on the Fire Service Website – ...or by calling... 0800 Fire Recruit... The N[Z] Fire Service... provides a smoke free environment.

...GLEN Eden’s volunteer firefighters are “heart-broken” after reluctantly deciding to hang up their ladders. [The b]rigade secretary... says they’ve voted to shut the unit after years of battling falling numbers... [T]he unit has only nine members and just three are qualified to drive the fire truck... Waitakere[s] deputy fire chief... says the Fire Service has done everything possible to keep the unit running... The service is trying to

relocate volunteers who want to work. Waitakere[']s fire chief... says the volunteers made a valuable contribution to the Fire Service... The unit has had 300 members, boasting almost 1000 years of service since it was launched more than 50 years ago.

...*Firebugs target Waikumete...* FIREFIGHTERS fear Waikumete Cemetery is becoming a major fire risk. Concerns follow Monday's scrub blaze where flames ripped through one-and-a-half-hectares of debris... near Glenview Rd where it could have endangered neighbouring houses. Fortunately, Glen Eden Fire Station backs onto the cemetery, but firefighters were at the scene for... three hours... The burned out area was littered with dead foliage cleared by the Ministry of Agriculture and Forestry in its bid to rid the area of the painted apple moth. The... Waitakere Fire District Acting Deputy Chief Officer... says firefighters don't like big piles of scrub left lying around... The M[AF] was unavailable for comment.

...*Search for excitement burns out of control...* IN HER green ranger's uniform, [a]... 38-year-old mother of two... patrolled America's Rocky Mountain forests with a love for the outdoors and a message straight from Smokey Bear: "Only you can prevent forest fires." Yesterday, [the ranger]... was indicted on federal counts of wilfully starting the largest blaze in Colorado's history, the Hayman fire, southwest of Denver. It is still raging after destroying an area of forest almost the size of Lake Taupo in the past two weeks. Investigators now doubt [the ranger]'s story that [it] accidentally started the blaze after burning a letter from her estranged husband at a forest campsite. Her original story was that [it] had found the fire on a routine patrol, but... confessed to the letter burning when arson experts found inconsistencies, including that the wind was blowing the wrong way for her to smell smoke. Now they say evidence at the scene shows the fire was deliberately lit and staged to look like an out-of-control campfire. The biggest mystery to fellow Forest Service officers is why one of their own would betray their profession as spectacularly... What drove her... to start a blaze that has now destroyed more than 54,000ha, 25 homes and forced the evacuation of 6000 people will be the biggest question in her court case... Among the theories being considered by prosecutors is that [the ranger] wanted to be a hero – that by "discovering" the fire and putting it out [the ranger] would get the credit. Instead, the fire raced beyond control and [the ranger] is facing up to 65 years in prison. The hero motive is a common thread in an extremely uncommon group – firefighters who become fire-lighters – but, in at least one instance, a 'contract firefighter started fires in order to earn money'. An FBI 1994 study of the subject found firefighter arsonists were most commonly motivated by a desire for excitement and to be seen as heroic. N[Z] fire authorities share that view and say pyromania... has not been seen among firefighters here... Firefighter arsons were almost unknown in N[Z] until a remarkable explosion of offences in 1998... Thirteen volunteer firefighters were convicted... for offences that ranged from setting a rubbish bin alight to serial arsons, usually in scrub or abandoned buildings. Many were reasonably new recruits who the Fire Service believe succumbed to their desire for excitement when their expectations of an adrenalin-charged job was not matched by the more mundane reality of brigade service... This month [an AUS]n rural fire service volunteer... began a two-year prison term for starting most of the bushfires that ravaged eastern A[US] last Christmas. It told police it... yearned to be feted for his... firefighting heroics.

...*Fire rules spark outrage among rich landowners...* Unpleasant news has been arriving in the mail boxes of more than 100,000 Sydney homes in the form of a letter from local government authorities. It tells owners that not only are they in a newly declared bushfire zone, but also are liable to draconian new planning proposals... curbing if not outlawing their freedom to rebuild or extend their properties... Almost every property affected... is worth more than A\$900,000... The N[SW] Bush Fire Brigade, which was consulted in framing the new laws, says the typical A[US]n bushfire emits 80,000 kilowatts of heat... At 16m the heat is sufficient to ignite hardwood timber frames, with 100[%] destruction of windows within 10 minutes at 29m from a fire front. Firefighters in full protective gear will be immobilised by pain at a distance of 100m, and the hair and flesh of an unprotected person will suffer severe burns at 140m. In the 1994 fires in Sydney, the coroners' inquests found that fatalities among people who had taken refuge in swimming pools occurred when they broke water and breathed air which contained burning eucalyptus oil vapour at [over] 100C. It was the forensic evidence from these fires, more than the slower burning fires at Christmas... that led to the new planning codes.

...Firefighters in Canberra fear scorching temperatures and gusting winds today will fan bushfires that have killed four people and destroyed 400 homes. About 220 people have been treated for fire-related injuries in Canberra Hospital... Firefighters worked feverishly in the A[US]n capital yesterday to bolster defences against bushfires, which finally burst through the city's western perimeter on a 10km front on Saturday after burning for a week. "The whole philosophy is to surround the ACT... either with the black that is burned or bulldozer lines," said... [the] director of emergency services... Eye-stinging smoke blanketed the "bush capital" – home to 300,000 people, including hundreds of diplomats – and a layer of ash stretched to Parliament Buildings in the city centre... [P]owerlines were down, leaving up to 25[%] of the city without electricity. Officials said it could be days before all power was restored. The streets were deserted of people but full of... birds, kangaroos and dogs, both alive and dead... Police said one teenager had been arrested for looting. The historic Mt Stromio Observatory on the outskirts of the city was largely destroyed.

...*Blame Game erupts over Aussie fires...* AT LUNCHTIME last Saturday... a bearish bloke with a "trust me" demeanour, sat down in his office in Canberra's west and told the capital's jittery residents they had little to fear. Outside, smoke was hanging heavier than it had for the past week... 12 hours after... Canberra's fire controller[']s... soothing words, the unthinkable happened; four people were dead, 532 homes had been destroyed, hundreds more damaged, and 68 people were hospitalised. Gone also was the Mt Stromio astronomy centre, the A[US]n federal police weapons range, a high school, and four government buildings. Were such losses inevitable? ...At any one time, Canberra usually has nine of its 12 firetrucks ready for use. That equates roughly to a capacity to handle six house fires at once. At the top of Saturday's blaze there were perhaps 800 homes alight... By Friday, the Insurance Council of A[US] told the ACT government it expected the cost of destroyed homes to top \$200 million. That figure is expected to rise significantly. So too are the stakes in the increasingly bitter and predictable debate about who to blame... ACT[']s chief minister for five years until [three years ago], was first to cut a piece of the blame pie. "If I was going to suggest a 30m firebreak around Canberra, I would have been lynched," [it] said, referring to a recommendation in a 1994 report... "For instance, it wouldn't have been politically saleable to do anything with the pine forests [that fuelled the [latest] blaze]... There were proposals to expand residential Canberra in that direction, but... the [public] said don't touch our pine forests. You can't just say any more that this [type of natural disaster] is part of living in Australia. It's not."

...Police declared crime scenes in towns destroyed by A[US]'s worst-ever wildfires, as investigators moving into the charred landscape discovered hellish scenes and more bodies. Police confirmed 131 deaths from the fires that tore a destructive path across a vast swathe of southern Victoria state, reducing entire towns to ruins. But dozens of people are still unaccounted for and the... Victorian Government in crisis meetings yesterday was told to prepare for up to 230 deaths... Officials suspect that some of the more than 400 fires that raged were deliberately set.

...A[US] was on the verge of launching a national bushfire warning system, using a vast telephone database to raise the alarm, as the lethal heatwave that ignited Victoria pressed down on southeast A[US]. But years after it was first proposed the system remained jammed in a bureaucratic funnel when disaster struck, despite claims by [the]Attorney-General... that it was a "real priority" for the... Government. The revelation has fuelled debate about universal official advice that people in the path of a bushfire should either prepare themselves to stay and defend their properties or flee well ahead of the flames. Survivors of the fires... said the flames broke upon them almost without warning, and that at least one town was engulfed before it was included on emergency alert lists... The political heat intensified as 30 fires yesterday continued to burn out of control across Victoria, adding to the 450,000ha already consumed by flames and threatening to add to the more than 1000 homes... destroyed, tens of thousands of livestock lost, massive damage to roads and communications... [plus a human] toll that may rise to as high as 300...

Wildlife rescue officials worked frantically to help the animals that made it through A[US]'s worst wildfires but they said millions of animals probably perished in the inferno... Kangaroos that survived are suffering from burned feet... Up to 100 Kiwi firefighters could be sent to... Victoria... but... it would likely be a week or two before the offer was taken up... and... N[Z]'s own high fire risk may restrict their contribution.

...The U[S] is appealing for additional support from abroad to help fight the dozens of wildfires sweeping along its west coast. Canada has already sent firefighting crews and aircraft to the crisis areas and now A[US] and Mexico are to be asked to have their experts stand by. N[Z's] national rural fire chief... headed off yesterday to help with advice. As of Saturday 70 fires were burning over nearly 300,000ha in... [11 states]. Forty-seven of the blazes are the most serious for over a decade. Around 1.43 million hectares of land cover has already been reduced to ashes – a vast increase on the annual average of 80,000ha – and the National Weather Service has started to talk of the worst fire season for 30 years... Skies turned overcast[at the end of last week], but instead of bringing rain that would help firefighters the clouds brought nothing but lightning... Officials reported 78,000 lightning strikes between Friday and Saturday... New storms and lightning have been forecast for Colorado, Nevada, Utah, Arizona, California and Idaho... “The situation looks pretty gloomy,” said... [a spokesperson] for the National Interagency Fire Centre in Boise... Twenty new big fires were reported on Saturday alone, underlining how hot weather, little rain and lightning strikes have turned this summer into a nightmare... Only around 40[%] of the fires in California are considered to be under control. Firefighters and additional staff from 46 of the 50 states have been sent to the area and have been joined in their battle against the blazes by two military battalions. The US Department of Agriculture has reported that a total of 15,000 people are now involved in the fight as well as 150 aircraft. The cost... is running at \$US15 million... a day, this is on top of the \$US300 million spent so far. The department estimates that by the time all the fires have been brought under control the total cost could rise to over \$US1 billion. [But o]fficials coordinating operations in the crisis zones have complained that... they still lack the [hu]manpower and the means necessary to successfully tackle the fires. Northern states... are particularly in need of reinforcements.

...Eighty firefighters from A[US and N]Z... yesterday joined 13,000 U[S] colleagues to fight fires in the state of Montana... [that] have charred... more than 2.03 million ha... [and] claimed the life of a US firefighter on Saturday, bringing to 11 the number of victims in US wildfires... so far this season... [In related news,] Fire Services released its report after a near five-month inquiry into the fatal explosion and blaze at Tamahere. The 155-page report said it was not clear whether the coolstore had fully complied with requirements to manage and use flammable refrigerants... The facility did not display any hazardous substances warning signs nor did it have a gas stenching agent to warn firefighters of the leak. Its multi-gas detector was away for servicing and there were no compliant fire detection or protection systems or hydrants [and] very limited firefighting water.

...Icepak Coolstores has pleaded guilty to three charges following a fiery explosion at its Tamahere plant last year that killed... Senior Station Officer Derek Lovell of Hamilton... and injured several of his colleagues. But the company's three directors each denied the individual charges against them... [In their defence, 'locals say they expressed concerns about the coolstore to the Fire Service, which had ignored them'! In international news, w]eary firefighters endured welcome rain, snow and near-freezing temperatures in the mountains of Southern California yesterday, as Mother Nature drenched wildfires raging for more than a week and gave hope the devastating blazes could be contained quickly... The more than 100,000 residents who fled their homes over the past week trickled back into areas charred by the 10 major fires to see if their homes were among the more than 3334 destroyed in the record 300,000ha fires... [The] state controller and California's chief auditor, said the cost of the fires could be US\$12 billion... making them by far the most expensive to hit the state. One firefighter was among the 20 people who died in the blazes.

...Twenty-seven schoolgirls were burned alive after a blaze broke out in a hostel at their secondary school in central Nigeria where they were locked in for the night. The victims were among 165 students locked into the hostel at the state secondary school... to stop them mixing with students from the boys hostel... Villagers alerted by the girls' screams broke down the walls of the hostel to rescue those inside... As relatives, many of them hysterical, gathered at the school... at Gindiri in central Plateau State... the state Government declared three days of mourning.

...It started as a secret way of studying after lights out in a dormitory and ended in the tragedy that has left the tiny Pacific nation of Tuvalu in mourning. As Tuvaluans in N[Z] gathered in Auckland to remember the dead, further details of the tragedy which killed 18 schoolgirls and a matron emerged. The Minister of Works, Energy and Communications for Tuvalu... said that while it was an electrical fire that ripped through the girls' dormitory at Motufoua School – locked and with mesh windows to keep the boys out – it was thought to have been caused when flames engulfed a girl studying by candlelight. After lights out, [the girl] had been using the candle in a cardboard box with a sheet over the top. “[The girl] must have fallen asleep. [The girl] caught fire, and so did the bed sheet. [The girl must have awoken and] thrown it off onto the switches,” said the minister, who attended a memorial service at Grey Lynn last night. The only formal fire-fighting service in the tiny... nation, home to 9500 people 1000km north of Fiji, was miles away on another island... T[he T]uvalu Community Trust chair[person –] ...an old-boy of Motufoua, the nation's only secondary school[–] said many of the 5000 Tuvaluans in N[Z] would be related to someone who died in the fire... [Tuvalu's f]ormer Finance Minister[, who is] based in Auckland, lost his adopted grand-daughter Leanne Folitau, 13, in the blaze. [The former minister said itself] and his wife were too distraught to travel to Tuvalu for funeral ceremonies but... [s]ome families were planning trips back to Tuvalu “to pay their tributes...”... [The] Professor of Pacific History at Auckland University... who wrote a book about Tuvalu in 1983, said the... country's strong commitment to its Protestant-based Church of Tuvalu would help those caught up in the tragedy. [By the way, on this day in '1990 a 12-year-old girl lay trapped beneath a blazing petrol tanker. Surrounded by a wall of flames, her lone hope lay in the pledge of a courageous firefighter. Although the firefighter knew of burning tankers that had blown up within minutes in a great fuel-air vapour conflagration known as BLEVE (Boiling Liquid Expanding Vapour Explosion) that reaches out for hundreds of metres to incinerate anything in its path – and only 100 metres from the burning tanker was Manukau Shopping Mall, packed with almost 20,000 late-night shoppers – it dropped his hose and ran straight into the inferno, reached into the tiny space and cradled the small body in his arms. “Don't worry,” the firefighter told the girl. “I'll stay, I promise you. My mates will soon get us out.” His heroism generated a flood of letters from well-wishers. His favourite is a handmade card from three eight-year-old girls. It says simply: “You are the greatest fireperson ever.”]

...Firefighters patrolled] picket lines across Britain last night as an increasingly bitter strike went into its third day, forcing... [a]bout a tenth of British troops – 19,000... personnel – ...to assume blaze duties rather than prepare for possible war... [F]irefighters were replaced with military troops and their antiquated military engines on the second day of a... scheduled... walk-out... The 50,000 firefighters, on an eight-day strike since Friday... after last week's two-day walkout, want a 40[%] pay rise. But authorities seem willing to give only 16[%] over several years and dependent on big changes to work patterns... On the second day of the strike, [four people]... died in separate house fires around the country and another... died in a fire in his caravan. The family of a striking firefighter escaped unhurt after a lighted paper was pushed through the front door of their home... [Incidentally,] Beijing police have arrested 12 people over a massive fire at a hotel complex... The 30-storey building, which was to have housed a theatre, studios and a five-star... [h]otel... was almost completely destroyed... China Central Television, the official... mouthpiece of the Communist Party, was forced to admit it burned down part of its hallmark new headquarters building with an illegal fireworks display.

...BIG bonfires could be banned at a Texas university where... [m]ore than 24 students were crushed and 11 killed when a 12m pile of 7000 logs collapsed on Friday. It was thought the supporting centre pole broke... The annual bonfire has been a 90-year-old tradition at Texas A&M University... The... University president... said they wanted to keep the tradition but... “We do not want this to happen again on our campus,”...

Moose scare backfires... A wildfire burning in Alaska's interior was ignited by state biologists using fireworks to ward off an aggressive cow moose. The 37,200ha wildfire, which started last month and is burning spruce forest south of McGrath, was inadvertently started during a field study into elevated calf mortality... State biologists have long used firecrackers to deal with aggressive moose and bears, and when such animals enter schoolyards. This was the first time they know of that one of the devices has started a fire... The fire is still active... but the flames are in an area where they are considered to pose no risk... [In local news, t]eenagers sending fireworks into one of Rotorua's most valued forests have prompted renewed calls for a ban on the sale of fireworks to the public. Senior police, fire officers and Rotorua's mayor believe the time has come for a total ban. Their calls follow and incident last week when a group of about 20 youngsters, aged 16 to 18, were seen throwing fireworks at one

another and into the Tokorangi forest... By the time police were called, the group had used up all their fireworks, said [a]Senior Sergeant... “They thought it was a joke and thought the prospect of starting a fire to be quite funny.” As a police officer, [the senior sergeant said it] was absolutely aghast at their lack of intelligence... [The senior sergeant] said no one was hurt and no fire was started but the potential for disaster was obvious.

...‘Disaster’ [gal] set to go off... After 12 years of grappling with floods, cyclones and planning for other emergencies and “things that go bump in the night”[, west Auckland’s self-proclaimed disaster gal] will pass on the torch as manager of Waitakere’s civil defence department in [a few months because of her]... health... “I’m one of the lucky ones who has been paid to do a job [it loves,” the disaster gal] says... “It’s been a good time to leave... with plans for new regional emergency legislation to help coordinate the country in the face of a civil emergency.”

...WAITAKERE City is taking part in a massive disaster relief exercise organised by the U[N]. Its emergency operations centre staff have joined disaster management officers from other Auckland councils to assess how the region would respond to a major earthquake in Wellington... [(aid] still hasn’t reached some parts of India, four weeks after an earthquake killed 19,000[]... Exercise Phoenix looks at issues including the logistics of delivering medical supplies and equipment to Wellington, how hospitals cope with the influx of patients and how quickly overseas rescue teams can be processed through Auckland airport. The UN has deployed urgent search and rescue advanced planning teams from the U[S], Singapore and A[US] to take part along with specialists to co-ordinate requests for international assistance. [The]Auckland Regional Council... says the UN participation is a first for N[Z] and a compliment to continuing regional and national efforts in civil defence and emergency management.

...The Defence Force’s capability to respond to a natural disaster in Auckland worries regional politicians, who came close yesterday to branding it inadequate. The Auckland Regional Council... which is responsible for regional civil defence... heard how the Army no longer had sufficient personnel in the region to put together a rapid response unit of 25, although an Army officer last night said this was incorrect... [T]he military’s northern civil defence coordinator, told councillors that [as long as the Government doesn’t follow through with its plans to close] the Air Force bases at Whenuapai and Hobsonville[, their]... equipment... could be used after an earthquake, volcanic eruption, tsunami or storm. The Navy and Air Force could muster the numbers for two response teams. But their... 700 blankets, 60 tents, 100 stretchers, one mobile kitchen and one water tanker... were sufficient for only a few hundred people at most... [Furthermore,] only half of that might be available at any time because of exercises or operations. The availability of the bases’ vehicles might also depend on the “commercialisation” of the Defence Force’s transport fleet, an option being investigated this year... [T]he Army was unlikely to call on Territorial soldiers in Auckland because of the cost. It was more likely to call out regulars from elsewhere... [B]ases at Burnham in Christchurch and Linton near Palmerston North could... muster teams of 100 in emergencies and supply further equipment... The Ministry of Civil Defence assistant commissioner responsible for Auckland... said large stockpiles of equipment would be an advantage to Auckland. “But speaking realistically in today’s world I don’t think any organisation, whether central Government or private sector, has those sorts of resources sitting around any more. It is not realistic to have those sorts of expectations.”

...The high cost of being unprepared Tsunamis in Samoa and Indonesia are a timely wake-up call, writes... an associate professor in the School of Environment at the University of Auckland... It is widely held that tsunamis are rare, and popular wisdom holds earthquakes responsible for the killer waves. Neither of these beliefs is entirely correct. A tsunami is a surge of water or a series of surges generated by an impulsive, shock-displacement of water that can occur anywhere... Submarine landslides... and... volcanoes can... cause these surges... Tsunamis can also have their origins in space... [O]n February 22, 1491, a meteorite strike caused tsunami waves in excess of 130m high along the A[US]n coast... Too often emergency management is seen to be concerned with little more than saving lives. In fact, more frequently it entails reducing the risks to people, buildings, infrastructure and economic activities. The focus is on risk reduction, readiness, response and recovery. In this context, government and local authorities have the responsibility to minimise social vulnerability and have a duty to promote community resilience through enlightened planning... According to the local plan there is a 49[%] probability that a tsunami will hit Auckland in a 50-year-period... A serious event is given a 43[%] probability of occurrence in a 50-year period and an extreme event a 7[%] probability. The latter would cause “significant damage... loss of life and high social disruption... Loss of key lifelines: communications – up to 7 days; water, sewerage and stormwater – up to 6 months; road/rail – up to 6 months; energy – variable, but could be several months [with] severe economic losses and a recovery timescale of up to 20 years.”

...AMBULANCES arrive relentlessly at Moto’otua Hospital in Apia. They bring body, after body, after body. Of the 79 confirmed dead by 10pm, the oldest is aged 102 and the youngest 2 months... Outside, families wait in groups, talking quietly. There is no wailing or crying. It’s unimaginable, they say. This is Samoa, this doesn’t happen here... The hospital is not equipped for tragedy on this scale. Two operating theatres are busy but two others are unused – there are not enough doctors and nurses to treat everyone. Six tourists are among the confirmed dead. Twelve N[Z]ers have been treated for injuries and discharged... Staff have no idea how much worse it will get. They don’t know how many people are missing or how many have been swept out to sea or buried in landslides... It is the biggest disaster since the 1918 influenza epidemic... Today’s arrival of NZ and A[US]n medical teams could not come soon enough. “I’ve never seen this kind of devastation. It’s unprecedented in the history of this country.” Even the streets around the hospital are quiet. Because of the tsunami alert people have been told to stay away from the coast...

A new tsunami warning caused fresh panic on the devastated islands of Samoa last night as people again scrambled for high ground. Others stayed put, confused by conflicting broadcasts... radio said there was nothing to worry about. Days of aftershocks are predicted after yesterday’s tsunami wiped out whole villages... The massive earthquake, measuring 8.3, was felt at 6.48am N[Z] time and triggered a series of mammoth waves. The Pacific Tsunami Warning Centre in Honolulu issued an alert for a large swathe of the South Pacific, including NZ, Fiji and Tonga.

...The only warning the Samoan people would have had to [the] tsunami was the earthquake that struck just a few minutes before. Despite a forewarned N[Z] having the luxury of a few hours to prepare for what eventually was little more than a ripple around coastlines here, the warning systems meant little with a locally-generated tsunami... Whether burying loved ones, recovering from injury or rebuilding homes, about one in five Samoans are suffering after Wednesday’s devastating tsunamis. An estimated 32,000 people have been classed as “affected”, following the series of waves triggered by an 8.3 earthquake off the coast of American Samoa... The death toll... rose to at least 180 yesterday, as a fresh earthquake rattled the region around Samoa... More than 200 N[Z]ers believed to have been in Samoa when the waves hit remain unaccounted for... A further 619 N[Z]ers are confirmed alive and well. Three N[Z]ers are known to have died, and another, a toddler, is missing, presumed drowned.

...The parents of a N[Z] toddler killed in the tsunami blame themselves for the child’s death because they tried to flee the torrent in a rental car instead of running for high ground... Two-year-old Alfie Cunliffe was with his parents... at the Taufua Lodge in Lalomanu, the village worst-hit... His father... was also carried out to sea, but survived by clinging to the coral reef. [The father] was swept back in with the second wave and was treated in hospital for internal injuries. Alfie is one of four N[Z]ers believed killed in the tsunami. Fears are held for the safety of two others.

...Samoa beach fales in areas worst-hit by this week’s tsunami were a model for Pacific development, breathing life into rural areas and giving young Samoans something to stay for. That was until Wednesday. Now some villagers do not know if they can bear to rebuild their livelihoods – though tourism experts say it is the mainstay of the local economy... Officials have put the preliminary cost of damage to resorts, family homes, roads, powerlines and water supplies at \$US36 million... and rising, leaving aside the human toll of the dead... [NZ’s P]M... last night voiced fears that the death toll... could rise even higher with the outbreak of disease... [The PM] was reluctant to put a dollar figure on the aid to be given by N[Z] on top of the \$1 million pledged, but said it would be significant... “It’s gone from being an idyllic part of the world to Ground Zero.”

...Samoa will come to a standstill on Friday as more than 100 people killed in the country’s greatest natural disaster are buried together in a mass grave... Five days since the water hit, the search for bodies continues... It took less than an hour of searching for bodies in intense heat before the four N[Z] sniffer dogs needed to cool off in Samoan waters... Silt has turned to dust in the hot air, the salt water poisoning the ground...

Critically injured Tongans whose island home Niuatoputapu was devastated by last week's tsunami continue to be flown 500km south to the main island of Tongatapu... More than 1000 people live on [Niuatoputapu], which is closer to Samoa than other Tongan island groups. Half had their homes destroyed by the tsunami... Tongan prisoners are serving their sentences extramurally after their prison was destroyed... Last night, the death toll stood at 189 – 149 in Samoa, 31 in American Samoa and nine in Tonga... [(just days before the tsunami, the tiny kingdom) dropped a marble plaque inscribed with 74 victims' names into the ocean above the wreck of the sunken ferry the Princess Ashika... [- t]he tragedy triggered accusations that the [Tongan] Government allowed the ferry to operate although it was unseaworthy... [and t]his week, it was revealed that the... former Christchurch business[person]... who bought the Princess Ashika in Fiji on behalf of the Tongan Government... had no shipping experience or qualifications... [and] failed to look at the condition of the hull[...]. Seven New Zealanders have been confirmed killed... with one other – a child – missing, presumed drowned... More N[Z] medical staff were heading to Samoa last night... An Air Force jet returned to NZ yesterday with a body, evacuated patients and family members... The Ministry of Health will today send an air ambulance from Auckland on a mercy flight to pick up a baby boy born prematurely in Samoa... at a cost of \$100,000... [His NZ] parents yesterday made a plea to the public for donations...

HOW TO DONATE... Donate online at www.redcross.org.nz or www.givealittle.co.nz... Oxfam.org.nz... worldvision.org.nz... caritas.org.nz... and... at each of Farmers' 58 stores nationwide. The company is matching its customers' donations dollar for dollar up to a maximum of \$50 per donation... ■ Major tsunamis occur about once a decade. Based on historical data, about 59[%] of the world's tsunamis have occurred in the Pacific Ocean... and 4[%] in the Indian Ocean... The largest recorded earthquake, of 9.5 magnitude in Chile in May 1960, generated a tsunami that swept across the Pacific, killing scores of people in Hawaii, Japan and elsewhere... The quake that triggered the [recent] Indian Ocean tsunami was magnitude 9.15. That quake and tsunami killed around 230,000 people in Indonesia, Sri Lanka, Thailand, Malaysia and... as far afield as Somalia.

...More than 170,000 of these victims lived in Aceh province in Indonesia... A wall of water up to 10m high set off by the tremor swept into Indonesia, over the coasts of Sri Lanka and along the southern Thai tourist island of Phuket... Waves travelling at nearly jetliner speeds began pummeling southern Thailand an hour after the quake. In 2½ hours, the torrents travelled 1600km and slammed into India and Sri Lanka... "About 1000km of the Andaman faultline broke, which is a huge area,"... said... a... geophysicist... Some experts blame the enormous loss of lives... on ignorance of the region's tsunami history. Very few people living along the coasts recognised natural tsunami warnings, such as the strong shaking felt in Aceh and the rapid retreat of ocean water from the shoreline that was observed in Thailand. But on an island just off the coast of Aceh, most people safely fled to higher ground... because the island's oral history included information about a devastating tsunami in 1907.

...In the early afternoon of September 13, 1999, the headmistress of the tiny school at Omoa on Fatu Hiva, in the Pacific, looked out the window to see water draining from the beach. [The headmistress] acted without hesitation. Her pupils were ordered to... climb out of the windows and head for higher ground. Minutes later... a tsunami... destroyed the building – but without casualties... Such awareness contrasts with most people's actions on Boxing Day. Tourists and locals wandered over newly exposed seabed to peer at flapping fish or crabs... This behaviour helps explain why the death toll [wa]s so appallingly high – and suggests measures that can be taken to prevent future disasters... Scientists knew in advance that southern Asia was going to be hit by the tsunami, but attempts to raise the alarm were hampered by the absence of early-warning systems in the region. Within 15 minutes of [the] earthquake, the Pacific Tsunami Warning Centre in Hawaii had sent an alert to 26 countries, including Thailand and Indonesia, but struggled to reach the right people... [K]ey officials within Indian Ocean nations could not be reached... Television and radio alerts were not issued in Thailand until 9am local time – nearly an hour after the waves had hit... The United States weather agency didn't have the phone numbers or staff to alert all Indian Ocean coastal countries when it saw the first signs that tsunamis could be heading their way, its top official said... A tsunami warning system could be built in the Indian Ocean in a year and cost as little as \$US20 million... an expert says.

...Red tape stopped scientists from alerting countries around the Indian Ocean to the devastating Boxing Day tsunami racing towards their shores. Scientists at the Tsunami Warning Centre in Hawaii – who have complained about being unable to find telephone numbers to alert the countries in peril – did not use an existing rapid telecommunications system set up to get warnings around the world almost instantly because the bureaucratic arrangements were not in place... It was used to alert Pacific countries to the tsunami, even though it affected hardly any of them.

...The tsunamis triggered by the massive Indonesian earthquake had a tiny impact on N[Z] – ...the ocean rising between 10cm and 20cm... off the coast of Fiordland... The official toll [of dead NZers] stands at two... Some 5000 foreign tourists, mostly Europeans, were... among the dead... Sweden, Norway and Finland[were] hard hit by the disaster as many Scandinavians like to escape their cold winters for the Asian sunshine... Agitated elephants felt the tsunami coming, and their sensitivity saved about a dozen tourists in Thailand... This was the quake that shook the world, literally and figuratively. No matter the religion – Muslim, Hindu, Buddhist or Christian – many of the prayers for mercy when the waves came were in vain... Status or wealth did not matter. The lives of the rich and famous holidaying in Asia were for once as vulnerable as the farmers and villagers whose everyday existence along the Indian Ocean coastline is precarious enough... Thousands of vulnerable children orphaned by the tsunami now have to deal with another threat: gangs of unscrupulous human traffickers looking for easy pickings... Landmines left from years of civil war... in Sri Lanka... were floated by the floods and washed out of known minefields... and the warning signs on mined areas ha[d] been swept away... endanger[ing] survivors... Munich Re, the world's largest reinsurer, said the economic cost of the devastation would top US\$13 billion...

The U[N] had its biggest relief operation in response to the Asian tsunami... that killed tens of thousands and left millions homeless. The disaster zone... cover[ed] at least 10 countries in Asia and Africa... Hundreds of rescue ships, helicopters and planes... evacuat[ed] tourists from wrecked resorts... But the Indonesian province of Aceh ha[d] been off-limits to international aid agencies [before the tsunami] and even after the disaster the Indonesian Government was reluctant to allow free admission to international aid agencies... One of the questions... world leaders... and humanitarian organisations... meet[ing] in Jakarta today... will discuss is how the world can prevent such a catastrophe occurring again.

...THEY ARE calling it the first global disaster, not because of the number of dead but because the toll touche[d] so many countries... Aid organisations have urged donor countries to avoid the broken promises of previous disasters and ensure that all of the US\$4 billion... pledged for the tsunami catastrophe is delivered. The call came as world leaders gathered yesterday in Jakarta, the Indonesian capital, for a one-day summit to decide how best to use the money. Aid workers also expressed fears the crisis will soak up donor cash and leave less help available for Africa.

...Unlike other areas affected by the waves, many of the dead in Thailand were tourists... Thai authorities, faced with the daunting task of identifying... each body... so it c[ould] be repatriated to the home country... ordered DNA tests on all the dead, including those already buried... Foreign tourists... determined to enjoy their holidays return[ed] to the beach[es as locals were still]... clearing up debris left by the waves.

...Tourists party as New Orleans battens down for hurricane... Hurricane Katrina strengthened last night into a Category Four monster packing 230km/h winds as it headed straight for New Orleans... Coastal residents jammed freeways and petrol stations as they rushed to get out of the way of the hurricane... Making matters worse, at least 100,000 people in the city lack transport... Some tourists heeded the warnings and headed for other destinations... But plenty of people in the French Quarter stayed put, and bars were rocking on Saturday night. "The only dangerous hurricanes so far are the ones we've been drinking," said [someone from] San Francisco... "We can't get out, so we might as well have fun." New Orleans' worst hurricane disaster happened 40 years ago when Hurricane Betsy... le[ft] half of New Orleans under water and 60,000... homeless.

...Rescue crews were frantically working last night to save hundreds of people trapped by floodwaters from Hurricane Katrina, which devastated the US Gulf Coast states... and left dozens of people dead... "Some of them, it was their last night on Earth," said... [the] chief of homeland security of New Orleans, of people who ignored orders to evacuate the city. "That's a hard way to learn a lesson." ...The death toll was expected to rise sharply from... a day of ferocious winds and blinding rain. The storm submerged entire neighbourhoods up to their roofs.

...‘This was our tsunami’ ...Katrina may be the most expensive hurricane ever to hit the U[S], costing insurers up to US\$25 billion... The storm paralysed the oil industry in the Gulf of Mexico, raising fears that damage to offshore platforms and pipelines could trigger a supply crunch in the world’s largest energy consumer... New Orleans resembled a war zone yesterday as armed police patrolled the streets to combat looters and carjackers taking advantage of the devastating aftermath of... Katrina. Unrest was escalating as deteriorating conditions forced authorities to evacuate thousands of people in shelters without food or power... In the flooded downtown, rescuers pushed aside bodies as they tried to help survivors... The flooding of New Orleans was growing worse, prompting... an audacious plan to drop huge sandbags from helicopters to close up one of the breached levees. [The water level is] rising perilously inside the New Orleans Superdome, the... shelter of last resort for... 20,000 people...

They lined up by the thousands to get inside, clutching meagre belongings and crying children. A few hours later, the power went out, turning the... 77,000-seat stadium... into a muggy mess. Then part of the roof blew off... With water pressure dwindling, the bathrooms were filthy.

...THE NEW ORLEANS Superdome was meant to be a hurricane refuge, but those who sought shelter there described a lawless “concentration camp” where two children were reportedly raped and other refugees terrorised by rioters... For some, the four days without proper food, water, sanitation and nights of lawless blackout had clearly taken a heavy physical and mental toll. Many broke down in tears... “The last few days were like hell,” said... one of the many thousands who sought protection in the giant sports arena when Hurricane Katrina hit... Yesterday thousands were still waiting for buses to take them to Houston, Texas, their relief at finally leaving the stadium mixed with outrage at their treatment.

...More than 11,000 Hurricane Katrina refugees found refuge in the Houston astrodome yesterday, before officials said it was full and began sending buses to other shelters in the area... [Meanwhile, back in] the Big Easy... [b]odies lie abandoned in the streets. Medical helicopters and law officers come under fire... [from] rioters and looters... Storm survivors battle for seats on the buses that will carry them away from the chaos. The tired and hungry seethe, saying they have been forsaken. New Orleans descended into anarchy yesterday, a city seemingly ready to explode.

...With the bodies of the dead floating through the waterlogged streets and gangs of armed looters picking through the remains of New Orleans, authorities reluctantly issued a total evacuation order yesterday saying it might be weeks or even months before their city would again be fit for human habitation. The shocked mayor of the city... said the numbers of dead could reach into the thousands... Officially, about 130 dead have been counted along the length of the Gulf Coast... [The] President... flew over the disaster zone yesterday and said later the recovery would take years.

...[The US] PRESIDENT... is facing not only the fallout of Hurricane Katrina but also an intense political storm as relief experts, Government officials and newspaper editorials criticise everything from disaster preparedness policies to his public entry into the growing crisis on the Gulf Coast. The *New York Times* said of a speech [the President] made on Wednesday: “Nothing about the President’s demeanour yesterday – which seemed casual to the point of carelessness – suggested [it] understood the depth of the current crisis.” ...[The President] was on holiday at his Texas ranch when the Asian tsunami struck... and was soon in the firing line for reacting slowly. This week [the President] faced the same criticism – [it] spent Monday on a fundraising tour of the American west, and was accused of failing to provide adequate leadership. As survivors complained of a lack of water, food and medical supplies, fingers from across the political spectrum were pointed at the White House. Experts pointed out that a plan to shore up the levees around New Orleans was abandoned last year for lack of Government funding.

...PITY New Orleans. Her buildings submerged, her citizens scattered and her streets under the sway of the mob. The city’s very future is under question. Across the American media, commentators note the vast cost and dubious viability of a city constructed mostly below sea level... “If New York or Los Angeles had suffered the same fate, would anyone be talking about abandoning them? Of course they wouldn’t...” spluttered a contributor to CNN... A former mayor of New Orleans... insisted on the reconstruction of the city, which many see as integral to the national soul.

...UP TO 10,000 people are now feared to have been killed by Hurricane Katrina in the southern U[S], as major relief efforts finally got underway yesterday... Engineers have plugged the levee break that swamped much of the city and water began to recede, but the good news was tempered by the direst prediction from local authorities yet: As many as 10,000 dead... [By the way, the flooding of New Orleans and the] deadly sea surges that swept across southern Asia were the latest of several ferocious natural disasters... It was a year ago, on Boxing Day... that the ancient city of Bam in Iran was destroyed by a powerful earthquake that killed more than 43,000, injured 20,000 and left 60,000 destitute.

...Iran’s earthquake-devastated city of Bam is filled with the stench of death, and a top foreign rescuer says hopes of finding any more survivors are fading. The quake has killed at least 20,000 people, and local officials believe the toll could reach 40,000... From China to South Africa, Britain to A[US], nations rushed to respond to Iran’s appeals, sending rescue workers, doctors, tents and cash to help deal with what appears to be[one of] the world’s most lethal earthquake[s]... Iran’s quick acceptance of international aid contrasted with its rejection of outside help in 1990 when a quake killed 36,000 people. Officials have said that this time help would be welcome from everywhere except Israel... [Incidentally, s]ix months after the worst quake to hit China in three decades... [– t]he earthquake killed 69,227 people and left... [m]ore than 5 million... homeless... [–] the Government... has... announced plans to pump 120 billion yuan... [into] ensuring schools... and [other] public facilities are built to higher standards. Much of the public anger after the disaster came from the collapse of 7000 classrooms, which experts have said were built with shoddy materials.

...Yes to vote, no to cyclone aid... THE MILITARY rulers of Myanmar went ahead with a constitutional referendum yesterday despite calls from the outside world to postpone it after the devastation of Cyclone Nargis... State-run TV news repeated yesterday’s broadcasts urging people to vote, making no mention of the estimated 1.5 million victims of the cyclone without food and shelter or tens of thousands killed in the... storm... Meanwhile, [our]... Foreign Affairs Minister... has reaffirmed N[Z]’s commitment to maintaining a community on Niue despite the devastation of Cyclone Heta. The future of the island is again under question as it faces the cost of reconstruction... [The minister said it] now saw two post-cyclone possibilities – that the people of Niue would give up, or that it could mean a new start and increased determination from the 20,000-strong Niuean community in N[Z] to help sustain the 1400 still in their homeland. “And I hope the latter scenario comes to pass.” ...But... [a] former chief executive of the Niue Government... said Niueans would think twice about rebuilding when their efforts could again be destroyed by the weather.

...Telecommunications destroyed by Cyclone Heta in Niue this month have been restored, says Telecom... Because of the cable damage... caused by the... cyclone, full restoration will take two or three weeks. [However, the ‘baby who survived in the arms of his dead mother after the cyclone destroyed their home, has died in Auckland’s Starship Hospital.’] ■... a... new credit card-like version of the traditional medical alert bracelet [(or the less-traditional ‘wrist pads which ring an alarm if they go untouched for periods of time’) that has just] arrived on the N[Z] market... could be a lifesaver in an accident or emergency... The Global Safe card can hold five A4 pages of information in microfiche form – ranging from blood type, allergies and medication to full medical history and even doctors’ files. The details of the card can be read using a special built-in viewer. Large viewers can be developed for ambulance crew to use... People who subscribe can attach stickers to their car windscreen or key ring to alert ambulance staff to look for the card.

...The ambulance driver who, on the way to an emergency, ran down an 85-year-old pensioner could have stopped nearly 100m away, a court has heard. [The driver] was travelling to a priority-one emergency on December 22, 1999, when Marjorie McGill, of St Helliers, stepped out in front of the St John ambulance on Long Drive and was killed. [The 28-year-old driver, who] is charged with dangerous driving causing death and an alternative charge of aggravated careless use of a motor vehicle... has pleaded not guilty. Under cross-examination in the Auckland District Court yesterday, [the driver] agreed it would have taken around 45m to make an emergency stop at 95 km/h. [The driver] spotted Mrs McGill from at least 145m away... [The driver] told the court that [it] had expected Mrs McGill, who was deaf and had poor peripheral vision, to notice him and move out of the way. After sounding the bull-horn, [the driver] braked heavily. But the brakes locked and the ambulance skidded straight into the elderly... [pedestrian. The d]efence lawyer... told the court during his opening address that [the driver] had been “confronted by someone who...

didn't stop, didn't look, didn't listen." Judged objectively, [the lawyer said, his client] was not at fault because Mrs McGill's own actions were to blame... Fellow officers yesterday described [the 28-year-old], who joined St John Ambulance Service in 1993, as an exceptionally cautious driver.

...The St John Ambulance Service wants people to get out of the way of its emergency staff. Its plea follows the conviction of a[n a]mbulance driver... for careless use of a motor vehicle after... kill[ing] an 85-year-old... [who] had not checked for oncoming traffic before... stepp[ing] onto the road. [The] conviction has spooked emergency services. St John's director of ambulance operations in the northern region... said yesterday that the actions of other road users were a constant frustration for emergency service drivers. While most people made way for speeding ambulances, some drivers deliberately ignored the sirens... "Then there are others who just don't hear you or see you and are oblivious to any traffic around them. They are a real hindrance at times." The public did not appreciate the stress ambulance drivers were under when travelling to emergencies... Meetings were planned between the ambulance, police and fire services next week to discuss whether driver training needed improving. At present, all St John drivers must complete a 40-hour defensive driving course covering traffic regulations, hazard identification, ambulance control and emergency stops... [A] memo was sent to all St John staff yesterday reassuring them that they could speed when necessary as long as they drive safely. Land Transport Safety Authority figures show that emergency vehicles had 30 minor injury crashes and three serious injury crashes between 1997 and 1999... [The director of ambulance operations in the northern region said the 28-year-old – who received a '\$4000 fine (half of which is to go to a charity) and had his licence suspended for 12 months' –] would continue with his present work in the St John communications centre.

...The Order of St John has decided to end its Auckland rescue helicopter service... [T]he service would stop within two weeks, after three years of service... [M]oney saved would allow the order to direct more money into its other services. It would continue to provide paramedics for rescue helicopter services. Rival service Auckland Rescue Helicopter Trust will now add St John's role of providing emergency transport for sick people under a Health Funding Authority contract to its service of carrying accident victims under an ACC contract. T[he Trust's chairperso]n... said the three years of competition had been frustrating for two good organisations operating in a city where only one air ambulance service was viable.

...[they track St John's vehicles here and 'GPS systems are being used overseas to keep track of children. Satellites can locate a child's position via chips embedded in their shoes or other clothing (and may eventually be placed under a child's skin'). By the way, w[ithin] the next two years... if your house is burgled and you know the date and approximate time, you'll be able to call up a private satellite company and order clear video of your property...

[A new] book... contains information from super-secret documents and an astonishing account of Diana's last hours, which were monitored by US spy satellites and British agents... Diana was the most famous [gal] in the world and, to this day, allegations surrounding her death in a Paris car crash still trigger intense debate and speculation. As late as last week, James Andanson, a key figure in the official inquiry, was found dead in a burnt-out car. French police are establishing whether... [the] photographer, was murdered or committed suicide... Andanson... was once suspected of driving the white Fiat Uno thought to have been in the smash, but was cleared by forensic experts. Now a[n a]ward-winning correspondent... lifts the veil of secrecy surrounding the activities of Israeli, American, British and French intelligence agents on the night Diana died.

...[the] Mossad secret agent, a natural manipulator of people... arrived in Paris in June 1997... His target was Henri Paul, assistant security chief of the city's Ritz hotel, owned by [the] billionaire... father of Princess Diana's new lover, Dodi. Mossad wanted to keep track of the arms sales to its enemies, and Middle Eastern weapons dealers were known to... negotiate... deals at the Ritz... Paul was a bachelor, living in a low-rent apartment, who drove a black Mini but liked fast cars... Paul... also [had a] curious relationship... with the paparazzi who staked out the Ritz. At night, [the agent] observed Paul drinking with several of the paparazzi – and receiving money for providing details of guest movements. [Hi]s first contact with Paul was in Harry's Bar in the rue Daumou. According to an Israeli intelligence source, "Henri... came straight out with it: was [the assistant security chief] being asked to spy? If so, what was the deal? Just like that." Paul was understandably frightened that [it] was getting in over his head and could well end up in prison if... found spying on the hotel's guests. But [the agent] maintained the pressure... To Henri... it would have seemed as if [the agent] had become a personal shadow, reminding him that there was no way out. Compounding the pressure was the forthcoming visit of Princess Di... and Dodi... Paul had been put in charge of their security while they were in the hotel, with particular responsibility for keeping away the paparazzi. At the same time, the photographers were calling him on his mobile, seeking information about the visit – [Henri] was being offered large sums of money to provide details. The temptation to accept was another pressure... Although [Henri] managed to conceal it, Henri... was unravelling mentally... taking antidepressants, sleeping pills and pep pills to get him through the day. This combination of drugs could only have furthered the strain on his ability to make reasoned judgments. For any operation, this would have rung alarm bells, but Tel Aviv decided to keep the pressure on Paul. Other events that no-one could have foreseen were moving to their own climax... Hours after the accident, [the agent] flew back to Tel Aviv, leaving in his wake questions that would remain unanswered. What part had his presence played in the accident? Had Henri... lost control of the Mercedes, causing it to crash... because [Henri] could see no way of extricating himself from the clutches of Mossad? ...Questions such as these would continue to fester in the mind of Dodi's father... In February 1998, [the billionaire] publicly announced, "It was no accident. I am convinced of that in my heart of hearts. The truth cannot remain hidden forever." ...Mossad [actually] had no interest in Di... and Dodi. Their sole concern was to recruit Henri... as their informer at the Ritz. But by 1999, [the billionaire] was alleging "a full-blown criminal conspiracy"... manufactured by MI5 and MI6, and French intelligence, with Mossad "manipulating in the background". Then came the news, reluctantly confirmed, that the US National Security Agency... had... 1050 pages of documents on the couple... Unknown to them, every conversation, however intimate, was silently gathered up by... satellites... Part of the reason... was that Di... had been under surveillance by ECHELON, one of NSA's most sensitive and ultra-secret surveillance systems. Following her divorce... Di... launched her campaign to abolish landmines. [Di] was blunt, outspoken and quickly gathered support that was not welcomed by the [US] administration or in London and other European capitals... My source insist[s]... that "anything Di... said, any decision [Di] made, would have been of prime interest, to certain people in authority"... There is confirmation of this in a secret Mossad investigation that focused on the two weeks before the accident and the days afterwards. Mossad investigators discovered there was a four-m[ember] British MI6 team in the city, with one of the team checking into the hotel itself four days before the deaths of Dodi and Di. *[A former MI6 officer... has since publicly accused British agents of being involved in the fatal crash.]* The Mossad report reveals that around August 14 to 15... a CIA team also arrived in the city. The team had been tracking Di... for some time, keeping tabs on her attacks on landmine manufacturers, many of which are US-based... Mossad's account of the final moments of Di's life]... begins at 11.45 pm... when... Paul was put in charge of the operation to whisk the couple away from the Ritz... 11.50pm, Saturday, August 30 In the Ritz bar... Henri[is] discussing the route... [and] said the hotel would provide two Range Rovers to act as decoys for the waiting paparazzi. That would give him enough time to get away... 00:15am, Sunday, August 31 In the hotel lobby, Henri... was using his mobile to organise the two decoy vehicles. 00:19am The decoys roared out of the Place Vendome that fronts the Ritz. Paparazzi gave chase. 00:20am At the hotel's rear entrance Paul arrived with the Mercedes... 00:21am At the top of rue Cambon, a Mossad agent kept watch. [The agent] would later report that "a white Fiat Uno passed the top of the street". The Mossad report states that in the car were two intelligence officers from the French security service. 00:22am The white Fiat Uno passed through traffic lights in the Place de la Concorde... Paul's Mercedes was forced to stop at the lights. 00:23am The Mercedes approached the Alma tunnel. Henri... would most certainly have seen the Uno ahead of him. 00:24am The Mercedes, travelling at high speed, passed over the dip at the tunnel entrance... [(Other sources allege Henri was then 'temporarily blinded by a bright light being shined directly into his eyes from the white Fiat Uno.')] Seconds later there came a thunderous noise inside the tunnel... Henri Paul and Dodi were dead. Di... was dying. Moments later, according to the Mossad report, the white Uno was driven into a side street and up the ramp of a waiting truck. Hours later the Uno was gripped in the claws of the truck's crusher. Within moments it had become a piece of crushed metal, devoid of any identification. There, at

the time of writing, the matter rests. [But could Mossad] have... evidence that would finally satisfy [the billionaire]'s belief in a conspiracy? Was Di... really pregnant at her death? These questions will be revisited well into this century. But they may never be answered fully enough to satisfy [the billionaire] or convince all those who believe him a dangerously misguided [perso]n who is using vast sums of money to nail down a truth that may... be best kept under lock and key by all those directly involved... [● After] 22 years and 232 deaths, Israel has pulled its troops out of south Lebanon... [M]embers of the UN interim force in Lebanon... were sent by the UN security council to oversee the Israeli withdrawal that was ordered on March 19, 1978, but ignored by the Jewish state until Tuesday... [T]he Israeli force withdrew... [six] weeks ahead of schedule... after its local militia collapsed... More than 6000 Lebanese, many of them members of Israel's south Lebanon army militia ally and their families, fled to Israel during the Jewish state's pullout.

...ISRAEL yesterday began building an electronic border fence to ease security fears. Israel's swift pull-out from south Lebanon on Wednesday has left border towns and villages without the fortifications... [their PM promised when pledging] to bring the army home... At a victory rally... Hizbollah threatened to go on fighting if Israel did not withdraw from the Shebaa farms, a disputed area near the Golan Heights that Israel seized from Syria in 1967... "Every captive in Israeli jails will return to you soon... Shebaa farms will return to Lebanon, God willing," [the]... Hizbollah chief... told the crowd... [while being] flanked by three bodyguards... Many Lebanese and their families who worked for Israel have been distributed in the north [of Israel] and... officials were talking about putting some of them into Arab-Israeli towns... Israel is planning to give the refugees tourist visas for a year with work permits and medical benefits, an absorption "basket" including a monthly sum of money and a rental subsidy.

...Beaufort Castle, built by the Crusaders in the 12th century and occupied by the Israelis until last month, has become the central attraction in a new deadly tourist trail in south Lebanon. Thousands of curious Lebanese, many of whom never ventured near the south during almost 20 years of occupation, are swarming around the ancient ramparts of the medieval fortress along with the other 100-odd Israeli and South Lebanon Army positions that stretch from the Mediterranean to the Golan Heights. But their journey to places such as Beaufort, on a mountain top where Crusaders once resisted the besieging armies of Saladdin, contains a lethal threat... According to U[N] peacekeepers, the Israelis and their client... militia have left an estimated 70,000 anti-personnel mines in and around their abandoned compounds, including the castle. A young boy from Sidon was killed while visiting a deserted S[outh Lebanon Army] stronghold that fell to the Iranian-backed Hizbollah during Israel's withdrawal from Lebanon... The child was foraging for souvenirs in the compound when [the child] spotted a camera. The camera turned out to be a booby trap left by the [militia] before they fled into Israel... [■ A] top Israeli official has told journalists... [that d]ifferences between Israel and the Palestinians are so profound that they are highly unlikely to reach a framework agreement by February's target date... [T]he official, who asked not to be named... put the refugee issue at the top of the list, saying the positions of the two sides were "diametrically opposed." ...[Israel's PM recently] repeated his opposition to a return of Palestinian refugees to areas inside Israel. The Palestinians reject his position, and are demanding the implementation of UN General Assembly resolution 194 of 1948, which recognised the right of return or of compensation for all Palestinians who became refugees as a result of the 1948 Arab-Israeli war. Israel opposes the return of these refugees and their descendants – who number 3.5 million today – both for fear lest they constitute a fifth column and lest they undermine the Jewish nature of the state.

...The Middle East riots which began 11 days ago at one site sacred to Muslims and Jews, reached new depths at another – the tomb of the Jewish patriarch Joseph in the heart of the Palestinian-controlled city of Nablus. For a week six Israeli soldiers backed by rockets from helicopter gunships and hilltop snipers had defended the shrine against rioting Palestinians. Israel had finally agreed to withdraw the troops from the besieged shrine on the condition that Palestinian police would protect it. But soon after the soldiers departed at dawn yesterday under an escort of Palestinian police, the rioters began moving in. Using crowbars, pick-axes and even their bare hands, they reduced the shrine to smouldering rubble in a matter of hours. The riots were sparked when [the] hawkish Israeli Opposition leader... visited... Jerusalem's holy... Temple Mount...

Old warrior again ignites violence in Middle East... Once again, [a guy who has long been]... considered to be one of Israel's finest sons... has set the Middle East on fire. And once again, [the finest son] claims it is not his fault. In 1982, when [the finest son] ordered the Israeli Army to invade Lebanon, [the general said it] should not be blamed if his Lebanese allies massacred Palestinian civilians in Beirut's Sabra and Chatila refugee camps. Now, the Likud leader claims [it] has nothing to do with the violence that has followed his visit to Jerusalem's Haram al-Sharif, the Muslim "Noble Sanctuary" built over the ruins of the ancient Jewish temple... [I]n a letter to [the US] Secretary of State, [the finest son] said: "It must be clearly understood that it wasn't my visit to the Temple Mount... that ignited the current outbreak of violence." ...Strong-willed and unconventional, [the finest son] was regarded as Israel's saviour in the 1973 Yom Kippur War, when [it] led his division across the Suez Canal and encircled much of the attacking Egyptian Army from the rear... To his adoring followers, who know him simply as "Arik," [the guy] is "Melech Yisrael," the "King of Israel." But abroad, the 72-year-old former general, built like a bulldog and with his face perpetually in motion with twitches, frequently attracts disapproval, even loathing... [Arik] may be trying to out-flank the P[M] on the question of Jerusalem. But, tellingly, in the face of this political challenge to his peace policies, [the PM] has not dared to blame [him] for the trouble... Palestinian leaders claimed [Arik]'s visit to the shrine was an attempt to shore up his popularity among right-wing voters as part of a leadership battle within the Likud. His biggest rival is [the former P]M... who could stage a comeback after Israel's Attorney-General closed a fraud investigation against him last week.

...As... Israeli-Arab violence moved yesterday to the border of Lebanon, where Hizbollah captured three Israeli troops, artillery duels erupted and Israel threatened more reprisals[the]... Israeli military... blew up two multi-storey apartment buildings overlooking a Gaza intersection that has been the focus of more than a week of riots. The notching-up of Israel's response to the violence came as the death toll stood at 83, mostly Palestinians. In the West Bank, the Israelis also sent attack helicopters into Hebron for the first time, blasting hilltop positions used by Palestinians to fire on the Jewish settler enclave below. This followed an ultimatum delivered yesterday morning... by Israel's P]M... who said if [the] [Palestinian leader]... did not stop the riots within 48 hours, Israel would assume [the PLO leader] had decided to finish peace negotiations and would unleash the full force of its army to end the violence. The Israeli military waited only a few hours. Military engineers set off explosives in the two tall Gaza buildings called the Twin Towers... There was no immediate word about casualties. Also, the military destroyed another nearby building known as the factory, and cleared an area of several dozen metres around the fortified position to prevent attacks, the... military said.

...Israeli bulldozers flattened the Brazil refugee camp in southern Gaza in a raid which... wounded... 14 people... and... killed a Palestinian gun[-holder]... The Israeli Army said troops moved in to Gaza on Wednesday to destroy buildings that Palestinian gun[-holders] had used as cover to fire at soldiers and as bases for planting roadside bombs... The Palestinian Authority denounced what it called a "planned aggression" that threatened regional stability. "We continue to demand international protection for the Palestinian people exposed to the ugliest forms of aggression,"...

A Palestinian child was crushed to death yesterday and dozens injured when Israeli troops blew up an area in southern Gaza while the occupants were sleeping, Palestinian medical sources said. Tawfiq Bereka, 4, was killed by falling masonry as Israeli soldiers dynamited a nearby house with a charge so strong it destroyed his house and the one next door in the southern border town of Rafah... "Troops discovered tunnels for smuggling weapons connected to two abandoned buildings which were all detonated in a controlled explosion," a spokes[person for the Israeli Army] said.

...The U[S] has demanded a full and immediate Israeli investigation into the death of... 23-year-old Rachel Corrie... who was crushed by an Israeli Army bulldozer... as... the... American peace activist... tried to prevent the destruction of Palestinian homes... in the town of Rafah.

...Britain yesterday demanded a thorough inquiry into the Israeli military's shooting to death of a British television camera[person] in a Palestinian refugee camp... Israeli forces demolishing a home suspected of concealing an arms-smuggling tunnel in the Gaza Strip shot... freelance

journalist James Miller... in the flashpoint Rafah refugee camp where [James] was making a documentary on the impact of violence on Palestinian children, witnesses said... It was the latest embarrassing foreign casualty for Israel... Peace activist Briton Tom Hurndall was critically wounded after being shot while helping children cross a street under fire. American Rachel Corrie was crushed to death by a bulldozer while protesting against the demolition of a house. Meanwhile, police arrested six people in central England... in connection with a Tel Aviv suicide bombing...

Late last night... Israeli construction workers prepared to break ground to put up a fence dividing Israel from the northern West Bank in a measure Israel hopes will keep Palestinian suicide bombers out of the Jewish state. Jewish settlers oppose the plan for a fence along Israel's frontier as it was before the 1967 Middle East war... Palestinians fear their land could be confiscated and families separated by the fence.

...Israel has begun a process of creating a physical barrier between itself and West Bank Palestinians while pushing off any discussion of Palestinian statehood on that land. In the northern West Bank, bulldozers have been at work since last week, levelling the ground for the first section of a 110km fence... [-] part of a US\$222 million... 350km... network of barriers... [-] aimed at stopping... suicide bombers... reaching Israel.

...The threat of all-out war in the Middle East... sent stock markets tumbling around the world yesterday. In the bloodiest day to grip the region in a fortnight of mayhem, Israel responded with airstrikes to the mob murder of two soldiers on the Palestinian West Bank, and suicide bombers in an inflatable Zodiac ripped a huge hole in the side of a U[S] warship in Yemen. The attack on the destroyer USS Cole in the port of Aden killed at least six and injured dozens. Diplomatic efforts... were being made last night in a bid to get Israel's P[M]... and Palestin[e's] leader... to meet.

...The streets of the West Bank and Gaza have finally quietened but the raging anger of the Middle East is spreading across the globe... An emergency summit in Egypt, arranged by [the UN] Secretary-General... and expected to include the leaders of Israel, Palestine, Jordan and Egypt as well as [the] US President... is due to begin tomorrow. No leader is hopeful of a breakthrough and pre-summit demands by the Israeli and Palestinian delegations have already threatened to abort it before anyone even takes a chair at the table. Oil prices, which soared to decade-high levels on Friday, eased slightly over the weekend amid hopes that Arab producers would not punish Israel's Western backers. Around the world there remained enthusiasm for a "day of rage" – a display of sympathy for Palestinians and anger at Israeli-military attacks. Members of a 2500-strong demonstration tried to storm the US consulate in Sydney, but were held back by police... Two police officers were stabbed in Pretoria... during clashes between pro-Palestinian demonstrators and police near the US embassy. Security at Jewish institutions in France has been stepped up after five synagogues were set on fire and others vandalised... [Y]ouths... have been shouting "Death to the Jews" at rallies in Paris and Lyon.

...It was a scene that the world wanted to avoid... – ...Israeli helicopter gunships airborne again and firing their machineguns over the low, dangerous hills and olive groves of the West Bank. Two days after the Sharm el-Sheikh agreement, it was under a fresh threat yesterday after a pitched battle erupted between Jewish settlers and Palestinians on a hilltop overlooking the Palestinian-controlled city of Nablus. It is further evidence that maintaining the fragile U[S]-brokered ceasefire does not only depend on... [the Palestinian President]'s efforts to rein in Palestinian militia... or on the Israeli Army pulling back its forces and softening its tactics so that it stops shooting dead civilian rioters, including children.

...Authorities in Cairo are to rename the road in front of the Israeli Embassy "Mohammed al-Durra Street" in honour of a 12-year-old Palestinian boy shot dead by Israeli forces. The *Akhbar al-Youm* newspaper said the popular council of Giza Governorate had agreed to change the street name to pay homage to the "martyr," who has become a symbol of more than a month of Israeli-Palestinian clashes in which at least 170 people, mostly Arabs, have been killed. Durra was shot in front of television cameras... The world... saw... [a] father... vainly trying to shelter his son... from gunfire in Gaza. Palestinians blamed the Israelis for his death. The Israelis denied it but it helped fan the flames of Middle East strife.

...soldiers shot dead a 9-year-old girl outside her home in the Gaza town of Khan Yannis yesterday... Hanin Abu Suleiman was playing outside her home next to a cemetery between the Palestinian town and an adjacent Jewish settlement when [it] was shot in the head... Israeli military sources said troops had returned fire in the direction of the cemetery after [someone] shot at their outpost, but could not say if they had hit anyone.

...Israel killed the commander of the military wing of Hamas, 14 other Palestinians, including eight children and wounded at least 145 others in an air attack on the Gaza Strip yesterday. Salah Shehade was killed one day after... Hamas said it would consider halting suicide attacks...

By threading missiles through the... third floor windows of an office building in Nablus this week in a lightning strike, killing the top Hamas leader in the West Bank, Israel demonstrated once again its formidable operational and intelligence capabilities. The action's strategic intent is less clear... The killing of... Jamal Mansour... and seven others, including two boys on the street below, has whipped the Palestinian territories into frenzy and brought rebuke even from Israel's major supporter, the U[S]. Israel has reconciled itself to a spate of suicide bombings during the 40-day period of mourning declared by Hamas. The Islamic organisation has also threatened to target Israeli political figures to avenge the death...

Vengeance is mine... Israel's new leader[s]... draconian security measures risk driving even the more moderate Palestinians into a corner, some Middle East analysts gloomily warned this week. It may be impossible for them to enter peace talks. His "tough guy" policies, designed to quell resistance before talking peace, could mean it would be a generation before conditions were again right to settle the issue of Palestinian independence... [Israel's new PM] – who panned peace proposals by [Israel's] former leader..., beaten by [the Likud leader] at the polls last week... [-] risked provoking a surge in support for Palestinian extremists... lead[ing] to even greater bloodshed... After a week in which [the PM] steadily turned up the temperature – seizing Palestinian-ruled areas and attacking a Syrian radar base in Lebanon – the analysts saw only grief ahead.

...In a heavily guarded room at a hospital near Tel Aviv, Israeli interrogators have been trying to solve a question that has baffled the entire world. What – or who – turned... a mild-mannered Palestinian bus driver with no record of violence or political militancy, into a ruthless killer? Sickened and angry, Israel buried most of the eight young victims yesterday – seven of them soldiers... aged 21 or younger... – whom [the Palestinian] mowed down with his bus as they stood at a hitch-hiking post at Azur... at rush hour on Wednesday. But the country's grief was coupled with bewilderment. Suddenly, Israel finds itself gazing at a new face of an old enemy – an attacker who worked compliantly in its midst for years, who repeatedly passed security checks, yet who, suddenly, set out to kill as many Israelis as [it] could. Only a week earlier, [the Likud Party leader] was elected P[M] by a vast margin because Israel believed his promise that [Arik] could keep them secure. But the carnage reaped by [the bus driver] – and the fact that [it] could do so without bombs or bullets – has already proved the emptiness of that pledge, shaking Israel to its core.

...Schoolboy suicide attacks bring more pain... School over for the day, the three boys told their unsuspecting parents they were off to see friends. Hours later, their bullet-riddled bodies were lying in the dirt outside a Jewish settlement in the Gaza Strip. Israeli troops had shot them before they could reach their target. Suicide notes left by the 14-year-old classmates showed they knew the venture would end in their deaths. The Israeli Army said the boys, named by relatives as Youssef Zaout, Anwar Hamdouna and Ismail Abu Nadi, were carrying home-made pipe bombs, an axe and knives. The boys' gesture of resistance to occupation has deeply disturbed some community leaders who fear other youngsters might copy their quest for "martyrdom". Even the Islamic militant group Hamas, which has sent scores of members on suicide missions against Israelis, described the schoolboys' actions as a "national catastrophe". Their deaths mirrored that of another 14-year-old, Haitham Abu Shuqa, killed last week trying to stage a solo attack on a Jewish settlement... As Gaza parents pondered the state of mind of their own offspring, [a Palestinian] psychologist... said many children were severely traumatised by seeing and hearing of Palestinians, especially children their own age, being killed by the Israelis.

...Siege of Palestinian cities deepens... Israeli officials stressed the Army's entry into five Palestinian-ruled cities and a town this week did not signal the imminent demise of the Palestinian Authority... The troops will stay in Palestinian areas until suicide attacks... [being] waged... against Israeli occupation... stop – or are snuffed out... Washington has condemned Israeli raids into Palestinian areas, but stopped short of publicly calling on it to withdraw... The raids followed the assassination of ultra-nationalist cabinet minister Rehavam Zeevi, the first-ever killing of an Israeli minister by Palestinians... Israel has demanded the authority hand over those involved in Zeevi's killing, outlaw groups it defines as "terrorist" and

arrest militants on a most-wanted list... But violence on the ground lent substance to fears that Israeli-Palestinian bloodshed is spinning out of control as Israeli troops pushed several hundred metres into the West Bank cities of Tulkarm and Qalqilyas yesterday. The raids followed similar moves into Ramallah and Jenin and troops were seen strengthening their hold on Bethlehem... [–] the birthplace of Jesus[–] and nearby Beit Jala.

...[a Palestinian boy] had to watch his 17-year-old brother, Munir, slowly bleed to death. [Munir] took several hours to die. A hole had been ripped in his shoulder by a round from an Israeli helicopter. When the boy's mother, Mariam, ran into the street screaming for help, [the brother] said, Israeli soldiers shot her dead. His story is typical of the claims of those who have managed to escape the carnage of Jenin refugee camp, the scene of the worst fighting of Israel's onslaught on the West Bank. The question facing Israel is what will happen when the full story of what Israel has wreaked in the Jenin camp is revealed? As the Israeli newspaper *Ma'ariv* said in an editorial: "We can begin thinking today about the war after the war; the public relations war in the media in which Israel can be expected to be placed in the international defendant's seat, when the television screens around the world become filled with the spectacle of bodies lined up, destroyed houses and crying, distraught relatives." The Israeli Army claimed yesterday that it had finally taken control of all but a tiny section of Jenin camp. But the stories coming out of Jenin for several days have been horrifying, although it is impossible to verify them because of censorship by the Israeli authorities, who have denied journalists access to the camp... The International Red Cross has said Israeli authorities have been refusing to allow ambulances to treat the wounded all over the West Bank, which is a war crime under the Geneva Convention... "Munir bled until 10 o'clock that night," [his brother] said. "...We went out to try to get an ambulance... but when it came... the Israeli soldiers shot at it... and the soldiers took us. They separated my brothers and me from my father. We haven't seen him since..." The soldiers held them for some days at a military camp and interrogated them.

...An Israeli politician who survived the Nazi Holocaust has been outraged by Israeli troops writing identification numbers on the foreheads and forearms of Palestinian detainees awaiting interrogation... [The Yugoslav-born politician told Israel's] Army chief of staff... and [the country's] Defence Minister... that the practice must cease immediately. "As a refugee from the Holocaust, I find such an act insufferable,"... A spokes[person] for Israel's P[M]... agreed that the numbering of prisoners did not create an attractive media image... □ [Yesterday in Brussels]... Belgium's highest court delivered a landmark ruling... that Israel's P[M]... can be prosecuted for war crimes... [relating to] a refugee-camp atrocity... in Lebanon in 1982... – but only after [the former general] leaves office... The court ruled that "international custom does not allow heads of Government to be the subject of legal action in a foreign state"... Israel responded angrily, recalling its ambassador to Brussels for consultation and summoning the Belgian envoy for a dressing-down. The decision by the Cour de cassation, the top appeal court, opened the way for several serving or ex-leaders around the world to be tried under a unique Belgian law that allows for war crimes prosecutions independently of where the offences took place.

...The Israeli Army pressed ahead with demolishing what was left of Yasser Arafat's besieged compound yesterday after [it] vowed not to give in to Israel and surrender wanted Palestinians held up inside. The Palestinian President was unmoved by Israel's action: "I hope God will grant me the honour of martyrdom. No one will be handed over to Israel," [it] told an Arab member of Israel's Parliament... by telephone. Israeli heavy machinery went to work tearing down a Governor's office and meeting hall next to Arafat's battered office block. The destruction will leave the building where Arafat is trapped the only one standing in a rubble wasteland. Thousands rallied in support of Arafat across the West Bank and Gaza Strip in defiance of Israeli curfews[– '40,000 Palestinians have effectively been put under 24-hour curfew so 400 Jews can go about their business in Hebron' –] and to protest at the siege, which Israel launched on Monday after suicide bombings killed seven people.

...Special legal teams will defend Israeli soldiers against potential war crimes charges stemming from civilian deaths in the Gaza Strip, the P[M] said, promising the country would "fully back" those who fought in the three-week offensive. The move reflected growing concerns by Israel that officers could be subject to international prosecution, despite the Army's claims that Hamas militants caused the civilian casualties by staging attacks from residential areas... Israel launched its 22-day offensive to try to halt Hamas rocket fire on southern Israel. The assault killed 1285 Palestinians, more than half of them civilians, the Palestinian Centre for Human Rights counted. Thirteen Israelis, including three civilians, were also killed during the fighting, [which]... destroyed... 20,000 homes... [leaving] 50,000 people in temporary shelters... and... destroyed or severely damaged... 219 factories... At talks yesterday in Cairo aimed at solidifying the truce, [a] Hamas official... said the Islamic group offered a one-year truce to Israel, including the reopening of border crossings to allow vital supplies into Gaza... Israel offered an 18-month truce, which Hamas rejected... A low-level delegation from Hamas' rival, [the]... West Bank-based government... [of the new] Palestinian President... was also in Cairo...

Hamas leaders yesterday launched an unprecedented attack against [the new Palestinian] President... saying they no longer consider him a Palestinian after [it] agreed to suspend efforts to go after Israel for alleged war crimes in Gaza. The harsh verbal assault is likely to undermine attempts at reconciliation between the Western-backed [President] and his Islamic militant Hamas rivals, who control the Gaza Strip... Hamas drove [the President's] forces out of Gaza... leaving him in control of only the West Bank. Repeated reconciliation efforts have failed, complicating peace efforts with Israel. Egyptian mediators have asked Hamas and Fatah to return to Cairo for another round of talks this month... In the West Bank city of Ramallah, several hundred protesters marched, calling for the resignation of those who took the decision... to suspend [the campaign].

...A priest] guided 200 people, most of them Muslims and many of them armed, through the 39-day crisis in the Church of the Nativity. [The priest] helped ward off hunger, tensions and anger, while dodging gunfire from Israeli troops outside and Palestinians inside. [The] Egyptian-born... Franciscan priest, is in charge of the 4th-century shrine marking the birthplace of Jesus. On April 2, Palestinians fled inside ahead of invading Israeli forces. Among them were several dozen [militants] wanted by Israel. Troops surrounded the church and demanded that the [militants] surrender. They refused... Seven Palestinians were killed during the siege... On Friday, with the intervention of the Vatican, European Union and U[S], the confrontation was resolved... 26... of the [militants were]... driven to the Gaza Strip... and... [13] were exiled to Cyprus...

For decades, Turkish jet fighters have fought high-speed mock dogfights against Greek jets flying over disputed territory, a show of strength that each side used to hone battle skills and intimidate each other. Yesterday, the Turkish Air Force carried out a new mission – welcoming the first Greek fighters to visit a Turkish air base in three decades. The visit is part of a thaw in Turkish-Greek relations that began last year, when both sides sent aid to each other after devastating earthquakes... Top Greek and Turkish officials have been talking throughout the year about ways to reduce tensions... Defence ministers from the rival countries met in Greece for the first time last week and discussed possible ways of cutting military spending... Six grey-and-blue Greek F-16 jet fighters touched down at Balıkesir, Turkey's main air base facing Greece.

...[the Labour Government] is... cancelling the F-16 contract[(r:p905, ln45). It will be]... interesting to observe... [if the move creates] negative repercussions... that will affect not only the N[Z] military but the country as a whole... The F-16 issue [wa]s of greater importance to N[Z] than perhaps most people realise... N[Z] must be seen by our trading partners as making an effective contribution towards regional security. This cannot be achieved without an adequate air-strike force. I would... go so far as to suggest that the F-16s [could have paid] for themselves, as a result of the increased trade and exchange that... should [have occurred]... when our trading partners realise[d we are] willing to become an active member of the global community, rather than sticking [our heads] in the sand and hoping that A[US or the USA] will come to our aid in times of trouble.

...Serious cracks in six Skyhawk fighter bombers will not be repaired... The cracks are in a forged component that holds the tailfin on to the fuselage and the six Skyhawks have been restricted to a final delivery flight from Ohakea to Woodbourne near Blenheim, where they will be stored until they are sold. The Air Force's fleet of 17 Skyhawks will be permanently grounded this year. The Government said in May that it was scrapping the air combat wing, which also includes the Aermacchi jet trainers... The remaining 11... Skyhawk[s are still]... based... near Sydney...

Forty-nine air force employees at Hobsonville and Whenuapai [air bases] have been given their marching orders. They are among 183 uniformed and civilian staff losing their jobs nationwide as air force chiefs complete the first stage of Project Reshape – a four-year bid to slash 700

positions... The cuts were announced yesterday morning following the Government's decision to disband the air combat force[and close both Auckland bases] earlier this year... The air force will move from its west Auckland base to Ohakea in the Manawatu within the next five years... [The] Minister of Defence... says having one operational base (Ohakea) and one support base (Woodbourne) will improve defence co-ordination, efficiency, training and operations while removing duplication of amenities and administration... The big question now is what the... 318.8 hectare Whenuapai property will be... used for... The Hobsonville site has been earmarked for state and low to medium cost housing by Housing N[Z].

...One of the three Skyhawk squadrons yesterday arrived home from its N[SW] base in what the National Party describes as a "black week" for [NZ's] defence forces... The two other squadrons have been based at Ohakea... The three squadrons will be formally disbanded on Thursday as the Government implements its decision to drop the air force's air combat arm in favour of re-equipping the Army... All 17 Skyhawks will make farewell flights around N[Z] tomorrow. The]... director of logistics... said N[Z] is one of the most taxing environments for jet fighters in the world.

...Russia's latest experimental stealth fighter was on show yesterday at an international air show outside Moscow where cash-strapped aerospace designers are seeking foreign buyers. The S37 Berkut, or Golden Eagle, still bearing the red star of the Soviet Union, was the main draw of the... show. Designers say it can elude enemy radar and is more agile in dogfights than its Western counterparts because of its forward-swept wing.

...More than 100 Russian sailors are trapped in their nuclear-powered submarine on the seabed... after... unspecified technical faults... forced them to shut down the nuclear reactor... [during] training exercises in the Barents Sea... Russia's independent NTV television station said the cause of the accident yesterday was flooding of the torpedo tubes and front section of the submarine Kursk. It said a power shutdown might lead to problems with oxygen supplies. The head of the Navy's press office... gave no details of the depth or location of the Kursk... but said no nuclear weapons were on board... and there were no radiation leaks. Rescue vessels had rushed to the scene... [A] Norwegian environmental group... said... that Oscar-2 class submarines did not have rescue capsules to take the crew to the surface and deep-going rescue submarines would have to be used... The Defence Ministry of Norway, which has territorial waters in the Barents Sea, said it had no information about the incident. One of the most serious recent submarine disasters was off Norway's north coast in 1989, when a Soviet Mike class nuclear submarine, the Komsomolets, sank after fires on board... 42 crew died... Norway says the submarine's nuclear reactor and torpedoes are still slowly leaking plutonium into the water.

...Russia's submarine disaster, unfolding before the eyes of the world, is a major blow to... [the President]'s aim to restore pride in the military. One of [hi]s first visits outside Moscow after his election in March was to the Northern Fleet, which included the Kursk... Since the first Soviet nuclear submarine, the Leninsky Komsomol, put out into the White Sea in July 1958, the fleet has been plagued by accidents – 121 by the count of... Greenpeace, in which at least 500 people have died. The latest disaster has raised memories of previous submarine accidents... As a 22-year-old cadet in the Soviet Navy, [the person who is] now head of reference at the Gratz College library in Philadelphia, boarded a Project 613 submarine for several months of training at sea in the spring of 1960. As the boat moved beneath the waves of the Barents Sea... a torpedo exploded in its firing pod sending the submarine plummeting 270m to the ocean bed... Only 14 of 56... [submariners] aboard the vessel survived. [The cadet] and his comrades donned protective camel hair suits covered in rubber along with oxygen masks and prepared to escape through an empty torpedo shaft at the submarine's rear. One at a time, the 14 entered the shaft... Once the first... was deposited into the freezing water, a long cable, buoyed by small pieces of cork, was released and floated to the water's surface... then... the... [submariners] began the long climb... through the pitch-black water. "From this depth the climb should have taken about three hours. I came in about an hour and a half... But... blood was coming out of my mouth. It was from a destroyed lung,"... [The librarian] was optimistic that the 116 submariners on board the Kursk could survive but was not so hopeful about the sub... being recovered... Such incidents were not confined to the Soviet side of the Iron Curtain. The... malfunctions of the Kursk has revived... a retired sonar technician[']s... memories of the sinking of the... USS Thresher... in 1963 with... 129 [crew. The technician]... had served on the Thresher from 1960 to 1962[– and] was supposed to be back on board, but had been delayed on the... submarine USS Thomas Jefferson... [The technician], who retired in 1975, served during the depths of the Cold War but... identifies with the trapped Russians. "All submariners are like a brotherhood... We're a very small group. Even though we were enemies at one point, we all share something most people don't." That something is the risk of such an accident on any given day... The Thomas Jefferson was south of Bermuda when Thresher disappeared about 354km off Cape Cod... [The technician] joined in the search for the missing sub. [The technician] also was involved in searching in 1968 for the Scorpion, the only other US nuclear submarine lost at sea. The searches... were unsuccessful in both cases. [However, the Hunley – 'the world's first military sub (a peddle-powered vessel that sank after completing its first mission during the American Civil War) – has been found, and plans are under way to raise it.']

...British forces equipped with a rescue submarine are on their way from a Norwegian port in a last-ditch effort to save 118 Russian sailors... All Russian efforts to save the crew of the Kursk, crippled on the seabed in chilly seas since the weekend and with oxygen running low, have failed. Moscow turned to Nato members Britain and Norway on Wednesday but it will be late tomorrow before the rescue submarine reaches the area. Although reporting earlier offers of help, Russian media loyal to the Kremlin had downplayed them and many ordinary citizens were unaware that the West could have been involved earlier. When this sinks in, Russians may feel a wave of anger against their own leaders for putting national pride before human lives and delaying accepting outside help until it may have been too late... The independent newspaper *Segodnya* commented: "Admirals for some reason think that even if one Russian sailor is saved from a Russian submarine with outside help, it will certainly end in a political catastrophe." Distraught relatives of the [crew] on board the stricken submarine were travelling up to the Arctic base of Severomorsk or ringing... hotlines for the latest [news]... The central city... after which the 14,000-tonne submarine is named, was especially anxious as six of its young [citizens] are... enduring the nightmare... The rest of the nation, still in shock after a deadly terrorist bomb in Moscow only a week ago, was glued to the television, mentally swinging between hope and fear. At the other end of the country, in the Black Sea resort of Sochi, [the] President... admitted... the situation was critical but assured Russians that everything was being done to try to save the submariners. The [crew] on the Kursk are a social mixture of the lowliest conscripts and some of the top brass from the Northern Fleet, who were using the vessel as a headquarters for what should have been morale-boosting manoeuvres... For youths obliged to give two years' military service to the Motherland, a posting to the Northern Fleet was regarded as prestigious.

... "Hero city," boasts the massive grey concrete slab on the drive into the bleak expanses of Murmansk. But today, "Radiation Scare City" might be a better name for the great port above the Arctic Circle, destination for the Allied convoy lifeline in... [WW2]. Murmansk is still an important port. But its main post-Soviet distinction is as the gateway to the Kola Peninsula in northwest Russia, and to the bases of Russia's Northern Fleet, generator of perhaps the greatest – and certainly the least protected – concentration of nuclear waste on earth. Solid radioactive waste is stored at 11 sites around the peninsula, often in the open without any protection. Liquid waste is stored at the five main naval bases on the Kola, usually in equally poor conditions. The stricken Kursk was based at Zapadnaya Litsa, or "Western Estuary," just 48km east of Russia's border with Norway. On the estuary's western shore lies Andreyeva Bay, where [enough] spent fuel rods... to... equal 90 reactor cores... are stored in rusting containers and tanks whose contents are exposed to the skies. On the eastern side is Nerpicha, home to, among other vessels, six 30,000-tonne Typhoons crammed with nuclear warheads, the largest submarines ever built. For curious Westerners, Murmansk is as far as you get. Severomorsk, the headquarters of the Northern Fleet which lies 16km to the north, is closed to foreigners, while Zapadnaya Litsa is off limits even to Russians, apart from workers at the bases and the submariners themselves... When... a founder of America's nuclear Navy, once paid a goodwill visit to the giant icebreaker Lenin in Murmansk, [the]... Admiral... tested himself afterwards for radiation exposure – to discover that in half an hour [it] had absorbed as much radioactivity as in half a lifetime on US nuclear-powered craft... The nuclear crisis of the Northern Fleet is a measure of Russia's... [attempts] to keep up with the U[S] as a global nuclear power without the resources to do so... Wedged claustrophobically along the

eastern side of its fiord, Murmansk is a city where you feel you are living on the nuclear edge. Still moored close to its centre is the infamous cargo ship Lepse, laden with hundreds of damaged fuel elements from nuclear-powered ice-breakers based in the port. Clean-up work on the Lepse has now started. But what dire stories are swirling there in the wake of the Kursk disaster may only be guessed at – though what happened for a few hours one May day in 1998 may convey the flavour. Rumours flashed around Severomorsk that a Delta class submarine carrying nuclear missiles had had a major accident in the Barents Sea. When the stories reached Murmansk and its population of 500,000, children were sent home from school and police issued with iodine tablets. Calm returned only when the regional governor and senior Northern Fleet officers held a press conference to insist that the episode had been merely a planned exercise to test reaction to a possible nuclear accident on board a submarine... [A] specialist at Norway's Bellona Foundation, the world authority on the nuclear pollution threat posed by the Northern Fleet, was sceptical about the explanation then. And the Kursk disaster has come as no surprise to him now. "Ever since the financial collapse of autumn 1998, the situation has been desperate for the Northern Fleet. There hasn't been enough money for wages and maintenance, the best officers have left for... paid... jobs..."

...The Russian Navy knows much more than it is letting on about... the sunken Russian nuclear submarine Kursk... Throughout the drama, the Navy has insisted that the only communication from the crew... had been tapping on the submarine's hull. But now intelligence sources in Washington... say the crew were in direct radio contact for a short time after the 10,700-tonne Kursk sank, giving the Russians a fairly accurate picture of conditions on board. The sources claimed that the crew said half of the vessel had been flooded... and, as a result, half of the 118 [submariners] on board had been killed instantly. The big question now facing the rescuers are, first, whether a British LR5 rescue submarine... will be able to dock with the Kursk and, second, whether there is anyone left to save. The answer to the first question appears to be yes. The... LR5 has previously docked with a Polish submarine with the same escape hatch as the Kursk. The Russians are pinning their hopes on the LR5 because it is much more manoeuvrable than their own underwater rescue craft. It can hover and travel up, down or laterally like a helicopter to reach its target... The answer to the second question is not so clear. The last sign of life detected on the submarine was a faint tapping on Wednesday... Since then nothing has been heard from the crew and the Russian Navy calculated that the air would run out yesterday. However, it now says the air will last for several more weeks. If there is anyone alive on board and the LR5 is able to dock, it will take the survivors to the surface 16 at a time.

...ANGRY Russian Navy wives wept last night when they faced the deputy [PM]. "You killed our [husbands]," cried one of the... [wives as they met] the politician blamed for the submarine tragedy which claimed 118 lives... People in the audience comforted each other as [the deputy PM] tried to speak. [The deputy PM] – who is holding a government inquiry into the incident – said the submarine had been hit from the outside by a large object... Rescue vessels have managed to dock with the submarine but could not get inside because of damage to the hull. Hopes are focused on a British mini-submarine... due there today[– although]... the LR5... has never done a real rescue before...

The rear escape hatch on the... Kursk is so badly damaged that it would be impossible for British rescuers to open it, underwater cameras reveal. A team of Norwegian scuba divers were on their way to the wreck last night to get a clearer picture and to decide what to do next... But after days of uncertainty and changing stories, it was generally accepted yesterday that the joint British and Norwegian mission was less a rescue operation and more an attempt to recover the dead. The death knell for the Kursk's 118 crew was sounded in a televised statement by the head of the Northern Fleet's general staff... who admitted... [that] after... 10 days... there was no hope of finding anyone alive. Scraps of information from those who survived the explosions enabled the Navy to piece together the horrifying hours and days that followed inside the submarine... "After the accident, we heard the tapping of submarine personnel following the rules of communication with a sunken vessel. Analysis of the tapping allows us to conclude that the crew in the compartments in the stern were telling us that... the whole of the front section of the submarine ha[d] been flooded and the staff in those sections died in the first minutes of the accident... [while] water was filtering into their sections and they wanted us to provide air..." The Norwegian seismic institute Norsar recorded two explosions about the time the Kursk sank, one registering 3.5 on the Richter scale...

[The] Kursk... was sent to the bottom of the Barents... after being holed by an anti-ship missile fired by a Russian cruiser, German newspaper reports claim. The *Berliner Zeitung*, quoted a report from Russia's intelligence service the FSB (formerly the KGB), saying the Kursk was sunk by a radar-guided Granit missile fired by the Kirov class nuclear-powered cruiser Peter the Great during exercises... on August 12. The newspaper said the report... did not say why exactly the missile hit the Kursk. It said the conclusions are a new blow to the image of Russia's military, adding that [the President] was going to keep quiet about the conclusion... Moscow initially said... the tragedy... came about because of a collision between the Kursk and another submarine, possibly from a Nato country, but then backed off a little to suggest only that an underwater collision was responsible... The Peter the Great had apparently been firing Granit missiles almost daily since August 2. On August 12... the... head of Russia's North Fleet... [and his] Vice-Admiral... were apparently on board the cruiser... U[S] officials have already spoken of two explosions recorded by US submarines in the area when the Kursk went down – raising the theory that an external explosion caused... torpedoes to blow up in the bow of the submarine. A US report said the second explosion, which occurred one minute and 16 seconds after the first, was 45 to 50 times more powerful.

...Only a week after hope was abandoned for the crew of the Kursk, Russians suffered another devastating psychological blow as they watched the Ostankino television tower, one of the symbols of their capital, go up in flames. "Our country seems to be cursed," said... an office worker, who was listening to a radio report of the fire as [it] shuffled papers. "It is a giant disaster zone." All the main television channels were knocked off the air and Russians relied for news on pop radio stations. The first channel to disappear was independent NTV. Until it became clear that fire was to blame, some Russians wondered whether [their] President... had pulled the plug on the station that led criticism of him during the painfully slow and ultimately unsuccessful operation to rescue the 118 submariners of the Kursk... The Interfax news agency quoted officials from Russia's State Committee for construction as saying that the 537m-high tower would probably have to be demolished. Nearly all the 180 steel reinforcing cables have been damaged. The fire in the building broke out at a height of about 450m on Sunday after a suspected short circuit of wiring. The blaze destroyed the transmitters of the main Russian television stations and then gutted the tower's Seventh Heaven revolving restaurant, its stairwells and liftshafts. As the flames swept downwards they snapped more than half of the support cables, prompting fears that the tower could collapse... Officials estimated that it would cost \$US100 million... to restore the tower, money that post-Communist Russia can ill afford... In theory, the fact that so much technology in Russia is obsolete should give the country a chance to leapfrog into the digital age. But the sheer size of the country and volume of its problems are daunting... [A]lmost everything is disintegrating, from the housing stock to hospitals, from power stations to airports.

...Britain has dramatically boosted aid for Russia to decommission its ageing nuclear submarine fleet in the wake of the Kursk disaster. Brit[ain's] Foreign Secretary... has persuaded the Treasury to increase the funds destined for bi-lateral assistance to... \$[NZ]277 million... from just \$5 million... The money will go to helping retrieve nuclear fuel from some of the 100 or so former Soviet nuclear submarines in northwest Russia. "We want to get this fuel out of the water as quickly as possible. There is a horrendous risk of nuclear pollution," a Foreign Office source said.

...Colombian drug traffickers have been caught building a sophisticated submarine to smuggle narcotics, reportedly with help from American and Russian criminals. Police stumbled upon the half-built submarine in a warehouse outside the capital, Bogota – 2300m up in the Andes mountains and 340km from any port. The 30m submarine could have crossed an ocean... "In the 30-odd years I have been in law enforcement I have never seen anything like this," said... [the] chief of the U[S] DEA in Colombia. "This is huge. We are talking about being able to load up to 200 tonnes of cocaine in this submarine..." ...Meanwhile, one of Russia's largest anti-submarine warships accidentally fired at a town on the far-east coast, the Pacific Fleet said yesterday... No one was hurt when the shell, fired... during an exercise, exploded in marshy ground near Slavyanka.

...an MP and former submariner... [who is] a member of a Russian parliamentary team investigating the... Kursk... disaster... said yesterday that the Kursk and the Peter the Great were carrying out an exercise in the Barents Sea in which the cruiser acted as an enemy aircraft carrier and the

submarine was expected to attack it... [T]he cruiser fired five anti-submarine missiles at the Kursk but only four could be found afterwards. "It looks like the submarine was hit by the missing missile." The Kursk then tried to rise to the surface but hit the bottom of the cruiser. A chastened Deputy P[M]... admitted in Parliament... that Russia's rescue effort was woefully inadequate. But [the Deputy PM dismissed the investigator]'s claim as "crazy" and denied that the Russian authorities had deliberately misled the public into believing that some of the... crew had survived two explosions which destroyed the prized vessel. The Kremlin now says that no one survived the initial explosion and that tapping sounds from inside the hull, which the Russian Navy had said showed that some sailors were alive 48 hours after the disaster, were made by automatic machinery. [The investigator]'s claim is similar to a report in the *Berliner Zeitung* newspaper last week. Russian officials have hotly denied that the Kursk could have been sunk by one of their own ships, but have been unable to explain exactly what happened... [● Russia] has signed a contract with a Dutch firm to raise the... Kursk... The... attack submarine was designed to destroy US aircraft carriers and... was thought to be unsinkable.

...A LETTER found on a body on the doomed Russian sub Kursk shows at least 20 [submariners] survived the explosion but died of suffocation... The Russian Government said yesterday that... a leak of hydrogen peroxide used to fuel the 65-76 Kit (Whale) torpedo[es]... caused the explosion...

A team of divers and metal experts have descended on Pearl Harbour to study the corrosion of the sunken battleship USS Arizona, which still holds an estimated 3.7 million litres of oil. The battleship... [lies] in 12m-deep water, and is an enormously popular war memorial that houses the remains of 1177 [sailors]. The study follows fears corrosion may lead to a massive leak. Lost to a Japanese bomb in the December 7, 1941, attack on Pearl Harbour, the ship sank in nine minutes and lit the sky for three days as the oil aboard burned. A trickle of oil has leaked into the ocean ever since... The Navy... has a 24-hour on-duty oil response team for Pearl Harbour, in the event of a spill... [that] could damage nearby wetlands which are home to endangered birds... "It's not an enormous undertaking to cut into a ship and pump out oil," said... [the] chief of the National Park Service's Submerged Cultural Resources Unit. "But we have to be respectful that this is a war grave..." Only a handful of specially certified divers are even allowed to be on the outside of the ship. They are mostly used to drop 9m down to what is left of a gun turret to deposit the remains of sailors who were assigned to the Arizona at the time and wish to be buried with their shipmates. An \$US11,500... mini-sub is being used to measure the thickness of the wreck's metal... [By the way, r]esearchers say they have found a Japanese midget submarine sunk more than an hour before the attack on Pearl Harbour. Discovery of the 24m sub could provide the first physical evidence to back US military claims that it fired first against Japan in W[W]II and inflicted the first casualties. The sub was sunk by a Navy destroyer... The remains of two Japanese crew... are... still inside.

...The U[S] Navy is trying to find out why a nuclear-powered submarine practising an emergency surfacing manoeuvre rammed into... a Japanese fishing ship southeast of Pearl Harbour. A search was continuing last night for nine people still missing from the 54m Ehime Maru, which split open and sank in 5486m of water 10 minutes after the submarine surfaced under it... Twenty-six crew members and teenage students were rescued. "While it's not yet clear how the accident occurred, it is both tragic and regrettable," said... [the] commander-in-chief of the US Pacific Fleet. "I want to express my apologies to those involved in the incident, their families and the Government of Japan." The submarine, USS Greeneville, stayed at the scene overnight and returned to port under its own power, [the admiral adde]d. Its rudder and port side showed scrapes from the collision... The US National Transportation Safety Board, an independent government body that looks into transportation accidents, said it had sent a five-member rapid-response team to investigate the collision. In 1990, the board cited a failure to use sonar detectors effectively on board the US Navy nuclear attack submarine Houston in an incident that led to the sinking of the tug Barcona off southern California the year before.

...A civilian, one of 15 invited aboard the USS Greeneville for a brief training cruise last week, was at one of the three control stations of the submarine as it shot to the surface and struck a Japanese fishing vessel, a Pentagon official said yesterday. The official, who asked not to be identified, said the civilian was under careful supervision at the time and apparently had no influence on the collision. Separately... a Pentagon spokes[person] declined to identify the 15 civilians from Hawaii who had been aboard the submarine. Meanwhile, a... 2040kg... Navy underwater robot vehicle arrived in Hawaii yesterday to examine the possibility of raising the Japanese ship that sunk after it was hit by the US submarine in a major international incident. The... US President... said [it] had telephoned... Japan['s PM]... and apologised to the Japanese for the accident.

...A crew member on the submarine USS Greeneville told the National Transportation Safety Board that civilians on board were a distraction as the vessel prepared to surface... [An] NTSB... official... said in Honolulu that the sonar plotter on the submarine - ...who notes contact with other possible ships - said [it] was unable to finish plotting sonar blips because the civilians were in his way... but did not ask them to move... [Furthermore, 'other equipment wasn't working.' However,] there were "significant reasons" not to repair the broken sonar repeater because doing so would require shutting down other key systems... If a malign force had deliberately set out to inflame the close but never comfortable relationship between the U[S] and Japan, it could not have been more destructive than the sinking of the Ehime Maru... The accident is unlikely to affect the strategic arrangements between the two powers. But... on the street[s] of Tokyo, the US's claims to be serving Japanese interests have never looked so threadbare. "It's terrible that the Americans should be so careless... Just imagine the outcry if it was the other way round, but it never is..."

...*Joyride turns to tragedy*... Nervous but excited, [a Texas oil magnate]... pulled two levers on the U[S] nuclear attack submarine Greeneville and quickly sat down as it veered towards the surface. [The Texan] was surrounded by real sailors. A few of them, including the captain, had looked around with the periscope before the submarine began its emergency surfacing exercise... Built to serve as an unseen, unheard killer, the submarine this time did not see or hear what was above in the choppy waters off Hawaii a week ago. [However, everyone aboard] heard a loud noise and felt the shudder of an unexpected impact... On the Ehime Maru, the... skipper... felt [it] had sailed his 57m trawler "over some kind of big building." Instead, it was a 108m submarine breaking the surface... like a "whale"... The Ehime Maru was the pride of Uwajima, a... port of 60,000 where nothing happens... The consequences are being felt far beyond the little town. On the outcome of the... tragedy depend several senior military careers, the job of the Japanese P[M] and the future of one of the most important military alliances in the world. Rarely has the U[S]-Japan military relationship been so beset by tensions and uncertainties. More and more Japanese... question the costs of the US-Japan Security Treaty... 48,000 [US troops are] stationed in Japan... Hardly a month passes without some crime or outrage being perpetuated by [one of them].

...*The US armed forces are building an unhappy chronicle of own goals*... When [our P]M... gets the explanation [it] has demanded for the accidental bombing to death this week of Major John McNutt in Kuwait it will, no doubt, be a document filled with diplomatic remorse and regret. That is, as they say at the Pentagon, standard operational procedure when something goes wrong - and America's military commanders have had plenty of opportunities to perfect their penitent prose style. While the world's greatest military power prefers to project an image of polished perfection, recent history paints a rather different picture. With friends like the US military, it can often seem that enemies are beside the point. Consider what happened more than 20 years ago, for example, when [President] Ronald Reagan decided that the future of the Free World was being threatened by a battalion of Cuban construction workers and their hard-left hosts in Grenada. A task force was hastily assembled and the troublesome island invaded without warning, or even much of an explanation. Twenty-four hours later, victory was declared and the surviving Cubans shipped home to Havana. At the White House, the Gripper's spinners let it be known that the 21 Americans who died represented the unfortunate but unavoidable price of wresting the world's fifth-largest producer of nutmeg from the clutches of the international communist conspiracy. But... [w]ith only two or three exceptions, all those US casualties were the victims of "friendly fire" or, more often, sheer military incompetence... [S]ome of the Marines who died were shot by fellow grunts in an engagement that saw two squads blazing away for more than an hour through a screen of tropical foliage. In another incident, a... commando squad jumped from a helicopter only to sink like stones in the offshore waters - dragged down by the sheer weight of their equipment they had been ordered to carry against their better judgment. But the crowning act of homicidal incompetence was inflicted on the poor unfortunates incarcerated in Grenada's one and only lunatic asylum... What the deranged

inmates cannot have known as wave after wave of helicopters pounded the building with rockets and mini-gun fire was that the invasion's intelligence officers had mistaken the compound for the island's Parliament... The Panama invasion mounted... to oust [a]drug-running dictator... – whose career the US had fostered in the first place – produced similar “civilian collateral damage” when a succession of air attacks levelled one of Panama City's poorest neighbourhoods. As in Grenada... no exact figure was ever put on the number of Panamanian casualties. Skip forward, and the cavalcade of Pentagon blunders continues: the Iranian airliner shot down in the Persian Gulf. The “friendly fire” deaths that claimed allied lives in the Gulf War. The bombing that reduced the Chinese Embassy in Belgrade to rubble. The 20 skiers who plunged to their deaths when the hot-dogging pilot of a Navy attack Prowler jet sliced the cable of their gondola. The five killed when the USS Saratoga fired on a Turkish destroyer during a Nato exercise. The caretaker who perished only last year in Puerto Rico when Navy jets blasted the wrong part of a bombing range on the offshore island of Vieques. And finally – if you overlook this week's Kuwait incident[(in which the NZ)... special services officer... and five U[S] soldiers were killed after an)... ace pilot... was told [it] could drop his three... “dumb” bombs... [during] a live-ammunition bombing exercise... [b]ut moments later, the controller frantically shouted, “Abort, abort!” as [the controller] realised too late that the pilot was flying towards his own observation post[; seven]... other soldiers were wounded in the accident[)]... that is – there was the collision between the US submarine Greenville and the Japanese trawler Ehime Maru, which killed nine... Ever since the Japanese ship went down, the US Navy has tied its version of events in the sort of complicated knots for which sailors are famous. At first, the fact that the sub's control room was crowded with visitors... was not mentioned. Then, even as the inquiry began, unnamed Navy sources began leaking all manner of fanciful explanations... By late this week the tide had turned, with even friends of the Greenville's captain going on record to say, well, shucks, [it] was the one who deserved to be keelhaunched.

...A U[S] Navy court of inquiry into the submarine-trawler collision off Hawaii in which nine Japanese were killed has recommended measures that would probably end the submarine commander's career but would spare him a court martial. A Navy official, who did not want to be identified, told reporters the recommendations, if implemented, meant [the c]ommander... would “be out of the Navy, but at least [it] won't be in jail.” The... 2000-page report by the court of inquiry, composed of three Navy admirals, was delivered to [the]Pacific Fleet Commander... at the weekend, and it is up to [the admiral] to decide what action to take, if any, within 30 days... [The submarine commander] would face 10 years in prison of court martial and convicted on the charges of negligent homicide that were considered by the panel... A... highly decorated... top-gun U[S] Navy pilot may[also] face a court martial for dropping his bombs in the wrong place, killing six soldiers, including N[Z]er Major John McNutt.

...US pilots accidentally dropped bombs near observation posts in Kuwait three times during training before the one that killed... John McNutt and five others... No one was killed in the earlier botched raids... in the months leading up to Major McNutt's death... [when a] Navy ace... mistook [an] observation post for his intended target. The target turned out to be about 1.6km away. The... Pentagon report into the... tragedy... recommends that [the pilot] and two other US defence personnel, air controllers who helped guide him towards the observation post, be punished...

U[S] officials early today demanded the release of 24 American[s]... and their spy plane from a Chinese island after the super-secret aircraft was forced to land following a mid-air collision... with a Chinese F-8 fighter jet on Sunday... Senior US Embassy staff reached the island of Hainan as a tense diplomatic showdown between China and the US deepened and the Pentagon admitted there had been no contact with the crew... The EP-3 maritime patrol plane, packed with top-secret electronics, was forced to make an emergency landing after [the] mid-air collision... The incident, for which each side is blaming the other, is a bitter blow to the already strained relations between the two countries. The extent of the damage rests on how quickly Beijing returns the aircraft and its crew... The US Navy and Department of Defence have warned the Chinese to stay away from the aircraft... [The US President's spokesperson] said it was the White House's “expectation” that the plane would be returned intact... The US Navy said the EP-3 was on a “routine surveillance mission” in international air space over the South China Sea when it was intercepted by two Chinese F-8s. One of the Chinese jets hit the EP-3's wing, forcing it down. Searchers failed to find the pilot of the Chinese fighter, which crashed into the sea... The incident provides a further challenge for [the]US President... At a meeting with [a]top Chinese diplomat... last month, [the US President] failed to resolve differences over the possible US sale of destroyers – equipped with the Aegis ship-based radar system – to Taiwan. China has threatened to invade [Taiwan] if the island, which it considers a renegade province, declares independence from the mainland.

...Taiwan's vote puts Beijing threat to test... Taiwan dumped its long-ruling Nationalist Government at the weekend and elected as President the leader of a pro-independence party reviled in Beijing... Within an hour of his victory, [Taiwan's new President] reached out to Beijing, saying that before his inauguration... [it] hoped to make a “journey of reconciliation” to the mainland... But [the President] set out his bottom line on reunification, saying [it] rejected as “unacceptable” China's “one country, two systems” formula under which it reclaimed Hong Kong and Macau... Before the results were announced, Taiwan's 400,000-strong military pledged to back whoever won.

...The radar-invisible stealth bombers may have lost their cloaks. It's been revealed today that China, Russia and several other countries have worked out how to track the stealth planes with something as simple as a TV transmitter. What's worse, the transmitter can track the aircraft without the pilots even knowing. The devices are what's called passive radar, and the US may have to spend billions to upgrade the stealth fleet.

...While... [‘remotely-piloted fighter aircraft (operated by ground-based pilots using a remote with the aid of computers) – that will finally unlock the problems of G-lock’ –] Flash Gordon flying suits, robot bugs and microlight flying spies have yet to be deployed in actual combat, every single one of those futuristic systems is either under development or already being tested by an agency of the U[S] armed forces that may well be the most remarkable, and certainly the most innovative, weaponsmith in the history of warfare, the Defence Advanced Research Project Agency – Darpa for short. “I think, dollar for dollar, the American taxpayer gets phenomenal value out of Darpa, which has always taken a refreshingly different attitude to weapons development,” said... the A[US]n-born Massachusetts Institute of Technology roboticist whose pioneering work on simple “insect machines” paved the way for the exploding cockroach... Now undergoing testing at the Army's tank training ground at Fort Hood in Texas, the first “exploded” tanks should be available for deployment by 2006. “History teaches us that effective innovation is the most potent weapon,” said [the AUSn]... At a time when [the US]President... is asking American taxpayers to pour what may well turn out to be a trillion dollars into a controversial missile shield that is supposed to protect the US from nuclear attack, Darpa's approach stands in stark contrast – not least because, unlike the Strategic Defence Initiative, its brainchildren actually work... [Incidentally,] 24 soldiers... were... asked to drive, march or crawl through a nuclear fallout zone in the A[US]n desert in 1956, official papers released in Britain show. The officers, N[Z]ers, AUS]ns and British, entered the fallout zone three days after a nuclear device had been detonated there, a military memo from A[US]n Government archives said. “The object was to discover what types of clothing would give best protection against radioactive contamination in conditions of warfare.” [The]Scottish radiation researcher... who came across a reference to “clothing trials” in the memo, said it appeared to contradict British Ministry of Defence denials that [soldiers] were used as guinea pigs... It was assumed that the [24 soldiers] had since died... “The relevant part is that Britain has admitted this,”...

N[Z] soldiers may have been exposed to debris from depleted uranium ammunition in the Gulf War or Balkans conflicts after all. The Defence Force, which has begun an investigation, announced yesterday that its staff might have gone into areas that had been attacked with the “tank-busting” shells. The controversy erupted in Europe last month when it was revealed that some Balkan peacekeepers had developed leukaemia after exposure to the radioactive material. N[Z] defence leaders indicated that their staff were unlikely to have been affected... [Yet NZ s]taff had, for instance, cleared away a tank destroyed by depleted uranium ammunition. Others went into villages or cities known to have been bombarded with the shells. But views varied... on whether the danger period was only during and immediately after the explosion or whether it lingered... Iraqi doctors have reported a huge increase in the cancer rate in areas coated in depleted uranium dust from exploding US shells in the 1991 Gulf War.

...European fears over depleted uranium munitions continued to snowball yesterday as Nato's top official denied the issue threatened to split the 19-nation alliance and the U[N] demanded wider health checks... The UN has begun to place warning markers at the scene of Nato airstrikes in Kosovo... Also yesterday, further evidence emerged that the risks of DU have been known for several years... The British Government is denying news reports on Thursday of being told of the dangers of DU to its troops in 1997. But, the BBC reported yesterday, a warning was made in 1991 by an official at AEA Technology, the trading arm of the UK Atomic Energy Authority... And an even earlier warning was issued in the US in 1990.

...[a] US review of causes of... Gulf War Syndrome... [has identified] pyridostigmine bromide which was given to 300,000 troops as... a... possible culprit... [In related news, the EU] yesterday promised to act over the escalating fears about Nato's use of [DU] in ammunition in the Balkans, as France said four soldiers who served in the region were being treated for leukaemia. Amid mounting pressure on Nato to investigate the so-called "Balkan syndrome,"... the European Commission president, said ammunition using [DU] should be banned even if there was "minimal risk."

...As more and more cases of "Balkans syndrome" are reported among soldiers, the risk to civilians is just beginning to be considered. The condition came under the spotlight after reports that six Italian soldiers who served in the former Yugoslavia had developed leukaemia and died after exposure to spent ammunition. Five have since died in Belgium, two in the Netherlands and one in Portugal. The Government of Bosnia's Muslim-Croat federation has complained that Nato has not cooperated with it in researching the dangers to its people. Bosnian health statistics indicate a marked increase in cancer in recent years... [T]he federation Health Ministry... said Nato refused to share information on [DU] in 1995, and called for international support to research the risks... Some 31,000 DU warheads landed inside Yugoslavia during the 1999 Nato air raids... Belgrade's Institute of Oncology, said that, so far, there had not been a significant rise in leukaemia or cancer but they can take up to 10 years to develop. The Yugoslav Army marked five areas in Yugoslavia, excluding Kosovo, contaminated by radiation... But many... people... in Serbia believe the experts are hiding the truth to avoid public panic. Many are convinced [DU] warheads were used in Belgrade, which officials deny.

...Nato has admitted using [DU] weapons in Kosovo, exposing civilians, its own troops and aid workers to health hazards, says the UN... [The] head of the UN Balkan environment task force investigating the use of munitions during the 70-day war, said Nato was still holding back crucial data on where and how it used [DU] weapons, which can contaminate land and water sources with radioactive and toxic particles... A Yugoslav pathologist said yesterday that... 400 Bosnian Serbs from an area bombarded by Nato with [DU] shells in 1994 later died of various forms of cancer.

...[12] British troops who served in the former Yugoslavia are planning to sue the Defence Ministry after suffering "Balkans War syndrome" health problems... The move comes after similar action by veterans of the 1991 Gulf War who complained of "Gulf War syndrome,"... More than 100,000 Gulf War troops, from the US, Britain and Canada, have suffered a range of symptoms linked to the syndrome, which has yet to be fully understood... [In further news from overseas, t]housands of Nigerians mourning those lost after an armoury fire faced the grim task yesterday of retrieving the bodies of loved ones before city authorities emptied overflowing mortuaries into mass graves. Workers pulled more than 600 bodies from two canals near a weapons dump that burst into flames on Monday... a death toll that pictures and witness accounts suggested could soar... Newspapers said the final toll could be around 2000, most of them boys and girls who drowned in the canals during a stampede after the fire, which sent smoke billowing and rockets raining over a crowded Lagos suburb... Pressure is mounting for the authorities to explain the disaster... Military officials had said the blasts were caused by a fire in a market near the armoury... The upper-house Senate summoned... [the] Defence Minister... "to answer charges of negligence". Senators said a House committee ordered the armoury's relocation from Lagos' Ikeja district about two years ago... The commander of the Ikeja cantonment... went on state television to dispel rumours that the explosions were the beginnings of a coup.

...Britain is considering developing a high-tech bomb which uses a blast of heat to destroy buildings and kill people. The Ministry of Defence said the weapon would be used by infantry in urban areas... [■ A US] Air Force... C-131 "Samaritan" aircraft... dropped a 9450kg bomb on a range in northwest Florida yesterday in a successful first live test of a powerful new weapon nicknamed the "mother of all bombs". Defence officials suggested the test was... about the might of the US military... The bomb packs 40[%] more power than America's second most powerful non-nuclear bomb, the 6750kg "Daisy Cutter"... The giant bomb... spreads a flammable mist over the target then ignites it, producing a highly destructive blast.

...*Son of Star Wars proves embarrassing fiasco*... A CRUCIAL \$200 million test of an anti-missile shield by the US has failed over the Pacific... The action was to be relayed live from the Pacific to a big screen at Boeing's East Coast headquarters. The atmosphere was relaxed and confident. A senior Pentagon official... ran a simulation of what was intended to be a seamless operation – a... test of a missile defence system that would push the U[S] into a new generation of nuclear weaponry. After a two-hour delay while technicians fixed a last-minute glitch, a 37-year-old remodelled Minuteman rocket containing a mock warhead and a decoy balloon thundered aloft from a tightly guarded launch pad at Vandenberg Air Force Base, 200km north of Los Angeles. Twenty-one minutes later, an interceptor missile carrying the "kill" vehicle ripped into the daytime sky from Kwajalein Atoll in the Pacific. The kill vehicle was supposed to separate from the second-stage rocket booster exactly two minutes and 37 seconds into flight, then manoeuvre itself into the path of the mock warhead. [The official] alerted the watchers as interception neared: "It'll be eight minutes after the launch." The clock ticked on past nine minutes. "We should have had confirmation by now," said [the official]... Nearly half an hour passed before officials who monitored the test from a basement office in the Pentagon reported that the interceptor missile had missed. Without making an announcement, Boeing and Defence Department officials transported the entire gathering through the dead of night to the Pentagon. There... we heard that one of the most technologically adventurous experiments mounted by the Defence Department had floundered for a banal low-tech reason. The booster had failed to separate and launch the "Exoatmospheric Kill Vehicle." ...It had not received the necessary signal. The test was intended to be the gateway to the most important policy decision of... [the US Administration]: whether to proceed with the embryonic National Missile Defence system... This was supposed to be the missile defence system that would take the US into the next phase of military world order, and – say its critics – run the risk of detonating another arms race. The test was the decisive one of three: last October a kill vehicle pulverised a dummy missile, but [the next test] missed another by 43m... The scope of the project is awesome: proceeding in four stages from an initial 20 missile interceptors in 2005 to a fleet, by 2011, of 250 Exoatmospheric Kill Vehicles in underground silos across Alaska and North Dakota, unleashed and guided by a global network of three command centres and five communications relay stations using 29 satellites and 15 space-based radar stations... Yesterday, the project seemed doomed. The technical problems make it almost impossible for the Pentagon to recommend pursuit of the high-speed timetable set down for the missile shield. They also reinforce a host of political and strategic objections... which ha[ve been voiced]... since a bipartisan vote in Congress last year mandated the President and the Pentagon to develop an heir to Star Wars.

...*As the catalogue of weapons fizzers grows, so does the bill. But... few seem to be counting*... Regardless of success or failure, weapons are a lot harder to kill than the soldiers who operate them. Even with a former anti-war protester in the Oval Office, Star Wars came creeping back. The White House of course denies that the defence contractors' unusually generous donations of late to Democratic causes and candidates has the slightest relevance to the debate. Last weekend, just a week or so after... the... Senator... of Virginia[']s... aides issued a string of press releases reaffirming their master's unqualified support for Star Wars' latest incarnation – now rechristened Theatre High-Altitude Area Defence System – the senator watched in dismay as a much ballyhooed test went gravely astray. Given the unusual amount of pre-test publicity, Pentagon sceptics had long since concluded that the fix was in. It would not have been the first time. When the Tomahawk cruise missile was being broken in during

the early 1980s, it was later revealed that Air Force generals had arranged to have homing devices stashed inside the targets. Another project, a radar-controlled Gatling gun known as Divad, was similarly gingered and would probably have been approved for full-scale production if congressional investigators had not blown the whistle. This time... a simple fault... sent \$US100 million... worth of high hopes plunging into the ocean. Was [the senator] discouraged? Not at all – even though the latest failure brings the score to eight flops and only one, very dubious, success. “America is defenceless and we cannot live with that,” [the senator] said with unintended irony. Since [the senator] is also the chair[person] of the Senate Armed Services Committee and exerts as much influence as the President over the Pentagon’s budget, his words carry a megatonnage of weight. “Early deployment of the system remains imperative if our country is to remain secure,” [the senator] continued. Any problems, his aides later explained, could all be ironed out after the first interceptors are installed on an island in the Aleutians between Alaska and Siberia, where they would (optimistically) take out any nuclear-tipped missiles from North Korea. The fact that Pyongyang’s only existing missile is barely capable of reaching Japan, and none too reliably at that, did not chill enthusiasm in the least. If we pour another \$US60 billion into the scheme on top of the \$US50 billion already spent, the US would surely get something worthwhile, was the thrust of his remarks. The Pentagon, its contractors, and hundreds of [the senator’s fellow members of C]ongress – Republicans and Democrats in whose districts parts for the system are being built – shouted their amens. Could so many people be so wrong? Well, yes, according to [a professor from the] Massachusetts Institute of Technology... who has been getting up the Pentagon’s nose for more than a decade. When the Gulf War ended with the generals congratulating themselves on the Patriot missile’s alleged successes at destroying incoming Iraqi Scuds, [the professor] analysed the data and discovered that the wonder weapon may not have scored a single kill. The Scuds exploded, [the professor] explained in a conclusion later verified by the Government Accounting Office, because [Iraq’s] President... had ordered a series of “improvements” that caused the missiles to break up of their own accord. If you have a mind to hear similar nuts and bolts explanations for the latest Star Wars flaws, [the professor] can list them for hours. His chief objections, however, are simplicity itself. The first is that an attacker could easily overwhelm any missile defence by launching flocks of cheap and simple decoy warheads. The second objection – and in [the professor’s] eyes, this is the real sin of Star Wars – is that [the senator] and his ilk must surely recognise even a “rogue” nation like North Korea would be most unlikely to launch an open nuclear attack. Such a move could only result in a counterstrike of instantaneous annihilation. The real threat, [the professor] says, is already known to [the senator] and every other [member of C]ongress who bothered to read a report entitled “Wild Atom” – c]omplied six years ago by the Centre for Strategic and International Studies with the help of the FBI, CIA and the US Energy Department... The authors noted with alarm that there was nothing the world’s last superpower could do to prevent “a nondescript freighter with a crude nuclear device in its hold from arriving in Baltimore Harbour.”

...Sometimes, the biggest stories in the world go unreported. Some... are missed because they concern people or things whose significance lies in the future; at other times, it is because the nature of the change is so broad, slow and incremental that the nature of the shift just escapes notice, in terms of front-page news. So here is the news: the next world war is on its way. That is the only conclusion one can draw from the U[S] defence budget, which has begun a rapid escalation. America may be enjoying its longest period of peace for decades, but you would never know it from the way the Pentagon is planning to start spending. The target, apparently, is China, the new global enemy of the 21st century. For most of a decade the US armed forces and the defence industry have been short of an enemy. Arms spending plunged at the end of the Cold War as there was no longer any prospect of fighting a massive, multifront conflict. Defence spending has not been much of an issue... since then, until the past year. Suddenly, it has come front and centre again. In part, the reason is political... [T]he Republican... President[] (and son of the 41st President[]), has argued that [the 42nd] Administration... let defence rot. That claim has been rubbished. In any case, Washington’s spending plans leave no doubt of its future intentions. The rate of increase of defence procurement declined almost every year from the end of the [40th President’s] defence buildup until last year, as the possibility of global conflict withered away to almost nil. This year, it increased by 12[%], the first time it has hit double digits since 1984. It is heading for \$US62 billion next year[], up[] from \$US45 billion... and reputable think-tanks believe it may be closer to \$US80 billion... In part, the reason is the usual suspect: the defence industry, which wants and needs a burst of activity to keep its balance sheets healthy. To some degree, Cold War kit needs replacing but that does not explain everything. There is a more profound reason for the new militarism. The US is thinking itself into a new global conflict. This time, it is not in Europe; it is in the Pacific, and it was spelled out in part in a document called Asia 2025, written by, among others... a Pentagon military thinker regarded with religious awe by his Washington acolytes. It never explicitly addresses the threat, China is simply called a possible future “peer competitor.” The other post-Cold War “threats” to America – terrorism, civil conflict and Bosnia-type peace enforcement missions – all pointed to a smaller, more agile set of US forces able to deploy rapidly anywhere. But the China threat – a nuclear power, two billion people... – is satisfyingly Soviet-shaped and justifies a different type of military build-up. The forces can argue for more heavy airlift, more sealift[] – including ‘a submarine capable of carrying hundreds of troops’ –] more attack submarines, aircraft carriers and long-range bombers. The strategy for future war is laid down in Joint Vision 2020, the Pentagon’s new blueprint. The keystone is something called “full spectrum dominance.” That means “the ability of US forces, operating alone or with allies, to defeat any adversary and control any situation across the range of military operations,” according to the Pentagon. It “calls for the US to work to shape the international security environment in ways favourable to American interests... and prepare now for an uncertain future.” This is Pentagon-speak for: be afraid, be very afraid. Of all the projects spawned by the new “menace,” the big one is the National Missile Defence... America says it is aimed at North Korea and Iran; it is not, or at least not only at them. It is aimed at China, and maintaining US dominance in the Pacific. It will cost up to \$US60 billion; you do not spend that for one or two North Korean missiles. By any standards these are serious developments. America is preparing for a massive increase in its armoury; it is shifting its gaze towards Asia and away from Europe[] – where most[] US military assets are... But the consequences of N[MD] are spelled out in a classified US intelligence report. It says there would be a tenfold increase in the Chinese nuclear stockpile, more Russian warheads, increased proliferation in India and Pakistan – in short, an arms race from the Atlantic to the Pacific, endangering security everywhere.

...[the US] Defence Secretary... has promised Europeans that Washington would not act alone on plans for a controversial national missile shield and would help its allies set up such defences. “The U[S] has no interest in deploying defences that would separate us from our friends and allies,” [the secretary] told the annual Munich Conference on Security Policy. The first top official of the... Government of [the 43rd] President... to visit Europe and address the touchy issue... reiterated that the US did intend to build a... NMD... against limited attack from such states as North Korea, Iran and Iraq. “A system of defence need not be perfect. But the American people must not be left defenceless,”... [The secretary] gave no timetable for such a defensive system. Two of the last three tests have failed, and critics say such a scheme would cost in excess of \$US60 billion...

At precisely 3.09.42 yesterday afternoon an American interceptor missile hit a dummy warhead 225km above the Pacific Ocean and brought [the US] President’s... much-derided Star Wars plans a step closer... It was the second time the Pentagon had succeeded in intercepting an intercontinental ballistic missile warhead, but the first time it had scored a direct hit... The dummy warhead... was fired from... 7700km away.

...It is two years since the US launched missile attacks on Sudan and Afghanistan in retaliation for the bombs which destroyed its embassies in Dar es Salaam and Nairobi. Operation Infinite Reach aimed at targets linked to... [a Saudi extremist – America’s] Public Enemy Number One... a campaign [designed] to bring him to justice, a campaign which is still under way. But in carrying out that crusade, justice is precisely what has been put in question. Ask [the person who] owned the pharmaceutical factory in Khartoum that the US blew up with cruise missiles on the pretext that it was being used to produce the precursors for VX nerve gas... No satisfactory evidence has been produced to show that it was. The US alleged that [the owner] was an associate of [the Saudi], and froze his bank accounts... held in London by a US bank. When [the owner] threatened to sue, they rapidly unfroze his accounts. But they refused to back down on their accusations. [The owner] has never been indicted or tried. But when

senior [US] Government officials speak, anonymously, of his guilt, there is no accountability; and [the owner] is effectively convicted in the court of public opinion without a chance to speak. There are several other people sitting in a grim building in New York in a similar position, the indicted suspects charged with the embassy bombings. They are held in total isolation in the notorious 10 South unit of the New York Correctional Centre under what are euphemistically called Special Administrative Measures. Perhaps they are guilty; perhaps they are not. They have not had their day in court and there is little sign that they will do so for some time. There is a solid body of legislation authorising extreme measures against “terrorists” (including an 1980s law which makes it ‘illegal to kill USers anywhere in the world’ – ‘the first person convicted under this law received a 30-year sentence’.) A series of top-secret US Presidential Decision Directives authorise striking back at suspects wherever and however the US chooses: Infinite Reach. The 1996 Anti-terrorism and Effective Death Penalty Act established a new court charged with hearing cases in which the Government seeks to deport aliens accused of engaging in terrorist activity based on secret evidence submitted in the form of classified information. The... evidence has always been used against Arab or Muslim suspects. It has frequently been overturned... According to the public record, none of the informants involved in the case [against the Saudi] have direct knowledge of [his involvement in the embassy bombings]... But then for those involved in this operation, evidence, apparently, is of little concern. “We should have a very low barrier in terms of acting when there is a threat of weapons of mass destruction being used against [US] citizens,”... America’s top counter-terrorism official, told the *Washington Post*. [The official] led the missile attacks in 1998. From virtually nothing, [it] has built up a huge powerbase in Washington, aimed at this new threat of international terrorism, which supposedly poses the greatest single threat to the lives and liberty of... [USers. The official] “compares the current threat of global terrorism with the situation faced by Western democracies in the period leading up to... [WW2], when appeasement carried the day,” noted the *Post*. The war on terrorism has become an all-consuming passion for some in Washington in the last few years, the new “clear and present danger” against which they will “pay any price, bear any burden,” as [US] Presidents once said of Communism. But this is about more than just a threat. It is about bureaucratic infighting in Washington, for a start. Since the end of the Cold War, there has been a struggle to define a new enemy (and the money and power needed to fight it) and [the official] has come out on top... [The official], a little-known figure even within Washington, more than anyone else has also been responsible for raising the spectre of an “electronic Pearl Harbour,” a devastating attack by hackers on computer systems. “Why would anyone want to mount such an attack?” asked the *New York Times*, but [the official] had an easy answer. “To extort us... To intimidate us!” There have been plenty of “life or death” struggles like this over the years, directed by strange [officials] in dark little Washington offices with odd agendas and little accountability. The “war on drugs,” for example, that incredibly counter-productive US policy in South America and the streets of its cities; J. Edgar Hoover’s fanatical crusade against communism; or... [the] “neat idea” for funding the Contras in Central America. In each case, the “ends justified the means” except that in the end, they did not. The claim to international leadership which the US makes at the beginning of the 21st century is a strong one. But it relies, crucially, on moral leadership – on persuading others that it has right as well as might on its side. Without that, it still has... [might], but it will lose the fight. And who is really the greater threat to freedom in America: [the Saudi or the official]? ...America... wants justice for those murdered in the embassy bombings. But the way they have gone about pursuing justice has involved the US in some unjust actions of its own. It is not just pious liberalism to say that, even when pursuing terrorism, two wrongs do not make a right... “This will be a long, ongoing struggle,” said [the 42nd US] President... after the embassy bombings, “between freedom and fanaticism, between the rule of law and terrorism.” No one could disagree; but America needs to remember which side of that struggle it is on.

...NZ a ‘staging post’ for... holy war... A world authority on terrorism has warned that N[Z] is a “cleaning and conditioning station” for Islamic terrorists conducting a holy war and that a suspected network uncovered in Auckland is not the only one operating in this country... [The] director of the U[S] Congressional Task Force on Terrorism and Unconventional Warfare, said [it] had been aware for some time of Islamic terrorist activity in N[Z], and... had corroborating evidence that a clandestine network of Afghan refugees uncovered in Mt Albert during a people-smuggling investigation... was linked to terrorist networks inspired by... a... Saudi extremist... [T]here was independent confirmation that members of the Auckland group – including veterans of wars in Afghanistan and Iraq – had telephoned their superiors overseas, mainly in Pakistan... [The director], who is also director of research at the International Strategic Studies Association and a former senior US Defence Department adviser, said the Mt Albert group’s activities and structure were identical to those of [the Saudi]’s followers throughout the world...” Significantly, [the director] said, none of the members of this network had been apprehended. The *Weekend Herald* revealed last month that when police discovered the Mt Albert cell, they found evidence suggesting a conspiracy to attack the Lucas Heights nuclear reactor in Sydney during the Olympic Games. The lounge of the Mt Albert home had been converted into a virtual command centre, a street map of Sydney highlighted access routes to the reactor and a notebook contained details of police security tactics for the 1990 Commonwealth Games in Auckland. [The director, who] agreed to speak to the *Herald* on aspects of his research [–] but... some confidential information could not be disclosed because of his work with the US Congress... [–] said it was alarming that the Mt Albert group was discovered accidentally. “This suggests that this and other dormant terrorist networks might have escaped discovery and monitoring so close to the opening of the Sydney Games. Hence, the security authorities... must operate on the presumption that this is neither the first nor the last terrorist network lurking in and around A[US and NZ.]” The director, who is the... author of the book [*Saudi extremist: The Guy Who Declared War on America*], said [the extremist] was a “spiritual guide” and source of inspiration for the jihad... Others were responsible for the “practical” aspects of getting the jihad implemented. N[Z] was used as a staging post... because of its liberal society and “relaxed security environment,”... It was an attractive place for terrorists to come to gain refugee status and residency to get “clean” documents so they could travel the world easily. [The director then warned that NZ]’s role in overseas conflicts opened it up as a possible target for Islamic terrorists. “N[Z] is not a friendly country to them. In Timor, you have prevented the jihad from unfolding, in Bosnia you supported the US. You are not in the good guys’ camp.” ...Senior [NZ] police intelligence officers refused to comment on the revelations yesterday.

...Afghan leadership won’t hand over bombing suspect... Afghanistan’s Taliban movement has refused to extradite [a] Saudi exile... to the US to face charges of masterminding embassy bombings in Africa... that killed more than 250 people. The Taliban’s chief spokes[perso]n... said the movement, which is not recognised as a government except by three regional allies, had no extradition agreements with any country... [The spokesperson] repeated the Taliban’s position that [the Saudi extremist] was in Afghanistan with a special guard but his precise whereabouts were unknown. The Taliban acknowledged last week that [America’s Public Enemy #1] was still in Afghanistan after a London Sunday newspaper said [the Saudi extremist] had been seen in the eastern city of Jalalabad. The US launched a cruise missile attack... on suspected bases of [the Saudi extremist] in southern Afghanistan and has not ruled out more attacks. It has also renewed its advice to US citizens not to travel to Afghanistan.

...A former U[S] Army sergeant has pleaded guilty to helping to plot the deadly bombings of two US embassies in Africa, saying [the Saudi extremist] once showed him where a suicide bomber could cause the most damage. [The former sergeant], aged 48, on Saturday became the first person to plead guilty in connection with the August 1998 bombings in Kenya and Tanzania... His trial... had been scheduled to begin [nine months ago –] along with the cases of five of the 17 named in the indictment. Of those charged so far, six are being held in New York, three others are being held abroad and eight are fugitives, including... [the] Saudi-born millionaire... [–] portrayed by the US Government as the mastermind of the bombings... [–] who is on the F[B]I’s 10 Most Wanted List. The US Government has offered a \$US5 million... reward for the capture of each fugitive... [In related news, l]awyers for the Libyan... convicted of the Lockerbie bombing argued yesterday that vital evidence was misinterpreted and a key witness was never called. A year after [the Libyan] was sentenced to life in prison for the murder of 270 people in the bombing of Pan Am flight 103 to New York in 1988, his legal team are challenging central elements of the judges’ findings... If permitted by the appeal judges, the

defence team will also call a fresh witness... who claimed after the trial that there was a security breach at terminal three, Heathrow, which could have explained how the bomb was planted. Yesterday's hearing made legal history, being the first British trial to be televised, although proceedings were curtailed because of a computer error in the transcription service. As the appeal began, [the Libyan]'s wife, brother-in-law and five children unfolded banners outside the specially constructed Scottish court at a former US Air Force base in the Netherlands, proclaiming his innocence... The original trial was held without a jury, a fact that has led to complex legal arguments about the appeal... Unless the conviction is quashed, [the Libyan, now aged] 49, will not be eligible for parole for nearly 20 years. At the trial last year the [perso]n accused of being his accomplice... was acquitted[, and]... returned to Tripoli to a welcome from [Libya's leader]... Relatives of the victims said they would press for an inquiry into claims that intelligence and aviation security warnings were ignored, whatever the outcome of the appeal.

...AMERICAN families of the Lockerbie disaster are suing the Libyan government for \$22 billion in damages... but they will probably end up settling for a lot less, [a lawyer] said... The lawyer for the 150 families said the Libyan secret agent found guilty of the bombing was high up in the North African nation's government... [and had it]s support... Libya says it will pay compensation if [the 49-year-old Libyan citizen]'s appeal fails.

...[the way to US\$billions in compensation payouts is open now that Libya has accepted responsibility for bombing Pan Am'] Flight 103 bound for New York.

...The U[S]... came under multiple terrorist attack early this morning. ■ Two planes crashed into the World Trade Centre in New York... Within an hour a third plane crashed into the Pentagon in Washington... It is believed the planes... had been hijacked... ■ A car bomb was reported to have exploded outside the State Department in Washington. ■ A fourth hijacked plane was reported to be heading towards Washington... The attack came as office workers began work at the World Trade Centre. There were huge explosions after the planes crashed, and within an hour both towers collapsed. The death toll was unknown but expected to be in the thousands... Within moments of the attacks America went into damage control. ■ The White House was evacuated and [the]President... took to the air in Air Force One, cutting short a visit to Florida. ■ The Pentagon and all federal Government offices in Washington were evacuated. ■ Public buildings in New York... were shut down. ■ All aircraft in the US were ordered to be grounded... All plane departures were stopped in the U[S] under a "national groundstop" from the Federal Aviation Administration... In England, the British parliament was evacuated and the underground rail system... shut in precautions against terror attacks.

...Americans reeling from history's worst act of terrorism are now demanding to know how four teams of hijackers could breach their national security to kill thousands of people. Shockwaves from the attacks on New York and Washington were felt yesterday in financial markets, air travel and in security clamps at public facilities all over the world. A global investigation involving numerous American and foreign security agencies is focusing on [the Saudi-born,]Afghanistan-based terrorist leader... Names of five suspects have been gleaned from passenger lists... The death toll from the airborne attacks... remained unknown early today – but... thousands... are believed dead or trapped in the wreckage of the calamity which rocked the nation's seats of finance and government. Authorities have not released details of those dead or missing... It is likely to be the deadliest day in American history, surpassing the worst event of the civil war, when around 4000 died, and the attack on Pearl Harbor, which killed 2390... All 266 people aboard the four aircraft died. Up to 800 defence staff are feared dead at the Pentagon... American skies remained no-fly zones overnight... The world's airline system virtually ground to a halt yesterday as hundreds of flights were cancelled or diverted after the grounding of all civilian flights to, from and within the U[S. In NZ], the Government ordered the screening of domestic and international passengers at all main centres... N[Z's] consul-general in New York... had no reports of Kiwi casualties but said up to 1000 worked in the environs of the World Trade Center.

...As many as 50 people could have been in the U[S] to plan and execute the unprecedented terrorist attacks on New York and Washington... The FBI has declared the investigation the biggest [perso]nhunt in history... US officials... say they have "credible evidence" that the... President... was the target of the attack... [The President] visited the Pentagon yesterday, committing the country to a "monumental struggle of good versus evil". [The President] worked through the day to build a global coalition against terrorism, and was boosted with an emphatic move by Nato, which invoked its mutual defence clause for the first time in its 52-year history... Across the Western world there were reports of followers of Islam feeling a backlash against the carnage in America... [P]ublic figures... were... urging calm and tolerance... New York City has asked for 6000 body-bags from federal agencies. About 40,000 people worked in the huge high-rises. The dead includes hundreds of firefighters and police officers who rushed to help after the attack... The first estimate of the direct financial cost came from the global insurance industry yesterday, which put a possible payout at close to \$NZ100 billion. The US Congress approved an emergency \$NZ50 billion recovery package sought by the White House.

...As insurance experts began to assess the scale of the devastation caused by the attack on the World Trade Center and the Pentagon, the estimate for the total bill soared to... be the largest bill the insurance industry has ever faced. The most expensive incident before this week's atrocity was Hurricane Andrew in 1992, which... cost the equivalent in today's money of about \$44.7 billion... [But w]as the attack... an act of war or terrorism? ...Policies usually contain exclusions for expected events and acts of war... When the... World Trade Center... towers collapsed, fatally weakened by the inferno of 1000 degrees C ignited by the aviation fuel in the planes' full tanks, they set off a cloud of dust that blanketed New York's financial district... The great imponderable is how many other buildings have sustained damage. Yesterday, emergency crews estimated 100 buildings could have been damaged. Rescue efforts have to be repeatedly stopped as parts of buildings around Ground Zero crumble away. Just hours after the attacks, another World Trade Center building, Number 7, collapsed. Across the street, One Liberty Plaza... was damaged but still stands. But at the centre of the devastation is the 500m expanse of rubble that was the twin towers. The rubble is not just being dumped. Trucks are taking it to a huge indoor warehouse on Staten Island. There... the FBI's Evidence Response Team pore over every broken piece, looking for anything that will yield clues to the atrocity... The heart of New York's financial quarter is now the world's largest crime scene.

...Bright searchlights lit the darkened, hellish ruins of the World Trade Center after a day of rescue efforts which recovered only three people alive. They brought the total of rescued people to five of the thousands feared buried and, most likely, killed in the rubble. Towards the end of a gruelling day for rescuers, One Liberty Plaza – a 54-storey building near the ruins of the 110-storey twin towers that had once dominated Manhattan's southern skyline – appeared in danger of collapse and the area was evacuated... but it did not collapse... Southern Manhattan from 14th street... was shut down... Distraught family members rushed from hospital to hospital desperately seeking missing relatives... Doctors... reported an alarming lack of people to treat... People donned face masks to protect themselves from the dust... and smoky stench that [has]drifted 8km north of the disaster area... Some... bridges and tunnels into Manhattan... and... Newark International Airport... reopened to limited traffic.

...Flights to the U[S] are unlikely to resume until the weekend. U[S] aviation officials announced a limited resumption of commercial flights yesterday to allow travellers stranded around the country... to return home... It is believed... Boston's Logan International Airport may have been chosen as a soft touch for launching airborne terrorism. Long-standing security concerns at the busy airport took on new weight as authorities pondered the apparent ease with which... hijackers boarded the two planes used to destroy the World Trade Center... The airport's owners were fined \$178,000 in 1999 for 136 security violations... Staff operating luggage-screening devices also routinely failed to detect test items such as pipe bombs and guns... Many baggage handlers and airport security personnel were low-paid foreign nationals not necessarily motivated to carry out their jobs... [□ A] 48-year-old lawyer educated at Auckland University, is the first N[Z]er to be confirmed as dying in the worst terrorist attack in the U[S]... The father-of-three was one of 45 people on board United Airlines Flight 93, which took off from Newark on Tuesday morning (New York time), bound for San Francisco. Terrorists took over the Boeing 757, probably with the aim of crashing it into the White House or another significant target, such as Camp David. Instead, it appears passengers fought back and the jet crashed in a wooded area near Pittsburgh... As the

US shuddered in the aftermath, the family and friends of Mr Beaven paid tribute to him. His... 34-year-old... [American] wife... told the *Herald*: “You’ve lost a gem N[Z. Alan]... was just the most incredible [perso]n in the world... it was a blessing to have known him. I’m going to cry now.”

...why did the twin towers at the tip of Manhattan, symbols of American economic power, disintegrate? After all, the Empire State Building took a direct hit from an errant B-25 bomber in 1945 and reopened within months. It was a matter of the sheer size of the aircraft – ...B-25[s] weighed a mere eight tonnes... The World Trade Center Towers were built to withstand hurricane winds or minor earthquakes, but not the kamikaze punch of a 200-tonne airliner loaded with thousands of litres of fuel. “It’s virtually impossible to design buildings for any terrorist act some nut can come up with,” said... a principal at... a Kansas City engineering and architecture firm... Although the 110-storey towers survived the initial impacts, experts say their steel frames ultimately succumbed to overwhelming stress and intense heat... “With a high-rise like that, you experience progressive collapse. If there is damage to an upper portion, it impacts on the floor below and continues to the ground.” ...[that’s why, w]hen the end came, the 30-year-old skyscrapers did not topple in Hollywood disaster-film style[– but instead] collapsed in a billowing cloud of debris...

Reality hit home in Hollywood yesterday as movie studios delayed the release of two major films... *Big Trouble* follows a group of people who find a mysterious suitcase leading to a terrorist plot with a blackmarket nuclear bomb... In *Collateral Damage*... a fire[fighter]... sees his wife and son die in the terrorist bombings of a building... Executives at the nation’s major television networks [have also]scrambled to rethink the coming season’s schedules, in which espionage and terrorism programmes figure prominently... Disney’s ABC television network cancelled a planned broadcast of the 1997 thriller *The Peacemaker*, which involves nuclear terrorism. “It just didn’t seem appropriate at this time,”... All major networks said they were taking a hard look at their shows to safeguard against content that might seem insensitive in light of the tragedy.

...“Kill one, frighten a thousand” is the terrorist watchword. This week, a terrorist organisation, or group of organisations, killed hundreds, perhaps thousands of people. The atrocity will frighten not merely individuals, but whole populations and the states that rule them. It was a dark event in the history of human liberty. The most likely outcome is the imposition of measures to restrict freedom of movement and residence. Such measures will be ineffective in preventing a repetition of the disasters, but will be made all the same... Meanwhile, [in]... the heart of Manhattan, in Washington’s suburbs, in saddened towns elsewhere, mourners grieved during the weekend at the first wave of services for the victims of the terror attacks. Among those farewelled were... Father Mychal Judge[, who] lived in... the friary of St Francis of Assisi Church, across the street from Engine Co. One/Ladder Co.24 in midtown Manhattan... On Wednesday, Father Mike raced to the World Trade Center with the unit. Seven of the engine company were to die in the disaster. Father Mike died with them, apparently when [it] paused to administer last rites to a firefighter mortally injured by a falling body from one of the 110-storey towers. “[Mike] took his hat off to pray, and something came down and hit him in the head,” said[the] battalion chief... Father Mike joined more than 300 firefighters lost in the inferno. In a city of heroes, hundreds of New York City firefighters yesterday paid their last respects to their chaplain of 10 years. Father Mike was listed officially as the first person to lose his life...

The... once-loathed New York Police Department, mourning 23 officers missing in the rubble, has won new respect... [But w]here once everything to do with the shattered towers was talked about in terms of heroism, controversy has now begun to seep in... New York police have been forced to admit that some scrap metal may have been diverted to mob-controlled businesses rather than the dump, where investigators are examining the rubble for clues and DNA that could help identify victims... of the... [atrocities]; 309 bodies have been found in the rubble, 5641 people are missing... And insurers are threatening not to pay out because crucial details of the [World Trade C]enter’s \$US3.4 billion cover had not been determined when the terrorists attacked... The cost of cleaning up “Ground Zero” and rebuilding the World Trade Center... is estimated at \$US39 billion... New York officials say just clearing up the 1.2 million tonnes of rubble will cost \$US7 billion and take up to a year... though exactly what should go on the site is the subject of strong debate... New Yorkers are... divided on whether to rebuild the towers or turn the area... into a memorial park...

The terrorists who attacked the World Trade Center in New York may have thought they were striking at the heart of America. In fact, they were striking at the heart of no fewer than 35 countries who have listed people as dead or missing in Manhattan... Some 4972 people are listed as missing... No survivors have been found since Wednesday. At least 189 people are believed to have died... [at] the Pentagon... The... military says it will cost “hundreds of millions” of dollars and take several years to repair the damage caused to the 48-year-old Pentagon... That comes on top of a \$US758 million... modernisation programme... [–] designed to prolong the life of the world’s largest office building... [–] already started when the terrorists struck. Renovations to the first wedge of the five-sided military headquarters in Washington had only recently been completed and the... hijacked airliner... smashed into that section... The fully fuelled aircraft clipped... lampposts and struck a generator as it came in... at high speed.

...As N[Z]ers tune in to gripping television coverage of the New York terrorist attack, a media expert is warning against overuse of footage showing the hijacked planes crashing into the World Trade Center. A[n A]uckland University media studies lecturer... was concerned at voyeuristic elements of the footage, which [it] believed in part played into the hands of the terrorists. [The lecturer], who specialises in television and national identities, said many academics and media scholars had written about terrorism being the guerilla warfare of the media age. In this case, it was clear the timing of the plane crashes was designed for maximum publicity. “It was done deliberately to create a media spectacle that would go around the world, and maximum propaganda for the people perpetuating the violence... They get what they’ve done in front of everybody.”

...THEY fell to their deaths one by one, a few holding hands, some in small groups. The images of plummeting bodies remain among the most haunting of the... terrorist attack and afford a terrible glimpse of the despair of those trapped in the World Trade Center. None of those who were photographed as they fell has been officially identified. In one heart-stopping photograph, a [guy] is shown plunging head first from the north tower, wearing the white jacket of a Windows on the World restaurant worker. [One person] believes it is a picture of her brother Norberto, 42, who was a pastry chef on the 107th floor... They had discussed what [Norberto] would do if... caught in a fire in a building that high. “[Norberto told me it] would jump,”... Some widows have asked: “Did my husband jump?” and have been told no. They have been consoled by the presence of a body... [A] Cantor Fitzgerald widow, has been asking the same questions... [after playing] her phone messages. There was one from her husband, John, 41: “I could hear him discussing with people all the different ways to get down...” [The wife] was discouraged from viewing her husband’s body... New York[’s] mayor] has promised to give each family of the missing an urn containing soil from ground zero. “...it will be all they have,”...

*As the world reels from last week’s terror attacks... how... can... parents... help their children deal with the media frenzy that has been unleashed[?] ...Around the world, millions of children have watched images of the two planes ploughing into the twin towers and people jumping from the burning buildings. And as the U[S] and its allies ready themselves for war, more disturbing footage is inevitable. But what impact does this have on children? ...Psychologists and child therapists spoken to by the *Herald* say... [v]ery young children won’t understand what has happened but older children may feel sad and confused. They will struggle to understand – like many adults – why some people... deliberately want to kill themselves. Some children may worry about whether it could happen to them... [I]t is best to stick to facts rather than speculate about what could happen.*

...When... New York’s... twin towers... collapsed before a worldwide... audience, almost anything suddenly seemed possible. The terrorist attacks caused an instant media frenzy, but in the rush to get the news first the usual journalistic checks also collapsed and false rumours, pranks and misinformation became facts fit for broadcast by radio, t[v], news agencies and the Internet. Even the *Herald* was not immune. False leads were rampant as reporters struggled to process the scattered reports flooding in. There were claims of up to eight hijacked aircraft searching for targets, and within hours of the first crash... an... ABC [anchorperso]n... was reading a report of a car bomb outside the State Department in Washington. The story was retracted within half an hour... Further bogus claims quickly followed, sending news crews on wildgoose chases – there was a bomb at the Capitol, a bomb at the Old Executive Office Building, and the *USA Today* building was in flames. By 6 pm [US] time, nine hours after the attacks, CNN was showing videophone pictures of explosions in the Afghan capital, Kabul, accompanied by suggestions and denials that it was a

swift act of revenge using cruise missiles. It took 30 minutes to become clear that the bangs were nothing more than the ongoing chaos of Afghanistan's civil war... Abu Dhabi t[v] reported it had received a call from the Democratic Front for the Liberation of Palestine abroad claiming responsibility for crashing two planes into the W[orld Trade Center] buildings. But a senior official from the radical DFLP denied the group had any connection to the attacks... False news stories finally raised such concern that on Friday New York[s] Mayor... appealed for media calm in an effort to stop the rumours that were creating insecurity... Unfortunately, even as reporters struggle to sort facts from fiction, there is no shortage of people who see such tragedy as an opportunity to take advantage of America's growing fear and create a story of their own. Reports of bombs have been rampant nationwide. There were about 100 alerts at the Empire State Building, which is once again New York's tallest building, in the four days after the attack on the... World Trade Center... and hoax calls continue to empty Government buildings, offices and schools across America.

...Spy chiefs rush to overcome fatal flaws... As they face up to the worst intelligence failure of modern times, security chiefs on both sides of the Atlantic are pressing for sweeping changes – new legal powers, unprecedented global cooperation and massive budget increases. Frankly admitting that last week's atrocities were completely unforeseen, they claim that, without these changes, there may be still more damaging attacks to come. The Western intelligence community is making little effort to hide the scale of the disaster. A former top CIA officer with long experience in Afghanistan and the Middle East told the *Observer*: "...The attacks on New York and Washington are a failure by definition: we didn't know about them." A British source added: "The most we had was the vaguest of warnings that [the Saudi extremist] was planning something big. But [the Saudi extremist] is always planning something big. M16 and the CIA shared a fatal misjudgment. We knew our citizens were at risk in parts of the [Last] World. But never, not for one moment, did we seriously imagine they were seriously in danger from Islamic terrorists in our motherlands."

...The local sharemarket regained ground yesterday as Wall St avoided the meltdown investors feared on its first trading day since the World Trade Center disaster... The Dow Jones industrial average... posted its biggest point loss – 684.81 points or 7.13[%] to end at 8920.70 – well within expectation of a slide of... 10[%]. It... did not make the Top 10 biggest daily percentage drops... Troubled Air N[Z]... shares gained a little ground... as the airline's global peers were savaged following last week's terrorist attacks... Airlines worldwide were already facing a difficult future before last week's events because of the worsening economic climate. US airlines, estimated to have already lost \$US10 billion through cancelled flights have called for \$US24 billion... in Government aid. Passengers have been scared away, airlines and airports face higher costs to comply with security measures, the global economy is under greater pressure and so are fuel costs... Continental Airlines has warned of a potential bankruptcy filing next month if it does not receive financial assistance. It is already cutting 12,000 jobs, or 21[%] of its workforce. Job cuts announced worldwide are already nearing 30,000 and the... Air Transport Association... said total losses could exceed 100,000 over the next few months.

...Eight days after two passenger aircraft from Boston were hijacked and crashed into the twin towers, [civilian] planes were flying again [military aircraft have been 'patrolling the skies over major American cities' ever since the atrocity], but the public were not. The airline industry in America announced it would have to lay off up to 44,000 employees... The airlines in America usually make about 40,000 flights a day and last year carried almost 650 million passengers. But when Wall St reopened on Monday some airline shares dropped 50[%] and about \$US12 billion was wiped off their value. Now the carriers face the extra costs of security... There appeared to be no shortage of people at JFK airport in New York yesterday morning. Queues snaked from the entrance of the terminals to the roads outside. But it was illusory. The crowds were caused by hastily introduced security measures, and the traffic was mostly outward, with people heading for international destinations and in no hurry to return.

...The world's airline industry, reeling from the terror strikes in the U[S], face an insurance crisis that could ground some aircraft. And N[Z]'s 3] biggest travel insurers have scrapped policy clauses that let tourists claim compensation when airlines, hotels, bus firms and other providers go bust while they are on holiday. Air N[Z] is... among dozens of airlines told that, from... Tuesday, their war risk insurance policies will be scrapped.

...N[Z]ers may soon find themselves uninsured against acts of gang intimidation as... N[Z] insurance companies which are overseas-owned... seek to reduce their risk after the... terrorist attacks in American... Until now, standard policies have covered acts of terrorism simply because they were not specifically excluded... [It i]s unlikely insurers would wait for policies to run out, but... they would have to tell policy-holders about any change.

...IN a television interview beamed around the world last week, [a businessperson wept as it] described the devastation of his bond-trading company, Cantor Fitzgerald, and the deaths of 700 employees in the World Trade Center attack... Not a single person who was in the New York head offices of the company on the day of the terrorist attacks has been found alive. Direct telephone lines linked the New York company to its London office, where conversations were broadcast on "squawk boxes". As the horror of the plane crash into the [90th floor of the] north tower began to unfold, Cantor staff in London heard the terrified cries of their New York colleagues [on the 101st-105th floors.] "The poor guys in London heard things that will stay with them for ever,"... It is sheer chance that [the] chief executive of Cantor, was not one of the victims. [The owner] took his son to his first day at nursery school and so left later than usual for the World Trade Center. His brother Gary was not so lucky... [The owner has] vowed to care for the victims' families... But... [a]lready, some Cantor families have told the company that they are worried about how much help they will get. Health insurance will be continued for the coming year, but salary payments stopped three days after the attack. The company's life insurance payments, normally twice an employee's salary, will be capped at \$US100,000 per family. What angers some families is that performance bonuses – which can account for two-thirds of a bond trader's salary – may not be paid. "Bonuses? I'm not sure I still have a company," [the owner] said last week, according to one family member's account. Just more than 300 Cantor Fitzgerald employees survived the attack and are now spread among temporary offices in Manhattan and in sales offices in London, Chicago, Dallas, Los Angeles, San Francisco and Connecticut. As the company began trading again, officials told the families that records used to calculate the bonuses had been destroyed but that bonuses will be paid if they can be documented. A company spokes[person] declined to discuss the bonuses... The impulse of a company to help victims of a disaster may be tempered by the struggle to save the jobs of survivors, said... a business professor at the University of South Carolina.

...New York Fire Department's response to the September 11 attack at the World Trade Centre was plagued by... problems... A report by independent consultants... concludes problems with the radio system caused commanders to lose touch with many firefighters who went into the twin towers, the *New York Times* reported. It said lapses in discipline led firefighters to rush to the scene without checking in with commanders at designated staging areas. A virtual absence of co-ordination with police officials... meant fire commanders had no access to reports from police helicopters that hovered above the 110-storey building, tracking their structural integrity and the progress of fires across the upper floors.

...Dozens of people trapped at the top of the burning World Trade Center... could have been airlifted to safety... [by] police helicopters... if doors had not been locked[, a newspaper]... reported yesterday... More than 1000 people were trapped on the floors above where the two hijacked planes smashed into the towers on September 11... [T]he doors to the roof were kept locked because a similar rescue in 1993, when... 28 people were taken to safety by a helicopter... was slammed as a "publicity stunt" by fire chiefs and the Port Authority, which owned the centre... [The] fire chiefs said the rescues could have cost lives if the helicopter had crashed, and the authority insisted that the doors be kept locked to prevent suicides.

...One horror on the heels of another... The daughter of the most senior New York firefighter killed... at the trade center... was about to pick up her children when the house shuddered and a mushroom cloud of smoke rose two blocks away... [The] daughter of First Deputy Commissioner Bill Feehan... frantically... called her husband... also a firefighter. "...you're not going to believe this... but a plane crashed a few blocks away. I'm not kidding you. A plane just went down. They've done it again." Many locals [heard] the roar of the stricken American Airlines Flight 587... saw the aircraft flying low, too low, and ran into the streets... Ground Zero yesterday was at Beach 131st Street and Newport Ave... [A congressperson] had just been at one of the memorial services held daily at the De Sales Church... when the [latest] tragedy happened. "This is just a mammoth aftershock after the earthquake of [the terrorist attack]... Just as people were returning to some kind of normalcy here, there is catastrophe again."

...A 15-year-old student pilot crashed a small plane into a skyscraper in Florida yesterday. Jet fighters were scrambled and Coast Guard helicopters alerted before the aircraft... [– which] briefly breached air space at MacDill Air Force Base... [–] hit the 28th floor of the 42-storey Bank of America building in Tampa... The only person killed was t[he t]rainee pilot... The White House said there was no indication that it was an act of terrorism. But the televised image of a plane blasting a hole in the side of a skyscraper was a chilling reminder of the World Trade Center attacks.

...Luigi Falsulo, aged 67, [the] Swiss-Italian business[person] who... flew his single-engine [aircraft]... into Milan's tallest skyscraper on Friday may have staged the spectacular crash to draw attention to international fraudsters on the French Riviera who conned him out of US\$1.4 million[, said his son]... Two people in the building died... The crash raised the spectre of... Islamic terrorism and sent shock waves around the world.

...25 people were killed and up to 20 missing following a massive blast that destroyed a petrochemical plant in the French city of Toulouse yesterday... The plant, which employs about 500 people, is located near an explosives factory... More than 650 people were in hospital following the apparent accident, which residents initially feared was a terrorist attack similar to those on the U[S]... Meanwhile, the E[U] is rethinking its refusal to send accused terrorists to face trial in the US. Justice and Home Affairs Ministers from all 15 member states will today debate the issue as well as other ways of boosting the fight against terrorism... The EU will be hoping to reassure America of its support for its "war against terrorism" at the summit yet also ease fears at home and in the Muslim world that the West may be about to plunge into a mad military adventure.

...The U[S] Congress will today start considering controversial new legislation that would give the US authorities the right to lock up foreigners considered to be terrorist suspects and have them deported without presenting any evidence of proof... With immense pressure on both the [US] Administration and Congress to "do something", civil liberty groups fear the Government could be responding to the tragedy with legislation that infringes constitutional rights. The Government has asked Congress to let prosecutors use information collected by foreign governments in ways that are unconstitutional in the US. It also wants to let the FBI and other police agencies seize billing information like credit card numbers from internet companies without a court order, according to a Justice Department analysis of the anti-terrorism package it plans to submit on Saturday... European leaders have warned that the response to the terror attacks must be smart, cool-headed and focused. In the past week, Europe has been rattled by the rise in ill feeling towards its 14 million Muslims and at the surge in fundamentalist sentiment in fragile Muslim states such as Pakistan. Opinion has also been dismayed at... [the US President]'s cowboy-style demand that [the #1] terrorist suspect... be handed over "dead or alive" – and his description of the anti-terrorism campaign as a "crusade," a term that rouses historic memories in the Muslim world of injustice and mass slaughter. An[analyst from]... the French Institute for International Relations said, "We are in the same boat, but we fear what the captain of the boat will decide to do. The sort of crusade that would create a 'clash of civilisations' war makes Europe really nervous."

...A *WHOLLY UNIQUE WAR*... AROUND the table were the cream of America's military, the joint chiefs – the [guys] who run the most formidable fighting machine the world has ever seen. The four-star general leading the briefing dropped his papers on the table, looked at the familiar faces and declared: "Before anybody says anything, let's be clear: there is nobody in this room, or outside it, who has any experience of what we are about to go through." The war ahead, [the general] said, would be like none that has gone before. The front lines will often be data sheets on banking computers, and embassy meeting rooms, and the shock troops are as likely to be accountants and diplomats as Green Berets. The meeting took place on... September 13, not far from the smouldering Pentagon... It was the first time since America's day of terror that senior planners had gathered to discuss retaliation. Their task was to prepare proposals for [the] President... to consider at Camp David over the weekend. "There will be no preconceptions, no assumptions and no examples," said the general. "This is a new war, and if we are to win it, we have to start thinking in new ways." The 10-year plan that emerged is revolutionary. It posits a war on terrorism that will not end with a signed surrender.

...LAST week Elvis Presley walked into Shelly's cafe on Hollywood Boulevard... took a glass of house wine, [then] strutted back and forth, his Vegas regalia tinkling, loudly addressing the room as Americans are wont to do in public... "So you guys think war's gonna be good for the economy?" A small but noteworthy moment... [in this town which is] full of people making a living by not being themselves...: wars are waged, we've come to believe, for reasons of morality rather than profit. Their economic effects tend – within the countries involved at least [–] to be debated once the fighting has ended. Only some decades after W[W]II did a school of American historians beg[i]n to wonder whether Franklin D Roosevelt hadn't goaded the Japanese into attacking in order to safeguard US markets and resources in the Pacific. Elvis' question was also appropriate, for in America, money is king. The size of my wallet proves God is in my heart and on my side... For the last decade Americans have monitored their economy's expansion with the same avidity and nervousness that parents scan the progress of their first child. Has it enough to eat? Is it feeling OK? By any diagnosis, Junior is crook. The long-threatened US recession seems set to arrive... About a sixth of [Wall Street's] 4300 stocks are trading below the one dollar mark. Normally the Nasdaq delists such companies, effectively killing their chances to gain equity. Last week, however, it suspended this rule, which may be compared to telling a drowning [person] you'll lower the water level a bit. [Aided by 'US telemarketers getting local staff to train Asian-based workers to do their jobs before making them redundant', t]he number of jobless has reached a 19-year high, a further sign of recession... Blame the W[orld Trade Center] atrocity, which has come to be known here as 9/11. It didn't just destroy two skyscrapers, it rattled American confidence of their place at the centre of the economic and moral universe... At the Shelly cafe... the answer to Elvis' question was uncertain... The diners wanted war, but they wanted prosperity too, a sign that they might continue to be the chosen ones.

...In the weeks since the September 11 tragedy, Arab-Americans – even those who just look like them – have felt under siege in the U[S]. They've been assaulted, threatened, shot at, stared down, barred from flights and, in several horrifying cases, killed in random acts of violence. Thousands have been interviewed by authorities in what many are calling one of the most widespread uses of racial profiling since the Second World War.

...Amid fears of further terrorist attacks on the U[S], Washington is pouring nearly \$NZ2 billion into intelligence. At the same time, ties between international intelligence agencies are closer than ever before. At least 100 countries have stepped forward to share information with the US. The C[IA], which has already committed hundreds of employees to the hunt for [the #1 suspect], plans a "very significant" increase in staff and resources... Meanwhile, fears that [the Saudi extremist's] organisation will soon attack another high-profile [US] target have reached fever pitch.

...A 63-year-old Florid[ian] has died after contracting anthrax... the first [US] person in... 25 years to contract the inhaled form of the disease.

...Postal workers... were not impressed. They had just been told by their managers at the Postal Service of the steps being put in place to try to counter the anthrax threat, but... it simply called to mind the old adage, Too little, too late. "I think that we have got a raw deal. The letter came through the Post Office. They closed down the Congress but they kept us going... They should have taken us for testing. They lost nobody..." These are troubling times for Washington's postal workers, and none more so than for the 2300 employees based at Brentwood, where the notorious "infected letter" was handled and where 14 out of 29 locations within the now closed facility have tested positive for anthrax spores. Two of their Postal Service family lie dead from anthrax infection, another two are seriously ill and who knows how many others may have been exposed. But what is increasingly troubling those here and the 10,000 or more postal workers across the capital who have been told they need to take antibiotics to guard against infection, is the realisation that none of this needed to happen: the shock and the fear of what might happen have been replaced by anger and disbelief about what did not happen... Why, if the letter addressed to [the] Senate leader... that led to around 30 people at the Capitol being exposed to anthrax passed through Brentwood, was the depot not closed?... "...management just kept saying 'we have to get the mail out'..."

...The spectre of terrorists spreading deadly anthrax spores in the mail has alarmed the U[S] as more cases of the rare disease are confirmed. Major media organisations closed their mailrooms after several received suspicious envelopes, some later found to contain anthrax material.

...SCORES of *Los Angeles Times* employees were locked in the newspaper's building yesterday for 90 minutes in an anthrax scare caused by the discovery of white powder near a computer keyboard in the book review department, employees said... Parts of NBC News headquarters at Rockefeller Center and the New York Times building were [also] sealed off for part of the day because of anthrax investigations. An NBC employee was found to be infected after [it] opened a letter with a white powdery substance in it addressed to [a] news anchor... The... US Vice President... said although there was no proof, there could be links between the discovery of four "suspicious" anthrax cases in the US and [the Saudi extremist].

...A key figure in the September 11 attacks was allowed to enter the U[S] this year although his name was on a US security blacklist circulated to other countries... Egyptian Mohamed Atta, told immigration authorities that [it] was coming to the US "on a march to spread the word of God"... After being questioned, [Atta] was allowed entry... US investigators say they believe Atta, acting as a ringleader among suicide hijackers, piloted one of the two airliners that struck the World Trade Center during the attacks on New York and Washington that killed about 5400 people.

...FBI investigators have officially concluded that 11 of the 19 terrorists who hijacked the aircraft on September 11 did not know they were on a suicide mission. Unlike the [8] "lead" attackers, who were all trained pilots, they did not leave messages for friends and family indicating they knew their lives were over... None of them had copies of the instructions for prayer and contemplation on the eve of the attacks and for "opening your chest to God" at the moment of immolation, which FBI agents discovered in the luggage of Mohamed Atta, the [guy] believed to be the hijackers' leader... Western intelligence services say the FBI's conclusions help to explain why, despite strong indication that [the Saudi extremist]'s al Qaeda network was planning a spectacular atrocity, the West remained ignorant about its scale, location and detail. "Of course, it is inescapable that this was a terrible intelligence failure," one British Government source said. "But the FBI analysis at least puts it into context. The terrorists' security was extraordinarily tight. They were employing intelligence organisations' most basic principle: the need to know." The *New York Times* reported yesterday that the CIA intercepted a message from an al Qaeda member boasting of plans to carry out a "Hiroshima" on America... But in spite of a frenzied search for evidence of what the message meant, American spies drew a blank and had no idea of the plans laid for... September 11...

In an earlier plea for care to ensure that other innocents did not become victims of retaliation after the terrorist attacks on the US, I told of a moment in the Hiroshima peace museum in front of a photographic mural of a child on fire in the ruins of the nuclear bombed city. An American... standing beside me said: "You should see what they did to our boys at Pearl Harbor." My reply: "What did that child do to your boys at Pearl Harbor?" ...Two letters of reaction... have just reached me. From... Sandringham: "I usually have great respect for your opinion but publishing your memories of the American widow was unworthy of you... Surely you must know the psychology of ...he[r]... remarks... I too have a memory like yours. When on a tour boat out to the... battleship Arizona in Pearl Harbor, I was horrified to see young Japanese tourists in our group have their friends photograph them, smiling happily, with the memorial as a background... Few nations have been so lily white in the past that their citizens would never be put in the position of having to justify their country's actions..." From... Mt Eden: "When the stakes are very high the 'Good Guys' don't have the luxury of experimenting with perfection to avoid 'collateral damage'. The Japanese regime basically set in motion the killing of their own innocents... with the unprovoked attack on Pearl Harbor... If the Japanese had won, a far greater number of innocent lives would have been lost... PS: There is a cure for hurting and killing those bodies (Heaven!). There is no cure for losing God and His truth (Matthew 10,28)". In reply: ...Since the *Bible* has been quoted – try Mark 10, 14: Jesus said "Suffer the little children to come unto me... for such is the kingdom of God." That, I believe, refers equally to the children of Coventry, Nagasaki, Dresden and... of Kabul and... for the... orphans from the twin towers...

Smiling faces give proof that children, orphaned by the September 11 terrorist attacks, have found happiness again. The happy-go-lucky kids play in the glorious sunshine, seemingly without a care in the world. They giggle and scream with delight as they make the most of being away from home for a wild week at a special... camp, the legacy of... kind-hearted business[person]... Scott Hazelnorn, 29... who was killed in the attack.

...Dozens of September 11 widows who gave birth after the attacks have met, some of them for the first time, at a bitter-sweet baby shower. The gathering of about 70 widows and their children was... to help ease the pain... [Since] the attacks, 102... widows [have given] birth to 105 babies.

...[actors] are using their own money to aid 30 LA animal shelters that [have] closed after government funding shifted to September 11 charities.

...The World Boxing Council indefinitely stripped [an AUS]n... of his ranking yesterday over controversial remarks the super middleweight made about the terrorist attacks on the U[S]. The... former rugby league player ranked 26th by the WBC, is... a Muslim[. It] said on Tuesday that the U[S] had brought the September 11 attacks upon itself. [The boxer] later apologised for the comment... but the damage had apparently been done.

...Contrary to the opinion of... others, there are not just two sides in the dispute between the U[S] and Afghanistan over terrorism. The US may be perfectly correct in wishing to punish [the Saudi extremist] and his followers for September 11, but whether mad or merely evil, [the Saudi] is asking questions that the US government seems remarkably reluctant to answer... How can the US take the high moral ground on terrorism when it has ignored or sponsored terrorist groups of its own when it suited [US] foreign policy? Why is no mention made in this war against terrorism of the dozens of terrorist groups that exist all over the world, including in Ireland, Spain, Sri Lanka and domestic... groups? Some... are funded from the US with the tacit approval of its government. Of course, these groups do not generally target [US] citizens... Until some attempt is made to answer these questions and address the problems that breed religious fanaticism and terrorism, the US had better learn to live with more of the same.

...[US President] warns Americans to brace for long, hard fight... THIS weekend I am engaged in extensive sessions with members of my National Security Council as we plan a comprehensive assault on terrorism. This will be a different kind of conflict against a different kind of enemy. This is a conflict without battlefields or beachheads, a conflict with opponents who believe they are invisible. Yet they are mistaken. They will be exposed, and they will discover what others in the past have learned: those who make war against the U[S] have chosen their own destruction. Victory against terrorism will not take place in a single battle but in a series of decisive actions against terrorist organisations and those who harbour and support them. We are planning a broad and sustained campaign to secure our country and eradicate terrorism, and we are determined to see this conflict through. Americans of every faith and background are committed to this goal... And this is why we will prevail. Thank you for listening.

...US mobilises around the globe as Taleban urge fight to death As the U[S] prepares its forces to strike back, Afghanistan's hard-line Taleban rulers have called on Muslims to launch a "holy war" if attacked. Yesterday, [the US] President... told the American military to get ready for a long war against terrorism and said the nation would smoke its enemies "out of their holes... We're at war. There's been an act of war declared upon America by terrorists and we will respond accordingly." [The President] has received congressional approval to use "all necessary and appropriate force" – just short of a declaration of war but one that allows him to strike... While the preparations went ahead, the whereabouts of the... exiled Saudi-born extremist... remained a mystery. But [the] President... warned that the mysterious millionaire, who is believed to have launched his campaign against the U[S] in retribution for the "desecration" of the land of Islam by the US deployment of troops in Saudi Arabia during the 1990-91 Gulf crisis, was Washington's prime suspect and would be hunted down... Washington has asked Pakistan to grant military overfly rights and "military access", to seal the Afghan border and halt fuel supplies to the Taleban regime, which has been sheltering [the Saudi millionaire]...

Pakistan is to send a delegation to Kabul in a last-ditch bid to persuade the Taleban to extradite [the Saudi extremist] and avert US military retaliation for the terror attacks on New York and Washington... The move came as [the US] President... told US troops to "get ready" after presiding over a war council of his top military advisers to plan retaliation... [T]he Taleban would be given three days to comply or face the consequences. Before news of the Pakistan delegation broke, the Taleban said they would continue to shelter... the mastermind behind the attacks.

...Afghanistan's religious leaders last night urged [the suspected] terrorist... to leave the country – but say they will not force him out. After a two-day meeting of hundreds of Muslim clerics, Afghanistan's Bakhtar news agency reported: "The Ulama [the meeting] wants the Islamic emirate of Afghanistan to encourage [our guest] to leave Afghanistan, but of his own free will." The country's Taliban rulers, facing a massive U[S] military build-up in the Gulf, are expected to follow the meeting's directive. Before the statement was issued, a Taliban diplomat in Pakistan said [the Saudi] was prepared to stand trial if Washington could produce evidence against him... [I]n Washington... the... [US] President... lifted sanctions imposed on Pakistan and India for their 1998 nuclear tests, rewarding Islamabad for its support in the U[S] confrontation with Afghanistan...

As clouds of war roll towards the borders of impoverished Afghanistan, a growing number of protesters, including N[Z]ers, are calling for peace. Nearly 300 gathered at Queen Elizabeth Square in Auckland on Saturday, urging the U[S] to seek justice rather than retribution for the suicide attacks that killed nearly 6500 people... Many said US bombs would merely kill the poor and the sick... and others said that killing was just plain wrong. A few called for Americans to step back and ask themselves why their nation was so hated... [T]here was also a question of proof. The US had yet to show that [the Saudi extremist] was behind the September 11 attacks on the World Trade Center and the Pentagon... Their calls were echoed around the world. The largest protest was in the U[S] – ...10,000 demonstrators assembled peacefully only blocks from the White House.

...THE first American pilots to fly missions over Afghanistan this year [will never leave] the ground. They[will si]t inside control stations, perhaps in Uzbekistan or even Turkey and fl[y]... drones by remote control... Defence analysts say Afghanistan's uniquely rugged and remote terrain is the perfect showcase for one of the U[S]'s most promising young technologies – the Un-[pilot]ed Aerial Vehicle, or UAV. Smaller and quieter than jets, more mobile than satellites, [such] drones are being used with increasing frequency to peer into hostile, unknown territory without putting the lives of pilots at risk. UAVs were used regularly during the Persian Gulf War to identify targets but modern versions can fly longer and farther and gather infinitely better intelligence. Besides simple photography, they can now use radar to track individual vehicles or even people – day or night, cloudy or not. The aircraft have their weaknesses. They are notoriously fickle in bad weather and sometimes crash mysteriously. But the air force and navy are so enamoured with UAVs that they are experimenting with missile-firing drones and considering giving them combat roles.

...fighter jets yesterday resumed missions from the US aircraft carrier circling off Pakistan in the northern Arabian Sea carrying deadly cluster bombs for use against tanks and enemy personnel in Afghanistan... A senior officer... said it was no longer necessary to use sophisticated stand-off weapons, which could be dropped further away from the targets, "now that we have established air superiority". The death toll pushed past 300...

[The Afghani] was asleep when it happened, and so his friends and neighbours had to tell him about the bomb that struck his house... How the American planes, which had been over earlier in the evening, had returned after everyone went to bed and how, instead of the Taliban base 3.2km away, they dropped their bombs on a residential area... In the eleven hours between the explosion and the moment when [it] finally regained consciousness, [the Afghani]'s wife, his four children, his parents, and five of his brothers and sisters had been lifted dead from the rubble of their home and buried. What do you say to a stranger who tells you that [it] has just lost every member of his immediate family? ...[the Afghani] is not familiar with the phrase "collateral damage"... In the nineteen days of the bombing campaign, many terrible things have been reported...

An American bomb missed its target in Afghanistan by 1.6km because a target coordinate was entered incorrectly into its satellite navigation system, a US defence official said. Ground reports indicated that four [civilians] were killed and eight injured... US officials said they had no way to confirm the number of casualties. Reports in Kabul said a[nother] bomb killed a 14-year-old girl and wounded four other residents when it hit a residential area in the capital... Meanwhile, [a]t... least 20 people were killed in Nigeria in anti-American riots yesterday... Nigerian authorities issued a shoot-on-sight order and clamped a night curfew on Kano, the biggest city in the mainly Muslim north, after some of the most violent anti-American protests in Africa since US air strikes on Afghanistan began... Kano['s] residents said the protests were hijacked by hoodlums from the city's army of unemployed, who chanted "May God destroy America!" and "Americans are terrorists". In India, at least 12 people were injured in a clash between Hindus and Muslims after Hindus tried to burn portraits of [the Saudi-born extremist] in the state of Bihar, authorities said.

...up to 16 Christians... [were] shot dead... at prayers last night in an unprecedented attack in the central Pakistani town of Bahawalpur. Christians have expressed fears they could become targets if unrest broke out in Muslim Pakistan over opposition to the U[S] attacks on Afghanistan... Earlier, US warplanes pounded Taliban positions around Kabul... but one bomb killed at least 10 people in a village controlled by Afghanistan's opposition Northern Alliance... The *Washington Post* reported yesterday that the CIA was considering secret missions aimed at killing individuals that the US designated as "terrorists". The agency believes it has the authority for covert, "targeted killing" missions based on classified memorandums... Meanwhile, among almost 1000 people being held in the US in connection with the terrorist attacks are people who made congratulatory telephone calls after the hijacked aircraft hit the World Trade Center and the Pentagon... These suspected associates of [the Saudi extremist] are among 977 people held on various charges related to the September 11 attacks. FBI agents intercepted telephone calls, moved in and made arrests, holding the bulk of those arrested on immigration or criminal violations and a smaller group on material witness warrants...

Afghan and U[S] officials headed to an Afghan village yesterday to investigate reports that a stray US bomb killed 40 members of a wedding party during a major operation to track down [the]Taliban leader... who was born close to the village but has been on the run... The US military said its forces had been fired on... and they had responded. But... at least one bomb had missed its target and there had been civilian casualties.

...AFGHAN and US forces continued their search for [the]fugitive Taliban leader... yesterday while a US special forces soldier was killed in... Afghanistan – the first American military casualty killed by enemy fire in the three-month war... The U[S] has arranged for Pakistan to turn over to US control the Taliban's former ambassador to Pakistan... who is in detention in the northwestern city of Peshawar. [The ambassador] would be one of the highest ranking Taliban members to come under US control... since the collapse of the Taliban... [The Saudi extremist] has disappeared...

When the body count doesn't count The call of nature drew [an Afghani] from his home just after the B-52 bombers started their pass over his village. In the early morning darkness of the remote area, [the villager]... could not see the bellies of the mighty... aircraft split open and release 25 bombs into the cold air. But [the villager] did hear one of the 450kg bombs slam into his house, killing 12 relatives[, and] also heard the other bombs as they cut a swathe through the other houses, killing more than 100 of the village's 300 residents... Fifteen hours later, when accusations of the latest civilian deaths filtered back to the West, [a US]Marine Corps spokes[person]... said simply: "It just did not happen." But journalists who visited the village and found huge bomb craters, smashed houses, scattered children's shoes, dead cows and sheep and graves swear it did. Which raises the question – how many civilians really have died in the US bombing of Afghanistan and why have we heard so little about them? A study by [a]New Hampshire professor... says 3767 civilians died in the first nine weeks of bombing. The toll... is now well over 4000. If his figures are correct, the civilian death toll in Afghanistan has passed the 2996 killed in the September 11 attacks that started the war in the first place... Not surprisingly, [the professor]'s Afghanistan death toll has been challenged by the Pentagon. A major at the US defence headquarters, who would identify himself only as "a spokes[person]", said the... military went to extraordinary lengths to avoid civilian deaths. [The major] said it was hard to work out how many people were dying and pointed out that the number of people killed in the New York attack was initially thought to be 10,000...

U[S] air strikes in Afghanistan... killed 812 civilians, largely because military leaders rel[ied] on false information from local warlords, a study says. The Pentagon's strategy of bombing targets instead of riskier ground operations... made it harder to discover when intelligence [wa]s wrong, says the report by American group Global Exchange, whose field workers in Afghanistan compiled a list of those killed... American military commanders disputed the figures, insisting they often verified their targets with several sources of information to ensure civilians were not hit.

...Marjan... survived wars, sieges, invasions and a grenade attack but... the lion of Kabul, has finally succumbed to the one foe [it] could not beat: old age. Afghanistan's only lion was found dead in his cage... yesterday after refusing to eat any food for days... Marjan – one-eyed, decrepit and at least 40 years old – became famous worldwide when his plight in Kabul's dilapidated zoo was highlighted... Cynics said the old cat generated far more attention than most of Afghanistan's needy human population. One British tabloid led a fund-raising campaign for him that collected \$US225,000. Recently Marjan had enjoyed... regular gifts of meat and the care of keepers who were being paid for the first time in years... His closest shave in his long and troubled life came when a Taliban fighter trying to prove his courage climbed into the... enclosure. A hungry Marjan pounced on the hapless [fighter] and ate him. Perhaps obeying Afghanistan's harsh codes of revenge, the [fighter]'s brother returned the next day and lobbed a grenade into the cage... blind[ing Marjan and leaving] him lame... A gift from Germany... 38 years ago, [Marjan] was a veteran of 22 years of civil war and the recent weeks of U[S] bombing that dislodged the Taliban... [□ The Taliban isn't the only organisation to collapse in the wake of the 9/11 attacks – Canada's 2]nd largest airline, Canada 3000, has folded stranding thousands and putting 4800 employees out of work. The low-cost 38-plane carrier became the [#2] airline in Canada after swallowing Royal Aviation Airlines and Can Jet [before September 11 last] year.

...“Before September 11, civil aviation was the... symbol of commerce. We knew with certainty that it built economies. We knew it tied the world together. We knew it improved our quality of life. On September 11, the world changed. Terrorists turned tools of commerce – instruments of unity – into weapons of hate.” ...AS the World Trade Centre towers began to crumble so, too, did global aviation, passenger confidence and world economies. The impact was immediate. Minutes after the attacks, the Federal Aviation Authority closed US air space for the first time in aviation history, grounding 6000 planes. Thousands of passengers were stranded for up to four days. As the horror hit, the aviation world faced a new reality... “We knew the world was different, we had a high-risk situation and we had to respond to it quickly.” But despite everyone's best efforts to remain calm, passengers stayed away. They had been bombarded with images of planes crashing into huge central-city buildings, triggering an unprecedented fall in travelling while aviation security and insurance costs soared. In September, passenger traffic worldwide dropped by 17[%] and freight traffic dropped by 16[%]. The US was hit hard: passenger traffic fell by 32[%]... But that was only the beginning – traffic continued to tumble until December. By the end of last year there were 60 million fewer passengers and freight had dropped by two million tonnes. The blow hit an already desperate industry. Airlines had lost \$3 billion in eight months before September 11... By September 11, airlines had little room to manoeuvre. To survive, they had to cut unprofitable routes and reduce flight frequency and staff. By the end of the year 120,000 airline employees had lost their jobs. To get passengers flying again airlines offered cheaper flights. But to do that they needed to reduce overheads. As well as cutting routes, they retired old aircraft to reduce capital costs. About 2500 new plane orders were cancelled. Aeronautical engineering and manufacturing companies had to cut 40,000 jobs. The... International Civil Aviation Organisation... estimates that aerospace manufacturers will have lost up to \$7.5 billion by the end of this year. International airlines lost more than \$10 billion by the end of last year, [and] [despite financial assistance... airlines still struggled... [‘Belgian Air and Swiss Air’ were among the airline companies that have folded.] Sure, some 30,000 planes[still] take off every day in the US, but many are all but empty... America's sixth-largest carrier, US Airways... gained court bankruptcy protection. That caused airline stocks to tumble, hitting the world's second-largest airline, United Airlines, when parent company UAL Corp's stocks fell 27[%]... A United Airlines closure could also affect other airlines that share passengers through the Star Alliance, including Air N[Z].

...Air NZ... has cancelled seven international flights because potential passengers are now reluctant to fly... The cancelled flights are on the daily Sydney-Los Angeles route[(Air NZ's Star Alliance partner, ‘United Airlines, has ended its service to NZ’ altogether)]... Last month, the Tourism Action Group predicted a 10[%] drop in international visitors [to NZ]... as a result of [last year's] terrorist attacks... on the U[S].

...BIG-SPENDING Japanese tourists are cancelling trips here in droves, confirming fears that the... terrorist attacks in the U[S last year]... may bring a lean period for many in the [NZ] tourist industry. One Christchurch tour company has had 21 of 25 tour groups scheduled to visit here... called off. The Japanese-owned company says many others who specialise in Japanese tourists are in a similar position and could go out of business.

...Easy, no hassle NZ gets vote as a safe place to visit WHILE many parts of the world are off limits to travellers, N[Z] has been voted... the safest destination[by r]eaders of UK magazine *Wanderlust*... The [editor of the] magazine... said the U[S] and Britain had scored in the top six... in its September [2001] issue... but... imagined they would not do so well now. “Even more so now, N[Z] would be seen to be a very safe place,”... Tourism in both countries has suffered since the [September 11 terrorist] attacks, with trans-Atlantic airlines hard-hit by a fall in passenger numbers.

...Britain has warned its citizens not to travel to Indonesia after two German tourists... mistaken for Americans... were kicked and punched... on Lombok Island... The attacks were the first reports of assaults on foreigners in mainly Muslim Indonesia since... the suicide plane attacks on the U[S]... “We are advising against any non-essential travel to Indonesia, with the exception of Bali,” said a [British] Foreign Office spokes[perso]n.

...Bloodbath on holiday island... More than 180 people, including at least one N[Zer], are feared dead after car-bombs ripped through packed nightspots on the usually tranquil Indonesian tourism island of Bali... Late last night overwhelmed Balinese hospital officials said 309 people were wounded, about 90 of them critically, in what the Indonesian police chief said was the worst act of terror in his country's history, and one that the U[S] condemned as despicable... [NZ's P]M... rang her A[US]n counterpart... last night to express her condolences for his country's loss... A[US]n travellers are believed to... make up around 75[%] of the dead and injured... [The AUSn media is already referring to the attack as ‘AUS's September 11th’. But their] Government is wary of linking the attack to A[US]'s support for the U[S]-led war on terror[– saying]... the attack was more against Westerners in general... [NZ's PM said NZ] had spent a lot more money in beefing up national security following September 11 than Indonesia. Acts such as yesterday's bombing in Bali justified that spending. The Government knows of seven injured N[Z]ers, including four who are in hospital, with serious burns... Also affected will be predominantly Britons, Canadians, Germans and Swedes – but few from the travel-wary U[S]... Another bomb exploded about the same time 50m away from the US honorary consulate several kilometres away... No casualties were reported.

...A[US] came to a standstill yesterday as a minute's silence was observed across all states during a national day of mourning for victims of the Bali bombings... In Auckland yesterday 21 people attended a service organised by the Indonesian Human Rights Committee to honour victims... N[Z and AUS] had shared traumatic experiences during wars and now shared another sad period in their joint history... The hard times are just beginning for Bali... Even as *Time Asia* once again names Bali as Asia's favourite destination, hotels have emptied. Official figures show that within three days hotel occupancy plummeted and international departures outnumbered arrivals almost two to one. Some figures now estimate that 300,000 bookings have been cancelled. The sprawling restaurants of the Natour Kuta are all but empty... now. At the nearby Ineka Hotel, staff say layoffs will start in two weeks... The official toll of confirmed dead stands at 187 after the weekend death of a Balinese [resident] who was air-lifted to A[US] for care... An Indonesian... has become the focus of international investigators hunting those responsible for the Bali... atrocity.

...‘Hated Americans’... – not A[US]ns or N[Z]ers – were evidently the avowed targets of the Bali nightclub bombers who killed 184 people on the Indonesian resort island last month. Indonesia's chief investigator says [the perso]n who has confessed to helping to build a bomb admitted blundering over the nationality of his victims. The suspect... allegedly told police [it] wanted to kill “as many Americans as possible”[and] was “not very happy” when most of the dead turned out to be A[US]n... Three N[Z]ers and up to 88 A[US]ns were among those killed... Only about three Americans are believed to have been killed, although many human remains have still to be identified. If [the suspect] was telling the truth, his confession discloses a woeful lack of research and local knowledge. The Sari Club was a famous A[US]n haunt... and American tourists were sparse

anyway after last year's terrorism attacks in the U[S]. ● Local rescue]... experts are pleading for money to set up a specialist September 11-style search squad in Auckland that could save the lives of people trapped in collapsed buildings. Teams equipped with remote search cameras and sonic detectors are established in Palmerston North... [- which] also has heavy concrete-cutting equipment... [-] and Christchurch. But rescuers in Auckland, the country's largest population centre and host to a potentially "soft" terror target, the America's Cup, are having to practise without heavy-duty equipment needed to save lives when big buildings collapse... [I]t could take three... years to get enough money from the Government...

Big Brother rules as the world enters a 'red alert zone'... Surveillance cameras, electronic swipe cards, turnstiles, metal detectors, x-ray screening, thumb print and retina scans... [-] for millions these are increasingly part of simply turning up for work. Security fears following the September 11 and Bali attacks are turning A[US]n city buildings into fortresses... and workers had better get used to it. Not only is... Big Brother... here to stay but it is set to become far more pervasive. Anxiety over safety means that walking through the front door at work is becoming, for some, akin to boarding an international flight... Landmarks such as Sydney's Opera House and harbour bridge are obvious targets, as are Western diplomatic missions. Police point out there are 120 consulates in Sydney alone, and it can take up to 10 officers to adequately protect one VIP... Police expect to receive continuous threat alerts in the coming years... [The] infrastructure protection co-ordinator for the N[SW] Counter Terrorist Command... said [it] had discussed with a military analyst the way the 2000 terrorist attack on the USS Cole in Yemen had been a precursor to the more horrific attacks a year later on US soil. "[The analyst] said Bali was not our September 11 but our USS Cole. I honestly hope that's not the case."

...Specialised units... including Utah Swat teams, spent the last two months of last year quietly training at a Government-financed counter-terrorism camp in the Nevada desert. There they faced every imaginable terrorist scenario – tractor-trailers crashing into powerlines, hostage-taking, live biohazards and an exploding nuclear plant. Despite a security budget of \$US310 million, the Winter Olympics are being viewed as the next logical terrorist target... [There] will be... 5000 uniformed troops, 7000 public-safety officers and 2100 fire and emergency service personnel. Just in case, local businesses have hired a 6000-strong private security force. Terror is hardly a new Olympic fear, as Munich 1972 and Atlanta 1996 remind us. September 11 only upped the ante... In what would be an unprecedented security move, Salt Lake City International airport is expected to be shut during the... opening and closing ceremonies... Never before has a host city's airport been closed during an Olympics ceremony.

...Recycled steel from the World Trade Centre will... build part of a new U[S] warship, according to... Northrop Grumman. The ship will be named the New York, in honour of the almost 2800 people who died in the attacks on September 11, 2001. Steel will be shipped to Northrop's shipyard in Pascagoula, Mississippi, for construction to begin in the middle of next year. The 208m ship should be ready for service in 2007. New York authorities face problems disposing of the 1.62 million tonnes of rubble that went to the nearby Fresh Kills landfill... Some memorial sculptures made from recycled steel have been commissioned by the city, and this year nearly 20,000 tonnes of World [Trade] Centre scrap was shipped to India for use in construction projects... Meanwhile, classified sections of the US Congress' September 11 report lay out a web of connections among Saudi business[people], royal family, charities and banks that may have aided al Qaeda or the suicide hijackers, according to people who have seen [i]t...

An audio tape purportedly from [the] top al Qaeda official... – considered to be [the Saudi extremist and] al Qaeda leader[']s right-hand guy (the official)... has appeared in almost every videotaped statement from the al Qaeda leaders since the September 11, 2001, attacks on the US[-] ...warned the U[S] yesterday that it would pay a high price if it harmed any of the detainees at the US base at Guantanamo Bay in Cuba... Washington is holding more than 600 people from 42 nations as prisoners at... the... naval base. US plans to try six of them in military tribunals that can hand out death sentences sparked international criticism... The detainees, suspected members of al Qaeda and others caught in... the "war on terrorism", have been held and interrogated without being charged. Human rights groups have criticised Washington for refusing to give the detainees the rights accorded to prisoners of war under international treaties... *Detained indefinitely, the prisoners have been denied legal representation...* The tape broadcast by Dubai-based Al Arabiya television also said the "real battle" against the US had not started yet... "We tell America only one thing. What you have suffered until now is only the initial skirmishes... Let those who conspire with America know that America is incapable of protecting itself... and let every captive held by the infidels be assured that the day of liberation is [coming] soon," it added.

...An American jet registered to a ghost company whisks terror suspects to countries that use torture... a process the CIA calls "rendition"...

Prevention... becomes the aggressive watchword in Washington... The U[S]... may take pre-emptive action in the next phase of its war on terror, ratcheting up the rhetoric that has alarmed Iraq and Iran. "The best defence is a good offence," [the] US Deputy Secretary of Defence... told a security conference in Munich, elaborating on a theme set by [the US] President... last week when [it] called Iran, Iraq and North Korea the "axis of evil". "Our approach has to aim at prevention and not merely punishment," said... a hawk in the [Republican] Administration. "We are at war." Iraqi newspapers... condemned "the dwarf..." as savage and aggressive and Iranian parliamentarians called him a threat to world peace and security. In Afghanistan... fresh fighting erupted between factions scrambling for advantage in the vacuum left by the vanquished Taliban... In Washington, [the US President outlined] plans... for an increase of \$US45 b... over this year's defence total... plus... \$US9.4 b... to battle terrorism...

The [US] Administration has told the Defence Department to prepare, on a contingency basis, plans to use nuclear weapons against at least seven countries. The military was also directed to build smaller nuclear weapons for use in certain battlefield situations. The countries named in the secret report – ...leaked to the *Los Angeles Times* – were China, Russia, Iraq, North Korea, Iran, Libya and Syria... The identification of Iraq, Syria and Libya as potential targets could complicate this week's trip by [the US] Vice-President... to the Gulf and the Middle East. His main mission is to try to strengthen support among Arab leaders for the US-led campaign against terrorism. Most are... opposed to attacks on any Arab countries.

...THE [US] government is hiring... 450 extra staff to help guard nuclear secrets after reports top-secret papers were leaked to China... over the past 20 years... from US nuclear weapons research laboratories... [To] obtain info... from US scientists, [China plied] them with liquor and t[ook] them sightseeing while having their hotel rooms burgled... ■ N[Z – which] established diplomatic relations with North Korea... last year... [-] has been hoodwinked into pouring... money... into... the impoverished... [nation, thinking i]t... would help to stop the rogue state's nuclear weapons programme. So far, N[Z] has contributed \$4.5 million to [the] international scheme... North Korea agreed to stop developing nuclear weapons in 1994 in exchange for help from the U[S] and other countries in building two light-water nuclear power plants and supplying heavy fuel oil... But two weeks ago Pyongyang admitted to the Americans that it had been engaged in a clandestine uranium-enrichment programme... [which] apparently would make enough material to build one or two nuclear weapons a year. [Some analysts fear 'the US appears to be ignoring North Korea as it turns its attention towards Iraq']

...*Musclebound megapower a victim of its own might...* North Korea is a rogue leftover of the Cold War that the US won more than a decade ago... North Korea[']s leader... was branded part of the "axis of evil" in [the US President]'s State of the Union address... when [it] warned North Korea that any attempt to restart its nuclear missile programme would bring terrible punishment. Now North Korea is cocking a plutonium snook at Washington by brazenly threatening to do what [the Iraqi dictator] is only suspected of trying to do. Nuclear weapons in the hands of North Korea are a clear and present danger, amplified by that unpredictable regime's record of selling missiles to other risk states. And what does [the US President do? It] suggests talks. Defy the hyperpower, and they'll ask for a chat... Yet even America finds it cannot operate without allies. This right-wing and unilateral-minded Administration has made the rude discovery that it cannot rule the world alone. America's allies in the Far East all want a diplomatic, not a shooting, solution to the crisis in North Korea. In the Middle East, the Turks are being difficult about allowing their soil to be used for an invasion of Iraq from the north. The second-rank powers on the Security Council – Russia, China and France – are staying

America's hand by demanding the production of the so-far-elusive "smoking gun" before they will consider mandating a war against [Iraq's leader].

...The coming assault on Baghdad already has its first hero: Colonel John Boyd, a foul-mouthed, insubordinate fighter pilot who has been in his grave... almost five years. When Iraq's tyrant is brought down, that inevitable victory will be Boyd's doing. You won't hear [hi]s name being cited in Rose Garden speeches, however. Nor will the Pentagon be authorising any posthumous decorations for the [guy] who, through 30 years of bureaucratic guerilla warfare, transformed America's military. Even though [Boyd] gave them many of the tools that made Operation Desert Storm... a sweeping success in 1991, the brass continued to hate [him] with such a passion that, as a final sign of contempt, they sent only a single general as their official representative at his funeral. But without his influence, the US would almost certainly be preparing to enter Iraq much as it fled Saigon; a vast, muscle-bound killing machine based on the assumption that big budgets and expensive weapons assured victory. That approach didn't work in Vietnam, nor... in tiny Grenada... "Thank goodness they have dumb sons of bitches in the Kremlin, too," Boyd fumed not long after. "If they weren't thick as ****, Grenada would prove how weak we really are." ..."[Boyd's military strategy was] Observe-Orient-Decide-Act – commonly known as the OODA loop," says [hi]s biographer... "Simply rendered, the... loop is a blueprint for the manoeuvre tactics that allow one to attack the mind of an opponent, to unravel its commander... before a battle begins." To [the biographer] and others, including [the US] Defence Secretary... Boyd is "the most influential military thinker since Sun Tzu wrote *The Art of War* 2400 years ago". So why should pacifists cheer the memory of a [guy] whose life was devoted to perfecting the use of martial force? Because, if the Iraq invasion goes even remotely according to plan, [the dictator]'s downfall will be short and relatively bloodless. Isolated, unable to trust his generals and with his every move tracked by the cheap, plentiful, all-seeing Predator drones... Boyd also helped to develop, [the dictator] will have two options: surrender or perish. The Baghdad campaign will reflect Boyd's greatest insight, the one... borrowed from Sun Tzu [– t]he sweetest victory... is the one that does not demand a battle.

...How to win friends at home and influence neighbours... [The dictator]'s decision to free all prisoners from Iraq's jails, including those locked up for opposing his regime, is the latest sign that [it] is clearing the decks for war. While his allies in Baghdad claim that [the dictator] is unmoved by American threats, every step that his regime takes must be seen in the light of [the US President]'s stated intention to overthrow him... [or] to "destroy Iraq"... By showing a softer face to the Iraqi people, [the dictator] hopes to rally them for war and maximise popular resistance to any American and British invading force... Freeing all political prisoners is a sop to international opinion and gives the Arab world an opportunity to argue that [Iraq]'s regime is reforming... For both his domestic and international audiences, [the dictator] has staged uncharacteristic displays of humility recently. [The dictator] returned Kuwait's national archives – looted during the invasion of 1990 – on Saturday. Kuwait claims that 600 of its citizens disappeared during the occupation and are in [Iraq]'s jails. The amnesty may result in their freedom too... [The dictator]'s change of approach began with last month's announcement that [it] would allow the return of U[N] weapons inspectors. Yet only the spectre of war has led [him] to take these steps. It would take immense naivety to believe [the dictator is now] a genuine reformer. The evidence suggests that [the dictator] does not believe [it] can avoid war... [The dictator]'s only option is to rally as much support as possible in advance of the conflict... [that] is coming.

...Iraq has been ordered to destroy dozens of missiles which violate U[N] limits, but the U[S] and Britain are not waiting to see whether [the dictator] complies. In recent days they have stepped up attacks on missile sites near Basra which could threaten the military build-up in Kuwait and the Gulf. The raids are being carried out by aircraft patrolling the "no-fly" zones in northern and southern Iraq, established by the victors after the first Gulf War. They claim the patrols are being carried out in the name of the UN – especially ironic, given the passionate debate over the need for a second Security Council resolution to authorise war on Iraq. Some have always disputed whether the... zones have UN authority, but now the US and Britain have widened the "rules of engagement" to the point where warplanes are effectively preparing the way for an imminent invasion.

...The... U[S] Defence Secretary... says the... attack on Baghdad is "as targeted an air campaign as has ever existed". But [the hawk] should not try telling that to... [one] wounded Iraqi child... [The] 5-year-old... looked at me yesterday... as [it] tried vainly to move the left side of her body. The cruise missile that exploded close to her home in the Radwaniyah suburb of Baghdad blasted shrapnel into her tiny legs... and, far more seriously, into her spine. Now [the girl] has lost all movement in her left leg... [The girl] was the first of 101 patients brought into the Al-Mastansaniya College hospital after America's blitz on the city began on Saturday... There is something sick, obscene about these hospital visits. We bomb. The [Iraqi people] suffer. Then we turn up and take pictures of their wounded children. The Iraqi Minister of Health decides to hold an insufferable press conference outside the wards to emphasise the "bestial" nature of the [US] attack. The Americans say... they don't intend to hurt children. And [the 5-year-old] looks at me and the doctors for reassurance, as if [it] will awake from this nightmare and move her left leg and feel no more pain. Let's forget, for a moment, the cheap propaganda of the regime and the equally cheap moralising of Messrs [US President and US Defence Secretary]... For the reality of war is ultimately not about military victory and defeat, or the lies about "coalition forces" which our "embedded" journalists are now peddling about an invasion involving only the Americans, the British and a handful of A[US]ns. War, even when it has international legitimacy – which this war does not – is primarily about suffering... After a while, "multiple shrapnel wounds" sounds like a natural disease which, I suppose, among a people who have suffered more than 20 years of war – it is. And all this, I asked myself yesterday, was all this for September 11, 2001? All this was to "strike back" at our attackers, albeit that [the 5-year-old and all of the other injured Iraqi children] have nothing – absolutely nothing – to do with those crimes against humanity... Who decided, I wonder, that the[y]... should suffer for September 11? Wars repeat themselves. Always, when "we" come to visit those we have bombed, we have the same question. In Libya in 1986, I remember how [US] reporters would repeatedly question the wounded: had they perhaps been hit by shrapnel from their own anti-aircraft fire? Again, in 1991, "we" asked the Iraqi wounded the same question. And yesterday, a doctor found himself asked by a British radio reporter – yes, you've guessed it – "Do you think, doctor, that some of these people could have been hit by Iraqi anti-aircraft fire?" Should we laugh or cry at this? Should we always blame "them" for their own wounds. Certainly we should ask why those cruise missiles exploded where they did, at least 320 in Baghdad alone, courtesy of the USS Kitty Hawk... It is the same old story. If we make war – however much we blather on about our care for civilians – we are going to kill and maim the innocent.

...Speculation continues that [the Iraqi dictator] was killed in the opening waves of the attacks on [Baghdad on]Thursday morning but Iraqi state television says [the Iraqi dictator] chaired a meeting of top officials on Saturday... Fox News [had previously reported that the dictator] was seen being placed on a stretcher and into an ambulance in photographs in the possession of the U[S] Government showing what is described as "panicked digging" at the bunker/command-and-control facility hit in the first strike of the war... [T]he US attack on [the] bunker... came during an intelligence meeting headed by... [the dictator]'s younger son... "Unfortunately, [the dictator] was not critically injured. We think [it] is still alive...", a front page report in the *Telegraph* quoted an unnamed official as saying. Meanwhile, the *Independent on Sunday* reported that [the British PM] and his ministers were told that US and British intelligence believe [the Iraqi dictator and his son] might have been killed in the first allied strikes.

...The US yesterday pulverised parts of a Baghdad neighbourhood in a direct bid to kill [Iraq's]President... and his sons. Four 900kg bunker-busting bombs dropped from an Air Force B-1B plane left a "huge smoking hole"... and broke windows and doors 300m away... It was unclear last night... whether anyone was wounded or killed... [but r]esidents standing around the rubble said shrapnel killed victims 200m away... The renewed attacks came less than 24 hours after... the Army's 3rd Infantry Division... stormed the Iraqi capital and seized [the] New Presidential Palace.

...Baghdad's arc of death... [A US] Lieutenant-Colonel... did not see much of Baghdad as his battalion of 60 tanks, Bradleys and other armoured vehicles churned along Highway 8, rumbling through an industrial and then a residential zone not far from the city centre. All [the colonel]

recalled, when it was over, were the... wisp and blast of rocket-propelled grenades, the whiz of bullets and the fiery explosions of cars packed, [it] assumed, with explosives. "It was three hours of organised chaos." The colonel's battalion, part of the Army's 3rd Infantry Division, rolled into the heart of Baghdad in what, on the Iraqi side, must have seemed like the beginning of the invasion of the city itself. The casualty count was unknowable, because the American soldiers moved virtually without stopping, but in the estimate of the Second Brigade's commander... more than 2000 Iraqi fighters died or were wounded. For commanders, the march was as much a psychological as a strategic display of force that they hoped would hasten the fall of [Iraq's] President... A tank commander, sitting exposed in his open hatch, was killed when a grenade or mortar exploded in his face. At least six US soldiers were hurt, some seriously, in the lightning thrust, which reports likened to a drive-by shooting... [A US gunner said it] simply never stopped firing... The Iraqi fighters... fired from streets, from groves of trees, from highway overpasses. Many mingled with civilians caught up in the unexpected armoured thrust. Some people ran. Others waved white clothes or held up their hands. "It was hard to shoot, because you don't want to shoot the civilians... It was hard to pick out the threat." The four tanks of [the gunner's] platoon, part of Company A, bear the names of the four airliners hijacked on September 11, 2001... [While the] audacious drive through Baghdad streets was... test[ing] their foe's mettle, [a]... US jet score[d] a 'really bad own goal', dropping a bomb right beside a convoy... [of] US special forces and Kurds... travelling... in Northern Iraq, killing up to a dozen soldiers... The Pentagon said yesterday that 113 members of the U[S] forces had been killed [so far] in the war against Iraq... Britain lists 27 dead... 1252 Iraqi civilians killed and 5103 injured, say Iraqi officials... No confirmed number of Iraqi military deaths.

...The [US] force advancing on Tikrit is intent on sealing the demise of the mortally wounded Government of [the Iraqi] President... The Army and Marine assault on Baghdad has dealt a devastating blow to [hi]s Government, and given the [US] control of the vital, if still lawless capital.

...American officials have another reason not to welcome the sight of jubilant Iraqis ransacking Government buildings in Baghdad. Crucial secrets, they fear, might be contained in the ripped and discarded documents now fluttering over the rooftops of Iraq's capital. The papers could at last... prov[e that the dictator (who 'has a US\$40 million bounty on his head')] sponsored terrorism or paid for nuclear technology – and justify U[S] claims that led to the war. And they could help track down the dictator's vast personal fortune... Estimates of [hi]s wealth range from US\$1 billion... to more than US\$20 billion... If the money is recovered, there are certain to be heated disputes over who is entitled to it. Iraq will be keen to repatriate it, claiming it was stolen. But the country has many international creditors, and owed US\$100 billion even before [the last Gulf War]. Kuwait still wants reparations from the last Gulf War.

...A huge cache of U[S] currency that American soldiers found hidden in one of [the Iraqi dictator]'s palaces could be as much as US\$656 million... [US] officials said the currency would be flown to a secure location for safekeeping and turned over to the new leadership of Iraq... Also at the weekend... a mass grave thought to contain up to 600 Kuwaiti prisoners of war executed... after the first Gulf War was uncovered west of Baghdad.

...ELECTRONICS giant Sony is about to cash in on the Iraq war by selling a PlayStation 2 game called Shock and Awe in the US... Other items planned for sale in the US include an Axis of Evil board game, Iraqi Freedom crockery and clothes, and Shock and Awe trainers and dolls...

[WHILE] CHILDREN in the US can play war... CHILDREN in Iraq live it... At the Iraq-Kuwait border crossing, dozens of Iraqi children hang around, pestering the Kuwaiti and British guards for food and clothing. A sign hangs from the border gate: "Please don't feed the children."

...Like many other N[Z]ers I am... appalled by the stance that... [our] politically correct Labour "regime" has taken towards the efforts of the U[S], Britain and A[US] to rid the world of the tyrant[of Iraq. The US] President... in a clear statement made in the aftermath of the September 11 attacks said that nations must decide whether they support the US and its allies or the terrorists. It is obvious that the Labour regime, motivated by a ideological dislike for the U[S] that dates back to the Vietnam War era, has decided to join the cowardly French and other nations with dubious histories in condemning the coalition of the willing for the brave action it is undertaking. Such condemnation amounts to support for the tyrant... I was [also] [saddened to see [the Labour P]M... on TV laying a wreath at Hiroshima, although I suppose for her generation W[W]II is just history, past and forgotten... I really don't know what the point of the wreath-laying was. Personally, I will always feel thankful the bombings took place.

...AS SOMEONE who only casually reads headlines, I'm not really sure what a free-trade agreement is. But in a world where there's no such thing as a free lunch, I'm sceptical... there's any such thing as a free-trade agreement. The cost, apparently, is the ability to voice certain opinions. Free expression comes at a price. Apparently, there are times to voice opinions, and times to leave the dinner party and cough into your hand. Why didn't [our PM] just shut up about her preferences on who runs America? We all know American democracy is rigged... But as a matter of principle, you have principles or you don't. And a principle is something you believe in, regardless of whether it costs you money... Let's say you and a friend have grown up together, known each other through thick and thin and, one day, that friend does something you disagree with. Do you shut up about it? The critics of [our PM]'s big mouth seem to think silence is the right decision. On one condition. If the friend in question is rich.

...Scud finds target The so-called defender of the free world is apparently just a little peed with [our P]M... after her off-the-cuff remarks that maybe the War in Iraq wouldn't have happened had [the Democratic presidential candidate – who got the most votes –] taken up residence in the White House. Well, that's tough Mr [President]! We do, after all, live in that free world you cherish so much – and that includes the right to say what we like. Or have you forgotten a basic tenant of the [US] Constitution that allows that people have a right to freedom of speech and writing?

...For a few days after the Dixie Chicks' lead singer... told a London audience, "Just so you know, we're ashamed the President of the U[S] is from Texas," there was not a ripple about the remark. The American Ambassador to Britain... was at the show on March 10 and made it a point to greet the Texas trio at a reception afterwards. Though six critics reviewed the concert, only one mentioned the comment in print. Four days later, all that had changed. Reports of the remark spread to the US through websites – notably the Drudge Report and... freerepublic.com – and in no time, the Dixie Chicks, who had been riding the top of the charts... after... their album... w[on] Grammy awards in February, found themselves the subject of radio boycotts and public CD burnings... For celebrities considering taking a public stance on the Iraq war these days, and in particular using the platform that the Academy Awards presents to address an audience of millions, the Dixie Chicks episode has become a cautionary tale.

...Freed from the oppression of their dictator, Iraqis are now free to complain. From tens of thousands of marchers chanting "down, down USA – don't stay, go away" to individuals spitting at soldiers, Iraqis are flexing a muscle that, paradoxically, had atrophied under [their dictator]. But now here's the irony that no one expected. Back in America, complaining about America is the one thing that's pretty much disappeared, lost under the weight of a collective patriotism and increasing constitutional limitations. Voicing any sort of anti-war opinion is just not done any more and a number of organisations have sprung up with the express purpose of blacklisting celebrities who speak out. [One celebrity – who]s obviously on the list[– was] quoted as saying [it] doesn't remember ever being in a climate where people were too afraid to even have a conversation about an issue, let alone a debate. But then in America, uttering any threatening remark about the President is illegal and likely to land you in jail... [L]ooking at America's history of tolerance and diversity, [one writer] said in the *Guardian* that the country was turning into a very un-American America...

The last shot in the war in Iraq will be the starting pistol for two further campaigns by the [USs' Republican] Administration... One will be fought in the region: No one really believes America's project is confined to Iraq. The toppling of [the Iraqi dictator] is first base in what... [the] leading thinker among the neo-conservatives driving foreign policy, calls "a war to remake the world"... America's continuing "war on terrorism" aims to secure Iraq, then focus on fresh enemies: Syria and Iran... The second front will be the home one: Unlike his father – who lost an election the year after driving [the Iraqi dictator] out of Kuwait – President [Dwarf] jnr has also to win what... a former aide to[the previous Democratic] President... promises to be a resumption of "partisan warfare" at home... [By the way,] Britain will commit more than 24,000 troops and 18 warships – more than half the Royal Navy's total – to a European defence force, says the *Daily Telegraph* newspaper. The figures, including 72

combat aircraft, are far higher than previously thought... The opposition Conservative Party has attacked the commitment, saying it is more than Britain can deliver.

...EU commits 100,000 troops to crisis force... Europe's decision to pledge around 100,000 troops, 400 aircraft and 100 ships to a new rapid reaction force opens the prospect of a new era of crisis intervention and peacekeeping well beyond the European Union's borders. Yesterday's conference of defence and foreign ministers assembled an impressive catalogue of [personnel] and machinery but acknowledged the size of the gaps which need to be filled, particularly in providing heavy lift, communications and better intelligence. But its areas of operation remain deliberately vague. While the 19-nation Nato alliance is constrained to operate within the "North Atlantic area," the EU has not prescribed a limit for its planned capability... While most assume that the Balkans, the Caucasus and North Africa are the obvious flashpoints in which it might be deployed, one British official yesterday reeled off a list of zones in which an EU force would have been useful: "Mozambique, Sierra Leone..."

IT WAS late at night when the... farmer came out of her house in the village of Joru in Sierra Leone to go to the lavatory. [The farmer] saw a large white truck that had stopped about 50m from her home. It was an unusual sight, so [the farmer] hid and watched. Inside were two white [guys] and a black [gal], who was yelling: "Leave me alone." "The door was open and one of them was on top of her..." The two [guys] then moved the truck further down the road and stayed about 30 minutes to rape her again. "After they finished, I saw one of them drag her out of the cabin and put her in the back of the big truck." They then drove off. There is nothing surprising about rape in Sierra Leone. During the brutal civil war, which was formally declared over in January last year, it was as common as the notorious mutilations. What made this crime stand out, however, was that the alleged perpetrators were peacekeepers from the United Nations Mission in Sierra Leone (Unamsil), which has been in the country since October 1999. With more than 16,000 troops, it is the largest peacekeeping operation in the world. "We're all a bit frightened of those Unamsil people now... We tell our girls never to get in a truck with them or the same thing might happen to them." As calls are made for UN peacekeepers to be sent to Liberia, it is disturbing to learn that [the farmer]'s tale – told in the Human Rights Watch report, *We'll Kill You If You Cry*, is far from unique. The report also describes how a 12-year-old girl was raped in March 2001 by a Guinean peacekeeper [patroll]ing a checkpoint after [the girl] asked him to help her get a ride to Freetown, the Sierra Leone capital. A soldier was charged and taken to court the same day. However, the Sierra Leone Police... dropped the case and the soldier was sent back to Guinea. A month before, a Nigerian peacekeeper reportedly raped a 16-year-old girl in Freetown. Unamsil said the Nigerian contingent and Unamsil's Civilian Police Section had investigated and the girl had dropped the charge. In June last year, a 14-year-old boy was allegedly raped by a Bangladeshi peacekeeper near the Jui transit camp outside Freetown. [The boy] reported the assault... and a medical examination confirmed that penetration had taken place. The Unamsil Provost Marshall took over the case, but concluded that there was insufficient evidence to link the crime with the alleged perpetrator. An order of repatriation was, however, issued. "What is particularly shocking and appalling is that those people who ought to be there protecting the local population have actually become perpetrators," said... the London director of Human Rights Watch. "It's also very disappointing that there seems to be a deep reluctance to investigate and prosecute these very serious crimes. To turn away from a problem like that is a terrible dereliction of duty." There are now 13 UN peacekeeping operations around the world, served by about 39,600 military personnel and civilian police. In 1993, the UN General Assembly approved a Code of Conduct in operation for all UN peacekeeping missions. Rule four states that they should "not indulge in immoral acts of sexual, physical or psychological abuse or exploitation of the local population... especially children... or U[N] staff...". Yet a report released at the end of last year by the UNHCR... and Save the Children UK on sexual exploitation of refugee children in Guinea, Liberia and Sierra Leone listed many allegations against peacekeepers from nine countries. The report claimed that children as young as 5 were asked to pose naked by UN peacekeepers in exchange for food... Nowhere is the problem uglier – or more embarrassing to the UN – than in Bosnia. The sex-slave industry scarcely existed there until the mid-1990s. But when Bosnia, Croatia and Yugoslavia signed the Dayton accord in 1995 to end the civil war, a team of 50,000... peacekeepers arrived... Hundreds of brothels appeared, many staffed by girls... from neighbouring countries who had been kidnapped or lured by promises of respectable employment and sold into sexual slavery... Last year... a former... UN International Police Task Force (IPTF) officer... investigating human trafficking and forced prostitution, was awarded £110,000... by an unemployment tribunal in Southampton after [it] was unfairly sacked after blowing the whistle on colleagues... involved in the Bosnian sex trade. [The officer] revealed that UN peacekeepers went to nightclubs where girls as young as 15 were forced to dance naked and have sex with customers, and that UN personnel and international aid workers were linked to prostitution rings. Girls who refused to have sex were beaten and raped in bars by their pimps while the peacekeepers stood and watched... [T]he former IPTF commissioner, who left the post in 1999, said one UN police officer downloaded so much pornography that [it] crashed the computer system... [N]ow the senior police adviser to the Secretary General of the Organisation for Security and Co-operation in Europe, the biggest regional security organisation in the world[, the former commissioner] says there is not enough commitment from the countries providing staff to international organisations to take seriously the required qualities and constraints. "You must look at the quality of the people you are providing. I wouldn't have thought anyone needed to be told that you don't behave like this. So we are clearly recruiting the wrong people."

Nations have armies, navies and air forces because their leaders have aggressive aspirations; are scared of being attacked by neighbouring nations whose leaders are aggressively ambitious; or believe that the best way to sustain the economic system is to have 'an arms race'. If, however, every nation chose its leaders on merit, none would have aggressive leaders – and, therefore, no nation would need armed forces ('in 1949 Costa Rica's army was proscribed and replaced by a Civil Guard'). Likewise, armed forces won't be required in a world which is governed by a united system (be its leaders chosen by merit or any other means). Furthermore, no one could use accounting as a justification for creating, maintaining or using armed forces in a moneyless world!

Because the motives of those who seek to form a worldwide moneyless meritocracy are honourable (i.e., are based on their desire to bring an end to unnecessary suffering, to make the use and distribution of resources more efficient and equitable, and to ensure that this planet will continue to support humans for an indefinite period) – whereas the motives of those who oppose such a society are dishonourable or simply stupid (i.e., are based on a desire to gain personal wealth or power; are based on the belief that this planet is irrelevant because it is destined to soon be literally destroyed then replaced by the Kingdom of God, or because humans have the potential to eventually build spacecraft capable of sending a few elite members to a different planet, or because all they care about is what happens to themselves after they've died) – the seekers can be confident that they have a moral mandate to use force if it is necessary in order to create a united, sharing and caring world. But, if efforts to create such a world are introduced by the UN administration and the motives for doing so are properly explained, there ought to be no need to use force.

In the event that one or more of the UN's members are dissenting, or that one or more non-member-nations are unwilling to become a part of a worldwide government, it may still be unnecessary to use force against such nations (especially if they show no desire to attack another nation, their leaders aren't maintaining control via ruthless means, and the UN administration is confident that the majority of their populations are also against being part of a united world – and understand what the motives for, and benefits from, creating a united world are). In this case, a scenario could evolve where a large united system and a few independent nations exist in tandem. The united system can still trade with the independent nations, but the goods provided to them ought to only be of a humanitarian nature (e.g., food, medical supplies). Hopefully, once the united system has proved its worth, the independent nations will decide that being a part of it is in the best interests of the majority of their citizens and descendants. If not, surely their descendants will!

The armed forces of supportive member-nations should be placed under the jurisdiction of the UN. The UN could then streamline its armed forces by releasing from duty personnel who are married (unless their partner also serves in the armed forces), have children who are school-aged or less, are

considered unsuitable to remain in the armed forces for other reasons, or wish to be released from military service. If any aggressive independent nations exist, and diplomacy fails to convince them to become non-aggressive, the UN forces ought to be used to disarm and pacify them – by whichever means best suits the task, while keeping civilian casualties as close to zero as possible. If an aggressive independent nation happens to be a major military power, disarming it might prove problematic (e.g., involve a high body count; impact adversely on infrastructure and environments). However, none of the present administrations of the most powerful military nations appear to be – or are likely to become – so irrational as to choose a war against the UN over unity.

Assuming that the leaders of all the major military nations would be willing and able to participate in creating a united world, the threat their combined militaries pose to any independent nations may be enough to convince them to remain non-aggressive – if not to become fully co-operative. Furthermore, even if a number of independent nations have to be defeated in order to finally achieve worldwide peace, the combined weaponry of the UN forces ought to be enough to achieve that. Therefore, weapons factories and development can immediately be shut down within the united system (the factories could be temporarily reopened in the unlikely event that UN forces run low of ammunition, etc., before they have made the world safe from nationalistic aggression).

Even if the UN immediately receives the support of every nation at a government level, there may be dissenting political parties or military leaders who cause problems by forming breakaway militias; and, in addition, there are existing private armies (including gangs) to deal with. Although the UN should want to disband such groups a.s.a.p. – so their members can be employed in, or trained for, positions which have a positive effect on society (i.e., contribute to the production of food and other necessities, the education of children, treatment of the ill, etc.) instead of a negative one (i.e., contribute nothing that society needs; necessitate the diversion of people from the provision of essential products or services to positions which are designed to counteract illegal or anti-social activities) – avoiding loss of life ought to be its primary objective. Therefore, such groups could be monitored (e.g., by satellite) but be left alone as long as they don't cause any trouble – then they might simply disintegrate through a lack of new recruits and decreased interest from existing members. However, if a private army causes harm to the united system's citizens or facilities, the united government would – after first giving the private army an opportunity to surrender – deploy its military personnel against the private army.

Ideally, every political and militaristic organisation will quickly agree to co-operate in building a better society. Hopefully, even if some need to be dealt with violently, doing so would require just a minimum of the UN's military personnel. Therefore, even if the number of military personnel is streamlined, the UN still ought to end up having a large number of military personnel who can be considered redundant. They should all be sent to parts of the world which need to be provided with basic amenities (e.g., sturdier accommodation, accessible and sanitary water supplies, suitable waste disposal facilities, electricity). Civilians who also are considered redundant (because their home district isn't under-privileged and has an oversupply of workers due to the closing down of unnecessary industries – and they don't have children who are school-aged or less) could volunteer for such work – which may involve contributing labour, medical assistance or acting as tutors to under-educated populations.

Excess portable accommodation (e.g., caravans) can be sent to shanty towns and other substandard residential sites to be used as temporary housing – or longer-term housing if there is an initial shortage of materials to build proper accommodation – for locals or the armed forces personnel (in some instances, a site may need direct UN assistance for a number of years; but UN personnel themselves, and any civilian volunteers, might only serve at a site for six months or so before being returned to their home district – perhaps performing subsequent six month stints, at the same site or elsewhere in the world). Tents and related equipment (be they sourced from military or civilian stockpiles) could also be used to accommodate the armed forces personnel – and locals if there is a shortage of caravans and other sturdier portable accommodation (an option is converting 'containers – many of which, because a lot of freight travels in just one direction, are only used once'). In addition, where UN personnel are operating near coastlines or major rivers, naval ships should be utilised for their accommodation – and ocean liners used as temporary or long-term accommodation for locals who are homeless or currently live in substandard housing. Bombers and other large planes (be they military or civilian) would be an accommodation option for inland areas. By the way, primitive tribal groups which inhabit, for example, remote parts of South America and Papua New Guinea, ought to be allowed to continue living on their traditional lands, according to their traditional customs – but efforts should be made to gradually (and peacefully) introduce the outside world to these peoples, so they can compare it with their own lifestyle and decide whether their children must receive a more sophisticated education in order that their children, or the next generation, will eventually be capable of joining and successfully contributing to modern society by moving to a neighbouring city.

Although armed forces (plus secret forces such as MI5 and the CIA) could quickly become irrelevant in a united world, there will continue to be a need for police forces and other emergency services. However, the amount of personnel that police and emergency services require should decrease in future. A reduction in the need for fire services would be expected because although houses (and probably many other buildings) are being built out of plastics – which generally *burn faster, at higher temperatures and produce more lethal smoke* than other building materials – fireproof plastics or non-plastic materials can be used around the oven and any other heating devices (e.g., hot water cylinders), there aren't going to be any open fireplaces, gas ovens and exposed heater elements or LPG heaters, dodgy wiring (wiring can, of course, be insulated anyway) or overloaded power-sockets, less or no people are smoking and doing other stupid things involving fire (hence there would be little or no need to produce matches or lighters – there would at least be no need for them to be kept in houses), etc. New housing may be built with sprinklers and fire alarms to limit any fire damage – but, if the chances of a house catching fire are close to zero, producing, inserting and maintaining sprinkler or alarm systems might be more wasteful than useful! If it becomes possible to construct the exterior walls of houses out of a non-flammable plastic, exterior fires wouldn't be a problem – but, if houses aren't positioned near large stands of trees, and residents don't need to have backyard burn-offs of rubbish or garden debris (and, preferably, don't have barbecues or hangis – 'Maori earth-ovens; a pit is dug, stones previously heated by a fire are put in it, the food gets placed on the stones' then is buried until cooked – either), exterior fires normally won't be an issue.

If 90% of all crime is committed for money there would be a reduced need for police officers in a moneyless world. Changing from an uneven economic system to one in which everybody is paid an equal allowance (excluding, perhaps, people who refuse to perform any kind of work in exchange for such payments and other benefits – e.g., free medical treatment) mightn't automatically eliminate the opportunity or motivation for greedy people to increase their personal share by theft, cheating, or some other method – but it will reduce the number of economic crimes committed in desperation (even if lots of people are refused a full weekly payment because they are unwilling to work or undertake a training course – r:Ins55-6 above + p1953, Ins48-9 – there would be less justification for any to be economically desperate). Hopefully, no one shall be unwilling to earn its payment, or be keen to supplement it. However, if some people do continue to commit economic crimes until money has been completely eliminated from society, the practice of punishing them by placing them in a prison should immediately stop. Indeed, because the only justification for locking someone up is if that person is a danger to society, every inmate who wasn't convicted of a violent offence can be released from prison (although somebody ought to be responsible for ensuring that each inmate has somewhere suitable to live before it is freed). Such inmates could either be pardoned or have their sentences commuted to some kind of community service.

While money continues to be used by society, non-violent crimes can be punished by demotion, humiliation (r:p1953, ln44) and/or a reduction in weekly payments – although there is a risk that the latter option may cause some people to reoffend! Furthermore, while military personnel and volunteers are being sent to help under-privileged communities, childless offenders could be given the option of joining them (in this case, being separated from family and friends would be their punishment – but they could also be sent to the least desirable locations). Once money has been completely eliminated, punishment for any non-violent crimes can involve demotion (or end a person's chances of ever being promoted), transfer to a less desirable job (r:p2521, Ins48-9), subtle public humiliation, an increase in work hours (e.g., having to complete more than 24-hours per week for a period of time – which would depend on the seriousness of the offence, or number of offences committed previously; there ought to be set punishments to simplify sentencing), and loss

of recreational privileges. Banishment to locations where offenders might feel more at home (e.g., a cave or tree in the wilderness) is another option – but this punishment should be voluntary not enforced (and few if any people are likely to choose it).

Bringing an end to private ownership of vehicles, and ensuring that every worker who operates a vehicle has been properly trained, will eliminate – or at least severely reduce – the number of traffic offences which are committed (reduced volumes of traffic would also affect the incidence of traffic offences), and thereby reduce or eliminate the need for police officers (or anyone else) to specifically manage traffic. To further help reduce the need for police officers, the range of activities which are classified as illegal can be narrowed. For example, because wealthy and materialistic people are themselves immoral, police needn't bother looking into thefts of their economically valuable but non-essential personal or household items. Another possible example is that the use of narcotic drugs could be decriminalised – although people who commit crimes while under the influence of drugs, or to obtain drugs, should still be prosecuted; and dealing in drugs ought to continue being illegal (but not warrant imprisonment). Instead of allocating resources to finding and punishing drug-users, society must try to end drug use by improving social conditions and offering treatment to addicts – while also trying to end the large-scale production and distribution of narcotic drugs by gaining control of land, labour, transportation, etc. (ending the organised production and distribution of alcohol will contribute to a decreased police workload, as would halting the arranging of large social events such as sports and music extravaganzas). In addition, the police must cease to perform undercover work – especially operations which encourage people to commit a crime so they can then be arrested! However, while trying to limit the amount of work police forces have to do, it shouldn't be forgotten – as, seemingly, is currently the case in many parts of the world – that the purpose of having police forces is to protect the public. In order to better do this, some legal (or controlled) activities might become illegal. An obvious example is the private ownership of weapons. Gun-owners often point out that if guns become illegal it'll curtail their freedom to shoot at other animals from a distance or to protect themselves, and their families or personal property, from criminals (who, apparently, won't give up their guns because they don't care about laws). Yet, making guns of any kind illegal obviously means police officers can be confident that any civilian who has a gun is a criminal – thereby making officers' jobs easier, and removing the opportunity for innocent people to be shot by their own guns or the police (and if officers were properly screened before being recruited, then properly trained and equipped – plus undergo periodic physical and psychological examinations to ensure they maintain acceptable levels of performance – there would be no justification for them to ever use a gun to try and incapacitate anyone who is unarmed or wielding a club!).

It would be ideal if police officers could shoot tranquillisers at violent or armed suspects instead of bullets. Unfortunately, tranquilliser darts aren't a viable option if the suspect isn't naked (tranquilliser darts are also 'more expensive than bullets' – although that wouldn't be an issue in a moneyless society). However, considering how many fatal gases have been developed for use in warfare, is it valid to assume that at least one gas capable of temporarily rendering people unconscious – or incapacitating them in a way which is equally harmless – and can be fired via, for example, a canister (such as those used for tear gas), has been identified? (Considering how many times oil companies have apparently acquired – and then kept undeveloped – inventions which threatened their industry, it's possible that the gun and ammunition manufacturing industry has successfully suppressed the use of such a gas!) If such a gas is available – or isn't difficult to develop – police forces will have less justification to possess guns. Furthermore, closing down the production and distribution of guns (and other offensive weapons – e.g., crossbows), and destroying – or at least transferring to police arsenals, and the UN armed forces while they continue to exist – guns obtained from the public (through amnesties prior to the criminalisation of guns, or from captured criminals), means the number of guns in private hands will continually decrease until, eventually, there are none in private hands; and then police will have no justification for possessing guns (hence their remaining guns, plus any armed forces' weapons, can be destroyed – preferably by recycling their materials).

Although it isn't incorrect to say that people can't be held responsible for their actions because life is *predestined* (r:p1212, ln41), and for this reason it is unfair to punish people, everyone who considers itself to be mentally well has the impression it is choosing whether or not to do something deemed unlawful – and instances of people making the wrong choice might be God's way of proving to them that their society is imperfect, thus needs further improvement – therefore, it isn't unfair to expect lawbreakers to somehow repay society for their behaviour (as long as the laws were created for valid reasons – e.g., because the behaviour has an adverse effect on others, be they individuals or society at large – and the punishments aren't unreasonable). However, once a moneyless society has been fully established, it is possible that the only crimes being committed are those involving violence (including sex offences and vandalism – the latter generally being mindless violence directed at society itself rather than individuals) – which could mean that the cleaning of *sewers or public toilets*, etc., will have to be performed by the least qualified citizens rather than the least well-behaved (unless robots can perform these tasks; incidentally, 'a street-sweeping truck roaring down a Bronx street sucked up a dog and killed her as her owner held the leash').

In HB-led societies (i.e., those of the past and present), violence is tacitly tolerated (consider the movie industry) – and often encouraged (consider boxing and ice hockey – plus the handling of player violence by sports-body tribunals rather than public courts). In a human-led society, the beliefs of people who abhor violence will be prominent – consequently, such a society would aim to ensure that non-violent people are able to feel safe. Furthermore, a maxim of the human society would be: although not every mentally ill person is violent, every violent person is mentally ill! Therefore, such a society wouldn't have any prisons, but instead have secure psychiatric hospitals – which will contain more than enough beds, but won't contain non-violent patients (who can be treated in the community or at a hospital's psychiatric health ward – where security needn't be as tight). Secure psychiatric hospital patients won't be expected to perform work tasks – but, if necessary, could be given a chance to improve their education in addition to undertaking treatment (improving their education should help patients to better cope with being a part of society if they are eventually released – and, prior to being released, patients ought to be given an opportunity to prepare for life outside by, for example, being moved into a unit where they can get used to, or refamiliarised with, cooking for, and cleaning up after, themselves, etc.). (Until enough secure psychiatric health facilities are available, existing violent prisoners would have to remain where they are – although it might be possible to convert some prisons into psychiatric health facilities. By the way, when there are no prisons, there will be no need for prison guards – their role having been replaced by psychiatric nurses and orderlies – while a moneyless world would have little or no requirement for security guards and bodyguards, guard dogs, security cameras, safes, etc.) In addition, violent people (and potentially violent people – such as stalkers or people diagnosed with mental illnesses known to cause uncontrollable violent behaviour) wouldn't be sent to secure psychiatric hospitals for a set period of treatment – they will all be admitted indefinitely (i.e., the only way for a patient to be released from a secure psychiatric hospital is if it manages to convince a panel of senior psychiatrists that it no longer has any violent tendencies or tendencies to perform antisocial behaviour such as stalking, or that it will continue to take any prescribed medication – patients released on medication would need to be regularly blood or urine tested to check that they are taking it, and be readmitted to the secure psychiatric hospital if a test is negative). This means the public can be confident that patients who have been released from a secure psychiatric hospital are no longer dangerous (so don't need to be stigmatised) – but, if a former patient does reoffend, the people responsible for okaying its release should lose their jobs (i.e., be demoted). Obviously, not every form of violence warrants a long-term stay in a secure psychiatric hospital. However, even someone who has just punched another person once ought to be sent to a secure psychiatric hospital until it has identified why it resorted to violence, and shown that it knows how to resolve conflicts in a non-violent way. It should go without saying that once someone is in a secure psychiatric hospital, it needs to be protected from other patients (especially those patients who will never be let out because their crime was so heinous – and, usually, being able to appear sane, charming and remorseful is part of their psychosis).

When someone has committed a violent crime, the public only needs to know whether or not the offender has been apprehended (the public can be informed via radio or TV news). Unlike with minor offences, the identity of violent offenders shouldn't be publicly listed or *broadcasted* (although, if they want, victims could appear in the news – but there ought to be no form of compensation for victims). This means that people will no longer be motivated to perform unspeakable acts in order to become infamous! While the necessary satellite equipment remains operational, formerly violent offenders could be

fitted with a discrete ankle or bracelet when being released so that, if the location of an unsolved act of violence is known, they can easily be discounted or identified as the suspect (but, by the time the satellites and related equipment need to be replaced, the amount of violent crime being committed could be down to a level which doesn't justify doing so).

If a formerly violent patient does reoffend, it ought to be virtually impossible for that someone to ever be re-released. Unfortunately, keeping someone in a secure psychiatric hospital for the remainder of its life is a wasteful burden for society. Ending the lives of these and *those patients* prematurely (e.g., by lethal injection) would be a practical solution – especially if a patient is willing to be *put down* – although not a humanitarian one! However, in an improved society (i.e., one that has less stress, less head injuries, less or no use of mind-damaging chemicals, and whose children aren't raised by people who have stupid religious beliefs), the incidence of mental illness should start to decrease – and, if potentially dangerous people are identified at a young age (as is possible in many instances – r:p2598, ln21 – if parents, teachers, etc., respond sensibly to a child's abnormal or unhealthy behaviour instead of trying to ignore it), efforts can be made to correct whatever problems such children have before they reach the point where they begin to rape or kill (i.e., before they need to be kept in a secure place – although, because in a society the rights of the majority have to take precedence over those of the individual, if a child's behaviour is severe enough to warrant isolating the child from other children or adults for their safety, it may be necessary to place the child in a secure unit at an early age). Therefore, a time could arrive when no one is a danger to society, so the need for secure psychiatric hospitals no longer exists – or, at least, a time could arrive when the requirement for such facilities becomes so minimal as to have a negligible effect on human resources (even if all of the patients are there for the remainder of their lives). Note that if a time arrives when people no longer have to be concerned about someone (be they strangers or not) entering their home to rob or attack them, houses won't need locks on their front and back doors – which means nobody will need to carry house keys, or ever be accidentally locked out of their home (likewise, if no one goes where they have no business being, other buildings shouldn't need locks either; and, in a world where everyone is trustworthy, leaving food deliveries, for example, outside unattended houses wouldn't be a problem – if it is a problem, counter-measures such as having food-delivery bins which can be locked and chained to the house might have to be introduced).

In a world which is crimeless, and where nobody is able to sue anyone else, or have any reason to be involved in a major dispute with another person – and industries also have no reason to be involved in major disputes with each other – there will be no need for a judicial system (and in a moneyless world there wouldn't be any bail hearings – but only people suspected of having committed a violent offence would be sent to a remand centre, which ought to be adjacent to a secure psychiatric hospital so the suspect's mental state can be assessed while it awaits trial). If, however, the judicial system continues to be required – or while it is maintained – it shouldn't involve lawyers (instead, each suspect ought to have a court or self-appointed adviser/counsel to help it negotiate the legal process – and speak on its behalf if the suspect feels unable to speak for itself, or is incapable of doing so; no one would be employed to make guilty people look innocent or innocent people look guilty). Obviously, the judicial system will only be used when a person's guilt has to be proven. Suspects would be judged on whatever forensic evidence is available (the person responsible for compiling and presenting such evidence would be acting in place of a prosecution lawyer, but deal only with facts) – including the results of a range of lie detector tests (the more times people have to repeat their stories, the more likely it is that liars will slip up) – and the testimony of any witnesses (who must also undergo the same lie detector tests but, hopefully, won't need to receive new identities and be moved to a new district, rather than on the oratory skills of a lawyer (the lack of lawyers might produce a bonus by allowing cases to reach court earlier, and are completed in less time, than at present). Furthermore, suspects should be judged by judges – who would also question suspects and witnesses – rather than by other members of the general public (r:p2586, ln13-5). A single judge can handle simple cases, such as those involving non-violent offences or disputes, and a jury of judges can handle more serious or complicated cases (their decisions being based on a majority vote – therefore such juries will need to have an odd number of members). This means judges will actually perform the task their name implies, and use their own brains, rather than just advise other people about what the laws are and pass sentences according to those laws and the decisions of those other people.

As befits their role, judges would have to be above reproach (i.e., they obviously can't have a personal connection to the defendants or witnesses who appear before them and need to be the most moral people of all: basically, they should be the most god-like members of society, effectively taking the place of religious leaders – who won't be required by a society which believes that God is inside every human, instead of believing that 'God is watching us from a distance', is only inside one human, etc.; therefore, churches won't be required in future either – but existing churches can be used for alternative purposes rather than be pulled down before they are nearly ready to fall down). This means society will be able to trust their conclusions – which ought to always be correct (but, if they are ever wrong, that will just be bad luck for the suspect involved; the notion that *it is better for five, 10 or 20 guilty people to go free than for one innocent person to be punished* is unjustifiable, especially if the 20 guilty people were all mass murderers! – and, anyway, if an innocent person has been judged responsible for committing a violent act, it ought to have little trouble convincing mental health practitioners that it isn't a threat to society) – thereby eliminating the necessity for an appeals process (if necessary, state courts could be formed to hear appeals against district court decisions; and a world court formed for appeals against state court decisions). However, if for any reason an inquiry has to be conducted, the inquiry members could be chosen from relevantly skilled near-retirees (r:p1951, ln61-2) – the time they spend on an inquiry would be counted as working hours.

If the percentage of Security Ministry personnel in the total workforce is eventually quite low, the ministry can afford to be choosy when selecting new recruits. Rather than simply being *the most athletic members of society*, they ought to be the high school students who are able to combine above-average levels of athleticism and morality with an ability to quickly choose the best option when under pressure. Furthermore, in order to complete their training, recruits should have to gain a minimum pass-mark for courses in: standard policing (which would not only involve learning how to properly restrain mentally disturbed people but include the control of large or dangerous animals – primarily via the use of tranquillisers – that, for example, manage to get past the fence which separates a district's farm and urban land from the wildlife land); search and rescue procedures (including learning how to use whatever equipment might be required); first aid (with the emphasis on giving initial treatment to injured people who've been rescued or are the victims of violence, accidents or natural disasters); firefighting. In addition to completing to a satisfactory level each course, each recruit will need to specialise in one of them (i.e., gain a high level pass-mark). Therefore, Security Ministry personnel could be formed into teams of four, with each team-member being a specialist in a particular discipline. Each team then works as a unit, with the team-leader being whichever member is the specialist in the discipline that relates to the task a team has been assigned to deal with (i.e., if a team has to deal with four completely different situations during a single day, the team might be led by a different member on each assignment). Security Ministry personnel may be fitted with matching uniforms, which ought to be practical enough to be used for most of the assignments they are sent on (with specialised uniforms – such as firesuits – being available for use whenever a standard uniform is impractical).

If Security Ministry teams use helicopters (or a future version of vertical-takeoff aircraft capable of hovering – so they can operate over land and sea) to travel about in, they will be able to quickly respond to any call-out. Such aircraft would need to be usable in all weather conditions (if they can't be developed to fly no matter how strong the wind becomes – r:p564, ln38 + 45 – they should have a good set of wheels and suspension so they can be driven instead) while carrying the team and a small number of passengers (e.g., people who have been rescued) plus basic equipment that the team might need to use (e.g., harnesses and winches; first aid supplies) and any extra equipment which is required to complete specific tasks. It may be possible to initially convert military helicopters to perform such tasks.

Rather than fit Security Ministry aircraft with water tanks for use when fighting fires, they could have a tank of compressed foam – for use when foam is more suitable than water, or when water is unavailable – and carry hoses (that can be connected to water mains at suitable locations, such as the points where parking spaces adjacent to one-lane residential roads end and pathways, under which the water pipes lie, begin – r:p2520, ln63; an absence of tall trees around houses should make it easy for the aircraft to land on the parking spaces, and if this isn't possible – because, for example, the fire is on a

hillside – one hose would have to go from the nearest hydrant to the hovering aircraft, and the water then pass through a second hose to reach the fire). When water pipes are unavailable and foam impractical, the aircraft will need to use extra equipment (i.e., equipment not normally carried by the aircraft – e.g., a monsoon bucket). By the way, Security Ministry aircraft ought to be used to carry patients who need to reach hospitals in a hurry (standard ambulances – i.e., Health Ministry vehicles, which can be stationed at suburban medical centres – would just transport non-urgent patients; and Transport Ministry taxis, rather than Security Ministry aircraft, can be used whenever the need to move non-urgent patients outstrips the supply of ambulances).

Even when the Security Ministry's personnel constitute a small percentage of the total workforce, the amount of time each team spends on call-outs may constitute a small percentage of their rostered work hours. However, while rostered on duty and awaiting a call-out, team-members should undertake revisional training programmes, fitness exercises, or study relevant literature – and every Security Ministry worker ought to effectively be on-call for the 24 hours of each day in case of a major emergency (for this reason, such workers might normally be rostered on for less than 24 hours per week; during emergencies, they may need to work longer than 24 hours over a week or more). Whenever a district is hit by a natural disaster (e.g., an earthquake), the aim of the Security Ministry would be to quickly flood that district with as many of its personnel as is practical. Local Security personnel could immediately be aided by locals who are able to help out (e.g., because they aren't rostered to be doing their normal work at that time; because, due to the disaster, they can't perform their normal work; r:p1951, ln67-9). These people will be bolstered by Security personnel and volunteers from neighbouring districts, and as Security personnel from more distant districts arrive on the scene, they would relieve the local personnel and workers, then the next lot of arrivals could relieve the personnel from the neighbouring districts, and so on. If the Security Ministry of each district has at least one large cargo plane (i.e., large enough to carry a number of teams plus their smaller aircraft and whatever equipment they will need to use – sometimes it might not be necessary to send the smaller aircraft – and emergency supplies of tents, medication, food, or whatever is required; every factory should maintain a store of the products they manufacture so, when one district suddenly sustains major damage, essential products can quickly be replaced – r:p2203, ln14). If necessary (i.e., if the damage caused by the disaster is extensive enough, or the effects are long-lasting – e.g., after-shocks), when each of these large planes has dropped off its passengers, their equipment and any supplies, they could return from whence they came (carrying injured people if they originated from a neighbouring district and the stricken district's hospitals and SMCs – which would handle non-critical injuries – are overflowing; note that while hospitals ought to have the capacity to handle maximum levels of demand – r:p2163, ln35 – normally they need only be staffed in order to handle above average demand, and in an emergency staff numbers can be increased by calling in non-rostered staff plus one or more staff from each SMC) to collect more Security personnel – who, upon arrival in the disaster-zone, might relieve the personnel from their home district; who are then returned home (unless they have to continue providing assistance after having a rest-break). In the event that more transport planes are urgently required than available, Transport Ministry aircraft would have to be temporarily commandeered (if the Recreation Ministry has its own supply of passenger aircraft – r:p2519, ln24 – the Security Ministry should utilise these firstly, which means cancelling recreational trips rather than transportation trips that, presumably, are more essential).

Although wild forest and scrub fires are a natural, and sometimes essential, part of many environments – and, in future, humans won't be directly threatened by such fires – they can consume huge amounts of oxygen and produce massive smoke clouds. Therefore, the Security Ministry should also mount large-scale emergency operations to try and extinguish (or at least minimise – by creating firebreaks, etc. – the impact of wild fires). Such operations might be conducted with the direct co-operation of workers from the Recreation Ministry – who would be responsible for trying to save injured wildlife, or else put them out of their misery. Other events that could warrant a joint operation between the Security and Recreation ministries is when whales have beached themselves; when people who have entered wildlife land to go hiking or camping, for example, go missing or get into a different kind of difficulty. Incidentally, the representatives of each industry who form a district's government will, under normal circumstances (i.e., when there is time to debate and carefully consider decisions), all be considered equals – or, in other words, no minister shall have precedence over another. However, decisions generally have to be made a lot faster during an emergency. Therefore, whenever a district is hit by a major emergency such as a natural disaster – and until the emergency is over – one minister ought to automatically become the premier decision-maker. The obvious candidate for that role is the representative of the Security Ministry (under normal circumstances, the Security Minister can act as chairperson of the government body). Likewise, if ever a major emergency affects an entire state (or a large part of it), the state's Security Minister would assume the role of premier decision-maker on the state government body; if ever a major emergency affects the entire planet, the Security Minister of the world government body becomes overall leader.

Security Ministry personnel who prove themselves to be more moral, and better able to think quickly (plus soundly) when under pressure – in comparison to other Security Ministry personnel within their district – will be promoted to management level (while any personnel who prove themselves to be equally moral but not so equal at thinking quickly and soundly when under pressure, would become court advisers – with the best of them being promoted to judges – unless courts aren't needed); with the district's Security Minister being the person who unquestionably is both the most moral and best at thinking quickly.

If the computer programmers who currently work on Defence contracts or for economic industries – or to undermine the efforts of those programmers – were to unite their efforts and then focus them on more meaningful activities, any remaining problems involved in the use of computers should be quickly solved. One project that would be meaningful is to design a cyber file system capable of storing important information about all of a district's citizens, and can be added to whenever a baby is born. A new file will just contain the baby's date of birth, given name, the names of its parents and any other relevant people (e.g., siblings, grandparents), their addresses, plus any relevant medical information (including its DNA make-up) – which ought to be stored in a section of the file that only authorised people (e.g., doctors, the child's parents) are able to access; although only doctors will be able to add details to this section of the file. Another section of the file could be activated when the child's education commences, and be added to by the child's teachers so that it eventually provides a full record of the child's educational history (to be used as an employment guide). When the file's subject commences work, or training for work, a section of the file would be activated to provide a record of its employment history (including, if necessary, details such as how many hours the subject has completed). Other ministries might also have sections to store information that pertains to their operations (e.g., the Recreation Ministry may have a section to keep track of the subject's use of recreational facilities – especially the facilities that, due to demand, can only be used a limited number of occasions within a set period of time). There probably will need to be back-up copies of each file (in which case, each time a file is added to, the relevant department – operating within the Work Ministry, perhaps – will have to be notified that the back-up disc has to be amended; perhaps the system can be designed to automatically notify the department of changes), but there should be no need to maintain a file once its subject has deceased (thereby avoiding the need to continuously create more cyber space to make room for new files – and more discs for back-up files). However, it might be possible for relatives to request a printed copy of the file (or have it transferred directly to their home computer) before it is erased.

Civil libertarians will be horrified by the notion of creating a records system of this nature, but it isn't very different to many records systems already in existence – r:p1264, ln38-9 + p1270, ln24 (and, anyway, the value of their opinions has to be put into perspective – at least as many people are horrified by libertarians' apparent willingness to aid the cause of gun fanatics and paedophiles!). Furthermore, as long as the information is correct, and no one continues to be so deluded (or atheistic, or materialistic) as to believe that it *has something to hide* from the rest of society, there should be no opposition to such a records system. The system ought to include some form of identification process which can remove the need to provide people with ID cards and things like Medic Alert bracelets (an injured person's fingerprint or pupil could be used by authorised people – e.g., Security Ministry personnel – to firstly identify the victim, especially if it is unconscious, and then inform them of any relevant medical conditions, such as allergies to certain medications; in addition, patients may have to be in the presence of a doctor before that doctor can enter its file – although some senior Health and Security Ministry staff might be authorised to override this security measure on behalf of less senior workers in special circumstances). The records system would need to be designed to allow other ministries to extract relevant statistical knowledge (e.g., to aid research) without being able to match those statistics to individuals.

SCIENCE

SCIENTISTS IN SPACE... [T]he American Apollo Moon-shot programme comes to an end in December... Exciting and spectacular though it is to see [creatures] from Earth set foot on another planet, the amount of scientific information that these astronauts can bring back is limited, and little, if any of it, is directly beneficial to [hu]mankind. - 1973

On July 20, 1969, [creatures] from Earth stood for the first time on the surface of an almost unknown planetary body, the Moon. The successful landing of Apollo 11 at Tranquillity Base marked the culmination of over ten years of... lunar exploration by remote-controlled orbiting, hard-landing and soft-landing spacecraft from the USA and the USSR. It also signalled the beginning of an extensive scientific study of the rocks and minerals, the interior, and the surface environment of the Moon; the new science of lunar geology. About a hundred and fifty scientists from laboratories throughout the world were selected to conduct a wide range of geological, chemical, physical and biological tests on the rocks returned to Earth, and to design measuring instruments for the astronauts to place on critical areas of the Moon's surface. These scientific studies have led to a host of new discoveries... Most dramatic of all was the discovery that the Moon was born at the same time as the Earth... Such studies will continue for many more years, as each discovery poses new problems to be solved... The total rock collected amounts to 382kg... At the Lunar Receiving Laboratory in Houston... are catalogued 35,600 small pieces of the Moon. The first aim of the researchers has been to discover whether any forms of life exist or have existed on the Moon... Secondly, the composition of the Moon and its evolutionary history needed to be known... Thirdly, we needed to know more about how the Moon originated... Some people thought that we also needed to know whether precious minerals existed on the Moon, but geologists already knew that the processes that operate on Earth to concentrate minerals of economic importance were unlikely to have operated on the Moon; also, economics tells us that even diamonds would be barely worth collecting in any abundance... After all, the short Apollo program alone cost around \$25,000 million[. By the way, 'shortly before the first atomic bomb was dropped in 1945, Vannevar Bush, the director of the Office of Scientific Research and Development, told US President Harry Truman: "This is the biggest fool thing we have ever done. The bomb will never go off and I speak as an expert in explosives." Vannevar Bush is, however, in good company when it comes to being completely wrong – the US Office of Patents proclaimed in 1899: "Everything that can be invented, has been invented", and in 1878 a British parliamentary committee said of Thomas Edison's lightbulb: "This might be good enough for our transatlantic friends but it is unworthy of the attention of practical or scientific minds"']...

It became fashionable and profitable for industry to ask professional scientists and engineers for advice. Thomas Edison (1847-1931) established the first independent consulting laboratory which actually proclaimed that it could make practical inventions to order, and his laboratory poured forth a stream of inventions including the first commercially practicable incandescent electric lamp. The momentum increased as governments, universities, industrial and consulting firms, and independent foundations established laboratories dedicated to generating new science-based technology. Research became highly organized and structured. Research budgets grew. Research teams increasingly took over from individual investigators. In addition to planning the production of new science-based technology, research directors became interested in the possibility of actually guiding the process of scientific discovery. As late as the 1930s such ideas still seemed heretical to many scientists, but they were soon to be put to a test which dramatized how basic and applied research can proceed in creative interaction. Einstein's original paper of 1905 had implicitly contained the germinal idea of atomic (or more correctly, nuclear) weapons; if matter can in principle be transformed into energy, cannot practical means be found to break a series of atomic nuclei apart and thus release large and even devastating amounts of energy? Significantly it was Einstein himself who, in his historic letter of October 1939 to President Franklin D. Roosevelt, convinced him of the practicability of creating a workable nuclear bomb and of the urgency of reaching that goal ahead of the Nazis. The result was the Manhattan Project. Here was something utterly unprecedented in scale and scope: a two-billion dollar effort to finish translating Einstein's original equations into nuclear weapons such as were to be test-fired at Alamogordo and then employed to end... W[W2]. The project involved every level of science and the service of thousands of scientists and engineers from the U[S], Britain, Canada and other countries working as one great team. The outcome conclusively proved the feasibility of such large-scale teamwork in science and technology... The... project... not only dramatized the practicality of scientific theory; it had shown that, given sufficiently well-defined goals and a sufficient sense of urgency, [humanity] can make comprehensive scientific plans and carry them to fruition. In that instance the goals and values related to a war against totalitarian tyranny, but in principle the same approach can be applied in support of goals and values connected with the purposes of peace.

...Even when the arms race ends, as it must be made to end, the scientific frontier will remain... But... as we should now, hopefully, also agree, an economy that is preoccupied however brilliantly with the production of private consumer products is supremely ill fitted for many of these frontier tasks... Private enterprise did not get us atomic energy. It has shown relatively slight interest in its development for power for the reason that it could not clearly be fitted into commercial patterns of cost and profit... [W]e have few civilian arrangements that are by central design and purpose directed to large-scale participation in modern scientific and technological progress... Much has been accomplished by research and development... under the inspiration of military need. This has done more to save us from the partial technology stagnation that is inherent in a consumer goods economy than we imagine. But this is a hideously inefficient way of subsidizing general scientific and technical development, as nearly all scientists agree. And it has the further effect of associating great and exciting scientific advances with an atmosphere of fear and terror. - 1977

...the old, scientific world view, which has up to now allowed scientists and "experts" to make self-delusory claims of "objectivity" is now obsolete... Their search for "certainty" is now seen as immature and must give way to a more sophisticated recognition of ambiguity and uncertainty – the indeterminacy of acknowledging that the scientist is a *participator* and that the act of observation itself affects the outcome of experiments and research. We are now awakening from the technological trance and realizing that in a very real sense... all science is normative and laden with value choices. The first decision a scientist makes is normative: the choice of what to study. Thus today scientists and technologists, economists and planners, as well as "experts" professing and selling "technology assessment," "management techniques," "economic forecasts," "futures research," and other "policy sciences" must now take full, public responsibility as participators, not observers who are "neutral" to the outcomes. Citizens are learning that they must now intervene at the stage of defining the "problem" and shaping the study... For each specific technology, we might ask whether it is... required... and... [d]oes it make maximum use of existing infrastructure, or will it entail costly or duplicative infrastructure? Are its cost, benefits, and risks equally born by all groups in society, and if not, who will be the winners and who the losers? What risks does it pose to workers, consumers, society at large, and future generations, and can they be assessed...? - 1981

MODERN ECONOMICS RELIES HEAVILY on the efficient market theory. Knowledge is assumed to flow freely from place to place. The people making important decisions are supposed to have access to more or less the same body of information. Of course, pockets of ignorance or inside information remain here and there, but on the whole, once knowledge is public, economists assume that it is known everywhere. Historians of science often take for granted an efficient market theory of their own. When a discovery is made, when an idea is expressed, it is assumed to become the common property of the scientific world. Each discovery and each new insight builds on the last. Science rises like a building, brick by brick. Intellectual chronicles can be, for all practical purposes, linear. That view of science works best when a well-defined discipline awaits the resolution of a well-defined problem. No one misunderstood the discovery of the molecular structure of DNA, for example. But the history of ideas is not always so neat. As nonlinear science arose in odd corners of different disciplines, the flow of ideas failed to follow the standard logic of historians... Partly because of language, partly because of restricted travel on the Soviet side, sophisticated Western scientists have often repeated work that already existed in the Soviet literature. The blossoming of chaos in the U[S] and Europe has inspired a huge body of parallel work in the Soviet Union; on the other hand, it also inspired considerable bewilderment, because so much of the new science was not so new in Moscow. Soviet mathematicians and physicists had a strong tradition in chaos research, dating back to... the fifties. Furthermore, they had a tradition of working together that had survived the divergence of mathematics and physics elsewhere... The emergence of chaos as an entity unto itself was a story not only of new theories and new discoveries, but also of the belated understanding of old ideas. Many pieces of the puzzle had been seen long before – by Poincaré, by Maxwell, even by Einstein – and then forgotten. Many new pieces were understood at first only by a few insiders. A mathematical discovery was understood by mathematicians, a physics discovery by physicists, a meteorological discovery by no one. The way ideas spread became as important as the way they originated. Each scientist had a private constellation of intellectual parents. Each had its own picture of the landscape of ideas, and each picture was limited in its own way. Knowledge was imperfect. Scientists were biased by the structure of their disciplines or by the accidental paths of their own educations. The scientific world can be surprisingly finite. No committee of scientists pushed history into a new channel – a handful of individuals did it, with individual perceptions and individual goals.

...Imagine being a traveller in inner space. Instead of blasting off and aiming for the stars, you plunge deep into the dot at the end of this sentence. Tiny though it seems, this black hole is a galaxy of about one million million atoms... Such an incredible voyage has been the dream of scientists since the existence of atoms was first postulated by the ancient Greeks. Now three scientists have won the Nobel prize for physics for making it possible. Their remarkable inventions provide the means to see and probe a whole new dimension of space – the universe of the microcosmos. THE STORY of [humanity]'s flight into the inner universe begins during W[W]I with a small boy playing too noisily in a street in Heidelberg, Germany... Summoned to the study and made to sit motionless for an hour, [the boy] found time dragged less when [it] focused his attention on a fascinating instrument with mirrors, lenses and brass knobs – a microscope. In better moods his father, a professor of natural science, let the boy peer through the lens. [The boy] marvelled at nature's wonders magnified a thousand times. But could [the boy] see in greater detail? Could [the boy] see *atoms*? No. The optical microscope employed light to carry images to the eye, so it resolved nothing smaller than the wavelength of light itself. Its limit was... about one three-hundredth the breadth of a human hair. The dawn of the electronic age was hardly a glimmer when [the boy] took up electrical engineering at the Technical University of Berlin. For a student project in 1928, [it] joined a team working on a measuring instrument allied with early television. [The student] was put on the visual problem: how could scattered electrons be concentrated together to trace a line on a glass screen? A German physics professor had theorised that an electron beam – a narrow ray of intense electricity – could be converged by an electromagnet just as sunbeams were focused to a hot spot by a magnifying glass. [The student] set up an electromagnet... and made the theory work. Next, the student's imagination made a conceptual leap of pure genius. [The student] reckoned that an electronic beam fired through a specimen such as a metal grid would emerge in a pattern that could be magnified by electromagnets in the same way as light rays passing through the glass lens of his father's microscope... This... established the principle of electron optics. [The student] then devised and built a system that magnified no fewer than 12,000 times, a 12-fold improvement on the finest optical instruments... This became the prototype of what the 26-year-old inventor called an "electron microscope." But there was one immense technical hurdle. In the bombardment of electrons, his specimens were destroyed. When [the inventor] succeeded in photographing the charred shell of a super-fine thread, nothing so small had ever been seen. But scientists were not impressed. What use was a microscope that grilled its specimens? Frustrated by lack of support, [the inventor] had to abandon the project on completing his doctorate in 1933. [The inventor]'s breakthrough finally came in 1937 when [it] was appointed by... [a] German industrial giant, to develop his electron microscope for commercial use... By 1939, his new electron microscope was the first in... production. Its incredible 30,000 magnification spawned new fields of research in every branch of science... During the post W[W]II years, the electron microscope came into use around the world as an indispensable laboratory tool. Its countless applications ranged from the study of killer viruses to the cause of metal fatigue in jet engines... IN OCTOBER 1986, [the inventor] was holidaying near the Black Forest when news came that [it] would share half the 1986 Nobel prize for physics for his invention – "one of the most important of this century." In Zurich, [two physicists]... received a call from Stockholm saying that they would share the other half of the award. Their invention, [which could magnify specimens]... 100 million times... was "a technique of exceptional promise, opening up entirely new fields for the study of the structure of matter." "...Once [humanity] can play with atoms... [it]s ingenuity will prove boundless," [one of the physicists] says. - 1988

The whole issue of the politics of science and technology is not developed yet... [Consequently], the large technological corporations do whatever they want because they pretend they are doing value-free work... 'If we can figure out how to do it, let's do it, and someone else can ask questions about it later.' ...That's the argument scientists have been making for three hundred years, that they are the only ones able to make judgments about what they are doing. That is simply an ideology... which allows them to take privileges in society that no one else has, that is, to work freely without any control or social responsibility – and to accrue high status and salaries for their sometimes unwise and dangerous work... The problem is that... science... is not at all value-free... The widespread belief... that science is intrinsically value-free was, in fact, invalidated by science itself when Heisenberg showed that the patterns scientists observed in nature are intimately connected with the patterns of their minds... [Thus]: the results scientists obtain and the technological applications they investigate will be conditioned by their frame of mind, that is, their concepts, thoughts and values. Although much of their detailed research will not depend explicitly on their value systems, the larger paradigm within which this research is pursued will never be value-free. Scientists, therefore, are responsible for their research not only intellectually but also morally... [Yet o]nly with the rise of the ecology and Green movements did we begin to realize that society must establish... the values that are to be held in science... We must introduce into the scientific field... ecological thinking... That is the key to responsible developments in the future... Two steps are needed. The first is an educational programme... to change the consciousness of people and make them aware of the issues. Later there should be a... committee in every community... that would be composed of people working within the field who have doubts about the wisdom of pursuing... a [particular research] path... The committees would discuss whether the... [research] should proceed as the[researchers] wish, or with some limitations, or not at all in certain areas. Such citizens' groups are being organized now in Braunschweig, Heidelberg... and Munich. - 1990

Life on Earth has come abruptly under the trusteeship of human beings. The improbability of this event exceeds statement in astronomical numbers. It is an event, moreover, that introduces factors transcending chance. People have demonstrated capacity to acquire objective knowledge

and to act in rational accordance with it. Long before circumstances urged the wisdom of the inquiry, they were asking how life began. In their new trusteeship of the planet, it is essential for them to know how life got started here and how it came to occupy and envelop the Earth.

...THIRTY-SIX METRES below the surface of the Mediterranean, a powerfully built diver cautiously entered the black hole ringed with coral and sea fans. His neoprene suit protected him from the rock surface as [the diver] manoeuvred his air tanks in the metre-wide passage. Then in absolute darkness that not even his diving light could pierce, [the diver] moved slowly forward. *I wonder if I will ever reach the end of this tunnel*, [the diver thought. The]... 35-year-old professional diver and diving instructor... had first happened upon the tunnel weeks before, at the foot of a rock slide in the Morgiou inlet... [at] Cassis near Marseille, [but since the diver]... didn't bring a light or other special equipment, [it] probed only ten metres... Now, on this September morning in 1985, [the diver] continued his probe for 150 metres through the flooded crannies of the cliff. Suddenly, after 30 minutes, [the diver] poked his head through the surface. Straining his eyes against the darkness, [the diver] stood up in the waist-deep water[and] trembled with excitement at the sight of an arching cavern 60 metres wide and ranging in height from two to five metres. The chamber was white, blue and ochre, with a forest of stalactites, stalagmites and majestic limestone columns... [The diver] was tempted to... explore the cave. But... couldn't, since diving time is strictly rationed... And[, anyway, the diver]... now knew that [it] could return at will. But for the next three years, [the diver] spent his time delivering yachts to the Antilles and running his diving school... Finally, on July 9 last year, [the diver] entered the tunnel once again, followed by three other experienced divers from his club... Torches in hand, they crept carefully along the cave's slippery floor, which was covered with calcite deposits. "Look, there's an opening in the rock," [one of the other divers] said... Through the hole, they saw a second chamber whose 30-metre-high ceiling towered above like a small lake... Quickly all the divers began snapping photographs. Soon they entered the other chamber and stood beside the second pool. "I'm going down," [the diver] announced. "We have to find out whether or not there's another chamber." After probing every recess in the rock, [the diver] realized there was no exit there. Resurfacing, [the diver] set his light down on the rock. "Hey, look!" [the diver] cried. The narrow beam shining on the rock wall brought a drawing of a hand surging out of the darkness... Two days later, when [the diver] picked up his developed slides at a shop, [it] discovered that there wasn't just one hand in the photo, but three! Now [the diver] began to think [it]d hit on something amazing and combed all the books [it] could find on archaeology. Four days later, the same group re-entered the cave with floodlights... and a waterproof video camera. What they found exceeded their wildest hopes... Along the western side of the main chamber, just above the waterline, ran a frieze of small black horses... On the roof they found a black bighorn goat, a stag covered by calcite deposits and... another horse. Farther along, on the east wall, were two big bisons and more stencilled-looking hands, some with "missing" fingers. There was a cat's head and three penguins. Feverishly, they recorded all the paintings and engravings... Visible among the horses and bisons were a few antelopes, a seal, even some strange geometric symbols. *It's a good thing we're filming all this*, thought [the diver]. *Otherwise no-one would believe us*. Nevertheless, they decided to say nothing. They wanted to amass as much data as they could before showing it to the Maritime Bureau. Also, [the diver] worried that tourists would try to reach the grotto, as their dives at the cave site had not gone unnoticed. On September 1, tragedy struck. Three divers lacking the right equipment tried to reach the end of the labyrinth. The first body was found a few metres from the entrance; the second body 30 metres into the tunnel; and the third, ten metres farther along. Without knowing their fins would kick up a cloud of silt that destroyed their sense of direction, the[y]... had panicked, violently banging their heads against the tunnel walls. There was air still left in their tanks... [The diver] realized the time had come to tell the world what [it] had found. The next day [the diver] marched into the Maritime Bureau's office in Marseille. They had forms for registering every maritime discovery – shipwrecks, booby traps, shoals, Roman jars, Greek treasures – but nothing for prehistoric relics. "Sorry, maybe you should check elsewhere," the clerk [said]... After much debate, the officials began to take [the diver] seriously, and the Department of Undersea Archeological Research (DRASM) was notified. Now [the diver] had to authenticate his find. Initially some of the "experts" were sceptical. No cave paintings had ever been found in southeastern France. Fortunately two [people] defended the dossier... The second was... a research director at the National Scientific Research Agency (CNRS) and a veteran diver who had already located Paleolithic bones, flints and charcoal in the bay of Cassis. [The director] knew that underwater caves had been occupied by [prehistoric people] tens of thousands of years ago, when the Mediterranean shore had extended some 100 metres beyond its present coastline. But the sea had covered all that so long ago that finding traces of Cro-Magnon [people] there was deemed impossible. The news of [the diver]'s find, then, was fantastic. And the evidence collected so far was very impressive. If [the diver] had been hoodwinked, it had to have been a forger clever enough to do perfectly authentic-looking drawings and coat them with calcite. Careful not to jump to any hasty judgments, however, the Ministry of Culture decided to send in an expert. On September 19 last year, an archeological research vessel of the French navy arrived at the site... The process of authentication went on for four days, and by the time the operation ended, doubt was virtually dispelled... "The paintings and engravings... are characteristic of the Paleolithic period," [the expert] noted, "and they are even drawn according to the conventions of prehistoric art. The bisons' and goats' horns, for example, are always presented in twisted or semitwisted perspective. Hooves were never drawn, legs ended in 'crutches.' All this tells us these paintings are older than those in the famous Lascaux cave." [The expert]'s first impression was soon reinforced by test results from the CNRS laboratory at Lyon: carbon dating established that the paintings were 18,440 years old... [The] discovery is doubly significant: it establishes the presence of Paleolithic artists in southeastern France. "And we have new archeological evidence that will continue to expand our knowledge of the history of the period," says... an official of the DRASM'S investigative unit... Requests for information have poured in from all over the world. But scientists will have to wait for more answers because the cave has been sealed until the next expedition gets under way in 1993. ON DECEMBER 24 last year... the... diver... remember[ed] the name of the boat that first took him to the cave site: *Cro-Magnon*. That's what it was called when [the diver] bought it a decade ago... An omen? Who knows.

...THE SMITHSONIAN INSTITUTION in Washington is full of whatnots from... the... past... a monument to the average American's inability to throw anything away. Altogether, it has 139 million items... Where does the Smithsonian keep all that stuff? The National Museum of Natural History has roughly 119 million scientific specimens. The other 20 million items are scattered among... 14 other museums and galleries, and among several research facilities. That's enough room to make housekeepers weep with envy. But what's a great nation without a great closet? - 1992

The... culture we live in seems to *control* us rather than the other way around. If national leaders and society – and that's you and me – seem to be "unable to do anything" about the straits we are in, how can one come to any other conclusion, however bleak it might seem? Where does responsibility lie for the acceptance and furtherance of new ideas? On government, in captains [of] industry, in the body politic, on lobbies backing vested interests, or on private citizens? In the early 1920's, an American self-taught inventor, Royal Raymond Rife, developed a microscope able to look at microbes in the human body that were so tiny they had never before been seen. What [Rife] saw convinced him that germs were not the cause but the *result* of disease and that, depending on its inner state, the body could convert a harmless bacterium into a lethal pathogen. Rife's microscope was able to examine the *living* whereas the Electron Microscope is able to examine only inert, or *dead*, matter. Yet the Rife instrument all but disappeared from the face of the earth while the electron microscope is used in every large laboratory in the world. What does that have to say about our "scientific" culture, about our biology which is supposed to be the "science of life?" In the 1970's, I was so amazed at all this that, after weeks of research, I wrote an article "What has Become of the Rife Microscope?" I finally went on to locate the scope in a dilapidated condition in a garage in San Diego. In 1987, I was put on to another microscope genius, a French-born biologist working and living in Rock Forest, a small village in a region of Quebec known as "The Eastern Townships"... My visit to [the biologist's] laboratory was one of the most exciting in my life. I found that, when [the biologist] was only twenty-four years old and still living in France, [it] had invented a unique microscope... as

powerful as that of Rife's and much easier to use. What this [French-born person] accomplished with a remarkable instrument of his own invention is spelled out in full in my new book, The Persecution and Trial of [Rock Forest's biologist]. So I will give you only what I consider to be the briefest account of his discoveries... With his microscope, [the biologist] revealed in the blood of all animals, and in the sap of plants as well, a hitherto unknown... subcellular, living and reproducing... ultra-microscopic... [which the biologist] called a *somatid* (tiny body). There were many peculiar things about these life forms. The most peculiar thing... was they were virtually indestructible, meaning they have resisted high temperatures and nuclear radiation capable of killing any living thing. The eerie implication is that the new forms are imperishable! At the death of their hosts, such as ourselves, they return to the earth – in “ashes to ashes, dust to dust” fashion – where they live on for thousands or millions, perhaps billions of years. In healthy individuals this form goes through a cycle of two more stages to become a spore, then a double spore. But in people whose terrain has been deleteriously affected, in whom the immune defense system has become weakened, destabilized or dysfunctional – and the potential causes for that are multiple – the cycle goes through thirteen more stages, each stage developing into the next like so many caterpillars metamorphosing into butterflies. An examination of the somatid cycle in the blood has allowed [the biologist] to pre-diagnose such degenerative diseases as cancer, rheumatoid arthritis, multiple sclerosis, lupus and others long before any clinical signs of them appear in the body. So there we have three interlocking discoveries: that of a super-microscope; a brand-new life form; and the pleomorphic (form-changing) cycle into which it develops. Various people have suggested that these discoveries alone are worthy of a Nobel Prize, perhaps two of them. [The biologist's] fourth discovery was that of a medicinal which, injected... intralymphatically, that is into the lymph system, the drainage system of the body, strengthens, or builds up, or enhances the immune defense system which in turn rids the body of degenerative diseases. For his pains, [the biologist] was put on trial, not once, but twice. The first time was in the 1960's in France where [the biologist] was accused of medical charlatanry. Seeking a “freer” place to pursue his research [the biologist] emigrated to Quebec. In 1989 [the biologist] was put to trial at the behest of the Quebec Medical Corporation (equivalent to a state “medical society” in the USA). The most serious of five counts was “contributing to the death of a patient,”... Had [the biologist] been convicted of it, [the biologist] would likely have been sentenced to a life-term in prison. The drama of the trial, characterized by a senior Canadian barrister as one of the “most important in recent Canadian history,” is... [testimony to] the monstrous persecution [the biologist] has had to suffer at the hands of orthodox medicine, that is the oppressive medical segment of our dominant culture... [The most obvious] conclusion to be reached about... [his trial] is that entrenched interests vested in medical power, and in the billions of dollars being made by the pharmaceutical industry that holds doctors in its thrall, tirelessly seeks, with every weapon in its arsenal, to prevent any chance that [the biologist's] gifts to the world will be made available. I only recently discovered what may be the... root cause of it. It came in a review of my book by... an... American medical historian of the first rank who lives and works in Washington... “Most interesting are [the author's] comment on the socio-political roots of physicians' professional behaviour... Physicians have so long escaped being called into account for lying to the public that they assume this to be a natural privilege of their position – like Wednesday afternoons on the golf course. They are protected in this assumption by the *monopoly of criticism* granted them by the Medical Practice Acts passed in the 1920's. Journalists who might otherwise expose malfeasance are neutralized by this *monopoly*: anyone consistently describing professional misdeeds would at once lose all contacts and all access to sources, hence all effectiveness... This disastrous situation cannot be effectively combatted without a clear understanding of the patterns of political forces. *Appeals to truth are a waste of energy*, as physicians' concern for scientific truth is a negligible quantity. Until the Medical Practice Acts are rescinded, cases like that of [the biologist] will be repeated *ad nauseam*.” ...[It seems appropriate at this point to add a quote from the] English philosopher and scientist... Roger Bacon: “... *Most secrets of knowledge have been discovered by plain and neglected [scientists than by disciples] of popular fame. And this is so with good reason. For the [disciples] of popular fame are busy with popular matters.*” The biologist's... conclusion – mind-boggling on the face of it – is not one that sprang full-blown from [hi]s mind alone. A few years ago, I came across a fascinating doctoral dissertation... authored by a pharmacist living in France... Several years in the writing, [the pharmacist's] thesis delved into a long-lost chapter in the history of science... This chapter concerned a violent controversy between, on the one side, the illustrious Louis Pasteur, whose name, inscribed on the lintels of research institutes all over the world, is known to all schoolchildren, if only because of the pasteurized milk they drink. On the other side was Pasteur's nineteenth century contemporary and adversary, Antoine Bechamp... While labouring on problems of fermentation... Bechamp, at his microscope, far more primitive than [the biologist's] own instrument, seemed to be able to describe a host of tiny bodies in his fermenting solutions. Even before Bechamp's time, other researchers had observed, but passed off as unexplainable, what they called “scintillating corpuscles” or “molecular granulations.” Bechamp, who was able to ascribe strong enzymatic (catalytic change-causing) reactions to them, was led to coin a new word to describe them: *microzymas* (tiny ferments). Among these ferments' many peculiar characteristics was one showing that, whereas they did not exist in *chemically pure* calcium carbonate made in the laboratory under artificial conditions, they were abundantly present in *natural* calcium carbonate... With the collaboration of his son... and... a Montpellier physician... Bechamp went on to study microzymas located in the bodies of animals and came to the startling conclusion that the tiny forms were far more basic to life than cells, long considered to be the basic building blocks of all living matter. Bechamp thought them to be fundamental elements responsible for the activity of cells, tissues, organs, and indeed whole living organisms, from bacteria to whales... [Bechamp] even found them present in life-engendering eggs, where they were responsible for the eggs' further development while themselves undergoing significant changes... Most incredible to Bechamp was the fact that, when an event serious enough to affect the whole of an organism occurred, the microzymas within it began working to disintegrate it totally, while at the same time continuing to survive. As proof of such survival, Bechamp found these microzymas in soil, swamps, chimney soot, street dust, even in air and water... So seemingly indestructible were the microzymas that Bechamp could even find them in limestone dating... back sixty million years... to the Tertiary, the first part of the Cenozoic Era, a period... during which mammals began to make their appearance on earth. And it could be that they are older still... [A] French paleontologist, writes in his book Terre: Mere de la Vie (Earth: Mother of Life), concerning problems of evolution, that... thin sections of rock, over three billion years old, taken from the heart of the Sahara Desert... contained tiny round coccoid forms, which [the paleontologist] placed at the base of the whole of the evolutionary chain... When I brought the book to [the biologist's] attention, the biologist told me, ingeniously and forthrightly: “I'd sure like to have a few samples of moon rocks to section and examine at my microscope. Who knows, we might find somatid forms in them...” ...In the first third of the 20th century Gunther Enderlein saw the... tiny motile bodies... which... Bechamp... named ...microzymas... and called them “endobionts.” Wilhelm Reich, in the late 1930s, saw a similar if not identical body which [Reich] named “bion.” There were others during this era. Today in Sweden and in Canada the properties of these same living particles are being explored by researchers who have assigned names from their own imaginations. The various theories advanced by members of this group of researchers remain rejected or largely unknown. Remarkably, *they all used dark-field condensers*, a known but uncommon practice. In microbiology it is particularly difficult to convince others of the truth and value of discoveries made with uncommon methods of observation. Rife employed a system of lighting as unknown to microscopy today as it was in the 1930's... This was the first and most fundamental technical strike against understanding Rife's microscope and biological discoveries. Fear of the unknown is greater than fear of the unfamiliar. Even scientists are not immune to this... instinct. There were a few who were not distracted by Rife's unknown method of lighting. Having a look at his work, they jumped to the next problem, that of their own dogma, which said it is simply impossible to realize such high magnifications and resolutions with a light microscope, and therefore we do not believe what we see. You, Mr Rife, are dishonest, and for trying to pull the wool over our eyes we will put troublesome clouds in your skies to the end of your days. Dogma is necessary, but it often lives too long, and is too often exercised unwisely. Only recently have discoveries been confirmed in biophysics to make it possible to understand the principle by which Rife's microscopes produced magnifications and resolutions so far

beyond the limits of conventional light microscopes. Remarkably, the basic phenomena behind these “new” discoveries were described by Gustav Le Bon, psychologist turned physicist, just before the turn of the century. Then as now, gifted individuals who cross disciplinary boundaries are not heard. Biophysicists have now shown that there exists a crucial natural interaction between living matter and photons. This process is measurable at the cellular (bacterium) level. Other research has demonstrated that living systems are extraordinarily sensitive to extremely low-energy electromagnetic waves. This is to say, each kind of cell or micro-organism has a specific frequency of interaction with the electromagnetic spectrum. By various means, Rife’s system allowed adjusting the frequency of light impinging on the specimen. By some insight [Rife] learned that the light frequency could be “tuned” into the natural frequency of the micro-organism being examined to cause a resonance or feed-back loop. In effect, under this condition, it can be said the micro-organism illuminated itself. Is it possible the newly discovered electromagnetic properties of living matter were visible to certain highly skilled microscopists with nothing more special than a gifted sense of sight? ...[a] Nobel Prize winning corn geneticist, who experienced years of travail because [the geneticist] could see the un-seeable, explained that [it] “had a feeling for the organism”. Perhaps Rife had such a gift of sight or insight... [and] applied it to building a device [Rife] hoped would make it possible for all to see further into the mysteries of living things. His device worked, but the world remained blind to these mysteries. Rife extrapolated from his lighting technique... that specific electromagnetic frequencies would have a negative effect on specific bacterial forms. There can remain no doubt that Rife demonstrated the correctness of his hypothesis to himself and those few who had the courage to look and the perceptual acuity to see! The same new discoveries in biophysics not only explain Rife’s principle of illumination, they also explain his process for selective destruction of bacteria. The latter phenomenon is similar to ultra-sonic cleaning, differing in delicate selectivity of wave form and frequency. Recently, researchers whose findings have been suppressed, have *caused and cured* cancer in the same group of mice by subjecting them to certain electromagnetic fields. Rife’s work was far more sophisticated. [Rife] selected specific microscopic targets, and actually saw the targets explode. Rife’s work demonstrated beyond a shadow of a doubt that bacteria are pleomorphic rather than monomorphic. This demonstration did more to bring down upon him the wrath of the worst kind of politics of science than any other facet of his work. It violated the strongest of established biological dogmas, that of the germ theory of disease... No one remembered... Bechamp’s microzyma theory which... [also] required that bacteria be pleomorphic, a fact [Bechamp] extensively demonstrated, but not to the satisfaction of those who ran the politics of science during the late 1800’s... [Many of today’s biologists still] find these concepts incomprehensible even though both bacterial pleomorphism and endogenous sources of bacteria have been demonstrated repeatedly since Bechamp’s time... Rife also had been seeking a way to identify and then destroy the micro-organism which caused cancer. His cancer research began in 1922. It would take him until 1932 to isolate the responsible micro-organism which [Rife] later named simply the “BX virus.” ...In the summer of 1934, 16 terminally ill people with cancer were brought to... [a] “ranch.” There, as Rife and the doctors worked on human beings for the first time, they learned much. The early patients were exposed to the frequency for only 3 minutes, but Rife soon learned that if a treatment was given every day, the toxins from the dead micro-organisms accumulated faster than the body could dispose of them. When [Rife] switched to a treatment of 3 minutes every 3rd day, the patients began healing swiftly... Rife... wrote: “With the frequency instrument treatment, no tissue is destroyed, no pain is felt, no noise is audible, and no sensation is noticed... Several diseases may be treated simultaneously... No rise of body temperature was perceptible in any of these cases above normal during or after the frequency instrument treatment. No special diets were used in any of this clinical work, but we sincerely believe that a proper diet compiled for the individual would be of benefit.” ...The full story of the cancer clinic of 1934 may never be known. Rife’s records were lost when [Rife] foolishly loaned them to Dr Arthur Yale a few years later. Yale had started his own clinic and apparently wanted to compare notes. After Rife learned that Dr Yale was altering the Frequency Instrument and thus failing to get results, Rife and Yale had an argument which marked a permanent separation. More disturbing is that after AMA pressure forced a law suit against the production company making the Frequency Instruments, many of the doctors who were involved became exceedingly cautious. And after Milbank Johnson’s death the records at the University of Southern California “mysteriously disappeared.” But... while the clinical records are gone, there is sufficient documentation to know that astounding results did take place... [and] a number of clinics used Rife’s technology to cure terminal cancer during the period 1934-38... In 1938, the AMA’s Fishbein found out about the Rife cancer cure and tried to “buy in.” When the offer was refused, the entire program was destroyed within six months. First all the doctors were visited and told to abandon the instrument or they would lose their medical licenses and go to jail. Then the leading medical electronic laboratory in America, where Rife’s treatment was being independently validated, was burned to the ground... while its director was in California consulting with Rife. Three months later, Rife was hauled into court and the treatment was effectively quashed. This was not the only occasion when scientists or doctors who opposed the AMA or whose discoveries threatened the AMA’s financial gains were “burned out,” arrested on trumped-up charges, or died mysteriously... [The] Director of Biochemistry at LSU Medical School and developer of a urine test for determining cancer, recalled: “Early one morning in 1946, our lab was mysteriously destroyed by fire... We then established a lab at our present location. Then again one morning in 1947 this lab was set on fire and completely destroyed.” Dr William F. Koch, the inventor of Glyoxylyde, was a particular target of Fishbein and the AMA. So were the doctors who supported him and used the cancer serum Dr Koch invented. “One doctor... J. W. Kannel, saved a young girl... [who] had hopeless cancer of the spleen... One shot of Glyoxylyde and [the girl] became well (in 1943 and was still alive in 1983)... Kannel was barred from all hospitals in Fort Wayne... [Two] physicians of distinction and prominent in the advocacy of the Koch treatment... [died suspiciously – one from poisoning, and one from being run down by an automobile... Dr Koch himself was the target of at least 13 unsuccessful attempts on his life.” Fishbein and his associates at the AMA had been interested in the Harry Hoxsey cancer treatment since 1924. In that year, Dr Malcolm Harris, the chief surgeon at two Chicago hospitals and later President of the AMA, offered to purchase the Hoxsey cancer tonic. Hoxsey would get 10% of the profits after ten years! The AMA doctors would set the fees and keep all the profits for the first nine years and 90% of the profits from the tenth year. When Hoxsey refused the offer of Dr Harris, Fishbein began years of official intimidation. Doctors who worked with Hoxsey lost their licenses. Pathologists who examined tumours for Hoxsey lost their businesses. State medical boards closed free clinics where hundreds of “terminal” cancer patients were being saved. In Iowa, Hoxsey was treating 300 patients a day in the late 1920’s. During the vicious period when Fishbein was stopping Rife’s treatment, Hoxsey was charged more than a hundred times with practising medicine without a license in Texas. Still, Hoxsey’s Dallas clinic grew to the point where it was handling as many as 12,000 patients, with affiliate clinics being established in Illinois, Pennsylvania and other states. In a legal action against Fishbein and the AMA in 1949, Hoxsey won. Fishbein’s attorney admitted that Hoxsey’s treatment did cure cancer. Judge W. L. Thorton ruled: “I am of the firm opinion and belief that Hoxsey has cured these people of cancer. Hoxsey has been done a great injustice and... articles and utterances by defendant Morris Fishbein were false... and libelous.” Nevertheless, through an organized conspiracy of the AMA, the FDA and the NCI, Hoxsey’s clinics were closed. His treatments have never been officially tested, despite admissions by opponents that they work and court testimony by experts which resulted in a jury concluding that Hoxsey’s cancer treatment had therapeutic value... Harry Hoxsey was born... into a family which had been successfully curing cancer for several generations using herbal medicine, taken internally, and a combination of powders applied to external lesions and tumours. According to Hoxsey, the healing power of the herbs used in the family’s secret formula was discovered by his great grandfather... In 1840 or thereabouts John Hoxsey had a horse which became sick with a cancerous sore. [John] fully expected the animal to die, but when it seemed to be miraculously gaining in strength, [John] observed the animal closely. [John] noticed that the horse would go and eat the wild herbs (weeds!) in a certain corner of its paddock. By[the] time the horse made a full recovery from the cancer which had threatened its life, [John] had become convinced it was the herbs which... were responsible for its reprieve from death... Rene Caisse was a nurse living in Canada, who, for a period of almost sixty years treated hundreds of people with a herbal

remedy... called Essiac[, which is]... made from four very common herbs... [Rene] discovered this remedy through a patient in the hospital where [Rene] worked who had been cured of cancer. The patient had used a herbal remedy given her by an Ojibway herbalist. Rene left the hospital in 1922 at age 33, and went to... Ontario, Canada, where [Rene] began administering Essiac to all who came to her... In cases where there was severe damage to life support systems, her patients died – but they lived far longer than the medical profession had predicted, and, significantly, they lived free of pain. Still others, listed as hopeless and terminal, but without severe damage to life support systems, were cured and lived 35-45 years (many are still living). So startling was the effectiveness of this simple herbal remedy, it could not be ignored, and the Canadian Ministry of Health and Welfare [CMHW] and the Parliament became involved. Friends, former patients, and grateful families petitioned Canadian Officialdom for Rene Caisse's right to administer the remedy to anyone who asked for it without the threat of interference from authorities... Royal Cancer Commission hearings... in 1937... c[a]me to the same conclusion that Rene had – that Essiac was a cure for cancer... In 1938, Essiac came within three votes of being legalised by the Ontario government as a remedy for terminal cancer patients... All the documents Rene had were destroyed by the... [CMHW at t]he... time of her death in 1978. They burned all that information in fifty-five gallon drums behind her home... Why? ...Because they d[id]n't want this information in the hands of the public or the press or anybody else... The information [was suppressed] because cancer is the second largest revenue producing business in the world, next to the petro-chemical business... [T]he research institutes, federal governments, pharmaceutical companies, anybody that has a vested interest in the health care of cancer, including the American Cancer Society[(ACS)], the Canadian Cancer Society... – all of these institutions are involved in the money and power around cancer... The FDA recommends only allopathic treatments for cancer and other life threatening diseases. It does not approve nor make legal alternative treatments of any kind... [The] personal physician to the late President John F. Kennedy... worked with Rene... from 1959 to 1962... [The physician] also worked with the Presidential Cancer Commission, with... the A[C]S... and the N[C]I. The physician, who] presented his findings after ten years of research... had come to the conclusion that, in his own words, "Essiac is a cure for cancer, period. All studies done at laboratories in the U[S] and Canada support this conclusion." Whereupon the federal government issued a gag order and said "You've got one of two choices, either you keep quiet about this or we'll haul you off to military prison and you'll never be heard of again." So we never heard another word out of him... Right now... the message of Essiac is beginning to make its way worldwide. But it's still known only on a very limited basis. Of course now you also have... herbal distributing companies throughout the world that are substituting yellow dock and curly dock for sheep's sorrel, which is one of the critical ingredients in Essiac. The sheep's sorrel is the herbal ingredient in Essiac that was found to be responsible for the destruction of cancer cells in the body... That research was done... at Sloan-Kettering in New York... over a three-year period. But when they gathered that information, they withheld it from the general public – yet they gave it to the C[MHW]. The Canadian government then immediately banned that herb for sale and distribution... [Another ingredient of Essiac] is... Turkish rhubarb[, although you]... can substitute ordinary rhubarb root. The other two ingredients are burdock root... and the inner bark of slippery elm... The[se]... three herbs are blood purifiers... I have... the formula[for Essiac, which]... also cures the common cold... Anyone can get it from me, free of charge... It's [also in my book, but there]... wasn't a publishing company that would publish it... So I published the book myself. As soon as I did, the IRS came in and slapped about a half million dollars in tax liens against me and said "You know this has got nothing to do with taxes. It's all about cancer." They actually started hauling the pallets of books out of my medical practice offices and confiscated them. I also had thousands of books that were confiscated by the Canadian government at customs. I have never received any of those books back. The only ones I have now are hidden in storage facilities... In Canada the book is being held by the C[MHW] because they say it is "advertising"... a cure for cancer... In 1946, Fishbein initiated an attack against Dr Max Gerson, whose dietary treatments for cancer were anathema to the drug and business-oriented Fishbein. The laboratories used by Dr Gerson were later threatened with economic ruin if they continued to provide services to him... Attempts against Gerson's life were also made... His diet, so vehemently opposed by the AMA in 1946, now closely resembles the anti-cancer diets recommended by the orthodox cancer organisations in the 1980s... [Yet, i]n 1994, the climate of mainstream medical hostility towards Dr Gerson's unorthodox therapy programme has not changed. "Anti-quackery" laws forbid the practise of the Gerson therapy in California and other states of the U.S.A. by medical doctors. People with cancer who reject the options of surgery, radiation and chemotherapy offered to them by the major cancer hospitals must either struggle to pursue a Gerson-type programme in their own homes without adequate medical support, or find the money necessary to travel to Mexico and pay for treatment at La Gloria Hospital, near Tijuana. The parents of a growing number of children with cancer are even less able to choose what they believe is the most suitable treatment option for their son and daughter, since by law, all children in the U[S] who have cancer must be given chemotherapy, or their parents may be imprisoned. Even a demonstrable improvement in the child's condition using non-toxic methods of cancer treatment will not forestall the application of this barbarous law... [P]atients of La Gloria Hospital experience an average improvement rate of 80% in early to moderate cancer and even more amazingly a 40-50% rate of improvement in people with so-called "terminal" cancer. Other benefits of the Gerson therapy for cancer sufferers included a marked reduction in pain, and also control of the acute infections which often led to the death of cancer patients. (The clinic does however, have a general rule of not accepting people who have previously undergone chemotherapy, since due to the damage that chemotherapeutic drugs inflict upon the liver and other organs of the body, sustained improvement in the condition of these cancer patients is much less likely...) Despite these impressive results of Dr Gerson's therapies, mainstream medicine is even less receptive to his ideas and treatment plans now than when [Gerson] began publishing the results of his work in the U[S] in the 1940's... In 1946, a Senate committee heard testimony from cancer patients successfully treated by Dr Gerson. The Senator in charge was Claude Pepper of Florida. When [Pepper] initiated legislation to conquer cancer, the AMA turned its power against Senator Pepper. [After being] defeated for re-election... Pepper later returned to the US Congress as a representative, but *ever* afterward served orthodox medical interests. [Pepper] had learned his lesson. The oldest member of Congress in 1988, [Pepper] has been a leading promoter of "quack investigations" for orthodox medicine, writing to the various state attorneys general for assistance in quashing different alternative treatments. As a national celebrity and "staunch defender" of older Americans, [Pepper] is the perfect front [perso]n for the medical and drug cartels. In this writer's opinion [Pepper] is more like a Judas to the elderly, but history alone will assess Claude Pepper's true infamy. Like many [officials, Pepper] ignored the deaths of millions of people for the sake of his own well-being and political position... [According to] Machiavelli (1469-1527)... *"There is nothing more difficult to carry out, nor more doubtful of success, nor more dangerous to handle, than to initiate a new order of things."* ...The cure for cancer will not come from chemotherapy, radiation, surgery or breakthroughs from within the government agencies, for reasons which have already been made clear. The cure for cancer has existed for many years. It lies in the area of "energy medicine" and the only reason desperate and dying cancer victims do not know of it and cannot obtain it is the ignorance and opposition of the orthodox medical hierarchy. When the public demands access to energy medicine as their right, then the barriers will fall as media and political forces converge and begin supporting these long-suppressed therapies... [In] 1987... a pioneer in the field of energy medicine... point[ed] out that it has been known since the 1800's that cancer is electrically negative. And electricity was linked to the Chinese system of acupuncture by Louis Berlioz as early as 1816. The Chinese determined thousands of years ago that: "there is an electrical wiring system in the body where all organs and systems have terminal points in various locations on the body, all of them being represented in the hands and feet." In 1889, the electronic genius Nikola Tesla described his research relating electromagnetic waves to the cells of living organisms. [Tesla] announced his findings to the American Electro-Therapeutic Association. In other words, electronics as therapy was widely supported as early as the late 19th century. Yet a hundred years later it is only beginning to re-emerge because of the successful political suppression brought about by the AMA, drug companies and federal agencies. A century has been lost. In 1925, George Lakhovsky, a French scientist, published studies which showed that plants inoculated with

cancer could be healed with simple radio frequencies... “...16 days after the first treatment, the tumours began to shrink and dry up. A few days later the tumours were entirely dried up and could be very easily detached from the limb of the plant by merely touching them. The drying action of the radio frequency radiation is selective and affects only the sick part of the plant. Even the inside sick tissues were destroyed, although they were next to healthy cells... [which had not been] affected... At the present time similar experiments are being carried out with animals and it seems that the effect on cancerous animals is the same as on cancerous plants. I am highly pleased to present my theory and the results of my work in a scientific review of the U[S], this great country which has always been in the lead in the fight against this terrible sickness, cancer, and whose sympathy and help I would greatly appreciate.” In 1926, George Lakhovsky built a device for treating human diseases. Lakhovsky was granted a US patent in 1934, but it was ignored and suppressed by the medical and scientific authorities of the time. Modern Lakhovsky devices are still built by individual engineers and alternative health practitioners, but there has been little interest or formal research, and no first-rate clinical studies by the army of cancer specialists being paid billions of dollars of the public’s money. The current devices are not FDA approved and all carry a statement “for experimental use only”. If the NCI and FDA were fulfilling their responsibilities, NCI would have 50 years of research into Lakhovsky and FDA would have established manufacturing standards which ensured quality. Of course, that could result in millions of people curing their own early-stage cancers in their homes, totally eliminating the physicians and drug companies... “*The Inquisition is still with us. It is called the Food and Drug Administration. It is called the National Cancer Institute. It is called the American Cancer Society and the AMA. They are allied together to destroy innovation in modern times.*” ...High officials of the AMA, FDA, NCI and ACS, along with their associates in the drug companies, lawyers, lobbyists, bankers, university chiefs and various investors, are guilty of contributing, by their actions or by their silence, to a monstrous crime against humanity... It is not an exaggeration to state that America has had on its soil for many years a clique whose evil is comparable to the worst crimes of... totalitarian m[onsters]. Indeed, the... number of innocent people who have died because of this conspiracy of greed ignorance and power exceeds the slaughter perpetrated by Hitler or Stalin... Radiology was originated by Dr Emile Grubbe in 1896 but it was not until the 1930’s that it began to be used to any extent. Following W[W2, the US] government... began... to “sell” radiation to the public. It fit[ted] nicely with the atomic energy program... Thus a mass propaganda effort in radiology took place in the late 1940’s and 1950’s. People literally became human guinea pigs... “In 1951 Collier[’]s published a lavishly illustrated article showing a [patient] lying, helpless and alone, in a huge vault at Brookhaven laboratories in New York. [The patient] was being ‘blasted’ by atoms of boron, which were ‘exploding’ the tumour in her brain. The writer explained that this therapy, being used for the first time and with no known results, was a ‘spectacularly promising phase of atomic research.’ Upset at the expectations aroused by such hyperbole, some critics warned that radiation therapy was at best an inexact science, at worse highly dangerous to patients.” Despite such concerns, radiation therapy expanded. By the late 1960’s, radiation therapy was the standard treatment following surgery for breast cancer. It was curtailed only when studies began showing it offered no survival advantage. By 1974, the respected British medical journal, *The Lancet*, reported that radiation following breast surgery *increased* the death rates... Yet, by 1980, a national survey of radiologists showed that 50% of them still radiated [patients] following surgery for breast cancer. Either the radiologists were incompetent and not reading the medical literature, or they simply preferred to make the money, no matter that tests showed they were killing their patients... “A Critical Look At Cancer Coverage” from the January-February 1975 *Columbia Journalism Review* contained the angry conclusion of one scientist regarding the radiology facts-of-life: “Look, when you’ve got 10,000 radiologists and millions of dollars worth of equipment, you give radiology treatments, even if study after study shows that a lot of it does more harm than good. What else are they [g]oing to do? They’re doing what they’ve been trained to do.” The destroyed tissue in the radiated area became a gathering place for the cancer virus to feast! ...Studies by [one medical researcher] in the 1970s indicated that X-rays were linked to leukaemia. As a result, NCI refused to renew his grant. [The researcher] declared the cancellation was due to: “medical politics... self-interest groups protecting themselves.” [The] Director of Bio-Statistics at Roswell Park Memorial Institute for Cancer Research, accused the entire profession of radiologists from the mid-1940’s to the mid-1970’s... of committing a crime against the American people. That crime continued throughout the 1980’s. It is likely to go on well into the 1990’s... A Public Broadcasting System documentary in the early 1980s, titled *The Cancer War*, included an interview with... [a] co-discoverer of 4 isotopes and 4 nuclear processes. [The co-discoverer] stated: “My estimate is that about 94,000 cancer fatalities for the future are being induced with each year of medical diagnostic X-rays” (in the U[S] alone)... A 1988 book... utilized... statistics to warn that a five-year old child was five times more susceptible to an X-ray induced cancer than a 35 year old adult while 10-year olds “may be at the greatest risk of all.” Unborn fetuses apparently are in a special category. In the mid-1950’s... Oxford University contacted the mothers of 1,694 children who had died of leukaemia... [The survey] discovered a direct correlation between the number of times the pregnant mother had received an X-ray and the unborn child’s risk of developing leukaemia. That was not surprising although the scientific facts were original. What was shocking was something else [the survey] discovered... “...pelvic X-rays given years *before* the mother became pregnant could predispose her child to get cancer.” This caused a furore among physicians and radiologists. They bitterly dismissed the evidence for the next ten years. Then, in 1966, the N[CI] published a study involving *19 million people*. It confirmed [the] earlier study... In 1978, the Office of Technology Assessment, an arm of the U[S] Congress stated that only 10% to 20% of all medical procedures had been shown to be efficacious in controlled trials. Radiation... appears to fall into that category, and despite scientific evidence revealing its dangers, the army of radiologists ensures that the practice will continue – as long as uninformed patients exist and political officials fail to protect the innocent against the organized unions of physicians and radiologists... Oxygen Therapies have been in use medically for over 100 years. The basis of the therapies is quite simple. Ultimately toxicity collects within the body over time. This buildup of toxicity... within the body invites the proliferation of anaerobic disease[-]causing micro-organisms. Oxygen therapies are used to flood the body with active forms of oxygen. When the body becomes safely saturated with these special forms of oxygen, it reaches a state of purity wherein the disease micro-organisms – like HIV – are killed, and the underlying toxicity is oxidised and eliminated. Healthy human cells love oxygen, but since the harmful viruses are anaerobic, once these viruses are surrounded with active forms of oxygen they must die. Active forms of oxygen also eliminate any cells with the virus hiding inside them since, unlike healthy cells, they no longer are able to protect themselves from oxidation with the body’s natural antioxidants. Once the viruses and bacteria are all killed, the patient’s immune system is then rebuilt with vitamin, mineral and if needed, behavioural modification and other therapies. In this way diseases like AIDS, cancer and multiple sclerosis are being eliminated or at least controlled on the international scene, and within the US medical underground. Ozone therapy is one of the oxygen therapies... Ozone therapy was used medically in the US by Nikola Tesla in 1900. It has been in continual use since then in our country, but due to legal pressures from the US FDA, ozone is presently only widely used in Europe... The biggest problem is that in 1976, the FDA declared ozone a “toxic gas with no medical uses” via publication in the Federal Register. I have written that: “Printing this statement in a publication paid for with our taxes is either a blatant attempt at suppression of truth from the highest levels, or one of the poorest research jobs ever done. It obviously favours competitive drug therapies, and ignores well over 50 years of safe and effective medical use on hundreds of thousands of humans – backed up with medical references and clinical studies in Switzerland, Italy, France, Germany, A[US, NZ], Mexico and the USA”... MD’s characterise ozone as “blatantly non-toxic”... Ozone therapies are among the safest therapies ever used. One European study of over 5.5 million treatments showed a side effect rate of 0.0007%... Side effects like fever and weakness are minor and temporary... When the proper protocols are followed ozone has been proven highly effective in the treatment – and the elimination – of over 40 common diseases... Although legally, ozone is believed by some to be “grandfathered” since its use in US medicine predates the existence of the FDA itself, no one has tested this position in court. So the FDA and the state medical agencies and boards that take their lead from the FDA... are actively persecuting any physician using ozone. Under these prevailing

“siege” type conditions I could get none of the US doctors who have achieved great successes with ozone therapy to... [appear before] the NIH. When asked to appear the[y]... all reacted in fear of the government, fear of the loss of their licenses, and fear of being raided and cleaned out by SWAT teams in the same way that... other MD’s have been treated most recently... On the bright side, if immunity from state, and federal, and agency, and medical board prosecution could be assured, these humanitarian doctors would gladly make available their knowledge for the public good... Due to the many interviews I have conducted, it is my opinion that the AIDS problem has been solved... [This conclusion was recently supported by a] radio station in New York. [“A scientist] has categorically invented a process to purify whole donor blood in the bag, and his invention of polyatomic apheresis ozone technology has created the most significant breakthrough in the treatment of AIDS and degenerative diseases found anywhere in the world to date.” ...Why is... the... inventor of... [t]his... particular ozone machine... in the Metropolitan Correction Centre in Miami...? Why hasn’t [it] had a trial in three years? Why does the government not want his story to get out? ...Is HIV the cause of AIDS? HIV has never been found in any scientific studies in the world to be the sole cause of AIDS. No one can prove it. It is speculation. It is political and economic. The [guy] who said in 1984 that HIV was the probable cause of AIDS (instantly it became dogma that it was) – did[n’t] also inform the public [that the guy] was the primary beneficiary of a test for HIV, that [the guy] owns the patent and that millions of dollars have gone to him and his associates... Did the press vigorously explore all the allegations of fraud and corruption[which were linked to that person? No. Only t]he alternative press did... The[medical authorities] tell you don’t challenge orthodoxy. [However, the alternative press challenges] you not to believe th[e medical authorities] but rather to believe the experience of those who are the ultimate authorities: the patients who are alive and well... [While] researching... a documentary that I had been working on, called Living Proof – People Walking Away From AIDS Healthy... I came upon ozone therapy, and I also came upon all the controversy that surrounds it. So when I was offered the opportunity to actually watch a trial happen first hand, in the Philippines, I jumped at the chance. I... was stunned with what I saw, because I was expecting the entire thing to take place in a sort of wing of a hospital, or something that looked a little bit more like what I expected medicine to look like. It was actually a clinic that was set up rather ad hoc to provide space to do justice to this trial, so I started out a little on the sceptical side, not knowing what I was getting into. There were 19 HIV-positive people there, five of whom had full-blown AIDS. Over the course of about three weeks I watched the patients, or participants as they preferred to be called... go through some pretty remarkable transformations... There’s no amount of journalists or medical people who can tell me that what I saw I didn’t see. I saw people who were unable to walk, be able to walk again. I saw people who were very, very ill just get considerably better, and all of the treatment was cut short by a raid by the... Department of Immigration... The patients were 20 A[US]ns, 19 with HIV, one with multiple cancers... [Unfortunately] it is illegal to... enter the Philippines if you are HIV-positive... but Immigration does not question you; there is no testing and I don’t know that the patients realised that it was illegal... There was not any evidence that the FDA had been involved; but what I was told was that the story really got under way when A[US]’s version of A Current Affair did a scathing story on the clinic... I was told by another journalist in A[US] whom I trust, that A[US]n health authorities]... went in to the Department of Immigration and tipped them off... I was also told that the producers were directed by their upper management to do a ‘chuck job’ on the ozone therapy. And no matter what they were told, no matter how much positive information they were given, it never aired... because AIDS is on the horizon as another big moneymaker. The chair[person] of the AIDS project in Los Angeles makes... \$US100,000 a year... I also worked with the AIDS Project Los Angeles through their Long Beach and San Pedro districts. They had sent 179 patients home to die. They all had pneumocystis carinii and histoplasmosis. Their weight was down to about 100 pounds. Their T-4 cell counts were less than ten. The Project gave me five of these patients. I took them off the AZT and the DDI and put them on Essiac three times a day... [Now t]hey’re exercising three times a day, eating three meals a day. Their weight is back to normal. For all intents and purposes you wouldn’t know they were sick a day in their lives. But this information is not being disseminated... [even though t]he other 174 are dead! - 1994

Th[is is a description of] the last rites of the pharaoh Ramses the Great, the mightiest ruler of Ancient Egypt... For 70 days since his death [Ramses] has been prepared for everlasting life by the... chief embalmer of the king, the keeper of the mysteries. His body has been cleansed, purified and dried. Sacred charms sealed by honey and molten resin will protect him on his journey into the next life. Each action expresses beliefs and dreams sacred to the Egyptian people. At stake is the very foundation of Egyptian life – the successful preservation of the body as the key to immortality. If his mummy remains intact, and if his name is remembered, then Ramses will never die. The coffin of the king is closed. Will it remain sealed? Will Ramses live forever? Ancient Egyptian civilization lasted more than 3500 years – one of the most enduring cultures of all time. Yet its people wanted more – they wished to live forever. And no Egyptian craved immortality more urgently than the pharaohs. Their remarkable temples and monuments were created to protect the king in his life after death. Yet, in all the land of ancient Egypt... only one king’s mummy lay undisturbed into the modern day... [T]he discovery of that tomb... far to the south of the pyramids, in the Valley of the Kings... would stun the world. The year is 1922. Archaeology has arrived in Egypt like an invading army. Hordes of Europeans comb the desert for the most coveted prize of all – an unopened royal tomb... [A]n experienced Egyptologist has spent years looking for the tomb of one minor pharaoh. The little known ruler’s name was Tutankhamun – King Tut. “[Howard Carter was in his] 10th year, the money was running out. [Howard] was a romantic – you have to be to remain in Egypt that long... [– but] always knew that Tut was there.” [Howard]’s big break came in the first days of his 6th expedition. [Howard] discovered indications of a crypt that lay buried beneath a later pharaoh’s tomb – an accident of fate that had kept it hidden from grave-robbes... After so many years in the desert, all that stood between [Howard] and what could be the discovery of a lifetime was a wall sealed with plaster more than three millennia ago. [Howard] had no intention of letting the finer points of the law slow him down. Without proper authority from the Egyptian officials [Howard] began to chip away at the wall. “[There can’t have been]... a more dramatic moment in the history of archaeology – I can imagine the feeling! The first thing they saw were the... huge ceremonial couches – the ones in the shape of the bull and the tiger... Nobody had ever seen the likes of that even in reliefs or paintings in the tombs...” Tut’s tomb was designed as a gateway to eternity – a storehouse of sacred and magical items for his journey into the afterlife. “You have weapons that nobody ever knew existed; you have fine bows; you have a piece of steel on his head... a little... miniature knife in steel, which was considered to be more valuable than all the gold that they found.” ...The inner most of four ornate coffins was solid gold. But it was not enough to ensure Tut’s place in eternity – his mummy shattered as soon as [Howard] unwrapped it, searching for the king’s jewellery. Sadly, King Tut would be remembered not as a pharaoh, not even as a [hu]man, but as treasure... The Nile... was the soul of Egypt – the sacred link between the land of the living and the land of the dead... In its constant and dependable rhythms, the river provided the basis for their belief... “The Nile was the vein[or] the heart of Egypt... The water which is coming from the flood, it’s red, it’s fertile – this is the mud that’s going to... feed the land...” The Ancient Egyptian’s oldest myth – the story of creation – was set amid the swirling waters of the Nile. In the beginning it is the great god Horus – the falcon god – that brings power to the pharaohs. Horus is the god of the skies... [who] invests the pharaohs with dominion over the land and the people... Tomb models buried with mummies of wealthy landowners depict details of... working Egyptian farm[s. They offer] a rare glimpse into the texture of life 4000 years ago. But the lives of the pharaoh and the farmer had little in common beside their desire for eternal life, and no element separated them more than stone... [S]tone was the embodiment of every pharaoh’s power... The overriding mission of each new king was to secure the quarries that would provide raw materials for monuments to his reign. [One] obelisk would have been the tallest in the ancient world but a flaw in the granite caused it to crack before it was completed. How its massive 1200 tonnes would have been moved and raised into place remains a mystery. In ancient Egypt stone was the medium of immortality. It was stone that assured the king’s name would be remembered... And one pharaoh surpassed all others in his efforts to be remembered... The greatest builder in

Egypt's history, Ramses ruled until his 90th year. His harem overflowed with queens, lesser wives and concubines, and included three daughters and a sister. [Ramses] was father to more than 90 children. But his greatest legacy was left in stone. As a great general motivates his troops for battle, Ramses' most inspirational words were for his builders. 'Oh my chosen... valiant [builders] of proven skill... in valuable stone, I am your constant provider. The granaries groan with grain for you...' But even Ramses' stone monuments would lose the battle against his ultimate enemy – time. By the year 550 AD, the golden age of Egyptian civilisation had passed. A waning Roman Empire now ruled Egypt. With the Romans came Christianity. The ancient faith in immortality and reincarnation was banned. Still, one last bastion of Egypt's ancient knowledge and beliefs remained... Inside... this secluded shrine... priests kept the ancient faith alive... and still practiced the rituals that promised immortality... And only these... [priests] could read the ancient writing – the hieroglyphs carved upon the walls. Finally, this last remaining outpost of Egyptian civilization came under attack. A mob of Christian zealots, outraged at the continuing worship of pagan gods, assaulted the priests – breaking the last living link to the pharaohs. The priests were killed or scattered. They took their knowledge of the hieroglyphs to their graves. Egypt's dreams had been destroyed. The divine secrets of sleeping pharaohs, their sacred quest for immortality, all lost – perhaps forever – beneath the drifting sands. But of all Egypt's wonders, one captured the world's imagination like nothing else in human history. In the desert of the Giza Plateau – stoically surviving the swirling winds and grinding sands ...[or] nearly 5000 years – they defined this society that dreamed of immortality; for the pyramids seem to have defeated time itself. The world's most recognised symbol of the glory that was Ancient Egypt; built as tombs, later gutted, robbed, battered by the centuries – and still they endure. There are more than 2.3 million blocks of limestone in the Great Pyramid of Cheops, each stone weighing from 2 to 15 tonnes. Its base is a near perfect square. 481 feet tall, it could hold the equivalent of 872 widebodied jets. And still today the mysteries abound: where did the technology come from – how were they able to move such vast amounts of stone prior to the invention of the wheel? Perhaps most intriguing of all: who could have imagined this possible – eternal stone structures, the largest on Earth, when nothing even a fraction of their size had ever been built? The answer lies nine miles south among the Old Kingdom tombs of Saqqara and[, in particular,] the step pyramid of King Djoser – the very first stone building in all the world. This was the laboratory that proved the great pyramids possible. Unlike anything the world had ever seen, it was so remarkable a feat of engineering its architect... was proclaimed a god. Originally designing a simple low-slung tomb... [the architect wasn't satisfied. It] added one layer, then another, and another and another, as if building steps to heaven. [The architect] also tunnelled deep into the earth, creating a labyrinth of chambers, galleries and corridors designed to keep the king's true burial site secret... Down dark twisting passageways, at every turn, in every detail, what [the architect] accomplished seems astonishing still. "There is no scientific explanation given to the public to tell them how the pyramids w[ere] built. They never left a papyrus scroll or a description in a stone to say how they did it." Today it takes a 350hp diesel engine and hydraulic lifter to pick up a tonne granite slab... Although no description or narrative account has ever been found telling how these massive stone monuments were created, [one] tomb drawing contains tantalising clues. It shows the 160 workers needed to move a single statue. How many more must it have taken to build a pyramid? Many believe the stones were moved on enormous wood sleds on mud-slicked paths. Others think rolling logs were used, or even canals built from the Nile and the stones floated in on barges. Ramps most likely raised the stones into place. But how they built on such a scale and with such uncanny precision is the greatest wonder of this great wonder of the world. The pyramids were built to house the pharaohs for eternity but the stones would fail them. The tomb became a beacon – attracting as many robbers as it repelled, and Egypt became a land overrun by treasure-seekers. There was no stopping the looting and plunder to come... Despite the royal architects' best efforts the tombs were violated. The great stone walls could not protect the kings from the greed in the hearts of [people]. The intruders might be simple robbers, members of the king's own priesthood, or even the very builders of the tomb itself. Actual trial transcripts, found on an ancient papyrus, reveal their greed. 'We broke through and found the pharaoh lying in the rear of the tomb. We took all his possessions of gold, silver and bronze, and divided them between us.' [The statement was made by the] temple stone mason. And the plunder continued down through the centuries. In the unbridled looting of the 1800s, nothing was scared. A giant head of Ramses was dragged from the desert and [taken] to the British Museum... Even a [person] of science... left a trail of destruction in his wake. A brilliant scholar... the French archaeologist... discovered the long-lost tomb of a cult that worshipped sacred animals 3000 years ago. Deep under the ground... a maze of catacombs contained massive stone coffins that once held mummies of full-grown bulls. Each granite chamber weighed 80 tonnes, and yet they too had been robbed – the lids pried open in ancient times by a force [the French archaeologist] could not even begin to comprehend. Only one sarcophagus remained unopened, but [the French archaeologist and his team] came well armed. [The French archaeologist] was a product of his time – as greedy for treasure as for knowledge, shamelessly indifferent to the desecration [his activities] would cause the sacred tombs. "In the raw pillaging days, it was just, 'Hey, let's get the biggest kind of stuff we can', and they blasted it with dynamite to get it out; and they dropped [artefacts] in the Nile by mistake when the winches didn't work, and all sorts of chaos. They would take dynamite and set it at the edge of the pyramid... [then] just let it go [to see if there wa]s a hole in there, [wa]s it next to a burial chamber, and so on." Despite the best efforts of Egyptian authorities illicit excavations continued... but the worst looting was not the work of amateurs. This was plunder with a pedigree; plunder in the name of art and science; plunder to fill national museums all over the world. "Museum curators are trained to do three things: they acquire, they exhibit and they publish... [T]he sexiest thing is to acquire... [T]he resentment of people living in the countries that were being pillaged finally got to the point where it had to be taken seriously by the industrial powers – who were the collectors. 'We don't want any more of this theft, and you people who are the scholars... you're the ones that are egging them on – you're contributing to the criminal behaviour by saying we'll buy anything in sight'..." "You know, Egyptian civilization does not belong to Egypt only, but belongs to everyone... all over the world. [However,] Egyptians are guardians of [this history] and this is why... Americans, Europeans [and so on have to unite] in stopping this [criminal behaviour]." The pharaohs have not been left in peace... [O]ver the years... the mummy of Tut... has been rudely ...handled. But mummies suffered far worse indignities. They became the objects of bizarre rituals and beliefs. "In medieval times pounded up Ancient Egyptian mummy was considered to be a powerful medicine, to say nothing of an aphrodisiac. Pounded mummy was worn by the king of France in a leather pouch on his belt. A thriving market in what was called *Mumia* developed throughout Europe, and there were numerous instances in the late 18th century and early 19th century of people throwing mummy-unwrapping parties... [G]roups of doctors and scientists would get together... throw a reception, and... formally unwrap the mummy. And the collection of mummies from there became big business." For over a thousand years, human beings have been treated as display pieces, historical oddities, props for cheap magicians. But another chance discovery, more than a century ago, would forever change the way mummies were treated... [I]n a cave lay the coffins of 32 kings and queens, including the mummy of Ramses... 3000 years ago their royal priests carefully identified each ruler and hid their remains in this secret burial chamber. For their own protection, Egyptian authorities... removed the royal mummies from their tombs and this collection of ancient rulers formed a funeral procession unique in human history. All along the Nile, Egyptians gathered to [show] their respects as the eerie caravan of ancient rulers made its final journey north to Cairo. Today, a century later, Ramses and all the royal mummies lie in the upper gallery of the Cairo Museum. A unique conservation effort is under way to preserve the ancient pharaohs, to complete the task their priests began. But now scientists have taken the place of [the priests] as the final protectors of the royal mummies... Steel and glass have replaced the stone and jewels of [their] original tomb. The casing [is] filled with an inert gas to reduce further damage to the mummies... It may be that what makes Egypt so mysterious and majestic is that traces of the humble have all but disappeared, erased by the passage of time. Our vision is of the exotic – the monumental buildings and the royal treasures of dazzling and inspired beauty; it is the fabulous trappings of priests and magicians, the resting places of queens and kings that survive – but the things that really ground us are the mummies, the preserved faces of... [people] who lived life to its fullest, and who died hoping that their perfect lives along the Nile were never really

over... [N]ow they are closer to eternity than they have ever been. [●] *'Pyramid* (TV One, Monday, 7pm) is a BBC documentary on the Great Pyramid of Giza, the only one of the Seven Ancient Wonders of the World to survive. The film graphically reconstructs King Khufu's tomb, which took over 20 years, 5 million tonnes of stone and 20,000 workers to complete. Unlike many documentaries on the topic, narrated by academics or TV presenters, *Pyramid*'s story is unravelled through the eyes of a fictional worker on the monument. Nakht and his fellow conscripts – not slaves as is commonly believed – are seen hauling huge limestone slabs to the pyramid's base. The structure was aligned by holding ancient plumb bobs towards the circum-polar stars, the part of the sky the Egyptians believed would grant Khufu an afterlife.' This week's TV also 'provides an insight into some of the oldest, newest, most famous and most unusual mummies in the world. *The Ultimate Guide: Mummies*, Tuesday, reveals how the quest for eternal life through mummification has given scientists a window into the lives of early civilisations. Some mummy facts: ■ Eva Peron, who died in 1952, is the world's best-preserved mummy. ■ In top-of-the line mummifications in Egypt the brains were sucked out through the nose and all vital organs were removed, except the heart which was thought to have been the seat of intelligence. ■ The oldest mummies in the world were not from Egypt but were Chilean (*Oldest Mummies In The World*, Sunday, attempts to date the origin of mummification and explores how the idea reached Egypt from the coast of Latin America').

... 'the mummified bones of a South American tribe – which predated the Incas and bound the heads of high-ranking babies between wood to produce an elongated skull – litter the desert. The Incas consulted a "court of the dead" (mummified corpses of past rulers or "sons of the sun") on important issues'...

'Machu Picchu, the "lost city" of the Incas in the Andes, is in imminent danger of being destroyed by landslides, Japanese geologists warn. Ground movement sensors placed by Kyoto University researchers have shown that part of the site's back slope is moving downhill at a rate of up to 1cm a month. Machu Picchu was declared a World Heritage Site by Unesco in 1983. It has become Peru's most economically important tourist attraction. Machu Picchu, 80km northwest of the Peruvian city of Cuzco, was the last stronghold of the Incas after their empire was overrun by Spanish conquistadors. Its ruins, in an astonishing state of preservation, were discovered in 1911 by an American archaeologist. The find spurred endless speculation about the lost Inca culture.'

...in] a world shrouded in mystery... a game [wa]s... played... We do not know the rules or how many played, but this [wa]s no ordinary contest – the[] contestants] played this game for their lives. More than a thousand years ago, the [people] who played and the crowds who watched... vanish[ed], leaving the arena and all their magnificent cities empty... They were called the Classic Maya. They built the greatest civilization in the Americas. When Europe was still in the Dark Ages, they produced artists and scientists whose achievements still astound. When London was just a town of wood shacks and dirt streets, the Maya were building mighty cities of stone in the heart of the Central American rainforest... [T]he greatest of them all... [was a] thriving metropolis of 40,000 people [which] reached its peak around 750 AD and covered an area the size of Manhattan. Less than a century later it stood empty. "It's a mystery that touches everyone because we... all exist... in civilizations, and we feel the fragility of civilization when we see something like the Maya ruins – when you see how high a civilization can develop and achieve, and how dramatically it can disintegrate..." Unlike so many other civilizations, the Maya did not fall to famine, invading armies or terrible disease. Maya cities were deserted... The Maya... just walked away, into the forest, never to return. Today descendants of the Maya still live in the land of their ancestors, yet their empire is no more. But why... did the ancients leave their magnificent cities? It is a question that has haunted historians and archaeologists for ages. Only by exploring the deepest beliefs of a people who died a thousand years ago can we attempt to understand who they were, and why they left deserted all they'd created. The trail is cold but clues can still be found... The origins of the Maya lie in the forgotten histories of the first immigrants – the Asiatic people who walked across the Bering Sea from Siberia during the last Ice Age and settled the Americas more than 15,000 years ago. Thousands of years would pass before the Primeval Maya established themselves in the sweltering jungles of Central America. Then, in a period lasting from 250 to 900AD, the sophisticated civilization we call the Classic Maya would flourish. Hundreds of cities were built. The vast territory that is now southern Mexico, Belize, Guatemala and Honduras became the empire of the Maya. They thrived for more than six centuries then it was over, all across the empire... For almost 1000 years their ruins lay lost and forgotten. It wasn't until the 19th century that the world would rediscover the Classic Maya. In 1839, [a]travel writer... and [an]illustrator... explored the jungles of Guatemala. Their work captured the romance and mystery of the Maya world, while providing the first serious clues to the origins of this lost civilization. Explorers before them had theorised the Maya were descendants of the Greeks, a lost tribe of Egypt, or even fugitives from the mythical land of Atlantis. But the[] travel writer and the illustrator] believed otherwise. "...we have a conclusion far more wonderful than that of connecting the builders of these cities with the Egyptians, or any other people. It is the spectacle of a people possessing cultivation and refinement." ...[the travel writer] understood this exotic civilization had not been developed elsewhere, by others, and brought across the Atlantic. The Maya, [the travel writer] suggested, were unique. Adventurers and eccentrics came from all over the world. One French explorer arrived in Mexico with 4000 lbs of luggage, and there was only one way to carry it – [on the backs of labourers or mules]. Not even the dense and dangerous rainforest deterred them. More than the promise of buried treasure lured these [adventurers] into the unexplored reaches of Central America – they were seeking answers to the riddle of a lost civilization. They found treasure, in abundance, but an understanding of the [Classic]Maya proved elusive. Archaeologists probed the jungle for decades, discovering great monuments in astounding profusion. Most intriguing of all, hundreds of pyramids that, like sacred mountains, reared up from the jungle floor. But the purpose of these pyramids remained a mystery. Then in 1957 it would all change... [A] great Mexican archaeologist... had spent four years excavating the most impressive pyramid... – the Temple of Inscriptions. Now [the Mexican] stood at the threshold of discovery... The centre of the burial chamber was an enormous stone tomb. His [labourers] worked feverishly to raise its massive lid. "I was gazing at the death-face of him for whom... this crypt, the stairway, the great pyramid with its crowning temple, had been built." ...rare film shows [the Mexican] moments after his dramatic discovery, but a ruined skeleton and a precious jade mask only raised further questions that nobody, not even [the Mexican], could answer. Who was... the [person] behind the jewelled mask? ...What happened in his life that his death warranted such ceremony? ...A century and a half ago [the travel writer] predicted that the strange, indecipherable engravings on their monument walls held the key to the mystery... [of the Classic Maya. The travel writer] was right but... the... sacred world of the Classic Maya should never have become a mystery. They left, after all, an abundant written record – an independently invented writing system; incredibly, one of the only five produced in the history of the world. These were texts imbued with magical power – descriptions of their cosmos, chronicles of their dreams. Beautiful, fragile documents, they were a truly remarkable achievement – a unique and totally original written language, as momentous as the hieroglyphs of Ancient Egypt. They bear witness to the birth of the first written language in the New World. The importance of these texts were recognised by the first European invaders centuries ago. In 1562 a devout Catholic priest... convinced one of the last surviving Maya scribes to translate the Spanish alphabet into Maya. [The priest] fervently wanted to bring Christianity to the Maya[, and] felt learning their language was his best hope of reaching the people... [The priest] dedicated his life to understanding the Maya, and to saving their souls. Still, his memory is not revered – rather, it is reviled. "[The priest] was distraught... maybe even destroyed, when [it] discovered... people that [it] believed... had been converted... continuing to practice pagan rituals... [The priest] went absolutely crazy, and... began to try to root out and extirpate any remnant of [the] ancient religion." In a single night this [representative] of God burned hundreds of precious books – books containing their science, their literature, a record of their lives. As the Maya looked on, it was as if every copy of their Bible and Constitution had gone up in flames. Throughout the Spanish Conquest, thousands more texts were burned. Of the prolific output of Maya scribes, only four books escaped the fires to reach the present day... and from this scant evidence would come remarkable insights into Maya culture. At first, only their sophisticated mathematical system was decoded. Maya math was tied closely to a complex system of astronomy. Their detailed observations of the night sky were recorded with astonishing accuracy. In the 1950s[a] great Maya archaeologist... would conclude these were a people dedicated to studying the heavens and the meaning of time. A thousand years before the first computer they recorded celestial events one half billion years in the past. But why such fantastically complex astronomical

calculations? [The Maya archaeologist thought it] knew... In the Maya, [the archaeologist] saw an idealised world of sacred beliefs and higher learning... Maya society was practically utopian [the archaeologist] concluded – a peaceful people, who worshipped time; a world run by tranquil priests and time-keepers; a place of sacred observations devoted to the tracking of the stars... His vision was as appealing as it was flawed. Certainly, the proof seemed all around him. The Maya built pyramids that were giant stone calendars and sun dials... [One] great pyramid... has 365 steps and platforms to mark the days of the year. Their alignment and design is so precise that once each year they cast a unique shadow that records the spring equinox. Like the star charts of an astrologer, their codices mapped the positions of the stars and planets for centuries to come. The Maya calendar was unlike any other... great gears illustrate their concept of time. The hieroglyphs on the larger wheel mark the 365 days of the solar year; those on... two smaller gears represent the 260 days of the priests' sacred calendar. Together this Maya time machine identifies the astrological significance of every single day. Using this calendar it must have seemed [to the Maya people] as if their leaders controlled the awesome power of the heavens. The accuracy of Maya astronomy still astounds. The cycles of the Moon were mapped so precisely that today, 1500 years later, their calculations are off by only 33 seconds. Even the moment of Maya creation, some 5000 years ago, is a fixed point in the sacred calendar. Forbiddingly, so too is the end of this world. According to the Maya calendar, this cycle of creation will cease to exist at precisely Sunday, December 23rd, 2012. Maya texts revealed the hidden world of their mathematics and astronomy, but... much more startling revelations were to come... And those revelations have created an entirely new understanding of the Maya... [P]ictures... painted on... Maya vases... reveal a people obsessed with the fearful and bloody gods of the underworld... "Some of these guys are very, very gruesome. The God of Decapitation, for example, is a skeletal god[which] very often is holding a decapitated head... by its hair... [and] is generally portrayed as having... stench coming out of him." For the Maya, the underworld was an ominous place. But to our eyes, many customs and rituals in their daily lives seem equally unsettling and bizarre. Children's skulls were deliberately deformed to create the flattened browline the Maya found so pleasing. Maya [gals] had their teeth drilled without known anaesthetics and then set with precious stones. The use of mind-altering drugs was encouraged and condoned. Powerful intoxicants were smoked. "The Maya got high. The Maya took lots of drugs but I think their drug of preference was fundamentally alcohol. And when they were so drunk that they were throwing up, they were then taking it an as enema – which would [give] a very intensive, even more intoxicating effect... They were getting incredibly drunk..." [The Maya archaeologist] was aware of such grotesque and bizarre practices, but... refused to let them alter his idealised vision of the Maya. Then [an] American film-maker... ventured into the jungles of Mexico... [where it] was led to a secret ruin... [which] would expose a savage truth, and alter forever the world's utopian vision of the Maya... ["When the film-maker] walks into this room [it]'s got a whole fore-notion of what the Maya are like. [The film-maker]'s imagining that they were priestly time-keepers, a... wonderful noble [people] – maybe like the very [film-maker] himself." Instead, what [the film-maker] found painted on the temple walls was a detailed depiction of the Maya not as peaceful stargazers but as fierce warriors; devout believers in bloodthirsty deities; devotees of bloodletting and sacrifice. It was a portrait of the Maya that up until that moment seemed unimaginable. "I think in fact there is probably no more... powerful painting of warfare and bloodletting in the world than this battle. It's full of sound and trumpets and screaming, and guys were all painted and pumped. Some of them are already slain... And the key point is right over in the corner... where this guy is ripping out the fingernails of that particular captive. And [the captive]'s face is collapsing. [The captive] seems to be almost burbling something out of his mouth. Maybe it's blood dripping from where they've ripped out a tooth or two. And the rest of these captives... look at their fingers[as] blood is spurting right out of them." This was an image of the Maya neither [the film-maker] nor the world at large could easily accept. Even these shocking scenes didn't immediately overturn the cherished ideal of the peaceful Maya. It was like a parent overlooking some obvious flaw in a child. "When [the film-maker] walked into this room I'm not sure that [the American] knew what to make of it. But when [the Maya archaeologist] walked into this room [it] didn't see warfare, [it only] saw a nasty little raid. In fact [the archaeologist] even wondered what was going on. 'The Maya wouldn't rip out fingernails.' [The archaeologist] thought perhaps there was some pot of red paint... that people were dipping their hands into..." It would take years before [the archaeologist] would acknowledge his mistake. But a continent away, another discovery provided a new set of clues. By pure accident, in a most unlikely setting, a new chapter in Maya history would begin. [It's] May, 1945. Berlin has been invaded by the Russians... Hitler's Germany is in ruins... The National Library is on fire... [A] Soviet officer plucks a random souvenir from the flames... The book [contains] reproductions of... Maya codices. [The officer] immerses himself in Maya studies, and the alphabet... [the Catholic priest] had attempted to transcribe. His great breakthrough was realising Maya hieroglyphs were much more than a simple system of numerical signs. His work was amplified by another Russian... a superb illustrator and archaeologist. Her keen eye detected patterns in the dates carved in stone. Where others had seen only numbers and signs, [the Russian] read the entire span of human lives. Based on her findings, the code-breakers went to work. They began to read the carvings in temple walls like tombstones in a cemetery. Much more than mere calendars, the images commemorated the entire reigns of kings and queens. 15 years after discovering the skeleton with the jade mask, [the Mexican archaeologist] would learn his identity... The tenth in a line of rulers that stretched back three centuries, [the king had] ruled for almost 70 years... [becoming] one of the most powerful kings in the history of the Americas. These were monarchs who commanded complex cities, large populations and vast areas of land. They ruled over their citizens with arrogance and disdain. But what was the source of their authority? Why did their subjects submit to such tyrannical rule? "We keep looking for the underlying source of the power of the kings – searching for economic and political and military power on a fairly grand scale. But the power isn't based in controlling resources or manipulating the economy or mounting large armies – it's based upon belief. That is the power of the Maya kings..." The power of the Maya kings – to understand it we must follow a trail of blood, a knife made from a stingray spine, a rope of thorns. These are the keys to comprehending the... Maya and the sacred power of their kings. Every portal of every Maya temple is a doorway to the underworld. Inside [a] temple it is the duty of both king and queen to re-enact the mythical moment of Maya creation. In myth, it was the blood of gods that gave life to [people]. This was the original act of sacrifice. On Earth, the king is as a god, and blood is the price of power – the debt to the gods that must be repaid. Myths and symbols will not suffice. Blood must be shed, and royal blood drawn from the tongue and from the genitals[of the king and] queen... forever bound that sacrifice of the gods to the li[ves of the people]. As his subjects watch, the bloody sacrament of the king [is burned and] spirals up towards the gods. In return for the sacrifice of royal blood the crowd believes the gods will cause the Sun to rise, the rains to fall, the corn to grow... "In the New World, people believed that your soul – the most potent part of you, the part that's indestructible, the part that you pass on to your grandchildren and to your great-grandchildren, the thing that is eternal – resides in your blood. So if you wish to give an offering that is the most precious and powerful thing on Earth, you give your blood." "Remember that the king had to do rituals of genital bloodletting and self-laceration on a regular basis..." In fact, all Maya gave offerings of their blood. "The difference between them and us is we have it easy. We say you can... get money out of your pocket. You can give something that doesn't hurt, that really doesn't cost you anything..." And there were other, even bloodier offerings. Skull racks commemorate war captives sacrificed to ensure the continuity of the Maya world. Even the ball games... [serve] a deadly purpose. The contest is in fact not a game at all – it's losers for sacrifice to the gods. The Maya revelled in this terror, even recording the brutality for posterity. [One statue of a] sacrificial victim still emits an eternal howl of unimaginable pain. [The victim] has been scalped, disembowelled, his hands and feet mangled, the wood bound to his back is ready for the torch. Today, Maya shamans still practice blood sacrifice, but now it is the blood of chickens [that] is shed. The ancient faith is intact, but only as a pale reflection of the rites and ceremonies of the Classic Maya. Sacramental blood still feeds the Maya imagination, but the context of the belief has changed. Christianity may have been forced upon the Maya, but once there it struck a deep and lasting chord. The Christian concept of a divine king who shed his blood for the benefit of [hu]mankind made perfect sense to them. For the [Classic] Maya the blood of kings was the mortar that bound all life together. The

king's sacrifice ensured the stability of the Maya world, guaranteeing the sanction of the gods and the belief of the people. [The king] stood at the centre of the Maya universe. Remove the king, and the whole system comes crashing down... [T]he crisis for the Classic Maya began the moment they lost faith in their kings. "Their source of power is this ritual, this display, this ceremony, the theatre, the charisma, and when real problems occur... it can be devastating in a way that it shouldn't have to be. But the authority is based upon belief... in the king, and failure is unacceptable. If this really is a holy lord who can manipulate the force[s] of the Universe, then failure undermines the whole system and it can't be adjusted for." The problems Maya kings faced as their authority eroded were not unique, but their solution was – more ritual, more sacrifice, more blood. But it didn't work... there were losses in war, overpopulation in cities, failures of crops – and, ultimately, the king was responsible. If the blood of the king held the world together, when that world fell apart it was the king's blood that had failed them. "When you begin to understand from the inside the way the Maya thought, and the way their civilization was constructed, it's amazing that they maintained it for as long as they did. The mystery should not be... [about] the Maya collapse but... of how the Maya... maintained th[eir] civilization for so long." The Maya... rose stone by stone out of the jungle – self-made and self-contained; unique and wholly original in all the world. But, ultimately, the great dynasties and the great achievements of the Maya kings and queens, all their formidable powers, were built upon the faith of the people. And when crops failed, or enemies prevailed, the people no longer believed. And when the people lost faith, the rulers lost power. And when the power vanished, the Maya abandoned their great cities, and the jungle reclaimed its stone.

...[3700 years ago], a dynasty of savage kings ruled a people called the Shang. Legends tell of barbaric sacrifices – thousands slaughtered by royal decree. The ruthless exploits of Shang kings are legends no more. We now know they were very real indeed. The Shang's quest for dynasty dates back to the very beginnings of Western civilization... [I]solated in the East, the most remote of ancient civilizations was flourishing in a land called China. Most Westerners see Chinese culture beginning in the capital city of Beijing. [Th]ere, within the walls of the Forbidden City, the destinies of countless peasants were decided by a succession of all-powerful emperors. But... China's emperors were [part of] a much older tradition – a tradition born of power, human sacrifice and the mysterious rites of the Shang. "The early dynasties of the Bronze Age in China were mentioned in great detail in the ancient texts from the... Han dynasties, but they're mentioned almost in a legendary way. The Shang dynasty moved from the stuff of legend to the stuff of archaeological fact with the discovery of... bones and their excavation at the very important Shang capital near Anyang." The city of Anyang lies 300 miles southwest of Beijing. Here, in 1928, Chinese archaeologists made an extraordinary find. Deep in the countryside, workers uncovered a cache of tortoise shells. The shells were covered with mysterious inscriptions – strange prophecies written in ancient Chinese characters. After years of research, the first pictures of Shang court life began to emerge. 4000 years ago royal priests used heat to crack the shells, then interpreted the cracks – predicting the outcome of a battle, the birth of a prince or the success of a great hunt. The shells also listed the names of Shang kings – rulers long thought as mythical as King Arthur and his court were now part of China's history. The discovery inspired the Chinese to widen their search... [T]he startling result was a series of royal Shang mausoleums. On ramps that led to the tombs, excavators were greeted by welcoming parties of headless skeletons. The missing skulls were found inside the grisly sanctuaries, arranged in mysterious patterns... Shang kings built their empire on a foundation of human sacrifice. "Critical to Shang religion was the belief that sacrificial offerings had to be made to the deities, or the ancestral spirits... [I]n order to obtain... wisdom..." The Shang valued bronze more highly than gold. In [bronze] vessels the kings would offer tribute to their gods, and royal control of the resources that each bronze required was absolute. They were a symbol of the Divine Right of Chinese kings that would, in latter years, be called the Mandate of Heaven. The Shang employed sophisticated technology to perfect th[e] most sacred of their crafts. While Mediterranean artisans were only beginning to experiment with metals, the Chinese had already elevated bronze casting to an art. From clay moulds packed with earth would come richly detailed works... The Shang aristocracy was addicted to hunting and warfare. By 1000 BC they'd found a more insidious addiction – alcohol. "We know from latter historical texts that the last Shang king was very, very fond of drink. In fact, [the texts] describe him as having built ponds filled with alcoholic beverages, and hanging slabs of meat... in the forest so [the king] could go out and party and banquet whenever [the king] wanted to – to the great destitution of his kingdom. It's also quite possible that the Shang use of bronze ritual vessels with a very high lead content... had physiological effects which decreased their capacity to rule." The inscriptions etched on the heat-cracked shells... had opened a new window on Shang royal life – their kings were ruthless. One... was said to have invented hideous tortures. Hot coals were poured into a hollow cylinder and victims seared to death. Whether such reports are fact or fiction may never be known... At a site called Sanxindui a competing culture was discovered – a people who vied with the Shang for the Mandate of Heaven... Sanxindui masks were found smashed to pieces – part of a mysterious ritual. They were reassembled... Over 5000 fragments were pieced together to restore [one] colossal nine-foot bronze... These once-shattered masterpieces seem to be evidence of a more sober approach to power. While the Shang severed heads as a show of force and authority, the rulers of Sanxindui conserved their population by decapitating statues instead. But kings rich enough to commission such extravagant bronzes were also capable of mustering formidable armies. Cultures like the Sanxindui may have weakened the Shang, and thus set the stage for a new dynasty – a people called the Chou... 300 years before the founding of Rome, Chou culture flourished. They established their capital near the present-day capital of Xian. Here the great King Wu secured his dynasty by creating China's first system of justice for the common people... Chou kings created a feudal system based on the teachings of Confucius. The king was considered a father-figure, who entrusted relatives with vast tracts of land. Soon these nobles raised armies of their own and a struggle for dynasty began. Fierce fighting would erupt. Smaller states were swallowed up by larger, regional powers. The final centuries of conflict – from 481 to 221 BC – are called the Warring States Period; a time when the seven most powerful states battled for supremacy. Armies of thousands were drafted from peasant populations. Enormous resources were allocated to training raw recruits and developing new weapons. Crossbows were developed some 13 centuries before they appeared in Europe. The Chinese weapon was armed with a sophisticated trigger mechanism. The Chou relied on their swords for close combat. But when all else failed, they resorted to psychological warfare... [One] Chou general, unable to break a long-standing stalemate, sent brigades of criminals to the front. Their choice was simple – die by their own hand or suffer an even worse fate if they refused. As enemy troops held their ground, the grim line of convicts approached. As the soldiers watched in astonishment, the convicts committed suicide. The gruesome diversion allowed the general's troops to overwhelm his stunned enemy. Xian leaders could now support a growing civilian population and feed their military machine as well. In the last years of the 3rd century BC, Xian ministers convinced a young prince that China's competing states were now his for the taking. The prince followed their advice and became the most powerful ruler in the world – Son of Heaven; lord of all things under the sky; 1st Emperor of China... A half-million strong Xian army destroyed all rivals in a series of savage campaigns. Under the Xian system even the lowest commoner could raise his rank and social status based on the number of heads [it] cut off in battle. In one conflict alone, 450,000 enemy soldiers were captured. All were beheaded by Xian warriors eager to improve their station in life. In the end, it's estimated Xian destroyed 2/3rds of [their] enemies' populations. The 1st Emperor succeeded where none before him ever had [by unifying] China. But the struggle to preserve it was just beginning. Far to the north of present-day Mongolia, nomadic warriors raided Xian settlements along the frontier. The 1st Emperor responded with an army of 200,000 convicts and 100,000 troops. Their mission – to build a barrier unique in the world, the Great Wall of China. Over the course of ten arduous years, thousands of [labourers] perished from exposure and fatigue. Their hobbled, broken bodies were added as fill... "If the king had a major construction project, you would be called away many years at a time, separated from your family, working under impossibly difficult conditions... and facing not only harsh climate, but possible enemy military action against you while you are involved in the construction – and, quite frequently, being put to death at the end of the construction project, so that you wouldn't reveal the secrets of the construction itself." ...The Great Wall... was a monument to dynastic might. It stretched from the lowest deserts to heights of over

6000 ft. Sections of new wall connected barriers built by earlier dynasties to create a wonder that spans 2600 miles – it's even visible to astronauts in space. The Great Wall stood as a warning to outsiders that China was at last a unified kingdom. [The 1st Emperor] now moved to secure his power from within – purging all political enemies. The old feudal system of landed nobility[and] their private armies [were disbanded. “The 1st Emperor]... established a safe system wh[ich]... concentrated all power into the central government. States had no independent military or financial capacity...” [The 1st Emperor] consolidated China with 5000 miles of roads and a sweeping programme of standardisation. Even the width of axle wheels was fixed. Travellers were required to carry passports. Rival states once issued coins of all shapes and sizes. By imposing a standardised currency, [the 1st Emperor] created a national monetary system. The written language was standardised as well, allowing the 1st Emperor's edicts to flow quickly and easily to the farthest points of his realm. But language was also the medium of ideas and opinions, and in their writings even royal scholars and historians began to criticise many of [his] new ideas as a dangerous break with the past. [The emperor's] Grand Chancellor... once observed that the well-fed rodents in the royal granaries were more aggressive than those in the streets. Later [the Grand Chancellor] would wonder if too much knowledge might feed insurrection. Such thoughts prompted a ruthless decision – on [his] orders, 460 scholars were buried alive. Vast collections of histories, poems and thought were destroyed. The civilization that gave the world paper and print would also conduct history's first book-burning. But opposition to [the emperor] only intensified. After three assassination attempts, [the emperor] lived in heavily guarded seclusion. China's 1st Emperor became obsessed with the search for a major potion to shield him from death. But one of the concoctions [it] hoped would make him immortal eventually succeeded where his enemies had failed. [The emperor] died in 210 BC[and]... was buried in the most opulent mausoleum the country had ever known. Long before his death, more than 700,000 convicts had begun its construction. It's said that precious jewels adorned the tomb's ceiling, depicting the Sun, Moon and stars of the Chinese sky. Crossbow booby-traps protected the main hall, where models of China's great cities sat beside scale model rivers. Filled with mercury, they flowed into a miniature ocean. To conceal the site... all who knew its secrets were sealed within its walls. 15 years of chaos followed [the 1st Emperor's] death. In 206 BC, a new dynasty called the Han rose to power. At its height in the 1st century BC, the Han dynasty was equalled in might only by the Roman Empire. But its 5th Emperor... knew that even the Great Wall would not protect his kingdom forever. Nomadic raiders in the north remained an ever-present threat. [The 5th Emperor] believed the key to dynasty was skilful diplomacy not battle. His secret weapon [was] a trusted adviser... [who it] sent... north on a mission of peace, to attempt a series of treaties cleverly designed to pit one Han enemy against the other. Midway [through his mission the adviser] was captured and given up for dead... Ten years later, an old [traveller appeared in the emperor's] court... the faithful diplomat, had survived. The courageous servant recounted his ten year odyssey, including a startling discovery [it ha]d made in his travels. [The adviser] had escaped his captors and fled as far west as Afghanistan. There, to his amazement, [it] found Chinese goods on sale in every market place. Traders were moving Chinese products to the edge of the known world. The most precious commodity, a cloth called silk. [The emperor] listened in disbelief as [his adviser] described how Chinese merchandise was transported along a network of rough trails called the Silk Road. Running across China, through Persia to the Mediterranean, the trade route covered some 4000 miles. Bales of the finest Chinese silk were being traded on the streets of Imperial Rome. In fact, the Romans bought the material in such abundance that the Emperor Tiberius imposed a limit on imported silk garments... [Amongst items uncovered from a Han prime minister's tomb were over] a hundred pieces of elegant, mist-like silk... in perfect condition. [One] transparent gown weigh[ed] 2 ozs – testament to the matchless artistry of the Han. Silk was also the medium for imperial map-makers... Researchers now know that the imperial lifestyle of the Han nobility, while opulent, was far from healthy. Remains found in... tombs reveal a fatty diet, rich in meats and seafoods... The [PM's] tomb's most precious relic offered the clearest picture yet of Chinese life at the top – [his wife]. Buried for 21 centuries, [the wife] showed few signs of decomposition. Her skin, pampered in life, was still smooth and pliant. Chinese researchers could now produce the first modern medical profile of the Han ruling class. [The wife's] lungs were scarred by tuberculosis, [the wife] suffered from intestinal parasites and a ruptured disc... But what ultimately killed [her], and no doubt many from the Han upper class, is an affliction common to us today. “The autopsy... indicated that [the wife] had heart disease and died of a heart attack sometime in her 50s.” The treasures of [the PM's tomb revealed] the wealth of the Han nobility, but the fortunes of a [PM] were pocket-change compared to the vast riches of China's emperors. To comprehend the magnitude of their power and wealth we must return to the time of the... greatest ancient Chinese ruler, [the 1st Emperor]. To protect his tomb, [the emperor] assembled the most remarkable bodyguard the world has ever seen. Nobody knows how many artisans laboured on this astonishing achievement, but estimates range in the thousands. The... super-human attention to detail, the very scope of the undertaking itself, is unique in human history. On secret orders, an assembly-line of subjects and artisans laboured for decades to create an escort for the Emperor's ascent into Heaven. In essence, [it] cloned his human army into life-sized soldiers made of clay. Warriors posed for their terracotta twins or suffered death. But this great army, created in their own image, was destined for defeat. In the chaos that followed [hi]s death, the underground vault of terracotta warriors was discovered by an angry mob and put to the torch. The roof-timbers gave way, sealing the soldiers deeply within the earth – seemingly forever. For two millennia, [the 1st Emperor's] great army remained lost, until 1974 when a discovery was made that would stun the world. The ancient vandals had smashed the warriors to pieces. With every figure unique, restoration is an arduous task. “The sculptures are very realistic. You see the detailed hair combed backwards with a little braid pulled up across the head. The ancient Chinese cared a lot about their hair. According to law records if you got into a sword fight and cut a soldier's top knot you could be put into prison for several years.” While the Roman Empire was content with an army of 100,000, the Xian amassed a military six times as large. The replica warriors... reveal the look of [the 1st Emperor's] troops in battle. The statues were buried in combat formation, giving researchers a haunting glimpse of dynasty on the march... Rescued from the hands of clay were 10,000 working models of Xian weapons. Laser technology confirmed Xian artisans used chrome-plating to block corrosion on the surface of [a] sword. Today its blade remains so sharp it can only be handled with protective gloves... More than 200 emperors would follow the [1st], ruling until the turn of the 20th century. Today they stand as a symbol of China's great paradox – a land where cycles of chaos gave birth to wonders and creations that enriched the world... Without the Chinese compass, without their creation of paper and printing, without their refinements to map-making and their invention of the ship's rudder, Europe's discovery of the New World would have been impossible. Ultimately, the reign of China's imperial rulers would end... in the Forbidden City around the turn of our century. In 1908, a... 3[-year-old boy] became China's last emperor. Three years later [the emperor] was dethroned, and China became a republic... [- which is another sign that o]ver the past 4000 years, while other civilizations have collapsed and vanished, the Chinese have continued to adapt and to survive. Despite countless wars, and a century of revolution...

This is the story of a revolution... that turned a nation from its blood-soaked and war-like past into a culture pursuing spiritual knowledge and inner peace. It is the story of an ancient prince who became a god, inspiring a line of divine kings who still govern and guide through [his] teachings... Hidden away for hundreds of years... at the top of the world, that civilization flourished, rich in its unique traditions and exotic culture. Only in this century has the veil of secrecy and mystery been lifted. And it is the story of a small peasant boy who became the last god-king in the Land of Snows. Born to rule [a kingdom, the boy] would instead witness the destruction of one of the world's most ancient cultures... Today... at the western end of the Himalayas... [in India, pilgrims converge on a] remote valley... They... come from local villages, neighbouring valleys and all over the world... It is an arduous journey, but each [pilgrim] is determined to attend one of the most sacred of all Buddhist ceremonies... [- the one known as] the Wheel of Time. This week-long ritual prepares for the end of all things – the complete destruction of time and space. Buddhists believe the world is entering an apocalyptic age. All week... monks will work day and night. They are heart-surgeons, but their knowledge of the human heart is... not... based... on medical science... They work not to save a single patient but to heal the heart of a world in crisis – to deliver

every living being from... the cycle of birth, life, death and rebirth[; from] the world of pain. With meticulous care, using grains of coloured sand, they create an intricate pattern... It's a kind of map guiding believers on the path to enlightenment, beyond the illusion of the material world – the world of things – to help them be reborn in a higher realm of spiritual truth. Presiding over the [week-long ceremony is the person who the pilgrims] believe to be the incarnation of... Buddha himself – the Dalai Lama, the god-king of Tibet... The current Dalai Lama – a title meaning Ocean of Wisdom – is the supreme leader, both religious and political, of 6 million Tibetans. His followers believe that over the past 600 years... his soul... has... return[ed] in a new body... 13 times... The year is 1933. The 13th Dalai Lama has died. A team of Tibet's most respected monks will begin the search for his successor – for a child born with the same soul as each deceased Dalai Lama. They pray for his speedy return to this world. Their search parties spread out across the land – and Tibet is a vast land. It is equal in size to Western Europe, or to Alaska and Texas combined. For a millennia it has remained remote and undisturbed behind the seemingly impenetrable walls of the Himalayan Plateau – the largest land mass on Earth, with mountains... that rise five miles into the sky. Always a place of mystery, Tibet was... the land of abominable snow[-people], strange rituals and magical rites; a world of levitating mystics, and of monks whose souls could leave their bodies and fly to mythical kingdoms... [Four] years after the death of the 13th Dalai Lama... the monks... are still... chant[ing]... for the success of their search for the... next god-king... They have travelled to the far-reaches of this desolate wilderness... Several auspicious signs lead the monks to believe that Tibet's eastern province... was the site of the Dalai Lama's return. It is said that days after his death, the head of the 13th Dalai Lama turned in that direction – indicating where to search. An image of a monastery with a distinctive turquoise roof appears reflected in the waters of a holy lake – the search party knows it is growing close. A series of rainbows appear in a cloudless sky. Rumours reach them of a boy born on July 6th, 1935... Horns were heard in the heavens on the day of his birth and the boy, it is said, often speaks of his home in Lhasa, Tibet's far-off capital – a place [the boy] has never even seen. [Upon seeing the monks, the young boy] immediately... identifies one of the search party by name, speaking in the [monk's own dialect. The boy] then reaches up and pulls at the monk's prayer beads – beads that once belonged to the 13th Dalai Lama. But one final test awaits [the boy]. Arrayed on the table before him are many objects. Among them, a few of the previous Dalai Lama's personal possessions. The boy selects these and none other. For the monks, it is as if the Dalai Lama has simply reclaimed what was his. Their long search is over. [The boy] is renamed... and prepares to become the 14th Dalai Lama. The year is 1940. Lhasa... prepares for the enthronement of its new god-king... Watercolours [of the event] were commissioned by... the only representative of a Western government to witness this most sacred of ceremonies. They offer an intimate record of... the world's only theocratic civilization; a society ruled by the priesthood... The son of a mule-driver from Tibet's most remote eastern province, [the boy] has come a long way from the two-roomed shack [it] shared with his parents and four brothers and sisters[. The boy now resides in a] magnificent temple... the great winter palace[– which is] seven storeys high, with over a thousand treasure-filled rooms... But this is no ordinary tale of rags to riches, nor would there be a fairy-tale ending. Walking through the vast halls and cavernous prayer rooms of the [palace], past... shrines containing the mortal remains of his 13 previous incarnations, the young Dalai Lama bears the weight of an age-old tradition on his slight shoulders. Constantly reminded of his place at the heart of Tibetan civilization, [the boy] is now the torch-bearer of a religion stretching back 2500 years. The origins of Buddhism take us back to the year 600 BC, to the plains of northeast India. Here, an event occurred as momentous for Buddhists as the birth of Jesus Christ is for Christians. 2500 years ago, an Indian prince sat beneath a sacred tree. [The prince] had spent many lifetimes in search of the truth and now vowed not to rise again until [it has] solved the mystery of existence. Immersed in deep meditation, [the prince] was to conquer all the dark forces of delusion. As Venus rose in the morning sky, [the prince] was rewarded for his age-long patience. Touching the ground, [the prince] called upon the earth to witness the sacred moment of his enlightenment... Buddha[claimed to have] unlocked... the meaning of time. All beings, [Buddha] taught, were caught up in... the cycle of birth, death and rebirth[– which] could only be escaped through the spiritual fulfilment [Buddha] called... Nirvana, where the soul is set free from the material world... While all souls climb life's ladder to enlightenment, achieving Nirvana takes countless lifetimes. Enlightenment only comes... [if a soul has been] purified by the good deeds of countless past lives... [and] when the true nature of reality is grasped – existence is impermanence... [However, Buddha] returns to the world... to help others toward enlightenment... The Buddhist philosophy is contained in 108 volumes that many followers learn by heart. It would take 1500 years for Buddhism to migrate from the hot, dusty plains of India into the Himalayan mountains, where it would finally take root... The Tibetan Plateau is one of the most... inhospitable places on Earth – an unlikely setting for a faith based on love and compassion to survive, and yet it flourished. Why? Perhaps the harshness of the setting provides a clue... [A]t 18,000 ft on the vast, desolate Himalayan Plateau, people are naturally humbled by the forces of nature. As nomads, they lead lives of change and impermanence, and need only to look around to sense their place in life's larger scheme. "...60% of Tibetans are nomads. One of the most important factors... that contribute to Tibetan resilience... is... the idea of impermanence. [This is] taught to you all the time. It's hammered into you... in our folk culture, in our sayings, even in... daily expressions... – suffering is impermanence; happiness is impermanence. [If a] Tibetan... from the plains... goes to New York... [it] is not impressed... with Western technology, even with the Empire State Building... [because it] knows... that's also impermanent..." ...In the 7th century, when the Buddhist method of love and compassion first reached Tibet, the people... were as savage and hostile as the landscape itself. From early records of the Chinese Tan dynasty, come the first outside views of Tibet – a portrait very much at odds with the peaceful society that would evolve here. 'There are hundreds and thousands of [guys] ready to bear arms... Their bow and sword never leave them. They prize physical strength and despise old age. Military discipline is strict. In battle, it is not until the troops in front have been completely wiped out that troops behind come up into line. They prize death in battle and hate to end their lives by sickness. As punishment, even for a small fault, they take out the eyes, or cut off the feet or the nose. They give floggings with leather whips just as they see fit.' Tibet was a feared conqueror in Asia. They toppled the Tan dynasty – took its capital several times; they conquered into the different Indian dynasties; they conquered the silk route cities; they smashed [a ruler] of Baghdad in a couple of battles. They were a very tough group, like a Genghis Khan in the 1st millennium. With China and Burma to the east, India to the south, Russia to the north and the Arabic Empire to the west, Tibet's expansion was by all accounts formidable. "...[then] they achieved something... which I think will lead them to be evaluated as one of the greatest civilizations... They basically demilitarised. Tibet was unique on the planet. No other country changed in the same way... All the others really went in the opposite direction." Tibetan criteria for civilization is a nation that does not use violence – that solves disputes and dilemmas reasonably, with conversation with neighbours. From the crumbling ruins of its aggressive past, monasteries sprang up across the land. Where there were once armies of soldiers there were now legions of monks... From the most unlikely beginnings, a peaceful, self-sufficient society emerged, dedicated exclusively to the pursuit of non-violence and spiritual wisdom. "...The experiment of Tibet... was... [about] creating a society that's based on the ideals of... an enlightened one[; about creating a society]... whose institutions are formulated from the ideals of that enlightened individual... institutions... that... are there to foster more of those people... We tend to do that the other way round in th[e US. We] make institutions and conceptual frameworks and try to fit people into them – rather than starting with the wonderful ideal and then have institutions and structures to create more of them..." ...An important visitor has arrived at [a] nomad... campsite – a reincarnate high lama... It is a time of excitement and great honour. All day, nomads visit the lama's tent presenting... white scarves of respect. Young and old alike have come, seeking his blessing. That the [lama] is only a small child is not important. For these nomads, th[e] boy is heir to many lifetimes of spiritual power and wisdom. In the 1930s and 40s there were reckoned to be... [about] 6000 such lamas in Tibet... At the turn of the century there were over 6000 monasteries in Tibet. A quarter of the population entered the religious orders for a life of celibacy and spiritual devotion. It was a source of great pride to have at least one son enter the priesthood, often before his 5th birthday. This was the world into which the 14th Dalai Lama was born... As the young Dalai Lama prepared to assume the mantle of Tibet's supreme spiritual leader his training was rigorous – including logic, Tibetan art,

medicine, poetry and philosophy. [The young Dalai Lama] would memorise thousands of lines of Buddhist scripture and practise meditation for hours each day. 75% of Tibet's budget was spent on education for the priesthood and the maintenance of its religious institutions... "Instead of guarding our borders we devoted ourselves to teaching and learning. Instead of launching invasions, we built monasteries..." In many ways [the young Dalai Lama]'s early life was similar to that of thousands of novices preparing for the priesthood, except in one essential detail – [the boy] was the... new god-king of Tibet. Unable to wander the streets of Lhasa like other boys his age, the young Dalai Lama would climb onto the roof of the [palace] with a telescope to look out onto the kingdom [it] was born to rule... The Buddhist belief in the end of all things is balanced by an equally strong belief in rebirth and renewal... Every Buddhist spends a lifetime preparing for death. This is their way of accepting the impermanence of all things. In much the same way, Tibet over the years has always foreseen the inevitable destruction of its own civilization. Genocide would descend on Shangri La – a holocaust, breaking the peace and silence of a world that hardly knew the sound of a machine, let alone a machine-gun. A country that had flourished undisturbed in a timeless corner of history was shaken into the present, and awakened into its own worst nightmare. The year is 1949. China, the most populous nation on Earth – its massive army battle-hardened and equipped with the latest weapons of war – invades its defenceless neighbour. Citing long-standing territorial claims, the Chinese quickly conquer what they call the Treasure-house of the West. Over the years, Tibetan monks had successfully warded off Chinese aggressions, trading spiritual power and blessings for peace and protection. But in the revolutionary fervour of China's new communist order, religion is considered a poison; and Tibet a backward, superstitious society in need of re-education. In 1933, 16 years before the Chinese invaded, the 13th Dalai Lama had foreseen the destruction... 'If we do not dare to protect our territory, our spiritual leaders may be exterminated without trace. The property and authority of our incarnate lamas and monks may be swept away. Our political system will vanish without anything remaining. The property of our people – high and low – will be seized, and the people forced to be slaves. All living things will have to endure endless days of suffering and will be stricken with fear. Such a time will come.' After ten years of Chinese occupation, the [14th] Dalai Lama decided [it] had no choice but to leave Tibet. In 1959, under cover of night, the Dalai Lama, his bodyguard and courtiers fled from the holy city to India, never to return. [The Dalai Lama] was only 23 years old, yet... had already witnessed changes far greater than any Tibet had experienced in its long... history. 100,000 Tibetans would follow, seeking asylum in India, but leaving one million more who would die in the atrocities and famines to come... Here in this rugged, yet breathtaking landscape, the Buddhist notion of... the loss of ego... beginninglessness, endlessness, and... impermanence are no longer abstract concepts. They are day to day realities... In the past, the [Wheel of Time festival] was celebrated only once every 20 years or so. Today the Wheel of Time turns faster – the ceremony is performed annually. It is Tibet's way of addressing a crisis that has brought its civilization to the brink... [At this year's Wheel of Time ceremony,] the Dalai Lama delivers the... [lesson] of impermanence... to a crown of 40,000 followers... – a lesson that has given the Tibetan people the strength and resolve to cope with tragedy and change. It has given them the ability to remain hopeful, even when they appear to have lost everything.

...*LOST CIVILIZATIONS*... [A]n Egyptian priest... claimed his sacred books contained an amazing story about a large island that had vanished in a single night... On the island, a highly advanced civilization had developed. 'There was an island called Atlantis, in which arose a great and marvellous power. The people retained a certain fineness of mind, and treated one another with wisdom and forbearance.' They were said to have built a magnificent city, and lived prosperous, productive lives. But according to legend they became corrupt. It was then that tragedy struck... Did that wonderful world really exist? Can such a civilization disappear so completely? The legend of Atlantis has teased the imagination ever since. As the mystique grew, it was claimed these ancient people possessed computers, space ships, even nuclear weapons. Atlantis has been found everywhere from the rainforests of Guatemala to the mountains of Tibet and, of course, on the floor of the Atlantic Ocean. More serious study has pointed to a Greek island known in the ancient world as Thera. A small dot in the Aegean... it's now just a rim of volcanic rock jutting out of the sea. But is Thera the lost city of Atlantis? For an answer we must journey back to the time of gods and heroes. What did their stories reveal about Atlantis? One [writer] – Homer – is the source of many of our myths. But did [Homer] describe real people, real places and real events? To find the answer we must re-examine the greatest legends of the Aegean world – the tale of a mighty Greek king murdered by his wife and her lover the day [the king] returned home from the Trojan War; the fierce... half-[hu]man, half-bull... Minotaur... who stalked his prey in the dark labyrinth on the island of Crete; and Helen of Troy, the face that launched a thousand ships... Our investigation... begins with Homer's dramatic tale of the Trojan War. [Homer] tells of Greek armies descending on Troy... in Turkey... to win back the beautiful Helen from her Trojan lover Paris[– who was 'appointed by the gods to adjudge the prize of beauty among the three goddesses Hera, Athene and Aphrodite. Paris awarded it to Aphrodite, who promised him the fairest gal in the world – Helen, the wife of Menelaus king of Sparta. Paris abducted Helen, thus bringing about the war which ended his life.' Mortals] battled to the death while gods squabbled over favourites on either side. For ten years, the Greeks were unable to penetrate the gates of Troy. Ultimately, the battle would be decided not by arms but by a trick. Pretending to accept defeat and depart, the Greeks left behind an enormous, hollow, wooden horse. The Trojans dragged the gift into the city, but it was filled with soldiers. For centuries, ancient Turkish legends spoke of a ruin on Turkish soil named Troy. But in the 19th century nothing along the shore suggested it was the site from Homer's epic war. Still, one [German] believed those legends... [The German ha]d been obsessed by Homer's Troy since childhood, and was convinced the stories were true. Clutching his well-worn copy of the *Iliad*, [the German] set out to find the site of the great Trojan War. "Heinrich Schliemann decided... [to] begin excavations... in the late 1860s, and... got permission from the Turkish authorities... [Heinrich] didn't really have a clue about archaeology, what excavation is like, but... was following the sources that [it] had read in Homer's *Iliad* and *Odyssey*... describ[ing] the topography of the plain and the rivers around there." Homer wrote of two rivers flowing near Troy – one with steam rising from it, the other cold as hail... On April the 9th, 1870, [Heinrich] selected a site and set his team to work... In one sense... [Heinrich – who had] made his fortune in America, in the California goldrush... [–] was an amateur prone to exaggeration; in another, [the]... German... was a visionary with an insight few professional archaeologists could match. Anticipation built when the team turned up a coin marked [with] the Roman word for Troy. Digging deeper, Schliemann found signs not of one city but of several – one on top of the other[(the 'stronghold called Hissarlik by the Turks was sacked c.1210 BC; again destroyed c.1100 BC, the site was resettled by the Greeks c.700 BC and finally abandoned in the Roman period'). Heinrich] kept digging, believing that when they reached Homer's Troy [they] would find a great treasure. "[Heinrich] plunged right down into the earliest levels, [and] made lots of mistakes, but... learned... along[the way], and... realised... that [his team] was truly on the trail of the epics of Homer in the excavations..." When... lost, Schliemann always returned to Homer. 'When the Trojans were feasting, Ulysses and his Greeks crept out of the wooden horse. They opened up the city gates and let the Grecian army in. That night the city of Troy was sacked and burned.' So Schliemann searched for traces of fire. In his diary [Heinrich] wrote: 'I found a street covered six to ten feet in yellow, red or black wood ashes, mixed with thoroughly burnt fragments of bricks and stones.' Schliemann decided that the street [they]'d uncovered must be the royal road to the palace of the King of Troy. [His team] was now uncovering ramparts as massive as the mighty walls of Troy Homer had described in detail. But beyond coins and towers, Schliemann wanted to find evidence of the [gal] at the heart of the legend... Along the way [Heinrich] would find and marry his own Helen, a young Greek girl who also loved Homer and dedicated herself to her new husband's expedition. They would be satisfied with nothing less than royal treasure. After years of digging, Schliemann was close to losing heart. Then one day his eye caught the glint of metal in a wall. [Heinrich] dismissed the workers and scrambled through the rocks with his bare hands... From the wall [Heinrich] pulled vases of silver, weapons of copper, 60 gold earrings, nearly 9000 gold rings, and exquisite tiaras and necklaces. It was one of the world's richest archaeological finds... [and Heinrich boldly announced that the German] had found the treasure of [the King of Troy]... Not all Schliemann's claims would be confirmed, but [the German] did uncover the remains of a city destroyed by war and fire 4000 years ago, and it did contain treasure beyond price. Legend became reality... On a hilltop at Mycenae lie the ruins of an ancient fortress.

Schliemann concluded it must be King Agamemnon's great palace, with a magnificent gateway guarded by enormous sculptured lions... Among the ruins Schliemann found skeletons buried in strange circular patterns, but his dream was to uncover the grave of King Agamemnon himself and the treasure [the German] was sure would lie with it... [Heinrich] found 19 clearly royal skeletons surrounded by gold treasure... It was a treasure even more spectacular than... found at Troy. But then [Heinrich] found the most exciting discovery of all, a gold mask moulded to the likeness of the face beneath it. In Schliemann's mind the mask could only have belonged to one [king]... After 3000 years such precise identification is impossible, but from their skulls what these people actually looked like can now be determined... [I]n a laboratory in Manchester, England, Schliemann's Agamemnon skull couldn't be restored from the few pieces that were found, but many skulls from other Mycenaean grave circles were much better preserved... [The lab technician's] reconstructions are so accurate the police seek his help with skulls of unknown murder victims. Relatives often make identifications from his models. But what did [it] think of the Mycenaean [guys]? "A bunch of thugs!" "[The technician's] quite right when [it] says they're thugs. They're big... by and large – we've got people of 5 ft 8, 5 ft 9, they're well nourished, a lot of them have good teeth... [but we've also] got people with arthritis, probably from carrying too many... heavy shields." ...Homer called the Mycenaeans the strongest generation of earth-born mortals. In the grave circles Schliemann found weapons that precisely matched descriptions in the ancient epics... "What Schliemann actually discovered in these graves was a lost civilization. [Heinrich] discovered the earliest evidence that we have of the origins of the Mycenaeans themselves." Only later was it determined that the skull Schliemann found was too early to be Agamemnon. Yet in fact [Heinrich] had revealed something far more important. "Until Heinrich... began his work our knowledge of the past was really based on the written records of ancient historians and other ancient authors." But now concrete evidence showed these ancient tales were rooted in certainties and facts, and if Helen's Troy and Agamemnon's Mycenae were real places, could other supposed legends be true as well? The most terrifying of all Aegean legends is the myth of the Minotaur... that lived... beneath the palace of King Minos... The Minotaur myth is said to have its origins in King Minos' wife's lustful passion for a bull... In the legend, King Minos of Crete demanded tribute from his subjects – boys and girls who were sent into the monster's underground labyrinth never to return alive. The reign of terror was ended by a young Athenian... Unravelling a ball of twine to guide him out again, Theseus entered the dark passages... His mission was more than survival. According to myth, by killing the Minotaur Theseus would not only save himself but free his people from King Minos' rule... One echo of that legend can still be heard in the villages of Greece today... Each year... [in one] farming town... the people dress up in their finest for a strange ritual that combines cruelty and celebration. The town has donated the most expensive bull for the honour of being sacrificed... As villagers take the bull to a place of ritual in the mountains, a legacy of deeply rooted primal instincts is at work. Local farmers out-spend each other competing for the honour of cutting the bull's throat. Just before it's stunned, the bull seems to sense what's coming... Greeks have ritually paid tribute to this fable for thousands of years, but not until this century was the myth's origin revealed, and then only by chance... [I]n 1883... Arthur Evans, a rich and highly-educated young historian from England was visiting antique shops. Intrigued by Schliemann's discoveries, [Evans] wondered if some odd seal stones Schliemann had found didn't point to an earlier pre-Greek civilization. Seal stones were like signet rings, used to stamp images in wax and clay. Evans asked where more of the stones could be found, and the answer everywhere was go to Crete... It would prove the setting for Evans' greatest discovery. As [it] travelled the island in search of seal stones [the historian] found a society that had changed little since the time of Christ. Local [gals] called the seal stones milk-stones and refused to sell them to Evans fearing the milk would dry in mothers' breasts. To find them, [Evans was told to]... go to a place called Knossos, where some said there was a palace beneath the ground. Evans started excavating... and soon discovered something far more exciting than seal stones. [Evans] uncovered a vast palace, with hundreds of passages and a carved throne – surely the throne of the legendary King Minos himself. The palace was first built around 1900 BC... [Evans] christened... the people [who built it]... Minoans... Remarkably, Evans found frescos depicting what the Minoans looked like and how they lived. Every night... [Evans] carefully described what [had been] discovered that day. 'Groups of [gals] are seated and chattering gaily, dressed in the height of fashion, with elaborate... hair[-styles]... and ignoring what was going on in front of them... These scenes of feminine confidences, of tittle-tattle and society scandals take us far away from the product of classical art in any age – nearer to quite modern times.' ...might the monster have been hidden in the dark recesses of this palace...? One thing is certain – Knossos, with its 1400 rooms, was once a capital of a great power. The magnificent palaces discovered on Crete shared one remarkable trait – none was fortified. These were not a militaristic people. Rather, they seemed to have been cultured and advanced, not unlike the people in Plato's story of Atlantis. "The legacy of the Minoans was a love of art, a love of colour, perhaps a love of life... [Clearly], on the island of Crete, there... once... existed a civilization that was peaceful and had great achievements." Was this the utopian world of lost Atlantis? There are some convincing clues. The bull is a recurring theme in Minoan art. Its many depictions on so many Minoan treasures echo Plato's descriptions of Atlantis. "We find the golden cups that Plato described, with the bull ceremony engraved on the sides that Plato described in association with those cups; and the bulls being tied down by nooses and with rope, which is something that is just totally unique – very distinctly Minoan... Early in this century when the Minoan civilization was first being unearthed, some of the first archaeologists to arrive on the scene – looking at the paintings of the bull ceremonies and so on – said: 'That's Plato, that's his Atlantis story'." But unlike Atlantis, Crete did not disappear into the sea in a single night. [However, not far] from Knossos – just across the Aegean – lies the... popular resort... island of Santorini... This is... [an island that was] destroyed in one devastating eruption 3000 years ago[when it was called Thera]. When that explosion occurred, the Minoan Empire was at its height. Could that civilization have extended to Thera? ...Some fascinating new evidence has revealed this was no ordinary eruption. The disaster on Thera was the greatest natural explosion the world has ever seen. "Try to imagine a nest of about 150 hydrogen bombs all going off in the same place in about the space of a hiccup. Immediately after the explosion you would have had a crater about eight miles wide and perhaps one mile or so deep, and the entire Mediterranean trying to fill that hole very quickly. For a period you would have had waterfalls that would have put Niagara... forever to shame... It was a tremendous explosion..." The eruption caused a tidal wave that reached 30 miles inland along the shores of the Aegean. "The wave would have reached heights of about 800 feet." The blast itself must have been felt continents away. Forensic science and ancient records make it possible to pinpoint 1628 BC as the year it struck, sending a dense cloud of ash across the Middle East and around the world. '...the Sun is covered and does not shine on the face[s of people]. If only it would shine, for even one hour. No one knows when it is mid-day...' Those words of an Egyptian scribe recall Biblical descriptions of darkness covering the Earth. There is evidence of the precise year the ash cloud reached China... There are even indications the cloud reached North America... In California the core of a 5000-year-old... pine shows a ring of dark cells dating back to the same year... The Thera explosion was so enormous it became folklore to the Egyptians and was passed down to Plato as the story of Atlantis. But even more fascinating evidence would be revealed on Thera. The ash-covered ruins of an ancient city would draw another brilliant historical detective into the story. In 1967 [this detective] began a search for Minoan remains, with no idea what [it] would find beneath the volcanic ash. [The detective] first uncovered signs of walls, then a whole street, then dozens of giant storage jars – many filled with produce as if waiting for their owners return. There were no bodies, no gold, no jewels. But what [the detective's]... team did discover was far more astonishing. With great care, they began uncovering exquisite frescos. In the 20th century, paintings wonderfully preserved for 3000 years in a tomb of ash were revealing a picture of life in this long forgotten town. Many rooms had a fresco on every wall... [depicting] an elegant, rocky landscape with graceful swallows – swallows that have never returned to Thera. "We find frescos... of what the people loved, apparently, and it's very different from what you find elsewhere in the world. [If y]ou go to Egypt... [or] to Syria, you find the theme was almost always war and conquest... [but] go to the island of Thera and you find paintings of [gals] gathering saffron... of children playing... with each other. My favourite piece is the dancing antelopes – in part because it seems to anticipate Picasso by more than 3000 years." ...As on Crete, [the gals] wore... elegant dresses and hair-styles – this was no

primitive society... All the evidence points to Thera being a prosperous island. Her harbours teemed with vessels. In Plato's legend of Atlantis: 'The area is densely crowded with habitation. The docks were full of boats... and naval stores, and of... merchants coming from all parts who kept up a multitudinous sound of human voices and din and chatter of all sorts, day and night.' [According to] Plato, Atlantis traded with Egypt, as did the people of Thera. And there were other similarities... 'They constructed buildings around them and made cisterns, they had fountains – one of hot water and one of cold – in gracious plenty flowing.' On the island of Thera we find multi-storeyed homes that were just honeycombed with plumbing – there are hints that there might have even been running water through these homes; we find flush toilets – thousands of years before flush toilets were supposedly invented; we find evidence of showers, bathtubs – many things that we consider very, very advanced, and that in Plato's time was very advanced even by his standards." Plato also believed Atlantis was in the Atlantic Ocean, but Greeks tended to place great mythical events outside their known world – at the time, simply the Mediterranean Sea... "Plato told us that the Atlantean civilization was a very, very large area – that it was the size of Libya and parts of Asia combined... [– in which case] Thera is not quite large enough. But when you look back at Thera as just a suburb of the Minoan civilization, which was centred on the island of Crete – whose ships seem to have gotten as far as England... – we see here that this was a great economic power... which pretty much ran the entire Mediterranean world." It's as if the legend of Atlantis is the history of Minoan civilization. When the Thera volcano erupted, it would have destroyed the Minoan navy in Crete, precipitating a slow and unrelenting decline... "This was a world that was thrown into terrible famine, and terrible disorganisation. [It wasn't like today where] you have the International Red Cross ready to rush in, [or] you have the UN sending people in..." [There was, however, the Mycenaeans]... "The explosion in Thera produced a lot of catastrophic earthquakes that destroyed the palaces of Crete... The only palace that survived was the Palace of Knossos, and for another 50 or so years Knossos continued to be a prosperous palace, but now the Mycenaeans were the masters of this palace." The Mycenaeans were long jealous of this powerful empire, with its fine art and magnificent [buildings]... With superior military strength... the Mycenaeans... swept to an easy victory... [over this] devastated... civilization... The trail of disasters didn't stop there. As more earthquakes rocked their broken empire, the frightened people resorted to the ultimate sacrifice... a young [guy]'s blood was offered to the gods – in vain[because] the earthquakes still struck... "When you look at all the pieces of the jigsaw puzzle, and you look at them objectively, the decline of the Minoan civilization[and] its takeover by the northern Greeks... all... fits in perfectly with the story that Plato told." The[Minoans] belonged to the very first European civilization. [Yet, u]ntil this century, no one even knew they existed. But recent revelations have led us back over 3000 years to discover a peaceful, artistic, but ultimately doomed people.

...THE DISCOVERY of ancient artefacts on the Indonesian island of Flores, north of Western Australia, has caused revision of scientific thinking about when humanity developed seafaring technology. Stone tools beside the bones of a long-extinct primitive elephant indicate that humans may have been able to navigate over short stretches of open ocean from 200,000 to 400,000 years ago, two Dutch archaeologists claim. Their find has focused attention on the Australasian region as the probable birthplace of maritime technology. However, its strongest implication is for the way humans view... their ancestors, says [a]Dr... of the Australian National University's Department of Prehistory. Until now, with only the evidence of crude stone tools and skeletal remains, *Homo erectus*... had been regarded as too primitive to be considered human. - 1995

A study of the age of Indonesian fossils threatens to topple theories about the origins of modern people and the settlement of Aboriginal A[US], and has triggered a major dust-up in the scientific community. The bones of contention were found in the 1930s at two sites in central Java. They come from a species of prehistoric humans known as *Homo erectus*, generally believed to have died out nearly 400,000 years ago. Using sophisticated dating techniques, a team... at the Berkeley Geochronology Centre in California, deduced that [the Java]remains... are a "surprisingly young" 27,000 to 53,000 years old. If true, this means the hominoid existed at the same time as the direct ancestors of modern people. It also indicates that *H erectus* survived on Java at least 250,000 years longer than on the Asian mainland, and perhaps a million years longer than in Africa. "If they're right, it would mean *Homo erectus* in this part of the world is an evolutionary dead end," says... an archaeologist with the University of New England... So the new age would virtually scuttle the multi-regional hypothesis which argues that A[US], like the rest of the world, was first colonised by groups of *H erectus* who emerged from Africa nearly two million years ago and evolved into fully modern people everywhere they went.

...A[US]n archaeologists have found Aboriginal stone tools and rock art they claim... could support suggestions that modern humans originated in Asia, not Africa... [The] team leader... said the stone chips found at a dig in A[US]'s remote north-west showed humans lived there between 119,000 and 176,000 years ago... "The initial samples were taken four to five years ago now, and we were so shocked with the results that we have been... go[ing] over them... trying to disprove these things, and we can't do that,"... The artefacts dramatically push back the earliest human occupation of A[US] and roughly coincide with the emergence of *Homo sapiens* in Africa... [The AUS]n Museum prehistorian... said... the antiquity of the stone artefacts implied that either modern humans originated outside Africa or *Homo sapiens* spread across the world more rapidly than currently presumed.

...['Outback AUS is as old as anywhere above water on Earth gets, and may contain come of the oldest art work in the world. There is contention over whether the so-called Bradshaw paintings were created by the ancestors of today's traditional owners, or were painted by another race of people altogether – who died out or moved back to Indonesia, or wherever they came from'. Incidentally, 'shortly after 11pm, in 1993, during the deep black of an outback night, a brilliant fireball grew slowly over the Western AUSn goldfields and flew parallel to the ground, before diving to earth beyond the distant trees. The handful of people watching were blinded by what was described as "a massive nuclear-sized flash" of white light and thrown to the ground by an explosion and earthquake. A huge red-coloured flare soared into the atmosphere, followed by the appearance on the horizon of a large, red hemisphere – similar to "half a setting sun" – three times the size of the moon and lined at its edges with silver. This phenomenon glowed for two hours across the arid landscape before vanishing abruptly "as if someone had thrown a light switch." While it was still in the sky, an hour after the first fireball, two smaller fireballs appeared from low in the south, and crashed to earth with smaller explosions and ground tremors. Eye-witness accounts were matched by 23 seismic stations operated by the AUSn Geological Survey Society, which reported a tremor from the first explosion of 3.9 on the Richter scale. The event was officially described as a meteor strike. But was it? No meteor fragments were found. This week the *New York Times*, quoting a series of inquiries into the event, reported speculation that the phenomenon could have been a nuclear blast. A US Senate inquiry has also taken seriously the theory that it was a test of a secret Russian super-weapon able to induce earthquakes a hemisphere away. Many scientists and defence analysts ridicule the idea – but an eclectic group of Japanese investigative reporters and AUSn and US researchers believe the Russians have had such a weapon since 1963. They believe that it was tested in WA in 1993 in connection with the Aum Shinri Kyo sect, which is also believed to have used an outback station to test the lethal sarin gas used to kill 12 people in a Tokyo subway in 1995. In early 1993, one of the leader's deputies visited Russia before coming to AUS to buy a 200,000 ha sheep station in the outback. Toxicology tests on 24 sheep carcasses and nearby soil showed traces of methylphosphoric acid, which occurs when sarin gas breaks down. But a Perth geologist believes there was an even darker purpose behind the sect's AUSn operations. Enter the death ray. "It appears that the fireball itself is an enormous slug of electrical energy as it travels through the air. They will have transmitted on two or more frequencies from two or more sites: one part to handle the plasma on to the target, the other to decide whether you want it in the air or on the ground, and where you want the energy to release. By interfering with that transmission you can dump massive amounts of energy in seconds. Tesla talked about dumping in one microsecond the combined power of all the naval dreadnoughts in existence in 1908. We're talking about something far worse than nuclear weapons. Apparently there are variations of it, where you don't get flash or damage from explosion or earthquake – you just kill all life instantaneously in the target area." Move over Darth Vader.'

...‘over the past few decades, more than 100 rhesus monkeys have been trained at a monkey butler college to assist US tetraplegics perform basic tasks about their home (the tetraplegic and its monkey help each other to do things that neither can do alone’). The college didn’t, however, train the monkeys that will soon] be strapped into a small capsule and launched into space. Flight time: 14 days... Nasa officials say the... mission, and a second in 1998, will shed light on the debilitating side effects of space travel, and that performing tests on secured, wired monkeys is the only way to obtain valuable data that can benefit astronauts... An independent task force, after conducting Nasa’s fifth review of the matter, concluded last month that the project was worthwhile and met animal welfare standards. But an animal rights group says it is torture with little scientific value. A taxpayer rights group also considers it cruel: to American taxpayers who will be paying about \$US35 million... for the two monkey missions... “Our contention is that this money should be either used for deficit reduction or higher-priority science,” said... [the] executive director of Taxpayers for Common Sense, a nonpartisan budget watchdog group. “This is just not priority science. This is a relic of an earlier era when we used monkeys in space back before people were up there.” Now that humans have been flying in space for 35 years on missions lasting as long as 438 days, there is no need to launch monkeys, opponents argue. Indeed, Nasa has not flown a monkey in space since 1985 (rats are cheaper and easier) and has no plans to do so in the future... As usual, two greyish-brown Russian-owned rhesus monkeys will fly, chosen from a pool of 12. Their tails already have been cut off for hygiene purposes, electrodes inserted in their arms, leg and neck muscles for strength measurements, temperature probes stuck in their abdominal muscles, and head rings screwed on... [T]he halo-like rings keep the monkey’s heads still during eye movement tests conducted before and after the flight... The two monkeys will be secured in adjacent chairs inside the orbiting capsule for safety. Their arms and legs will be free for eye-hand and eye-feet coordination tests. They will be fed automatically from tubes. Urine and solid waste will be removed by collection systems built into their chairs. They will have computer games to fight boredom... After the experiment the[y]’re to be returned to a zoo.

...A four-year-old monkey... and a companion... [have been] launched into orbit in a joint U[S]-Russian mission... The two-week mission... has aroused controversy because of the way the two monkeys are being used. The... U[S] space] agency, Nasa, says that performing tests on... monkeys is the only way to obtain valuable data for life on space stations... [In related news, t]he dream of... living on the moon has received a dramatic boost after the discovery of water in a lunar crater. A[remote-controlled] spacecraft located a lake-sized mass of ice near the moon’s south pole, undermining the belief that it is arid. The apparent lack of water has always been seen as a barrier to colonising the moon because of the prohibitive cost of transporting it from Earth... “With water you could have enclosed areas to grow plants, grow your... food, make your own fuel, make your own air. You don’t have to launch all that stuff from big rockets on Earth.” The lake was discovered by the... \$45 million... spacecraft Clementine, which was sent into space... by the Pentagon... in January 1995... to monitor missile systems... [A spokesperson] for the Pentagon’s Ballistic Missile Defence Organisation, said... the moon water could allow humans to explore the moon... or use it as a launch pad to explore other planets. “Obviously you’re talking way, way in the future.” Some scientists clearly will need more convincing. “There’s a community that’s very anxious to talk about going back to the moon and living in a colony, they are very passionate about that...,” said... a scientist at the Harvard-Smithsonian Centre for Astrophysics... “Personally, I’ve always been sceptical of that whole proposition. I think it’s a lot of wishful thinking.”

...Nearly three decades ago, Apollo astronauts conquered the moon, and astronomers all but abandoned the place... But last month, astronomers painted a new and exotic picture of one little corner of the moon, presenting evidence of frozen water at the bottom of the deepest crater on the moon... The notion of lakefront property on the moon is just the latest in a series of fantastic claims in the past year from astronomers, who have offered evidence of past life on Mars and photographs of the edge of the universe. It’s as if science and science fiction are locked on a collision course. Like the discovery of any natural resource, the prospect of water on the moon has already sparked excitement over ways to exploit it... But other scientists warned that the ice might be nothing more than a shimmering mirage. Sceptics cautioned that... more work needed to be done to confirm the theory.

...The tiny coral Pacific island of Niue injected an extraterrestrial note to a U[N] food summit yesterday, saying feeding the Earth’s hungry was a better way to spend money than unlocking the secrets of Mars. “I would like to reassure those countries who are spending billions of dollars in trying to find out whether there is life on the red planet Mars that there is life on Earth,” said... [the PM] of Niue. “Earthlings need nourishment much more than any Martians,” [the PM adde]d. Seizing the opportunity to draw media attention to the island of 2500 people, on a day dominated by the arrival of the Cuban leader[the Niuean PM]... broke with the general gloom of the summit to tell how Niue enjoyed “plentiful food all year round.” ...But... the remote island had not forgotten the plight of the hungry despite having access to “some of Nature’s abundant bounties.”

...It’s life Jim, but not as we know it. That classic line from the cult television series *Star Trek* may ring true in time when humans are forced to flee Earth in search of a new home... [A] visiting world leader in astronomy, does not regard himself as alarmist when [it] says the sun will expand and destroy our cosy environment. There is no need yet to build that intergalactic Noah’s Ark and head for greener pastures, though. His prediction is two to three billion years away from coming true. [The visitor] does, however, see himself as a staunch fighter for more Government spending on basic scientific research to expand knowledge of what hovers beyond our familiar skies. That work will eventually help to prepare for the big journey when the Earth becomes a planetary hot pot. “I’m a champion of fundamental research. Not the sort of stuff to help build better mouse traps or non-stick pans, which are in themselves worthy, but purely fundamental work with no obvious practical benefit in the short term.” Such study is essential for civilised nations and is vital for long-term survival... adds[t]he 68-year-old British astronomer and physicist [who] was knighted last year for his extensive work and has held academic posts across the globe... [– his] academic letters would struggle to fit onto a standard business card... The professor... starts a N[Z] lecture tour in Auckland tonight. It will take in Hamilton, Wellington, Christchurch and Dunedin over the next two weeks. Organised in part by the Auckland Astronomical Society and the Auckland Observatory, his lectures are not pitched solely to scientific boffins... “It’s important for scientists to go out and tell the public about their work. If you talk like a boffin, no one will understand you.” ...like Captain Kirk[the visitor]... promises to take people on a tour of galaxies far, far away during his upcoming lectures. “We will look at evidence of the ‘Big Bang’ and wonder whether the universe will continue expanding or come back in again. That’ll be the big crunch,”... The latter does not make for a rosy prediction, but we need not fear... There is [still] controversy among scientists over the theory that the universe began with “a big bang[” – and, anyway, his]... earlier prediction of the expanding sun destroying life on Earth will kick in much sooner on his mind-blowing timescale... Despite his lengthy and world-renowned scientific work, [the visitor] also believes that God played a hand... [in creating] the sun and planets... and... life... as we know it... “My view is that God must be responsible for some of this; it’s all too clever for humans to work out.” Asked how [the visitor] reconciles his evidence-based scientific views with abstract religious beliefs, [the professor] admits it is not easy. “The two thoughts are not inconsistent though. One deals with the material facts and the other deals with values and spiritual elements which do meet... [I]t’s important people [know] that we don’t understand everything and we can’t visualise everything. It’s not a closed book.”

...A senior volcanologist involved in... the hazard-monitoring programme at... Mt Ruapehu is understood to be among the high-profile scientific redundancies revealed yesterday. About 20 scientists... [– mostly] aged in their 50s... [–] are to be made redundant from the Institute of Geological and Nuclear Sciences[(IGNS)], apparently because they are not money-spinners... The... volcanologist... would not comment when contacted yesterday. Other... top scientists who... [are on the] list of redundancies... [but] remain unnamed while negotiations continue... are believed to be prominent in the field of palaeontology, study of life in the geological past, a field not known for generating money and one that has not figured highly in recent funding rounds... The president of the Geological Society... said research requirements tended to be profit and “issue” driven, meaning research was too often subject to changes of fashion or thinking... [The president] deplored the redundancy of “predominantly established scientists with geological expertise[” because NZ]... could ill-afford to lose earth science experts as such skills could not easily be brought in from

overseas... “The skills lost may be irreplaceable since it takes many years for a researcher to acquire the necessary expertise and experience to make a meaningful contribution,”... Earth science research was of vital importance to N[Z] as the country sat astride a boundary between two tectonic plates and was subject to... earthquakes, volcanoes and landslides. It also had one of the largest off-shore economic zones in the world which was “far from exploited geographically.” ...[Furthermore, i]t was surprising that a crown research institute would dispense with experienced scientific staff at a time when Government funding was increasing for pure and applied research in the geosciences... [The president] said the society [also] shared the concern expressed by the Association of Scientists that extensive job losses in science must be sending negative signals to school and university students. “N[Z] already has one of the lowest ratios of scientists and engineers per head of population in the OECD and one of the highest proportions of lawyers and accountants... This situation can only get worse.”

...Spending on research and development in N[Z] is catching up with other developed countries, according to the Ministry of Research, Science and Technology... A survey in the 1993-1994 year showed research and development spending was... 1.02[% of GDP – up 9%]... on the previous year. Spending in five years had risen to the same level as in the reference countries – A[US], Denmark, Finland, Ireland, Sweden and Norway – and exceeded the rate of growth in the O[ECD] nations as a whole... In 1993-1994 the Government paid \$452 million for work carried out by its departments, crown research institutes, universities and the private sector. It was estimated businesses spent \$293 million, including \$14 million overseas, which was up 23[%] on the previous year... Spending in the electronics industry rose 15[%], compared with 55[%] the previous year, and information and communications research funding was up 61[%]. Those industries had increased spending an average 29[%] a year from 1991 to 1994. N[Z] businesses spent on average... 0.4[%] of sales revenue on research and development, compared with 2[%] in the reference countries.

...*Science friction*... The redundancy of... high-profile scientists from one of the crown research institutes has rekindled debate over the effects of changes to science funding. Scientists say their vocation is being “forced into a pseudo-business model” that demands short-term economic gain at the expense of long-term research that could benefit the country in the future. The Government and management of the CRIs argue the changes are about making scientific research more relevant to people’s day-to-day lives and say that the shift in emphasis from traditional to developing areas of research will net a “better return.” The I[GNS] this week announced that 20 of its 140 scientists would be made redundant, despite the CRI having received an increase in funding this financial year, from \$12.7 million to \$13.1 million. This increase is part of an overall boost in Government expenditure on science, research and technology by \$100 million over three financial years to \$419 million by 1998-99. Most of the money, in the form of the Public Good Science Fund, is handed directly to the Foundation for Science, Research and Technology, which then distributes money to winning applicants from 17 areas of science whose projects fit the foundation’s priorities. Applications come from universities and the nine CRIs, which were set up in 1992 following the restructuring of the former DSIR and other science-related Government departments. The foundation’s nine-member, Government-appointed board is made up of scientists and business consultants. Separate funding is allocated to the Marsden Fund, which the Minister of Research, Science and Technology... says was set up two years ago to facilitate elite “blue skies” research – that is, long-term, open-ended study not bound by any pre-conceived priorities or end uses. Administered by the Royal Society, the fund’s level of Government support was increased from \$5 million in 1995-96 to \$11 million this financial year, and will rise to \$22 million in 1997-98. So scientists are not complaining about the amount of money being poured into their sector. But the principles by which allocation decisions are made are causing concern. The Government has instructed the foundation to select successful funding applications “primarily on the basis of relevance.” Under the notion of “tactical relevance,” end users, such as industries, must be located, before the research has begun. These end users must pledge support, involvement in the planning and direction of the research, and, preferably, additional funding. Evidence must also be provided that the results of the research will be in a form that can be readily implemented. Scientists say this requires them to know what their research will find before they begin and encourages mediocrity. The president of the Geological Society... says an example given by the foundation of how to apply for PGSF money “would be funny if it wasn’t so ludicrous. You mustn’t use words like ‘investigate’, ‘explore’ or ‘study’, because they are not measurable objectives. You have to suggest a project in terms of what you will produce. So instead of saying you want to investigate the differences between two pieces of wood, you have to say you want to identify three differences between different lengths of wood. This means that you already know there are differences, that there are at least three, and if you find four you will only report three because that’s all you’re contracted to do. I would refer to a lot of the projects which receive funding as data gathering rather than real research.” The president of the Association of Scientists... adds that “trying to predict short-term winners is an efficient way of making sure you get low-grade information.” They, along with the president of the Royal Society... say there is nothing wrong with making science relevant to everyday social and economic needs, but that the importance of open-ended research should not be overlooked. “To get to the point of further research being tactically relevant, you need to do a lot of basic research to underpin it... and at the moment that’s not being funded. The Marsden Fund is quite small and in its first 12 months only 60 out of 1000 applications received support. A lot of the big leaps forward in science have been through pure serendipity during long-term research. I think there needs to be more flexibility in the foundation’s funding to allow the CRIs to do more basic research over longer time frames.” [The Association of Scientists president] says you cannot “buy science off the shelf – it has to be built up in steps through a long-term programme and through scientists tapping into leading-edge research around the rest of the world.” [The Geological Society president points out] that open-ended research is one of the few resources that will keep N[Z] afloat when it cannot compete against international prices and labour rates[, and] cites the computer graphics technology used by television during the previous America’s Cup, which was developed by “a few guys working in a back room in Dunedin” and sold around the world. “If you go back 10 years, the research that went into developing that technology would have been viewed as fairly esoteric, and if funding had been dependent on locating a guaranteed end user, it would never have started.” ...The chair[person] of the board of the I[GNS]... admits that the 20 redundancies in his CRI are the result of funding being directed away from “processes” and towards “felt effects.” “So while there is still a lot of funding going into, for example, why a volcano goes bang, there is a greater swing toward finding out what will happen when it goes bang to ensure a more immediate payoff from the research being done. The people being made redundant are basically surplus to requirements in their field, and we have a need for new skills. If we don’t deal with this bow wave problem now, the cash we generate from our well-funded people will have to be invested in people who are not well-funded. We’re working in a contestable, dynamic system with funding trends being signalled quite well ahead so we can plan, but we must plan in a timely fashion and not let things drag on.” When asked why planning was not done several years ago to lose staff by attrition, [the chairperson said it] took over... only in July this year, “and I guess my predecessors made judgment calls that were in part justified and in part were not.” [However, the Association of Scientists president] says... “In terms of recruitment, it sends a bad message, and to young scientists, it sends a horrendous message, that no matter how well they may be looked upon now, that can’t be guaranteed in five years’ time.” [According to the Geological Society president]: “Aspiring scientists may well think they are better off getting an MBA, because what’s the point of spending years becoming specialised in a scientific field if you are only as good as your next research grant?” ...[Furthermore,] it is difficult for scientists to concentrate on their work when they have to also “wheel and deal for funds over relatively short time frames.” [In reply, the IGNS chairperson] says that when funds are scarce, priorities need to be able to be changed to make the most of future opportunities, rather than handing out money on the basis of past success. “If you had frozen funds during the 1970s, with so much going into geology, botany and chemistry, what would you have done about molecular biology when it came over the horizon? If we want to be a centre of excellence in the world, [institutes like ours] have to fine-tune our portfolio of people to make sure we have those with the right skills to run top-flight programmes.” [The Minister of Research, Science and Technology] says... “...Yes, the institutes do need to be profitable, but all the money they make is ploughed back into science; the Government takes no dividends. When you change a system you send shock waves through it,

and I think what we are seeing is a working through of some of those shock waves. But there are now more scientists employed than four years ago – 2908 compared with 2738 – and I have no doubt that by the turn of the century there will be many more. The institutes can't spend all this extra money without taking on extra scientists, but they will be in areas of growth such as environmental and social science instead of the traditional areas... We have a system now that says there are some areas of interest, and some of less interest – you can't just do anything anymore."

...The corridors of power are echoing to departing footsteps: the Ministry of Research, Science and Technology, the Foundation for Research, Science and Technology, the [CRI]s and the universities are hearing the same sound – leaders leaving science management. While I do not wish to catalogue individuals, since their motives are their own, resignations from senior positions in science are too numerous to ignore. The exodus makes one reflect on the apparent change from science leadership to science management in the past few years. To many scientists "science management" is a contradiction in terms. One can manage money; accountants are trained to do so. One can try to manage people; human resource personnel and councillors make the attempt. Managing inspiration is impossible. The more inspirational or innovative an idea, the more risk is attached; the more risk, the less likelihood of a positive outcome or definite output... In the old days we had science *leaders* – people who had been scientists themselves and created an environment in which staff could create. Their role was to support innovators, encourage collaboration and secure the resources required by their scientists. The [CRI]s have science *managers* who, in order to meet commercial requirements, set goals that they know can be reached. The style is restrictive, producing a completely different attitude to science within an organisation... Isaac Newton made his revolutionary discoveries about gravity while sitting in an orchard. Archimedes was in his bath. Both were relaxing when inspiration dawned. A university professor commented recently that the only member of his staff whom [the professor] ever sees completely lost in thought is the only one who has no part in the N[Z] science system, receiving his funding from overseas... As scientists struggle for dollars and security the pleasure that used to be associated with research is lost; increased enrolments in arts, social sciences and commerce reflect this realisation. Parallels between sciences and the arts are stronger than generally recognised. Both began to develop when food was sufficiently plentiful to allow the coexistence of family groups and time for relaxation. People with ability in one area of achievement are often able in others. Talk to the top third and fourth-formers in any school and many will be tossing up between arts and sciences, having equally good grades in each. Put a composer or a painter into a room for 10 hours and tell him to create. The outcome will be guaranteed as a piece of music or a painting, but will it be good? Under this sort of pressure creation is unlikely to result in something new. There are some authors whose "secret to success" is to write 10 pages of a book every day. Barbara Cartland is one. With apologies to her devotees, I suggest that [Barbara] is likely to be remembered for being [related to Princess Diana and, as a writer,] prolific rather than "great." Similarly, scientists working under pressure, where the performance criteria are income generation and publications, are likely to produce quantity, but not necessarily quality... Science cannot be managed, inspiration cannot be programmed – if it could, we would have had cures for the common cold, cancer and Aids years ago. The echoes in the corridors of power emphasise my concern. N[Z] has had and does have some world-class scientists. With more freedom they could address the problems of the world with more hope of success.

...Are we facing an increasing flight from science and rationality...? If so, does it matter? These are questions which scientists generally prefer to ignore and get on with their science. But anti-science sentiments are now so widespread that the beleaguered state in which scientists now find themselves is probably attributable, at least in part, to these beliefs and attitudes. What is more important, they pose a threat to the survival of the human species and a good few other species. Biomedical research financed through the Medical-Health Research Council has dropped by about 40[%] over 10 years in favour of public health research. This is largely a result of pressure from a powerful group of researchers... Another attack comes from some feminists. [Gals] rightly feel alienated and discriminated against by... the ways in which science operates... Another major group attacking science are extreme ecoradicals. On the one hand they blame science for ecological destruction, on the other they reject the need for scientific research into highly complex integrated ecosystems while looking for signs of apocalyptic disaster in scientific findings which may not be well established. We have only one Earth and an exponentially growing human population (sometimes also deemed a fault of science through lowering human mortality) and everyone who is even remotely aware of the precarious ecological situation of humanity regards environmental sustainability as of the greatest priority. The tragedy is that ill-informed, simplistic interventions in ecosystems prove either ineffective or worse than no intervention at all, or catastrophic. We need the very best environmental science to survive. The Kaimaniwa horses decision was a sad example of emotion overcoming environmental realities... [A]nimal rights activists... elevate animal welfare to the level of human interests and sometimes higher... There are also ongoing attacks on science by religious fundamentalists, creationists, New Age mystics and so on, often attacking the whole idea of evolution. Science is regarded as a form of heresy. Science does often undermine superstitious or naive belief although it has so far left issues of human spiritual faith largely untouched. Alas, the finding that humans are not the centres of the universe but are transient organisations of matter on a minute temporary bit of cosmic dust is acutely discomforting. With these groups one can probably add the desperate or gullible who patronise the thriving so-called "alternative medicine" industry. The magnitude of belief in these often mystical therapies can be seen in any general bookstore... The N[Z] Qualifications Authority science committee did not want scientists on it; it threw our representatives off. It did want the "alternative medicines" industry. Science is disappearing from the polytechnics but Aoraki Polytechnic has proposed to start a naturopathy "M.Sc." The evidence for an increasing belief in superstition and magic is widespread in N[Z]. Does all this matter? I believe that it does. The practice and teaching of science in N[Z] is being severely affected by the combined effort of all these strands of anti-science and hostility. One probable effect is a tentative, ambivalent and eroding public support for science. Science is increasingly seen as an elitist, marginal or disposable activity and this is manifest in our political systems where champions of science are frighteningly few... The Government does not always see the need for scientific debate... The use of rabbit calicivirus as a biocontrol agent is one such issue where N[Z] microbiologists as a group were simply not involved in a highly contentious microbiological issue. Even the National Museum, until now a major repository of specifically N[Z] knowledge, has reduced its curators, downgraded its research and is apparently focusing on becoming a multi-media theme park... Looking at the science which my 7th-form son has studied over the years I... [-] the outgoing president of the N[Z] Association of Scientists... [-] feel some disquiet. His 6th-form chemistry book was mainly a set of so-called practical examples, a coherent edifice was not detectable and in fact it was almost impossible to look up information. Unbelievably [my son] did not get to study evolution until 6th and 7th form biology. The most powerful, the most interesting concept in science alongside quantum mechanics is simply not being taught to most N[Z] children.

...two new books... take [a] sober view of technological promise and scientific exploration: *The End of Science*... contends that science is fast approaching its conclusion, that the great era of scientific discovery is over... *Why Things Bite Back: Technology and the Revenge of Unintended Consequences*, speaks of the limits of technology, and states that technology designed to solve one problem invariably ends up creating another by undoing its own solution... [□ An] international group of scientists claimed yesterday to have discovered the source of the Amazon River, which carries a fifth of the entire world's flowing water... They said the first waters of the Amazon emerged from an underground glacier at the Apacheta crevice, 5170m above sea-level in the southern Peruvian Andes... Their claim ran counter to previous accounts of the river's source, including that established in a 1971 expedition by the National Geographic Society, which put the source at the nearby but slightly lower Carhuasanta crevice.

...A study by gene researchers at the State University of New York... pushes back by hundreds of millions of years the era when the vast array of animals now living may have shared a common ancestor... [- a] squishy little critter... in a primordial soup... The grand divergence – the theoretical point of the start of genetic changes that led to many species – began slowly about 1.2 billion years ago... says... [a] co-author of the study. That finding, published in the journal *Science*, is far different from conclusions historically drawn from the study of fossils... [- which] first appeared in the geological record of the Earth about 500 million years ago, an era often referred to as the "Cambrian explosion" because of its apparent

suddenness and variety. But... the[gene] study shows... the animals that left those first fossils were really late-comers to the long, winding parade of evolution... All the animals a billion years ago lived in the ocean, probably migrating up and down the water column, grazing on plankton...

A... group of scientists and fossil-hunters are excited about the possibilities of some... dinosaur eggs... Seventy-five million years ago, a dinosaur called a Therizinosaurid, or Scythe Lizard, delivered her eggs by a watering-hole in Hunan province. Seven failed to hatch and, perfectly preserved by the mineral-rich waters, they came into [the group]'s hands two years ago. Now two of them are to be sold... in New York on December 12, the first authenticated embryonic dinosaur eggs to be auctioned... The more preserved of the two eggs has an almost complete skeleton... They will almost certainly end up in museums or research institutes... [and] each could raise at least £200,000... Four enthusiasts led by... [a 52-year-old] from Leicester, need the cash to pay off... debts and finance further research on what they call the Dinosaur Embryo Project... "We can sell off the two specimens because we are left with four viable embryos from the same clutch. Now we need money to buy suitable research premises..." ...Is [the 52-year-old], who is looking for about \$1,340,000 to fund another six years of work, planning something similar... [to a] *Jurassic Park*... in his back garden? ..."I... doubt if you will be able to clone a dinosaur from... DNA... extracted from these embryos... DNA has its sell-by date and I reckon these eggs are well past it... but... [what I]d like to decide, once and for all, is whether dinosaurs were warm or cold-blooded creatures..." - 1996

A Japanese veterinary scientist who is aiming to recreate the long-extinct woolly mammoth by extracting sperm from a frozen carcass and using its DNA has virtually no chance of success, according to a British scientist... [The] palaeontologist specialising in mammoths, told the *New Scientist* magazine... that [it] doubted sperm from the long-dead creature would be available. "Everything we know about the preservation of DNA in frozen tissue suggests that it's smashed up into fragments,"... The Japanese scientist... plans to inject DNA from the mammoth sperm into the eggs of African elephants using in-vitro fertilisation... [The Japanese scientist, who] felt a realistic mammoth could be created over generations by fertilising hybrid eggs with more mammoth sperm... has already shown that viable embryos can be formed by injecting DNA... from the sperm of dead bulls into cows' ova. But his plans hit trouble when [a] British geophysicist... travelled to Siberia this year with a ground-penetrating police radar device in an attempt to locate frozen mammoth carcasses. His efforts were frustrated when Russian customs officials impounded his equipment. [The British geophysicist] plans to resume his hunt next year, centring the search on cliffs overlooking the Kolyma river in north-eastern Siberia.

...[*Scientists will soon begin to open the secrets of a huge block of ice containing the best example yet of the prehistoric elephant* The mammoth may yield some of the oldest and best-preserved blood cells ever examined. "We also hope to correct the popular belief that mammoths were adapted to the snow-covered Ice Age tundra and in fact lived on a grassy slope, the so-called Mammoth Steppe, which was widespread in the Northern Hemisphere 250,000 years ago." The scientists were alerted to the remains when nomads belonging to the Dolgan people found a tusk sticking out of the ground. After negotiating to buy the tusks in return for new skidoos (motorised snow vehicles) and supplies of sugar, flour and bread, the team began excavations two years ago. Last October, the block of ice was airlifted to the Siberian town of Khatanga. The block of ice will be placed in a special snow cave where temperatures are a constant minus 15 degrees. A dozen hairdryers will be mounted on an overhead frame and the researchers plan to melt the ice over a year. Previous mammoth carcass finds were wasted because researchers tried to defrost the animals as quickly as possible. They ended up washing away most of the clues contained in the dense coats – although studies of the frozen carcass of a baby mammoth revealed it was more similar to the Asian elephant than the African. Researchers using ground radar have detected six other woolly mammoths in the Siberian perma-frost. Another site is believed to contain a woolly rhino.'

... 'The arrival of human hunters triggered a mass extinction of large animals in North America, dooming such Ice Age behemoths as the woolly mammoth and mastodon, as well as one in AUS tens of thousands of years before that (among the AUSn animals lost shortly after the ancestors of the aborigines first landed were: 3m-tall kangaroos that may have eaten meat; Diprotodon, which looked like a wombat but was bigger than a cow; Thylacoleo, a fearsome predator known as the marsupial lion; the heaviest bird ever known, Genyornis, which weighed 100kg, stood 3m and could not fly; and Megalania, a flesh-eating lizard measuring 8m in length), scientists say. Two studies, appearing in the journal *Science*, discount climate change as the cause of the calamities on the two continents, instead pinning the blame squarely on prehistoric people who were fanning out around the globe.' Speaking of climate change, 'tomorrow hundreds of scientists will gather in Monaco for the "Second International symposium on the Ocean in a High CO2 World". Scientists calculate that the seas are absorbing so much carbon dioxide they are 30% more acidic than at the start of the Industrial Revolution. The change has happened 100 times faster than any time during the past 20 million years. Biodiversity of plants and fish has dropped by 30%.'

... 'tiny fungi that live under the Rocky Mountains snow pack get busy reproducing in the winter and may affect global warming, say US scientists. They found a winter wonderland of fungal species, including many new to science, under the snow of a high-altitude Colorado meadow. Unlike most life, which hibernates in the winter, these fungi proliferate – creating measurable amounts of nitrogen and carbon dioxide. The University of Colorado researcher who led the study said this could have implications for the global climate, because about 40% of the earth's land surface is covered by snow during the winter.'

... 'NZ scientists have been part of an international team studying a tiny spider that is the largest land animal in Antarctica's Ross Sea region. The team spent 11 weeks weathering temperatures as low as minus 20C to study the 2mm-long springtail spider – named after the spring-like organ on its abdomen (the furcula) that allows it to jump – at Cape Hallet, 600km north of Scott Base. "It can survive temperatures below minus 30C by utilising anti-freeze to keep body fluids liquid. They are capable of running around when their body temperature is as low as minus 10C." The team hoped its spider data would help scientists understand the mechanisms that limited distribution of plants and animals. "If we know why any species has a distribution limit, that allows us to predict how species respond to changes in their environment." ■ A millionaire] has bought a polar exploration vessel for \$190,000 and given it to an environmental campaigner to clean up scientists' rubbish in Antarctica... ["The campaigner] has badgered me about this project for years due to my interest in environmental matters... and it is satisfying to know her working life is continuing in such a worthwhile venture." ...In donating the ship, the only proviso that [the millionaire] has made is that if the non-profit-making clean-up project fails, [the businessperson] can buy the 1000-tonne vessel back for \$1.70 and dispose of it how[ever the owner of a]... sports television company... wishes. The ship, the *Krista Dan*, has been anchored unused off the Greek Island of Syros for 10 years. It has a long history of Antarctic exploration... The ship has been given to... a former director of Greenpeace, who campaigned to prevent mining in Antarctica in the 1980s and made six voyages to the continent. [The former director] was appalled at the mess left behind by more than 60 scientific bases. Because the continent is so cold and dry nothing rots, and thousands of tonnes of rubbish, oil drums and discarded food are left lying on the snow. A footprint on a bed of Antarctic moss takes a decade to fade.

...A set of 117,000-year-old footprints found... in what is now the rocky shore of the Langebaan Lagoon, about 96km north of Cape Town... have been described as possible evidence of... the common ancestor of all modern humans. The fossilised footprints were made during a barefoot stroll in wet sand after a rainstorm, and are an important clue to a period with a scarce fossil record: 100,000 to 300,000 years ago... The discovery was made two years ago but announced at the National Geographic Society yesterday by... a palaeoanthropologist who said the footprints were made by a person who looked anatomically just like modern humans... [The palaeoanthropologist] and... a South African geologist who actually found the footprints, referred to the person who made them as... "Eve"... based on their relatively small size, but acknowledged that they could also have been left by a small [guy] or a young child. If the prints were made by a [gal, this gal] holds the possibility of being the... hypothetical [mother] who lived somewhere in Africa between 100,000 and 300,000 years ago and carried a particular type of DNA... passed on only through [gals]... Only three other sets of hominid footprints have been found in Africa, and two of these came from more than a million years ago, too early for modern humans. The third set were dated about 30,000 years ago, an eyeblink in the course of human evolution... More Langebaan footprints are believed to be buried under rock, and scientists plan to uncover more by creating a "mine."

...[guys can all]... trace their ancestry back to one [person] who lived 150,000 years ago and whose closest living relatives are a small tribe in South Africa, according to scientists who have spent a decade searching for the original... Adam, who they say lived alongside an Eve... Research into the human Y chromosome has pinpointed the time and place where just one [guy] gave rise to the [masculine] genetic ingredients of modern [humans]... The Khoisan people... share most of the genetic traits that first arose when Adam hunted game and collected berries in his African Garden of Eden... Two independent investigations of minute mutations on the Y chromosome pinpointed the... people... better known as... Hottentots... as the only ethnic group to possess so many ancient remnants of the original Adam... The Khoisans' ancestors probably migrated from the Rift Valley...

British scientists have traced a living descendant of a 9000-year-old skeleton. In an astonishing piece of detective work, they matched DNA material extracted from the tooth cavity of Britain's oldest complete skeleton with that of a 42-year-old... teacher. The genetic material showed that [the] teacher... was a direct descendant through his mother's line of the skeleton known as Cheddar [Guy] – found in 1903 in caves in Cheddar Gorge in south-west England... Previous tests have shown that Cheddar [Guy] suffered a violent death at the age of about 23 in 7150 BC... “It's extraordinary that the DNA survives at all, but we were able to extract it and sequence it,” said... Oxford University's Institute of Molecular Medicine... The Oxford University team spent months analysing samples from the skeleton before taking DNA swabs from about 20 locals whose families had lived in the Cheddar area for generations... [The teacher, who] lives less than a mile from the caves... said [it] only took part to make up the numbers. “I was astonished when the scientists said I was the descendant. Appropriately enough, I am a history teacher, but I have to admit I know next to nothing about Cheddar [Guy]. I suppose I should try to include him in my family tree.” Scientists said the odds of finding a match were not as enormous as they might appear because of the relatively small number of people who lived in Britain in the Stone Age... “There has been an idea that most modern Europeans are descended from farmers who came in from the Middle East about 10,000 years ago, reaching Britain about 6000 years ago. This kind of evidence shows that is probably not true and that modern Britons are in fact descended from the earlier inhabitants like Cheddar [Guy] who existed on hunting and gathering and who were not farmers.” Scientists are now hoping to use the same DNA sampling technique to prove whether Neanderthal[s], who died out... 25,000 years ago, w[ere] linked to homo sapiens or w[ere] a different species.

...archaeologists have uncovered a 5000-year story of successive civilisations... [b]eneath the war rubble of central Beirut... Layers of Canaanite, Phoenician, Hellenistic, Byzantine, Roman, Mameluke and Ottoman civilisation have been unearthed in an area where hundreds of buildings damaged in Lebanon's 1975-90 civil war have been demolished to make way for... a... 1.8 million sq m[tr]... futuristic city centre[– whose developers have financed 80%] of the \$US8 million... cost of the excavations... Discovery of the Law School of Berytus, the most prominent in the Roman Empire before the city was destroyed in AD 551 by an earthquake, would be an archaeologist's dream come true... [S]ix sites had been deemed worth preserving by the experts, who include archaeologists and scientists from the Universities of Paris, Nice, Amsterdam, Tübingen and Berlin, and London Museum as well as groups from Italy, A[US] and the Czech Republic... [T]he Lebanon Ministry of Culture, which supervises the digs with the General Directorate of Antiquities, had decided to keep sites such as a Canaanite hill and the Phoenician quarter in their original place. Three other sites... would be dismantled and rebuilt... Cardomaximus, the main street of Roman Beirut, would most likely be repaired and preserved.

...A TRIP DOWN MEMORY'S LANES Scientists are mapping the many winding paths memory takes in the brain. Their... research may... [uncover an] effective treatment for the distressing memory loss suffered in neurodegenerative disorders such as Alzheimer's... [and could] also... lead to “smart drugs,” chemical compounds that boost people's learning ability... Until recently, recollections of the past were believed to be enclosed in compact bands of neurons called engrams, where they lay dormant until retrieved by some present associations... Scientists now believe that memories are not to be found in any single molecule or neural group... “It is impossible to ask where in the brain a particular memory is located,”... says... [the head of] Biology at the U.K.'s Open University... “Memory is a dynamic property of the brain as a whole rather than of any one specific region. Memory resides simultaneously everywhere and nowhere in the brain.” The scientific foundation for this hypothesis was laid by the [US] psychologist Karl Lashley some 50 years ago. To study learning and memory in mammals, Lashley taught rats to negotiate complex mazes... then began incrementally removing thin slices of the rats' cerebral cortex in an effort to pinpoint the memory locus for this task. But no matter which section of the brain Lashley removed, the rats were still able to run the maze. Their performance diminished as more brain was excised, but Lashley found no one region whose ablation completely erased the memory. In a landmark research paper Lashley proposed the theory of “equipotentiality,” which stated that memories are in fact scattered across the entire brain... B[uilding on Lashley's work], and that of others in the intervening half century, [the head] has worked his own way through a few of memory's mazes. By studying learning and memory in newborn chicks, [the head believes it]'s found a model for how memories are made and stored in the... brain. Memory is composed of two complementary processes: learning something new and later recalling the experience. Using a passive avoidance experiment, [it] trained day-old chicks – which have a powerful pecking instinct – to avoid pecking heads... coated with a bitter liquid. After only a single trial... 80% of the birds were able to learn and remember this simple task. When [the head] examined sections of the chick cerebral cortex after training, [it] observed profound and permanent changes in the brain's biochemistry and physiology... that could serve as a neural map of how memories are formed. In chicks – and by extension, humans – learning initiates a cascade of protein synthesis and neural-firing activity in the brain... The formation of short-term memories, unstable and easily disrupted, takes place soon after a chick is trained. During this phase, while the taste of the bitter bead is still fresh on the chick's tongue, its cortex is flooded with glutamate, the primary information carrier in... brains. Glutamate opens the synaptic communication channels between neurons so that information about the experience – encoded in electrical and biochemical signals – can be transmitted across them, the crucial first step in making memories... If memories are indeed held and tagged in the brain as fluctuating patterns of synaptic connections, then how are they recalled? How does a childhood memory endure through a lifetime while the name of someone you just met vanishes within minutes? ...And how does memory endow us with a sense of personal identity? According to [a] Portuguese-born neurologist... remembering is neither a tranquil nor a passive process – assembly is required. The brain is not a computer... so recall is not simply a matter of clicking on the proper icon to call up the desired document from the brain's hard disc. Memories must literally be *re-remembered*, put together again from pieces found in various parts of the brain. “The brain does not file Polaroid pictures... Memory depends on several brain systems working in concert across many levels of neural organization... Whenever we recall a given object or experience... we do not get an exact reproduction but an interpretation, a newly reconstructed version of the original.” Ironically, the volatile nature of memory is paralleled by the body's own internal dynamics. All the cells in the body – excepting, significantly, nerve cells – die and are replaced as new ones are generated... Though most of our cells will be replaced many times over during the course of a lifetime, we still feel that “we” haven't changed. In this respect, our bodies are not our “selves.” But what if all your memories were suddenly replaced with new and different ones? Strange as it may seem... this is what happens... Memory is a constant work-in-progress. When an object or experience is recalled, the neural pattern corresponding to that memory flashes through the brain as clearly and as quickly as a lightning bolt. But like lightning, it is as swiftly gone. And the next time that same event is remembered the pattern will be different. Yet we somehow manage to construct a sense of self from this welter of mercurial memories. “The self is not a little person inside the brain... It is a perpetually recreated neurobiological state, so continuously and consistently reconstructed that the owner never knows it is being remade.” In that sense, we may be more than the keepers of past memories. We may also be their creators.

...NO ONE turned up to an Athens conference on memory loss. “Terribly embarrassing,” said [the] organiser... It must have been. Someone had forgotten to post the invitations. [□ Carbon monoxide, until now thought to be useless, poisonous waste gas produced in the body, is believed to be an important messenger in the brain. Scientists at Johns Hopkins University say their work shows the noxious gas carries signals between nerve cells in the

brain, and without it the brain could not function. "We've shown that carbon monoxide produced in the body plays a role in the normal functioning of neurons." US scientists also say many fat people who fail to lose weight blame their perfectly normal metabolisms or genes but they simply eat too much'...

US scientists said yesterday that they had succeeded in mapping all the 4288 genes of the *E. coli* bacterium – the most studied microbe in science... [The team] at the University of Wisconsin beat a competing Japanese team in a race to sequence the genome of *E. coli*... The researchers, who spent six years painstakingly mapping each amino acid that makes up the genes, compared the work to deciphering a language... Their achievement could... help shed light on the dangerous strains of the bacterium and perhaps point to ways to fight the mutant strains with new drugs... Their achievement... also... opens doors for other scientists who use the bug as the basis for studying everything from how animals metabolise sugar to the evolution of humanity from the primordial ooze... [Speaking of which, US space scientists are confident life exists in the muddy waters of one of Jupiter's moons. "I am sure there's life there," [a professor from] the University of Washington, said in a reference to the Jovian moon Europa. [The professor] and the other experts spoke at a news briefing in Pasadena detailing results of pictures from the Galileo probe. Pictures of Europa after Galileo's closest flyby of the moon in February... showed a red-coloured sea with a crust of ice about one metre thick in which huge ice-burys several kilometres across were floating. The scientists said they believed all the ingredients for creating and sustaining life forms existed in Europa's waters... [The] professor of oceanology... was very excited by Galileo's pictures. "The bottom line is, it's about life. The discovery of life on another planet will surpass anything that has ever taken place in human history,"... [A] planetary scientist... believed there was organic matter in sediment at the bottom of Europa's ocean. "On Earth, these same ingredients in a million years gave presence to life." In an effort to bolster their life-in-outer-space theory, scientists and engineers from around the world were meeting in Pasadena to discuss an exploration of Lake Vostok, a sub-glacial lake under the ice in Antarctica which they believe has conditions similar to Europa's sea.

...Twenty-five years after launch, Pioneer 10, history's longest lasting and most distant interplanetary explorer, is being retired 10 billion kilometres from home. Pioneer 10's science mission – which began early in March 1972 – would end later this month with the craft twice as far from the sun as Pluto, officials said at the Nasa Ames Research Centre in Mountain View, California. "This is a bittersweet moment," [the] project manager... said. "We're celebrating one thing [the 25th anniversary of Pioneer 10's launch]. But we're sad it won't be around much longer." The spacecraft's power sources are quickly degrading... While the craft will continue to transmit data for about another 12 months, "we believe the scientific return that we are getting at this point does not justify additional expenditures on the mission,"... Pioneer 10 is so far away that its radio signal... takes more than nine hours to reach the Earth. Pioneer 10 was launched in the same year Hewlett Packard introduced the world's first hand-held calculator. "By present standards, the instruments... were low tech,"... Its mission was intended to last just 21 months. But to the surprise of many scientists, it survived to become one of Nasa's most prolific interplanetary explorers... Pioneer 10 was the first spacecraft to travel through the asteroid belt... the first to visit Jupiter, the first to use a planet's gravity to change its course and reach solar-system-escape velocity, and the first to pass beyond the known planets... Six of its original 11 instruments are functional, but the energy produced by its generators can only operate two of them... Once Pioneer 10's radio signal dies out, the ghost ship will coast silently through deep space on its own momentum.

...[Voyager 1 and the elderly Pioneer 10 are heading away from the Sun in nearly opposite directions. Both are powered by nuclear batteries that keep them functioning in the freezing blackness of space. Barring breakdowns, Voyager 1 is expected to have enough electricity and propellant to operate until about 2020 (by then, the spacecraft will be almost 22.5 billion km from Earth').]

...The starship Enterprise would have a hard job boldly going anywhere, scientists believe. Hopes of ever building a warp drive like the one that zaps the *Star Trek* space ship across the universe have just hit a technical hitch. Physicists have calculated that it would need more than the entire energy of the universe to work – and as Spock would say, that's illogical. Three years ago scientists were astonished and Trekkies delighted when [a boffin] from the University of Wales in Cardiff suggested that a faster-than-light starship might in theory be possible. Although the laws of physics forbid any material from reaching the speed of light[– a speed that is 'over 27,000 times faster than the fastest speed ever reached by humans, which was 39,897kph in Apollo 10 on re-entry to the Earth's atmosphere' – the boffin] showed that space itself could be altered to achieve the same effect. In theory a starship could "warp" the space around it so that it expanded behind the vessel while shrinking ahead of it... But... [a couple of researchers] at Tufts University in Medford, Massachusetts, used Einstein's general theory of relativity to work out how much energy would be needed in a given region of space to warp it... Speaking from Germany, [the boffin said it] did not rule out other ways of driving starships being found in the future. "There's still a lot we don't know about the quantum effects of gravity and that sort of thing... There might be a way around it, but I have to say it doesn't look good at the moment." Other scientists have suggested the idea of wormholes through space and time, but these concepts also faced major problems. One difficulty common to warp drives and wormholes is that both require the creation of "negative mass" – an exotic substance no one has the slightest idea how to produce... [Incidentally, algae won't work as food for astronauts flying a two-year mission to Mars. It simply has too much indigestible material in its cell walls. Yes, fungus grows on waste and requires no light, but mushrooms really can't be counted on to provide enough calories for a hard-working astronaut hurtling through space. Food, it turns out, is just the beginning of problems for sending people to Mars. As the public marvels over the Pathfinder robot mission to Mars, the notion of sending humans seems like the natural step. But a report commissioned by Nasa and issued by the National Research Council is a quiet reminder that such a mission is not likely in the near future. There are still fundamental objections to a [peopled] mission to Mars, or even a long-term camp on the moon. To make long-distance space exploration by humans possible, scientists would have to build a biological system as efficient and balanced as Earth's ecology and develop equipment that could reliably monitor this little ecosystem for impurities. Both goals are out of reach today... The most difficult task is developing the ability to build a self-contained biological system that could fly to Mars without being refuelled... "One of the problems with a human mission to Mars is that they have to come back, and carrying enough fuel is a pretty substantial weight penalty..." ...Technology already used in spaceships recovers 80[%] of the water that would otherwise be lost to waste and humidity. But so far, astronauts have packed along all their food and air. On a long mission – the 600-700 days estimated for a Mars flight – that would no longer be possible. For 15 years, Nasa has been doing research on "bioregenerative systems" – plants and animals that recycle waste and bad air into food and oxygen. The Holy Grail would be a "closed loop," a system that is 100[%] efficient and needs nothing but the sun's energy to keep it running... The biggest hurdle, however, might have nothing to do with technology and everything to do with psychology. No one really knows if people are mentally suited for two or three-year journeys through space. And Nasa isn't doing enough to find out, the report says... A lack of money is also likely to rule it out. Nasa is spending just 0.1[%] of its budget developing technology for long-distance missions... But if Nasa made such a mission a priority, it could probably be achieved in about 15 years, said a former astronaut... [and chairperson] of the committee that wrote the report. Nasa has no plans for a [peopled] mission to Mars. The \$770 billion price tag of such a mission has ruled it out. Last year, [the US] President endorsed Nasa's strategy... to explore the cosmos with robots.

...Swarms of... insect-like satellites weighing... 14g could provide a cheap alternative for space exploration. Los Alamos National Laboratory... designed "micro-satellites" with control systems based on simple animal neurons which... could make complex, bulky spacecraft obsolete. "These microsatellites can go where expensive, big satellites can't... Nobody knows how little you can go. That's what we aim to find out." The little satellites, measuring just 7.6cm across, could be sent on missions to measure solar wind and map different parts of the Earth. They could prove more reliable than conventional, large satellites because their simple robotic controllers have been built to survive in almost any environment – and can work in concert, enabling the swarm to continue even if one individual unit fails... The... micro-bugs appeared "nearly impervious to electrical or mechanical fault and surprisingly capable of self assembly and collective behaviour." ...a microsatellite designed to orient itself in Earth's magnetic field by turning automatically toward the brightest available light source... could be harnessed to... measure Earth's magnetosphere.

...A balloon taller than a 30-storey building... is... being built by Nasa... to carry astronomy instruments to the edge of space. The super-balloon... is expected to be ready by 2000. Exact launch sites and dates have not been set, but N[Z or AUS] will be its launching pad... [AUS is the] more logical choice given its large, flat interior... Favoured months are January or June, when high-altitude winds peak over Australasia. The balloon will carry more weight, rise higher and stay aloft for longer than any scientific balloon before it, said... a Goddard Space Flight Centre astrophysicist and chief of the Ultra Long Duration Balloon Project... [By the way, the] Auckland StarDome Planetarium in Cornwall Park is offering kids an intergalactic adventure in the school holidays... [The planetarium's] holiday co-ordinator... said many children were in awe of space and the one-and-a-half-hour show aimed to inform and create fun... The show attracts all ages but is most suitable for 8 to 12-year-olds... [T]he children sit in the planetarium's dark room with its simulated sky above... [a]s an audio show tells them about the universe... The observatory underwent \$3 million of changes in February this year and the simulated sky was so real kids believed they were outside... "After the show the children will be taken upstairs to be shown the 50cm Zeiss telescope and if the weather is fine, they will be able to use it... [to] see a star..."

Hubble "is free to study the stars," radioed [the commander as the]... crew of the space shuttle Discovery released the Hubble Space Telescope yesterday after a \$US350 million... refurbishment that left... [t]he four-storey silver telescope... with better eyes to probe the universe... During the shuttle's service call, two teams of astronauts made five spacewalks... [- together completing] 33 weary hours of spacewalking... [-] to fit the \$US2 billion... orbiting observatory with an improved light-splitting spectrograph to seek out black holes and an infrared camera capable of peering through veils of dust. They also dabbled in electronic brain surgery, installing a new control box and a relay system for its computers. Its peeled, sun-burned skin also needed some unexpected repairs... A shuttle crew will return to the telescope in December 1999 to install another new instrument and replace its electricity-generating solar panels. Astronomers hope regular service calls will keep Hubble operating until 2005.

...Astronomers study many unusual things in the sky, but gravity waves may reveal the strangest events of all... THEY are world-shattering events that pass unnoticed; catastrophes that unfold quietly in remote places. For example, nobody has ever seen, nor is likely to see, the wrenching turmoil of two black holes in collision. This is not surprising, when you consider that black holes are accumulations of matter so dense that not even light can escape from them. But since such events are invisible, physicists hope for the next best thing: to feel them. Cataclysms such as colliding black holes give off gravitational waves, which are, in effect, ripples in space. Several groups of scientists are building a new generation of enormous instruments that might be able to sense these waves. Meanwhile, other groups are spinning computerised stories of such apocalypses, in an effort to predict what the new machines might see... GEO 600, an Anglo-German collaboration located near Hanover, should be the first[of the new machines]. VIRGO, a Franco-Italian project based in Pisa, and LIGO, its American counterpart (with instruments in the states of Washington and Louisiana), will follow shortly after. Each of these "telescopes" will consist of a pair of tunnels up to 4km long, arranged at right angles to each other. Any gravity wave passing through one of the instruments will alternately stretch and squeeze one tunnel more than the other. To detect the distortion, laser beams will be shone down both tunnels... THESE gravity-wave telescopes (known as beam interferometers) are designed to notice events such as the coalescence of "compact binaries" – two lumps of extremely dense matter in orbit around each other. The lumps are likely to be black holes or neutron stars – left-overs from the collapse of stars that have run out of fuel. Astronomers suspect there are a lot of these bodies about, but they are very hard to see. However, two of them in a decaying orbit, spiralling ever closer towards each other, might be detectable. The objects would – in the last three or four minutes before they merge – be spinning around each other hundreds of times a second, at a large fraction of the speed of light. When this happens, the space nearby will be whipped into a storm of gravitational waves. Even this would not be easy to see, because the events are so rare. If the theorists are right, an interferometer would have to be able to detect binary coalescences as far away as the Virgo cluster of galaxies, 50 million light years distant, to pick up a few of them each year. But if the binaries are that far away the waves could distort things on earth by only about 1 part in 10 with 21 zeros after it. In other words, even if an interferometer were to be built with tunnels several light-years long, such waves would alter their lengths by only the thickness of a human hair. With tunnels mere hundreds or thousands of metres long, the detection of such waves would be an impressive feat. It would also be an important piece of science. It would be a further confirmation of Einstein's theory of gravitation, which has few experimentally detectable differences from that of Newton. And there are grander plans. Researchers hope that patterns in the waves may let them deduce not merely that a merger is taking place, but also the masses and sizes of the coalescing objects... As a science, gravitational astronomy has promise.

...LOCAL scientists are joining a global research effort into a mysterious fourth state of matter once predicted by Albert Einstein. Some of the coldest temperatures ever recorded in N[Z] have already been produced in the course of the ground-breaking work. By cooling atoms of gas at close to zero temperatures, teams of local physicists in Auckland, Wellington and Dunedin are trying to reproduce a bizarre and only recently discovered substance known as Bose-Einstein condensate. Creation of this long-hypothesised "superatom" is being hailed worldwide as the dawn of a new era of atomic physics. What is fascinating about these Bose-Einstein atoms, is that they defy all the known laws of science by moving in unison – at identical speed and direction. Excited scientists now have an ideal workshop for exploring basic questions of atomic physics – as well as a range of potentially important practical applications... [For example,] it might be used to create microchips on an ever finer scale than today's... The award of this year's Nobel Prize in Physics to three pioneers in laser cooling of atoms highlights the importance of this new field... Last year, the Marsden Fund set up by [the NZ] Government to foster excellent scientific research, identified this rapidly-developing field as a priority... This year, the effort has been boosted with the addition of... one of the country's most distinguished physicists... [- the professor] was awarded the... premier award in theoretical physics... from the British Institute of Physics in 1995 – ...giving N[Z] a strong competitive position... Recent work by [the p]rofessor... and his team of post-doctoral students... at Auckland University... has focused on laser cooling of atoms... The creation of a Bose-Einstein condensate was first achieved in the U[S] in July 1995 when scientists cooled atoms of sodium to within a whisper of absolute zero. When scientists mapped the distribution of the atoms' speeds, they logged a speed close to zero that represents the atoms slowly emerging from the condensate. Discovery of the condensate paved the way for the creation by American physicists of the world's first atom laser in January this year... Ultimately, the atom laser may be used in the emerging field of nanotechnology – the creation of objects on an atomic scale.

...Science finally makes something of nothing... but what does it mean, exactly? ...PHYSICISTS have known for most of the 20th century that emptiness is actually full. The vacuum, as physicists call it, is full of particles that pop into existence for such short periods of time that they can't be detected directly. But the particles can have real, observable effects... While working at the University of Washington in Seattle, [a physicist] set out to show an effect predicted... by Dutch physicist Hendrik Casimir[– who] calculated in 1948 that so-called virtual photons, which spontaneously burst into existence like kernels of popping corn and then disappear almost instantly, ought to push two narrowly separated metal plates together. For five decades, nobody bothered to challenge Casimir's prediction. The theory behind the prediction, known as quantum electrodynamics, is so sound that almost nobody dreamed it could be wrong... The theory describes natural phenomena so well that some physicists consider it the most successful scientific theory going... As a demonstration for his students at the University of Washington, where [it] taught until last summer, [the physicist] thought, "Why not... test Casimir's prediction...? You never know what you're going to find when you do an experiment..." The theory worked fine. As [the physicist] incrementally moved a pair of metal plates closer to one another, to distances a hundredth the thickness of a human hair, the plates began to feel an attraction to one another... THE two plates felt only a minuscule force, about what's exerted by a protozoan's flapping flagellum. Yet no matter how slightly, the presence of the two metal plates changed the character of empty space so as to generate the force. The two plates attract each other because the space between them is like a box... Virtual photons can be thought of as waves coming in a range of sizes, and when the plates are extremely close the longest waves are excluded from the box. Since the

longest wavelength photons can't pop into existence between the plates, the total energy of virtual photons inside the box is lower than it is outside. The energy difference is what pushes the plates together... Although some researchers have speculated that the popping particles could be harnessed as an energy source, most physicists find no apparent practical value to [this] experiment. BUT it may be of practical concern in the future, when researchers hope to build machines that operate in such tiny realms. Nanomachines, as they're known, could... be launched on space missions at incredibly low costs... Nanomachines could also... cruise capillaries to repair damage caused by atherosclerosis – as foreshadowed by... the... 1966 Oscar-winning sci-fi film *Fantastic Voyage*... The possibilities of nanotechnology are as endless as the imagination of the field's enthusiastic proponents.

...*Sci-fi pipe dreams rush into reality*... A BRAVE new world of artificial wombs, ['synthetic eggs and sperm,'] robot surgeons and freeze-dried corpses brought back to life is no longer a fantasy, say some of the leading experts on scientific developments. It is not a question of whether such technological achievements will ever be possible but when they will be invented. The most far-fetched ideas of scientists today, such as complete meals in a pill and house-cleaning robots, will become reality within our children's lifetime, according to a survey of scientific futurologists conducted by *Wired*, the international technology magazine... It will also be possible in the same time scale to buy custom-designed clothes, measured by digital body-scanners and delivered to shoppers within 24 hours. Adidas has already begun testing a digital foot-scanner for measuring shoes... Custom-tailored clothes for the masses should be on sale by 1999. It will take a further eight years for clothes to be made of "smart" fabrics that can alter their properties to keep people warm in winter and cool in summer. Eventually clothes will assume some of the functions performed by laptop computers and mobile phones today. "Embedded electronics may enable fabrics to serve as computer screens..." To keep in touch there will be holographic telephones within 20 years, transmitting 3-D images of callers as well as their voices. Nanotechnology... will produce a wealth of new devices for the home based on microscopic robots that... will emit static charges that would act as magnets for dust... that can remove... rust and reconfigure plastic. The toilet seat that changes shape for whoever sits on it will become a reality... By 2010, robots and nanotechnology will be combined in a single pill-sized device that can be let loose in the body to perform delicate surgical tasks... Continued improvements in drug design will also spawn the first fat-destroying pills... It will take until 2020, however, to develop a reliable sober-up pill... The gap between test-tube conceptions and incubators for premature babies is narrowing continually. "Medical science may well have closed it completely by 2022,"... Despite recent advances... cryogenics... is... unlikely to become a reality before the middle of the next century. At least four companies in America offer a deep-freeze service for people hoping to be revived in the distant future, but freezing a kidney is not like freezing and reviving a brain with its memory still intact... [The] president of the Alcor Life Extension Foundation which offers a cryogenic service, hopes to make headway soon, however: "Within 10 years we will know how memory functions well enough to see if particular structures that are vital to it have survived." One of the more bizarre technologies by the middle of the next century will be teledildonics, which promises virtual-reality sex using 3-D goggles... [- transmitting i]mages of sex acts... at the speed of light... [-] and a condom-tight body suit with thousands of inbuilt sensors.

...*Mates and why we choose them was the only topic at the 25th International Ethological Conference in Vienna – a talkfest for scientists out to solve the mystery of sexual attraction*... THE Jackie O syndrome, where a beautiful [gal] is squired by a spectacularly unattractive [guy], is the exception to the rule. Walk into any cafe and if there's a Barbie lookalike [it] will be with Ken. Self-evident, maybe, but not to scientists who want proof beyond reasonable doubt. Proof has been provided by photographing established couples, and then having the [gals and the guys] ranked separately for physical attractiveness by third parties who did not know the people involved... [Someone from] the University of New Mexico has gone further in his analysis of who mates with whom, and why. Over the past few years [this someone] has sought to find out just what it is that makes people attractive. And what [this someone] has found is that one of the most important factors is symmetry... [and] that people are not alone in these preferences. Some 42 other species, including insects and birds as well as other mammals, use aspects of bodily symmetry to help choose their mates. His discoveries have provoked several follow-up projects... Other research indicates that the human sense of smell is much more important in mate selection than even perfume manufacturers have dared to dream... [S]taff at the... Ludwig Boltzmann Institute for Urban Ethology in Vienna... assailed [guy] nostrils with a synthetic mixture of the fatty acids that are found in human vaginal secretions, and found that when [guys] inhale this mixture their sexual judgment goes to pot. Photographs of [gals] to whom they would not normally give a second glance suddenly become attractive. Indeed, the worse a... picture rates without the chemicals, the larger the leap [its subject] undergoes in a [guy]'s estimation when [it] is sniffing them. Even the most acutely tuned genetic responses, it seems, can be subverted environmentally by the correct stimulus. Which raises a query: why would evolution have produced [guys] whose lust could so easily be subverted? The answer to that remains to be seen, though it might simply be that the secretions indicate... sexual arousal and thus an increased chance of a successful seduction. That would make sense, for while it seems that natural selection may have toned down the promiscuous... impulse in human[guys], the anguish of wives throughout the centuries shows that such promiscuity has not yet been abolished. [A married actor, 'who has admitted to a roving eye, says, "Guys aren't supposed to only see and desire one gal. I mean, that's just science. That's human nature. It's what guys were put on earth for. Society values wisdom in guys and youth and beauty in gals."']

... 'AS THE actress and temptress Mae West once said: "So many guys, so little time!" The sultry West was in jest but scientists are convinced they have proved that gals are genetically programmed to have sex with several different guys to increase the chances of healthy kids with the greatest likelihood of survival. The theory helps to explain the high incidence of mistaken paternity. Evidence suggests that one in seven people is not the biological child of the person they believe is their dad. The US television comedy *Sex in the City*, criticised for being a guy fantasy depicting sexually aggressive gals, is apparently only showing gals doing what comes naturally. Conventional theory has suggested that only guys are naturally promiscuous, since it increases their likelihood of having many offspring by different gals. But two reports in scientific journals have added to a growing body of evidence that gals across the animal kingdom are promiscuous, and researchers are convinced human gals are the same. A study by *Nature* magazine shows hens mate with several cocks but actively choose which sperm they are fertilised by. A professor of evolutionary biology at the University of Sheffield, discovered that "when hens are mated by cocks they don't like, they just chuck the sperm straight back out after mating. It reinforces the view that gals aren't just passive vehicles for sperm." The professor believes that, like jungle fowl, human gals show evidence of having spontaneous abortions of clusters of cells not compatible with what they want. Evolutionary biologists say the evidence has become overwhelming and ties in with anthropological studies. "Since humans have evolved from other forms of life, it is likely they have many of the same mechanisms. The motivation that makes us seek other partners is evolutionary," says the professor, who has published a book called *Promiscuity*. By being promiscuous, gals can ensure greater care for their kids. The Inuit people of the Arctic have traditionally had "co-marriage" where two couples effectively marry each other. This means the kids have two sets of parents to look after them in the harsh conditions. Returning to Britain, the professor cites the case of a guy who went for a vasectomy after his wife gave birth to her third child. However, the surgeon found the husband had a congenital defect that meant it couldn't possibly be the dad of any of the children. One study followed couples awaiting fertility treatment where the husbands were "azoospermic," meaning they produced no sperm and were totally infertile. It found that 25% of the wives became pregnant before fertility treatment started. However, the strongest evidence that human gals are promiscuous actually comes from guys themselves – or rather their testicles. The concept of sperm competition suggests that guys have an incentive to produce as much sperm as possible to flood out those of a rival mate. This implies the more naturally promiscuous the gal of a species is, the larger the species' testicles will evolve. Gal chimpanzees are wildly promiscuous, and guy chimpanzees have large testicles (there is a reason why chimps are dressed up in circuses); in contrast, gal gorillas are extremely faithful so gorillas have tiny testicles. Humans have mid-sized testicles, suggesting moderate promiscuity. The only comfort that guys can take

from the animal world is that gals also have an incentive not to have all their offspring from adulterous liaisons. "If they are totally unfaithful to their social partner they might just be abandoned," says the professor. Editor's note: 'the average NZ guy has 16 sexual partners; the average NZ gal has 20'.

...Why do humans] have their testicles on the outside of their bodies, while elephants don't? This burning issue may be answered by a team of Otago scientists who have been given a government grant of \$350,000... [The p]roject leader... is used to ribbing about his study, entitled: "Testes, temperature and evolution: Should an elephant keep his cool?" ... "We get a lot of jokes and that is part of the fun,"... The testicle researchers will be testing mostly ram semen. Elephant semen, they argue, is a little hard to come by... But some people think it is a load of old cobbles... "The question is, is it a significant scientific question and, if so, why? I can't see either application or theory. It sounds literally like jobs for the boys."

...Last week I was waxing enthusiastic about a recent book... which demolishes many a myth about the supposed need for governments to subsidise science and technology and instead argues that markets are the driving force for technology, new science and economic growth. We saw that the early Industrial Revolution occurred in laissez-faire England, where neither science nor technology were subsidised one iota. Moreover, the new industrial technology of that time owed next to nothing to the (then) recent developments in science. In fact, science and technology interact far less than is commonly thought: mostly they keep on their separate tracks of development. But as the industrial revolution wore on, private industry did feel the need to do more science. So companies undertook in-house research, or endowed universities. And because this was the age of low taxes... philanthropists were also active. The 19th century saw a huge upsurge of British science – all without direct Government support. And the first country to overtake Britain economically was the U[S], whose science was equally laissez-faire... Japan's universities are mostly privately funded... But for a variety of reasons – including sinister military inventions – other countries were starting to take a more state-directed approach to science and technology. This century Britain and America (and N[Z]) have tamely followed this trend. Little good it has done any of us. In N[Z], for instance, the half billion dollars that the taxpayer spends annually on science... probably represents money badly spent. And this policy has created... another vocal interest group dining at the public trough, in the form of tax-funded scientists... There will always be a demand for science, just as there will always be clever and curious people wanting to do science. Our choice is whether they work for the Government – a notoriously stingy and unreliable employer whose economic policies are noted for picking born losers – or whether they work in private industry and... foundations. The lesson is twofold. Not only does taxpayer funding waste the talents of scientists[i]t can politicise them to an embarrassing degree. Scientists, if anyone, should be bywords for objectivity. Yet some scientists turn into performing clowns on the hint of reduced taxpayer support.

...*Serious weaknesses in market-driven science*... [A NZ Herald columnist] proposes that science and technology would develop faster, and that society would be better off, if Government support was minimised and its management left entirely to the market. There are two striking things about major scientific discoveries. The first, that they are unexpected, should not surprise us. If discoveries were made where people expected to find them then the process would be easy. When Faraday and Maxwell made their discoveries concerning electricity and magnetism (less than 200 years ago), coal and later gas were the basic sources of energy. There was nothing at the time to show that the science of electromagnetism foreshadowed our present understanding of the fundamentals of atomic particles and matter generally, or their technological contribution to electricity in its manifold uses. Their scientific successors were all the physicists and chemists we know today, including Einstein and our own Rutherford and Marsden (sons of a regulated economy). Their technological successors are producers of power, communications and the multiplicity of electronic equipment that serve our societies. If research had been market-driven by coal and gas technology would any of the discoveries relevant to our understanding of physics have been made, and if so how belatedly? The second theme of discovery in modern science and technology has been the availability of already gathered information which often was part of no systematic study to a technological end. For example, the development of transistors and, following them, the silicon chip of computers depended on a knowledge of the semi-conducting and other properties of otherwise useless elements. There are other more dramatic examples in pure science... It is worth noting the role of mathematics especially. [The columnist] claims that the reason the Roman Empire did not make any notable technological progress was that it was a "plunder culture" not a "market culture." ...One contributing reason suggested is that the mathematics of Rome and the succeeding societies of medieval Europe was based on a primitive number system which allowed no calculation. It was only after we borrowed the number system of the Arabs, with the abstract concept of "zero," that further scientific and technological progress was possible. What would the market justification be for the study of speculative mathematics? ...[the columnist] speaks favourably of the benefits of the Industrial Revolution in England, and contrasts the failure of France to undergo a similar social process, as an example of the benefit of market forces over a regulated economy. But the Industrial Revolution was an unmitigated disaster for at least two generations of a major part of the population in England. During it, most English people lived in dread of the poverty caused by technological innovations, or lived in abject poverty and misery. The horrors of life in early Victorian cities for a large proportion of the population should not be minimised. To read social accounts of the time does not lead to admiration of the English politicians who caused so much suffering to their own people, even if they did create immediate wealth for a small proportion of the people and launched an empire. Although the French took advantage of technical innovation more slowly, they also acquired a sophisticated industrial society and an empire. At the beginning of this century was England noticeably better off, and France noticeably worse off, the one for having undergone a rapid and violent Industrial Revolution, and the other a progressive change? By analogy [the columnist's] message seems to be that we should embrace unfettered market delivery of technology whatever the price to present generations because in two or three generations our grandchildren may realise untold wealth and marvellous technical innovations which we cannot imagine. Is this a political and social equation that we would willingly accept? [His] major claim that basic science would be better funded entirely by market-driven decisions assumes that the only function of science is to serve technological advance and not, for instance, wider social interests such as the consequences of technological advance. My view is that... it is not impossible that technology as it is practised in the market may... create an increased population, and demands for food and the consumption of resources which cannot be delivered within renewable systems. The world's resources are not infinite. Having had one revolution in food production and having used a significant proportion of the world's non-renewable energy resource, we assume that we will find further technical solutions to these problems. This is not inevitable.

...*Start of a New Frontier or... End of the Road?* ...I WAS ONCE, LIKE THE LATE PETER MEDAWAR, A FERVENT BELIEVER in scientific progress. In fact, I became a science writer in large part because I viewed science as the most ennobling of all humanity's creations. We are here to figure out why we are here. What goal is more worthy of us? Science could also help us create, if not a utopia, then at least a better world than we now inhabit. Initially I simply assumed that the quest for knowledge and power would never end. As the island of our knowledge grows,[one] physicist... once told me, so does the shore of our ignorance. But sometime during the early 1990s I lost my faith in science's boundlessness. Where once I saw challenges and opportunities, I began to see limits and barriers. Now I believe that the glory days of science are in a very important sense already over. My pessimism stems in part from the fact that so many brilliant, creative scientists – particularly in the fields of physics and cosmology – are working on theories that are hopelessly speculative. For the past 15 years or so physicists... – [such as the person] dubbed one of the most influential people in America by TIME in 1996 – have dedicated themselves to superstring theory. Often touted as a "theory of everything," it posits that all the matter and energy in the universe – and even space and time – stem from infinitesimal, string-like particles wriggling in a hyperspace consisting of 10 (or more) dimensions. Enthusiasts hope that superstring theory can answer the most profound of all questions: Why is there something rather than nothing? Unfortunately, probing the realm of superstrings directly would require a particle accelerator the size of the entire Milky Way. Meanwhile, [researchers at] Stanford University and others have proposed that our cosmos is merely one of an infinite number of

universes, some perhaps with laws of physics totally different from our own. Some observers contend that these unconfirmable, far-fetched theories are signs of science's vitality and boundless possibilities. I see them as signs of science's desperation and terminal illness. We have been so dazzled by the enormous advances science has made in certain areas that we have overlooked those realms in which there has been little or no progress. For example, it once seemed inevitable that knowledge of nuclear fusion... would culminate in a clean, economical, inexhaustible source of energy. For half a century, fusion researchers have said, "Keep the money coming and in 20 years we will give you energy too cheap to meter." Now, fusion research is scaling back dramatically worldwide. Even the most optimistic proponents predict it will take at least 50 years to build economically viable fusion reactors. Realists acknowledge that fusion energy is a dream that may never be fulfilled... An even more ambitious goal of science is immortality. Many scientists are now attempting to identify the precise causes of aging. It is conceivable that if they succeed in pinpointing the mechanisms that make us age, [w]e... might then learn how to block the aging process and to design versions of *Homo sapiens* that can live indefinitely. But evolutionary biologists caution that immortality may be impossible to achieve. Natural selection designed us to live long enough to mature, breed and raise our children. As a result, senescence does not stem from any single cause or even a suite of causes; it is woven inextricably into the very fabric of our being. One might have more confidence in scientists' ability to crack the riddle of senescence if they had had more success with a presumably simpler problem: cancer. Since the U[S] officially declared "war on cancer" in 1971, the country has spent more than \$30 billion on research. But overall mortality rates from cancer have remained virtually unchanged since then... Maybe some day all our research will yield a "cure" that will render cancer as obsolete as polio and smallpox. As someone whose family has been ravaged by cancer, I certainly hope so. But one cannot blithely assume that science will stamp out cancer soon, or ever. Science has also made pitifully little progress in understanding our fantastically complicated and often troubled minds. To be sure, researchers have acquired powerful tools for probing the brain... But all this work has failed to yield either a powerful new theory of the mind or truly effective treatments for its assorted disorders... Pessimists like me are often accused of lacking imagination. Actually, it is all too easy to imagine great discoveries just over the horizon. Our culture does it for us all the time, with TV shows like *Star Trek* and movies like *Star Wars* and advertisements and political rhetoric that promise us tomorrow will be very different from – and almost certainly better than – today. Scientists, and science journalists too, are forever claiming that a huge revelation or breakthrough or Holy Grail awaits us just around the corner. It is much more difficult to imagine that there is no Next Big Thing over the horizon. What if what we have is basically all we're going to get? We are not going to invent warp-drive spaceships that can take us to other galaxies or other universes. We are not going to become immortal through genetic engineering or by transforming ourselves into computers. We are not going to discover "the mind of God," as... a... British physicist... once put it. Peter Medawar would no doubt have found my views to be fatuous and mean-spirited. I believe they are merely realistic.

...YOUNG DISCOVERERS NEED NOT DESPAIR – THOUGH THERE ARE few blanks left on today's map of the world, there are still... [missing] pieces in the puzzle of how the world works... In 1844, U.S. commissioner of patents Henry L. Ellsworth famously quipped: "The advancement of the arts from year to year taxes our credulity and seems to presage the arrival of that period when further improvements must end." More than 150 years later, our credulity may still be taxed by the latest advances in science, medicine and exploration, but new discoveries and inventions show no sign of coming to an end. Historically, the greatest discoverers and inventors were often regarded by their contemporaries as quacks or even heretics. [During] our own time, this reluctance to discard conventional wisdom and embrace new ideas persists. In 1930, American rocket researcher Robert H. Goddard and a group of colleagues were given a grant of \$25,000 by philanthropist Daniel Guggenheim to develop rocket technology to carry scientific instruments into earth's upper atmosphere. But, fearful of losing their professional reputations and being branded cranks, the scientists emphatically denied the possibility of ever reaching the moon. In 1977... [the] founder of Digital Equipment Corp., saw "no reason why anyone would want a computer in their home." Now many people around the world can't live without them. But true pioneers – people like Socrates, Voltaire, Newton and Einstein – have consistently had the courage of their convictions: the vision to ask the right questions and the determination to keep on asking until they got satisfactory answers.

...How's that for inventive? I READ once that [guys], like nature, abhor... a vacuum. In my case this isn't strictly true. In fact I actually quite like the vacuum cleaner. I guess I've always been amused by the idea that a vacuum could be cleaned. But that's the kind of guy I am. I enjoy paradoxes... If I go to the health food shop to pick up some free range eggs I often wonder why I should have to pay for them. If they just called them range eggs the confusion would be avoided. And if it's Roget's *Thesaurus* shouldn't we really give it back? These are crazy ideas, but I guess it's just in my nature to push the intellectual envelope. Universities all over the world are packed with botanists doing obscure plant research and genetic experimentation, but to date no-one has invented a non-slip banana skin. How much pain and humiliation can the human race endure? The much-maligned Macdonald's has bred its own species of rectangular potato. Is a non-slip banana skin totally out of the question? ...When you're in the middle of something you can't see the wood for the trees. Who among us could now imagine a world without coffee? It seems ridiculous to think about it, but there must have been a time, and not that long ago, when there wasn't an espresso bar on every corner. And who knows, at some point in the future even our four-wheel-drive urban jeeps might look odd. Maybe not in our lifetimes, but perhaps our grand-children will look at photos of us standing next to these jeeps and wonder why on earth we needed such extreme forms of transport to simply pick up bread and milk from the corner dairy. They might even think we look absurd. They won't understand, of course... Tradition as our grandparents understood it was simply a farce that facilitated the repetition of obsolete knowledge and emotion... We know now that each generation is only answerable to itself. - 1997

If you had to single out one machine and say that it formed the 20th century, it would have to be the internal combustion engine... And a manifestation of the internal combustion engine... [was t]he... 2-stroke... This engine didn't so much turn the world as totally infest it and, personally, I hate the buggers... Unfortunately, there are plenty of other folk who just love the 2-stroke to bits... Who would've thought that a hardy... little... industrial... engine, born out of poverty and necessity, would become... [at] the latter part of the 20th century an engine that gives... pleasure to thousands and drives the rest of us completely bananas! ...Like all apparently simple inventions, the genius of the 2-stroke was... [that] at a stroke, or rather 2, it allows you to throw out three-quarters of the moving parts of a 4-stroke engine. When the piston goes up to fire, the vacuum inside... is used to draw fuel and air mixture through the carburettor... and when it comes back down it's... compressing all the air... and that pressure is used to push the fuel up and onto the top of the piston – so the piston comes up and fires again, and it just goes on and on... The simplicity of the 2-stroke engine is much appreciated around [the former East Germany]... In the dark days following W[W]2, the German economy was in a shambles and money, especially... behind the Iron Curtain, was tight. There was a desperate need to get industry kick-started, to re-build and to get people moving – and in the East, they turned to the 2-stroke... [An example of the result is] a car that has driven millions from A to B at very low cost and been the butt of every lousy comedian's terrible jokes for some years... the Trabant... Listen, don't knock the Trabi – it's reliable, efficient and costs about a third as much as your car to run. The entire car can be dismantled with 5 spanners... The new Germany seems to be trying to bury the old Trabi along with its recent past, and I think that's a shame. I mean, how many cars can you name that can do 60 miles to the gallon, need servicing once every 2 years, and have an engine that can be removed... in... [a few] minutes. Of course, if you happen to be a macho speed-freak, the Trabant may not be the car for you... [I]n the macho speed-freak department, the 2-stroke engine features in a very different machine [also] developed in East Germany. What's more, it's the subject of a classic tale of Cold War espionage, intrigue and betrayal. The machine in question was developed in the 1950s and built... at the MZ factory... You've got to hand it to the Germans – when it comes to efficiency allied to inventiveness, the history of engineering is littered with them. One such was MZ's chief engineer... [who] spent 10 years [tinkering] with

the 2-stroke engine and turned it from a lawnmower into the fastest motorbike in the world... In the 1960s... MZs were cleaning up in the European Grand Prix circuit, and the opposition seemed unable to come up with anything to match the flying machines. It was Suzuki who finally solved the problem... In a pre-arranged deal with the Japanese... MZ's premier rider at the time mysteriously disappeared halfway through the 1961 Swedish Grand Prix. In fact, [the rider] had established enough of a lead to be completely out of site on the far side of the track where [it] simply drove off a slip-road and into the welcoming arms of a Suzuki rep. [The rider] had also had the forethought to stuff his racing jacket with a complete set of the MZ's engineering specifications... Although, fundamentally, they've never improved on [the] original designs, Japanese motorbikes have ruled the world ever since – and the Swedish Grand Prix signalled the beginning of the end for the German, American and British bike industries as they all collapsed in the face of advancing Japanese technology... In the economic grimness of the post-war Eastern Bloc, the 2-stroke engine brought cheap, efficient power to the people. But in the West, the emphasis was on pleasure... [I]n Britain, the fashion was for model making, and the 2-stroke was just perfect. Here was an engine whose mechanical parts were so simple they could be reproduced in miniature and they'd still work... I love Sundays, don't you? The peace... and... tranquillity of the loch. It's a perfect day for... a spot of bird-watching, or just taking the [model] helicopter for a walk... The reason the 2-stroke engine makes such a delightful noise is that it does everything at twice normal speed – you get power with every second stroke of the piston instead of every fourth, so you get lots of power out of smaller, lighter engines. That's why they run so fast; that's why they scream a lot... The 2-stroke engine found its way into dirt-bikes, microlites and frisky little beggars like the [jet-ski and] snow-mobile... Northern California [is] serious timber territory. They've been cutting down timber [t]here since the 1870s, and yet it wasn't until the late 1920s that the mechanical engineers came up with an improvement on [the axe]... In 1926 an engineer came up with another use for the 2-stroke engine that was to make life a lot easier for the loggers. And wouldn't you know it, [the engineer] was German! ...his contribution to the world was the chainsaw. The world has been on the run ever since. I think I have found the one justification for the 2-stroke engine here, because no matter how painful it may be to... ecological sensitivities... we need wood – we can't do without it... unless you want to engulf the world in plastic... It would appear that the chainsaw is the only absolutely essential application of the 2-stroke engine. They do burn oil all the time, and they're very high polluters – in fact, in California they're just about to be totally banned, so that's something against them. Also, they make the most irritating noise... So, on reflection, I still don't like 'em.

...[guys] and machines: what is it that makes us so obsessed with them? ...We love them. And yet, you know, the engine that's probably had more influence on the history of the world this century – the most simple, the most powerful, the most reliable engine in the history of engineering – is very much the Cinderella of [engines]... If you think the silicon chip revolutionised the 20th century, then think again. Surfing the Net has nothing on a fighter plane doing Mach II at sea level, or a fully-laden 747 doing 500 miles per hour at 35,000 ft. In little over half a century, the jet engine has achieved legendary status in a truly global sense... [But], for all its brilliance, it is treated with virtual disregard by the people who use it... The jet, it has to be said, has a bit of a personality problem. Never in the field of human transportation has such a near-miraculous improvement been so cruelly neglected. The jet engine is the Liberal Democrat of the engineering world – bags of hot air, but nobody's terribly fond of her. But the amazing thing is that had it not been for the efforts of one [person], we might not have had the jet at all... [T]he basic training plane for fighter pilots between the middle of... W[WI] and about the late '20s... was... run [by] a big piston engine which was lubricated by castor oil, and the engine had two settings – *On* and *Off*. It [wasn't]... exactly what you call sophisticated. Which is exactly what... [a] young RAF cadet... called Frank Whittle... thought. Whittle was a flying ace and was well-aware of what the 504 was capable of. However, despite pushing it to its limits [Frank] knew deep down the propeller plane had some fundamental problems. So at the age of 21 [Frank] outlined these problems in an astonishing student essay. Basically, in order to fly at any great speed, an aeroplane has to go high, where the air is thinner and there is less drag. However, precisely because the air is thinner, the propeller gets less grip and is less effective. As if that wasn't bad enough, as the air gets thinner, the aeroplane's engine also gets less... efficient. The propeller plane was a trap. [The sound of a propeller plane is] an absolutely delicious noise... at least to those of us who've got a closet full of anoraks and a big tool-box marked *Do Not Touch*. However, to Frank... it was just a noise of wasted energy – literally wasted petrol. [Frank] wanted to get rid of all those... moving parts and produce one solid thrust. And that's what [Frank] set about designing... [F]or every action in the Universe there is an equal and opposite reaction[. If you attach a firework to a model plane suspended by a string, the plane will start to fly in a circular direction]... because all the thrust coming out the back [of the firework] is producing a forward thrust by the plane. This is the basis of jet-propulsion. But unlike the firework, a true engine has to be able to control the thrust. So with virtually no help from the [British] Government and the RAF, who both thought [the cadet] was bananas, Whittle set off to create a controllable stream of thrust... [D]espite a few teething troubles, the principle of the jet engine was established... [In] a very primitive turbine... the heat [from candle flame rises] up and... blades which are angled... try and avoid it and... as they move away from it... because they're all the same shape they eventually produce a spinning motion... [Whittle's] genius was that [the cadet] took the turbine a[nd]... put it on one... end... [of a] shaft, and at the front drove a compressor... The compressor is basically a huge fan that sucks air into the engine and squeezes it into an explosive mixture with the fuel. This then ignites and goes scooting out the back, creating forward thrust and turning the turbine on its way. Because they're both connected to the same shaft, the turbine then turns the compressor again, so completing the cycle... Whittle's jet engine first took to the air in May, 1941. You might have thought that a country at war would be interested in a plane that would do over 300 miles an hour without a propeller – but, incredibly, the test flight was met with wilful disinterest from the British Government. "...of course you had the [lobbying] power... of the combustion engine industry, which was vast, and Frank was doing something which nobody believed... would really happen... [Being someone who had written] a thesis at 21, putting aircraft at speeds of... 400 m[ph] at 35,000 ft – when the standard fighter was [only reaching 150mph] – you can imagine that it was a very difficult job... [Frank] had to do[to convince others]." In a way you could see their point. Who couldn't love the Spitfire, with its big Merlin V12 engine, and its propeller thrashing the air to a pulp... [In comparison,] the jet is cold, inscrutable, and sounds like something at the back of your fridge. By the end of the war, the Government relented and ordered a squadron of... Meteors – the first jet plane to be enrolled in the Air Force. But even then, the response of the pilots was less than enthusiastic... Although the Meteor's engines pointed straight towards the future, its airframe construction was firmly rooted in the past... Accordingly, it ha[d] to be flown with a certain amount of respect... The early Meteors might not have won many friends amongst the propeller boys but it wasn't long before the jet found its feet. By the time they'd created the Mark V model in 1946, the Meteor was doing over 600 m[ph] – and no amount of pistons and propellers can argue with that! ...Now all the jet had to do was to achieve world domination. During WWII the Allies open secrets policy meant the [US] got to see the jet engine. If the jet engine had been lacking in character, then it was about to get it... [The J57 is] the engine that took the world into the jet age... [One J57] could develop thrust equivalent to 15 Spitfire engines... Basically, the [US] took Whittle's jet and added sex. The F100 SuperSabre... was introduced to the US Air Force in 1950, fitted with a J57. On its first flight, the pilot took it up to 35,000 ft, opened the throttle, and smashed through the sound barrier – the first plane ever to go supersonic in level flight. And it was thanks to a feature that was to inspire schoolboys the world over... [The development of the jet engine had gotten] so good that the old compressor was producing so much oxygen that some of it would come... out the back end. Now some boffin noticed this and... decided to start squirting fuel in. This is where the after-burner started... [E]ffectively it worked like a rocket... [and] produced tonnes and tonnes of thrust... it could add up to 50% more power... The after-burner summed up America's attitude to the jet engine – pure raw power at any expense. It was like saying: "We've got so much fuel we can do whatever we like with it." ...The J57 with its afterburner ensured America's aerial dominance in the '50s... Things must have looked pretty rosy for the U[S]. However, there was a small detail that had gone awry. When the British Government had sent the jet to the [US], they also sent a few to the Russians – so there wouldn't be any fighting, so to speak. Oh dear! The jet

engine was fundamental to the Cold War. It powered everything from the colossal B52s, to their fighter support, to the re-fuelling planes that kept them afloat for 24 hours at a time. In Vietnam it allowed the bombers to operate from such a range and height that the planes were not visible or audible from the ground. It was so fundamental that the only way to keep the peace was by grounding the[planes], chopping them up and recycling them... [The US] military aircraft recycling centre, where the jets get turned into dog food cans, is an inglorious end for these mighty planes that once dominated the skies – but, tough! ...The scrapyard marked the beginning of the Strategic Arms Limitation agreement between America and Russia. Planes have to be laid out in rows so they can be counted by Russian satellites before being decommissioned and dismantled... The speed and power of the jet engine totally changed the way wars were fought[– it] meant the B52s and their fighter escorts could leave Washington and be back in time for Cheers. Even the Cruise missiles they carried were powered by jets. But the jet's greatest impact was... to come in commercial travel... [I]t was here that arguably the jet's most invisible but greatest asset came to the fore – reliability... It always irritates me when people bitch on board about how bad airline food is – as if sitting [and] eating at 35,000 ft in a tin can wasn't a bit of a miracle in itself... I think one of the ways people reassure themselves about flying – and the fact that it is sort of unnatural – is not to think... about the fact that it's a machine, and... originally it was iron ore and bits of rubbish lying... under the ground... It's precisely because the engine is so simple that a fault can be utterly catastrophic. It either works perfectly or not at all... The component failure that... [caused] one of America's worst air disasters was traced back to a defect the size of a grain of sand.

...It seems an inevitable feature of modern life that as soon as someone invents something new and useful, someone else comes along with evidence to suggest it might end up killing us... The 20th century has been an astonishing breeding ground for ideas, yielding inventions that have rendered life easier, healthier and longer than ever before... The... [century] began with the horse and carriage; the ink pen and ledger; knowledge that was confined to libraries and a tiny elite... diseases, epidemics and deformities that could brutally truncate lives. It ends with robot emissaries sent from the Earth to the farthest bounds of the solar system; email and live satellite television; the democratisation of knowledge, through the Internet; and medical breakthroughs that have made the plague, smallpox and cataracts the stuff of *Bible* stories. But two of the greatest breakthroughs in knowledge – atomic fission and DNA – have brought two of the greatest perils: the proliferation of nuclear weapons and the risk of human cloning. "Science has increased [our] control over nature, and might therefore be supposed likely to increase [our] happiness and well-being," philosopher Bertrand Russell once wrote. "This would be the case if [we] were rational, but in fact [w]e... are bundles of passions and instincts."

...*The next millennium is hurtling towards us. If we want to survive it, we need to start asking: what if?* ...IN SCI-FI movies and paperbacks, the future is depicted as macabre and exciting, crowded with gangsters in sensational overcoats, armed to the teeth. The landscape throbs with cyborgs and psychopaths, jet motorbikes and aerial taxis, mad monks and malevolent black holes, oozing gore and adrenalin. If by fluke, or benign tyranny, a city survives the future with tranquillity and roof gardens – as in *Demolition* [Guy] – the inhabitants keel over with boredom, suffocated by psychobabble... This is the future for rent at the video store. Is it what we want? Each person's journey into the future proceeds... [with] a series of panic attacks about, oh, old age on skid row or a visionless government leading us into the third millennium. Mostly, the future is left to chance. This is a bad idea. We tend to become victims of other people's agendas. Yet the key forces shaping our culture compel us to look ahead – more so now than ever. Why? Because the future isn't what it used to be. It comes at the speed of light. Time to take over the controls and be part of the Futures Revolution. The goal? To shape the conditions for a civilised life in the 21st century. It's a revolution that goes to the heart of who we are and where we're heading. One of the triggers of this revolution is time. Where has it gone? The faster everything happens the quicker time disappears. Food, news, knowledge and puberty come at us quicker, leaving us breathless... Fact-based knowledge doubles every 18 months, according to a 1989 study by the Massachusetts Institute of Technology, and by 2010 it will double every four weeks. This is because about 90[%] of scientists who ever lived are living now, and working in cyberspace. The growth rate is so furious it has led to "Net time" – one year on the Internet is like seven years in any other medium... [(and] seven minutes on the Net can equal seven years in Tibet[)]... In previous ages extra information was a boon. Now it is blamed for burnout... The anarchists of the 1870 Paris commune foresaw the tyranny of time when they shot the clocks. Today, French futurists decry the ever-accelerating present as a perpetual "state of emergency." Politicians have short attention spans. Capitalists dance to the fluctuations of finance markets. In my youth speed was a drug. Now it's a lifestyle. Trapped in the frenetic present, dizzy with data smog, we're too busy to reflect on the future. But our "culture of impatience" makes it more urgent than ever to probe the horizons of our tomorrows. Like a car driving at night, the faster we zoom, the further the headlights need to shine, or we crash. The beam of foresight needs an uplift. The Futures Revolution has little to do with quirky wizards in pointy hats dusting off Nostradamus, talk-show psychics or fashion tips for 2020. It's a bid for survival. The... Professor of Alternative Futures at the University of Hawaii, has spent 30 years teaching students how to scan the socio-cultural horizon and identify patterns of change. [Hi]s metaphor of the future is an onslaught of tsunamis... whose formation his students can scrutinise, like surfers, then hop on for the ride of their lives. The next "big three" tsunamis, according to... [him], are... molecular manufacturing (nanotechnology), the human genome project, and artificial intelligence. The ultimate, though hard-to-accept, implication of nanotechnology is the abolition of scarcity. In the future, it is claimed, the building blocks of nature – atoms – will be snapped together in almost any arrangement we desire, quickly and cheaply. This will spawn a new generation of products: lighter, stronger, smarter... cleaner, more precise... In theory, we can endlessly replicate steel, diamonds, mink and cement. Science-fiction writers already depict nanotech machines on street corners spitting out speedboats and cornflakes at the flash of a credit card (though not in Calcutta). The genome project puts the levers of evolution in the hands of humans. If genetic illness can be eradicated and future fetuses customised, where does that leave God or chance? With what means will the poor avail themselves of medical miracles? ...As for artificial intelligence, it hovers around the scene as I tap these words. Powered by a brain bigger than mine, the software, Microsoft Office, alerts me to grammatical anomalies, designates its own file names and projects a loathsome bozo to dance a jig at any (rare) displays of keyboarding prowess. Thanks a lot, [Mr Chairperson of Microsoft], for imposing American spelling and entwining my emotions with your materialism... Russian scientists say they have developed the first artificial brain, a "neuro-computer" with the same intellectual potential as its human counterpart... The computer is based on the brain cell, or neuron, and outstrips previous brain models by using new findings in neurophysiology and neuromorphology to produce a truly thinking machine... But... [one Russian] scientist... says the technology could turn into a Frankenstein's monster if mistreated. "This machine needs to be trained like a newborn child. It's extremely important for us to make it a friend, not a criminal or an enemy." ...In the labs, intelligent robots – "knowbots" – are surely sorting the laundry and filing the tax. What are the legal rights of such beings...? Would you allow your child to marry one? Who has custody of the offspring? Quoting [a past] dictum – "We shape our tools, and then our tools shape us" – [the profess]or foresees the "end of homo sapiens in one form and our emergence, during the 21st century, into something totally different." What, exactly? Both artificial intelligence and genetic engineering allow us to produce other self-conscious entities... The creation of self-conscious mutations could be the entire point of our species. ['Some engineers countenance the idea that our evolutionary destiny is to create "superhumans" in the form of highly intelligent robots to take over the Galaxy.'] Some futurists see the imminent retirement of the human race. Perhaps our role is similar to butterflies: we are here merely to "pollinate machines" which do not possess their own reproductive organs – yet! As [the profess]or says: "Any useful statement about the future should seem to be ridiculous." One role of the Futures Revolution is to create a variety of scenarios ahead of time... an attempt to avoid a future by fait accompli. Futurists follow the cycles of nature, the rhythms of history. They draw from science fiction and fact, market research, intuition, imagination and quirky rumours. At seminars, audiences can be turned into futurists by tapping their collective foresight and crafting a series of alternative scenarios: bleak, benign and business-as-usual. These are not predictions, there being no such thing as a future fact, but catalysts of the

imagination. The aim is to help us to avoid a future we detest and to create the future we desire. Futurists look for “emerging issues” in five areas – society, technology, economy, environment and politics. The cement slab of building a scenario is demographics. It is expected that by the year 2050, 99[%] of the world’s population will be non-white. A global political trend, keeping this in mind, is the mounting aggression of white racists as they resist the bronzing of humanity. Another emerging issue is the assertion of community rights over the rights of the individual. Perhaps the West’s gung-ho adulation of the individual-as[-]centre-of-the-world eventually erodes those cultures which – by honouring other ways of being – creates individuals of a different kind. Asian intellectuals are increasingly agitated by... the satellite-delivered image of muscle-bound hedonists swathed in brand names, indifferent to religion... [and] the honouring of tradition. It’s a clash of ethics which is likely to escalate. A variation of this clash occurs daily, as developers with resorts... on their drawing boards clear wetlands and degrade ecosystems, regardless of communal needs – never mind the rights of the future unborn. An emerging issue in economics is “true pricing” – the incorporation into the balance sheet of social and environmental costs... As [one] economist... has noted, the expense of destroying the Earth and damaging society is largely absent from the prices set in the marketplace... In *Wired* magazine... [the] author of *The Art of the Long View*... took 20 pages to unfold the “history of the future” from 1980 to 2020, which is startlingly at odds with the projections of most social commentators. “We’re facing 25 years of prosperity, freedom and a better environment for the whole world,” [his essay] claims. “You got a problem with that?” This scenario is driven by bio-technology, silicon and sustainable energy which will “rapidly grow the economy without destroying the environment.” ...This scenario, published last year, also extols a “booming Asia” which shows the “unambiguous benefits” of thriving market economies and free trade. Mmm... back to the drawing board. But upbeat visions are useful. John F. Kennedy’s 1961 pledge – before the technical capacity – to put a [U]Ser on the moon by the end of the decade became its own fulfilment. Today, what kind of vision will inspire a nation? Perhaps that’s the wrong question. The top-down model of imposing a mission is losing its relevance, even if politicians were suddenly willing to look beyond market dictates and electoral stunts. The Futures Revolution, like all revolutions, is thrusting up from the grass roots. In multiple e-mail postings, in community halls, in offbeat consultancies, radical Websites, think-tanks, even corporate conferences... free-thinkers are thrashing out ways to redefine what it means to be human in the 21st century (already, and hopefully, deemed the Century of Healing). This upsurge goes by various names – heart politics, the new resonance, the social potential movement. A central plank is sustainability, which applies to personal lifestyle and the provision of goods and services. For... [the] managing director of the Mitsubishi Electric Corporation in the U[S], the mission of his organisation is the same as the mission of civilisation – “to develop the human ecosystem, sustainably.” ...In a stunning address to the World Future Society last year, [the director] proclaimed the rainforest a perfect learning organisation – a place that excels by learning to adapt to what it doesn’t have... “To succeed in the new economy... we must operate by the design principles of the rainforest.” ...If two businesses have the same niche, only one survives. Hence the race to cut costs and downsize... People who regard competitiveness as the key to success are wrong, [the director] says. The future belongs to those who cooperate... Fast disappearing in all kinds of organisations are job titles, hierarchies, cubicles, the office desk, even secrets... Once the corporation is viewed as a human community, rather than a hunk of property with patent rights, the Futures Revolution will hasten its ascent from feudalism to democracy. Who owns the future? Essentially it is a projection of the hopes and aspirations of the West, according to [one] British academic... “Other civilisations in the world are either irrelevant or, where they have something positive to offer, that ‘something’ (often labelled Eastern Wisdom) can easily be appropriated for the benefit of the West.” [The academic] believes that cyberspace, the bio-electronic frontier, is geared towards the “erasure of non-Western histories,” and likens its “constructed anarchy” to the rape/pillage mentality of previous colonisers. Ultimately the Net is a means of distracting the West from its inhumanity and spiritual poverty, [the academic] says. The fear of futurists from other cultures is that the triumph of the information age is set to vanquish an ageless wisdom. Having savaged the planet, is the West now in the process of colonising the future? Even the calendar is globalised. The 21st century is an arbitrary cut-off point. It has little relevance for Confucians... Muslims or the Hindus, for whom “time is the blink of Brahma.” So now we’re back to the beginning, back to the question of time, the disappearance of which spurs us to look further... into the future. And if we can rescue this future... [while] letting a multitude of cultures shape their destinies according to their own dreams, visions and aspirations, then we can also rescue a sense of time. A time to reap, a time to sow, a time to reflect... [upon] converting our state of emergency into a state of emergence... [Speaking of reaping state emergencies from what is sown,] Britain’s BSE – “mad cow” – epidemic has cost the country £4 billion, claimed the lives of 43 people and triggered fears that the death toll could reach several million. And it appears it was caused by a scientific experiment which went wrong. Experts believe hormones taken from the brains of slaughterhouse carcasses were injected into cows in a bid to create a new breed of super-cattle... [T]he Ministry of Agriculture refused to be drawn. “It is a theory being considered, but it is only a theory.” ...[the ministry’s response was predictable as] families of victims of the BSE-related CJD... are suing the Government... The... inquiry into the BSE epidemic has uncovered a tale of rivalry between government departments, inadequate hygiene enforcement in slaughterhouses and breakdowns in communications between ministers and public servants. The scandal... [led to] Europe’s ban on British beef... and is blamed by many for laying the groundwork for popular public protests against genetically modified crops.

...I... find... it... hard to think positively about genetic engineering. While my brain comprehends the methodology of gene modification and some possible beneficial outcomes, I feel sick in the gut... when I think about it. It’s not that I’m hostile to science... Far from it – I studied sciences at school and university, and I try to keep up with new thinking... and technology. I’d be lost without electric water pumps, computers... the fax... and look forward to some of the possibilities of nanotechnology... Good science and applications of science in appropriate technology have done wonders for our comforts. Rational thinking and research can free us from traps of anecdote and superstition, promote civilised understanding and decision-making. Appropriate technology can reduce waste, promote health and safety, as well as improve communication. However, not all science is good... and technology does not guarantee survival. Some of the experiments being undertaken by genetic scientists are nothing more than insane tinkering with the fabric of life[(‘glow-in-the-dark tropical fish are the first creatures genetically engineered just for our amusement’)]. Good science involves careful observation, prediction and testing. The problem with much genetic manipulation is that the testing process itself may produce unpredicted, irreversible changes in our biosphere. This goes beyond science. It is human beings playing at being gods. Our myths – Prometheus, Maui, the Tower of Babel – tell us that when [mortals] steal from or try to be gods, they are punished[or]... destroyed. Mind out, our ancestors said. We need feelings as well as thoughts, we need to keep head and heart in balance or else our hands will do horrors we cannot easily undo... We are right to feel enraged when multinationals turn functional, self-feeding communities into cash-crop mono-cultures, supplying luxuries for the rich and obese of the world, while local people, their land and customs degraded, seek survival in the slums of cities. We are right to be appalled by pictures of bloated-belly fly-blown children, maimed by... wars and famines. [Humanity] has made a huge mess on this planet, as well as some significant improvements. The two main causes of the messes are uncontrollable greed (feeling without reason) and inappropriate technology (reason without feeling). To improve the world we need to become both more reasonable and compassionate. We already have more than enough technology... Of course, some genetic modifications might be helpful. Crippling diseases might be prevented; useful changes might be made to the Y chromosome... But before scientists do any more jiggling of genes they should surely solve the problems they have already created. We need extensive, well-informed public debate about science, and about morality, before we take the next steps towards our evolution... as a species.

...In a few... [month]s, scientists will have completed the Human Genome Project, the mapping of all the genes that make up a human being. After four billion years of evolution by the slow and clumsy method of natural selection, we have now evolved to the point where we can direct our own evolution... But those who hail it as important as the splitting of the atom seem to have forgotten the horror to which [that] led. Where is this latest tinkering going to take us? Genetic screening of fetuses, job applicants, potential partners...? The perfection-obsessed world of... 1997 sci-fi film...

Gattaca... is now scarily close, but there are no controls over how the discovery will be used... If only we had acquired this knowledge sooner, the following people would never have been born: Homer, blind from birth; Napoleon Bonaparte, epileptic...; [British physicist (r:p2673, ln25 + p1123, ln18), motor neurone disease; C.] Darwin, chronic invalid... Of course, the other birth that would... never have taken place is your own.

...a professor of mathematics at Cambridge University and probably the world's most recognised... academic, paralysed by motor neurone disease... who wrote... the best-selling book *A Brief History of Time*... has raised the spectre of a *Terminator*-style future in which computers will take over the world unless we beat them by adopting genetic modification. The... [physicist]... says computers are developing far more rapidly than humans. Therefore... we must change our DNA or be left behind... Humans could "raise the complexity" of the DNA they were born with, "thereby improving people"... And the genome project to crack the entire code of human DNA opens up the ability to alter the chemical strands...

Scientists publish the initial sequence of the human genetic code this week in a scientific achievement that will revolutionise science and medicine. The... achievement[marks] the end of a decade-long endeavour by scientists in the U[S], Britain, France, Germany, Japan and China...

Researchers reading the "book of life," as the human genome is known, have made the startling discovery that much of it is rubbish. The first analysis of the entire set of 3 billion human genetic instructions has revealed far fewer genes than scientists expected. Only 1.1[%] of the length of the genome consists of genes and scientists have found our genome is more filled with litter than any completely sequenced so far. The surprisingly small number of genes means humans have only half as many again as the simple roundworm – 31,780 compared with the worm's 19,099. Researchers had thought we might have up to 140,000 genes. But scientists speculate that the junk, known as transposable elements, works in an unknown way to make humans more complex than worms... [T]he tiny thale cress plant has 26,000[genes; a]... dog is 85[%] identical to a human...

The largest bacterium ever identified... [- measuring] .75mm, or about the size of a full stop... [-] has been found by researchers sampling ocean dredgings in the South Atlantic. The microbe, discovered near Namibia, lives by absorbing sulphur and nitrates, and swells as the chemicals are stored inside its cell walls... [In related news, t]he claim that it is "unnatural" to create genetically modified creatures by moving genes between different species has received a knock with the discovery that hundreds of our human genes probably originated from bacteria. The remarkable revelation that we are all a bit microbial, that dozens of our genes were created by parasites called transposable elements, or "transposons," underlines how nature is stranger than we can conceive. These alien influences on our genetic make-up are reported... by the publicly funded International Human Genome Sequencing consortium... The consortium found 223 genes – including one that plays a role in depression – that are the codes for proteins very similar to those made by bacteria. These genes have no similarity to those of yeast, worms, flies and mustard seed, the other organisms whose genetic secrets are now laid bare. The team rules out contamination as a possible explanation – despite claims to the contrary by its commercial rivals – and suspects that the genes were transferred to humans from bacteria, as bacteria often exchange genes in their equivalent of sex. Bacteria are not the only parasites that seem to have been tampering with our DNA. There are also genetic parasites, "duplicate me" instructions that have been passed down over the generations... One scientist has suggested that, under stress, the parasites may go into action to enable a richer repertoire of proteins to be made to help us cope. In other words, these particular parasites "earn their keep in the genome." ...The consortium has focused on the most common Sine parasite, called an "Alu," and found that it likes to lurk in gene-rich regions. There is evidence of a 13-fold enrichment in these regions over the past 30 million years, and it seems these "selfish" elements may benefit us in some way.

...Discover of selfish gene... In 1964 William Hamilton wrote a paper on "the genetical evolution of social behaviour" which became the most cited paper in all science. The question that obsessed Hamilton, if none of his peers, was how altruism could evolve. The prevailing view in biology was that animal behaviour was always devoted to the "good of the species." To Hamilton... [- b]orn in Egypt of N[Z] parents, died in London on March 7, aged 63... [-] that made no sense because an animal's closest competitor was often a member of its own species. H[amilton] posited that animals might be selected to have altruistic instincts towards relatives... His paper was the first clear statement of what has become known as the "gene's eye view" of evolution, the "selfish gene" school, or "socio-biology" – the theory that individuals are vehicles for competing genes... As a shy and lonely graduate student dividing his time between the London School of Economics and University College, London, Hamilton was ignored at one institution and mistrusted at the other. H[amilton] wrote of this time at University College: "I never had a desk there nor was ever invited to give any presentation to explain my work..." In 1977 [Hamilton] moved to the University of Michigan, where [William] experienced the controversy stirred among radical students by opponents to the sociobiological theories [it] had spawned, enduring protests and sit-ins. In Michigan [Hamilton] published two influential theories. One... was on the evolution of sexual reproduction as a means of combating parasites – the Red Queen theory.

...[Guys] get another excuse SO marriage stifles the creative genius of [guys]. A Canterbury university researcher says once [guys] have snaffled a chick they no longer feel the urge to compete. Their work is done. They have impressed a member of the fair sex sufficiently to win her. Once lured into the domestic trap, they become careworn husbands and fathers, exhausted and drained of ambition which may have sparked inspirational thoughts and creativity. These findings, which have been published all over the world, were a result of looking at all the works of great [geniuses] over the centuries, and the age at which their breakthroughs were made. Sadly for those husbands and fathers who still believe their genius can be fulfilled, most of the truly ground-breaking work was achieved by [guys] who had remained maritally unencumbered. Hardly surprising really... Then again, geniuses' lives weren't all that happy. Most were troubled souls who never felt appreciated and loved in their lifetime.

...Let not your heart be troubled... SINGERS croon that it makes life worth living, poets declare it to be the answer to the human condition. Now scientists have come up with a definition of love: it's a warm patch near the centre of the brain. Neurologists have shown that when you see your beloved, parts of your brain "light up." The heart has nothing to do with it, apparently. A study by... University College London, confirms that being in love is physically different from merely liking someone. Physical effects of this brain activity may account for the traditional sensations associated with love, including euphoria, butterflies in the stomach, loss of appetite, love sickness and love addiction... The caudate nucleus and the putamen are believed to have a role in addiction. They could explain why lovers seem rarely to learn from experience, and keep coming back for more. Equally important to the sensation of love is the reduction of other brain functions. Activity in the post-cingulate cortex, an area associated with sadness, was reduced, and the pre-frontal cortex, which is linked to depression, was virtually inactive. Despite suspicions from some quarters that [guys] are cold and heartless, with only one thing on their minds, the study shows the brain patterns indicating love were the same for... [both sexe]s. The findings could have practical implications: for example, in... raising the prospect of love-detector tests if you suspect your beloved's amorous claims[;] ...to produce the first aphrodisiac to promote love rather than lust[; in]... developing drugs to help to tackle depressive illnesses.

...Scientists have put the brain's mysterious sleep-inducing cells under the microscope for the first time in a discovery that could... lead to improved drugs for insomnia and other sleep disorders and to cures for problems caused by sleep deprivation, such as memory loss... A team of Swiss and French scientists have reported in the journal *Nature* that a study of rat brains enabled them to understand how neurons that induce sleep and wakefulness interact in the brain. The intriguing question of why and how we sleep has stumped scientists for many years, and it remains a mystery how sleep neurons in the brain are activated and why... "We spend a third of our lives sleeping, but sleep is still a big unknown," said[a] co-author of the study and a professor at Geneva University. "Despite all these years of research, no scientist can tell us why we sleep..." ...But after a year of research, the scientists said they had discovered that sleep-inducing nerve cells, when activated, blocked neurons in the brain that led to wakefulness... Four years ago, [an]American scientist... traced the location of these neurons to the ventro-lateral pre-optic area of the brain...

People who are not blind can still fail to see, as a result of unattended visual information escaping awareness. By studying such loss of awareness after brain damage, combined with brain scanning, scientists are beginning to unravel the neural basis of conscious visual experience. Their work at the Institute of Cognitive Neuroscience at the University College London is also helping to lead to new treatments for conditions which affect

many thousands of people, usually as a consequence of stroke. Light reaches our eyes from many sources and many visible objects, but at any one time we are consciously aware of only a few of these stimuli. We can to some extent choose where we direct our attention, and this can alter our visual awareness of the world even when the image entering our eye remains unchanged. Experiments have shown that we can become completely blind to information that we are directly looking at, if our attention is directed to something else. This is called “inattention blindness.” ...Inattention blindness can be brought about by some forms of brain damage in which patients become permanently unaware of events on one side of their field of view, usually the left side... [T]his condition... is... known as spatial neglect... By using computer-generated displays... the Institute... ha[s] shown that some patients... can have some conscious vision restored in the neglected part of their visual field. This provides evidence that some neglected events can be brought back into the awareness of a patient... by harnessing the residual function of unaffected areas of the brain. Wearing spectacles with the right half of the lens for each eye covered has also been shown to help some patients affected by spatial neglect to regain some awareness of events in the left-hand side of their field of vision. So has the use of prisms which redirect light from the left to the right-hand side of the visual field. There is hope that more effective treatments may be devised. Researchers are discovering that the brain is more plastic and adaptable and has more capacity for self repair than used to be thought, even in middle and old age.

...*The right hand is blind to the left...* THE human body is a machine and the brain just some fancy computer. That’s the outrageous conclusion 400 years of science have led us to. It seems absurd – even heretical – yet when something goes wrong with your machinery you realise just how much truth is in it. Like the night I was watching television and the picture mysteriously degraded. When frenzied channel-changing and a few good thumps had no effect, I rushed to the nearest mirror for a good look at my eyes. The right one seemed fine but the left eye wasn’t so good. In fact it wasn’t there. Indeed the whole left side of my face was missing. Now, you don’t see that every day. The weird thing was, there was a blank spot where the missing features should be. My field of vision *seemed* completed, it was just that only half my face filled it. Scientific curiosity didn’t last long though. I looked around the room and noticed half of it was missing as well. Started to panic a little... This was a brain thing; not an eye thing... I rushed to hospital, stormed up to the right-hand-side of the front desk and blurted my symptoms to the half-nurse. “Ah, you’re just suffering a retinal migraine, mate. Sit down for a while and it will go away.” I did, [the nurse] was right, and I was embarrassed. But those few hours did, at least, make me personally aware of how machine-like our thinking organs really are. My brain went from some mysterious magical entity, to just another computer, capable of crashing. Brain studies over the last few decades have revealed some remarkable things. For example, it’s more the case that we actually have two brains cobbled together in our skulls[(and we’re not talking about a brain’s ‘higher intelligence part and lower, or primitive, part – which activates in times of danger’ – here)]. The left hemisphere being a complete thinking organ as well as the right[(note that ‘sticky switching – slow brain side switching – is a biological condition which isn’t recognised by psychiatry’)]. Indeed the main lines of connection between the two halves can be severed without killing the patient. This operation has been carried out many times (in last-ditch attempts to cure epilepsy) and afterwards it is hard to spot a personality difference in the patient. But in the lab the differences are incredible. A patient is sat down in front of a screen and different images are projected on to the screen’s left-hand-side and right-hand-side... [A] snow scene might be on the left and a chicken’s foot on the right. For most of us, images to the left of the nose are processed by the right brain, and images to the right by the left. We then integrate the two pictures. But for split-brain patients, whose communication channels have been cut, the two images remain separate. Ask them to point to a picture that relates to what they’ve just seen on the screen and you’ll get different answers, depending on whether they point with their left or right hands. (Because each hand is controlled by a different half of the brain[; ‘the human hand is the most complex in the animal world, and more of the brain is devoted to operating our hands than any other part of our body’].) The right hand will point to a picture of a chicken because its half of the brain saw the chicken foot. The left hand will point to a snow shovel. The mystery deepens when the patient is asked why their left hand chose the shovel. The problem, you see, is that speech is controlled by the other side of the brain and it has no idea why the left hand is doing what it’s doing. But, as quick as a flash, the speaking part of the brain just makes up a plausible answer. It is not a snow shovel, it insists, it is a chicken dropping scoop. With our grey matter able to make executive decisions like this, it makes you wonder just how much control we really do have over the choices our computer (or computers) make. Maybe we have no free will at all, like every other machine in the universe.

...[‘It’s consciousness that separates humans from animals. Or is it?’ The word consciousness was invented three hundred years ago to describe the fact that we know that we have thoughts and sensations – we are aware of experiences, we know we exist. We take it for granted that other humans are similarly aware. But what about animals? Most pet owners think their animals are conscious, have a sense of who they are. But do they? Perhaps even the most human-like animals, such as chimpanzees, are not conscious at all? This question seems to be beyond the limits of scientific inquiry, but it’s one that scientists – who, like everyone else, are divided on this important issue – are currently finding ways to investigate.]

...Justice would seem a human concept if ever there was one. Its allure has stirred souls as diverse as American and French revolutionaries, British abolitionists and sign-wavers at the recent W[TO] talks... Many of the world’s religions think of justice in sacred terms, as something ultimately meted out by God. But among more secular thinkers the only question is whether it is an inalienable part of who we are, or – as many economists seem to believe – a patina of culture slapped onto the human animal, who is forever on the verge of reverting to his natural state of brute selfishness. Human motives, the latter argue, come down to one thing: self-interest. The latest salvo in this longstanding debate comes not from philosophers, economists or priests, but... the lab. After a four-month study of capuchin monkeys... Emory University in Atlanta... came to a startling conclusion: these primates have a rudimentary sense of justice, and in some cases are willing to take a stand against injustice even at the cost of their own well-being. The findings... suggest... justice is not so much a product of nurture – a lesson taught by parents and community – as an evolved trait. For humans, the implications are clear: if lower primates have an inborn sense of justice, humans probably do too. Does this mean that... Thomas Hobbes and Adam Smith were wrong about our selfish natures? “Economists have always disregarded the sense of fairness because it’s not considered to be a rational behaviour... Now it looks like it was there long before advanced cultural institutions came about.” ...Scientists may never succeed in tracing how the fairness instinct grew into the even more enlightened sense that... “any [perso]n’s death diminishes me, because I am involved in [hu]mankind.” That may not matter so much. There is probably no need for monkeys to share all of our virtues.

...Gossip around the watercooler may not be the time-wasting nuisance that bosses think it is – and one Auckland University academic is poking her nose into everyone else’s business to find out... how gossip and rumours spread and operate in the workplace. But... [the] senior lecturer at the Department of Management and Employment Relations... has quickly realised that pinning down those hushed chats is like bottling fog. Studying gossip on her home turf, [the lecturer] has found a reluctance among university colleagues to admit they gossip. As soon as [the lecturer] traces a juicy rumour to whoever started it, they deny ever doing such a thing or say they were misinterpreted. [The lecturer] has also run into concerns from interviewees – people think there is something wrong with gossip itself but something even more suspect about a person who researches the topic. [However, r]esearchers from many fields have spent the past 50 years studying tittle-tattle, says [the lecturer – although] their discoveries have not been applied to situations such as the workplace. It is a common idea that informal communication in the office is important, but... [m]anagement tend to see it as a negative, divisive influence in the workplace... [in addition to being] a waste of time, morale-sapping and show[ing] a lack of control. They also fear it helps to pass on false information... Positive aspects of gossip include stress reduction, a feeling of solidarity, teamwork and friendships... And who gossips the most? Most researchers agree that [gals] pass on gossip more readily than [guys], but do not tend to start it as much... [By the way, p]sychological stress and unhappiness at work are leading predictors of occupational overuse syndrome, fresh research has revealed. This calls into question the widely held belief that pain in the forearm is caused purely by repetitive movements of the arms or wrists. In the past many doctors dismissed complaints of... OOS... or RSI... as it is also known, as being “all in the mind.”

...Just because you recall an event is no reason to believe it happened... Your brain may be recreating the past... In the July issue of the *Journal of Experimental Psychology*, [a]... psychologist... of the University of Puget Sound... conclude[d] that the mind's drive to infer causes can fool people into "remembering" something they never saw. In other words... "memories can be illusions". When it comes to memory problems, forgetting is only the tip of the iceberg. The failures and failings of memory run much deeper than an inability to recall your neighbour's name, the capital of A[US] or the location of your keys. Much recent memory research has focused on why we forget... but not the rest of it. But unlike absent-mindedness and other "sins of omission", as [a] psychologist... of Harvard University calls them in his new book, *The Seven Sins of Memory*, memory's "sins of commission" shape – and often distort – our view of reality and relationships. Some of those sins are: *Blocking*. Somewhere between remembering and forgetting lies blocking. You know that the word for an oration at a funeral begins with a vowel, maybe even a "u"... but it just won't spring into consciousness... *Misattribution*... In misattribution, people unconsciously transfer a memory from one mental category to another – from imagination to reality, from this time and place to that one, from hearsay to personal experience. The brain has made what psychologists call a "binding error", incorrectly linking the content of a memory with its context... *Suggestibility*. In this memory error, people confuse personal recollection with outside sources of information. Suggestibility is therefore a form of misattribution, but an especially pernicious one... *Persistence*. Memories that refuse to fade tend to involve regret, trauma and other potent negative emotions. All emotions strengthen a memory, but negative ones seem to write on the brain in indelible ink... That's especially true if the memory reinforces your self-image: if you think of yourself as a screw-up, you'll have a hard time erasing the memory of the time you spilled wine all over your boss... *Bias*. It is a cliché that couples in love recall their courtship as a time of bliss, while unhappy pairs recall that "I never really loved him (or her)". But the cliché is true. "We rewrite our memories of the past to fit our present views and needs,"... That may be an outgrowth of forgetting: we don't recall how we felt in the past, so we assume it must be how we feel today. But often bias arises when more powerful mental systems bully poor little memory. The left brain, driven to keep thoughts of yesterday and today from conflicting, reconciles past and present as boldly as the Ministry of Truth in Orwell's 1984... Stereotyping can also bias memory... When memory conflicts with what you're convinced is true, it often comes out on the losing end... As much as 70[%] of the population reports having experienced some form of *deja vu*. While there is much speculation as to how and why this phenomenon occurs, several psychoanalysts attribute it to... a mismatching in the brain that causes the brain to mistake the present for the past.

...Sleep tends to help people better remember aspects of a negative event while allowing memory of background information to fade, researchers have found. The brain "seems to make adaptive 'decisions' about what to remember and what to forget," says... Beth Israel Deaconess Medical Centre and Harvard Medical School in Boston... This suggests the sleeping brain does more than simply consolidate whatever one puts into it...

Researchers find novel way to learn and remember new motor skills A thinking cap that can enhance the mind's ability to learn has moved a step closer, scientists claim, after tests showed magnets can boost brain power. Researchers discovered that the ability of the brain to learn a task and remember it was greatly enhanced when a magnetic pulse was applied to the premotor cortex – the area of the brain just behind the forehead... How fast you can throw a ball or run or swerve a steering wheel depends on how quickly brain cells fire off commands to muscles. Fast firing depends of good insulation for your brain's wiring. Now, US research suggests that in middle age, even healthy people begin to lose... insulation in a motor-control part of the brain – at the same rate that their speed slows. That helps explain why "It's hard to be a world-class athlete after 40"...

Remember the day when you fell out of your cot as a baby? Or your mum took you to the beach aged one? If so, [an] Otago University psychologist... believes your memory is playing tricks on you. Babies can remember things day to day, but people cannot remember things before they [could] talk because they did not have the words to express them... [M]ost people have lost any true earlier memories through "infantile amnesia"... [In other news from the world of science,] the precise origin of the Aids virus... [has been] pinpointed... Scientific sleuths found that... chimps ate monkeys infected with separate viruses >> The viruses combined. >> When humans ate the infected chimps, the HIV/Aids virus began.

...In a ground-breaking study, scientists at Harvard University report that it may be possible to "educate" the body's immune system to keep the... Aids virus... under control in the absence of anti-Aids medicines... The approach involves starting patients on potent Aids drug cocktails, then temporarily stopping the drugs when the patients' virus count drops below detectable levels... The finding[is] based on a study of eight patients... All eight were able to go off their medicines for a time without the virus gaining the upper hand. And five of the eight have now been off the drugs – and kept the virus at bay – for more than six months... The Harvard findings, published in the British medical journal *Nature*, confirm scattered reports of a few HIV patients who stopped taking their medicines on their own and seemed to suffer no ill effects. The first such case, known as the Berlin patient, drew attention at the international Aids conference in Geneva in 1998. The fundamental premise of the approach is rooted in basic biology – in order to combat germs, the immune system first has to "see" them. But when patients are on the powerful Aids drug mixtures, their viral levels are so low that the immune system is not activated. By temporarily stopping a patient's HIV medication, doctors give the virus still lurking in a patient's body a chance to multiply. Once they come back, the immune system can then "see" them and send out white blood cells to attack. When the virus count rises to dangerous levels, doctors can again give the drugs to bring it back down. By repeating stops and starts of drugs, scientists hope that the immune system will eventually get stronger and stronger in its ability to combat HIV.

...Scientists... at Harvard Medical School... have made a breakthrough in the development of an Aids vaccine, using the genes of HIV, rather than the virus itself, to stimulate... the "killer" cells of the body's immune defences. Vaccinated monkeys that were subsequently injected with a highly virulent strain of an Aids virus remained healthy, while half of those that were not vaccinated died. Although such a DNA vaccine is primarily aimed at boosting the chances of someone surviving an HIV attack, the scientists also hope it will have a prophylactic effect by making it less easy for the virus to spread from one person to another... But... even if a DNA vaccine failed to prevent HIV infection it would still be an important weapon in the war against Aids.

...Researchers at the United States National Centre for Atmospheric Research were surprised to discover stressed plants produce an aspirin-like chemical that can be detected in the air above the plants. The chemical may be a sort of immune response that helps protect the plants... According to the researchers, the finding raises the possibility that farmers, forest managers and others may eventually be able to start monitoring plants for early signs of disease, insect infestation or other stresses. Currently they do not know if an ecosystem is unhealthy until there are visible indicators, such as dead leaves... While researchers had known plants in the laboratory produce a form of aspirin known as methyl salicylate, they had not, until now, looked for it in the forest. Previous studies have shown plants being eaten by animals also produce chemicals that can be sensed by other plants nearby... [Incidentally, a] program that keeps cats off computer keyboards has won [its] creator... one of 10 annual "Ig Nobel" prizes. The Harvard-based spoof of the real Nobels recognises achievements that "cannot or should not be reproduced." Recipients include two physicists who used magnets to levitate a frog, an A[US]n author who believes people don't need to eat, and a Canadian biologist who studied the tastiness of Costa Rican tadpoles. "There are certain ideas that occur to only one person," said... [the] editor of the Cambridge-based journal *Annals of Improbable Research*, part of the group that bestows Ig Nobels... Recipients of real Nobel Prizes were to present the awards on Thursday, but it is unlikely the Royal Navy will parade for a peace award for ordering that sailors in training shout "bang" instead of using live cannon shells.

...Some U[S] money intended to help find civilian work for unemployed weapons scientists in the former Soviet Union has gone to scientists working on Russian weapons programmes, a congressional study found. The General Accounting Office (GAO) study, released yesterday, also said that only a small percentage of money in the programme, overseen by the US Energy Department, seemed to be getting to the intended recipients. The... Senator... who asked for the study, said the findings were "of enormous concern to me and others in the Senate. It is absolutely unacceptable for the [US] Administration to donate the US taxpayers' money to Russian scientists who spend their time working on poison gas, biological agents

and new nuclear weapons designs for the Russian Government...,"... The GAO report... said the projects the scientists were working on "may not be adequately reviewed by US officials." The... report did not say how much money had gone to such scientists... [but] said that of the \$US63.5 million... spent so far on the programme, just \$US23.7 million... went to scientific institutes in Russia and other former Soviet states. About 63[%]... of the programme's funds was spent in the U[S], mostly by the Energy Department's national laboratories "in implementing and providing oversight of the programme." Furthermore, the... amount of money actually reaching the scientists at the institutes was unknown because these institutes were withholding some of the money in taxes and "other fees." ...■ Russia's political and economic turmoil... threatens to derail the... International Space Station... project. If Russia collapses, the launch schedule will collapse with it, forcing American taxpayers to pay still more.

...THE U[S] and 15 partners have finally embarked on perhaps the most difficult and expensive engineering project in history – building a small city in space. Under design for 15 years, the Nasa International Space Station will take at least five years and \$94 billion to complete. When finished, it will cover an area nearly as large as two football fields end-to-end... Construction began on Friday and many engineers are already comparing it to structures that were the highest technological achievements of their time, such as the pyramids of Egypt and the Panama Canal. But at its heart, the station is something else: The first attempt to unite the world to explore space. Nasa officials say the station will be a permanent foothold in the heavens and serve as a proving ground for the technological advances needed for bases on the moon or expeditions to Mars... Since the... station... [w]as... first proposed... in 1984 as a \$15 billion effort... to mark the 500th anniversary of the discovery of the New World by Christopher Columbus... it... has gone through a dozen redesigns, several project chiefs have quit in frustration, and the outpost has barely survived an attempt by Congress to kill it... The huge cost... [– which doesn't include e]stimated annual operations support... of... \$24 billion... [–] is causing critics to call the station a welfare programme for the world's aerospace industry, which has been suffering since the 1991 fall of the Soviet Union. Perhaps the biggest stake involves Russia, which was brought into the project by [the US]President... in 1993. Station money is helping convert Russia to capitalism by keeping aerospace plants open and employing engineers who otherwise might be developing nuclear weapons for rogue... countries... Nearly 200 companies are involved around the globe – including 127 firms from 21 American states – providing pay for 100,000 workers... Yet as impressive as the station's potential might be, aerospace experts say its successful completion is uncertain... [Furthermore, m]any scientists from around the world say the station is a financial black hole that will produce few scientific results while draining scarce money from research on Earth... And many observers question whether N[asa] can safely carry out the most complicated endeavour ever in space, noting the danger of the construction industry on earth. To grasp the risks, consider this: ● The construction site is 400km above Earth, and 450,000kg of prefabricated building material will have to be hauled up by rockets that could explode. ● Experts say the loss of one of those vehicles is likely during the 36 US space shuttle and nine un[peop]led rocket missions required to raise the outpost. Besides the possible loss of human life on a shuttle, which would ground the fleet, an accident could add billions to the... cost by requiring Nasa... to replace whatever station parts were destroyed. ● The station will be assembled by... 144 space walks... If a space suit gets torn on a piece of jagged metal, it could mean instant death.

...*Marriage made in heaven*... [Y]esterday... two... US astronauts... took 4 1/2 hours to complete the cable couplings marrying the US-built Unity module, the Russian Zarya power station and the adapting module connecting the two... The... astronauts... us[ed] largely unrehearsed methods to... connect[the] 40 cables and umbilicals that will carry electricity, data and computer commands through the newly joined segments of the space station... [They] worked tethered together all over the seven-storey structure docked to Endeavour... While... [t]his... first of about 75 spacewalks totalling more than 1100 hours... [was being completed, space scientists were saying that] radiation belts surrounding Earth could become extremely powerful in a matter of seconds, posing far greater risks to spacewalking astronauts and communication satellites than previously believed... "We had thought the radiation belts were a slow, lumbering feature of Earth but in fact they can change on a knife's edge,"... The observation, discussed at the American Geophysical Union meeting in San Francisco, caught scientists by surprise. The doughnut-shaped structures, known as the Van Allen Belts, extending more than 32,000km around the planet and discovered 40 years ago, were thought to be very stable. But it now seems the planet's own magnetic field can accelerate electrons in the belts to the speed of light, transforming them into "killer electrons"...

Nasa's latest trick will be to extend a 59m boom from the space shuttle Endeavour to capture 3D measurements of Earth. It will be the longest rigid structure ever deployed in space, and will have radar scanners at each end, so scientists can measure the Earth's terrain with stunning accuracy... swath by swath; each 225km wide... Because of last-minute safety issues, Nasa... cut a day of mapping from the mission... due to launch tomorrow... Nasa officials want to leave time at the end of the 11-day flight in case there are problems bringing in the mast. If it gets stuck, two astronauts will have to spacewalk to crank it in... But even so, scientists still will be able to map... 70[%] of the Earth's terrain. They expect to collect enough data to fill 13,000 [CD]s that will take one to two years to analyse... They are expecting nine times more topographic data than at present recorded, and expect it to be twice as good. The detail will give the US military a better idea where to deploy troops, launch fighter jets and fire missiles. On the civilian side pilots will have a better grasp of landing sites, communications companies will know where to install towers for cell phones and satellites, and disaster-relief teams will be able to better cope with floods and earthquakes. A byproduct of the mission will be a snapshot of the planet at the beginning of the 21st century... ■ During the 1960s, when both Russia and the US were trying to beat each other into space, they came across a problem – ballpoint pens would not write in zero gravity. The [US] gathered a group of scientists together and spent millions of dollars trying to invent a pen which would write in space. The Russians took the simple approach and decided to use pencils instead!

...When a Soyuz spacecraft delivered [an]American astronaut... and two Russian companions to the International Space Station this week, Nasa threw a little party at its Houston headquarters – to which one of the most star-crossed figures in the space race was not invited... [A] Texas banker, has just blown \$US200 million... on something called the BA-2 – an almost-complete attempt to build the largest and most powerful rocket since the Saturns that took America's astronauts to the moon more than 30 years ago. Nasa's shindig was an upbeat affair, so it was just as well the bitter B[anker] was not there. Though [the banker] is not given to violence, [hi]s grievances against official U[S] space policy in general, and Nasa in particular, are such that [it] might well have socked someone. [The banker's] beef is simple. Nasa has sabotaged at every turn his efforts to make space a paying proposition... By subsidising Nasa to the tune of billions of dollars, US taxpayers are allowing it to kill off better, much cheaper, launch systems – like the one [the banker] has just scrapped. Originally conceived in the... years[of the 40th US Administration], the Space Station began life as an affirmation that the US could whip the Soviet Union any damn place it chose. By the time... the [41st Administration] moved into the White House, Soviet space efforts were faltering, as was the Soviet Union. With its budget and future at stake, Nasa retooled. From asserting America's Cold War superiority, the station became a staging post for a return to the moon and, after that, the [peop]led Mars expedition [the 41st President] pledged for 2019. Meanwhile, the cost went from \$US8 billion to \$US12 billion. When the [42nd Administration's] era began in 1992, sceptics were already suggesting the station's motto should be something like that old line from *Alien*: "In space, no one can hear a taxpayer scream." Told by Congress that \$US400 billion to visit Mars was absurd, Nasa... did another remodelling. The name changed from Freedom to the International Space Station, while the Russians – the very people it had been conceived to intimidate – came on board. But Moscow's woes made its participation dependent on "loans" from the US, ...which [currently total]... \$US30 billion. And that covers only construction. After a decade in orbit, the sum will be \$US100 billion – Nasa's figures, not one from its critics. And what will the space station do? According to [the banker], nothing more than give the current space shuttle fleet and its successors a place to visit – justifying that other, gold-plated foundation on which Nasa continues to build its future... [A] space-industry advocate, says there is no experiment that cannot be done better and cheaper on a shuttle or an un[peopled] orbiter. The advocate] says it takes about \$US65,000 to get every kilogram into orbit on a shuttle, once maintenance costs and 25

years of overheads are factored in. Nasa says it is never more than \$US10,000. But by [the banker]'s reckoning, both figures are beside the point... [H]is BA-2 could do the job for \$US2000 a kilo – perhaps half as much again once initial research and development had been amortised. But while his innovative, hydrogen peroxide-fuelled booster worked flawlessly in a recent static test, it will never take to the skies. Nasa made sure of that.

...*Bleach to help Kiwis clean up in space* A SCIENTIST has an out-of-this-world plan to launch Hamilton into the space race... [The 44-year-old] American scientist and pacifist... who has been living in N[Z] for two years... wants to design and build a space plane fuelled by bleach – and [i]s looking for \$30 million to do it... [The American has already] set up a Hamilton-based company, FireShips NZ, and has started experimenting with the help of volunteers. “I want to tell people the truth – that space flight can be low-cost, not harm the planet and that science can be used for good... Some people say I’m an idiot but a lot of people understand that what I’m talking about makes a lot of sense.” ...[□ NZ]ers will be able to catch their best glimpse of the \$135 billion International Space Station as it passes overhead in the next few days. It will be the station’s first pass over the country with its 73m-long solar panels unfurled. Auckland Observatory... says the station will appear as a bright, moving star from tomorrow... The huge high-tech spacecraft, whose assembly will take six years and 43 space flights to complete, w[ill]... be most visible at 5.11 am...

After two years of delays and hiccups the seven-m[ember] crew of American astronauts and Russian cosmonauts managed a trouble-free launch from Kennedy Space Centre despite storm threats... The team will get the International Space Station ready for its first long-term crew – due to arrive in November... When... [t]he space shuttle Atlantis... reaches the station site it will offload about 2200kg of computer hardware, clothes, water, exercise equipment and a toilet... The water is a byproduct of power generators on... space shuttles... The shuttle programme has been plagued with delays because of bad weather and technical problems since 1998... The launch from Cape Kennedy was the 99th in almost 20 years.

...space shuttle Discovery flew six times with a faulty part in its main engine... A turbine seal that had been rejected as faulty and should have been discarded was instead installed on Discovery, which flew... most recently in December on a rescue mission to the Hubble Space Telescope.

...An astronomer in California has emerged as a key witness to solving the mystery of the disaster that killed seven astronauts, rained debris from the sky and threw the U[S] space programme into disarray. Nasa stressed that it could take weeks, even months, to determine what caused the Columbia to break up 63km above the Earth, but suspicion has focused on damage to heat tiles when a piece of foam insulation fell off and hit the left wing at launch... A[n AUS]n working at an observatory north of Los Angeles, sa[w]... flashes that could have been tiles falling off the Columbia as it streaked over California on its way to the scheduled landing in Florida. If [the astronomer] is correct, it suggests the shuttle was disintegrating more than 3000km from its destination... Although Nasa’s computers were picking up heat problems in parts of the Columbia, the tiny holes [where the foam hit the wing] were too small to be picked up on its radar, said experts... The shuttle, covered with 24,000 extremely heat-resistant but fragile tiles, would never have survived the stress of 1600C temperatures and 20,100km/h speeds on re-entry with its heat shield breached.

...Astronaut Laurel Clark’s death on the space shuttle Columbia was the second sudden and very public tragedy to hit... a 76-year-old retired Episcopal minister... and [his wife] in 17 months. Laurel Clark was their niece and her final moments were broadcast again and again on television as exploding white dots 60,000 metres above the Earth. On September 11, 2001, television had first brought tragedy. The [couple] were watching after the World Trade Centre absorbed the impact of a terrorist-piloted jetliner, burned and then collapsed, with their 41-year-old son Timothy inside... Timothy’s wife... lost a brother in the September 11 attacks. Robert W. Spear, jun, 30, was a... New York Fire Department... firefighter...

Tragedy revives memories... The circumstances were different – they were coming home, not vaulting into space – but again there was a familiar jolt to the gut. Again the great space adventure that began 4[0-odd] years ago claimed seven lives. Again flags across the U[S] were lowered to half mast... Like space shuttle Challenger... the end for Columbia came in a tremendous burst of light... Challenger’s end was only 73 seconds after liftoff. Columbia’s was in the last 16 minutes of a 17-day flight. The last time this happened, Nasa learned from onboard voice recorders that Challenger’s astronauts lived through most of the capsule’s death plunge. But the force of the crash ended any chance for life. Yesterday, there was no chance at all for Columbia’s crew... [After t]he Challenger explosion... [it] was more than 2 1/2 years before shuttle flights resumed.

...The loss of... Columbia... [(t]he oldest member of the U[S shuttle] fleet, with more than two decades of service[)]... and the halt to further space shuttle flights threatens a temporary shutdown of [peopl]ed missions to the International Space Station... But officials stressed the current crew of three astronauts – two Americans and one Russian – on board the ISS is not in any immediate danger, although Nasa shuttles have been the main means of transport to and from the station... The complex always has a three-seater Russian Soyuz vehicle docked to it in case of emergencies... “They are not stranded, and if necessary they can be repatriated on board the Russian Soyuz rocket,” said... an ISS senior official based at the French space agency... While Russian Soyaz craft could be used to keep a[st]ronauts... on the ISS, there is little for astronauts to do without the shuttle to bring up scientific experiments and components for further construction of the station. But with only two Soyuz capable of docking with the ISS, [the presence of astronauts] can be maintained on the ISS for only one year. Thirty-six astronauts were due to visit the ISS this year on five shuttle flights, and six on two Soyuz flights. Flights of Russian Progress supply vehicles would also need to be stepped up, according to experts cited by Russian’s Ria-Novosti agency, but these take two years to construct. A Progress flight to the ISS, planned for today, is due to proceed as planned after consultation with Russian officials, Nasa officials said. The mission is due to take fuel, equipment, food and documents to the crew of the ISS... There are no other quick alternatives to replace the shuttle. A US replacement for the Soyuz, the Orbital Spaceplane, is not due to be ready until 2010. The Europeans abandoned a [pilot]ed vehicle for the Ariane-5, and its cargo vessel will not be ready until next year. “Europe is dependent on the Russians and Americans to reach the station,” said France’s junior research minister... Increased use of Soyuz rockets would be a potential windfall for the Russian Space Agency, which has seen its budget shrink drastically since the collapse of the Soviet Union and has sought alternative sources of funding... After dumping its Mir space station... the Russian space programme has concentrated its meagre resources on the 16-nation ISS, a US-led project. Russia has sought to earn money by taking “space tourists” to the ISS, who pay vast sums for a trip into orbit.

...Apart from a few trips to the Moon, humans have hardly ventured further into space than what scientists call a low Earth orbit. But [a Nasa scientist] believes that one day... we will set foot on some planet as distant as Mars. If we do, it may be plants we have to thank for keeping us alive during the year or so it takes to get there and back. It is not just a question of a few fresh veges, but of making sure we have enough oxygen to breathe and fresh water on such an extended voyage... Such daunting titles as “Bioregenerative Life Support Systems” or a “Controlled Ecological Life Support System” for long-term space missions may sound like science fiction. But these terms cover real research at the... Kennedy Space Centre... [The scientist]’s job as manager of Dynamac Corporation’s plant research group at [the space c]entre is to work on the intricacies of growing plants in zero or micro-gravity... The space centre’s research, known as the Advanced Life Support programme... is also looking specifically at how... bioregenerative processes will respond in the micro-gravity environment that will be present on the trip to Mars. [The manager] says the biomass production chamber has been particularly successful with wheat, rice, lettuce, tomatoes and potatoes. “The great thing about the tomatoes is they make juices and sauces that make the rest of the food somewhat more edible. We’ve also managed to achieve two times the world-record field yield for potatoes in two-thirds of the time.” ...[50%] of the nutrients required for growing the potatoes are taken from previously harvested potato tops. This method seems not to have produced any negative effects on productivity... The scientists have worked out how to stagger production so the astronauts are not left with plenty of food but no oxygen. The present system assumes harvesting 25[%] of the crops every 26 days. It takes 4... to 5 sq m of plants to provide drinking and washing water for one person. A “bioregenerative life-support system” now requires 20 sq m to provide enough oxygen for one person. But this area would provide only 50[%] of the food requirements for that person, so the rest of the food would come from stores taken on the voyage. Despite this, [the manager] says it is still the best option to support long-term space missions... Now that the Kennedy Space Centre has created a cost-effective and reliable life-support system on the ground, the research

group faces the challenges of moving the system into space... Some of the experiments w[ere meant to] take place inside the new International Space Station... “There are a lot of things we truly don’t understand about how plants... act in space.” How do you even water the plants for example? In space, water forms beads – air is not lighter than water when there is no weight. On Earth, carbon dioxide is heavier than oxygen, which creates convection currents, but in space that does not happen. The use of fans to create currents and the surface tension that bonds soil and nutrients together have helped to overcome some of these problems. The possibility of having things... [like d]irt... drifting around in a spacecraft rather than staying where they are put is significant... The lack of gravity also creates directional problems for plant top and root growth. “Fortunately, plants are... influenced by light, so we can create a negative phototropism effect for root growth...” Although a primary challenge for growing plants in controlled environments is providing as much photosynthetically active radiation as possible, the spectral composition of light can be critical with regard to plant development and structure. Light-emitting diodes... can be used because of their small size and safety, and because they can provide light in the narrow part of the spectrum that plants require before the green chlorophyll pigment in their leaves can trap the light energy needed for photosynthesis. However, [the manager] says that an improved lighting system is an area where a tremendous amount of research is still needed. “But all that said, maybe in my lifetime we can have individuals living on the surface of Mars... It may sound like pie in the sky, but we have the capability. And, unlike the race to the Moon, it will be a concerted effort as a species.”

...N[Z] scientists have grown the world’s first Martian vegetables. The tiny asparagus and potato plants were successfully grown in soil taken from Martian meteorites, which landed on Earth thousands of years ago[. at]... Lincoln University... The scientific breakthrough... [– which was] presented at an astro-biology conference at Nasa’s Ames Research Centre... [–] has brought closer the possibility of humans living on Mars.

...[“By the year 2020 the first astronauts could be blasting off to set up the nucleus of a permanent outpost on Mars. For the first time human beings will sever their ties with Earth to confront the vast scale of the Solar System – going far beyond all other explorers. “It’s a spiritual quest for what our place is in the universe. When I joined Nasa I was going to Mars – I wasn’t just dreaming.” People have dreamt of flying to Mars for hundreds of years but now there are detailed plans. Robot factories will be sent on ahead to manufacture air and water from the thin Martian atmosphere, and all the fuel needed to get home. The spaceship taking the crew will almost certainly be too large to launch in one go from Earth, so it will be assembled in orbit. But it’s just a one way ticket – the return vehicle will await them on Mars. “The crew basically have to land in the general vicinity of the things that we have pre-deployed to get them home. If they land too far away and can’t get to them, we’re in real trouble.” The Russians, too, have been planning a Martian landing – since the Russians launched Mir more than a dozen cosmonauts have completed stays in space the equivalent of the journey to Mars – but have opted for the short stay. The cosmonauts will fly with everything they need for the entire return trip, but they’ll only have a week on the surface of Mars. The Russian space ship will use electric rocket motors powered by giant solar panels. They’re efficient but slow. For their week on Mars the cosmonauts will have to spend two years travelling through space. The US plan is more ambitious – they won’t be back on Earth for nearly three years – but at the moment the US is the only nation who could afford to go to Mars. However, even if they aren’t mixed-sex, the first Mars crew will be a mixture of nationalities. When the crew is far from the protection of Earth’s magnetic field they will be exposed to the dangers of outer space – solar flares. The full dose of radiation from a solar flare will kill within hours – but the crew will be able to clamber into their radiation chamber, where they might have to spend a week sitting out the cosmic storm. Even so, anyone signing up for Mars will have to accept a heavy dose of radiation. “To be honest, on a medical level, the radiation is so bad that it is better to do this at the end of your life than at the beginning.” Furthermore, space complicates medicine. The lack of gravity changes blood flow around the body, affecting how drugs behave – and the Mars crew had better hope they don’t need major surgery. “We do have to send healthy individuals and hope that we won’t have to address the surgery until we’re in a G-field.” Once they reach their target, their primary mission will be to research this freezing desert world for signs of life – to look for alien fossils etched into the Martian rock. But whatever they find, this first visit is destined to set humanity on a new course. “Why are we doing this at all? It’s all to do with human expansion. Looking for more territory, more resources. I think it’s generally accepted that if we do this in a thoughtful way we are justified in expanding our borders. I live for it and I would love to do it. And I will defend us doing it to the end.””]

...Mars is a planet of natural violence far greater than is known on Earth... “Mars is a small planet that does things in a very big way,”... said [a speaker] at a meeting yesterday of the planetary division of the American Astronomical Society in Wisconsin. Researchers analysing pictures taken by the Mars Observer said the red rock and soils of Mars were imprinted with marks of high-speed wind storms and of gigantic floods... [W]inds have been clocked at 579 km/h – almost five times stronger than a minimum hurricane. It is the dust in the Mars atmosphere that may make its storms so violent... The suspended particles capture sunlight and heat up rapidly, setting off a vortex of moving air that grows and grows...

Nasa’s first chance for a signal from the Mars Polar Lander passed in silence, heightening fears that the \$US165 million... mission may have ended in failure – just like another Mars expedition three months ago... Controllers... have not exhausted all the simple explanations for the silence, like a mispointed antenna or a computer reset. They say the spacecraft was in good shape and on course just before communications ended as expected before its descent... “We are remaining upbeat,” said... the spacecraft’s project operations manager at Nasa’s Jet Propulsion Laboratory... However, critics say the Lander may have been in trouble even before it left the launch pad 11 months ago. Weeks before the craft began its descent towards the Red Planet, questions were being asked about the mission and whether it might be doomed by tight budgets and under-staffing. But the embarrassing... loss of the Lander’s \$US125 m... sibling... the Mars Climate Orbiter, is not far from the minds of engineers and scientists. Nasa investigators later determined that engineers failed to convert data into metrics in a critical navigation programme, causing the satellite to fly far too close to Mars. It is believed the Climate... burned up in the atmosphere it was to study. The 43-page report... faulted navigators for taking short cuts and not knowing enough about the Lander. It also found that too few people worked on the programme, and... they were... undertrained. The president of the Mars Society... who has written several books supporting exploration of the Red Planet, said that if... Lander w[as] lost forever the momentum to study the planet might be diminished. “Losing that probe is not a tragedy, but losing the will to explore is. Do we... cease being a nation of pioneers? The problem with the Mars programme is... underfund[ing]... We shouldn’t be pinching pennies.”

...[a NZ]-born space rocket scientist... says, despite recent Nasa mission failures, the red planet will continue to be the exploration focus. Now aged 89, [the NZer] was a pioneer in the U[S] space programme, directing the development of many spacecraft in the 1950s and 60s, including the first to photograph Mars, Mariner IV. [The NZer] also directed Nasa’s Jet Propulsion Laboratory from 1954 to 1976. [The NZer] says the lure of Mars lies in its similarities to Earth... As for the great beyond, [the NZer believes] travelling outside our solar system remains outside the realm of possibility because of the enormous travel times – but... prefaces all his predictions with a warning about the hazards of forecasting the future.

...scientists are turning the pages of science fiction novels hoping to find new ideas on how to cross the cosmos and explore distant planets. The European Space Agency is asking science fiction authors and readers to submit suggestions... that may become the basis of innovative technologies for exploring the real universe. Already suggestions are flooding in... Agency scientists emphasised the scheme does not mean they have run out of ideas, only that they want to make sure they are not overlooking any potentially useful concepts... [The] president of the Ours Foundation in Embrach, Switzerland... said there was a long tradition of seemingly fanciful notions in science fiction becoming reality, such as the idea of orbiting communications satellites... first outlined in 1945... nearly 20 years before the launch of the Telstar satellite... and the construction of orbiting space stations complete with living quarters and supply ships... More recently, scientists have made tentative breakthroughs in faster-than-light travel, supporting the concept of the “warp drive” familiar to *Star Trek* viewers, and quantum electrodynamic effects that might form the basis for teleportation systems, another technology visualised by... [the] creator of *Star Trek*... A still unsolved problem that authors have wrestled with for decades is how to get a single-stage spacecraft into orbit. All existing rockets have several launch stages, which is expensive and wasteful.

...[“It’s a lovely day for a launch, and the purpose of today’s mission is truly electrifying.” “That’s correct. The lion’s share of this flight will be devoted to the study of the effects of weightlessness on tiny screws.” “Unbelievable! And, of course, this could have millions of applications here on Earth.”]”

...The astronauts who went to the Moon thought they would be the first in a long line of travellers in space, but in fact there have been no more... For billions of years, constantly bombarded by solar particles, the Moon has been a diary of our Sun. Its rocks act like a sponge, quietly absorbing the particles, and so keeping a record of the Sun’s activity. The Apollo astronauts removed the rocks buried beneath the lunar dust and brought them home. The rocks show how the Sun’s energies have fluctuated over time. It has been much more active in the past. The Sun is ageing, and we too are part of that ageing process. “...we tend to think of the Earth as forever – the eternal sea, we call it. But yet, when we start looking at the planets in our Solar System, we realise that they’re not eternal. The Earth is in some sense half way through its... expected lifetime. We’re living on a middle-aged planet.” The Earth is middle-aged because the Sun is middle-aged, and as our Sun gets older it will start to work against us. Since its creation it has been getting 10% hotter every billion years. In just one billion years time it will have become so hot that it will begin to destroy life on Earth. Plants and animals will find it hard to cope with the rapidly falling levels of carbon dioxide. Our time on Earth could be limited by these events. “...we can see the... Earth becoming less and less desirable as a place to live... so, ultimately, we have to find another place to live... We’ve always imagined life on Mars and, yet, when we [went] there to look for life we didn’t find any. And it was the more puzzling because there was everything life would need in terms of the elements.” But the key ingredient for life on Mars, liquid water, is missing. [However, w]e now know that water once flowed in abundance on the planet... “If we assume that there is water tied up in the polar caps, and as the Sun gets much brighter than it is now and the surface of Mars gets above the melting-point, then the polar caps [will] just turn into oceans and Mars will once again have a water-rich environment, and that could trigger a release of large amounts of CO₂ very quickly. Mars may have its second awakening, and could be suitable for life. And that would occur when the Sun is two or three times brighter than it is today.” ...as the water vapour rises the planet will rebuild its atmosphere and once again be shrouded in white cloud, like the Earth. “As the Sun gets brighter [that] could be too much of a good thing for Mars’ point-of-view – it could go from being too cold to being too hot. Mars is probably not a long-term place for home. But if you think about it there’s no place that’s going to be suitable for life forever – it’s just a question of how long... do we want to have the rent on this planet or that planet... [W]e may have half a billion years... [on] Mars... But, still, a place to live for half a billion years is a good place.” As the Sun warms, the moons of the distant planets will always be the best hope for life in the future Solar System. Jupiter’s moon Europa is already the most likely haven... In the future Europa will warm up and its icy surface will start to melt. But it could become a water-world – a place too challenging to inhabit... The Cassini... mission left Earth in October 1997 on its seven-year journey to Saturn and its moon Titan. As the Sun continues to heat up, this little moon will also come into its own. “It’s the only other planetary object that looks like our own Earth. It’s the only other object that we know of that has an atmosphere of nitrogen... The only thing that is lacking is a little bit of... heat and a little bit of oxygen.” ...No matter now Earth-like it becomes, eventually even the sanctuary of Titan will not be enough. Like the Earth, it too will finally become uninhabitable. Ultimately, there is no hope for survival within the Solar System. The Sun is on a path to destruction and nothing can stop it... Fred Hoyle, the [perso]n who coined the phrase Big Bang, was one of the first people to realise what was going to happen to our Sun... “Stars... die. And part of the way a star dies is that it becomes a Red Giant. So... the Sun, for example, will swell... to a size perhaps as large as where Earth is on its orbit... after another... 5 billion years [at] our best guess – nothing that I’m going to worry about...” ...There are 100 billion individual stars in our galaxy, and there are at least 50 billion galaxies in the Universe... [N]ow astronomers are setting out to hunt for planets around other stars... With no chance of ever seeing a planet directly from Earth... [-] because... the contrast of light between the stars and planets is so huge... so it’s absolutely impossible, at least at the present time, to directly detect and take a picture of a planet... [- two Swiss astronomers] developed a way of looking for planets indirectly by looking at the motion of stars. A wobble in the star would indicate the presence of a planet, tugging against the star’s orbit. In December 1994 they discovered a star whose wobble could only have been caused by something like a planet... The Swiss team had discovered the first world outside our Solar System... “...We’re [now] discovering about a planet every month...” ...But we’ve yet to find a planet... like the Earth... “The Earth is a... pale blue dot... And in many ways much of what the Origins program is about is a search for yet another example of a pale blue dot. Some 500 years ago Copernicus in effect removed the Earth from the centre of the Universe. We have since... showed the Sun itself is nothing special and neither is our galaxy, but the thing that remains is that we only have evidence of one example of life – and that’s... on this planet,”...

Scientists have hit upon a novel way to save the planet: move it to a cooler spot. All it would take, they say, is a few comets deflected towards Earth, and its orbit would be altered. Our world would be sent spinning into a safer, colder part of the solar system. The plan is the brainchild of a group of Nasa engineers and American astronomers who say it could add six billion years to the planet’s working life, effectively doubling it. “The technology is not at all far-fetched... It involves the same techniques that people now suggest could be used to deflect asteroids or comets heading towards Earth.” ...Space engineers would have to be careful when they aimed their... comet. The slightest miscalculation could fire it straight at Earth... It is a point the group acknowledges... The[ir] proposal... involves carefully directing a comet so it sweeps close by the planet and transfers some of its gravitational energy to Earth[the Moon is ‘causing Earth’s rotation to slow – in 400 million years time, each day will be 26 hours long’; however, the Moon is also ‘slowly drifting away from Earth – eclipses will no longer occur in about a billion years’]... Engineers would then direct their comet so that it passed near Jupiter or Saturn, where the reverse would occur. It would pick up energy from one of the giant planets, its orbit would bring it back to Earth, and the process would be repeated... [Incidentally,] Japanese scientists are attempting to build a lift that will take passengers 100,000km into space. The project could see the realisation of a vision that has inspired science fiction writers for generations. The lift’s carriages, which will themselves require new feats of engineering, would move up and down high-tech cables. Those cables would... be anchored to the ground and disappear into the sky, eventually reaching a satellite docking station orbiting above the Earth. Scientists hope that as well as carrying human passengers, the carriages could also haul huge, solar-powered generators that could power homes and businesses back on Earth.

...N[Z] has teamed with A[US] in trying to build a huge radio telescope capable of discovering the building blocks of the universe.[NZ’s] Economic Development Minister... yesterday announced the joint bid for the \$3.1 billion Square Kilometre Array... telescope. N[Z and AUS] were last year named as the short-listed rivals to South Africa to build the collection of up to 5000 antennas with a combined area of a million square metres. By electronically linking them to operate as one giant telescope, the array will become what [the minister] touted as a top global science project of the 21st century, funded by 19 countries... [By the way,] Nasa is cancelling all space-shuttle servicing missions to the Hubble space telescope, a decision that in effect will cause the powerful observatory to slowly degrade and eventually become useless, say officials.

...ASTRONOMERS have discovered four more moons orbiting Saturn... [In related news, t]he next generation of U[S] rocket scientists could be dominated by [gals], as... most young astronomers are fem[inin]e. The... American Astronomical Society found that of astronomers and astronomy students aged 18 to 23, 56.8[% are gals], a big jump up from those aged 23 to 28, where 39.7[% are gals]. Of those over 50, only 10[% are gals]. Meanwhile, even as Nasa engineers debated possible damage, a flight director emailed Columbia... to say there was “absolutely no concern” that breakaway foam that struck the space shuttle might endanger its safe return. The shuttle’s commander cheerfully replied: “Thanks a million!”

...Two years after the death of the great British astronomer Fred Hoyle, his colleague... is still unconvinced that the universe started with a single “Big Bang”. [His colleague], an Indian astrophysicist who co-wrote four books with Hoyle, has dusted off Hoyle’s rival theory of a “steady-state universe” and updated it with new evidence. “The alternative we have proposed is that the universe is without a beginning and without an end,” [the astrophysicist] said in Auckland this week. “It has ups and downs, or oscillations. It expands and contracts – not to nothing, but to a small size, so the universe could be 200 to 300 times more dense when at its maximum density. But it’s not infinitely dense.” ...More than 20 years ago,

scientists realised that there was a basic flaw in the original Big Bang theory because it required initial expansion in the first few fractions of a second at a speed faster than the speed of light. That would have meant that some parts of the universe could not have been subject to the laws that make the speed of light the same everywhere. But in fact, observation suggests that the same laws do apply throughout the universe. To get around that, Big Bang theorists invented the idea of a kind of cosmic “inflation” in which the universe expanded slowly in the first few fractions of a second in which the basic universal laws were established, then suddenly picked up enormous speed for a while before settling back into its current rate of expansion. “Is the physics of inflation tested?” [the astrophysicist] asked. “Has inflation been directly observed? Is it repeatable and observable at other times and places?” The answer to all three questions, [the Indian] said, was “No.” And that was just the first problem. Next scientists realised that there must be far more matter in the universe than they could see to explain their observations of stars and galaxies. First they invented the idea of invisible “dark matter”. Now the mainstream view is that 97[%] of the stuff that exists in the universe is either dark matter or the even more elusive “dark energy”. [The Indian] said it was all “speculation”. [The Indian] says a simpler explanation is that the universe expands and contracts in roughly 50 billion-year cycles. Since [the Indian] agrees that the current expansion began about 14 billion years ago, “we are about a quarter of the way through the cycle... The creation of matter is the main source of expansion, and it switches off once in a while because the system has feedback mechanisms so it can’t go on creating all the time... When it creates matter, it expands faster and faster, and the force causing it becomes less and less dense when it expands. When the force becomes weak, creation stops, and the universe starts to contract. It gets weaker because of its rapid expansion, so expansion is a feedback which makes the force weak.” The [Indian] says that... his “quasi-steady-state” theory can be tested because it holds that in the shrinking phases, the universe merely shrinks to a much smaller size but never actually disappears. Therefore stars that existed in earlier cycles must have been crushed together in the contractions, but not eliminated. “Some of those old stars should be left out there today. We should look for them.” ...[the Indian] admits that his latest theory may be wrong... In polite astronomical circles, his view is a heresy. [The]Dr... who introduced... [the Indian’s]lecture at Auckland University on Wednesday, said the evidence that the first matter was created in a Big Bang about 14 billion years ago was “overwhelming.” “The predictions are being tested experimentally and found to be in quite good agreement, so generally the mainstream is quite relaxed about the fact that the Big Bang is more or less right,”...

A group of N[Z] scientists has joined an international experiment to re-create conditions... believed to have existed in the first few millionths of a second after the “Big Bang” in which the universe began between 12 and 14 billion years ago... The [NZ]scientists... join a worldwide network of almost 2000 researchers linked to the European Centre for Nuclear Research, known by its French initials CERN. They will take part in an extraordinary experiment, to be conducted 100m underground at CERN’s Geneva research centre in 2007, that will zap lead atoms into one another at greater speed and intensity than human beings have generated before... It will test a theory that under such intense pressure and high temperature, matter did not exist in the form of stable protons, electrons and neutrons that make up the atoms of the world as we know it... [A] senior lecturer in physics at Auckland University and co-ordinator of the N[Z] input to CERN, said some people expressed concern at first about generating the almost unimaginable energy that will be created by colliding lead particles in the experiment. “At first there was a fear that we would create a black hole which would swallow up the Earth... But we have concluded that no, that is not going to happen according to our knowledge, because the moon is being hit by cosmic rays that are much higher-energy all the time [and has not disappeared into a black hole].”

...Astronomers have detected what could be a “missing link” in the development of the universe: mid-size black holes that are neither supermassive nor as small as a single exploding star. The middling black holes were spotted using the Hubble Space Telescope in two separate globular star clusters in Earth’s celestial neighbourhood... Astronomers have known for years about vast black holes... [– these] supermassive black holes, believed to lurk at the centre of galaxies... could have the mass of millions or even billion of suns... [–] and rather small ones... created when stars about 10 times the size of our sun died in... supernovae... but... “...didn’t know if we could get from one to the other or if they were completely unrelated, and this seems to be the step that takes us from one to the other.” ...In the past several decades, black holes have gone from being rare and almost mythic phenomena whose existence was routinely questioned, to being accepted by most astronomers as a feature of the cosmos.

...Two giant black holes 400 million light-years from Earth are drifting together and will eventually merge... in several hundred million years... in a catastrophic event that will... create an even bigger black hole... unleash[ing] waves of radiation and gravitational energy throughout the universe. The two black holes, each with the mass of at least a million suns, are circling each other in a single butterfly-shaped galaxy, astronomers say. It is the first time scientists have got proof that two of the giants can exist in the same galaxy, using data gathered by the... Chandra X-ray Observatory.

...Two N[Z] astronomers have found one of the oldest objects seen by human beings – a burst of gamma rays believed to be from a “black hole” 11.5 billion light years away. [The h]usband-and-wife team... of Canterbury University’s Mt John Observatory near Lake Tekapo, were the first astronomers to spot the phenomenon after an automatic alert from a US satellite on March 24... About 30 years ago, American satellites launched to detect gamma rays from Russian nuclear tests discovered huge natural bursts of gamma rays, occurring every few days somewhere in the universe. Each burst produced more energy in a few seconds or minutes than the sun will produce in its entire life. Although many theories have been put forward to explain them... evidence from another gamma ray burst on March 29 showed that at least some were caused by the collapse of once-bright stars into immeasurably dense “black holes”... [T]he American Association of Variable Star Observers gave cameras to Mt John and to a network of other observatories around the world in late 2001 to track gamma ray bursts. “This was the first time any of the new equipment was the first to pick up one of these things... We compared our pictures with reference pictures taken some years ago, and found this little point of light... Then the European Southern Observatory in Chile pointed its eight-metre telescope at it and found it was 11.5 billion light-years away...”

...In a changing world at least something seemed constant: the speed of light. That’s what Einstein taught us. Wrong, says a team of Sydney researchers led by [a]renowned cosmologist... of Macquarie University. The team argues that the speed of light must have slowed since the Big Bang. As claims by scientists go, they don’t get much bigger. The physical constants of the universe, such as the speed of light, have been assumed to be “God given, fixed numbers”, [the cosmologist] said. “The fact that one of these appears to be varying with time isn’t supposed to happen.” If confirmed, it could herald the biggest scientific revolution since Einstein’s theory of relativity... In fact, that cornerstone of modern physics would “have to go”. The research... is based on observations of distant bright objects in the universe, known as quasars, by... a[n astronomer who] found that the 12-billion-year-old quasar light had properties that could not be explained by today’s laws of nature... [The cosmologist] was “incredulous” when first told. “It was not the thing a physicist wants to hear.” But science was based on “overturning cherished ideas”. So... [the team] examined the possibilities by calculating the consequences for black holes. They were able to rule out that another physical constant, e, the electronic charge, had varied. That left c, the speed of light, which appeared to have “hit a speed bump” 6 billion years ago and slowed. A very high light speed back then would help explain the mystery of why far-flung regions of the cosmos now look so uniform from Earth. Light travelling at its present accepted speed, 300,000km/sec, would not have been fast enough to have made it from one far-flung region to another... Last week, [the cosmologist] won the... Michael Faraday Award, given by the Royal Society in London to scientists who have done the most to further public communication of science, engineering or technology. In 1995, [it] was awarded the prestigious Templeton Prize for progress in religion.

...[‘what makes the life of a scientist special: Winning the Nobel Prize is a great thrill. But it does not compare with the incredible excitement that comes when you realise an experiment is a success; when you discover some new fact about the universe. It’s astonishing how often this happens when you are alone in the lab. You’ve learned something profound, and not one of the other five billion people on earth knows what you now know’ (*The God Particle*).]

...*Is God all in our heads?* ...ONE Sunday morning... 19 years ago, as... [a] neurologist... waited for a train in London, [it]... suddenly felt a sense of enlightenment unlike anything [it] had ever experienced. His sense of individual existence, of separateness from the physical world around him, evaporated like morning mist in a bright dawn. [The neurologist] saw things “as they really are,”... the sense of “I, me, mine” disappeared. “Time was not present. I had a sense of eternity. My old yearnings, loathings, fear of death and insinuations of selfhood vanished. I had been graced by a comprehension of the ultimate nature of things.” Call it a mystical experience, a spiritual moment, even a religious epiphany – but [the neurologist] will not. Rather than interpret his instant of grace as proof of a reality beyond the comprehension of our senses, much less as proof of a deity, [the neurologist] took it as “proof of the existence of the brain.” ...[hi]s experience inspired him to explore the neurological underpinnings of spiritual and mystical occurrences. To feel that time, fear and self-consciousness have dissolved, [the neurologist] reasoned, certain brain circuits must be interrupted... Frontal and temporal-lobe circuits, which mark time and generate self-awareness, must disengage. When that happens, [the neurologist] concludes in a paper, what we think of as our higher functions of selfhood appear briefly to drop out, dissolve, or be deleted from consciousness. When [the neurologist] spun out his theories in 1998, in the 844-page *Zen and the Brain*, it was published not by some flaky New Age outfit but by MIT Press. Since then, more and more scientists have flocked to “neurotheology,” the study of the neurobiology of religion and spirituality... Researchers’ newfound interest in neurotheology reflects more than the availability of cool new toys to peer inside the working brain. Psychology and neuroscience have long neglected religion. Despite its centrality to the mental lives of so many people, religion has been met by what... a... psychologist... of Wheaton College in Massachusetts... calls “indifference or... apathy” by science. The rise of neurotheology represents a radical shift in that attitude. But for all the tentative successes of scientists in their search for the biological bases of religious, spiritual and mystical experience, one mystery will surely lie beyond their grasp. They may trace a sense of transcendence to this bulge in our grey matter. But it is likely that they will never resolve the greatest question of all – whether our brain wiring creates God, or whether God created our brain wiring.

...*Scientist maintains God is all in the mind – or brain...* Does the biological structure of our brains programme us to believe in God? Recent advances in “neurotheology” have even prompted some scientists to propose they can induce the kind of holy visions of prophets, even in those who have never experienced religious belief... [A doctor at] Laurentian University, Canada, has devised a special helmet that uses electromagnetic fields to induce electrical changes in the brain’s temporal lobes, which are linked to religious belief. So confident is [the doctor] that God is all in the mind... that [the Canadian claims it] can induce mystical feelings in a majority of those willing to don his Transcranial Magnetic Stimulator. So the BBC Science series *Horizon* took up the challenge by putting his hat to the ultimate test: could [it get an] arch-sceptic and militant atheist... to start believing in God by electrically massaging his temporal lobes? ...[the] author of *A Devil’s Chaplain*, was the ideal candidate... Unfortunately, while [the atheist] had some strange experiences and tinglings during the experiment, none of them prompted him to take up any new faith. “It was a great disappointment,” [the atheist] said. “Though I joked about the possibility, I of course never expected to end up believing in anything supernatural...” [The Canadian] has explained away the failure of his Transcranial Magnetic Stimulator. Before donning the helmet, [the atheist] had scored low on a psychological scale measuring proneness to temporal lobe sensitivity. Recent studies on identical and fraternal twin pairs raised apart suggest that 50[%] of our religious interests are influenced by genes. It seems [the atheist] is genetically predisposed not to believe.

...Scientists are hunting for the “God gene” that underpins our ability to believe... The idea of genes linked with beliefs does not look far-fetched, given the influence of genetics on the developing brain... There are many suggestions as to why the “God gene” – or a constellation of genes linked with belief – might thrive... Belief can help people to cope with stress and religious people might be more compliant and less likely to overindulge. If belief really does boost an individual’s chances of survival, any genes linked with a propensity to believe would survive in future generations... From Copernicus to Charles Darwin, scientific discoveries have had a habit of offending religious susceptibilities. Most scientists, even Darwin, tread warily and avoid attacking religion, but... [t]he scientists who launched a revolution with the discovery of the structure of DNA in Cambridge... have used the anniversary to mount an attack on religion... [B]oth... are... outspoken atheists. Speaking to the *Daily Telegraph*, [one of the Cambridge scientists] said: “The god hypothesis is rather discredited.” Indeed, [the scientist] says his distaste for religion was one of his prime motives in the work that led to the sensational 1953 discovery... [It] argues that since many of the claims made by specific religions over 2000 years have proved false, the burden of proof should be on the claims they make today, rather than on atheists to disprove the existence of God.

...For 150 years many scientists have argued religion is a tissue of fantasies and fables, whereas science provides the facts. The adage that you have to “leave your brains at the church door,” still keep many scientists silent about their [religious] beliefs. Equally, many religious leaders have reacted in knee-jerk fashion, denying the validity of any scientific discovery that impinges on our origins. However, there has been an easing of tension between the two camps. A growing band of scientists and theologians are looking for common ground rather than bones of contention. Driving the thawing of relations are scientific discoveries which could be interpreted as showing the world was made for [us], as well as advances such as cloning which raise tricky ethical issues. Some members of the movement, such as... [the] author of *The Science of God*, even claim to show how some of the latest scientific theories dovetail with the account in *Genesis*... [T]he physicist and Hebrew scholar from Israel, subtitles his book “the convergence of scientific and biblical wisdom”. H[is book] shows how the 16-billion-year history of the universe can be viewed as compatible with the six-day creation timetable... Academic interest in the overlap between science and religion in N[Z] was explored by a symposium in August 1993... In Britain, the debate is focused on Cambridge University, which has established a lectureship in theology and science, regardless of sharp criticism from some scientists. In America, institutions such as the Centre for Theology and Natural Sciences in California and the Chicago Centre for Religion and Science have been established... Pope John Paul II presided over a tangible step in bringing both factions closer at his summer palace... [when the pontiff] held a meeting on religion and evolution. Soon after, the Pope acknowledged evolution to be “more than just a hypothesis”. The Vatican has also apologised for its arrest and ex-communication of... Galileo... The idea of a war between science and religion, which science had won, first took root in the mid-19th century... [when] Thomas Huxley, the first populariser of Darwinian evolution... colourfully proclaimed... that “extinguished theologians lie about the cradle of every science, as strangled snakes beside that of Hercules.”

...*LYING SCIENCE Many scientific ‘breakthroughs’ are nothing but mirages...* IF YOU were going to have a heart attack, it seemed there was never a better time than in the early 1990s. Leading medical journals were regularly reporting results from trials of new treatments for heart attacks that weren’t just good – they were incredible. In September 1992, the *British Medical Journal* published results from trials in Scotland of a clot-busting drug called anistreplase which suggested it could double the survival chances of a heart-attack victim. The following year another “miracle cure” emerged: injections of magnesium... Leading cardiologists hailed the injections as an “effective, safe, simple and inexpensive” treatment that could save the lives of thousands. But then something odd began to happen. In 1995, *The Lancet* published the results of an international study of heart attack survival rates among 58,000 patients – and the “amazing” life-saving abilities of magnesium injections had vanished. Anistreplase fared little better: the present view is that its real effectiveness is barely half that once claimed. Other “amazing” heart drugs seem to have suffered the same fate, also mysteriously losing their potency once on the wards. A study published last year in the *British Medical Journal* compared death rates among cardiac patients in the early ’90s with those back in the early ’80s, in the Dark Ages before the advent of “clinically proven” heart attack treatments. What... Queen’s Medical Centre in Nottingham found was disconcerting: “Despite an increasing uptake of the ‘proved’ treatments, in-patient mortality... did not change.” The death rate in 1992 was the same as in 1982: 20% – and double what had been found in the trials. Scientists have a long list of excuses. Some blame the fact that patients in clinical trials tend to be hand-picked and fussed over. Others argue patients arrived on wards too late for the wonder drugs to work. Or, perhaps the original trials simply hadn’t been big enough. But there is another explanation, and its implications are so serious that scientists who understand them often refuse to go

on the record to talk about them. They have been discussed behind closed doors by leading scientific journals and academic institutions – only to be swept under the carpet. Meanwhile, millions of dollars of taxpayer money is being wasted following up illusory breakthroughs. At the centre of this scandal is a simple statistical technique used by scientists as the basis for supposed research breakthroughs. It is called “significance testing”. And it is fatally flawed. When used to analyse clinical trials, significance testing can easily double the apparent effectiveness of a drug, turning a borderline result into a “significant” breakthrough. It can throw up convincing – yet spurious – evidence for links between diseases and any number of supposed causes. But even more astonishing than these dangerous flaws is that experts have been warning about the methodology for more than 30 years – yet the scientific community has refused to act. In the meantime, a host of implausible “breakthroughs”, which raise the hopes of patients and families, are announced with fanfare... and then quickly disappear... Just why has the scientific community failed to act? The answer lies in its squeamishness about subjectivity. It is hard to convey the strength of emotion aroused within the scientific community by the “S-word”. Subjectivity is seen as the barbarian at the gates of science, the enemy of objective truth. So when, in the '20s, brilliant Cambridge mathematician and geneticist Ronald Aylmer Fisher came up with an apparently objective way of drawing conclusions from experiments, it was seized upon by the scientific community. In 1925, Dr Fisher published his techniques in a book, *Statistical Methods for Research Workers*. It has become one of the most influential texts in the history of science, and forms the foundation of virtually all the statistics now used by scientists. On the face of it, Dr Fisher had found techniques anyone – sceptic or advocate – could use to prove the significance of a new finding. Critical to his method is the so-called P-value – defined as the chances of getting at least as impressive evidence as that actually seen if mere fluke were at work. These P-values are worked out mathematically from the raw experimental data. According to Dr Fisher, if the resulting P-value is below 0.05, then it is safe to label a finding “significant”. Combining simplicity and apparent objectivity, the P-value method was an immediate hit and its popularity endures to this day. Open any leading scientific journal and you will see the phrase “ $P < 0.05$ ” in papers on every conceivable area of research, from astronomy to zoology. But no sooner were P-values taken up throughout the scientific community than other statisticians began to ask awkward questions. Most importantly, just how did Dr Fisher know that his figure of 0.05 was a safe point at which to declare a result “significant”? Incredibly, Dr Fisher didn't know. [Dr Fisher] simply chose the figure of 0.05 because, [the mathematician] said, it was “convenient”. The implications are stark... The first hints of this appalling flaw in Dr Fisher's methods emerged in the early '60s... Now, more than 30 years after the warnings were sounded, it is clear the scientific community... has grown used to seeing its supposed breakthroughs come and go[, and]... has no intention of taking decisive action to tackle the critical flaws in significance testing... Taking action would mean “radical re-training”, some scientists lamely argue. Curiously for a profession supposedly dedicated to discovering truths, the reliability of research findings is never mentioned. It is hard to avoid the conclusion that the real explanation for all the endless evasion is not scientific at all. It is simply that if scientists abandoned significance tests like P-values, many of their claims would be seen for what they really are: meaningless aberrations on which taxpayer money should never have been spent.

...*Scientist thinks small in search for cures*... It sounds like science fiction: microscopic oil droplets protect patients from germs and viruses by fusing with the dangerous bugs and causing them to explode. University of Michigan scientists, searching for ways to protect soldiers from biological warfare, say they have created just such a drug. It can eradicate deadly anthrax within an hour of contact, and promises to be so non-toxic to humans that one day it might be possible to decontaminate germ-laden food... [The] creator of these drug droplets so tiny they have been dubbed “nano-bombs,” added some to a sample of cholera viewed through a microscope. A few minutes later: “All that's left here is debris. The remarkable thing is this happens almost immediately,”... While the drugs are still highly experimental, [the creator] told a biotechnology meeting in Seattle that [it] envisions one day using the[m]... not just to treat infection but as protection. They might work as an HIV-blocking vaginal cream.

...[a] German scientist... is looking for... [a] terminally ill patient... [it] can cut up and recreate as a new, improved person... The donor will be asked how... [their] body has served them during their life and how it could have been better. Once the donor dies, the body will be deep-frozen and dissected. Within nine months, [the German's] team hopes to unveil the preserved corpse as a redesigned human being and put it on public display.

...the Discovery Channel documentary *Body Parts* (10pm, Monday...)... explores the new forms of technology being investigated to replace or rejuvenate failing body organs, such as... genetic engineering... artificial hearts, lab-grown organs and animal organs adapted for human use. There is even the possibility that a human head could be kept alive and functioning on machines designed to mimic the body's functions. Ick!

...Imagine celebrating your 200th birthday – with perfect skin, good hair and your parents dropping by. A visiting U[S] scientist says we should start thinking about making extra-long-term plans as medicine closes in on the age-old drag of old age... [The] clinical professor of medicine at Michigan University, believes that within a decade scientists will confirm they can reverse ageing and eliminate age-related conditions, including cardiovascular disease, arthritis, Alzheimer's and even youthful skin. The youthful-looking 50-year-old yesterday told an Auckland conference, hosted by the N[Z] Chelation Therapy Society, that... it... was not interested in slowing ageing, but reversing [ageing]. His tongue-in-cheek sign-off was: “Hope to see you guys here in another couple of centuries.” Some experts dismiss his claims as another garden path on the search for the fountain of youth; others say any practical use is a long way off and could only keep people healthier longer rather than increase lifespan. But [the professor] points to growing research demonstrating how human cells can avoid normal ageing. Many human cells have finite lifespans, dividing only so many times, before they stop. In 1998 scientists at the University of Texas Southwestern Medical Centre found that by adding an enzyme called telomerase to the chromosomes of cells, they continued to divide and showed no signs of ageing or dying. The enzyme, which occurs naturally, resets a cell's biological clock – called a telomere... The Texas researchers said such cell rejuvenation might increase the normal health span, but not the normal lifespan. [The professor], however, believes subsequent research will lead to both... [The professor] admitted there were still technical barriers and huge social and ethical issues in any attempt to extend human lives to 200 years and beyond. Overpopulation, ecological pressure and economic displacement were a few of the complex questions raised, as well as the fundamental issue of playing with human lifespan. “I think this whole prospect should scare people... But I think we should see if it can work.” N[Z] has no specialists in the telomerase field, but the head of Auckland University's molecular medicine division... said difficulties understanding the biology involved should not be underestimated. Gene therapy, where the biology was well understood, was progressing only slowly, [the head] said. So don't put aside those 200 candles just yet.

...The mutation of a gene can double the life span of fruit flies – a chance laboratory discovery that... may lead to drugs that help people live longer... University of Connecticut Health Centre researchers found that the fruit flies lifespan increased from 37 to 70 days when a gene was modified on a single chromosome. The same long-life gene exists in humans, where a doubled life span would be about 150 years... [T]he gene mutation appears to work by “putting the cells on diet.” ...not only did the fruit flies live longer, they also seemed to maintain a high quality of life.

...*Answer does lie in the soil*... Science has backed up religion in a study that suggests life may have... sprung from clay – just as many faiths teach.

...Auckland University researchers [recently] stunned academics worldwide by tracing the origins of the English language to Turkish farmers... [Now an A]uckland scientist... has embarked on the ultimate detective quest – to use genetic techniques to track down the origin of life. The Auckland University microbiologist has been awarded \$475,000 from the Government's Marsden Fund to try to recreate a gene from the last common ancestor of all living things... [The] Waiheke father of two who does the *Herald* cryptic crossword on the ferry each day, delights in the puzzle-solving power of genetics. [The father] says that studying the genes of thousands of organisms has enabled biologists to piece together a much more complete “tree of life”, sorting all living things into genetically related families. The size of that tree has ballooned since [an] American scientist... used the new genetic techniques to do “DNA fingerprinting” in the mud beneath a hot pool in the early 1980s. “[The American] found that we had observed less than 0.1[%] of the micro-organisms out there... We can't even quantify how ignorant we are, there is so much to learn.”

...scientists... have discovered a microbe that... [they] believe... is easily the oldest living creature... [C]losely related to a bacterium that lives in the briny environment of the Dead Sea... the microbe... has lived for 250 million years... [- which] is many times older than a microbe found living in the gut of a bee trapped in amber about 30 million years ago... [-] and shows every sign of being able to continue for the same length of time... “If bacteria can survive for this length of time, why should they die at all?” ...asks... a microbiologist at Bristol University... “The potential implications are profound. For instance, can spores effectively be immortal?” ...Spores of the bacterium appear to have survived in a state of suspended animation in one of the driest environments on Earth – an underground salt cavern in New Mexico – and the discovery raises the possibility that primitive life-forms might, after all, be able to cross the vast distance of space stowed away within the rocks of asteroids and comets, as suggested by... [a] British astronomer... The bacterium was extracted from a tiny pocket of liquid trapped inside... a... salt crystal, which was found in the wall of a ventilation shaft serving the salt cavern... that had been buried underground since the first dinosaurs stalked the land.

...The... first recognised dinosaur fossil – the iguanodon tooth found by the family of Sussex country doctor Gideon Mantell in the 1820s – will be feted at a fossil hunters’ breakfast in Wellington today. The fossil... [-] brought to N[Z] by Dr Mantell’s son... [-] is held by the Museum of N[Z], but has been allowed to go on show at the National Library. [A NZ p]alaeontologist... said the tooth was the holy grail of evolutionary biology.

...IT’S a lonely job, but someone’s got to do it. [That someone] is the country’s only paid vertebrate palaeontologist. Which is to say [the guy] is the only person in N[Z] who earns his living as a bone fide dinosaur expert. As an associate professor of geology at Otago University, [hi]s specialty is the ancient marine reptiles that once swarmed off our shores... Along with 656,000 others, [the palaeontologist] has tuned into the BBC documentary *Walking with Dinosaurs* [- which] is the second most watched programme on [NZ] television, after One Network News. Great television, [the palaeontologist] says, hesitating because [the palaeontologist] cannot give the same affirmation to the science behind it... “It’s great to see that past life on Earth is being taken to a broader audience. The programme has brought the animals to life. I guess for the average audience that is enough. But if you ask, ‘Is it based on fact?’, well, you would be scratching your head to find that.” [His] response is what any medium can expect when science is presented for a mass audience... [D]ocumentary-maker Natural History N[Z]’s... chief executive... knows the issues... “The pitfalls are confusing fact and fiction – you have to signal opinion.” By training, scientists are wary about speculating beyond the evidence and facts, which... is what documentary must do. “I’ve had these discussions. I think... [t]here tends to be a view from scientists that unless it’s proven you cannot say it. But that isn’t so. You are not making programmes for scientists, but for an audience. You have got to use supposition and storytelling mechanisms. [However, y]ou do have the responsibility to make sure that there’s no confusion about what is absolutely known and what is supposition.” As the cliché says, the only certainty, even in science, is uncertainty. Theories conflict, evidence can be interpreted to support multiple answers... “...Scientists have conflicting theories and really to present that to an audience you have to find a path that presents that with integrity.” What science can say with little quibble about dinosaurs rests largely on the discipline of functional morphology... It is possible and legitimate... to extrapolate a wide range of behaviour from skeletons: from how much a beast might have weighed to how it might have walked or hefted its tail. It is entirely responsible to examine a dinosaur jaw and depict how that jaw clothed in flesh might have stripped ancient foliage of its leaves. But even the most basic question – for a documentary-maker – of what colour dinosaurs are resides in the realm of speculation... “You could say they were purple and nobody could prove you right or wrong.” ...[an] Institute of Geological and Nuclear Sciences... [geologist says:] “It’s wonderful television but you have to say that there’s also a large amount of intelligent expediency...” If [the geologist] has one central criticism, it is that the programme presents its stories as seamless. “By giving the viewer a fait accompli, it becomes a sort of backhanded slap to palaeontologists. It’s saying that there is no more to be told, when the reverse is so. In that way it does not help science because we rely on the next generation to be infected with a sense of curiosity about what is not known.” [The geologist] argues that a central difficulty in animating dinosaurs is that, despite the wealth of research, scientists have only a fragmentary image of what it was really like in the age of the dinosaurs... [e.g., w]hat we know of *Tyrannosaurus rex*, the celebrity dino that every child can identify, is based on the evidence gleaned from only 11 skulls... “Everything we know about [dinosaurs] comes from the fossil remains of only about 500 species from a span of 160 million years. Yet we know from the fossil record of other animals that for every species that we have found there are some 25,000 that we don’t have any record of at all.” [Consequently, t]he challenge *Walking with Dinosaurs* faced is akin to archaeologists 100 million years hence trying to reconstruct the vast diversity of human experience and behaviour from an episode of *The Simpsons*... [- assuming there will still be archaeologists in 100 million years! There might not be if future generations take note of this quote:] “I did a million different jobs, including being an archaeologist. I wanted to be like Howard Carter and open the tomb of Tutankhamun and say I’d discovered the key to lost civilisations. It never happened – I found myself down in the trenches in the rain with a toothbrush for hours.”

...WHERE are our dinosaurs? ...The search for N[Z]’s dinosaurs did not begin in a productive way until... the late-70s... [when] a band of volunteers... took up fossil-hunting as a hobby... [They] have located fossil fragments in their favoured site, at the mouth of the remote Mangahouanga stream. To date the fragments have been identified as belonging to a meat-eating theropod, a vegetarian ankylosaurus and the flying dinosaur pterosaur. Following confirmation by overseas experts, [the leader of the volunteers] has been rewarded with a CBE and an honorary doctorate in science from Massey University. [The honorary DSc] says that the fossil fragments imply that N[Z] was once well-populated with dinosaurs. That accords with the geological record. Eighty million years ago N[Z]’s land mass was much greater as it was in the process of splitting from the great southern continent of Gondwanaland[(‘*Gondwana* – or land of the Gonds – was a vast continental area thought to have once existed in the southern hemisphere and to have broken up in the Mesozoic or late Palaeozoic times to form Arabia, Africa, South America, Antarctica, AUS and the peninsula of India’; ‘the precise geophysical mechanisms involved in the drift of continents and, indeed, plate tectonics – a theory which expands upon that of continental drift – are still hotly debated; the idea of such lateral displacement is generally ascribed to the German meteorologist Alfred Wegener, although similar but less detailed suggestions had been put forward by earlier writers’)]. All manner of life including the dinosaurs would have thrived. [The local fossil-hunters] believe... that if there was funding for a greater effort, more fossils would be uncovered despite two difficult hurdles. “It comes down to terrain. There has been considerable geological turmoil over the past five million years; our rocks have been folded and faulted, leaving a rugged landmass that makes it hard to do prospecting and difficult to recover what you do find.” The other hurdle is acidic soil. The country’s substantial vegetation has resulted in giant coal deposits associated with acidic conditions. “The acidic waters dissolve fossils. The chances are slim that much has survived.” Where there is a wealth of evidence is with marine fossils. Marine dinosaurs died in the coastal seas and were preserved in limestone formations that later ended up on land after geological disruption. “These are our strengths, the big marine reptiles have been well catalogued.”... There are three main groups: the plesiosaurs (like the mythical Loch Ness monster), mosasaurs (sea-going lizards) and ichthyosaurs (reptilian ancestors of dolphins). [Perhaps this is why a local palaeontologist] remains optimistic about his chosen vocation: “By overseas standards N[Z] is one of the last frontiers. We can make a good contribution to what [is known about] the dinosaurs.”

...A “dinosaur in miniature”, the largest beetle of its type, has entered the scientific record books... The wrinkled fungus beetle grew to the length of a... thumb and, with moa, raptors and large weta, was part of N[Z]’s “mega-fauna” that existed thousands of years ago. With its... warty body covered in patches of bristles and a crust of waxy secretions, *Archaeophylax worthyi* provides palaeontologists and entomologists with a tantalising glimpse of early N[Z]... “As more fossils are discovered, it becomes patently apparent that N[Z] was a land of giants and *Archaeophylax worthyi* is possibly one of hundreds of extinct insects that once truly walked with the dinosaurs.” ...but the mystery of its extinction may never be solved.

...N[Z] scientists... believe they’ve found the smoking gun that killed off the dinosaurs. The theory that an asteroid hit the planet... [in the area which is now called] Mexico... destroying the animals’ ecosystem and food-chains is an old one. But the evidence is new, and was found in a disused

coal mine at Moody Creek, north of Greymouth... The... evidence... was preserved in tiny grains of pollen found in the coal. The grains showed the forests on the West Coast suddenly disappeared 65 million years ago, eventually replaced by ferns... But there are [still] unanswered questions...

The dinosaurs were wiped out by an asteroid that smacked the Earth 65 million years ago – but they survived another possibly similar cataclysmic event 200 million years ago, say scientists. The early calamity snuffed out 80[%] of all species, said... a University of Washington palaeontologist who led [the] researchers. By studying the fate of a type of plankton – single-celled organisms called Radiolaria – the researchers found that the mass extinction was a sudden event, not the prolonged die-off that experts previously thought... [T]he extinction occurred at the boundary between the Triassic and Jurassic periods in the Mesozoic era. The event was the death knell for most species and helped crown the dinosaurs, which arose earlier in the Triassic, as rulers of the Earth... [Incidentally, t]he Kiwi, N[Z]'s national bird and sports symbol, probably originated in A[US], says a N[Z] scientist. The m]olecular evolutionist... led an Oxford University team that found the kiwi developed in A[US] and migrated to N[Z] about 70 million years ago along the Norfolk Ridge, or Lord Howe Rise, that linked the two countries. The sea later closed in, isolating the kiwi in NZ... The team found that the ancestors of NZ's 11 moa species were probably separated from other ratites – one of the most ancient groups of birds – in A[US]-Antarctica when NZ broke away 82 million to 85 million years ago. Kiwi, ostrich, emu, and cassowary ancestors all developed outside NZ. It appeared kiwi diverged 64 million to 71 million years ago. "The moa and kiwi represented separate ratite invasions of N[Z]," said the scientist –] ...a Natural Environmental Research Council advanced fellow at Oxford... Four years' work sequencing genetic material from old and modern birds has confirmed that the Australasian area was an important source from which ancestors of modern birds spread.

...*Feathers fly over dinosaurs* A lizard that glided through the trees of prehistory 220 million years ago has overturned an established theory of how birds evolved from feathered dinosaurs. The 24cm lizard, which lived 75 million years before the first known bird, may have sported a set of feathers yet was not a dinosaur, a study has found... The research has focused on the fossils of Longisquama insignis, an archosaur – the group which gave rise to the dinosaurs, crocodiles and birds – that lived in the forests of what is now central Asia... Soviet scientists found the fossils in Kyrgyzstan in 1969 but they remained in a museum drawer in Moscow for many years after an initial examination concluded that two parallel rows of appendages on the back of the animal were scales, not feathers. Closer scrutiny... by a team of... [US] scientists found that the... appendages had a long, thin tube or shaft running down the centre with projections, or pinnae, extending from the sides of the base, just like modern feathers but quite unlike reptilian scales... "These are some amazing fossils which, at the very least, prove that feathers did not evolve from dinosaurs," says... [a] professor of zoology at Oregon State University. "The supposed link between dinosaurs and birds is pretty entrenched in palaeontology, but it's not as solid as the public has been led to believe... A point that too many people always ignored... is that the most bird-like of the dinosaurs, such as Bambiraptor and Velociraptor, lived 70 million years after the earliest bird... So you have birds flying before the evolution of the first bird-like dinosaurs. We now question very strongly whether there were any feathered dinosaurs at all... They were probably flightless birds."

...Scientists have peered into the chest of a 66 million-year-old dinosaur and discovered a heart not unlike a human's. The fossilised dinosaur heart, belonging to a Thescelosaurus named Willo, was identified using medical imaging techniques and was much more like that of a mammal or bird than a reptile. The finding supports the belief that dinosaurs were warm blooded, unlike lizards.

...previously overlooked dinosaur fossils show... Tyrannosaurus rex was... no solitary, brutal, lonely carnivore. In reality, it was both caring and cunning... "In... *Jurassic Park*, which boasted the most accurate popular depictions of dinosaurs ever, T. rex was, as usual, presented as a killing machine whose sole purpose was aggressive, bloodthirsty attacks on helpless prey," says [a] palaeontologist... "T. rex's popular persona, however, is as much a function of artistic licence as of concrete scientific evidence." In fact, mounting evidence points to gregarious T. rex behaviour... Tyrannosaurs probably lived in herds and developed complex interrelationships – "in many ways, an entirely new species to contemplate." Several key pieces of evidence point to such sociability, say scientists. One of the most important of these involves a recent re-examination of a set of nine T. rex skeletons found in Alberta, Canada, in 1910. Researchers always assumed these creatures had perished one after another – in mud or soft sediment – as they tried to reach and eat other dinosaurs... which had also been caught there. But when scientists from the Royal Tyrrell Museum of Palaeontology in Alberta returned to the site... they could find no other dinosaur remains. T. rexes, they deduced, had not been lured individually to their doom but had most likely "associated with one another naturally, and perished together from drought, disease or drowning." ...Similarly, re-examinations of other T. rex fossils have revealed that several creatures, thought to have been buried alone, were members of groups. One, at a site known as Hell Creek, has shown that the remains of a second dinosaur found with a... T. rex was actually a baby tyrannosaurus. Marks on the [baby's] bones have been scrutinised and found to bear considerable likeness to the marks left by T. rex's own teeth. This suggests, some scientists say, that there may have been a great deal of social interaction within a tyrannosaur herd, the marks being a result of family members nuzzling and biting each other, much as lions behave today... "Tyrannosaurs were the big cats of their day. And just as we have prides of lions today, it is perfectly reasonable to assume that we may once have had prides of tyrannosaurs wandering around in Jurassic times." ...Such interaction, however, may have been more violent and had more unfortunate effects... Young tyrannosaurs may well have perished after such encounters... Tyrannosaurs were blessed with teeth "like lethal bananas," as [a] palaeontologist of the University of California at Berkeley, puts it. They were the size of "railroad spikes with serrated edges." ...[but] the evidence... is[n't]... unequivocal, says... a... British dinosaur expert... of the Sedgwick Museum, Cambridge... "This is a new way of looking at tyrannosaurs, but... [s]ome big cats hunt as loners and some in groups. Unless we get a time machine and travel back 65 million years, we will never know for sure which was the case with T. rex..." [● 'Scientists have unveiled the reconstructed skull of the largest species of meat-eating dinosaur ever found. Named gigantosaurus carolinii, the dinosaur that is about 1.5m longer and nearly 2 tonne heavier than the previous king of dinosaur predators – T rex – lived about 97 million years ago. Discovery of the dinosaur's remarkably complete skeleton near a lake in western Argentina was announced in 1995. Its 76 dagger-shaped teeth set in long, narrow jaws made for "collectively, just an absolutely horrifying predatory machine." Running on its hind legs, the 14m-long, 8 tonne, flesh-ripping creature probably chased down and ate plant-eaters at least twice its size. In contrast, T rex, with heavier teeth and a more-blocky skull suited to crushing bones, most likely scavenged the bodies of dead dinosaurs.']

...*Roll over T-rex – here comes... the world's biggest carnivorous dinosaur.* P[alaeontologists] in Patagonia have... confirm[ed] theories put forward... almost 20 years ago[. I]n his book *In Patagonia*, [Bruce] Chatwin described how his obsession with a scrap of dinosaur skin compelled him to track down the cave of a prehistoric giant sloth, the glyptodon. The tale of this personal quest in a remote landscape was to spur a scientific monster hunt throughout Argentina's southern badlands... The place turned out to be cluttered with the bones of prehistoric giants like some Jurassic memorial park. In the 10 years since Chatwin's death, the fossil boneyards beneath Patagonia's arid dunes have yielded rich finds, and professional fossil-hunters are going to great lengths to gather more... Long before there were gauchos, pampas or even Andes in Argentina, huge herds of saurian beasts rumbled across a lush Patagonia. "Huge" is the key word. A study of six partial skeletons unearthed by... palaeontologists reveal that dagger-toothed dinosaurs, 1.6m longer than Tyrannosaurus rex, may have formed packs to stalk prey even larger than themselves... [Indeed], the latest archaeological evidence... points to plant-eating dinosaurs that grew to such enormous proportions that only "pack hunting" techniques could have brought them down. This year helicopters will haul out the neck vertebrae, each one more than 1m across, of another newly identified dinosaur species: the Rio Negro Giant. This 48m swamp-dweller, the biggest in the world, was excavated in January from a desolate Patagonian grazing spot called La Buitrera. Although enormously bulky, the creature had a tiny head on a serpentine neck. Stretching up to nibble fruits, it would have looked much like a Loch Ness monster on steroids and was... tall as a five-storey building. These creatures are believed to have travelled in herds like elephants, and defended themselves by lashing out with their tails. They were trailed by small packs of fierce predators, each

one 50 times the size of a cow... The still nameless prehistoric creature, measuring closer to 14m from snout to tail and weighing in at nearly 9 tons, appears to be closely related to *gigantosaurus*, an outsized meat-eater discovered in 1993 in the same area... Because the [unnamed creature's] bones were found at the same geological level as *argentinosaurus* – hitherto the world's largest herbivore until the Rio Negro Giant turned up – local scientists assume that they were direct links in the food chain... [A palaeontologist from] the Royal Tyrrell Museum in Canada... also believes that the sophisticated communication required to hunt in a pack could have led the flesh-eaters to practise “patterns of conduct protecting their young.” Considering the age of the bones, the pace of dinosaur finds in Patagonia has been comparatively fast and furious, and the many discoveries are a source of pride for Argentines. “Africa was the birthplace of [humanity],” says one... “and our country was the birthplace of dinosaurs.”

...The world's oldest human footprints will be lifted from a lagoon near Cape Town next week to protect them... Apart from vandals, who have taken to carving graffiti in the rock and to put their own feet into Eve's prints, the fossil is being eroded by the elements. The delicate removal operation, funded partly by *National Geographic* magazine, involves cutting the fragile rock with a high-powered diamond drill... Other... fossil footprints... buried near the original set are also being considered for excavation. The South African Museum will be asked to provide replicas of the footprints to be put in place of the originals... [A]n archaeologist with the National Monuments Council, which is overseeing the preservation... said that if it had been possible, the footprints would have been conserved where they were found. “However, in conserving the fossils by removing them... we will ensure their survival as a global asset with high tourism potential... We simply had to ensure they survived for future generations.”

...South African researchers have discovered an almost entire skeleton of an ape-[perso]n, the oldest such find anywhere in the world, which could provide long-sought clues to the evolution of humankind. The 1.22m fossil was unearthed at Sterkfontein, on the outskirts of Johannesburg, and is estimated to be 3.6 million years old. The oldest previous skeleton was 3.2 million-year-old “Lucy,” found in Ethiopia, while older bone fragments have been discovered in East Africa... “It is the most important find out of South Africa since the Taung skull was found in 1921. This probably exceeds that in importance... We're getting down nearer to the critical parting of the ways between apes and us...,”... said... [the p]rofessor... who led the team of researchers from South Africa's University of the Witwatersrand... [In related news, t]he out-of-Africa theory is not dead, anthropologists and other experts say, despite two studies that challenge the idea that we are all descended from a single African “Eve.” U[S and AUS]n researchers have published two reports that used physical and genetic evidence to suggest possible mixing of pre-humans with modern species. They said they had proved wrong the mainstream... theory – that the ancestors of all living humans emerged from Africa some 50,000 years ago and either killed or out-competed all other human-like creatures. One study... analysed physical features of early human skulls to suggest there must have been interbreeding among the migrating Africans and resident Neanderthals and even *Homo erectus*... Another study... used genetic evidence that suggested “Mungo [Perso]n – an A[US]n skeleton dated to between 40,000 and 60,000 years ago – was genetically unrelated to Africans. The... A[US]n National University... researchers... said their finding showed the first modern humans evolved in A[US], not Africa.

...Step aside African, here's Mungo [Perso]n... The 60,000-year-old skeleton was found in 1974 in Lake Mungo, N[SW]. It was one of 10 indigenous A[US]ns – all ancient yet anatomically modern – whose DNA was analysed by... the A[US]n National University in Canberra... Earlier studies suggested that our most recent common ancestor lived 200,000 years ago, and traced the root of the gene tree to Africa. But the DNA from Mungo [Perso]n does not exist in modern... mitochondria, the cell's “power packs” passed from the mother... This suggests that the most modern lineage of the modern human tree so far found emerged in A[US], then became extinct. The study, “an amazing technological feat,” highlights the danger of reading too much into mitochondrial DNA evidence, said [a] Dr... of SUNY College, New York. But... [p]revious studies of mitochondrial DNA from three Neanderthal specimens were sufficiently different from modern humans to rule out Neanderthals as our ancestors... The new study shows it is possible to be anatomically modern but still have different DNA. Thus the lack of Neanderthal mitochondrial DNA in modern humans did not rule them out as our ancestors... This weakens the case that Neanderthals are somehow separate,”... said [the SUNY College] Dr...

Genetic analysis of Mungo [Person shows it]... wouldn't look out of place in a modern group of A[US]n Aborigines... says the [guy] who's examined him as closely as science will permit... The results of... the... palaeoanthropologist[s]... research have sparked fierce and often bitter debate in the scientific community because, says the genial and soft-spoken [AUSn], they deal a body blow to the so-called “Out of Africa” theory of human evolution... an idea which has held sway in academic circles since the mid-80s... [The AUS]n never liked the idea because, as [the anthropologist] puts it, it didn't fit the facts... [Because the prevailing theory held that] *Homo erectus*... emerged... in Africa and “progressively went around the world killing off... all the others[we]... used to call them ‘killer Africans’ and my opponents didn't like that[.]” The AUSn, [who] gave a public lecture at the University of Auckland this week, marvelled at the serendipity of a rash of recent discoveries which have upended anthropology and our understanding of where we came from. First, a skull found in Central Java... prosaically known as SM3 shows clear evidence of brain structure close to that of modern humans. The skull, something between 100,000 and 800,000 years old, has torn a gaping hole in the theory that *Homo sapiens* arrived, as a killer horde, only 150,000 years ago and displaced *Homo erectus*. At the same time, research at the University of Michigan at Ann Arbor compared ancient and modern skulls from A[US] and central Europe. The local family resemblances in both cases were more striking than the similarities between specimens from opposite sides of the world, which, the research concluded, was powerful evidence of what [the AUSn] calls “regional continuity.” “It's been a fantastic year... A lot of evidence has come forward in the last few months, new dates, new fossils which make it clearer. There are two groups of scientists – anatomists, archaeologists, neurologists, even some linguists, and anthropologists – and the one thing we all agree on is that one side is absolutely wrong.” On one thing all anthropologists are agreed. Humanity – the genus *Homo* – emerged in Africa. That's because chimpanzees and gorillas, our closest relatives, are African and are found nowhere else. The warring factions also agree that about 2 million years ago some humans – the conventional term is *Homo erectus*, a category [the AUSn] disputes is even valid – began to leave Africa. “They are in Java and China and the ancestors of Neanderthal[s]... in Europe. That's not a problem; even at 50km a generation, getting to China from Africa is a doddle.” But the group of which [the AUSn] is a leading light does not hold with the idea – embodied in the so-called Eve hypothesis... – that *Homo sapiens* emerged as a new species who killed off *Homo erectus*... “...the way I see the [prehistoric] world is the way it is now. [Our ancestors move] out of Africa, populations mix and meet, a bit of bonking goes on, genes are flowing from Algiers to Capetown. When they get out into the Levant and Europe and China the same things are happening. That's why a person from anywhere in the world can meet someone from anywhere else in the world and they'll produce children... All humans can interbreed with all other humans. At the same time we're making adaptations to different environments – from high altitudes, to deserts, to jungles and that's why we've got black Africans and pygmies and white, yellow and b[rown] people. What a European person looks like today is not what [it] used to look like, and the same goes for Africans...”

...AUSTRALOPITHECUS One of the first apes to walk upright, which... kicked the bucket 3.2 million years ago... RIP...

We can all call Africa home New genetic research supports the theory that anatomically modern humans rose out of Africa in the past 100,000 years and swept aside populations of archaic humans, with no inter-breeding. Chinese and American geneticists obtained blood samples from 12,000 [guys] across Asia and examined characteristic DNA sequences called markers on the Y chromosome. They found each one could trace his ancestry to forefathers who lived in Africa over the past 35,000 to 89,000 years. The findings appear to confirm the out-of-Africa theory...

Skull shakes old theories... Scientists have unveiled the skull of what they called the earliest member of the human family so far discovered, dating back six or seven million years... [An anthropologist from] Harvard University told the *Nature* scientific journal that the find would have the impact of a “small nuclear bomb” among students of human evolution... Exactly where the... thick-browed, flat-faced skull... discovered in Chad... fits into

[humanity]'s family tree is not clear, but its age, shape and location challenge basic beliefs about the evolution of our earliest ancestors. Among other things, the find could push back the date at which humans are believed to have diverged from apes. And it suggests that upright-walking human ancestors evolved not just in the grasslands, as anthropologists have long thought, but in forests as well. Scientists nicknamed the specimen Toumai, or "hope of life" in Africa's Goran language. It was unearthed a year ago by a research team led by [a]French palaeontologist... "It's not what we thought we would find," said [a colleague from] George Washington University in the U[S]. "If you look at the back of it, it looks like a chimpanzee, and if you look at the front of it, it looks like something in the human fossil record unambiguously a couple of million years ago." [The] Harvard University anthropologist... said the skull raised "a wheelbarrow full of questions"[, and] likened it to Raymond Dart's 1920s discovery of a skull of an ape-[perso]n in southern Africa, which lent the first support to Charles Darwin's theory that the deepest traces of human evolution could be found in that continent... Toumai is the oldest addition to a growing array of recently discovered hominid, or pre-human, fossils that show human evolution was not an orderly progression. Instead, Africa appears to have been populated with many transitional species.

...one of the world's most prominent anthropologists... who is based at the University of California, Berkeley... has unveiled the fruits of his latest research – three pristine skulls belonging to the earliest members of our own species, *Homo sapiens*. The... two adults and a child... lived about 160,000 years ago, making their skulls... 60,000 years older than the previous oldest fossils of anatomically "modern" humans. [The anthropologist] said these... people probably belonged to the group of ancient humans from whom everyone is descended. "With these new crania we can now see what our direct ancestors looked like... We've lacked intermediate fossils between pre-humans and modern humans, between 100,000 and 300,000 years ago, and that's where these fossils fit in... Now the fossil record meshes with the molecular evidence... These well-dated and anatomically diagnostic Herto fossils are unmistakably non-Neanderthal. These fossils show that near-humans had evolved in Africa long before the European Neanderthals disappeared... They thereby demonstrate conclusively that there was never a Neanderthal stage in human evolution."

...The Neanderthal was a squat, powerful hunter who dominated Europe for more than 100,000 years, but... disappeared forever when modern humans evolved in African and moved to the other continents... [T]here is no convincing evidence that Neanderthals and modern humans ever mixed in substantial numbers, which means that when the Neanderthals died out, so did their genes... The reason for the Neanderthals' extinction is unknown. Disease is one theory. Another is that modern humans were able to outsmart the Neanderthals for limited resources of food.

...The Neanderthals [we]re supreme hunters, which is why they... lasted over 260,000 years. But they ha[d] a weakness, they d[id] not adapt well to change... [- whereas t]he humans... c[ould] adapt, and they ha[d] the ability to shape the world around them... We have since built museums to celebrate the past, and spent decades studying prehistoric lives. And if all this has taught us anything it's this: no species lasts forever.

...*Scratching the Naked Ape theory*... Early humans shed their coats of fur as a result of being plagued by disease-carrying parasites, a new theory of evolution claims. The new hypothesis challenges the long-held view that our early ancestors became almost hairless in order to control their body temperature in the heat of the African savannah. Instead, claim two [British]scientists... our ancestors' hair loss was a consequence of their natural intelligence. These hominids were smart enough to use fire, clothing and shelter to regulate body temperatures. And – unlike the dense fur that still covers apes and monkeys, forcing them constantly to groom each other for lice – clothing and bedding could be cleaned if they became infested.

...Traditional woven harakeke taonga at the Museum of N[Z], Te Papa, are fading and falling apart. Some of the museum's flax treasures, such as elaborate woven cloaks, are now so fragile they cannot be handled. But scientists have pinpointed the traditional dyeing process as causing the antique Maori clothing to disintegrate, not only in N[Z] but in overseas collections, such as those at the British Museum... Unlike undyed fibre, which is comparatively stable, the flax cloaks and other artefacts which have been dyed... are badly degraded. The... dye was created by soaking the fibre in a tannin solution, usually derived from hinua bark or manuka-kanuka bark. This later reacted with the iron in paru mud in which the fibres were... placed, to dye the fibre black... The problem is now being tackled by a multi-disciplinary team of scientists, weavers and other textile conservators... [which] has received funding of \$160,000 from the Public Good Science Fund... "We are aiming to slow this degradation and, where the damage is extensive, find a method of consolidating the fibre,"... an Industrial Research scientist... said yesterday... [S]everal novel, gel-like reagents had been tested for their efficiency in strengthening the fibre. "One of these has given promising results in preserving the mechanical integrity and handle of the fibre, and showing no visible alteration to the appearance of the fibre..." In the laboratory, test fibres had been artificially aged by thermal treatment (heating at 80 deg C for a month), or irradiation with simulated solar radiation... [A]geing experiments using controlled and limited oxygen supply indicated that oxygen was important in the degradation process. Preliminary work on fibres containing different iron contents also indicated the rate of degradation was increased in wet air. A systematic study of this was now in progress...

In knowledgeable Chinese archaeological circles it is whispered that when the tomb of a Ming Dynasty emperor near Beijing was carelessly opened some years ago, the richest trove of ancient silk ever uncovered crumbled to a pile of dust... Some reckon the century's greatest archaeological discovery is China's Terracotta Warriors, a buried 2200-year-old army of archers, infantry... charioteers and horses guarding the tomb of the first emperor, Qin Shihuang. Competition for the honour, admittedly, is intense: the tomb of the Egyptian pharaoh Tutankhamun, or the Dead Sea Scrolls. [But o]nly a brave person would bet against China indisputably winning the honour in the new century. Right next door to the awesomely large dig still underway – after 25 years of labour it has yielded just a fraction of the 7000 life-sized warriors and horses buried there – is the underground tomb itself, which has never been opened. Or, at least, it is thought to have been left untouched by either plundering armies or grave-robbers... So what is down there? Chinese archaeologists have little to go on beyond the writings of the great Han Dynasty historian Sima Qian (145-90BC). The tomb holds... "everything in the world: Palaces and pavilions filled with priceless gems and other treasures, rivers and lakes swirling with mercury, constellations of pearls embedded in ceilings, bales of the finest silk, entire zoos of rare animals crafted from beaten gold and silver." Qin Shihuang may have been the greatest despot who ever lived. Besides building the Great Wall and unifying China, [the first emperor] is most famous for burning the country's scholarly books, and burying alive its scholars. For now, the tomb is marked by nothing more than a grassy hump rising out of a ploughed field. If... [the] curator of the Museum of the Terracotta Warriors and Horses of Qin Shihuang, has his way, that is the way it will stay for some time yet. "...There are those who want to open it, and... those who are adamantly opposed to opening it." [Hi]s worry is that China does not yet have the skills or technology to preserve the contents of the tomb that took 700,000 slave labourers 37 years to build – indeed, that nobody in the world could contemplate such a task. Not that China would contemplate outside help. Foreign archaeologists have been kept well away from the present dig. Unlike the tombs of the pharaohs, opened without destroying the pyramids that housed them, Qin Shihuang's burial vaults... cover an area roughly 2 sq km. Exposing the necropolis would require an effort on a scale more akin to open-cast mining than archaeology, posing an environmental quandary. Then there is the real danger that a sudden change of temperature, atmospheric pressure and moisture content in the air – not to mention a rush of oxygen – could irreparably damage the more fragile treasures.

...*Treasure of the ages trashed in two days of looting*... The National Museum of Iraq recorded a history of civilisations that began to flourish in the fertile plains of Mesopotamia more than 7000 years ago. But when American troops entered Baghdad and toppled [the Iraqi dictator]'s Government last week, it took just 48 hours for the museum to be destroyed, with looters taking at least 170,000 artefacts. The full extent of the cultural disaster came to light only yesterday, as the frenzied looting that swept much of the capital over the previous three days began to ebb. As fires in a dozen Government ministries and agencies began to burn out, and as looters tired of pillaging in the 30-degree heat, museum officials reached the hotels where foreign journalists were staying along the eastern bank of the Tigris River. They brought word of what may be one of the greatest cultural disasters in recent Middle Eastern history. A full accounting of what has been lost may take weeks or months... What is beyond contest is that the 28 galleries of the museum and vaults that descend floor after floor into unlighted darkness have been completely ransacked...

Nothing of real value remained from a museum regarded by archaeologists... as perhaps the richest of all such institutions... Officials with crumpled spirits fought back tears and anger at [US] troops as they ran down an inventory of items they said had been carried away by thousands of looters who poured into the museum after daybreak on Friday and remained until dusk on Saturday, with just one half-hour intervention by US forces on Friday... [US] commanders say they lack the troops to curb the looting while their focus remains on mopping up pockets of resistance.

...The case for invading Iraq to remove its weapons of mass destruction was based on selective use of intelligence, exaggeration, use of sources known to be discredited and outright fabrication. A high-level British source said yesterday that intelligence agencies on both sides of the Atlantic were furious that briefings they gave political leaders were distorted in the rush to war with Iraq... [A]n editorial in a Middle East newspaper... said, "Washington has to prove its case. If it does not, the world will for ever believe that it paved the road to war with lies"... Since the war... there have been finds of suspected chemical weapons but they have turned out to be false alarms... U[N] inspectors who left Iraq just before the war started were searching for four categories of weapons: nuclear, chemical, biological and missiles capable of flying beyond a range of 150km. They found ample evidence that Iraq was not co-operating, but none to support British and US assertions that [the Iraqi] regime posed an imminent threat to the world... US and British teams claim they are scouring Iraq in search of definitive evidence but none has so far been found, even though the sites considered most promising have been searched... An Iraqi scientist said in a note slipped to a driver in a US convoy that [it] had proof information was kept from the inspectors, and that officials had destroyed chemical weapons just before the war. Other explanations for the failure to find the weapons include the possibility that they might have been smuggled to Syria, or are so well hidden that they could take months, even years, to find. But last week it emerged that two of four American mobile teams in Iraq had been switched from looking for the weapons to other tasks. One US official said privately that "in the end history and the American people will judge the US not by whether its officials found canisters of poison gas or... some biological agent [but] by whether this war marked the beginning of the end for the terrorists who hate America".

...On Day 84 of the search for Iraqi weapons of mass destruction yesterday, once again nothing turned up. Spies are spitting mad at the way their work was manipulated to exaggerate the Iraqi threat, and... emphasise that even if weapons of mass destruction still turn up, there is a fundamental problem – not within the intelligence community, but with senior [US] Administration officials – particularly in the Pentagon. "As an employee of the Defence Intelligence Agency, I know this Administration has lied to the public to get support for its attack on Iraq," rages one informant. Others see a pattern not so much of lying as of self-delusion – and of subjecting intelligence agencies to those delusions. One has to take the outrage among the spies with a few grains of salt because the intelligence folks have [often] been on the [other] end of... the... misuse of truth...

I've been roaming Iraq, turning over rocks in my unceasing effort to help the [US] Administration find those weapons of mass destruction. No luck yet. But I did find something related... in Nasiriyah... where it seems that contrary to early Pentagon leaks, [a US]Private... did not mow down Iraqis until her ammo ran out, was not shot and apparently was not plucked from behind enemy lines by U[S] commandoes braving a firefight. It looks as if the first accounts of the rescue were embellished, like the imminent threat from weapons of mass destruction, and like wartime pronouncements about an uprising in Basra and imminent defections of generals. There's a pattern – we were misled. None of this is to put down [the Private], whom her Iraqi doctors described as courageous and funny in the face of unrelenting pain; they said [the Private]... told... a hospital worker who had befriended her, not to take risks for her because [it] was needed by his 17 children. [The Private] is still a hero in my book, and it was unnecessary... to turn her into a Hollywood caricature. As a US citizen, I deeply resent my Government trying to spin me like a pingpong ball.

...[US] pilots dropped... napalm on Iraqi troops during the advance on Baghdad. The attacks caused massive fireballs that obliterated several Iraqi positions. The Pentagon denied using napalm at the time, but Marine pilots and their commanders have confirmed they used an upgraded version of the weapon against dug-in positions... because of its psychological effect on the enemy... The Pentagon said it had not tried to deceive. It drew a distinction between traditional napalm, first invented in 1942, and the weapons dropped in Iraq, which it calls Mark 77 firebombs... A 1980 U[N] convention banned the use against civilian targets of napalm... The US... did not sign the treaty... ■ T[w]o... Iraqis and two Saudis with purported links to [the Iraqi dictator] and the al Qaeda terror network were being held yesterday over the killing of a Shi'ite Muslim leader, as his followers denounced the U[S]'s occupation and called for revenge. Thousands of Iraqis yesterday mourned Ayatollah Mohammad Baqer al-Hakim, killed with 82 others in a car bombing outside the Mausoleum of Imam Ali in the holy city of Najaf... the worst attack since the start of the US-led occupation... The car bombing, which wounded 229 other people, followed a... suicide truck attack on the UN headquarters in Baghdad, which killed 22 people, including top UN envoy Sergio Vieira de Mello, and wounded more than 100... The Naja[f] blast, together with [the]deadly attacks on the UN headquarters and Jordanian Embassy in Baghdad have created the impression the country is out of control... [-] tallies based on hospital sources and media reports... show that more than 110,600 Iraqis have died in violence since the 2003 invasion[(plus 'more US soldiers have now died in Iraq since the war than during it')]... Shi'ites have warned of dire consequences if their leaders or shrines are attacked again. They have been the patient planners in postwar Iraq, despite decades of torture and repression under [the Iraqi dictator]'s Sunni-dominated Government. Instead of seeking revenge, they provided social services in slums and urged followers to pursue a peaceful path to power in a country where many had predicted a civil war... Elsewhere yesterday, [a]tribal sheikh... who presides over a million-strong clan, was arrested by US troops west of the northern Iraqi oil capital of Kirkuk on suspicion of abetting sabotage of fuel pipelines... An oil pipeline... in Kirkuk... was still ablaze...

Al Qaeda has developed a new generation of explosives that enable suicide bombers to breach airline security. Anti-terrorism experts held an emergency meeting last month after an al Qaeda militant passed through several airline security checks with a bomb hidden in his intestine. [It] detonated the bomb with a cellphone signal, but failed to kill a Saudi Prince. "While not wanting to be alarmist, I admit this is alarming," said... [the] head of the United Nations' al Qaeda and Taleban monitoring group... By becoming coiled inside [the militant]'s large intestine, the bomb would have gained additional force. The Saudis believe the bomb weighed 110g and was made with PETN plastic explosive, to avoid detection by airline and other metal detectors... [In related news, the al Qaeda leader]'s personal driver, was to enter a specially built courtroom in Guantanamo Bay today for the first full trial of any of the hundreds of detainees to be sent to America's infamous prison camp since the 9/11 attacks... Even the US does not say the driver and sometime mechanic... was a major terror figure. But... [i]f convicted... could find himself in prison for life. For many, however, it is the erosion of America's historic liberties that will be on trial... ■ It[has] emerged that... Britain succumbed to "blackmail" from the U[S] by suppressing details of the torture of a British resident at Guantanamo Bay. Two High Court judges issued a scathing attack on the White House after... the US threatened to withdraw all intelligence co-operation from Britain if details of the treatment... were made public.

...The British Government is considering a ...\$[NZ]32.55 billion... plan to monitor the email, telephone and internet browsing records of every person in the United Kingdom. It would involve the creation of a mammoth database to store hundreds of billions of pieces of communications traffic and its supporters say it would become one of the security services' most comprehensive tools in the fight against terrorism.

...CITY-BOUND rail commuters will be hard pressed to find a rubbish bin in [Auckland's] new Britomart transport centre. It has none because of growing international fears over the possibility of more terrorist attacks in crowded public spaces... [In the US,] a proposed bill in Congress... would make "auto-terrorism"... [- when mostly 4]-wheel-drive vehicles were set on fire at dealerships... [-] a federal offence... [Meanwhile, a spate] of recent deaths of New York police and fire officers who took part in the emergency operation at Ground Zero after the 9/11 attacks has heightened fears it could be the start of a delayed epidemic of cancer-related illness... Up to 70,000 people helped in the massive operation, including... construction workers who volunteered from all over the US. Many worked for months amid a toxic soup of dust and chemicals.

...[In what'll] be one of the trials of the century, the suspected plotters of the 9/11 attacks [will appear] in a civilian court only 800 metres from the scene of the crime, Ground Zero... rais[ing] fears in New York that such a high-profile case will make the city a renewed target for terrorist attack.

...The final design of the signature tower to be built at the former site of the World Trade Centre has been revealed. It will soar above Wall St to become the world's tallest building. The shimmering, glass-encased... 1776 f[t]... Freedom Tower... include[s] 2.6 million feet of commercial space...

The great grey cloud of the global recession does have a silver lining – for petrolheads at least. The latest luxury model of Cadillac, the CTS, has dropped in price from \$100,000 to around \$63,000 after the collapse of General Motors. More than 80... have been snapped up by a [NZ] dealer.

...Move over accountants – here come the scientists to save us... The 1980s and 90s were the decades of the accountant – but scientists say the new millennium belongs to them. The new chair[person] of Science New Zealand... said it was time for scientists to “strut their stuff” and help solve the world's most pressing problems – food shortages... climate change... energy crises, and the need to... harness the nation's natural resources to increase exports and tourism... [during and after the current financial crisis. Speaking of which, a sweeping US] Government plan to buy up to US\$700 billion... in bad mortgages may not be enough to save some banks, which experts say may have to absorb big losses if they sell their troubled assets. The proposal for the Government to soak up the mortgage-backed securities would be the biggest bailout plan since the Great Depression...

Europe's four biggest economies pledged stronger co-operation to stem the worst financial crisis since the 1930s at a summit in Paris yesterday, but failed to dispel undercurrents of tension and disorder. The heads of Germany, Britain, France and Italy agreed to support solvent banks which found themselves buffeted by the financial storm, promised to tighten controls over the financial sector and warned that the heads of failed banks would carry their share of the blame. But beneath the rhetoric, key details were vague... France reportedly proposed that European governments put together a ...\$[NZ]623 billion... package that would act in tandem with the ...\$1 trillion... bailout for the US financial sector.

...Europeans leaders pleaded with American lawmakers yesterday to reach agreement on a financial rescue package “for the sake of the world”... A string of banks in Europe have had to be rescued as financial institutions in Iceland, France, Germany and the Low Countries have fallen to the global economic crisis... It is feared that other banks will follow if Congress does not reverse its decision to reject a US\$700 b... bailout of US banks.

...THE country that calls itself the US of A now needs another “S” in its title: the United Socialist States of America. The problem is: they aren't united about it. The attempt by the US government to plaster “Wall Street” – their shaky financial sector – with up to US\$700 billion... in public funding has exposed deep divisions in the country and its politicians. A compromise deal cobbled together enough votes to pass Congress... The nationalisation of the huge mortgage companies Fannie Mae and Freddy Mac... was carried out swiftly and smoothly and without fuss... But the... Wall St bailout is dirty socialism. Same thing as crony capitalism, really – the mixed economy at its worst... The conservatives say: this is not how you run an efficient market economy. The liberals say: this is not what you do with taxpayers' money – bail out shonky banks.

...Those footing the bailout bill have a right to ask – what went wrong? ...[US] taxpayers deserve an immediate inquiry into the banking system...

Across America, people know these desperate times call for desperate measures. But there's something about hearing the word “trillion” bandied about so easily by Washington these days, and the persistent pleas from the [US] Administration for patience and trust, that gives people pause.

...World leaders... declare an end to unfettered capitalism at the G20 summit... to prevent a repeat of the worst economic crisis since the 1930s.

...AS THE global crisis unfolds, the great gurus of the world economy – those who have presided over its fortunes for much of the last two or three decades – have largely ducked for cover... WITH unabashed glee, many commentators have again predicted the end of capitalism... For years before the financial crisis... economists had warned of the dangers of imbalances in the global economy – namely huge trade surpluses and currency reserves built up by exporters like China, and similarly big deficits in the US and other economies. With US consumers now holding back on spending after house prices plunged and as unemployment climbs, Washington wants other countries to become engines of growth... European officials renewed calls... to curb bonuses paid to bankers. Huge payouts linked to risky investments are widely seen as a factor in the credit crisis.

...Public anger boiled over last month when it was revealed that the total amount of bonuses paid out to... Wall St... staff... was US\$18.4 billion...

YOU GREEDY BASTARDS... Up to 10,000 staff at the New York office of the bankrupt investment bank Lehman Brothers will share in a bonus pool set aside for them that is worth US\$2.5 billion... The revelation... prompted a renewed backlash over the compensation culture in global finance... The chair[person] of besieged insurer AIG has asked employees who received... US\$165 million... in bonus payments to pay at least half back... [S]ome recipients had already returned 100% of their bonuses... [By the way, i]n the hours before [US] bombs began falling on the Iraqi capital, one of [the Iraqi President's sons (both sons are now dead following a shootout with US soldiers – their dad was later found)]... cowering in a hole in a Tikrit cellar[]... and a close adviser carried off nearly US\$1 billion in cash from the Central Bank, say [US] and Iraqi officials... The removal of the money, which would amount to one of the largest bank robberies in history, was performed under direct orders of [the President] says an Iraqi official with knowledge of the incident... The sheer volume of the cash was so great – some US\$900 million in [US] \$100 bills and as much as US\$100 million worth of euros – that three tractor-trailers were needed to cart it away... The [\$1]billion... is nearly twice the amount of hard currency believed to have been looted by Iraqis in the three weeks after the collapse of the Iraqi Government.

...U[S] military detectives have begun investigating five US troops for the theft of hundreds of thousands from an Iraqi money cache. US troops have recovered more than US\$600 million... from hiding places... in central Baghdad... But along the way, US troops apparently tried to stash... US\$100 bills, for themselves... So far, they have recovered approximately US\$900,000... a soldier... said... But it was suspected more was taken.

...American investigators in Iraq have recovered more than 700 artefacts and tens of thousands of ancient manuscripts that had been missing from the collection of the National Museum in Baghdad, some of which had been stored in underground vaults... [-] including five within the museum complex... [-] for protection... before the... invasion... Iraqi museum officials... said that while many irreplaceable antiquities were looted from the museum... the losses were less severe than thought... The FBI is co-ordinating efforts with international law enforcement, and the US-led coalition in Iraq has begun broadcasting messages on the radio offering rewards to Iraqis to return antiquities. More than 100 items had been handed in, including a 7000-year-old vase and one of the oldest recorded bronze bas relief bulls. At a conference in London last week, the world's top curators pressed US authorities to go further by tightening Iraq's borders, saying artefacts were still being smuggled out of the country.

...Scores of artefacts looted from archaeological sites in Afghanistan are being smuggled to Britain and sold to wealthy clients. With a single statue fetching up to \$US70,000... the trade is worth hundreds of thousands of dollars each year. London is one of the key centres for the sale of works illicitly taken from the war-torn state. Investigators believe there is a “loose network” of dealers who keep a low profile and, working from home, sell to collectors all over the world... Major auction houses and dealers are careful to avoid smuggled or illegally excavated material, forcing the trade underground... Interest in early Afghan art has been boosted by the [actions] of the Taleban, the Islamic militia that [formerly ruled Afghanistan and destroyed] thousands of statues, including two 45m Buddhas carved into a mountain in Bamiyan... [(the) Taleban... ordered the slaughter of 100 cows to atone for its “delay” in destroying Afghanistan's historic statues of Buddha)]... Whether “all moveable statues” in Afghanistan have been destroyed, as the Taleban claim[ed], remains in some doubt, however. None of the smaller statues were destroyed in public and Taleban officials lev[ied] unofficial taxes on the trade in Afghan antiques... Governments, museums and private collectors offered to buy them from the Taleban rather than have the works destroyed... There are also fears that the bulk of the collection once in Kabul Museum, looted during fighting between Afghan groups in the early 1990s, is in smugglers' or collectors' hands. The most famous exhibits were the Bagram ivories, a series of exquisite Indian panels nearly 2000 years old, excavated by French archaeologists in the 1930s. Recently a London-based dealer has offered several of the ivories by a Pakistani politician... [The dealer] bought several and donated them to a French museum. But most of the ivories are still missing... All the museum artefacts have been carefully catalogued and the antiques markets in the West will be monitored in case the [smugglers] try to sell [any of the artefacts]... “People in the countries where the works come from are sick of seeing their heritage ripped out of the ground and sold in Western cities,” said one archaeologist. But some say that without the trade much more Afghan art would have been lost.

...Sunken Atlantis... has been found, and it was right where they left it. French researchers mapping the sea-level found that the ocean was 130m lower 19,000 years ago. This led to the discovery of a large submerged island on the spot where ancient wisdom pinpointed the lost city... This month, an expedition to hunt for its remains among submerged Gibraltarian islands will be unveiled at the Royal Geographical Society...

Historians and naval experts are hailing news that Captain Cook's flagship, HMS Endeavour, may have been found at the bottom of an American harbour. For more than 150 years the final resting place of the 18th century's most famous ship has been the source of debate and controversy. Marine archaeologists took out a court order at the weekend, protecting a section of Newport Harbour, Rhode Island, where they are certain the Endeavour lies in 6m of water. The curator of the National Maritime Museum in Auckland... said... [w]hen Cook was finished with the Endeavour for his scientific journey to the Southern Hemisphere, which lasted from 1768 to 1771, the Navy sold it and it was used to transport supplies to the Falkland Islands... Some historians had thought it was either left to rot in the Thames or used as a collier... [But l]atest research shows it was renamed the Lord Sandwich and anchored in Newport Harbour, for use as a floating prison... Historians believed the Endeavour... was burned during a naval blockade in 1778, when the American Revolution was at its height... [It is] hoped a lot of the ship would have survived.

...The wreck of a 17th century British Royal Navy vessel thought to hold... £2.9 billion (\$[NZ]10 billion)... of gold and silver – making it one of the world's most valuable hoards of sunken treasure – has been discovered off Gibraltar. The ship, believed to be the Sussex, lies at a depth of about 900m in Spanish waters. It is reputed to hold one million coins, amounting to 10 tonnes of gold and 100 tonnes of silver... The 80-cannon Sussex was part of a British fleet sent to the Mediterranean to contain the expansionist plans of Louis XIV of France, the Sun King. Historians believe it also had the secret task of ferrying a vast sum of gold and silver to buy the loyalty of the Duke of Savoy. The Sussex sank in 1694 in a storm in the Straits of Gibraltar and only two of the 500 soldiers and sailors aboard survived. The body of Admiral Sir Francis Wheeler, who commanded the fleet, was washed up on the Gibraltar shore in a nightshirt. The Duke never received the money and Britain never gained his loyalty... A[US] company, Odyssey Marine Exploration, from Tampa, Florida, has recovered a series of artefacts from the ship that have pointed to its identity.

...The Securities Commission is warning people to steer clear of a sunken treasure scheme off the coast of Indonesia which has already attracted nearly \$1 million in investments. Around 80 N[Z]ers have invested \$520,000 and A[US]ns \$420,000 in the scheme... being promoted by Auckland-based Ocean Salvage Investments Ltd. [Its s]ole director and shareholder, [an AUS]n... formerly of Adelaide but now living in Auckland, was banned for life from the A[US]n securities industry in 1995. In 1998, [the director and shareholder – who]... could not be contacted last night... [-] was convicted of offences in A[US] relating to two illegal fundraising schemes involving sunken treasure and given a four-year suspended jail term.

...[a NZ]er and five A[US]ns are among a group of 48 detained by the Indonesian Navy... [for] hunting treasure from sunken ships... Navy staff took control of two vessels in the waters off Bangka Island... and late last night were towing them to the Indonesian capital... Archaeological objects, porcelain and ceramics had been found in containers on board one of the vessels... [The Navy] said neither of the boats had clearance documents or permission from Indonesian authorities... Indonesian law decrees that any treasure recovered from its waters belongs to the state.

...How to protect the hidden secrets of the world's shipwrecks from destruction by commercial divers has been top of the agenda at an Athens conference. The experts studied guidelines during the weekend to try to safeguard thousands of wrecks in international waters, as ocean floors become increasingly accessible to private salvage crews... Unesco is to hold a meeting in Paris in [two months] aiming to hammer out international consensus on protecting underwater heritage. Disagreements between countries over the cost and methods of wreck protection have delayed an agreement for years. Some countries, like Britain, have too many potential sites to protect, while others have allowed tourists and hobby divers to damage sunken ports and wrecks in shallow water. Archaeologists argue that shipwrecks provide unique insight into the past – about wars, commerce, migration and technology. H[owever, plundering]... is a lot faster than research... The world's most famous sunken ship, the Titanic, is at the heart of the debate. The liner went down in 1912... [and rests] some 4km below the sea's surface... It was reached by underwater explorers 70 years later and has since been the subject of multiple legal battles over display and salvage rights and the attempted sale of artefacts... Unesco's planned agreement would not tackle problems like ownership of salvaged wrecks but, instead, urge Governments to identify sunken ships and leave them in the sea until they could be properly studied. "The... water often provides a stable environment for [the wreck's] future," [Unesco] said.

...A... team... contracted to search for a missing Israeli submarine... discovered what is almost certainly one of maritime archaeology's more important finds... [S]itting 321km to the southwest of Crete in an area known as the Herodotus Abyssal Plain, was the remains of a Greek trading vessel laden with thousands of jars and amphorae used for carrying wine and olive oil. Most are intact – even though the wreck is thought to be 2300 years old. The vessel is believed to be the world's deepest, ancient shipwreck... Nauticos Corp, the... deepwater exploration unit employing... [the team] believes the vessel was travelling directly between the Greek island of Kos and Rhodes to the markets in the Egyptian port of Alexandria.

...a researcher... says... [a] skeleton thought to be that of Alexander the Great's father, Philip of Macedon, is no such thing... [The researcher] thinks the skeleton, unearthed in the Northern Greek farm village of Vergina in 1977, is actually that of one of Alexander's half-brothers... "New skeletal evidence shows that the skeleton belongs to King Philip III Arrhidaeus..." ...Features in the skull thought to be the scars left when an arrow blinded King Philip II, a known historical incident, are actually just normal anatomical quirks, [the] anthropologist... reports in *Science*.

...A Greek farmer has stumbled across a rare gold wreath that could provide more clues about the worship of Dionysus, the ancient god of wine and revelry. Archaeologists are examining the 2350-year-old solid gold ornament, only the third of its kind to be unearthed in Greece.

...the 3000-strong Kalunga community... has lived in virtual isolation in central Brazil since its ancestors, a group of escaped slaves fleeing work in gold mines, settled there in the early 18th century. The remoteness of north Goias state, a rocky mountain region, meant that life for the... Kalunga – the name is from an old Bantu word referring to a supernatural force – ...has stuck in a virtual time warp for 250 years. They have no running water, electricity or telephones, make manioc flour using archaic wooden tools and still sing prayers in Latin and old Portuguese. And they had no road until last year, when the state Government built one. "The road is the most important thing to have happened in my lifetime..." says [a] 66-year-old... "Our suffering has lessened." But while the Kalunga believe their lives have improved, anthropologists worry that contact with modernity will ultimately be catastrophic... [The] professor of anthropology at Brasilia University, argues that the Kalunga stand to lose more than they will gain... The Kalunga may live in poverty, but according to [him]... they have a sense of identity and self-esteem that most other Brazilian blacks lack. This communal pride... would disappear if white[s]... were allowed to develop the area. [The professor] adds that despite any good intentions, Brazil's chaotic and land-owner-biased political system will not give the Kalunga adequate protection against the vested interests of agricultural expansion... A decade ago a power company started to look into the prospect of building a hydroelectric dam which would destroy large parts of the Kalunga region. The Kalunga managed to gain an injunction against the project – although whether they are ultimately successful may depend on whether they can win title of their land before the injunction is judged. [The professor] is pessimistic about the Kalunga's future. "...Probably they are collapsing already..." ...The attitude of anthropologists, however, has irritated the Kalunga, who... can see no suffering greater to what they are already experiencing. "[The anthropologists] want to keep us in slavery," claims... a Kalunga leader... aged 38... Their culture is a mixture of African, Portuguese and Amerindian, because they live in an area that in the past also contained nomadic indigenous tribes. Having glimpsed the outside world, few people wear the home-made smocks that once were common and only the old [gals] remember how to use backyard looms that now lie idle. Some young people who visit the surrounding towns stay and earn a little cash, returning with modern clothes and watches. However, there is still no health post and the Kalunga suffer from preventable diseases and a high post-natal death level.

...Thousands of South American Indians were infected with measles, killing... hundreds and probably thousands... so that U[S] scientists could study the effects on primitive societies of natural selection, according to a new... book, *Darkness in El Dorado*... The astonishing story of genetic

research on humans, which took 10 years to uncover, is likely to shake the world of anthropology to its core... “In its scale, ramifications, and sheer criminality and corruption it is unparalleled in the history of anthropology,”... says... [a] Cornell University... Professor... in a warning letter to... the president of the American Anthropology Association... [The] letter was... trying to warn the A[ssociation] of the impending scandal so the profession could defend itself... Once the epidemic was under way, according to the book, the research team “refused to provide any medical assistance to the sick and dying Yanomami, on explicit orders from... James Neel, the geneticist who headed the long-term project... Neel... insisted to his colleagues that they were only there to observe and record the epidemic, and that they must stick strictly to their roles as scientists...” ...The book was originally scheduled for release next week, but [the publisher has]... delayed publication... so the author could add material. Few people have actually seen the book... But pre-publication copies sent to anthropologists have generated a bitter academic war waged by e-mail. Although Neel died last February aged 84, many of his associates, some of them authors of classic anthropology texts, are still alive... They are now asking colleagues in the field to come to their defence... “[The authors of *Darkness in El Dorado*] have repeatedly accused me of some of these things in the past... This is just a more elaborate extension of their long vendetta against me,”... a University of California-Santa Barbara anthropologist who accompanied Neel on the 1968 expedition... wrote in a message posted on the internet... In his work, [the companion] portrays the Yanomami as violent and prone to constant warfare. [However, the companion] has been accused before of instigating much of the violence [the expedition] observed... One of the most controversial aspects of Neel’s research... is that it was funded by the US atomic energy commission, which was anxious to discover what might happen to communities when large numbers were wiped out by nuclear war... [The Cornell University professor] quotes another anthropologist who read the manuscript as saying: “[*Darkness in El Dorado*]’s analysis is a case study of the dangers in science of the uncontrolled ego, of lack of respect for life, and of greed and self-indulgence. It is a further extra-ordinary revelation of malicious and perverted work conducted under the aegis of the atomic energy commission.” ...Neel and his group used a virulent vaccine called Edmonson B on the Yanomami... “Medical experts, when informed that Neel and his group used the vaccine in question on the Yanomami, typically refuse to believe it at first, then say that it is incredible that they could have done it, and are at a loss to explain why they would have chosen such an inappropriate and dangerous vaccine... There is no record that Neel sought any medical advice before applying the vaccine. [Furthermore, Neel] never informed the appropriate organs of the Venezuelan Government that his group was planning to carry out a vaccination campaign, as [they were] legally required to do. Neither [Neel] nor any other member of the expedition has ever explained why that vaccine was used...” The 1970 account of the inoculation programme in the *American Journal of Epidemiology* says the shots were an attempt to stop an epidemic that had been going on for months. But [*Darkness in El Dorado*] charges... that in isolated populations that had never been exposed to measles, the shots would actually generate the disease... “This nightmarish story – a real anthropological heart of darkness beyond the imagining of even a Joseph Conrad [though not, perhaps, a Josef Mengele] – will be seen, rightly in our view, by the public, as well as most anthropologists, as putting the whole discipline on trial. This book should cause the field to understand how the corrupt and depraved protagonists could have spread their poison for so long while they were accorded great respect throughout the... world. This should never be allowed to happen again.” ...In a statement... the A[ssociation]... said: “The A[ssociation] is extremely concerned about these allegations. If proven true they would constitute a serious violation of Yanomami human rights and our code of ethics. Until there is a full and impartial review and discussion of the issues raised in the book, it would be unfair to express a judgment about the specific allegations...” ...a University of Pennsylvania historian of science, has studied Neel’s field notes of the 1968 expedition and claims they do not support the book’s allegations. Neel’s papers show that [the team] had permission from the Venezuelan Government to administer the shots and also provided antibiotics in an attempt to stop the disease... [Yet, even if the allegations are found to be untrue, Neel was also] well-known for his research into the effects of radiation on human subjects and personally headed the team that investigated the effects of the Hiroshima and Nagasaki bombs on survivors and their children... [T]he same group also secretly carried out experiments on human subjects in the US. These included injecting people with plutonium without their knowledge or permission... Anthropologists consider the Yanomami one of the most isolated indigenous groups remaining in modern times and the best remaining example of Stone Age human society.

...Stone Age Europeans were the first transatlantic sailors. Columbus and the Vikings were mere ocean-crossing latecomers, according to a[n]... anthropologist... of the Smithsonian Institution in Washington[. It] says... Neolithic fisher[s] and hunters sailed the Atlantic in boats made of animal skins 18,000 years ago and colonised the eastern U[S]. Such a journey would represent one of the most astonishing migrations ever undertaken – the Earth was then in the grip of the Ice Age, and much of its high latitudes were blasted by blizzards. On the other hand, much of the planet’s water was locked up in icecaps and sea levels would have been much lower than today’s. The edges of continents would have extended further into the oceans. “It could have been quite feasible... to sail around the southern rim of the ice packs... that covered the North Atlantic and reach land around the Banks of Newfoundland,”... [His] theory, outlined at an archaeology conference in Santa Fe, is based on discoveries indicating that ancient American people were culturally far more like the Neolithic tribes of France, Spain and Ireland than the Asian people whom scientists had previously thought to be the sole prehistoric settlers of North America... [A]lthough modern Native Americans possess DNA similar to that of Asians, they also carry some variants that are found only in European people. This genetic input could only be explained by accepting that Stone Age people were capable of sailing ocean-going boats, [the anthropologist] said. The theory that prehistoric Europeans colonised America was first put forward in the 1950s... but was discredited by evidence supporting the notion that the continent was populated 20,000 to 15,000 years ago by Asian incomers who walked across the land bridge that then linked Siberia with Alaska. [The archaeologist] does not disagree that Asian folk colonised ancient America, but argues that present genetic and archaeological evidence shows an influx of Europeans must have taken place. And the prime candidates for these incomers are the Solutrean people who lived in Spain 23,000 to 18,000 years ago and who later colonised parts of France and Ireland. They designed and made beautifully crafted fluted stone blades which bore a striking similarity to those made by the Clovis people who lived in America 11,000 years ago... [This means that] Native Americans are Iberian, not Siberian, in origin. The idea has startled palaeontologists and anthropologists. Some support [the theory], some do not... [A p]alaeontologist... of the Natural History Museum in London, said the evidence was far from convincing. “Clovis and Solutrean spear points and stone blades are alike, but the similarity is superficial...”

...A bamboo raft journey from Indonesia to A[US], which was to prove that A[US]’s first residents could have sailed there between 100,000 and 700,000 years ago, failed just five hours after leaving the island of Roti. [Its] British skipper... blamed El Nino’s effect on currents and winds.

...[‘8th century Arab explorers’ could have visited NZ, some people suggest, and a solitary rock carving is alleged to be evidence that ‘Phonecians explored NZ in 600BC’! ■ The *kiore*, or ‘Polynesian rat, is thought to have originated from Asia.’ A Christchurch scientist claims that some ‘arrived in NZ with Buddhists – an outrigger canoe is depicted on one of the holiest Buddhist shrines’ (the Buddhist link with NZ may come from ‘11th century Tamil traders’). ‘However, according to Maori tradition, the Polynesian rat came to NZ in one of the canoes of a “great migration” in the 14th century, about AD1350.’

...‘Polynesian seafarers may have fetched up in NZ 2000 years ago but scientists say they can now determine the date they decided to stay for good. Researchers in three separate disciplines worked together to conclude that settlement of NZ took place no earlier than AD1250. The findings challenge a decade-old theory of an Auckland University archaeologist that the first arrival of humans was about 1000 years ago. They also call into question the conclusions of a Christchurch scientist who used radiocarbon testing of *kiore* bones to suggest that people might have been here 2000 years ago. The radiocarbon method, in the spotlight over the *kiore* rat-bone dating, was reapplied “exhaustively” at a range of archaeological sites. Over 200 dates showed very close agreement, falling between 1300 and 1400. The finding was supported by a second study involving pollen analysis of sediments from lakes and peat bogs in the North Island that contain a very distinctive layer of volcanic ash known as Kaharoa – which came from an eruption between 1300 and

1400. The first detectable impact of humans was massive burnings of forest by early Polynesian settlers which took place close to the time the ash was deposited. A Waikato University scientist said strengthening the case was that no one had yet found any archaeological remains sealed beneath the ash.'

...NZ has a story which in some ways is the most interesting of any of the countries of the world. Long before the first Maori ran his canoe upon the beach and gazed around him in wonder, for age upon age the great forests had rustled in the breeze while a myriad of song birds, unheard by human ear, had chanted their morning and evening hymns of praise. But the forests, and the birds who dwelt in them, were themselves but late-comers. Geologists and naturalists tell us that three hundreds of millions of years ago NZ was lying at the bottom of the sea, the waves breaking here and there upon some lonely barren mountain peak thrusting itself up into the sun and wind and rain. During these millions of years NZ had several times risen slowly above the sea, sunk beneath the waves, and risen again. Once the land kept rising until it is thought that at length it may have joined up with Tasmania and AUS on one side and the Chatham Islands on the other, forming part of a great continent. It is also thought that, as well as being joined in the west to AUS, NZ may at some time have been linked up, by way of the Antarctic, with South America in the east.' ●] **The bar-tailed godwit... has been acclaimed as the long-distance flight champion of the bird kingdom... complet[ing] the 12,300km journey... from Alaska to N[Z] in... six... days... Maori legend has it that it was their forefathers' observations of the godwit flying south over the Pacific that made them take to their war canoes to find land.**

...A pigeon's ability to find its way home from distant and unfamiliar locations, even after it has been drugged, has been explained for the first time by two N[Z] scientists... They... found that homing pigeons returned home by a sort of ingrained GPS system, responding to markers on the Earth's magnetic field... Scientists recently discovered that migrating birds may be able to "see" the Earth's magnetic field, helping them orientate themselves. Molecules known as cryptochromes in the retina of the[ir]... eyes react to the magnetic field... and other animals all have... [t]his... sixth sense[. Incidentally, 'people arrived in NZ from eastern Polynesia, possibly in the 9th century. These population movements were accidental voyages made by adventurous seafarers, defeated warriors or wind-blown fishers. By the 11th century they had explored much of the east coasts of both main islands']...

It is odd where a journey through the interior landscape that is the human body's genetic make-up can lead... Two months ago... ground-breaking research... provided compelling genetic evidence that Maori settlement in... [NZ] 800 years ago was the outcome of deliberate quest, not random wayfaring... Tracing mitochondrial DNA... and linking it with archaeological evidence... came up with a "conservative estimate" of 70 [gals] as the nucleus of the people who... set out for Aotearoa... "[A] lot of random canoes would have had to have been blown ashore to accommodate the number... calculated." ...Trace... the [mitochondrial] line... back through... to Eastern Africa from where the African Eve, mother of us all, originated and there are 44 variants of this particular gene. As people migrated the number of gene variants was reduced; Maori... were probably the last major group of people to migrate [and]... have the least number of variants of any group of people: just four...

Archaeologists, who differ on their views on when N[Z] was first colonised, also disagree on the credibility of... the... Christchurch scientist... [who] announced his belief that the Polynesian rat, or kioere, may have been brought by people who came here about 2000 years ago... although many accept the possibility of there being two separate dates – one for a transient first contact by Polynesian voyagers, and another, later date that marks the beginning of settlement, or continuous occupation. Some, cynically, refer to the "ratification" of dates... The makers of tonight's *Documentary N[Z]: Who Was Here Before Us?* (TV One, 8.30 pm) couldn't go wrong because they started with such a great question. The programme canvasses a range of theories about who arrived in N[Z] first and when, from the orthodox to the downright silly. All these stories, whether there is scientific evidence to back them up or not, make for fascinating [TV]... despite the documentary managing to tell the tales poorly.

...this land of white cloud and shining mists was... the last great land mass on Earth to be discovered and settled... But... "...who were the first N[Z]ers? ...of course, until 1950... we knew for a fact who they were, where they had come from, what their names were. The only problem was, we were wrong." ...Who was here before us is N[Z]'s oldest and most puzzling mystery... [T]he laboratories of the 21st century... [are] where researchers have taken the first [official] steps towards unravelling our pre-historic riddles... But there is a second search underway – one in which... amateur archaeologists and historians are on an unconventional quest in search of a pre-Maori civilisation... with links to the pharaohs of Egypt and the Celtic Britons of Stonehenge. They are searching for signs of an ancient race known as the Stone People... Orthodox historians say these theories are flights of fancy... [Although 'in recent years the case for Portuguese sailor Jean Rotz coming here in the 16th C. has been put most strongly', 't]he current orthodox theory... is... that the first ancestors of the Maori people arrived here... [1000] years ago – as probably the last step in a series of travels across Polynesia and simply lived here, in splendid isolation as it were, right up until 1769..." But this theory is under threat... from the amateur researchers and explorers who scour the countryside... [F]rom time to time strange things appear which cannot be forced into the accepted way of things. Things like [an] eerie statue which emerged from the Kaipara sand dunes... "In 1991 there'd been quite a storm," says the]... curator of the Dargaville Museum[– who] has spent a lifetime looking for the earliest settlements in... [NZ – "and an] ex-neighbour of ours... happened to be walking over the... dunes... the next day... and... here was this... carved statue laying on the... ground where it'd been scoured. It was a fantastic find really. I'd heard about the ancient... people of the Kaipara, and here was one of their statues... [T]he main feature of this particular carving – there's no other one like it anywhere in N[Z; although]... 20 years ago... another 7 [were] found still in the upright position... [b]ut, unfortunately, within a day they'd covered over again and they're still... buried under the sand... [– is] it's got a 5-fingered hand. All... known Maori carvings... have a 3-fingered hand... Unfortunately from the mouth up is missing... If only [it] could speak." But is [a] piece of unusual art evidence of a different culture? ..."People are always finding... certain things are not typically Maori, and jumping to conclusions that they might relate to vanished tribes... But... you have to look at the things we find in N[Z] and the broader Polynesian context and, generally, you come down to thinking [that] all of the things are comfortably in the range of what we could expect to be Maori[," says one academic. Another points out:] "Over... those few hundred years that people were here, they were immensely creative... They changed their clothing, their jewellery, their language, their methods of cultivation... the nature of their fortifications, [and] they created new traditions in art." "There were creative people always in Maori society. Some of them pushed the boundaries a bit and made things that... weren't right in the mainstream but still fit within the Maori or Polynesian tradition." ...amateur archaeologists are quite happy to fly in the face of th[ose] opinions. The curator]... says there's concrete evidence of older civilisations... "...From the Hokianga down [to] the Kaipara... there are pre-Maori sites. My family has been... here for 5 generations and there's always been talk of [a] hidden village... we believe now would have covered an area of... 2 to 3 sq miles. It goes back [1000 to 2000] years going on oral history, but until any archaeological work [is] done on the site... we're just hazarding a guess... [There's a] dam... just on... [100] foot across... dug out with old stone tools in the sandstone to form a basin to hold the water coming over... [a waterfall. The village] must have hosted 3[000 to 4000] people in its heyday..." In what might just seem to be a tangle of bush and rock mounds, [the curator] sees signs of pre-Maori folk. And [it] believes there is evidence of an even larger settlement hidden in the nearby Waipoua Forest – a place [the curator] has photographed in the past but is now barred from. "Up in the Waipoua Forest... there is hundreds of acres of stoneworks... – stone terracing, stone walls, altars, fire places. They're a very early peoples.'" Local sensitivities are such that... [Maori] elders... told us they wouldn't dignify any theories of pre-Maori [people] by discussing them or allowing filming. They're angry that people are desecrating areas of great importance to local iwi. Unfortunately, the veil of secrecy has only fuelled speculation... The Department of Conservation says... archaeologists did fully survey the area... 12 or 14 years ago... but they found nothing pre-Maori. "There's certainly a large amount of stonework there... but... [someone] who worked there for first the Forest Service and then DoC for several years... got dates from excavations... and his interpretation of the dates was that the area was settled and cleared for gardening in... the 15th century." ...[one researcher]'s studies are to try and prove [human habitation of NZ] goes back much further than that. "I'm... [convinced t]here were people here prior to the main arrival of Maori from the Pacific, and that these people may have been here for... 4000 years. Trying to string together hard evidence is not easy, and we've journeyed extensively throughout the North and

South Island[s], looking at ancient sites... looking at rock carvings... at stacked stones. So it's a very long journey that we're on and I feel that we're only part way there." ...Deep in the primeval forests of the volcanic plateau stands a structure which looks [hu]man-made – a monumental stone wall. For [the researcher], the Kaimanawa Wall provides the tantalising possibility of more evidence of a pre-Maori race. "I believe that the Kaimanawa Wall is very significant to the ancient people. I've visited [it] on numerous occasions, and in doing so I have met a number of people from all persuasions there, and they all have their own interpretation of the wall... [which first] came into prominence about April 1996. At that stage it was being promoted as a [hu]man-made structure... possibly built at [an]... age of great antiquity... People were immediately comparing it to things they'd seen in South American and... in Mediterranean areas. There are many levels of the stone. Some people have likened th[e level]s to a stepped pyramid..." ...one academic disagrees[with such statements]... "...The... so-called pyramid structures are just one big hoax – they are natural rock formations." [A geologist concurs:] "...The eye is deceived by [a] fairly horizontal... fracture... which gives the impression of a very block-like structure and the illusion that it's a wall, but when you look more closely you can see... blocks... th[at a]re not square... at all – they angle off at the top in a much more natural profile. In the area there are many other outcrops with similar fracture patterns..." Nature may claim the wall as her own but... [on a] remote spot, high on the coast in Northland, [another amateur]'s search is telling him that the scientists will have to rewrite our early history. [The amateur s]targazer... is not a scientist – [and] has little time for the orthodox view. Scientists, [the stargazer] believes, are not far-sighted enough. "I've known for about 25 years that there was an ancient, pre-Maori culture in N[Z], and I've waited with anticipation for the academics to enlighten the rest of us about this. Basically, I got sick of waiting, so I decided to go out... and start doing some research myself." ...[at the remote spot, the stargazer] has found complex patterns and alignments of stones, and come to a truly astronomical conclusion. "I plotted the positions of over 600... individual stones, and then worked for many months trying to work out the geometry and measurement standards that... were us[ed]... I've had moments of elation, especially in front of the computer screen, when I started to... [see] beautiful star patterns... [T]here's an 8-pointed star on the site which gives you the primary points... plus your secondary points... of the compass. The site itself is composed of 2 great circles – each circle is 192 ft across – and the circles dissect each other... In order to understand the significance of the... site, the first realisation you've got to come to is that there is nothing Maori about it – it is not related to any of the Polynesian groups. What I see on the site is typically... pre-Celtic... [The] site... is exactly the same width as the... circle at Stonehenge..." But [the stargazer]'s passion and his complex calculations are not enough to sway the scientists who, in the end, just see a pile of rocks – no matter how curiously arranged they are. "In the DNA of Polynesians, in Maori artefacts, in all the marvellous work done on the reconstruction of Maori and pre-Maori languages in the Pacific, there isn't a [thread] of evidence for [a] Celtic presence. Alignments of rocks occur in nature. Nature is a highly structured system – any kind of structure can be found in geological forms, in alignments of trees... The question is: what does it mean historically? The answer is: it does not mean the Celts were here first – that's for sure." "There will always be non-believers," responds the stargazer, "[e]specially among academia. They seem very, very reluctant to accept any new ideas or... anything that changes the status quo. What I say to those individuals is get out and check it out and do some true scholarly research." Scientists reply: we need facts not theories. The wild theories of the past led to some of the misconceptions we all grew up with – misconceptions that were nothing more than the artistic inventions of early Europeans. For generations, school children were taught that N[Z] was first colonised by a great fleet of 7 canoes – which journeyed from the legendary homeland of Hawaiki, somewhere in the Pacific. Victorian artists of the day had Maori arriving as starving castaways... "That's a figment of the imagination. There was no[t]... a whole lot of... yachts going in the same direction at about the same time. It was never like that. [The story] came from the... deliberate... misinterpretation... of Maori traditional stories by amateur [historians of the 19th] century." Whatever his motives, amateur historian Percy Smith took Maori oral traditions and forged them into a European-style history. In doing so, [Smith] created one of N[Z]'s most enduring myths. It's a myth that many of us – Maori as well as Pakeha – accept as fact even today... Another story with more sinister overtones concerned the Moriori – sometimes spoken of as the Moa-hunters. This idea of a technologically inferior and weaker people displaced by invading Maori... provided a convenient parallel to what Europeans were doing to Maori at the time. "The accepted understanding of the Moriori is that they were a group of Polynesian people who were isolated in the Chatham Islands before European contact. Moriori is their own name for themselves. It's often been suggested that they were chased out of N[Z] by later Maori invaders, and sometimes been suggested that they weren't Polynesian at all. [It c]ertainly seems likely that they're a group of early Maori people who... probably... got... blown away from the east coast of N[Z], reached the Chatham Islands and couldn't get back. And they remained there... and developed a very interesting and very successful adaptation to a very difficult environment." The Moriori living on the Chathams may have developed along different lines to mainland Maori, but there is no indication they were in any way a separate or more ancient race. It was yet another Victorian theory completely lacking in the facts to support it. "I think in the colonial history of N[Z] you had science in one corner and Maori tradition in the other, and what happened was that science appropriated Maori tradition. And it simply reinterpreted the whole thing, and made it something which it was never intended to be." Pre-history has always provided fertile ground for speculation. The only safe route for science is to look for the hard evidence – human impact on the land. People – ancient and modern – leave signs. It's the job of the trained eye to find traces of that older past hidden amongst the new... [K]umara pits and terracing [on Auckland's One Tree Hill] are the hard proof needed to show people were here – in this case, early Pa Maori. The signs of how people first got here are... harder to find... In crossing the Pacific, the first N[Z]ers made some of the most astonishing sea voyages of all time. How did they do it? For many years, early N[Z] scholars refused to accept that a people some considered barely out of the Stone Age could cover the vast distances of the Pacific in a sailing craft, using only the naked eye and primitive navigation techniques for guidance – that is, until... [an a]nthropologist and adventurer... strapped himself to a raft and took on the Pacific... [The adventurer] believed the islands of Polynesia had been settled from South America... [so it] sailed a balsa-log raft from Peru to Eastern Polynesia in support of his theory... [The adventurer] was convinced by the presence of kumara and other South American plants throughout Polynesia, as well as by the fact that it was the prevailing wind, that people simply must have come from that direction... His voyage aboard the Kon-Tiki proved it could be done. But did that mean it really happened that way? ...Bits of crockery... that the first explorers left scattered behind them told a very different story... Scientists were interested in the... pottery because it was the first archaeological evidence of the earliest human presence in the Pacific... [Those] scraps of pottery revealed the real truth about the direction from which those first people had come. "When you look at the dates of [the pottery], the oldest are in the west – maybe [3500] years old – and the youngest are in the east in Samoa... Hawaii and Easter Island..." ...And the linguistic map – the way in which languages develop and change – follows the same pattern as the pottery... Centuries later... common links to Maori can still be heard in languages as geographically distant as the Philippines... "The brilliant work which has been done on the history of the languages spoken in the eastern and central Pacific shows fairly clearly now that these languages had their origins in Taiwan 8[000 or 10,000] years ago – and that what you have then, at the end of the Ice Age in east Asia, is a movement of maritime peoples south, through the great archipelagoes... and... ultimately... they came... upon the north coast of New Guinea... [They then] spread along that coast, ever eastwards, but at a certain point they came across the last great human frontier on the globe – that is to say, the last vast area containing nobody. And at that point they surged ever further eastwards, out into the Pacific... using very smart boats – fast, double-hulled canoes that they had developed... At some point, it is suggested, they got to the coast of the Americas and brought back the sweet potato[(kumara)]. Having settled all of the equatorial islands – and one does mean all of them, and there are thousands – they then swept south and west... [A]t that point – and we don't know quite when – they found N[Z]. This is a very remarkable epic." ...To reach here the first N[Z]ers would be sailing into the face of both wind and current... [so] to modern-day sailors the... early... Polynesian explor[ers]... seem to be travelling in the wrong direction – the hardest direction... [However, a] combination of science, sea[person]ship and psychology produced a

breakthrough for [one archaeologist]. “While I was travelling across the Pacific on a research trip I had a brainwave. If you put yourself in the position of these first colonists – they knew what lay behind them, they didn’t know what lay ahead. They knew that if they sailed too far they mightn’t get back. The safest direction in which to sail is against the prevailing winds, because in the event of not finding land you are assured of the safest possible return...” But [the archaeologist] still needed to test his theory. “So three of us here in the university... programmed in[to]... the computer... a map of the Pacific, and we put in the weather that you could normally expect by month, and we set off many hundreds of thousands of simulated voyages... [T]he first strategy was sending canoes off in... random directions... [T]hat simply didn’t get the islands settled. So we knew that people weren’t exploring at random. And the second strategy that we used was to set off canoes in directions which were chosen by the navigator on board the canoe – but these were one-way voyages. Now what we found was that if you go out searching empty ocean on one-way voyages then the death-rate is huge, and it looks as if... colonisation couldn’t have supported such a high death-rate.” Only one strategy worked – when canoes searched areas from which they knew they could return... There was no point in exploration if you weren’t going to survive the journey. Survival was also why N[Z] was the last place on Earth to be settled – it was the hardest to get back from. No bedraggled castaways settled Aotearoa guided by guesswork and hope. The sailors who first arrived here had to be confident they could get here, or home again if they failed... It seems remarkable that sailors able to criss-cross the Pacific would, on their arrival in N[Z], seem to forget where they came from. So mysterious would Hawaiki’s... location... become that many believe it is a made up name – a mythical place with no real meaning. [However, c]lues... have come from an unlikely quarter – another immigrant, a rodent once found all over N[Z], but definitely not a native... “Basically, the... Polynesian rat... had to get to N[Z] with people. They are not strong swimmers. They are not even good floaters on objects – studies have shown that as soon as... the surface of the object gets wet, the rat will jump off, swim around in a circle and drown. It has been suggested that they possibly drifted to N[Z] in canoes – unaccompanied by people – but that’s highly unlikely...” The rats were once a common food source. Their bones have been excavated from archaeological sites all around the country... Using techniques similar to those used to trace human lineages, scientists are studying rat DNA from samples taken from all over the Pacific. They’re looking for populations from other islands where the DNA is most closely related to N[Z] rats. “Basically, we found a high degree of variation in N[Z] rat... DNA, and the most closely related... [DNA was] in the southern Cook Islands and the Society Islands. So it looks like there were multiple introductions of rats from those locations to N[Z]. We also found a close relationship between N[Z], the Kermadec Islands... and the southern Cooks, so it almost looks like there was a stepping stone.” ...While a tiny creature helped solve one mystery... the scientific search [into when they arrived] continues looking for the hard facts. And this time they find them quite literally written in blood. N[Z] in the 21st century is a rich amalgam of people from all over the world. After all these years it seems impossible that we could discover just how many people it took to first colonise this nation. But... new technology has provided an answer... “The history of the human race is written in our DNA... The sequence... just... [uses] the... letters... A, C, G and T. But... the arrangement of those... [letters makes] words, and putting together the words... make[s]... sentences. And the difference between your DNA and my DNA is very small...” Those differences, locked in our blood cells, can be seen in something called mitochondrial DNA. It’s a genetic marker that is only passed down from mother to daughter... It’s like an invisible name-tag. “And, therefore, you can trace the migration of [gals] as they move around the globe... And from this we were able to calculate that there was – as a conservative estimate – 70 [gals] who were needed to found the population of N[Z]...” 70 or so founding mothers tells us a lot about the original Maori journey. It couldn’t have been a lone canoe... blown disastrously off course, or... 2 canoes making the hazardous journey. Those who came here came intentionally. They came to settle and to colonise this new land... But that number of 70... presupposes an arrival date of... 800 years ago... The [supporting] evidence... scientists... say, is... under grassy slopes covering a vanished forest in central Otago. “When we dig and bring up samples of soil we find... a... layer... of... charcoal [which] represents beech trees...” When the first people got here they immediately began clearing the land for use. Charcoal deposits are all that’s left of our ancient forests – felled for timber, cleared for cultivation, or to make hunting easier. In the process, vast areas of South Island forests were destroyed... Before [the arrival of people] the forest would sometimes have caught alight through natural causes, such as lightning strikes. But the difference between natural fires and human burnoffs is simple – people burn the land again and again. “Lightning-induced fires almost certainly would have been very rare events – perhaps once in a millennium. Once the human-caused fires began they may have been occurring... every 20 or 30 years. [The forest] was just burnt so often that the seed sources were lost... and the grass took over. And once the grass and fern takes over it’s very difficult for the forest to come back again.” To establish when those very first fires were set, samples of charcoal and pollen were taken to be radiocarbon-dated... The dates from the charcoal, and from bone and shell samples taken from archaeological sites, are remarkably consistent. “It’s very rare that you get archaeological dates which predate 1200 to 1300AD...” [However, c]arbon dating has limits. Scientists can date only biological material. But N[Z]’s fiery geology has provided one scientist with further clues to the date of human arrival. [The scientist] has been looking under a volcano. “I... study layers of volcanic ash, and this is a way of travelling back in time – as the layers build up, one on top of the other, after each eruption. And so we can look at... section[s] of ash and work]... out... which volcano they came from and[, therefore,] when they were erupted...” [An] eruption around 1350AD spewed material in a huge column 30km into the air... It threw a distinctive volcanic ash... for hundreds of kilometres in every direction... The ash layer is in a sense marking a moment in time solid. Anything below it must be older than 1350. If people were here before then, evidence would have to be found beneath the ash. “And in fact we find that there are no known archaeological sites anywhere in the North Island with any deposits beneath the [1350 ash layer]. So in fact there are no archaeological sites older than 1350AD.” ...But have people truly only touched this land so recently? It’s a question that is still not answered categorically... The 19th century English colonisation of N[Z] brought the dawn of scientific method to this country. As the European Sun rose, other histories were relegated to the shadows – but not forgotten... [One person’s] conversion from modern... lecturer in history... to champion of a much older and more elaborate tale came after meeting some of the elders of N[Z]’s Waitaha people. “At that time I was just taking my first steps into another world. I was totally committed and convinced around the whole view of the past that was what you’d call the standard version. I was schooled in that and I believed in it.” [The lecturer] was to become a student of a far more ancient school, and hear an extraordinary tale of peoples coming to N[Z] from all over the globe – coming to form something known as the Waitaha Nation over 2000 years ago... [T]he Waitaha people... say they... quietly survived centuries of invasions... [and] they can trace their ancestry back an amazing 67 generations... “...When the elders of Waitaha asked me to tell their story they opened the doors to 3000 songs. Some of these songs were so ancient that the language in which they were... recorded doesn’t compare with modern Maori... I believe in time we will discover that... we have a history that goes far deeper than we ever imagined... There were 3 peoples who established the Nation of Waitaha – peoples out of Africa... the Stone People who came... out of Asia and... the people who... were... white-skinned, blue-eyed, hazel-eyed, red-headed people...” [The lecturer] says the Waitaha have jealously guarded their amazing tale until recently, and they say there are even more startling revelations – but they must wait until just the right time to reveal them... But [the lecturer]’s beliefs are based on folklore. Has [the lecturer] repeated the 19th century mistakes of... confus[ing]... oral history with actual fact? How true can stories remain if they’ve been handed down[orally] over thousands of years? “Oral traditions have got a cultural purpose, which is not about recording history – they are there to establish relationships between people; to tie people to the land and so on. They’re not there to talk about dates and when people came and what they did when they got here.” “People embellish things. That’s the same for even Captain Cook and his writers of the time. [Abel] Tasman, for example, talks about finding... a huge continent. [Tasman] saw giants striding the hillsides... heard people speaking in guttural tones and blowing... trumpets. Now that sounds very mythological to me and it’s all written.” ...Historically, the Waitaha are seen as a group within N[Z]’s Nga Tahu people – or, more accurately, one of 3 lines of descent that make up this large Maori tribe. Nga Tahu certainly see it that way. “There’s a huge gap between

what we would call authentic Waitaha tradition and the New Age Waitaha Nation myths. What I would say to people who say they came here 67 generations ago is that clearly in the old tribal traditions – and the records that... the Waitaha ancestors wrote down... – ...Waitaha came here approximately 44 generations ago...” [the Waitaha response is predictable:] “A great many people say we don’t exist. The law of this land says we don’t exist. The Ministry of [Waitangi] Treaty Settlements say we don’t exist. But we are here – our oral traditions are here, still alive and well, and resting with people who are carrying on that tradition.” Tradition and science have never been easy allies in the puzzle of N[Z’s] pre-history. Radiocarbon dates and the geological record have sided against the Waitaha stories. But recently [a] biologist... quite literally smelt a rat in the accepted scientific picture. “I’m an extinction biologist, and one of the main thrusts of my research is to find out when the first predators arrived in N[Z].” In 1996, the biologist... excavated a rat bone from a site in the South Island and submitted it for carbon dating. The result was completely unexpected. “...The first series of dates showed that... rats had been in the South Island for at least 2000 years. This is completely contrary to the accepted dogma... So, whoever brought the rats must have... visited both the North and South Islands 2000 years ago.” That date was so early, scientists questioned the carbon dates. Some other form of proof was required. [A] cave in Hawkes Bay was buried in volcanic ash from the massive Taupo eruption 1800 years ago... “...There was a bone which had been collected from beneath the ash, and I dated that bone. And the date was consistent with... the rat having died before the ash fell... [T]he rats... were [definitely] brought by people, [who apparently] didn’t stay... I don’t know whether they stayed here any time – you cannot tell that from a rat bone...” [The] rats raise more questions than they answer. Did people arrive here at the time of Christ and then for some reason leave again; did the very first N[Z]ers die, leaving their rodent stowaways to flourish here after them; or will we one day find the missing evidence that people like the Waitaha survived here? The scientific community is split. “My view... is that people could have been here at any time within the last 2[500] years. That is because for the whole of that period – if not longer – people have been within 10 days sailing of N[Z]. And, therefore, in logic it’s possible they were here.” “If people did arrive here, then they were in such tiny numbers as to be archaeologically invisible. And, therefore, we cannot prove or disprove they were here.” ...a former mayor of the Auckland Astronomical Society, [who has]... been working on this for 24 years[, believes]... there’s no doubt at all... that there were civilisations... [-] with obvious intellect... [-] here a long time before either the Europeans or the Maori... “...whether they were wiped out or not, do you think that it’s going to... make a difference to the future of N[Z]...?” “One would hope... that it will be investigated properly... by the academics or archaeologists... because it is our history... and it is important that it be known. At the moment it is not known.” “...We’re looking... at little bits and pieces of the huge picture, and I think we’ve got to keep our mind open to what’s still to appear.” “...The most interesting thing about [re]search is that no one ever gets to the end of any story. There’s still room to find out more.”

There is still room to find out more about, for example, how to: prevent and cure illnesses or physical disabilities (or improve existing treatments – but, since most healthy bodies already contain their own natural nanobots, which are called white blood cells, *nanotechnology* shouldn’t need to be a field of medical research; neither does *cryobiology*, unless the technology is being developed to aid operations on live patients, to preserve dead bodies for medical studies or for trainee surgeons to practise on, or to preserve donated organs for transplants; and nor does cloning of humans or other animals, although cloning plants is okay – r:p2084, ln55); produce plastics and other materials from plant fibres; generate or store energy. Uniting scientific activities under one worldwide ministry should help to make advances in these and other important areas come more rapidly. The rate at which this ministry produces useful technological improvements would also be assisted by eliminating endeavour in unimportant or potentially dangerous areas of research. The weapons industry has already been mentioned as one example – r:p2643, ln9 (note that Leonardo da Vinci, who proclaimed that ‘there is no certainty where one can neither apply any of the mathematical sciences, nor any of those which are based upon the mathematical sciences’, ‘hated war, calling it “beastly madness”; even in this the supreme example of a Renaissance person seems to anticipate many scientists of the 20th century – abhorring war and yet putting his great genius into its employ’) – and others are the fields of *anthropology*, *archaeology*, *palaeontology*, *astronomy*, *cosmology*. People could still try to find out more about past life-forms, societies or the Universe – especially if they have access to relevant astronomical equipment, or don’t adversely affect the environment by digging it up (preferably, they will only be given permission to dig up fossils or artefacts which have been partially uncovered by natural earth movements) – but only in their own spare time (i.e. as a hobby) and district. The Science Ministry ought to only employ people to work on projects that are directly relevant or beneficial to present and future generations. Eliminating unnecessary projects will either mean that more scientists are available to work on necessary projects, or that the Science Ministry can make many of the existing scientists and researchers redundant.

By the time the working week has been reduced to 24 hours, individuals would have more spare time in which to think about new theories or technology. If someone who doesn’t already work for the Science Ministry comes up with a new idea, that someone should be allowed to present it to the Science Ministry. If the Science Ministry accepts that the idea is worth pursuing, the someone (and, perhaps, some colleagues) might be transferred to the Science Ministry in order to participate on the project (in some instances – e.g., when relevant equipment is only located in one or a few districts and can’t be shifted – this may mean that the someone has to move to another district) – then, if the project is of limited duration, remain with the Science Ministry or return to its original ministry (and, if possible, its original position).

An idea would be considered *worth pursuing* if it improves the performance of one or more ministries, or if it creates a product that citizens need to have. However, when it comes to creating products that citizens need, the need to distribute the product evenly has to be taken into consideration (if it is a new or improved household appliance, production could be commenced in order to supply the appliance to new housing – so, by the time every existing house has been replaced, every house ought to have the appliance; likewise, only when it comes time to rebuild factories which produce an existing model should they be replaced with factories that produce the improved model – r:p2203, ln6-8), and the value of the product has to be balanced against the cost in resources to manufacture it. It may be that the new product is considered unnecessary because bare hands or an existing product can perform the task satisfactorily. The same argument should be applied to the introduction of new products to be used by ministries. Obviously, all existing patents would become public property.

Science Ministry facilities (e.g., laboratories) should be situated adjacent to – or at least be affiliated with – district job-training institutes. This means that some of the time trainees spend on a course could involve acting as assistants on science projects which are relevant to the ministry they will eventually be working for. People who are in-between jobs (r:p1952, ln3-5) and near-retirees (r:p2645, ln47) might also be temporarily utilised as assistants by the Science Ministry. The Science Ministry could update and maintain (or replace) museums throughout the future, especially if they are deemed to be useful for educational purposes (this may include significant archaeological sites – the ‘Sphinx, which is losing its skin at the rate of 30cm each century’, is currently being ‘done up in the hope of attracting more tourists’, while ‘many of Egypt’s ancient pyramids and tombs have been encased in glass to preserve them because their inside walls are crumbling due to the excessive amount of moisture created by having large numbers of breathing tourists pass through them’; note that there is no justification for maintaining art galleries and their contents – which can, while they remain presentable, instead be displayed in or hung on the walls of public buildings, especially museums, libraries or schools). By the way, if high school students are informed about improvements in knowledge and technology, this would help to assimilate new ideas into society (e.g., the high school students can pass the information on to their parents – r:p1924, ln43; the students will be aware of new ideas and technology before they have to use them during training or when they start working).

It is possible that a time will arrive when improvements to existing technology can no longer be made (incidentally, because the human species has over the past several million years evolved from apes into its present form, and other species have also changed their physical appearance over millions of years, it has been inferred that our species will continue to undergo physical changes throughout the future – yet, since the physical appearance of some species

has undergone little or no change over hundreds of millions of years, it is possible that the human body has evolved as much as it needs or is able to and, hence, will stay much the same regardless of whether the species continues to exist for another billion years or trillions of years). In which case, there would be little or no requirement for a Science Ministry. However, if such a time arrives – and human society is able to spare the resources – the ministry might start to commence (or reopen) projects that have no immediate benefit but may be of interest to humanity or have the potential to become beneficial in future. Examples are the fields of *astronomy* and *space technology*. Absolute knowledge of the how the Universe operates has little direct relevance to existing humans, or any future humans for that matter – which means *cosmology* isn't likely to ever become useful – but, although statistically (and from a religious perspective) Earth is unlikely to be struck by a large asteroid or comet in the immediate future (and when most of society's food is being grown in climatically-controlled glasshouses, the effects of such a strike on humanity ought to be less severe – assuming the majority of such structures survive the initial impact), developing the capacity to track and destroy large Earth-bound objects could become a valid work-activity once humanity is no longer threatened by self-caused disasters such as nuclear or biological warfare, epidemics, catastrophic degradation of the environment and its resources, the ozone layer, etc.

Apart from launching satellites, the only requirement for space technology prior to its use as a defence against comets and asteroids – something that it should be possible to achieve via existing technology – is, perhaps, to send radioactive and other non-recyclable waste to the Sun (r:p2219, ln69). Therefore, assuming humans can control their population and avoid causing an ecological catastrophe, they will only need to develop superior space technology (i.e., the means to travel quickly between our neighbouring planets or far beyond the Solar System) when the Sun has grown to a size which renders Earth unsuitable for mammals. However, if Earth is revered it is going to be at least *a few hundred million years* before humans need to abandon this planet, which means there ought to be plenty of time to perfect such technology (and to work out how to overcome the fact that human bodies aren't suitable for space travel). Yet, if space-travelling aliens exist ('there are over 300 NZers who have registered themselves as being aliens'!) they might be able to share the technology with humans (or simply ferry humans to safe and habitable planets using their own craft) – and, in the meantime, protect Earth from rogue comets and asteroids; safely rid Earth of radioactive wastes (which they may be able to use) or help us in other ways (e.g., share their energy-generating technology; medical technology).

WE are already here, among you. Some of us have always been here... watching, and occasionally guiding you whenever the opportunity arose... We have been confused with the gods of many world-religions, although we are not gods, but your fellow creatures... Now... our numbers have been increased in preparation for a further step in the development of your planet: a step of which you are not yet aware, although it has been hinted at frequently enough in the parables of your prophets, who have garbled whatever inspiration th[at has] been... implanted in their minds... Since... we established our headquarters... in... ancient Egypt... upon the occasion of our last... public appearance... the whole art of building, in stone, has become symbolic, to many of you, of the work at hand – the building of the human race towards its perfection. - 1947

Even while you read this, interplanetary space-ships are rebuilding a world grid system from which... they can draw motive power, and they are possibly also using the grid for navigational purposes on the planetary surface. When I say *re-building*, I mean exactly that, because my investigations show... an earlier grid existed way back in history. Somehow it was destroyed[– probably by the shifting of Earth's crust over the millennia –] and the remains that are buried under the Earth are now being repaired and reconstructed... I... found one small section of... the... geometric... grid pattern... over N[Z], and now I had to form some theory of construction for the whole world. This was to take all my spare time for the next four months... Many times when I was stuck for the next move, some isolated piece of information would appear that would set me going again. I might have waited months or years for that elusive peg on which to hang my grid, but it was probably no more than a couple of weeks after I had finalised the grid system that I picked up an item of news. On 29th August, 1964, the [US] survey ship *Eltanin* was carrying out a sweep of the sea-bed off the coast of South America. A series of submarine photographs was being taken of the area by means of a camera attached to a long cable. A surprise was in store when these photo[s] were developed. On one of the prints, in marvellous detail, was an "aerial"-type object sticking up from an otherwise featureless sea-bed. This object appeared to be metallic, and perfectly symmetrical in construction. The array consisted of six main crossbars with small knob-like ends and a smaller crossbar at the top... As this bit of ironmongery was situated at a depth of 13,500ft... I was certain no human engineers had placed it there. Scientists may be able to descend to those depths in specially constructed bathyspheres, but I don't think they could work as deeply as that on a precision engineering problem. If this object had been tossed over the side of a vessel and allowed to sink, there would have been no control of its exact position... I centred the grid on the position found by the *Eltanin*, and the 180° reciprocal of this in Russian Siberia, lining the whole thing up with the section I had found over N[Z]. The parallels of the globe were not evenly spaced and the grid had a stretched-out appearance... I found this grid to be lined up very closely with the magnetic field of the Earth... The intersections of the grid fell on positions in many places around the world where UFOs had been sighted... Working back over sighting reports, I had a theory that reconstruction on the complete grid had begun about 1945 at the north polar position. From this point the work has progressed southwards over the last 20 years until, in 1965, the programme was complete to within 1,800 nautical miles of the south pole... A few accidents have happened... but they are nowhere as serious as [humanity]'s own apparent determination to destroy ...[i]t[s] own world... ACCEPTING THE FACT that UFOs... are constructed and [pilot]ed by beings of extreme intelligence... does not mean that accidents have not happened to some of the craft. A malfunction in a machine of such complexity has no doubt occurred on many occasions, and if this were close to our Earth, then there... [is] a hole in the ground somewhere; unless the whole thing disintegrated at some height... - 1968

All of the examples of interstellar vessels discussed up to this point... use existing technology... [Yet] the conclusion that other technological civilizations... [– such as any possessing 'intelligence which isn't like ours, or that are technically years ahead of us' – could] develop the capability of spreading among the stars is inescapable. The question we must ask then is how long it would take us (or any other starfaring race) to spread out and occupy the entire galaxy... The best mathematical calculation of this process was done by... an astronomer turned geologist at Los Alamos Scientific Laboratory... [who] concluded that... it... would take any race capable of spaceflight only 30 million years to spread through the entire galaxy... Now... the sun is a relatively young star. Stars like it existed in our galaxy for several billion years before the birth of the solar system... [which means] there should be millions of civilizations in the galaxy that reached our own present level of sophistication at least 30 million years ago... Which brings us... to the question asked by Enrico Fermi, Nobel Laureate and builder of the first nuclear reactor... "Where is everybody?" If a single civilization could colonize the galaxy in millions of years, and if billions of years have elapsed since the first such civilization was supposed to arise, how can we explain the total lack of evidence for an extraterrestrial presence on earth? ...There are some who would... say that there is an extraterrestrial presence on earth in the form of unidentified flying objects... If extraterrestrials are really visiting the earth, there are two possibilities – either they are attempting to avoid detection or they are not. Either possibility leads us into difficulty. If they are trying to avoid detection, then we are forced to explain the wide range and number of UFO sightings. In the U[S], for example, there are one or two sightings every day, and these sightings have taken place continuously for more than thirty years. Surely a race capable of interstellar flight would have a better track record than that if they wanted to stay concealed? We must conclude, therefore, that the aliens are not attempting to remain concealed. Their reasons for doing so could be anything from indifference to human beings to something more sinister; we have no way of guessing. In this case, we run up against another problem – the absence of a single piece of hard evidence for a genuine UFO sighting. We live, after all, in a nation

that has more cameras than people... why is there no hard photographic evidence of even one of the thousands of UFO sightings that have been reported? ...From this we conclude that neither of the two alternatives... is plausible and that UFOs, whatever light they may shed on atmospheric phenomena and human psychology, tell us nothing about extraterrestrials. It is interesting that many leading "UFOlogists" are coming to the same conclusion and are starting to talk about the UFOs as visitors from "other dimensions" or "parallel universes." ...["People like myself started out feeling that we're dealing with nuts and bolts spacecraft coming from another star system. But there are some very bizarre things that UFOs do which indicate this might not be so. For example, you might have a radar visual sighting where you see a UFO at Point A, and instead of travelling from A to B it might just disappear and reappear at B. So some of us began to think that maybe we're dealing with something that is able to penetrate our dimension from another dimension or parallel universe; that can take on material aspects here but actually disappear and go somewhere else – enabling them, perhaps, to bypass what we call the Laws of Physics." It all adds up to this: maybe] we should pause to consider whether the answer to the question "Where are they?" might not be "They're here, but you just don't know it." ...There is a charming variation on this theme... called the "zoo hypothesis." Basically, this hypothesis states that there are indeed many advanced galactic civilizations, but that the solar system, for one reason or another, has been placed off limits to them. Perhaps we are the subject of an anthropological experiment, or perhaps we are a zoo (hence the name of the hypothesis), or perhaps we are designated galactic wilderness area... [T]he absence of extraterrestrials would be consistent... [i]n any of these cases... Having said this, I should add that... the evidence we have at present clearly favours the conclusion that... we are alone in the galaxy... [E]verything points to the same conclusion – we are... living on an insignificant speck of rock going around an undistinguished star in a low-rent section of the galaxy... [and w]e are one member of a large family of animals using one particular variant of carbon chemistry known as DNA. Maybe so, but we are special... [b]ecause only on this insignificant speck of rock have beings evolved who can look at the universe and ask the question, "Why?" If I were... religious... I would say that everything we have learned about life... shows that we are unique, and therefore special in God's sight. Instead I shall say that what we have learned shows that it matters a great deal what happens to us. We are not... one more life form whose ultimate fate is of little moment in the grand scheme of things. If we succeed in destroying ourselves, it will be a tragedy not only for the human race but for the entire galaxy, which will have lost the fruit of a 15-billion-year experiment in the formation of sentient life. - 1981

...in 'unofficial' conversations with the various astronauts, certain reports stated that all the early 'moon shots' had alien visitors following them for a time. But then, [as]... the space projects of earth pushed ahead in the 1960's very few persons were aware of the fact that some of our most sophisticated advances came from duplicating the equipment on 'alien' craft. A number of wrecked craft of this period reportedly got rushed to the Wright Patterson installation and thoroughly dissected... Exactly how many Government rooms are filled with data on UFO's could be anyone's speculation. What is well remembered by many is the fact that many samples of strange materials and machinery have been handed over to Government authorities. In all of these cases, the samples have simply disappeared and have been denied to later inquirers. A typical case in 1969 involved a material found by... the... Professor... who solved our spinning satellite problem. Absorbing heat and releasing it slowly over a period of several days, this material could not be analyzed nor duplicated by our best procedures. ['There are plenty of reasons why a government would cover up evidence of alien life – it would call into question our political, religious and economic systems' – but i]s there actually an organised force to stamp out rational data on UFO's? A... magazine article mentioned dozens of saucer researchers who mysteriously disappeared... [and] a well-known researcher, told of seven visitations by mysterious '[guys] in black'... with... powers... such... as... be[ing] able to cloud people's[... minds... Another well-known UFO researcher... felt that the '[guys] in black' who contacted her were... aliens who wished to frighten her out of her work... What occurs to many persons of open minds in this area is that there are not only UFO's of Earth origin, but there are very sophisticated craft of extraterrestrial... origin as well. With literally hundreds of UFO publications and groups and thousands of sightings, the evidence is pretty overwhelming for either or both craft. ['I would challenge anyone to show that all of these reports can be considered nonsense. It's just calling too many highly trained people liars']... By changing inertia from positive to negative – or even redistributing it, one might thus overcome gravity. Einstein observed that if the UFO occupants had mastered gravity, they would also have overcome inertia. Saucers with anti-gravity screens could ignore both gravity and inertia. They can instantly change direction and speed. Anyone who has observed the darting movements of some UFO's must concede that something is breaking the laws of inertia... Will our leaders continue to assume that we are too dense to understand? - 1994

The idea that politicians and scientists can happily shoulder the burden of knowledge about alien beings but that ordinary people cannot be trusted with this information is, of course, absurd... [However, there is some justification for the authorities'] belief... that the sense of shock that would follow the sudden announcement... that... human beings... are not the only sentient beings in the universe... would be so great that human society might disintegrate... There is little doubt that even the discovery of a single extraterrestrial microbe, if it could be shown to have evolved independently of life on Earth, would drastically alter our world view and change our society as profoundly as the Copernican and Darwinian revolutions... In fact, the Vatican recently embarked on an evaluation of the significance for Christianity of the discovery of alien intelligent life... In his Gifford lectures... the Bishop of Birmingham, Earnest Barnes, addressed the question 'Is the whole cosmos the home of intelligent beings?' Barnes, who was also an accomplished scientist, expressed the opinion that God created the universe 'as a basis for the higher forms of consciousness' and deduced that this purpose is best served by a multiplicity of inhabited worlds... Many religious commentators have noted the vast number of other stars in the universe and have asked: what are they all for if Earth is the only inhabited planet? [An]Oxford cosmologist... in his 1952 book *Modern Cosmology and the Christian Idea of God*... identifies, however, a serious problem for Christians if... intelligent beings... exist... on other 'planets'... Believing that it is 'of the essence of Christianity that God intervenes in History', [the cosmologist] notes: God's most notable intervention in the actual historical process, according to the Christian outlook, was the Incarnation. Was this a unique event, or has it been re-enacted on each of a countless number of planets? The Christian would recoil in horror from such a conclusion... The Christian would avoid this conclusion by the definite supposition that our planet is in fact unique. What then of the possible denizens of other planets, if the Incarnation... [of] the Son of God... occurred only on our own? We are in deep waters here... [The cosmologist] offers his own solution to the problem by appealing to his belief in the possibility... [that] human beings may, in the fullness of time, convey the news of a unique Earthly Incarnation to alien beings. This resolution was roundly rejected by... a philosopher priest, who, in his 1956 Bampton Lectures, opined that [the cosmologist]'s theology was defective. 'It is in sharp contrast with the attitude... of the great classical tradition of Christian thought' concerning the Passion of Christ to suppose that 'the necessary and sufficient condition for it to be effective for the salvation of God's creatures is that they should *know about it*.' [The priest] goes on to articulate the mainstream Christian view that the essence of the Redemption is that 'the Son of God has hypostatically united to himself the nature of the species that [it] has come to redeem.' ...Regarding alien beings, [the priest concludes: 'It would be difficult to hold that the assumption by the Son of the nature of one rational corporeal species involved the restoration of other rational corporeal species... The suggestion which I wish to make... is that there are no conclusive *theological* reasons for rejecting the notion that, if there are, in some other part or parts of the universe, rational corporeal beings who have sinned and are in need of redemption, ...the Son of God has united (or one day will unite) to his divine Person their nature, as [God] has united it to ours[.]' ...I recently raised this problem in discussion with... a Jesuit priest and Director of the Vatican Observatory [who] is actively involved in the search for extra-solar planets. In his opinion, salvation does not require God's incarnation. [The Jesuit] believes that if alien beings exist and have sinned, then God is free to choose to save them in some manner other than by taking on alien flesh... Further theological problems arise from the expectation that, if alien communities exist, [we]... could expect to be dealing with beings whose

wisdom and knowledge are incomparably greater than our own. The difficulty this presents to the Christian religion is that if God works through the historical process, and if [hu]mankind is not unique to [God's] attentions, then God's process and purposes will be far more advanced on some other planets than they are on Earth. As Barnes pointed out long ago: 'If God only realizes [It]self within an evolutionary process, then elsewhere [God] has reached a splendour and fullness of existence to which Earth's evolutionary advance can add nothing.' It is a sobering fact that we would be at a stage of 'spiritual' development very inferior to that of almost all of our intelligent alien neighbours... The discovery that [hu]mankind did not represent the pinnacle of evolutionary advance would prove a two-edge sword. On the one hand, it might serve to make people feel demoralized, marginalized and inferior... [- and] would have an enormous impact on age-old philosophical and religious issues, such as... the existence of souls and life after death... On the other hand, the knowledge of what is attainable through continued progress would surely be exhilarating and inspiring. Either way, it is hard to see how the world's great religions could continue in anything like their present form should... alien[life be discovered]... If they practised anything remotely like a religion, we should surely soon wish to abandon our own and be converted to theirs... Contrary to popular belief, the possibility of extraterrestrials was often debated, and the ramifications analysed, in previous ages. [One] historian... estimates that 170 books on the subject were published between Greek times and 1917... During the first half of the twentieth century, discussion of extraterrestrial life was almost entirely confined to fictional literature. Although the stories were overlaid with a veneer of science, they were unashamedly fantasy. A turning-point in the public perception of the subject came with... [WW2]. The development of the tools of aerial warfare – especially jet aircraft, radar, rockets and the atomic bomb – sensitized people to the threat from the sky. It seemed but a small step from the reality of the V2 missile to that of the interplanetary spacecraft carrying aliens with superior weaponry. Science-fiction writers, cartoonists and film-makers played on these fears, and the era of space-age fiction... began in earnest. The post-war years also saw a huge rise in the number of reports of... UFOs... Many people became convinced that the Earth is being visited regularly by aliens in saucer-shaped spacecraft... Meanwhile, scientific interest in extraterrestrial life was also rekindled by the wartime and post-war spurt in science and technology... The problem of the origin of life became a serious subject of scientific inquiry, with much speculation about scientists creating life 'in a test tube'. In 1953, in a famous experiment at the University of Chicago, [two biologists]... attempted to simulate the conditions they believed prevailed on the primitive Earth four billion years ago... [They] introduced water, methane and ammonia into a flask and passed an electric discharge through the mixture for several days. The liquid turned red-brown. On examination, the flask was found to contain several amino acids – organic molecules found in all living organisms on Earth. Although [it]... was a far cry from the artificial creation of life, the experiment gave the impression that if some of the basic building blocks of life could be synthesized in a few days, then, by leaving the experiment to run long enough, living organisms might appear... It followed that if this state of affairs had come about on Earth, it could also have come about on other planets too... [- and this theory was seemingly confirmed when [the Murchison meteorite which fell in A[US in 1969 w]as... found to contain dozens of amino acids, including many that are common to terrestrial organisms... If the biologists had made it easier to believe in extraterrestrial life, the astronomers and physicists made it harder. The more that was learned about our sister planets in the solar system, the less likely it seemed that they could support life... [Therefore,] it may be necessary to search beyond the solar system. However, the distances to the stars are so great that there is no real prospect of our sending spacecraft to extra-solar planets in the foreseeable future. Moreover, from what astronomers and physicists have discovered about stars, only a small fraction would be suitable for life. The nearest suitable star with an Earth-like planet may be tens or even hundreds of light years away. (...To get some idea of scale, the Sun... is about 8 1/3 light minutes away.) The barrier to SETI occasioned by the immense distances between the stars was well appreciated even in the 1950s. However, that decade saw the development of the science of radio astronomy. It soon occurred to the astronomers that if they could detect radio signals from across the galaxy and beyond, they could also detect signals of an artificial nature, so that radio telescopes might be the best hope for finding extraterrestrial life... But one problem was potentially solved only to be replaced by another. The Milky Way contains about 100 billion stars. It would take an immense amount of time to 'listen in' to all of them. Worse still, there are millions of different frequency bands on which a signal might be transmitted. How could the astronomers know which frequency the aliens might be using? The situation seem[ed] hopeless. In 1959, however, the subject was transformed once more... In a famous paper in the journal *Nature*, [an]... Italian astronomer... and [an] American physicist... argued that if alien beings were serious about communicating with us, they would make it as easy as possible for us to spot their signal. This suggests they would pick a transmission frequency that is somehow marked out as special for both us and them... One such frequency immediately commends itself: 1.42 GHz. This is the frequency of the so-called song of hydrogen, a ubiquitous hiss produced by a spin-flip transition of hydrogen nuclei, and well known as background noise to every radio astronomer. Of course, to avoid swamping the signal with noise, it would make sense to use, say, twice or one-half the hydrogen frequency, but even with a range of possibilities it is clear that the waveband of interest can be narrowed down dramatically by this sort of reasoning. Suddenly it became feasible to begin a radio search for intelligent alien beings... It is important to realize that the discovery of an alien signal would not lead rapidly to radio dialogue between our civilizations. The nearest star is over four light years away. Even on the most optimistic assumptions, the probability of an alien civilization existing within 100 light years of Earth is remote. A message from aliens 100 light years away would take 100 years to reach us, and any reply would take another 100 years to get back to them... Whatever the nature of the alien message, if it contained basic information about a *different* biochemistry, that should be enough to establish an independent origin. If, on the other hand, the alien life turned out to be based on DNA and proteins as we are, we would be faced with two possibilities: either both communities have a common ancestor[– as is proposed by believers in 'panspermia (the arrival of life on Earth from outer space)' –] ...or the evolution of life operates in a highly non-Darwinian fashion such as to direct matter towards certain very specific, highly complex chemical structures in a remarkably teleological manner... Today a separation is usually made between belief in extraterrestrial life forms and belief in supernatural or religious entities – i.e., between aliens and angels. Yet it was not always thus. For most of human history the 'heavens' were literally that: the domain of the gods. Beings who inhabited the realm beyond the Earth were normally regarded as supernatural. In spite of the fact that [aliens are] now firmly in the domain of science, or at least science fiction, the religious dimension of SETI still lies just beneath the surface. Many people draw comfort from the belief that advanced beings in the sky are watching over us and may some day intervene in our affairs to save us from human folly... The history of belief in UFOs demonstrates clearly the intimate association between extraterrestrial encounters and religious or supernatural experiences... Indeed, it is easy to trace reports of flying craft and human-like occupants back into antiquity, where the reports merge with religion or superstition in a seamless manner[(and offer an alternative perspective on tales of past *miracles*)]. Consider, for example, the many Bible stories of angels coming from the sky, of humans ascending into heaven (the sky) or of flying chariots. The most striking biblical account is perhaps that of Ezekiel, who describes an encounter with four flying wheel-shaped craft... The account might have been taken straight out of a modern UFO report, yet it is normally interpreted in strictly religious terms... The modern notion of a UFO... dates from the late 1940s... [when] witnesses... described... a metallic flying disc, sometimes with protuberances or portholes, executing elaborate manoeuvres and occasionally accompanied by an eerie glow or bright lights... In a distinctive subset of cases, [people have encountered]... UFOs on the ground and even ha[d] contact with alien beings. The occupants of the UFOs are almost always said to be of a more or less human appearance but of varying stature, from dwarfs to giants. The witnesses describe a sense of powerlessness in the face of distinctly superior beings... Most intriguing are those cases where witnesses claim to be taken on board the craft... Typically it is claimed that the 'abducted person' was subjected to medical examination or even impregnation... Carl Jung... concluded that flying saucers were merely the modern manifestation of archetypal symbols that have appeared in dreams, visions and religious experiences throughout the ages... My own feeling about these bizarre reports of alien contact is that in most cases the witnesses are sincerely reporting genuine experiences (i.e., they are not lying)

but that the experiences are of a largely subjective nature and reflect deep-seated human desires and/or anxieties of a quasi-spiritual nature... It is not my intention to discuss here the veracity of UFO reports, or the possible explanations for them... What I am more concerned with is the extent to which the modern search for aliens is, at rock-bottom, part of an ancient religious quest. The interest in SETI among the general public stems in part, I maintain, from the need to find a wider context to our lives than this earthly existence provides. In an era when conventional religion is in sharp decline, the belief in super-advanced aliens out there somewhere in the universe can provide some... inspiration for people whose lives may otherwise appear to be boring and futile. This sense of a religious quest may well extend to the scientists themselves, even though most of them are self-professed atheists. One of the most vocal proponents of SETI is the astronomer... [whose] novel *Contact*... describes a successful outcome to a massive radio-telescope search for alien signals. Following the receipt of a message, the scientists... [are] made privy to some far-reaching secrets about the nature of the cosmos. But underlying the narrative is the sub-theme that the universe as a whole is a product of intelligent design, and the aliens hint at how the hallmark of this design is written into the very structure of the universe. Thus the aliens play the traditional role of angels, acting as intermediaries between [hu]mankind and God... This powerful theme of alien beings acting as a conduit to the Ultimate – whether it appears in fiction or as a seriously intended cosmological theory – touches a deep chord in the human psyche. The attraction seems to be that... the resulting broadening of our horizons will in some sense bring us a step closer to God. - 1995

Copernicus told people they were not at the centre of the universe. Darwin told them they were not a divine creation. Now the risen apes are hearing that the same evolutionary process that created them may have gone on elsewhere... The search for extraterrestrial life is the most compelling of all scientific quests... [However, s]hort of a visitation from... an alien... civilisation's ambassadors, radio is the only way any... contact can be made... A couple of times, astronomers have thought they have heard them. When... a regularly pulsing radio signal... [was] noticed... coming from the sky in 1967, [astronomers] nicknamed it "LGM-1"... The discovery a few weeks later of LGM-2 somewhat dampened the idea that a first contact had at last been made (the signals turned out to be coming from a new class of star now known as pulsars). A second radio emission, known as the "Wow Signal," also attracted fans of extraterrestrial intelligence. The signal was heard in 1977 by astronomers at Ohio State University. It looked, to the faithful, like a radio beacon. Unfortunately, when they looked again, it had vanished. And that, so far, is it... Yet... scientists... believe... a meteorite from... Antarctica... was once inhabited by Martians. Not, to be sure, the malign, tentacled geniuses invented by H.G. Wells, but things a bit closer to terrestrial bacteria... If the evidence from the... meteorite stands up in the court of world scientific opinion... it may be that primitive life can evolve quite easily. That says nothing, though, about how easy it is to arrive at intelligence... [T]here remains a large gap between bacteria and intelligence... On Earth, the evolution of intelligence involved at least four giant leaps... [spanning] over three billion years... The first, and in many ways hardest, was from bacteria to the more complex cells of which animals and plants are composed. The second came when these cells formed viable colonies (bodies). This meant some cells giving up the sacred right of reproduction in order to specialise in other functions, something that goes strongly against the evolutionary grain. The third was for animals to become complex enough, and to develop sufficiently sophisticated nervous systems, to allow for intelligence. Even when this had happened, at the beginning of the period known as the Triassic, it still took around 250 million years before the fourth leap, when [our] ancestors started to develop a brain big enough to support such intelligence. It is quite possible, therefore, that the galaxy is teeming with primitive life, but that none of it, other than on Earth, is intelligent. The message of the... meteorite could, therefore, be somewhat paradoxical. If it does indeed contain... extraterrestrial life, that is tremendously exciting. But it may also suggest that the history of life is not one of automatic progress from primeval soup to potent primate... Rather than telling us we are not alone, the... meteorite may emphasise how utterly alone we are.

...We haven't yet discovered a single extraterrestrial, but our searches up to date have been so primitive that we'd have had no chance of finding a civilization like Earth's, not even if it existed among the nearest stars. Still, in attempting to explain the 'Great Silence'... several scientists have suggested that everyone is listening and nobody broadcasting, for fear of attracting hostile attention... Perhaps, though, extraterrestrial intelligence evolves only very seldom... Note, however, that our failure to detect intelligent extraterrestrials may indicate not so much how rarely these have evolved, but rather how rapidly they have destroyed themselves after developing technological civilizations... Other suggestions as to why we have detected no extraterrestrials in our galaxy are much less plausible... It can seem unlikely that extraterrestrials have spread right through the galaxy without our noticing it (perhaps because they treat our solar system as an untouchable zoo...); or that they have one and all been happy to stay at home; or that they haven't been travelling long enough, since they developed advanced technologies only a little before us; and so forth.

...The source of strange blue lights in the Auckland sky has proved to be terrestrial... Press releases issued by the "UFOPB Society" were picked up by some broadcast media, fuelling the imaginations of UFO believers... [However, t]he flying saucer was in fact a twin engine Squirrel helicopter fitted with special blue lights for a soft-drink promotion... MEANWHILE, the A[USns] are still at it with orange nocturnal lights in triangle formations over Sydney, Adelaide, Melbourne and Canberra... Further A[US]n sightings of UFOs included ones that reputedly "slimed" areas of Tasmania after a violent thunderstorm. The... breathless... [reporter] neglected to mention that the "slime life" was fish eggs and baby jellyfish carried inland by the storm... In Brisbane, [a resident] protested outside a theatre screening *Independence Day* because the movie... [-] in which these really dumb aliens come to Earth and hover in giant spaceships over all the major cities to make themselves easy targets for the gallant earthling defenders... [(t]he blockbuster's blockbuster is littered with narrative inanities, crass dialogue and appalling acting and portrays a society gripped by militaristic xenophobia but the effects are awesome[-] ... "promotes inter-planetary racism." ...About the same time a *Newsweek* poll showed that 49[%] of all Americans believed their Government was hiding information on the subject of UFOs.

...As "alien fever" continues to sweep the U[S] – and the TV networks – more and more people are becoming convinced that intelligent life exists beyond Earth, including some who believe alien lifeforms have already set up housekeeping on the planet. More than 100 children and adults paid \$US10... each at a recent meeting in Chicago to hear... American "ufologists" speak. Among the topics was the tarnished reputations of humans among our galaxy's extraterrestrial species. "Humans have an image in the galaxy. It's not the best right now but it will be worse if we turn our backs on our neighbours in need,"... [an] associate professor of political science at Emory University, told his audience. Such "neighbours" include a handful of Martians already on Earth who are waiting for a more welcoming climate before bringing an entire refugee population here... According to a... poll... 53[%] of Americans believe there is intelligent life elsewhere in the universe and 40[%] believe it exists within our own solar system. And even the sceptics say those numbers are going to increase as the coming millennium conjures visions of apocalypse and television and film studios capitalise on the intrinsic appeal of [alien] characters... "Quite clearly, there hasn't been any change at all in the scientific evidence to support any claims of extraterrestrial visitations by aliens," said... a retired professor emeritus at the University of Kentucky, who has been studying the subject since 1947. "What has magnified has been the media support of this phenomenon, this legend, this myth," said [the professor emeritus], who specialises in abnormal psychology... Even politicians are not immune. A Florida politician... recently risked political suicide with her announcement that space aliens cured her of cancer in 1975. Such tales are nothing new, [the professor emeritus] says. "It is modern folklore. In the Middle Ages we had serpents in the skies and demons and witches. Nowadays we have our flying saucers." ...This puts ufologists in the unenviable position of having to supply proof. Some, like... a clinical hypnotherapist who also spoke at the conference, refer to hypnotic regression as evidence. Under this procedure, [the hypnotherapist] claims many of his patients have remembered alien abductions in stunning detail.

...The first publicised abduction was in Brazil in 1957, and, since then, they have grown in frequency... Abductions have been reported in 17 countries from Argentina... to... the former Soviet Union... [Even in] little old N[Z, from]... Balclutha to Kaitia, people are saying they've... been

subjected to alien abduction experiences that are difficult to explain... These stories run counter to the way our culture understands reality, but, if you consider that 400 years ago people were burned alive for saying the Earth was round, maybe it is time for us to review the way we see the universe as well... [A] Pulitzer Prize-winning author and professor of psychiatry at Harvard University, has detailed nearly 100 abduction accounts and noted: (1) the high degree of consistency between individual accounts; (2) the absence of psychiatric illness or psychological conditions that could explain the reports; (3) physical lesions on the bodies of those claiming abduction experiences; (4) independent witnesses who corroborate the abduction claims; and (5) reports by young children of abductions... [In addition to these accounts] there is definitely some interesting information to be considered... FACT [A] former NATO intelligence analyst... has revealed that, in 1961, a flying disc as large as a football field crashed in Germany. Twelve [extraterrestrial] bodies were recovered, their blood not red but a viscous greenish fluid... [A]n extremely classified NATO assessment of UFOs... states that at least four [extraterrestrial] races are visiting the Earth, that their intentions appear to be friendly and that they have been studying this planet for a long time... FACT In 1994... a former NASA astronaut, stated, "We have [had] contact with alien cultures... [but] for nearly 50 years the secrecy apparatus of the US Government has kept from the public UFO and alien contact information"... [Another] astronaut... revealed "UFOs were waiting up there for us". [The astronaut] was confined to a mental institution for ...a... year... FACT In 1978 the UN requested the first compilation of UFO sightings throughout the world. This revealed 63,144 appearances of UFOs between 1947 and 1978... A February 1987... poll showed 19 million Americans claimed to have seen UFOs[('57% of Republicans and 36% of Democrats believe in UFOs')]. FACT ...the CIA's UFO desk reports[that the US] President... has already made several alternative pilot videos of proposed public announcements about UFOs and [extraterrestrial] visitations for broadcast... FACT On June 19 last year, six F14 navy fighter jets reported to base that they had intercepted a UFO over Puerto Rico. The F14s and their crews have never been seen since... FACT The US has an extraterrestrial law that says: (1) to have dealings with aliens is considered treasonable; (2) abductees can be arrested indefinitely due to fear of "viral infection"; (3) government employees can be arrested, jailed indefinitely and lose their pensions if they have unauthorised alien contact.

...Welcome mat out for alien drivers... IF [an alien movie star] is ever looking for a place to phone home... Rachel, Nevada may be just the ticket... Residents are convinced there are alien visitors just over the mountains to the south, at a top-secret Government base known as Area 51... "I think there are people and machines from other planets over there... [and] I think our government is working in conjunction with them..." says [someone who] scrubs breakfast dishes at the Little A'Le'Inn – [the]... tiny cafe... featur[ing] racks of UFO tee-shirts, caps and books... [which is] the focal point of this hamlet of 100 people... Area 51 is veiled in mystery. The heavily guarded, isolated base... is where the Government has tested some of its most exotic aircraft, including the U-2, SR-71 Blackbird and F-117A Stealth fighter, and the new reconnaissance plane Aurora. While the federal Government wishes everyone would go away, the Nevada Transportation Department has named a 148km stretch of desolate State Route 375 the Extraterrestrial Highway. It plans to put up four signs at a cost of \$4900... Highway officials say it draws only about 50 vehicles a day on average, though more show up twice annually when Rachel holds "UFO Friendship Campouts" for tourists looking for flying saucers.

...a fleet of massive spaceships descend... in a ball of flaming orange cloud above the major cities of the world. They will attack and everything in their shadow will be destroyed. Everything... at the box office that is. The film *Independence Day* has wiped out the competition... *ID4*... as everyone calls it, shows the Earth under attack from a hostile and unreasoning alien force. One by one, the great cities are levelled... Los Angeles becomes a burning hell-hole (so no change there). While the film is transparently improbable, at its heart is something that many people believe to be true. That a flying saucer crash-landed to the north of the little cattle town of Roswell on the night of July 5, 1947. That the commander of the local air base confirmed this, but was almost immediately silenced by his superiors. That the wreckage and four or more alien bodies were spirited away to Area 51, a research base in the depths of the Nevada desert so secret that the US Government will not even admit it exists. That for nearly 50 years, there has been a massive cover up at the highest level... The evidence that what crashed at Roswell was a flying saucer is notable only by its absence. All that remains is hearsay and rumours. Some of the statements that "prove" the Roswell UFO story were given by people who have since died. The two most dramatic reports concern civilians who stumbled across the crashed UFO before the military could intervene. Jim Ragsdale, a local... who had driven away from the main road to be alone with his date, admitted to hearing the scream of the UFO motors overhead and then the explosion of impact. The next day [Jim] searched for the site and found the crashed saucers and several bodies. [Jim] died five days after making a taped confession... Roswell was fewer than 350km from the White Sands atomic weapons and rocket testing ground... Last summer, an investigation of highly classified National Security Council records by the Federal General Accounting Office, concluded that the debris came from Project Mogul, a top-secret project to monitor Soviet atomic tests using a train of balloons and radar tracking devices... So why would anyone still believe a fable half-a-century old? Unfortunately, the US Government, having lied for more than 40 years, now finds there are many who still do not believe it is telling the truth... Others see the rumours of Area 51 and the many sightings of UFOs in the area as something of an opportunity. The State of Nevada recently designated Route 375 to Area 51 as the "Extraterrestrial Highway", in an attempt to promote tourism. The new road signs show a pair of flying saucers straight from the Cold War paranoia of the '50s. One pair is at either side of Rachel, [which]... is little more than a collection of mobile homes and a petrol pump... Its inhabitants make up in eccentricity what they lack in numbers... Twelve hundred kilometres to the east, Roswell is also aware of the commercial potential of its past. The town of 50,000 inhabitants supports two UFO museums and an annual flying saucer festival each Independence Day weekend. A popular exhibit is a wax prop of a dead alien undergoing examination on a hospital trolley from the feature film *The Roswell Incident* (and, incidentally, identical to photographs of a "genuine" alien[for] which magazine *Penthouse* is recently said to have paid \$50,000). Outside town, the rancher who now owns the crash site offers guided tours at \$US15 a head (children under 13 free). In the past two months, several fragments of the alleged 1947 UFO have come to light. They are said to have been pocketed by a former GI involved in collecting the wreckage... One... piece... is... in a local jewellers... while two others are at the International UFO and Research Centre on Main Street. Provisional tests have shown the metals to be copper and silver. So are these the fragments of an alien craft? Ambitious plans to analyse... the pieces using a mass spectrometer at Los Alamos are hampered by suspicions that the authorities might spirit the pieces away, but mostly by a lack of cash.

...In October, 1993, Congress cut the funding and pulled the plug on Nasa's SETI project... If we had made contact with other intelligent life, it would['ve been] the greatest event in human history, but there was no money in it. And even the best minds in science have to eat – so when the last Government pay check was cashed, they packed their bags and moved on. And who of us wouldn't do the same?

...there were people who thought UFOs were a question – like morality or the environment – that was too important to dismiss. And whether the Government had indeed dropped the issue or just wanted people to think it did, the sightings never stopped. So in the tradition of American grass-roots activism, individuals across the country began attempting to fill the void created by the Air Force. "A civilian organization researching UFOs came about really almost as a protest against what civilians were being told that UFOs were. People would see structured objects and would be told they had seen Venus or a weather balloon, and people who had good credentials were being ridiculed really because of Government statements." The citizen investigators do what they do because they believe if there is even one iota of possibility that UFOs are in any way real then someone should be pursuing the question. Perceiving an absence of official action they take it on themselves. For its part, the Air Force has never forgotten the 1950s, and the lessons [gleaned from UFO sightings over] Washington... Whether it has no answers or doesn't want to share what it knows, the Air Force public policy on UFOs continues to be *silence*. Planet Earth[is] home to every one of us, from the dedicated UFOlogist to the doubting sceptic... which, from the point of view of the UFO investigator, presents a formidable obstacle – ...[h]ow does one investigate the question of life elsewhere in the Universe when one is confined to our small planet? All the evidence we have seems to exist only in the mind's eye. The clues are

most often anecdotes – extraordinary tales told by ordinary people. With plenty of witnesses but little hard physical evidence, the heart of the UFO mystery lies in perception. This... is the dilemma of the UFO investigator – how to decipher evidence derived mostly from perception? The answer, in a word, [is to] *innovate*. With so much unknown, there is no single technique for investigating UFOs. Each investigator develops the tools and the methods that... [it] finds most promising... [One investigator's] search for evidence has brought him to a very unusual... [valley in] Colorado. "People arrive here and they don't even know why they're here – they just know that they have to be here. I didn't quite feel that compulsion. However, I did early on identify that I possibly had a role to play and this place was key to it." For [him], investigating UFOs starts with being in the right place at the right time, and... [in this valley] almost any time is the right time to see a UFO. "This may be one of the strangest places in the whole country in terms of the activity that goes on... We have a variety and intensity of unusual objects and occurrences." [For example, i]n the sky, weird lights and unexplained sounds at night; and on the ground, a bizarre string of unusual animal deaths. One [person's] strangeness is another [person's] opportunity. For our investigator, whatever is going on in this valley adds up to one thing – evidence. "There's a major... chunk of data that can be gleaned from the things that have been reported and nobody has bothered to do it... I felt compelled to elect myself to... be... the person that documents and tries to get down in one place all the events that have been reported here... I think it could really give us some major clues, and maybe... further... our understanding of these things that I'm investigating." [The investigator] started a newsletter – *The Mysterious Valley Report* – and spread the word: if anything unusual was going on, [the investigator wou]ld like to know. It wasn't long before his telephone became a virtual hot-line for the paranormal. "Now that people know... I'm here... there's no question that... if somebody sees something in this valley, within seconds, minutes or days, I will find out about it." ...A sceptic could easily dismiss... anecdotal evidence... as nothing. But [the investigator] has heard too many stories that can't be dismissed – some told to him by the most reliable of sources, and involving some very high level players... Deep inside... Cheyenne Mountain, Colorado... is NORAD, the Air Force electronic eye in the sky. If anything enters US air space from this world or any other, NORAD will detect it and sound the alarm. Perhaps coincidentally, the Air Force built NORAD right next door to... where all the strangeness and UFO activity keep[s the investigator] so busy. Ever since it was built, NORAD's been like the secretive neighbour here – wanting to know all about everyone else's business while revealing little of its own. "We had one of the dark-horse events of UFOlogy occur here when NORAD called the Rio Grande County Sheriff, and the under-sheriff... answered the call." It sounded like something from space had fallen into the Mysterious Valley and NORAD wanted the sheriff to do a ground search. That seemed pretty reasonable to [the under-]sheriff – all part of the job. "...they said... a large explosion [had occurred]. They said the co-ordinates would have been in the Rock Creek area." Then things started to get a little odd. "They called back 30 [or] 40 minutes later and gave us a completely separate set of co-ordinates... I sent down a ground crew [and] got a... plane in the air... We flew and drove... until dark... and checked with the residents to see if they'd seen or heard anything and came up with nothing." NORAD is the most sophisticated space tracking network there is. They monitor more than 5000 objects 24 hours a day, right down to a screwdriver that floated away from [a] space shuttle – yet they couldn't seem to get their co-ordinates right for [the under-]sheriff... Because NORAD steered him to two different locations, [the under-sheriff and his fellow officers] spent two days on a wild goose chase over thousands of acres. By now [the under-]sheriff... was thinking it was more than odd – it was suspicious. Maybe NORAD intentionally misled him...? "[In t]he afternoon... when I called [NORAD, a] Major... told us that there was no reason for us even to look any further. I've got people calling up that there's black choppers... [with] no markings... flying around... When we called [the local Air Force base] they said they had no knowledge of any... manoeuvres going on... After this whole thing went down... I called [the investigator]." "I investigated the event as thoroughly as I could, but one thing that really... bothered me about the whole sequence of events was the obvious interest that our military – or some... quasi-military organisation – showed in the... area where this thing was reported." Was it an Air Force crash, a meteorite or something else? NORAD wasn't saying. [The under-sheriff believes:] "...that NORAD knew what it was... and they didn't want us to find out... There's a lot of people in my county jurisdiction that would like some answers." For the Air Force it was all over... "Forget it ever happened," NORAD said... "Whatever it was had been taken care of." ...[for the investigator,] the NORAD event was just one more puzzling case – one more set of clues that indicate something's going on... [and y]et another reason to keep on investigating. The very same kind of [official response] was... seen in Michigan in 1966... An entire dorm of co-eds and their dean saw something hovering in the night sky. Also among the witnesses were a dozen cops called to the scene. With all these witnesses the story got big in a hurry, so the Air Force called in their scientific consultant... It became a case that [the consultant] would long regret; a case where [the consultant] found itself doing more public relations than investigating. [At a press conference the consultant said:] "Project Blue Book at [the local] Air Force Base suggested that I might come here and get a line on what's been going on." [The consultant] was actually there to give a line – the Air Force line. "[The consultant] got up in front of the cameras and said that what was seen... was swamp gas. This was one of the sightings that certainly would never have matched swamp gas, which is very rare in any account, and there was wind that day and swamp gas would be just little pieces of flame... going off and on. It was ludicrous." [The consultant] would do the best [it] could to convince people of the swamp gas story, but it wouldn't be easy. For the Air Force, the Michigan case was a fire they needed to put out. For [the consultant], it was a compromise with his principles. "[The consultant] visited... my home... one day... and I asked him about this swamp gas story, and [the consultant said it]... had to do exactly what [it] was told and... that... [a] Major... said... 'Some of these objects were seen in a swamp. Think about [what] might be seen in a swamp that might be misinterpreted, tell the press about it and then get out of town.' [The consultant] said: 'I did exactly that, and if I were to say anything else I might not be able to stay as a consultant to Project Blue Book.'" The Michigan sightings were a rude awakening for [the consultant]. They made it painfully clear that to the [USAF] the real priority was public relations and not the question of life elsewhere in the Universe... ['Project Blue Book – which was designed to de-bunk alien stories – had 700 unexplained cases when it was wound up.' The Air Force and Nasa have left the quest to t]he lone citizen investigator[s, and the]... only way to find out... [if we are] alone in the Universe... is to search... Nasa began SETI, the Search for Extraterrestrial Intelligence, because some of the best minds in science said it was worth doing[– although some]... scientists said... "...It's a needle in the most gigantic haystack in the Universe." Still, in spite of the odds and the cost, America went ahead with Project SETI as our best hope of contact. But... [the now-defunct project wa]sn't our only hope... [A]nother UFO investigator... knows the one thing UFOlogy lacks is hard scientific data, so [this investigator has] made it his life's work to obtain some... Inspired by a [personal UFO] sighting... 22 years ago, and encouraged by his grandparents, [this investigator] began to construct his own radio equipment to reach out to space... It started out in the corner of the living room[, but as his] vision grew, so did the project. "It got to the point where... [the living room] was getting very cramped, so we decided to build an addition on to the house... that we could [have] the laboratory itself in... which ends up being 740 sq ft..." [This investigator taught itself everything it] knows about electricity... Every circuit, socket and diode in ...his place was put together by him, from power company cast-offs to military surplus. There are 60,000V running through his basement, powering a signal that's beamed straight out into space. [This investigator] has no definite proof, but... thinks his signal may have had an effect. "We had some close encounters of the second kind here, we had quite a few very close sightings of small satellite objects darting across highways in front of... vehicles... things like this started happening very rapidly about a year after we went on the air..." When all those sightings started happening, [this investigator] needed a baseline reference – a way to separate the false alarms from genuine sightings. So [this investigator] devised an experiment to test human perception – a UFO-decoy hat. "The hat is a device that allows me the ability to analyse people's psychological reactions and interpretations of a visual phenomena." With the decoy hat on his head, [this investigator] goes out where [it knows it]ll be spotted... After an evening spent in the field, [this investigator] checks with local law enforcement to see if any unusual sightings were reported... "...in asking some of these people later to describe things that they saw, they describe...

objects as big as 50 ft in diameter – and this was the hat without a question.” But the heart of [his] project... is the broadcast operation... Seven days a week, 365 days a year for 22 years... [this investigator has beamed] two signals out into space. One, a digital post code, and the other a live radio show. These are the bait [this investigator] uses to try to lure UFOs into the area. There are no sponsors, no commercials, maybe even no listeners – but just the possibility that something out there might hear and perhaps respond keeps [this investigator] going... Over the years, [a third investigator] has cultivated a network of informants, mostly aviators. [The third investigator] never intended to become a Father-confessor to troubled pilots, but there is no 12-step program for aviators who’ve seen UFOs, and so they call him. Which brings us to [his] newest case. The [troubled pilot] who called... today is a distinguished aerospace engineer, and veteran of Nasa’s Apollo moon landing team; and in the 1950s a military aviator with SAC – the Strategic Air Command. During the Cold War, SAC was America’s first line of defence. Its bombers were in the air 24 hours a day, loaded with nuclear weapons. Crews were trained to do the unthinkable, knowing they would almost certainly never return – [and] the Air Force trusted [them] with America’s most precious military secrets. After the Washington [incident] it was illegal for a military aviator to publicly discuss UFOs [it] might’ve seen. This aviator did his duty – kept his silence. But [his silence] can’t erase his memories. A long time ago something happened on a routine training mission in a SAC bomber. Now [the military aviator is retired and] needs to put to rest something that’s still alive in his mind’s eye... It’s finally time to go on the record to an investigator and fellow aviator... “Where were you when this took place?” “I would estimate probably about 22,000 ft, perhaps halfway across the Gulf of Mexico.” “Where were you in the aircraft...?” “I was in the right gunner’s position.” “What did you see at first that drew your attention?” “Well the first thing that happened was when the radar operator had finished calibrating his system [there was] a target at 60 miles.” “At what point did something come into your visual range...?” “It was less than 5 seconds after [the operator] reported a target at 1 o’clock and 5 miles.” “And what caught your attention?” “I saw a neon blur go by the right side of the aircraft.” “...what speed would you estimate this thing was travelling?” “The... target covered... 60 mile[s]... in 45 seconds.” “...So it couldn’t be an aircraft that was one of ours?” “It was definitely not an aircraft... the object was travelling approximately 1.33 miles per second. Configuration-wise, it was almost impossible to tell what it was. If anything, every time I think of this a neon tube comes into mind.” “...were you able to ask the pilots about it?” “I didn’t ask [th]em. I was waiting for them to say something.” “...[what] about on the ground later, [or] at any time afterwards?” “I never said a word to [th]em.” “Why?” “The mindset at that time was one that you would jeopardise your security clearance... by talking about something like this.” “It was like you [were] all maintaining a conspiracy [of] silence with each other.” Memory is a funny thing. In his Air Force career, a [SAC crew-member] could spend hundreds of hours in the air, yet decades later [one] finds himself haunted by... an event that lasted less than 60 seconds. “Knowing what you do about flying velocity and weaponry, what would have happened had that thing hit the aircraft?” “The aircraft would have been vaporised, and it would have been another routine training mission that wound up with a missing aircraft and crew.” Another sighting that can’t be dismissed, but [also] can’t be explained. No photographs, no confirmation, yet what it was seems to have been real... “At any time since this event have you entertained the... thought that this object might not have been of this Earth?” “There was never a time that I ever thought that it was of this Earth.” - 1996

HAVE you ever seen an unidentified flying object? Yes, you say. Well join the queue, buddy. Judging by the growing fascination in the idea of aliens from outer space those whose only close encounters are with their nearest and dearest will soon be a minority... *The X-Files* has spawned a mass audience of X-FILES, a handful of clone programmes and generous salary hikes. In March, Auckland University will be the venue for a conference on UFOs, with guests that include a former Nasa astronaut... According to a... poll taken last year, 53[%] of Americans believe that there is intelligent life elsewhere in the universe... While it might be more enlightening if the pollsters asked about the incidence of intelligent life in America, th[e following] guide has been prepared to make sure that even if you don’t know any aliens personally, you can fake it with the best of them when the next dinner party turns weird. A *stands for Area 51*. Part of the Nellis Air Force base in Nevada where conspiracy theorists claim the U[S] Government is “back-engineering” crashed flying saucers. Immortalised by *Independence Day* [the base is where [the hero] leads the... counterattack from] and the Extraterrestrial Highway... B *stands for BETA*... Harvard University’s Billion channel Extraterrestrial Assay... [which] has been searching the spectrum since 1995 for radio signals broadcast from an intelligent culture... C *stands for conspiracy*. When sceptics ask if there’s so many aliens why they don’t just land at Auckland Airport, the response will always be because of a secret plot... D *stands for Disbelief, as in suspension of*. Thesians rely on this when they walk out on stage. It’s the same for alien theorists... E *stands for [extraterrestrial]*. Blame the director of... *Close Encounters of the Third Kind* and *ET the Extraterrestrial*... for giving all this stuff some credence... F *stands for the Foo Fighters*. No, not the band. [WW2] pilots sometimes saw lights following them... A newspaper headline, “Where there’s feu, there’s fire,” gave them the name. G *stands for greys*. If you do see an alien, it’s likely to be... [a] metre or so tall, bald, grey skin, spindly with big spooky eyes... H *stands for Herbert George Wells*. H[is]... powerful *War of the Worlds*, a gripping tale of alien invasion, is a seminal source of much of the cultural baggage that we now carry. Orson Wells whipped half of America into panic and hysteria with a radio broadcast of the book... I *stands for ID4*. Shorthand for the surprisingly empty and objectionable megahit... Talk about jingoism, talk about silly plots, but who cared when those cities went up in flames, huh? J *stands for...* [t]he Harvard psychiatry professor... [whose] book *Abduction: Human encounters with aliens*, gave all the credibility of a former Pulitzer prize winner to the phenomenon... Unsurprisingly, his colleagues at Harvard aren’t happy. K *stands for Klaat barada nikko*. The first words uttered by a giant robot from another world in *The Day the Earth Stood Still*. Don’t ask what it means. L *stands for...* [a] mysterious scientist and engineer who claims t[o have] worked on flying saucers in Area 51... M *stands for the Martian face*. A big favourite of conspiracy buffs. In 1976 the Nasa probe Viking Orbiter took a picture of the Mars landscape that seemed to be a giant face. Nasa says the image is a trick of the light... [but] attempts to rephotograph the area have been unsuccessful, causing conspiracists to cry “cover-up!” N *stands for the Nazca lines*. One of Peru’s odder tourist attractions can be found on the Pampa de Ingenio. An expanse of desert is furrowed with a web of straight lines linking huge geometric forms. Nobody knows what or who made them[– but ‘the mysterious people hastened their own demise by clearing forests 1500 years ago (lack of trees made the climate too dry’)]. The alien theorists say they are approach markings for spaceships. They don’t ask why a culture able to fly a spaceship light-years across the galaxy should need help to land. O *stands for OBE*. As in Out of Body Experience. Not strictly an alien experience, but can sometimes accompany one... P *stands for Pope*. Not the pontiff, but... the civil servant who spent four years (1991-1994) analysing reports of UFOs for the British Ministry of Defence Secretariat (Air Staff) 2A... handl[ing] up to 3000 UFO reports a year, 95[%] of which could be explained. [The civil servant has] written a book *Open Skies, Open Minds*, about the 5[%] that can’t be. [It] still works for the MoD, but his colleagues now call him “Spooky,” Fox Mulder’s nickname. Can’t be fun at morning teatime. Q *stands for Queensland Incident*. Just last year the Queensland town of Gladstone was buzzed by mystery lights... [that] throbbed and darted about completing right-angled turns at high speed. No aircraft were in the area at the time. R *stands for Roswell*... S *stands for...* th[e] author of a first-hand account of abduction by aliens, *Communion*. [The author] said his kidnappers implanted a device at the top of his spinal cord. When [the author] dies, his will states that an autopsy will uncover it. Finally, physical evidence. Can’t wait... [The] former fiction writer, has churned out a further four books on alien experience. Is [the author] cashing in? ...T *stands for...* a logger... [who claims it] was kidnapped by aliens. [His] story was made into a movie, *Fire in the Sky*, that went pretty quickly to video. U *stands for Ufology*... X *stands for X-Files*. Does the FBI really have X-Files? No... Y *stands for Yeti*. Strictly this falls under the arcane field known as cryptozoology, or the study of creatures that may or may not exist. But if little green [people] from Beta Centauri don’t qualify, what does? Z *stands for Zzzzzz*. No, not a death ray. Merely the sound your guests make after you’ve illuminated them about your abduction experience. Being asleep they won’t take offence when your little grey friends take them off for a full rectal examination...

Abductions of humans by aliens are not always hoaxes or the result of a vivid imagination. So says [a civil servant] who used to investigate UFO reports for the British Government... [R]esearch into the controversial subject has convinced him that the abductions are terrifyingly real and more widespread than anyone suspected... The idea of a cover-up on the subject of abductions may sound bizarre, but there are persistent rumours of such a conspiracy in the U[S], based on little more than an extension of the idea of a UFO cover-up. The theory is that the US Government has struck a deal of some sort with extraterrestrials, and that aliens have been allowed to carry out a programme of abductions in return for technological aid for the Americans. Some researchers believe such a deal came into being after the alleged Roswell flying saucer crash... forced the extraterrestrials to show their hand... [The civil servant]'s personal view is that... [w]hile the US Government may well suspect that abductions occur, it probably has no direct knowledge... Meanwhile, [one alleged abductee] has passed two polygraph lie detector tests given by an expert... Childhood recollections of "when the moon landed in the garden" came back to haunt... [her] after the birth of her son... The doctors were curious about a strange scar on her navel, consistent with keyhole surgery. [The mother] was shocked and frightened as, apart from the removal of a cyst on her ear, [it] had never had surgery... Unable to find any obvious cause, her doctor suggested hypnosis to relax her, and this was when [the mother] recounted her story of the abduction. Regression revealed that at 16, [it] had been sealed in a perspex capsule which floated above the ground and was filled with a jelly-like pink liquid... Then [the teenager] was lying on [a] platform, being prodded with a lime-green device... [A little while later, the teenager] glanced down and, to her horror, saw there was something moving inside her stomach. There was a sharp pull at her navel, then the sound of things being put in a tray, out of sight... [□] A bizarre variation on... the surgery game called Operation... that... involves performing an autopsy on an alien... is being snapped up... Players use tweezers to pull organs from the body but if they touch the sides the extraterrestrial's eyes light up and it lets out a piercing scream. The alien autopsy game sells for about \$60. It is intended for players aged 8 and over.

... "People say I'm crazy," says... the former clerical worker... [who] has got used to people not believing that [the mother of three] is frequently taken away by [aliens] who conduct scientific experiments on her... [And h]er three grown-up children hate her talking about the relationships [their mother] has forged with her brace of visitors... [The former clerical worker] explains that in her 47 years, [it] has been poked, prodded, and impregnated by extra terrestrials... From her suburban Auckland home, [the former clerical worker says it] speaks out because [it] wants fellow abductees to know there are others like them around. "There are a lot of people like me out there and they do not have people to talk to."

...It was the night of August 8, 1993... A couple... were driving home through the outskirts of Melbourne. They... came across what seemed like a barrier of light across the road. Across in the paddock was a three-storey high structure the width of an Olympic swimming pool. Two other carloads independently described the same structure. All three carloads independently led researchers back to the same location. All three drew similar sketches of the craft they saw: A saucer-like shape with a row of orange lights and a fluorescent structure flowing to the ground beneath it. Later, researchers found circles of burnt earth where the craft had been seen. Laboratory analysis by Monash University revealed the chemical pyrene, which... geologically should not have been there. The analysis also revealed a magnetic anomaly in the burnt circles, and changes in the soil chemistry. "The ground had been compacted as if it had been under high pressure. The soil was full of minuscule air holes as if it had been suddenly dehydrated, and there was a major amount of sulphur in the samples." ...Mrs [C] was approaching the craft when... a wave of energy hit her like a ton of lead. "It... [was] like repeating waves of low-level intensity so dense I could feel it going through my body." Figures came from the structure – tall, with large, glowing red eyes and no other distinguishing facial features... [Mrs C and two gals] in another car later found a triangular mark on their stomachs, below the navel. Two individuals from two separate cars had ligature marks around one ankle. Three, again from separate cars, had a row of three dots on their thighs... Much later, still trying to work out what had happened, [Mrs C] came across a defence-equipment magazine... [containing] a picture of a Chinese-manufactured night vision mask, with large red goggles. [The magazine also contained a] reference to kinetic energy paralysers weapons. So maybe that's the solution, though that doesn't explain the marks on her body, nor the other [gals'] recollection of having been in the craft, being gynaecologically examined... Scientific analysis of the scene raised puzzling questions, and... "even the sceptics didn't have much more to say than what a neurotic... I must be to take my handbag with me on an encounter".

...close encounters with little green [aliens is] the subject of *Future Fantastic's* first episode... [The host o]f the BBC... series... (who's spent some time chasing aliens as agent Dana Scully on *The X-Files*) offers views from alien doubters and devotees, including NASA. In 1992, the American space agency put \$US100 million into listening for messages from the final frontier – after nearly 30 years of fruitless eavesdropping for tidings from other worlds. One interesting – and rather worrying – point is that we've already been sending messages to the stars via television. Apparently the first broadcasts from the box are now 480,060 billion km from home. God help us if the [extraterrestrial]s have already seen *Lost In Space* or, worse, *Independence Day*. The show predictably traverses the subjects of alien abduction [–] one writer says: "many, many people who now believe they have been abducted by aliens have been abducted by [the director (r:p2705, ln43)] in effect"... But such frippery does not detract from the views of sensible science folk. The most potent comes, unsurprisingly, from [the sci-fi author who penned 2001: A Space Odyssey]: "I think that contact would be the most important event in human history because it will tell us whether we are nearer the apes or the angels."

...*SIGHTINGS UFOPEDIA*... comes with a database containing more than 350 entries on subjects ranging from angel hair to the Bermuda Triangle[– but primarily]... discusses famous cases involving the alleged abduction of people by extraterrestrials... An Internet site has been set up[– 'aliens is now the 2nd-most-popular subject on the Internet (sex being the most-popular)' –] and users can visit it for regular updates. *Sighting* does not try to convince you we are being visited by aliens. It looks at the evidence and claims with the aim of making you think... [As for what you think, a NZ] *Herald*... survey has revealed that... 40.6%... [of NZers] believe in the existence of UFOs (visiting aliens, space ships, etc)... Belief is most prevalent among Alliance supporters, with 42.9[%]. And, believe it or not, least prevalent among N[Z] First supporters, at 12.5[%]... Belief was slightly higher in Greater Auckland than the rest of the country... The survey[also] shows that young people are more likely to take UFO sightings for real. About 45[%] of people aged 18 to 30 believe, compared with 28[%] of those 51 and over. [Guys and gals] had similar rates of belief.

...ARE humans special? For most of [our] history we've thought we were... Then a bunch of astronomers showed... the Earth... is... residing in an extremely nondescript part... of the universe... Ever since, it's been the trend of science to dethrone humans from the pedestals we naturally seem to want to put ourselves on... The latest incarnation of the there's-nothing-special-about-people-rule is... the Search for Extra Terrestrial Intelligence. Humans can't be the only advanced beings in the cosmos, the argument goes. That would be hoisting us back on our throne. And a mighty impressive throne it would be given there are hundreds of billions of galaxies each made up of hundreds of billions of stars. The SETI project was devised to try to tune into any radio messages the aliens might be sending us... Why haven't they dropped in to say g'day? Of course, some claim they have and they're living among us. But assuming the *X Files* is fiction rather than documentary, there is no hard evidence we're being buzzed by curious space explorers. Yet this is not what logic seems to predict. If the galaxy is riddled with aliens, surely many are far more advanced than us... And they wouldn't have to be much more developed to have mastered interstellar space flight. After all, 20th Century Earth scientists already understand the basic principles. And the galactic journeys wouldn't have to be mounted in Starship Enterprise-style. Rather than sending people (if that's the word), a battalion of self-replicating robots could go out and explore. They land on a planet, use the natural resources to build copies of themselves, then each journeys to a different planet to do the same thing. Like multiplying bacteria... before long the galaxy is teeming with the robotic pioneers' progeny... [I]f their rockets were capable of the miserably slow speeds managed by our craft it would take a few hundred million years... to cover the entire galaxy... This may seem like an eternity, but the Milky Way is ten billion years old. Intelligent aliens in other parts could well have evolved hundreds of millions of years ago, allowing plenty of time for such exploration. Perhaps our cosmic cousins have the ability but not the desire. Maybe they're sensitive new-age, non-expansionist types. Possible, but hard to believe given the only intelligent life form we know

exists... in the universe seems to enjoy expansion no matter the cost. Perhaps they have a non-interference policy rigorously applied to fledgling civilisations such as our own. Again, not much evidence of humans employing such a policy with regard to the other life here on Earth.

...HOLLYWOOD sure knows how to throw a big-screen barbecue. Just toss a few aliens on the grill and watch the box office sizzle. Movie-goers went crazy last year when *Independence Day*'s space warriors reduced the White House to singed splinters. The apocalyptic thriller went on to be the year's biggest movie, making more than... \$US670 million by the end of September... But this year's intergalactic blowout features fireworks of a different colour... [Guys] in *Black*... is red, white and blue in its portrait of hard-working, unlauded secret agents who protect US citizens by monitoring visitors from beyond. What could be more all-American than the notion that Earth is a neutral zone for immigrants displaced from other planets who take on human form and live among us? ..."*Independence Day* is a big movie with huge spaceships all over the world," says [the Guys] in *Black* screenwriter... "Ours is a small movie about a handful of people doing their job anonymously..." ...The [Guys] in *Black* "aren't superheroes. They're ordinary guys who have gotten a glimpse of the way the universe works. It's a fantastic story with a reality base." The \$130 million [Guys] in *Black*... does have a few ties to *Independence Day*, such as... [the lead actor, who] distinguishes between his two roles this way: "The pilot in *Independence Day* had his life together. Agent J in [Guys] in *Black* thinks [it] knows everything but finds [it] knows nothing." But the secret to making the film work is the [person] behind the camera: [the]... director of *The Addams Family* movies and *Get Shorty*... has done what [his peer] wasn't able to pull off with the campy *Mars Attacks!* – a close encounter of the truly funny kind[that contains the following conversation: "Do we know they're hostile?" "What do you mean, 'Do we know they're hostile?' Mr President, they have our planet surrounded by thousands of warships!" "Do we know they're warships? Professor, what do we know about them?" "We know they're extremely advanced technologically, which suggests, very rightfully so, that they're peaceful. An advanced civilisation is by definition not barbaric, Mr President. The human race, on the other hand, is an aggressively dangerous species. I suspect they have more to fear from us than we from them. Our planet is suffering with the ozone and the rainforest, and so many people unhappy in their lives. I think the aliens heard our global cry for help – and they've come to save us, to show us the way.""]

...eminent scientist... bets on malevolent aliens... HOLLYWOOD got it right, says... Cambridge's professor of mathematics and author of *A Brief History of Time*... – ...any contact with alien life is likely to be nasty... In the first airing of his views on extraterrestrial life to a mass audience, [the British] Professor... said we probably were not alone. But [the professor] cautioned about answering any messages we intercepted because of the risks of a hostile invasion. "We should be wary of answering back... Meeting a more advanced civilisation might be a bit like the original inhabitants of America meeting Columbus. I don't think they were better off for it." [The] Professor... sounded his warning in a CD-ROM released this week. "I see no reason to believe that life cannot develop elsewhere, but the fact that we do not seem to have been visited by aliens needs an explanation... Perhaps the most likely (explanation) is that although the probability of the spontaneous generation of life is reasonably high, most of the life systems do not develop intelligence... I don't think UFOs are evidence that we have been visited by aliens... Why reveal yourself only to cranks and weirdos? I think such visits would be much more obvious and more unpleasant, like *Independence Day*." In the film... [-] which... "borrowed" heavily from... si-fi oldies such as *War of the Worlds*... [-] a fleet of spaceships arrives without warning over the world's great cities. A day later, the aliens attack, destroying huge areas of the planet. Humanity, however, wins the day by infecting alien computers with a virus. [The professor]'s favoured theory is that Earth has been over-looked by aliens so far. Although known as... [someone] who is prepared to take bets on complex cosmological theories, [the professor] has not gambled on the chances of extraterrestrial life. "One could never prove it didn't exist,"... As for humanity colonising other planets, [the] Professor... said we were now entering a third stage in our evolution where that would become possible. The first phase of evolution saw humans develop from more primitive organisms. The second involved transmitting information in language and books. "We are now entering a new phase of what might be called self-designed evolution in which we will be able to change and improve our DNA... Laws will be passed against genetic engineering with humans. But some people won't be able to resist the temptation to improve human characteristics such as size of memory, resistance to disease and length of life." ...[the professor] predicted the appearance of such "super humans" would raise big political problems as "unimproved" humans fell increasingly behind... Metatools, the Californian company that designed the CD-ROM, said [the professor]'s synthesised voice had been incorporated into the disc to take people on a journey through his imagination.

...Scientists plan to launch missile attacks against asteroids that threaten the Earth. Set for a launch in two years' time, the mission marks the first step by the human race toward defending itself from the impact of asteroids and comets... whose cataclysmic impacts have often intervened in the evolution of life on Earth... NASA has picked out two asteroids on Earth-crossing orbits. The first, 1986JK, will be attacked in May, 2000. Another, Toutatis will be intercepted five months later. The U[S] Air Force will build the main space probe, named Clementine II, and fit it with instrument-packed missiles. These, released into the path of the on-coming asteroids, will take close-up pictures and make scientific measurements before slamming into their targets at 72,000kmh. Although not violent enough to destroy the asteroids, the missiles will give scientists vital information about the strength and make-up of the objects... According to... the British astronomer who heads Spaceguard A[US]... the mission has its origins in America's controversial Star Wars project, which was supposed to protect the West from surprise nuclear attack by the Soviet Union. "It's a prime example of beating swords into plough-shares..." Some astronomers have voiced concern about the use of military technology in space, no matter how benevolent the aim. They claim that the interest of the armed forces has less to do with saving the planet than with finding a new enemy to justify huge budgets. Clementine II... is expected to be only the first of a series of missions to deflect comets and asteroids. If the objects are discovered early enough, only a tiny change in velocity [or flight-path] would be needed to protect the Earth, as the small deflection would build up into a huge distance by the time of closest approach. But nudging a comet or asteroid off course requires a detailed knowledge of its structure. If it is weak, then too much violence would shatter it, turning it into a swarm of impactors. According to [the British astronomer], just getting to the asteroid is a major challenge... "To be able to hit targets only a mile or so in size when millions of miles from the Earth, and travelling at over 10 miles a second, will be a remarkable demonstration of technological capability."

...*Save the Earth!* IT IS A STUNNING CONCEPT. FROM THE time that terrestrial life emerged nearly 4 billion years ago, it has been assailed time and again by global catastrophes that have caused wholesale extinction of species. But now, for the first time, one species, *Homo sapiens*, has evolved the intelligence and capability to defend itself against the next such calamity – if it has the will to do so... Astronomers estimate that as many as 2,000 "Earth-crossing" asteroids wider than a kilometer are out there... But only about 7% have been identified. "We simply don't know where the others are," says... the... geologist... [who, i]n 1973... began the world's first systematic watch for Near Earth Objects (NEOS)... with... the renowned U.S. astronomer/geologist... Eugene Shoemaker... who was killed in an automobile accident this summer while hunting for craters in A[US]'s outback... "That should be enough to get the attention of [the U.S.] Congress and the public, yet it doesn't seem to. We're just barely eking by with this detection program, because we can't convince people that it's worth funding." Equally disconcerting, an estimated 300,000 asteroids larger than 100 m wide are on paths that cross the Earth's orbit, each one capable of devastating a large metropolitan area. And... a University of Arizona astronomer, thinks that the population of Earth-crossing asteroids larger than 20 m – one of which could destroy London – is as high as 100 million. "There is no way in the foreseeable future that you could detect all of these objects,"... The sheer numbers haven't dissuaded [him] from launching a search of his own... In attacking a large comet or rocky asteroid... the interceptors would have to take care not to blast their quarry into many large chunks, each of which would be a potential city-killer. One proposed scheme for avoiding that deadly consequence is to use the neutron bomb, a weapon that delivers most of its energy in the form of speeding neutrons rather than an explosive blast... But at least one faction of astronomers has been adamantly opposed to the notion of having still more nuclear weapons at the ready, either on Earth or in orbit, poised to meet a space emergency... Aware of strong anti-nuclear sentiment, both among some scientists and members of the U.S. Congress,

scientists at the Lawrence-Livermore National Laboratory in California are weighing a scheme for destroying asteroids as large as 300 m across without employing nukes. Borrowing from both the Star Wars “brilliant pebbles” strategy and conventional mining techniques, the Livermore group would pack the nose cone of an anti-asteroid missile with an array of interconnected tungsten balls and springs. As the nose cone approached the incoming asteroid, it would deploy its cargo, which, forced apart by the springs, would expand into a flat array of metallic balls... When the asteroid, hurtling at some 30 km/sec, smashed into the array... “the tungsten balls would burrow in from meters to tens of meters deep before they slowed down.” When the balls did slow down, their kinetic energy would almost instantaneously be converted into thermal energy, about 100 times more than high explosives can generate. “You’d get an array of explosions going off... and the shocks between these explosions would propagate out and fracture all the rock between the points of the explosion.” The result... is that the asteroid would be pulverized into pieces small enough to burn up when they entered the Earth’s atmosphere. Still, before they decide what weaponry to use against an incoming threat, Earth’s defenders should be aware of the nature of the intruder... However, [the US]President... recently pulled the plug on a project to discover the nature of a near earth asteroid... [The President] vetoed the \$30 million Congress had allocated for the Clementine II mission... And hopes that Congress might supply modest funding to set up a worldwide detection network have [also]been dashed... But wiser heads in the U.S. Air Force may yet prevail. They are mulling over plans to allow NEO hunters time on satellite tracking telescopes in three locations. This would involve equipping the telescopes with... a charged-coupled device (C.C.D.), an extremely sensitive camera that electronically records the images of celestial objects... and detection software, which would also improve the Air Force’s satellite tracking ability. “They could do double duty,” Gene Shoemaker explained last year, “tracking the satellites at twilight and surveying for NEOS in the middle of the night...”

...*Things that could go bump in the flight...* ALMOST 10,000 objects in the solar system have been tracked by the Near-Earth Asteroid Tracking system in Hawaii in the two years since it began. The new year has begun well for the system with another 700 sightings, including one of an asteroid orbiting close to Earth... The new asteroid spotted by the NEAT team is one of a select group referred to as the Aten asteroids, which stay predominantly within Earth’s orbit. Unlike much of the matter within the solar system, this asteroid doesn’t orbit in the same plane as that of the Earth and the other planets. Instead its orbit is tilted 31 degrees, possibly as a result of disturbances caused by a close encounter with Earth in the past. There is increasing interest in keeping track of such asteroids as we become more aware of the potential for a planetary disaster should one of these... 24... tiny wanderers happen to collide with Earth. Atens tend to make relatively close approaches fairly frequently, making them more likely to hit us. The new asteroid may sound small, at an estimated 170m in diameter, but that could pack a most impressive wallop should it hit.

...[‘Don’t make plans for Sept 21, 2030 Scientists have spotted a small asteroid or a piece of space junk 29m-69m long that has a 1-in-500 chance of hitting the Earth in the year 2030 – far greater odds than any similar object ever discovered. For now, though, that is “fairly low in terms of concern.”]

...‘*Rocks in SPACE* The end is nigh. Nostradamus is quite clear about it: the jig is up this month. There will be fire from the sky and we can’t say that we weren’t warned. In fact, the signs and portents may have started already. What might be the first crack of doom sounded recently high above NZ, to focus the attention of many good Kiwis – or “sinners” as I suppose we must now think of them – on the wrath to come. Of course, quite apart from its moral inconveniences, the Day of Judgment will be of extraordinary scientific interest. The seismometers of the Institute of Geological and Nuclear Sciences will be quivering overtime, and the director of the One Tree Hill Observatory will have his work cut out. The director’s still trying to figure out the trajectory and determine the dimensions of the latest visitor, which could be anything from the size of a pea to “a flying armchair.” As it turns out, NZ is bombarded by celestial Laz-Z-Boys on a regular basis about this time of year, when a meteor shower called the Australids rattles over our heads. It is believed that only 800 years ago one of them rearranged Otago in an explosion on a par with the Tunguska event which flattened half of Siberia in 1908. Maori, many of whom blame the explosion for the disappearance of the moa, remember it in the names Waipahi (“place of the exploding fire”) and Tapanui (“big bang”), both of which are peppered with tektites (astronomers appear to have a keen sense of the dollar value of stuff from the stars – you can buy and sell meteorites from as little as \$US40 at Mike’s Meteors to as much as \$11,000 at Lang’s). The US spends up to \$8.5 million a year tracking asteroids and comets that may hit the Earth at some point. Heaven is an untidy place. You’d think we would have the sense to leave well enough alone, but instead Nasa’s planning a sort of space-whaling expedition which involves actually harpooning a meteor. Its stellar prey is comet P/Temple 1, which it plans to stick with a 500kg copper harpoon travelling at 10 km/s. Deep Impact will blast a crater as big as a rugby field and as deep as an office-block to analyse the primal stuff inside. Hopefully, this will not redirect P/Temple 1 from its appointed path to, say, Sunnynook. Moby Meteor won’t come cheap (\$US286m), so no doubt Nasa will be looking to recoup some of its investment. The editor of *Meteorite!* magazine reports that a bounty of \$US25,000 has already been put on the NZ arrival’.]

...An off-the-planet American story has launched N[Z] astronomers into space-sized guffaws of laughter. A mass-circulation national tabloid daily in the U[S], the *Sun*, claims to have a secret report co-written by a N[Z] astronomer, Curtis Jemison, saying seven deadly asteroids are hurtling towards Earth courtesy of aliens... The *Sun* says Nasa and U[S] Air Force experts are racing the clock to come up with a world-sized shield which will protect us from the space rocks... Sending conspiracy theorists into a spin, the paper added: “The Government can’t keep a lid on this much longer.” ...Of course, the story appears to be nothing more than that – a story. No prizes for guessing that Mr Jemison seems non-existent. Two leading astronomers... of the Mt John University Observatory at Lake Tekapo, said they had never heard of the doom-merchant scientist. “And we know most people actively involved in N[Z] astronomy and everyone with an interest in asteroids,” they said... From N[Z]’s real-life asteroid experts, the news is much brighter. “There are a number of Earth-crossing asteroids known, but none of them is in a position to collide with Earth in the present era... [However, w]hat they may do in several thousand years cannot be definitely known.” The *Sun*, meanwhile, continues its run of world exclusives, including: “Found! Christ’s deathbed writings” and “Miracles that will change your life forever.”

...The truth isn’t out there, it’s in an Auckland warehouse. [Inside the] dark building in Onehunga... [a]liens of every shape and hue that have supposedly visited... Earth in the past 40 years are lined up for inspection in what is billed as the world’s first Alien and E[xtraterrestrial] exhibition. Two s]elf-professed Auckland jacks-of-all-trades... spent 12 years researching human encounters with aliens, developing a database to rival the fictional *X-Files*. The pair picked the 25 most credible accounts and painstakingly built replicas... Their creations have been patented because they ...are their intellectual property. The *Herald* was allowed to photograph only the “common grey” aliens, of which there have been about 10,000 sightings worldwide, so as not to breach copyright. The pair talk of deals with Disney and [the director] which went wrong... With more money [they] would have invested in robotics and made [the] creations move. Instead, [the pair’ve] relied on spooky music, fog machines and weird lighting effects to create an appropriate extraterrestrial world. From Onehunga, the show travels to A[US], and there is interest in taking it to England.

...[NZ’s] first international UFO Symposium opens tonight at Auckland University... [Among the participants is a] retired Lieutenant-Colonel... from the U[S] Air Force... Yep, the 73-year-old says, aliens are out there and Planet Earth is increasingly one of their favourite destinations... [However, a] worldwide conspiracy involving the [US] military is suppressing the truth about the existence of extraterrestrial life... Between 1947 and 1949... the guy who served as a fighter pilot in... [WW2] and the Korean War... served in Alaska supervising a “special group of civilians”... [at] the air development centre where staff tested new aircraft, analysed captured planes and studied the latest technology... Among the data collected... was information on “unidentified aerial phenomena” sighted in the area... over the Arctic... Strange craft would approach a B29 head on and then, without turning around, stop and instantly match the... bomber’s speed... “Because of my training I was current on most modern air technical information available worldwide... One reason why I was sent to Alaska was that I was supposed to be able to distinguish between an Earth vehicle and something more exotic... There’s no aircraft designed on Earth to do that.” [His] job was to type reports based on the crew’s testimony. [The guy] was not allowed to develop photographic and movie footage taken by air crew. Both the film and his reports were sent to

Washington. "Somewhere in Washington there are scores of reports of mine. I tried to see them but I didn't have the right security clearance." While generals [declared that] the Russians had used German intelligence to make a technological breakthrough... [this guy] favoured the aliens from outer space theory... After 24 years active service... [it] retired to "pursue my own investigations of this phenomena." Globe-trotting as part of his job selling decommissioned military aircraft, [it has] amassed a library of evidence, including more than 3000 photographic images of... [UFOs. The guy] would spend weeks interviewing witnesses and collecting physical evidence such as strange metal and plastic objects that were "not from this world." ...[the guy] said that the infamous Roswell Incident in New Mexico was not the only alien crash in 1947 – seven spacecraft smashed into terra firma that year as a result of the American Navy's experiments into aerial search radar which inadvertently "fried" flying saucers. [The guy] said aliens were interested in Earth because of its harsh environment and humans' comparatively short lifespan, which makes our habitat the perfect laboratory... [and] humankind... the galactic equivalent of white mice... for extraterrestrial scientists.

...The US Air Force... says "space aliens" who supposedly crashed in the New Mexico desert... were actually aluminium and plastic test dummies used in high-altitude parachute drops. A 231-page... report, which was issued yesterday, a week before the 50th anniversary of the incident... denied that the military had recovered alien bodies from damaged flying saucers... and had covered up the discovery ever since... The private Fund for UFO Research, based at Mt Rainier, Maryland, quickly attacked the report, noting that the test dummies were not dropped by parachute until 1955... [T]he Air Force simply claimed that the time discrepancy was due to faulty memories on the part of eyewitnesses... The report[, which was accompanied by a]... photo showing the [saucer-like] aeroshell of a Nasa Voyager Mars space probe just before its launch... said claims of bodies at the Roswell Army Air Field Hospital that helped feed the speculation were most likely a combination of two separate incidents in 1956 in which 11 Air Force personnel died in a KC-97 aircraft accident and two... were injured in a [pilot]ed balloon mishap... On July 7, 1947, the Roswell Army Air Field issued a press release saying it was in possession of a "flying disc" that had fallen, but the same evening an Air Force General in Fort Worth, Texas, said the craft was a weather balloon... Despite the lack of hard evidence, Roswell has become an article of faith for those who believe in extraterrestrial life and up to 100,000 people are expected in the town next week...

...one of the few living witnesses... was a civilian employee at the Roswell Army Air Field in July 1947 when [it] was dispatched to see what had crashed into a dry river bed northwest of town... [The witness] got a close look at two dead aliens, one in the wreckage and another slumped against a rock wall in the river bed... [A] 22-year-old mortician at the time... said [it] saw strange activity at the army air field... and a nurse at the base screamed to him: "Get out of here as fast as you can..." ...[the mortician] was escorted from the base by military police and warned to keep quiet, but the nurse found him the next day and told him [it] had conducted autopsies on small creatures weighing no more than 14kg with large heads and eyes and four fingers on each hand with suction cups on the end. The nurse then mysteriously disappeared and the sketches [it] allegedly made of the creatures were lost... [By the way,] UFO experts... are gathering... [in] Mexico... for the Second World UFO Congress, which [begins] today.

...*LOVING THE ALIEN*... An interplanetary dating service is being launched by the Paris-based European Space Agency. Singles seeking out-of-this-world friendships, or even permanent partnerships, can send messages in a US rocket which will be aimed at the moon Titan, near Saturn, in October. First client is [a 30-year-old] whose request reads: "Tall... French earthling... seeks tall, handsome alien, romantic if possible." Ms [30-year-old] would presumably appreciate a picture with any reply...

A lot of aliens do look like [an alien movie star (r:p2705, l:n43)]. Big eyes, big forehead, tiny... nose, little pointy chin. At least, that's what the sketches showed when nearly 400 believers packed into a UFO Symposium at Auckland University... There weren't just sketches... There were hours of videos and photographs of strange lights and objects in the sky, and a series of speakers who, [the] conference organiser... said, were "the most brilliant people I can assemble". The audience loved them. They drank in the videos of UFO sightings over Mexico... [- s]ince 1991, interest in UFOs has risen so sharply that Mexican television is now about to start a daily half-hour series on the phenomenon, fronted by... a 60 Minutes journalist [(91% of viewers of 60 Minutes believe there is intelligent life in space)] who kicked off the symposium and can be said to have largely kicked off the Mexicans' interest as well... [-] nodded wisely at the New Age conspiracy and self-empowerment theories, and warmly applauded the "I was abducted by aliens" testimonies... [plus the] tales of UFOs emerging from oceans and lakes, and allegations of underwater bases, off Great Barrier Island... off the south A[US]n coast... and... off the coast of Argentina... [There was also] talk of hybrids – creatures formed by combining eggs taken from human[s] with aliens – a topic which might explain why some of us, for example, go bald or have haemorrhoids while others don't... Almost half the audience had seen a UFO; almost all, plainly, wanted to be assured the extraterrestrials are here, friendly and about to sort out this messy planet into a more harmonious state. There's no doubt there have been incidents and sightings that have still not been satisfactorily explained. Here in N[Z], for example, there were the strange lights over Kaikoura in the 1980 New Year period, picked up on aeroplane and Wellington Airport radar and filmed by an A[US]n television crew. They were eventually put down to reflections from squid boat lights. But lights don't show up on radar. Earlier, there was the 1969 Ngatea incident, when a dairy farmer found three scorched circles, about a metre in diameter and 3m apart, amid flattened scrub in a back paddock. Geiger counters remained silent until they reached the circles, and then ticked furiously. A horticultural examination of manuka trunks within the circles revealed the wood seemed to have been cooked instantaneously... [A] veteran UFO investigator based in Tauranga, said there was no sign of burning on the outside of the trunks. A DSIR examination, carried out some six weeks later, decided a fungus was to blame. "But that particular kind of fungus doesn't kill a tree, it only attacks it after it's dead,"... A... former National Airways Corporation pilot who developed his theory of ley lines and UFO grids after seeing many strangely-moving objects in the sky, says airline... and air force pilots see UFOs quite often. Astronauts do, too, several speakers said. Apparently the first thing the Russian Mir astronauts said after six months in space was that there are extraterrestrials out in space. [The US astronaut] who stayed orbiting the moon while [two of his colleagues] made the first lunar landing, later told the U[N] General Assembly... extraterrestrial vehicles were visiting this planet... [This astronaut] had never seen a UFO himself, however... [The] astronaut... who in 1971 became the sixth [earthling] to walk on the moon... is among those who believe aliens have crash-landed on Earth... [That astronaut] wants congressional hearings into what [it] calls a... US Government [cover-up of] the matter... A... speaker... for... Borderlands Sciences... "the oldest UFO research organisation in the world", produced... what looked like Rorschach test patterns. Turned out they were blow-ups of black and white NASA moon photographs, in which [the speaker] could discern clouds, plants... roads, tunnels and bridges... [The speaker] is convinced the Americans didn't land on the moon. The film of the landing shows the American flag fluttering, and there's no wind on the moon. There was no blast-hole from the lander, and no dust on the aircraft kicked up by the landing, even though footprints in the ground nearby were clearly defined. And a film clip of the second astronaut descending from the moon's surface showed a sudden, abrupt stumble: A movement too rapid for the moon's lighter gravity. It was all filmed in the Nevada desert, [the speaker] suspects. NASA now regretted releasing those photos... said... [the speaker, who also says that:] "The moon very possibly is artificial, controlling Earth." ...[an A[US]n speaker... showed a film of [the 40th] US President... suggesting to the U[N] that an extraterrestrial threat could be the only thing to unite the nations of the world. More food for the conspiracy theorists. Maybe the chap with the clearest photographs is just a government plant. [The chap], a retired US Air Force colonel, [has]... apparently been investigating the UFO phenomenon for more than 35 years, and showed about 100 photographs in Auckland... some of them with as much detail as an elaborate hubcap, most with much less clarity... Later, [the] Colonel... let drop [it]d been given a note by an alien once. [The colonel ha]d been asking people in contact with extraterrestrials to ask them questions, and one answer came back on a piece of paper written by the alien. Sensational. Was it alien paper? "It looked like Earth paper." The writing? "It was in block letters." What did [the colonel] do with the note? "Unfortunately, I didn't keep the paper." A UFO investigator... [who] doesn't keep the

paper? ...As several speakers said, dealing with UFO and extraterrestrial material demands an open mind, and the ability to separate the wheat from the chaff. Or the corn from the corn circles, but that's another story... - 1997

Crop circles have got a lot more press after... the... new movie Signs... It's like diving into a deep pool of movie mystery, a spine-tingling plot which features... some of the most bizarre and inexplicable phenomenon that has occurred on earth: crop circles. *Signs* is a supernatural thriller where even N[Z] has a bit role – the film's trailer featuring a fictitious crop circle movie producers would like viewers to believe appeared in the South Island town of Ranfurly... Crop circles have been mysteriously appearing across the world – with a heavy concentration in southern England – over the past couple of decades. In England they often appear close to ancient monuments and there seems to be some connection between ley lines and crop circles. Especially intense over the past decade, the crop circle phenomenon is now a regular part of the British summer season... It's not the first time crop circles have made it to the screen – *The X-Files* featured the circles on one episode and the directors of... [the] movie *Contact* also collected circle information, though the phenomenon never made it to the film's final cut... Crop circle enthusiasts say the earliest recorded crop circle was 300 years ago, while [a recent] edition of *Nature* carried a reprint of a reported circle in Guildford, Surrey, England in 1880. Further afield, and more recently, a 457-metre crop circle appeared in a Punjab, India wheatfield in 1987. Theories on the phenomenon abound: An alien species is trying to communicate with us; they signal some kind of cosmic musical note or tune (think the powerful musical sequence in *Close Encounters of the Third Kind*); or they're nothing more than elaborate, [hu]man-made hoaxes... ● [A group of]... experts... believe they have discovered a new type of alien known as Rods, translucent creatures that fly though the air. [But the 'scientific community won't accept the existence of Rods until one is caught and put on a dissecting table. These alien lifeforms ("sent to confuse us") may have been here always but we never saw them before because the creatures, that vary in size from a few inches to 50ft long, move too fast – "6700mph" – although not too fast to be caught on film']]

...“We actually know a great deal about what's required to travel across space at high speed. Interstellar space-travel is very unlikely... [because it] flies in the face of the Laws of Physics... We should not, therefore, expect extraterrestrials to visit us.” ...[therefore,] abductions can't be real... [T]he only thing fast enough to travel between hugely distant civilisations [i]s radio... Even a slow tune goes... [at] the speed of light... Astronomers say intelligent creatures would discover radio waves and use them to communicate – just as we did. And that's how we could discover them... “My hunch... is that we will never really meet them – not in person. We will talk to them, we will know everything about them – just as we learn about other cultures through television – but I think a direct contact is very unlikely.” ...[unfortunately, i]n some high places there are people who believe any interest in extraterrestrial life deserves derision – not tax[payers'] dollars. Less] ...than a year after... Nasa... thr[e]w a big party in the desert [to celebrate the launch of] perhaps the most far-reaching quest in the history of exploration... SETI was dead. But an act of Congress can't kill human curiosity. The search was bound to go on – with scientists or without them... Stunning million dollar donations have brought SETI back to life.

...More than a million people have volunteered to use a “screensaver” computer program that is helping to search for extraterrestrial intelligence... The program, designed by a team at the University of California at Berkeley, analyses data gathered by a radio telescope in Puerto Rico[']s mountains that is ‘the size of 27 football fields’]. “It's truly a phenomenon,” said the project director for... SETI... “One person runs it in an office and pretty soon the whole office is doing it.” ...people can download and install [the program] on their home computers. When their computers are idle and slip into screensaver mode, the program works to analyse data gathered by the main SETI program.

...Humans may one day come face to face with aliens but they are unlikely to be the cute, friendly variety [like an alien movie star], says a Wellington astronomer. Carter Observatory[']s astronomer... who is running a course on extraterrestrial life starting today at the observatory... believed life was common elsewhere in the galaxy and included advanced civilisations... The observatory's course, which... first ran last year, ...also looks at... how life evolved on Earth and how advanced civilisations could have evolved on other worlds... But if Earth ever encountered these civilisations their impact might not be positive. “Whenever one culture has met another and one was considerably more advanced in technology, the other culture has tended to collapse... If somebody turns up here, just that they can turn up here would mean they are exceedingly more advanced than us.” ...advanced alien technology would be like magic to humans. Their biology and way of thinking could be completely different[– a]dvanced civilisations could... be machines rather than organic life... [H]umans beating advanced alien invaders, as happened in the film *Independence Day*, was also unlikely. “You wouldn't be able to beat something like that any more than a group of Stone Age people if the Navy turned up on their shore.” ...Despite claims from some people about UFOs and alien abductions, no hard evidence existed of aliens ever visiting Earth... [T]he absence of visits could be because of the vast distances between stars... [– plus t]here are... so many trillions of stars... [–] time scales and how long a civilisation lasted. Human civilisation had been around for only about 5000 years, about a millionth of the... years the solar system had existed. “So if somebody came across space at a random point in time they have only one chance in one million of arriving when we are here.”

“...at 11 o'clock... tomorrow... an alien ship will begin passing through this Solar System... They're on a survey mission. They have no interest in Earth – too primitive... [But] when they detect... your [signal]... they decide to alter their course... It is one of the pivotal moments in human history... You get to make first contact with an alien race. And after you do, everything begins to change... It unites humanity in a way no one ever thought possible... We work to better ourselves and the rest of humanity... Economics of the future is somewhat different... [because] money doesn't exist... [any more. Consequently, t]he acquisition of wealth is no longer the driving force in our lives... Poverty, disease, war – they'll all be gone within the next 50 years...” - Star Trek: The Next Generation

When your captain first approached [the Collective] we suspected that an agreement with humans would prove impossible to maintain. You are erratic, conflicted, disorganised. Every decision is debated, every action questioned, every individual entitled to their own small opinion. You lack harmony, cohesion, greatness. - Star Trek: Voyager

One UFOlogy group believes that at the beginning of our 21st Century ‘33 spaceships carrying 30,000 aliens will be landing in the US to educate humans.’ Assuming that a visit would have been planned well in advance, it is possible aliens could have built up a stockpile of things they believe humans need. Alternatively, they might have some useful equipment which is simply excess to their own requirements. Which raises a valid point: would a species that has the technology to travel large distances through space do so while, back on their home planet, hundreds of millions of its own species still lack the most basic forms of technology? If we are talking about HBs, the answer would surely be YES! However, HBs don't yet have the ability to travel large distances through space. Perhaps a species has to develop to the point where it has collectively proven itself to be responsible enough to visit other inhabited (or habitable) planets before it is able to? Another valid point is that wise humans are peaceful. Logic decrees that space-travelling aliens must be at least as wise as the wisest humans (r:p2699, ln56 + p2700, ln71 to p2701, ln1) – therefore, they must be peaceful also (if aliens are performing experiments on abducted earthlings, that could be said to disprove the notion they are wise; but such experiments could be meant to highlight this hypocritical side of HB behaviour – i.e., countless HB's fear being experimented on by aliens while condoning similar experiments being performed by their own species on other earthlings!). Now, if you were a peace-loving alien, would you visit Earth at the moment (or share space-travelling technology with a species whose opinion appears to be that: ‘Earth is base, Heavens are pure and clean – we can leave behind our mess and start over again’)?

Some Velvet Morning when I'm straight I'm gonna open up your gate...

THE BOOK OF CAIN

On the first day energy created black, which it called dark, then white, which it called light.

On the second day energy created brown, which it called earth and used to separate light from dark.

On the third day energy made brown revolve around light, and called this motion time.

On the fourth day energy created blue, which it called water, then green, which it called plants, and used them to keep earth warm.

On the fifth day energy used motion to mix brown, blue and green which, in the presence of warmth, made what it called creatures. A notable feature of creatures was personal mobility, a feature they used to make lots more of themselves so, to limit the number of copies of each creature, energy created red.

Watching the creatures make themselves made energy feel lonely, so on the sixth day energy decided to make a celibate creature that it could communicate with on a more personal level, which was called sapien. Everyone was mostly happy until the sapien asked why it had been made. After receiving the answer, the sapien became too consumed with feelings of loneliness to bother communicating with energy. Concluding that two could be better than one, energy created a partner for the sapien. But energy quickly became bored with their conversations.

To expand their interests, energy decided to give the sapiens stewardship over the other creatures. In response, the sapiens asked if energy intended to compensate them for this responsibility. A deal was struck whereby they would be stewards if allowed to use whatever they deemed necessary to satisfy their needs, with a proviso that they were forbidden from killing any other life form without proper justification. Unsurprisingly, the other creatures weren't very pleased with this arrangement so, to appease them, energy created a guard that would become alarmed if the sapiens ever became irresponsible.

On the seventh day sapiens asked why energy had created the guard. "Don't you trust us?" Energy replied that it was up to them to prove they could be trusted. "How are we to do that?" Energy told them to invent their own language. When they could use this language to record the difference between responsible and irresponsible, at that time energy would trust them. The sapiens began their language by making up the word human, which meant the two of them together, and used sapiens to mean the two of them apart. The first sapien then called itself Adam, and the partner called itself Eve, after which they named everything else they could see.

Most of the other creatures had natural coats of some kind whereas Adam and Eve's skin was predominantly hairless. This sometimes caused them to feel cold, so they made coats for themselves using leaves. Then they started to make other things, and eventually became so absorbed in their new pastime that they forgot about trying to prove they could be trusted. Adam and Eve built a home for themselves at the foot of a mountain that they had named Eden, and built a fence around their home to gain some privacy and security – as they were scared that the predatory creatures might one day try to attack them.

The fence kept out the predators, but not the birds, so to scare them away Adam captured a serpent – which was unable to go through or over the fence itself. However, although the serpent was willing to be the sapiens' friend it wasn't keen on being their prisoner, and also didn't like being separated from its own kind, so the snake devised a means of becoming unpopular. It began to taunt Adam by saying only Eve knew how to be responsible. The taunting continued until Adam became angry and started to hit the serpent with a heavy stick. Adam landed such a blow to its middle that the serpent broke into two halves. In an attempt to defend itself the serpent's top half bit Adam. The bite hurt Adam and made him very sick. When Eve heard Adam's condition was caused by the serpent she opened the gate and chased it away, yelling that it was banished from their home forever. The serpent's top half slid to a river but the bottom couldn't see where it was going and fell into a hole in the ground.

Energy was disappointed with Eve. It told her that being responsible meant she was supposed to protect the serpent. To remind Eve of the serpent's suffering, energy punished her by making her body bleed periodically. As his punishment, Adam received a serpentine penis, which was meant to constantly remind him of his own indiscretion. Adam and Eve apologised for their behaviour but explained that they had just wanted something to look after, like energy looked after them, then protested that as it was their first mistake they deserved clemency. Their plea convinced energy that they should be able to reproduce themselves, so it explained what would happen to Eve's body during each period of bleeding and, to encourage her to have sex – and compensate her for the inconvenience of the bleeding plus the untold pain of childbirth – gave her a clitoris.

Adam and Eve were particularly fascinated by their new-found knowledge and extra body parts, and henceforth enjoyed being naked whenever they were together in the privacy of their home. They had sex often and within a year Eve gave birth to twins. They called the first-born Cain and the second-born Abel. A sibling rivalry developed between the children that intensified as they grew older. This rivalry was fuelled by Adam and Eve who both gave Abel the most attention. Cain often felt like an outsider, so she spent an increasing amount of time away from home, observing and learning from what was happening on the other side of the fence. Meanwhile, Abel would stay at home and be fussed over. Adam and Eve felt honoured by Abel's presence but were disappointed in Cain as she began to show less respect for them. By the time Cain had reached adulthood she understood much about the plants and other creatures, so when Adam and Eve asked her what kind of job she wanted to do to prove how responsible she was Cain chose to till the ground. Abel grew up to be lazy and complacent, because his parents did most things for him. Abel decided that an easy job would be to look after sheep, so he befriended some and kept them near him. In due course the sheep followed Abel wherever he went, which made Abel feel even better about himself.

One day Cain and Abel had an argument about whose job was more responsible. Cain said her job made it easy for the family to obtain food but Abel's job did nothing for the family. Abel resented this so he decided they should have a competition. Cain agreed with Abel's suggestion that they take the results of their labour to Adam and get him to choose the winner. Abel killed one of his sheep, cooked its body and gave Adam the roasted flesh to eat and the fleece to wear. Adam enjoyed the taste of the meat, the warmth of the fleece and Abel's explanation of how easily the products had been obtained. Adam didn't enjoy the familiarity of Cain's offering, a selection of her favourite vegetables, fruits and nuts. Cain was devastated. She complained to energy that Abel had killed without proper justification and, therefore, must be punished in some way. Energy asked Cain, "Why are you unhappy? If you do well, won't you be accepted? If you do well sin will lie at your door and sin will do whatever you ask it to and you will rule sin." Cain didn't know what energy's statement meant, but was too embarrassed to ask. She later confronted Abel and told him, "I am the first-born. Because you were born second, or last, you lose in this instance. Therefore I claim the right to inherit all of our parents' property at a future time. Henceforth I will call you sin and a day will come when I will make you lie outside the door of our house with your sheep, and I will rule over you and you will have to do whatever I say." Abel wasn't impressed with Cain's speech. "It was only luck that made you the first-born. Rams fight to be head of the flock. If you wish to be head of our household you must prove you are the strongest. Let us fight and the winner shall have the birthright." Abel started to attack Cain with a ferocity that surprised her, for he was determined not to lose, but although Cain wasn't as strong physically as her brother she was more cunning and the fight ended when Cain accidentally killed Abel. Cain looked at Abel's dead body and immediately felt sad. She had proved who was the best at fighting but had lost her only brother. To remind herself of how foolish they'd been she made up the word war.

When Adam and Eve learnt of Abel's death they were furious. They dragged Cain before energy, demanding she be suitably punished for killing their son. Energy wasn't pleased about being asked to punish Cain but Adam and Eve were persistent. Eventually energy agreed to banish Cain until she had completed Adam and Eve's task of recording the difference between responsible and irresponsible. "You must leave our presence and this land, and you will become weak as a lamb because the soil will no longer yield unto you its strength." Cain pleaded that this punishment was too harsh for her to bear. "I will be alone and forced to scavenge for food while trying to hide from any predator creatures that may recognise me as being sapien and, motivated by jealousy, try to kill me." Energy told Cain that if any creature tried to kill her its punishment would be seven times worse than hers. As Cain left the land of Eden, she was unaware that energy had set a mark on her so no creature would kill her. Energy also put Cain into a trance, then told the half of the

serpent which had fallen into a hole to remain in the ground and listen for the vibration that means Cain has returned. After Cain was out of sight energy told Adam and Eve that, since their behaviour had repeatedly been unacceptable, they must also leave Eden. Energy sent them west – the opposite direction to Cain's path.

Adam and Eve later had more children, the descendants of whom eventually divided their world into three parts. In the first world people danced while in the second world people worked and in the third world people died. During this time there were many rapes committed. Some men raped young girls because they thought they were God and needed a virgin to produce God's son. During this time there were also many murders committed. Some people murdered because they thought they were a reincarnation of Cain and had to repeat her life, while others thought that they were Abel and had to seek revenge. Another feature of this time was that there were lots of wars. Most wars were small but some were large. Two of the largest were World War One, written by some people as WWI, and World War Two, written by some people as WWII. After WWII the wealthy made an army using the political and religious leaders. They wanted to start World War Three, written as WWIII but pronounced by some people as World War Free. The army of the wealthy began destroying everything it encountered, leaving behind a desolate landscape. This rampage continued until the only thing left to destroy was the city of Heaven. However, the wealthy discovered that they were unable to enter the city of Heaven, because their army couldn't scale or destroy its gate and wall. They laid siege to the city and began to wonder how this stalemate would end.

The poor citizens of the city also wondered how the stalemate would end. If the army of the wealthy were to breach the wall, the city's only means of defence, its inhabitants would surely be slain. But they were confident the wall could keep them secure, and because the city was able to provide them with all of their needs, they had the ability to endure the siege forever.

On the eighth day, at twenty-seven minutes past twelve, during the twenty-seventh of the twelfth, an alarm sounded. The alarm woke Cain. She opened her eyes to find herself lying outside the gate of a great city. The wall of the city was like clear glass. Through the wall she could see the city's citizens who, in a state of hopelessness, were all leaning against the wall, looking forlornly at the world outside.

When Cain stood up every other sapien could see her. She looked down at her body, which was naked, and saw that the colour of her skin was brown like the earth. She looked at the gate before her, which was like a mirror, and saw in the reflection a mark on her forehead. The mark was 465042. Cain punched this into a keypad on the gate, which immediately disappeared along with the wall of the city of Heaven. Cain smiled because she could see Mt Eden. Now that the wall was gone the people inside and outside the city faced each other without any barriers. The number on the outside was 3.6 billion and the number on the inside was also 3.6 billion. Cain stepped into the ranks of the poor, and the wealthy could see they were outnumbered. The wealthy, who were awed by Cain's power, discarded their weapons and asked Cain for help to put right all the wrongs that they had inflicted upon the earth. Cain showed them a book she had written which explained what was irresponsible and how to be responsible, then everybody joined together to do what the book said.

On the ninth day there was a hush over the universe, for the ruler had been restored to its rightful place. The name of the one who sat upon the throne was Peace. Then all the creatures heard energy say, "This is my dream."
